* Productivity Team Report: Cotton Spinning. Anglo-American Council on Productivity. 3s.

The Platt mission denied that British workers were inferior in skill. This report states as firmly that they work as hard as the Americans. What, then, are the causes of the disparity? One, at least, is probably outside the power of British firms to control: the American spinners have the pick of the cotton crop. The premium for high-quality raw cotton is not so high in America as to offset the saving in labour costs through shorter processing. Whatever quality the American spinner buys, he is assured of continuity of supply of the same grade, staple and character. This simplifies his processing and his control of work.

Beyond this, it is made perfectly clear that the Americans achieve higher productivity simply through seeking it at all points. A general acceptance of the usefulness of work-load measurement is one manifestation of this state of mind. The condition of being "productivity-minded," already described by teams which have visited other industries, is described once more:

> Managements are very receptive to new ideas and will try out any new device themselves rather than depend on others to try it out. They will do so as an insurance against being left behind in the race, and they do not mind having occasional failures. Operatives are prepared to give new devices and set-ups a fair trial with a fair work assignment and are encouraged to do so by the unions.

*

This attitude is accompanied by a different idea of what mill improvements are for. An official of the Textile Workers' Union of America, who addressed the team, made it clear that the notion, so common in England, of an automatic right of the particular workers concerned in a machine improvement to get immediately in their wage packets a substantial share of the benefits arising from the change, was not current in the American industry. Another example of the difference is the important part which the movement towards larger packages has played in raising American mill productivity. The prime purpose of fitting larger packages is to reduce the work-load which one machine imposes on the operative. They lead, therefore, to higher productivity—if the worker is at the same time given more machines to tend. This is the general rule in the American mills; but the report observes that in British mills, when larger packages are fitted, the number of machines per worker often remains unchanged; and thus "the full effect on operative hours per 100 lb. of product is often not obtained."

Saving Fuel in the Steel Industry

An encouraging account of the trend of fuel consumption in blast furnaces and steelworks appears in the February issue of the *Statistical Bulletin* of the British Iron and Steel Federation. In considering the trend (which is shown in the accompanying chart) it has to be remembered that the quality of the coal used has fallen heavily, on balance, in the last eleven years. The *Bulletin* recalls that an investigation in 1947 showed that the average moisture content of coke supplied to the industry had risen by 50 per cent since 1939, and the ash content had risen by some 20 per cent; and since 1947, it adds surprisingly, "there has been no improvement."

It is probably a fair inference that merely to have maintained the 1938 standard of fuel consumption with a debased quality of fuel would have been a saving in effect. There has, however, been a positive improvement as well. The production of a ton of British pig-iron consumed, on the average, 32.6 cwt. of coal in 1938 and 30.8 cwt. last year. To make a ton of steel required 40.7 cwt. in 1938 and 37.2 cwt. in 1949. This figure includes the "coal content" of the pig-iron used; consumption in the steelmaking processes themselves was reduced from 19.5 cwt. in 1938 to 17.5 last year. The average amount of pig-iron used to

make a ton of steel fell from 13 cwt. to 12.8 cwt. in the same period ; this figure can perhaps be taken as a measure of the relatively small part of the saving which has arisen from the greater use of steel scrap. In these figures, as in the graph, oil consumption is represented by its equivalent in coal.

Technical improvements in the blast furnaces and steel-works must have most of the credit. The article makes it clear that great economies still remain to be achieved by these means, which include ore preparation and sintering, the fuller use of furnace gases, the adoption of oil and gas

firing for certain processes, and the greater integration of works to cut out the cooling of metal between treatments. The steel industry development plan is beginning to show results in fuel saving. When the plan was drawn up in 1946 it was estimated that the new blast furnaces would have an average coke consumption of 16 cwt. a ton of iron on imported ore, and 20 cwt. a ton on British ore. This gave a weighted average of 17 cwt. of coke (the equivalent of 26 cwt. of coal) for the new furnaces ; the average consumption in the existing furnaces in 1947 was 32.2 cwt. of coal, so the improvement from this source alone should be great. Now that some of the blast furnaces are in operation, the *Bulletin* claims that the expectation is being met " and in some cases even improved upon." When the plan is complete (it estimates) the average for the whole blast-furnace industry will be no more than 27 cwt. of coal per ton of iron.

How to Sell Shoes

Sales of British footwear in the United States expanded in 1948, but fell off again last year. A mission which visited the United States from the Leather, Footwear and Allied Industries Export Corporation expresses the view in its report that " America could absorb considerably increased quantities of British footwear of all types," but expresses no very firm hopes that this possibility will be realised. In the market for women's shoes, any great headway seems to be ruled out by the fact that the British manufacturers do not—with certain exceptions—produce new designs of their own ; their practice is rather to reproduce American designs for British consumption.

The prospect for men's shoes is less hopeless, but even here there are serious "deterrents to trade" to be overcome, and changes in manufacturing and marketing policy are recommended as first conditions of improvement. The central objective which the report sets before the British footwear industry for its American trade is an expansion of exports to (as a starting-point) 1,000,000 pairs a year of men's medium-priced shoes—the grades which retailed at $13 to $20 a pair before devaluation. To reach even this " starting-point " would require a more than fivefold advance over 1948. What are the obstacles in the way ?

The report says plainly that British quality has fallen off since before the war, while the American product has improved. It specifies faults of finish and shortcomings in " eye-appeal." Punctual delivery is needed before American stores will be persuaded that British footwear can be fitted smoothly into their selling policies ; not all British manufacturers have lately been satisfactory in this respect, and the difficulty has grown since last year's recession of business, which caused American retailers to cut their stocks and thrust the onus of stockholding more and more on to their suppliers. Prices must not be allowed to rise :

> There are many indications that British prices have risen beyond the point at which a substantial decline in business follows even a small additional increase.

Continuity of supply, and uniform standards over large quantities, will be essential. The bulk of any increase in this class of trade will therefore have to come from manufacturers who are individually capable of diverting large quantities of footwear to the American market ; and all except the largest of these are recommended to form groups which would use their selling and distributing organisations jointly. Going further, the report suggests a co-operative manufacturing organisation, entirely devoted to production for the American market, as a possibility to be explored.

*

Clearly there are flaws in this ; their nature is suggested by the condition which is attached, that the organisation would have to be given " priority claim on all necessary raw materials and labour." The fact is—and the report concedes it by implication in various ways—not only that the right kind of effort is not being directed at the American market, but also that the trading conditions have yet to be brought about which might cause the right kind of effort to be made. The report is much concerned with the difficulty of " diverting " output from the home market and from the other export markets ; but so long as those markets are easy, will manufacturers look for large-scale trouble in America ? Upper leather of the right quality, at the right price, is hard to obtain, and manufacturers who sell to America are no better placed to get it than are any other manufacturers. The leather manufacturers themselves " can command for their leather in export markets considerably higher prices than they are permitted to charge to British shoe manufacturers." They can only get their best materials for dollars, and then only on condition that they sell every hide for dollars. How can difficulties of this kind best be solved ? By creating a new superstructure with more priorities and privileges ? Or by restoring the conditions of competitive trade ?

* * *

Defence Orders and Aircraft Employment

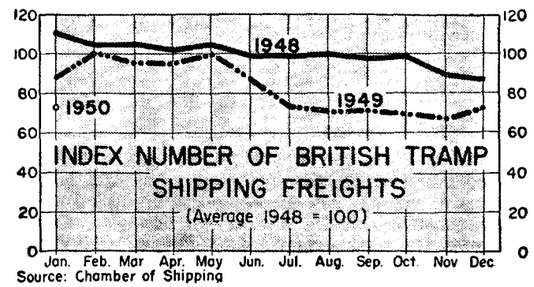
The Defence Estimates published last week provide for expenditure of £54.78 million on aircraft, most of them fighters. The jet fighter strength of Fighter Command is being doubled, and this concerns the Meteor of Gloster Aircraft, a subsidiary of the Hawker-Siddeley group, and the Vampire and its successor the Venom, both built by de Havilland. Gloster Aircraft use Rolls-Royce turbo-jet engines ; de Havilland make their own. Rolls-Royce supply the engines for all British military jet aircraft with the exception of de Havilland's own aircraft and of the experimental Saunders-Roe fighter flying-boat. Their predominance may possibly be challenged by Armstrong-Siddeley, another Hawker-Siddeley group member, who have now in production the turbo-prop engines used in the new anti-submarine aircraft, and who have taken over from Metropolitan Vickers the development of the powerful turbo-jet Sapphire engine.

Orders for other military aircraft, which include naval attackers and trainers, are much smaller. The three companies concerned in standard fighter production, Rolls-Royce, Gloster and de Havilland, were together responsible for most of the £25 million worth of British aircraft exported in 1949. The Western Union defence programme stimulated exports last year and the estimates say that the 1950 production programme " includes the manufacture of a substantial number of jet aircraft for use in Western Union defence." The industry had expected that this part of the defence programme was nearly complete and that European needs would in future be met to an increasing extent by the manufacture of aircraft and engines under licence. Several countries have such licences, but, since the engineers need 18 months' training in this country, production is only just about to start.

The first turbo-jet bomber, the Canberra, is the English Electric Company's first venture in aircraft designing since 1924. It is also to be built in Australia and there was some mention of its being used as a night fighter. The order is probably among the largest recently placed. Other, possibly supersonic, fighters are under development, notably those of Vickers-Armstrongs and Hawker Aircraft, but the prototypes are at present considered as purely experimental. The other aircraft being built are designed for specialised and therefore limited uses.

*

The efforts of the Ministry of Supply to spread aircraft orders in such a way that the manufacturing potential of the country is maintained are complicated by the fact that the manufacturers tend towards specialisation and the defence forces towards standardisation. The dilemma in which this places the Ministry is shown by the present distribution of orders. It is expressed in the difficulties of the Bristol Aeroplane Company and Handley-Page Ltd., who both specialise in larger aircraft and whose orders in 1950-51 for transport aircraft have been severely cut. The Minister of Labour said on Monday that the two companies would probably dismiss 2,000 men in the next few months as a result of the cuts, but members of the industry would be surprised if the figure were not larger. The third firm affected by the cuts, Vickers-Armstrongs Ltd., has received an order for a new trainer, which provides work for men who would otherwise have become redundant. Is work similarly to be found for the 2,000 other men facing dismissal ? Mr Attlee, in one of the letters which were published last weekend, suggested that something of the kind might be attempted, but the steps which have been taken so far only postpone the date at which a large number of engineers will become redundant.



* * *

Replacement of Ships

While the replacement of the large proportion of obsolescent merchant ships in the United Kingdom registry grows more desirable, the shipbuilding industry is faced at the same time with a marked decline in orders for new tonnage. Some light on the reasons for this apparent anomaly is to be found in the annual report of the Liverpool Steam Ship Owners' Association. It is not easy to finance the replacement of a wasting asset in a setting of inflated prices. Ships that were lost in the war have been replaced, ton for ton, since the war ; the shipping industry was helped in this by the war risks insurance scheme, which took into account some, though not all, of the rise in shipbuilding prices which occurred between 1939 and 1945. These insurance recoveries were related to the value of the ship at the date of loss and could not take into account the rise in shipbuilding costs which has occurred since 1945. It is estimated that for a plain deep-sea tramp ship the price in 1945 was 169 per cent, and in 1949, 254 per cent, of the 1939 figure. The replacement of war losses, therefore, has caused a drain on the industry's resources. But it is the ships that survived the war that are now becoming obsolete, and shipbuilding prices are showing no sign of receding yet.

Now that shipping faces falling freight markets, the question is growing acute. The Chamber of Shipping freight index for January was 72.8 (1948 = 100), the same as in December, at a time when a seasonal rise might have been expected. The industry has passed through a period of profitable freight rates since the war, but it complains that the unprecedented level of income tax and profits tax has prevented it from building up the funds it would normally have set aside for the replacement of ships. The 40 per cent initial depreciation allowance, although it lightens the immediate tax burden, does not in the end amount to a reduction in taxation. The shipowners hold that, if they are to maintain the industry in a state to meet keen foreign competition, sums set aside out of earnings and used for replacement ought not to be taxed by the state and used for other (and largely unproductive) purposes.

Another source of finance for replacement, the sale of old ships to foreign flags, is still denied to British shipowners by Government regulation ; this question was discussed in

Source: Chamber of Shipping

The Economist on February 4th. The Liverpool Steam Ship Owners' Association records the continued failure of the industry's efforts to persuade the Minister of Transport to do away with this outmoded control. It points out that economic as well as strategic reasons make it " desirable to help and not hinder the getting rid of unsuitable tonnage and replacing it by new." It can be added that the top of the market for old ships has now passed, and the industry estimates that it could have got £2,000,000 more a year ago for the ships which it would, if permitted, sell today.

Finance and Trade

Cables Scheme in Full Dress

The full details of the modified reconstruction scheme of Cable and Wireless (Holding) were posted to shareholders this week. Almost by the same post came a circular from the ordinary stockholders' committee recommending the adoption of the scheme. Interest, therefore, finally passes from controversy over the issue of liquidation to the practical implementation of the plan itself, though it would still be useful to know the nature of the " other cogent reasons against liquidation apart from certain difficulties and liabilities which exist as regards subsidiary and sub-subsidiary companies " to which Sir Edward Wilshaw refers in this latest circular.

The market has been intrigued by the fixing of the issue price of 96 per cent. for the £4,000,000 4 per cent. unsecured loan stock which is to be offered to holders of the £16,766,591 5½ per cent. cumulative preference stock. The gross redemption yield on this stock, redeemable at par, is approximately £4 11s. per cent, sufficient to warrant a premium of possibly one or two points when dealings begin; it is patently attractive in present conditions, particularly to surtax payers. It should attract a full subscription from preference stockholders and thereby strengthen the cash resources of the company to make purchases of the 3½-year unsecured loan

(to be offered to ordinary stockholders) in the market. A hint is given in the circular that the rate of interest on this stock may well be 3 per cent., since this is one of the assumptions on which the board's estimates of future earnings are based. If that is the rate, it seems equally clear that this stock would open at a discount in present market conditions, but the actual rate will depend on market conditions at the time of the offer—and these are particularly difficult to forecast in the next few months.

On the other hand it is intended to maintain the price of the 3½-year unsecured loan stock by purchases in the market and to redeem five-eighteenths of the issue by drawings after the end of the period during which letters of allotment are renounceable to the company. Given fixed redemption at par, there is no reason why ordinary stockholders should not opt to hold this stock; they may then be able to realise the estimated £295 per cent for their present holding in the company—if the Savings Bonds included in the offer realise their present price. Confidence in this outcome is reflected in the increase in the price of the ordinary stock to 279 this week.

* * *

Earnings Prospects

For those who opt to hold ordinary stock in the reconstituted company, Sir Edward has given an idea both of prospective earnings and the consolidated position of the group, assuming that the scheme goes through. On the basis of present revenue, provided that the 4 per cent 10-year unsecured loan stock is fully subscribed, that the interest on the 3½-year unsecured loan stock is 3 per cent and that the ordinary capital of the reconstructed company is made up to the maximum of £6,883,103, the rate of earnings after repayment of the first five-eighteenths of the 3½-year unsecured loan stock is estimated at 7¼ per cent before taxation. Given the first two assumptions, but assuming a minimum ordinary capital of £4,995,834 (the whole scheme is contingent on this amount being reached) the estimated rate of earnings is 8¼ per cent before taxation. The board appears fairly confident of these estimates, but in putting forward an estimate of earnings of 6 per cent at the end of the life of the 3½ per cent loan stock, it is less so. Here, much will depend on how far expenses can be cut (the figure of £100,000 for administrative expenses must surely yield to substantial pruning), the course of revenue (at present unpredictable) and the extent to which investments have been realised to redeem the 3½-year unsecured loan stock.

At values based on August 31, 1949, and assuming an ordinary capital of £6,883,103, 3½-year unsecured loan stock of £7,433,752 and the full complement of 4 per cent unsecured loan stock, the balance sheet of Cable and Wireless (Holding) after the adoption of the scheme would be as given in the accompanying table. A broad outline of the underlying quoted and unquoted investments was given in the February 25th issue of *The Economist*.

CABLE & WIRELESS (HOLDING)
PRO FORMA BALANCE SHEET

	£
Land and buildings at cost, *less* amounts written off	1,121,672

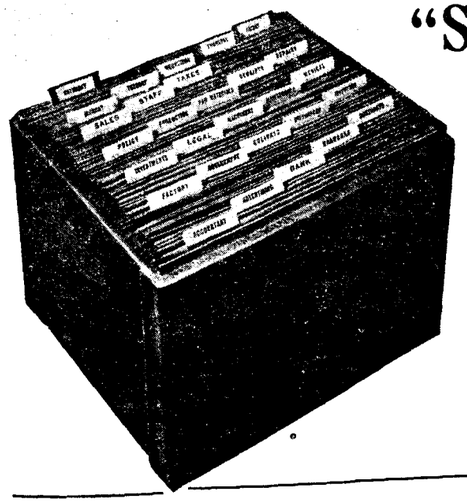
Banking in the East

Sir Arthur Morse's address to the shareholders of the Hongkong and Shanghai Banking Corporation—like the annual addresses of the chairmen of the Eastern Bank and the Chartered Bank of India, which also became available this week—gives on a broad canvas an illuminating picture of present economic conditions in the East. All three banks report a small increase in net profits for 1949, but Sir Arthur drew attention to the fact that branches of British banks in China have now become a liability; most of them are being kept open in the belief that the Communist Government, if it has any concern for the welfare of its people, cannot for ever forgo the essential services which only foreign banks can at present supply.

On China's southern and western borders, too, the Communist shadow darkens the economic prospect. Hongkong, it is true, had a bumper trading year in 1949, thanks to the diversion of business from Chinese ports; even here, however, confidence reeled last summer and share prices and the "merchant" rate for the Hongkong dollar reeled with it. Progress in Indo-China, Indonesia, Thailand and Burma is also inhibited by political nervousness; Sir Arthur Morse expressed his regret that Government intervention in trade is increasing in Thailand and that the able Minister of Finance, Prince Viwat, has lately resigned. In the Philippines, too, a retreat has been made from the outposts of economic liberalism; exchange control was introduced there from December 9th last.

CANADA

This Bank's services are at the disposal of British business men for the development of two-way trade between Great Britain and Canada.



Enquiries welcomed by

BANK OF MONTREAL
47 Threadneedle Street, London, E.C.2
Head Office: MONTREAL
Over 540 Branches throughout Canada
Assets Exceed $2,000,000,000
Incorporated in Canada in 1817 with Limited Liability

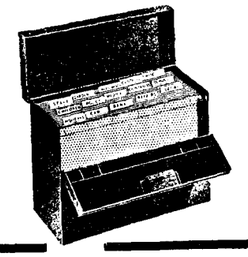
ROYAL INSURANCE COMPANY LIMITED

North John St., LIVERPOOL - *Head Offices* - Lombard St., LONDON
Branches & Agencies throughout the World.

"STRICTLY PERSONAL"
for the OFFICE and for the HOME



Two Self-Contained Units to Control All Your Activities.

Firstly, here is the self-contained "secretarial" unit . . . It is especially for business men who have to keep their papers filed nearby—on their desk or side-table. It also helps where space and staff shortages are problems. The Unit contains the famous Shannoblic adjustably-tabbed files (as used in all modern businesses). The angled tabs can be set in any of five or six positions to give staggered, quick reference visibility. Filing can be numerically, alphabetically, geographically, etc.

Every Executive can utilise one or two of these Units. Just send 96/9*d*. for foolscap size or 84/6*d*. for quarto.

And secondly, have you seen the new Personal Portable Home File? The efficiency of your office in your home. This totally enclosed metal file, complete with lock and key, will enable you to keep a close watch on your personal affairs—letters, bills, receipts, tax returns, etc. Costs only 76/9*d*. foolscap or 69/9*d*. quarto. Just tear out this announcement and send with remittance for despatch within 48 hours.

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk—and all that it means to your dependants—*without* this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon. PA/6

Please send me full particulars of 'General' Personal Accident Policies.

FAMOUS FOR ALL CLASSES OF INSURANCE

REPORT BY THE COURT OF DIRECTORS OF

The ROYAL BANK of SCOTLAND

To the ANNUAL GENERAL COURT OF PROPRIETORS, on WEDNESDAY, 15th March, 1950.

The Court of Directors now submit to the Proprietors, Group Accounts comprising the Balance Sheet and Profit and Loss Account of the Royal Bank of Scotland as at 8th October, 1949, and the Balance Sheets and Profit and Loss Accounts of its Subsidiary Companies, Glyn, Mills & Co. and Williams Deacon's Bank Limited as at 31st December, 1949.

The Net Profit of THE ROYAL BANK OF SCOTLAND for the year to 8th October, 1949, after providing for Taxation and making transfers to Reserves for Contingencies, out of which Accounts provisions have been made for all bad and doubtful debts and fluctuations in the value of Investments, amounted to £615,222 1 9

Interim dividend at rate of 8½ per cent. actual paid at Midsummer, 1949, required	£361,250 0 0	
Less Income Tax	162,562 10 0	
		£198,687 10 0
Interim dividend at rate of 8½ per cent. actual paid at Christmas, 1949, required	£361,250 0 0	
Less Income Tax	162,562 10 0	
		198,687 10 0
There have been transferred to Property Maintenance Reserve Account		30,000 0 0
Contributed to Staff Pension Fund		75,000 0 0
Carried to Reserve Fund		112,847 1 9
		£615,222 1 9

The Reserve Fund now amounts to £4,672,553.

A dividend of 17 per cent. per annum having already been paid, the Court of Directors do not recommend any further dividend for the year.

A valuation of the Bank's quoted investments at 8th October, 1949, is in excess of the sums at which they appear in the annexed Balance Sheet.

The Directors record with deep regret the death of The Right Hon. The Earl of Strathmore and Kinghorne, D.L., who had been Deputy-Governor since March, 1945. In virtue of the powers conferred upon them by THE ROYAL BANK OF SCOTLAND ACT, 1873, the Directors elected The Hon. Michael Claude Hamilton Bowes-Lyon, D.L., as Deputy-Governor of the Bank. During the year Mr. Gerard P. Dewhurst, Manchester, resigned as an Ordinary Director, but the Directors are pleased to announce that he has agreed to continue to serve the Bank as an Extraordinary Director, and in exercise of the powers already mentioned has been so elected. In virtue of the same powers, the Directors elected Sir Walrond A. F. Sinclair to fill the vacancy on the Ordinary Board; he holds office until this Annual General Court only, but is eligible for re-election.

The Governor, the Deputy-Governor, the Extraordinary Directors, and the Senior Ordinary Director (Mr. Michael James Babington Smith, C.B.E.) retire at this time, and are eligible for re-election.

Mr. George James Gregor, C.A., and Mr. S. W. Murphy, C.A., Auditors for the past year, are willing to continue in office as Auditors, and will be re-appointed pursuant to Section 159 of the Companies Act, 1948.

EDINBURGH, 21*st February*, 1950.

By Order of the Court of Directors,
J. M. THOMSON *Cashier and General Manager.*

STATEMENT OF ACCOUNTS, 8th OCTOBER, 1949.

LIABILITIES for Acceptances, Confirmed Credits and other Obligations			6,039,104
Notes :—			

The profits of Williams Deacon's Bank Ltd. and Glyn, Mills & Co. have been taken into the Royal Bank of Scotland profit only to the extent of the Dividends declared.

The Nominee Companies are non-trading and have made neither a profit nor a loss for the year ended 8th October, 1949.

Foreign Currency Balances have been converted into Sterling at the rates current on 8th October, 1949.

United Kingdom Income Tax has been provided on the profits to date.

— — — — —

Statement required by the Eighth Schedule of the Companies Act, 1948.

The Directors of the Bank have, in terms of Section 153 (1) of the Companies Act, 1948, investigated the possibility of making the financial year of each of the Subsidiaries coincide with its own. The practice of the Subsidiaries has been to make up their Accounts as at 31st December in each year, and it is considered impracticable to alter this arrangement. The Royal Bank of Scotland has, since 1879, made up its Accounts annually on the second Saturday of October, and any alteration in this long-established and convenient procedure would involve administrative difficulties in the conduct of the Bank's affairs. The Directors are satisfied that the foregoing considerations constitute good reasons for not making any alteration in the financial years of the Bank or of the Subsidiaries.

A. MAITLAND, ELGIN, C. AUGUSTUS CARLOW. *Directors.*
J. M. THOMSON, *Cashier and General Manager.*

Pension, other than as a Director	4,000		
	£45,054		

AUDITORS' REPORT

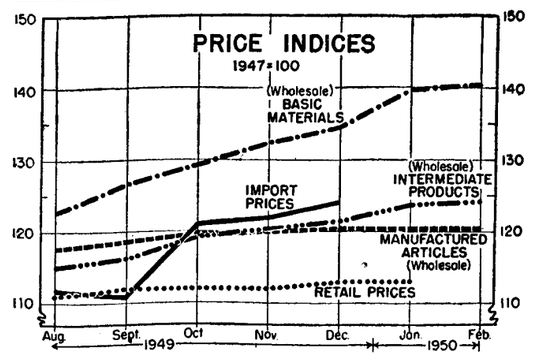
We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our Audit. In our opinion proper books of account have been kept by the Bank so far as appears from our examination of those books, and proper returns adequate for the purposes of our audit have been received from Branches not visited by us.

We have examined the above Balance Sheet and Profit and Loss Account which are in agreement with the books of account and returns of the Bank. In our opinion and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1948, in the manner so required, and on the basis authorised by the Act for a banking company give a true and fair view in the case of the Balance Sheet of the state of the Bank's affairs at 8th October, 1949, and in the case of the Profit and Loss Account of the profit for the year ended on that date.

We have examined the Group Accounts (comprising the above Balance Sheet of the Royal Bank of Scotland as at 8th October, 1949, and the annexed Balance Sheets of its Subsidiaries, Glyn, Mills & Co. and Williams Deacon's Bank Ltd., both as at 31st December, 1949) with the audited accounts of the Banks dealt with thereby, which accounts, with the exception of the Royal Bank of Scotland, have not been audited by us. Subject to the foregoing, in our opinion, the said Group Accounts have been properly prepared in accordance with the provisions of the Companies Act, 1948, and, on the basis authorised therein, give a true and fair view of the state of affairs and of the profit of the Royal Bank of Scotland and its Subsidiaries.

EDINBURGH, 19*th January*, 1950.

GEO. JAMES GREGOR, C.A., *Auditor.*
S. W. MURPHY, C.A. *Auditor.*



Political uncertainties have also clouded the economic horizon in the Commonwealth countries in the East. Each of the three bank chairmen found grounds for optimism about the long-run economic prospect in the Indian sub-continent and in Malaya, but these grounds are at present overlain by the Indo-Pakistan dispute in the one case and the banditry problem in the other. It was therefore left to Japan to make what was, perhaps, the most marked progress achieved by any Eastern country in 1949. Even here, however, optimism must be tempered by uncertainty about the peace treaty and the future course of Japan's foreign trade balance. Owing partly to disturbed trade relations with China, this is now running into considerable difficulties. Since the signing of the trade agreement with the sterling area last November, purchases of sterling area goods have been outstripping the rate at which licences have been issued in the sterling territories to cover purchases of Japanese goods, so that the commercial banks operating in Japan have had to undertake financing arrangements which Sir Arthur plainly regards with distaste.

Price Trends

The rise in British prices since devaluation is bearing out the forecasts made at the time. Wholesale prices (as measured by the Board of Trade index) rose by 7 per cent between August and February. Basic materials alone have shown a rise of 14½ per cent, intermediate products of 8 per cent and manufactured articles of 2½ per cent. The interim index of retail prices rose by almost 2 per cent between August and January: food was mainly responsible but dearer fuel and light also contributed. The latest published figure for import prices is December when it showed a rise of 11 per cent compared with August. The January figure will probably show a further increase, probably making the total rise since devaluation about 12½ per cent. The entire increase in import prices and in the wholesale prices of raw materials will not necessarily be reflected in retail prices, but a further rise in the retail index of several points is to be expected. Two important factors will be the decision to limit or not to limit the cost of subsidies in the new Budget and the outcome of the present negotiations on British farm prices.

The rise in wholesale prices in February amounted to only 0.2 per cent, the smallest monthly increase since devaluation. This fact may suggest that the direct effect of devaluation has already taken place, and that the next

indirect stage, when higher costs of raw materials begin to work their way into prices of manufactured products, is getting under way. But the existence of long-term contracts has damped down some of the price effects resulting from devaluation. No decision, for instance, has yet been taken over the Argentine meat price or over the prices for Danish bacon and dairy produce, while Australia and New Zealand may seek further increases in their contract prices next July.

Last month the wholesale price of meat rose owing to the increased surcharge, while fruit and vegetables (except tomatoes) were also dearer. Among the non-ferrous metals, zinc and tin were somewhat lower. Cotton prices, however, rose by 2½ per cent for American types and by 3½ per cent for Egyptian types, whereas wool became cheaper; merino prices fell by nearly 2 per cent and crossbreds by 7 per cent. Sisal continued to rise and so did rubber, both commodities showing a 5 per cent increase on the month.

Revival in Swiss Foreign Lending

In recent months Switzerland's traditional role as an international lender in Europe has been rapidly reviving. In a world short of Swiss francs, Switzerland's trade and industry more than ever depend for foreign orders upon the proceeds of these loans. In the early postwar period the lending mainly took the form of inter-governmental grants within the framework of the various payments agreements. Now, it seems, the role is passing back to the banks and to the capital market in Switzerland. Since the beginning of this year some new credit or flotation has been launched almost every week. Banks and investors welcome these foreign operations as a much-needed outlet for the liquid funds which have piled up since the decline in the level of internal investment last year. The loans have generally taken the form of medium-term facilities extended by the banks direct or raised through them by issues to the public.

The largest single operation so far has been the credit of the Sw. fcs. 250 million granted to the French railways by way of three months' bills drawn on Swiss banks and renewable for a maximum of three years. Other recent credits to France include a loan to the Port of Havre for reconstruction purposes and a credit of Sw. fcs. 12 million to Electrité de France to expand the power plant at Nantes with machinery supplied by Brown Boveri. Belgium has had three credits, one to purchase telephone equipment, and two in favour of the Belgian railway companies. The telephone loan, a 4 per cent public issue of Sw. fcs. 50 million, now stands at 102. Last week Holland received a loan of Sw. fcs. 50 million, raised by issuing 4 per cent 12-year bonds at 98 per cent. Another operation was the loan of Sw. fcs. 30 million granted by the banks last year to the South African Government; this loan is repayable in gold at the end of three years. A further loan operation on behalf of the World Bank was concluded earlier this month with a banking syndicate, which agreed to purchase firm Sw. fcs. 28.5 million of World Bank bonds to provide the bank with Swiss exchange for imports by Brazil, Finland, Mexico and Holland.

In addition to these publicised operations, the banks in Switzerland constantly have revolving credit lines outstanding in most countries west of the Iron Curtain. So far loans to Germany, formerly the leading user of Swiss credit, have not been resumed, despite many overtures made by the Germans.

* * *

February Exports

Exports showed their seasonal decline last month and totalled £156 million compared with the record of £176 million in January. The seasonal fall in February was slightly smaller than a year earlier and the daily rate of exports in February was 11 per cent higher than in February, 1949. Imports are provisionally estimated at £182 million—a fall of £20 million on the January total, but £20 million larger than in February, 1949. Re-exports amounted to £5,300,000. Thus the excess of imports (valued c.i.f.) over total exports (valued f.o.b.) was £20.7 million compared

with £19.5 million in January and £36.5 million per month for the last quarter of 1949.

The needed expansion of exports to the United States and Canada is still missing. Shipments to both markets fell last month. Exports to the United States showed a reduction for the third successive month, and the check to the steady

BRITISH EXPORTS TO USA AND CANADA
(Monthly Averages—Million $)

Destination	Unit	1949				1950	
		1st Qtr.	2nd Qtr.	3rd Qtr.	4th Qtr.	Jan.	Feb.
United States..	US $	21·2	13·4	15·1	18·7	19·2	17·7
Canada	Can.$	26·7	26·5	25·2	22·0	25·9	24·6
TOTAL	US $	47·9	39·9	40·3	38·7	42·7	40·1

expansion in shipments to Canada will, it must be hoped, prove temporary. Britain's total exports for dollars (reckoned in US currency) are substantially below their level before devaluation though last month's earnings still showed an improvement compared with those of the last three months of 1949. The contention that the devaluation of sterling would do no more than arrest the decline in exports to dollar markets has so far been borne out.

* * *

Germany Joins Wheat Agreement

At the meeting of the international wheat council this week, Germany was admitted as a full member and unconditionally. Britain had already received an unofficial undertaking from the German Government that it would not purchase more than 5,000,000 bushels of sterling wheat in any year under the agreement. Britain thereupon supported the German request. Japan, however, was unwilling to give such an undertaking and although its application was supported by all the exporting countries, Britain (which exercises a veto power among the importing countries) argued that Japanese purchases of sterling wheat should be limited. Since the United States felt that such a condition altered the whole basis of the wheat agreement, the Japanese application was postponed until a future meeting of the council.

Germany's annual import quota under the agreement is 66 billion bushels. In the current season all of this will come from the United States, since Germany had already signed contracts with America. In subsequent seasons the Australian export quota is to be raised by 5,000,000 bushels and the remaining quantity is to be shared by the United States and Canada. By joining the wheat agreement Germany will save some $33 million a year on its wheat purchases—representing the difference between the price it was paying the United States and the maximum price under the agreement.

The Japanese difficulty remains to be solved. Britain is in no way willing to risk having to spend more dollars on wheat. On the other hand Japan wants unconditional admittance. A possible solution might be found by Britain and Australia reaching an unofficial bilateral pact—another gentleman's agreement. But that would prevent Britain from indulging in various tactics to force the Australian Wheat Board to reduce its price.

* * *

Hoover Incentives

"We should not freeze industry with restrictions, we should stimulate it with incentives." This is the keynote of Mr Charles Colston's annual statement to Hoover shareholders. Mr Colston's remarks on "moderation and restraint" in dividend policy deserve a wide audience. He justifies the modest increase from 2s. to 2s. 3d. per 5s. stock unit on the company's ordinary stock of £935,000 (absorbing an additional £25,713 and a considerably higher dividend of 7.938d. a share (0.48d.) on the 800,000 1s. "A" ordinary shares (absorbing £13,673 more than in 1948). These additional payments represent less than one twentieth of the increase in profit; they may be compared with the much greater increase from £20,000 to £124,000 in net dividends paid in hard currency to the parent company by subsidiaries operating abroad. The group's trading profit has risen from £1,140,518 to no less than £1,962,393 in 1949, resulting in an increase in earnings from 81½ per cent to just over 100 per cent. Moreover incentive schemes have increased wages and salaries by a substantial amount before striking one year's profit. Further, £108,167, nearly double the 1948 amount, has been appropriated from profits towards pensions for employees.

Certainly in the Hoover organisation there has been no curb to the rewards available to workers for increased efficiency, nor to directors of the parent company whose emoluments have increased from £50,246 to £80,556. And now shareholders are given a new inducement "to back any further undertakings on which the company may embark." In this case, all round incentives have had a tangible result in higher efficiency, record output and profit. These are the criteria by which Mr Colston chooses to measure "moderation and restraint."

He would regard dividend limitation as no more than a temporary expedient to combat inflation, on these grounds:

. . . The basis of dividend limitation as a weapon against inflation is in the process of disappearing. Many companies are not earning sufficient to be able to raise their dividends. Many are reducing their dividends. It is not the policy

laid down from above, but the hard facts of the economic situation which in a growing number of cases will limit company dividends.

That is the other side of the penny. It is Mr Colston's view that "a large increase in the volume of efficient production is the effective counter to inflationary pressure," that "this should be the acid test of any economic policy" and that dividend limitation, together with the wages freeze, stifles the spirit of adventure in industry, a spirit which should manifest itself not only at the factory but also in the ready provision of risk capital.

Wool Profits and Finance

The disposal of the dominion wool stocks accumulated during the war years by the British Government has proved to be very profitable. Trading results of the UK-Dominion Wool Disposals Ltd. (the Joint Organisation) for the year ended June 30, 1949, showed a net profit of £30 million. Over 1½ million bales of wool were sold during the twelve months, realising £53 million. Stocks at the end of June amounted to 1,700,000 bales. The Joint Organisation started to operate in August, 1945, and 8,700,000 bales of wool have since been sold yielding a net profit of £85.4 million. The wartime divisible profits account for a further £27.7 million making the total share-out £113 million. Of this sum £57 million stands to the credit of Britain, £40 million to Australia, £9,000,000 to New Zealand and £7,000,000 to South Africa. Most of the remaining stock of wool is expected to be sold during the current year, and if prices maintain their present course, the Joint Organisation should be able to show another handsome profit next June.

In addition to this substantial profit the Joint Organisation has also paid back to the British Government, from the proceeds of sales, the whole of the original capital amounting to £140 million and represented by stocks of wool, stores and buildings. The architects of this stock disposal scheme never imagined in 1945 that the liquidation of what seemed then to be a burdensome surplus could have been so profitable.

The present height of wool prices is having repercussions on the various credits granted to European countries to cover their annual requirements. The Austrian wool credit, first granted in 1946, has been renewed and the ceiling raised by £1,000,000 to £2,500,000. The credit is again being granted by a syndicate that includes Barclays Bank and Messrs. N. M. Rothschild and is headed by Hambros Bank. The raising of the ceiling will enable Austria to cover increased wool imports

REPORT OF THE AUDITORS TO THE STOCKHOLDERS

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion proper books of account have been kept by the bank so far as appears from our examination of those books, and proper returns adequate for the purposes of our audit have been received from the branches, which have not been visited by us. We have examined the annexed balance sheet and profit and loss account of The Chartered Bank of India, Australia & China, which are in agreement with the books of account and returns as aforesaid. In our opinion and to the best of our information and according to the explanations given to us the said accounts give the information required by the Companies Act, 1948, in the manner so required for banking companies, and, on the basis indicated in Note (4) on the balance sheet, such balance sheet gives a true and fair view of the state of the bank's affairs as at 31st December, 1949, and the profit and loss account gives a true and fair view of the profit for the year ended on that date.

We have also examined the annexed accounts of the subsidiaries, Allahabad Bank Limited and The Chartered Bank (Malaya) Trustee Limited, which have not been audited by us. Subject thereto in our opinion such accounts have been properly prepared in accordance with the provisions of the Companies Act, 1948, so as, in conjunction with the accounts of the bank as audited by us (which include particulars regarding Nominee Companies), to give on the basis mentioned above a true and fair view of the state of affairs as at 31st December, 1949, and of the profit for the periods ended on that date of the bank and its subsidiaries so far as concerns stockholders of The Chartered Bank of India, Australia and China.

at higher prices. Austria is so short of sterling that it could not bridge the interval between payment to the Australian shipper for raw wool and the receipt of payment by the Austrian exporter of finished manufactures without credit accommodation. Bills drawn against the credit will vary from four to six months usance to cover the period of shipment and the processing and re-export stages. The Export Credits Guarantee Department has insured the credit. In sanctioning the renewal of this credit, the authorities were not faced with any of the nicer calculations of economic gain or loss when London banks submit proposals to lend to foreign countries whose central banks are well provided with sterling. Such a case will be posed later this year when the French wool credit comes up for renewal.

Shorter Notes

A scheme to inaugurate a compensation fund for the protection of the public is to be considered at the annual meeting of the Provincial Brokers' Stock Exchange next month. Compensation would only be considered for persons who suffer financial loss by reason of dishonesty of brokers or their servants. An annual contribution of three guineas from each member of the exchange resulting in an eventual total of £50,000 is contemplated, the monies to be vested in Trustees. A Scottish insurance company has agreed to provide cover up to £50,000 for the fund in its initial period.

★

Coal output showed some improvement last week. Total production was 4,375,600 tons, of which 4,128,200 tons were deep-mined. Figures for the previous week were 4,338,200 tons, of which 4,119,200 tons were deep-mined. The gradual loss of man-power continues. In the week which ended on March 4th there were only 705,200 men on the colliery books compared with 705,700 the week before and 727,000 in the first week of March last year. The number of face workers fell by 300. Total output for the first ten weeks of the year is 43,035,100 tons, 636,900 tons more than in the same weeks of 1949.

HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong)

(The liability of members is limited to the extent and in manner prescribed by Ordinance No. 6 of 1929 of the Colony)

ONE HUNDRED AND THIRTY-THIRD REPORT OF THE BOARD OF DIRECTORS

SUBMITTED to the Ordinary Yearly General MEETING of Shareholders held at the Offices of the Hongkong and Shanghai Banking Corporation, 1, Queen's Road Central, Hongkong, on Friday, 10th March, 1950.

The Directors have pleasure in submitting the Profit and Loss Account for the year ended 31st December, 1949, together with the Balance Sheet at that date.

The Profit for the year after providing for taxation on profits earned to date and making transfers to reserves and provisions for contingencies, out of which accounts provision has been made for any diminution in value of current assets, amounts to		HK$17,772,326
Less: Special Administrative Expenses, including Chairman's emoluments as Chief Manager, Directors' Fees and London Committee fees	HK$704,849	
Auditors' Fees	25,000	
		729,849
leaving a net profit for the year of		17,042,477
To this balance must be added the undistributed profit brought forward from the previous year		4,278,631
		21,321,108
An Interim Dividend of £2 per Share, free of Hong Kong Corporation Profits Tax, was paid on the 15th August, 1949, amounting to £320,000 @ 1/2-13/16		5,184,810
leaving a balance of		16,136,298
which the Directors recommend be appropriated as follows:—		
Amount to be written off Bank Premises	HK$3,000,000	
A Final Dividend of £3 per Share, free of Hong Kong Corporation Profits Tax, £480,000 @ 1/2-13/16	7,777,215	
		10,777,215
leaving a balance to be carried forward to next year of		HK$5,359,083

DIRECTORS—During the year Mr. N. O. C. Marsh and Mr. E. G. Price resigned and Mr. J. D. Alexander and Mr. C. C. Roberts joined the Board in their stead.
The Hon. Sir A. Morse, C.B.E., has been elected Chairman for the year 1950 and the Hon. D. F. Landale Deputy Chairman.
Mr. E. R. Hill, Mr. H. D. Benham, and Mr. C. Blaker retire by rotation, but being eligible, offer themselves for re-election.

AUDITORS—The Accounts have been audited by Messrs. Lowe, Bingham & Matthews and Messrs. Peat, Marwick, Mitchell & Co., who offer themselves for reappointment.

HONG KONG, 28th February, 1950.

A. MORSE, *Chairman.*

BALANCE SHEET at 31st December, 1949

Share Capital—

STATEMENT IN CONNECTION WITH SUBSIDIARY COMPANIES.

(1) The Investments in Subsidiary Companies appearing in the annexed Balance Sheet represent the Issued Share Capital of three Trustee Companies and three Nominee Companies wholly owned by the Bank. No Group Accounts have been submitted as the Directors are of the opinion that such Accounts would be of no real value to the members of the Bank.

(2) No part of the Profits earned by the Subsidiary Companies has been dealt with in the Accounts of the Bank. The Net aggregate amounts of the Subsidiaries' profits after deducting the Subsidiaries' losses are as follows:—

(i) For the year ended 31st December, 1949	HK$15,095	
(ii) For previous financial years	83,269	
	HK$98,364	

REPORT OF THE AUDITORS TO THE MEMBERS OF THE HONGKONG AND SHANGHAI BANKING CORPORATION.

We have examined the above Balance Sheet with the Books of the Corporation kept in Hong Kong, with the audited accounts of the London Office and with the returns received from the other Offices which have been signed by the Branch Managers. We have obtained all the information and explanations we have required and in our opinion such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Corporation's affairs at 31st December, 1949, according to the best of our information and the explanations given to us and as shown by the books kept in Hong Kong and by the returns received from the other offices.

HONG KONG, 28th February, 1950.

LOWE, BINGHAM & MATTHEWS, PEAT, MARWICK, MITCHELL & CO., } *Chartered Accountants, Auditors.*

COMPANY MEETINGS

ROYAL BANK OF SCOTLAND

HIGH LEVEL OF ACTIVITIES MAINTAINED

RESERVE FUND INCREASED TO £4,672,553

DIVERSITY OF SCOTTISH INDUSTRIAL ACTIVITY

THE DUKE OF BUCCLEUCH'S REVIEW

The annual general Court of Proprietors of the Royal Bank of Scotland was held on March 15th, at Edinburgh.

His Grace the Duke of Buccleuch and Queensberry, K.T., P.C., G.C.V.O., governor of the bank, presided.

The Governor said: Before dealing with the ordinary business of the meeting I have to refer to the great loss experienced by the bank through the death of the Right Hon. the Earl of Strathmore and Kinghorne, D.L., who had held office as deputy-governor since March, 1945. The directors record their deep sense of loss in his passing and their high appreciation of his interest in the affairs of the bank. The Hon. Michael Bowes-Lyon, brother of the late Earl of Strathmore, has been elected by the directors as deputy-governor, and they feel sure that this appointment, which maintains a connection between his family and the bank which has subsisted since 1875 with only one break, will be as welcome to the proprietors as it is to the board.

Mr Gerard Powys Dewhurst, who was chairman of Williams Deacon's Bank, Limited, and one of our ordinary directors, retired from our board in July after having rendered long and valued services to both banks. The directors were glad to offer him, and are pleased that he has accepted, appointment as an extraordinary director of the bank.

Sir Walrond A. F. Sinclair, K.B.E., has been elected to fill the vacancy on our ordinary board and holds office until this Court, when he is eligible for re-election. Sir Walrond Sinclair has for many years been a director of Williams Deacon's Bank. He recently became chairman of their board and, in view of his wide experience and well-established reputation in business affairs, we feel sure that the appointment will be cordially approved by the proprietors.

I assume it will be your pleasure that the annual report of the bank and our balance sheet and profit and loss account and those of Glyn Mills and Company and Williams Deacon's Bank, Limited, which have been circulated, shall be taken as read, but in compliance with statutory requirements the auditors' report falls to be read at this meeting, and I now call upon the secretary to do so, after which it is open to inspection by any proprietor.

The secretary having read the report of the auditors,

The chairman continued: Turning now to the accounts, which you will observe are in similar form to those of last year, with the addition of comparative figures, the directors are pleased to submit a statement which they consider to be very satisfactory. I shall confine my remarks at this stage to the affairs of the Royal Bank of Scotland.

DEPOSITS AND OTHER LIABILITIES

Our deposits and other accounts for the first time since 1939 show a slight contraction, but this reflects the general trend and does not indicate any lessening of our activities, which are fully maintained at their postwar high level.

The item, acceptances and other obligations, shows a substantial increase in the year, and is indicative of the ready support we are prepared to give to facilitate foreign trade, with which it is mainly connected.

Our capital remains unchanged at £4,250,000, but the published reserve fund, by the addition of £112,847 from the year's profit, is raised to £4,672,553.

LIQUID ASSETS AND INVESTMENTS

On the assets side our customary liquid position has been more than maintained with cash, balances with the Bank of England and other banks, money in London at call and short notice totalling £30,800,000. This sum represents over 21 per cent. of our liability for deposits and notes issued

There is little change in the total of bills discounted, but there is an increase of about £300,000 in the trade bills comprised therein. The Treasury deposit receipt total is halved at £5,000,000, being the result of the policy followed by the Treasury during the year.

The total of our investments is much the same as last year and, as usual, those quoted are valued in the balance sheet at or under the market prices ruling on the date of our balance. Our Government securities are well distributed, and there is a large proportion in the short and medium dated stocks.

The increase of more than £5,000,000 in our advances to customers is well spread over the main fields of lending, and it is in line with the general banking experience.

I may say in passing that, adhering loyally to the principles which govern lending by banks at the present time, we have found ourselves obliged to refuse a number of applications for advances which were unexceptionable from the point of view of safety and security but, when the conditions affecting the national interests are satisfied, we are in a position, and are prepared, to lend to all credit-worthy borrowers.

The valuation of our two subsidiary companies' is unaltered, and there is no significant change in any of the other assets.

PROFITS AND APPROPRIATIONS

We now turn to the profit and loss account, where we show an increase of £2,461 in our profit for the year, which, considering all the circumstances, including a further increase in charges of all kinds, may be regarded as satisfactory. Following our usual practice, full provision has been made for contingencies and all bad and doubtful debts.

Two interim dividends were declared and paid respectively at midsummer and Christmas, amounting together to 17 per cent. per annum, and the directors do not recommend any further dividend for the year. The allocations proposed for property maintenance and staff pension fund are similar to those of last year, and there remains £112,847 to be added to our reserve fund, raising it to £4,672,553, as I have already mentioned.

THE THREE BANKS—AN UNIQUE ORGANISATION

The accounts of our associated banks, Glyn Mills and Company and Williams Deacon's Bank, have already been submitted at their general meetings, and it is only necessary for me at this stage to report that the businesses of these two institutions continue to develop along very sound and satisfactory lines. The three banks, working closely together and yet maintaining their own characteristics, form a banking group which can aptly be described as unique, and I would again lay stress on the willingness of each of them to place their services at the disposal of the customers of the others.

A year ago I referred to the impending publication of "The Three Banks Review." This venture has now been successfully launched, and I am glad of this opportunity to say publicly how much we have appreciated the many complimentary references which have been made to it. The "Review" now enjoys a world-wide circulation, and we have been much encouraged by the many requests from institutions and individuals in many different countries to have their names added to our mailing list.

THE POLITICAL SITUATION

Today, I speak to you at a time when the internal political situation of the country is in an unsettled state, and it should be clear that there is a call to all men of good will—no matter what their political opinions may be—to forget their differences and to concentrate their activities on safeguarding the best interests of the nation. There may even be advantages in a new Parliament with a small government majority and, with wisdom and tolerance on all sides, the nation might benefit from a period devoted mainly to the necessary financial measures, administrative improvements and a minimum of legislation.

It might also be argued that legislation has been excessive in recent years, increasing domestic controversy and imposing burdens on state departments, local authorities and industry which cannot readily be absorbed and which add greatly to the time and cost of non-productive work. In the circumstances, I hesitate to venture any detailed observations on government action designed to place the affairs of the nation on a more realistic foundation.

There is much to be done, and it will be to the advantage of all if the appropriate action is not too long delayed. The heavy rate of public expenditure is a problem which, sooner or later, must be tackled. An individual may for a time live beyond his means, and a country may do the same. But it is only for a time. The end is alike in both cases, and it is disaster.

THE DOLLAR PROBLEM

There is also the dollar problem, and it has to be solved by 1952 when Marshall aid is due to end. Devaluation may help, but this has still to be proved, and the position from this angle is being made all the more difficult by the disappearance of the sellers' market. Production in this country is still at a high level, and so is our export trade, but the problem is to get our goods into hard currency markets and to the extent that is necessary to give us a properly balanced economy. The shipment of goods to other markets in the form of unrequited exports may be a nice gesture, and certainly it aids employment in this country for a time, but, in need of food and raw materials as we are, it would be much to our advantage if we could, to an ever greater extent, direct our exports in a way which would enable us to command visible imports in return.

SCOTTISH AFFAIRS

Turning to the position of affairs in Scotland, one is glad to say that, while we cannot expect to remain immune from the problems which affect Britain as a whole, there is visible a determination on the part of the Scottish people to overcome, in so far as it is in their power, the difficulties with which they are faced. The Scottish Council is worthy of every praise for its ceaseless efforts to further the interests of the country, and it is to be congratulated on the outstanding success achieved by the Scottish Industries Exhibition in Glasgow in the autumn of last year.

The shipbuilding yards are still busy, but the position in this highly important industry is causing concern by reason of excessive costs, and the fact that new orders are not coming along in anything like sufficient

volume to replace the work which is rapidly being completed. It is to be hoped that this state of affairs will be remedied, as any recession in trade is bound to affect many smaller concerns whose activities are closely related to the shipbuilding industry.

In Scotland in recent years there has been a growing emphasis on the need to establish what are termed light industries, and the diversity of industrial activity thus achieved will make for greater stability in employment. Agriculture, still our largest industry, continues to do well, and the need to develop food production at home remains as great as ever. The export business of certain of our specialised industries continues to help in easing the dollar position, and similar aid, if meantime on a somewhat lesser scale, has resulted from the efforts being made to reduce imports by developing new lines of production.

On the whole it can be said that, while at times unemployment figures in Scotland have shown a tendency to rise, the trade and industry of the country may be regarded as good. But this is a short-term view. Looking ahead, and paying every regard to the alleged virtues of a planned economy, we are forced to the conclusion that the present standards of industrial output will only be maintained by the greatest efforts and, it may be, sacrifices on the part of employer and workman alike. And if that should prove to be the case, may we not regard it as a challenge to a race which has the character and ability to meet it?

TRIBUTE TO OFFICIALS AND STAFF

The directors desire once again to place on record their sincere appreciation of the valued services rendered to the bank during the year by Mr Thomson, the general manager, the assistant general manager, and the officials and staff at head office, London City and West End offices, Glasgow, Dundee, Aberdeen, and all the other branches.

I now beg to propose that the report, containing a statement of the accounts and balance sheets, be approved

The report was approved, and the governor, deputy-governor, extraordinary directors and the retiring ordinary directors were re-elected.

PHILLIPS RUBBER SOLES LIMITED

DIVIDEND MAINTAINED

The twenty-third annual general meeting of Phillips Rubber Soles, Limited, was held on March 16th in London.

Mr Charles E. Pettit, the chairman, who presided, said that the net profit for the year was £106,377 as compared with £142,031 for the previous year. The difference was not due to loss of sales but to increased costs of production. Including £7,500 now being appropriated to general reserve out of taxed revenue a total of £20,191 had been added to investment and general reserves, as against £10,000 in the previous year. In these circumstances the directors recommended a final dividend of 11½ per cent., making a total for the year of 15 per cent. on the ordinary shares, the same as for the previous year.

The two outstanding trading features of the year under review were the high total sales of the group and the continuing increase in costs of production. The continuing heavy demand for Phillips' soles and heels demonstrated the high repute in which they were held.

Phillips' Superfine Stick-a-Soles were firmly established as an essential item in the family budget of the nation, as they really did double the life of shoes, and the company's well-publicised advertising figure, "The Craftsman." was recognised by the trade and the public as the hall-mark of quality. Quality was, and always had been, A1 priority with Phillips, but it was the firm policy of the company to keep prices as low as was compatible with maintenance of quality.

The current year had started reasonably well, and he hoped for another year of good trading.

The report and accounts were unanimously adopted.

SISAL ESTATES, LIMITED

YEAR OF IMPROVED PRODUCTION AND PROFIT

COL. C. E. PONSONBY ON THE OUTLOOK

The thirteenth annual ordinary general meeting of Sisal Estates, Limited, was held on March 15th, at Winchester House, Old Broad Street, London, E.C., Colonel C. E. Ponsonby, T.D., D.L., the chairman, presiding.

A representative of the secretaries, Messrs. John K. Gilliat and Company, Limited, read the notice convening the meeting and the report of the auditors.

The following is the chairman's circulated statement:—

The consolidated accounts for the year ended June 30, 1949, show a trading profit of £354,190 after providing for replanting and maintenance of immature areas, depreciation, directors' and auditors' fees, and administration expenses, as compared with £272,101 for the year to June, 1948. Out of this profit £122,095 has been provided for taxation (compared with £78,835 for the previous year) and £181,425 has been retained in the accounts of Bird and Company (Africa), Limited, leaving in the accounts of Sisal Estates, Limited, a balance of £50,670, reduced by tax adjustments in respect of previous year to £47,740. After adding the amount brought forward from the previous year and deducting dividends paid or recommended amounting (less tax) to £47,850, the sum of £962 is carried forward in the profit and loss account of Sisal Estates, Limited.

Out of the profits retained by the subsidiary company, amounting to £181,425, £60,000 has been transferred to reserves, leaving £121,425, to which is added the amount brought forward from the previous year of £171,719, increasing the carry forward to £293,144. As £50,000 has been transferred to a general reserve it has not been considered necessary this year to make any further appropriations in respect of development and cultivation. The reserve for this shown in the consolidated balance sheet remains at £78,105.

BIRD AND COMPANY (AFRICA), LIMITED.

I am pleased to be able to report a continuance of steady and satisfactory progress of Bird and Company (Africa), Limited, the wholly owned subsidiary company. Its properties at June 30, 1949, comprised 18,698 hectares (46,185 acres), of which 12,199 were suitable for sisal cultivation. Of this, 9,297 hectares were planted with sisal, 5,088 hectares being cut and 4,121 hectares immature, while 88 hectares were nurseries.

Since the end of the financial year two further estates have been purchased comprising about 2,000 hectares, of which 1,890 are already developed and should in due course produce 2,000 to 3,000 tons per annum. This area is in continuation of the Lwengera Valley, where the soil is very fertile, and its acquisition will make for economical working. The price of these estates including legal and other costs, was £315,000 and satisfactory arrangements have been made for the financing of this purchase.

On the Lwengera Estate, purchased in 1945, where there are 2,300 hectares of very good land, 964 hectares have been planted. Production commenced on a small scale in September, 1949, and for the time being the leaf is being processed at the Magunga estate. It is hoped that the new Lwengera factory installation will be completed this summer, equipped with modern machinery. The light railway system there has been graded and 12 miles of track laid. Work has been started on the necessary buildings and the laying out of a labour village. In three or four years' time production from this estate should reach something over 3,000 tons per annum.

PRODUCTION

Last year the production for 1948-9 was estimated at 10,000 tons. The actual crop was 10,350 tons, including 1,045 tons from the leased estate of Hale. During the year the labour situation has been good. This was due partly to satisfactory organisation in the labour bureau of the Tanganyika Sisal Growers' Association and partly to the drought and lack of food supplies in other areas of Tanganyika. The Government have introduced a food subsidisation scheme, under which the company has to purchase food at 46s. per bag and sell it for comsumption on the estate at 36s. (in 1939 meal cost the company 10s. against the present 46s.). This and other labour costs, including recruiting charges, have increased the total labour charges, while devaluation has increased the cost of spare parts and materials imported from overseas; this follows the already considerable increase in the cost of heavy machinery, spare parts and decorticating machines which, as I mentioned last year, is three or four times the prewar cost.

PROSPECTS FOR 1949-50

In view of the present rate of production it seems reasonable to hope that, excluding the new estates, production will this year be not less than the 1948-9 figure, though the prolonged drought has had a serious effect on some estates. This will also be felt in 1950-1, especially in the districts further away from the coast like Lwengera and the new estates.

In the past a great deal of sisal waste (small dirty and tangled fibre) has gone down the flume and been left to decompose. In the year under review Bird and Company had the opportunity of buying for £16,000 a carding factory on the edge of their Kange estate, about five miles from Tanga. What was formerly regarded as rubbish is now being recovered on the estates and sent to the carding factory, which has been extended by the installation of further machines. Production started in August, 1949, and by December 800 tons of what would otherwise have been waste had been sold at a satisfactory profit. It is hoped to work up the capacity of the factory to take at least 1,500 tons from our own estates, as well as waste from other estates.

MARKETING AND PRICES

Government bulk purchases came to an end in December, 1948. As I mentioned last year, Mr Hitchcock took a leading part in the formation of a voluntary association known locally as Tasma (Tanganyika Sisal Marketing Association), covering nearly 70 per cent. of the Tanganyika growers. This association acts as selling agents for its members, operating through the regular selling houses in London, New York, and elsewhere. It is the policy of Tasma to sell to the best advantage of its members and to ensure a sound stabilised price level in the interests of both producers and consumers.

From January to September, 1949, prices remained steady, the average price of No. 1 being about £87 10s. per ton f.o.b., as compared with the control price of about £88 for the second half of the previous year. That prices remained stationary was partly due to the uncertainties of the outlook, especially the dollar-sterling position and partly to the slowness with which the recovery on the Continent proceeded. Since then it has come to be realised that apart from current consumption, world stocks have to be replenished on a large scale and purchasing power for primary commodities is increasing; these factors have imparted a stimulus to prices, which was accentuated by devaluation in September, 1949. Owing to forward sales Bird and Company will not derive much benefit during the current financial year from the recent rise in prices, which are around about £117 per ton f.o.b.

As credit expands and economic rehabilitation continues in Europe and Japan, demand must increase: but to meet this there is bound to be increasing production in Mexico and Brazil and, at some date in the future, in the East Indies also, where 100,000 tons were produced in 1939. For the time being the situation, so far as East Africa is concerned, is satisfactory.

The Government of Tanganyika recently proposed an export tax of 10 per cent. on the f.o.b. price of sisal. On strong representations made by the industry this has been reduced to 5 per cent. till March, 1950, and in the meantime discussions are continuing with the Government. The tax will not apply if the price falls below £75 per ton.

GENERAL

I would emphasise that Bird and Company, although based on tropical agriculture, must be regarded in the light of all industrial processing companies. It is therefore advisable when the price of the processed product is high, to plough back such reserves as will enable the company to operate profitably when the price of the product falls. This "ploughing back" creates a substantial cash reserve for such extensions, replantings and improvements as may make the operations more efficient and help to spread the overhead charges.

I may add that a considerable amount of expenditure has been and should be undertaken for the benefit of the African workers. This is done either at the request of the Government or to attract and retain employees (who number anything between 8,000 and 10,000). It is to the advantage of the Africans that they should have permanent houses, though at first they may not appreciate them, as well as hospitals, schools, mosques, and other amenities.

Once again I have to thank Mr E. F. Hitchcock, C.B.E., for his energy, foresight, and initiative. He has throughout been ably assisted by his deputy, Mr C. A. Bartlett, C.B.E., and the management of Bird and Company (Africa), Limited in so efficiently running one of the largest sisal concerns in the world.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the chairman said: Ladies and gentlemen, you have received my statement, which was circulated with the accounts, and I do not suppose that you will want me to read it to you, but the board have received five letters from shareholders raising various points, and I think that it may be of assistance to you if I answer those in advance of any questions which may come during this meeting.

First of all, there were one or two questions regarding the remuneration of Mr Hitchcock. I explained last year the position of his contract with Bird and Company, made in 1939, and extended in 1945 with five years more to run. Under that contract Mr Hitchcock receives £2,000 a year salary and 5 per cent. of the net profits. This, as I remarked last year, is common practice with plantation companies. In the last two years his commission has worked out larger than was anticipated at the time the contract was made, partly owing to increased efficiency in running the estate, but mainly owing to the rise in the price of sisal, which was as fortuitous as it was unforeseeable.

The commission due for the year under review was actually £4,500 more than the figure in the accounts, but Mr Hitchcock voluntarily suggested that for this year it should be restricted to the same amount as for the previous year.

THE NEW ESTATES

Then there was a question as to the purchase of the two new estates. As mentioned in my statement these properties adjoin our Lwengera area. The price of £315,000, which includes all expenses, may appear to be on the high side. It works out at about £157 per hectare, but on a conservative estimate of production and even allowing for a reduction in price, the net proceeds of sisal from those estates, after deducting all expenses, including a proportion of overheads, should pay for the property in four or five years. This will be a valuable asset for Bird and Company, as not only can it be worked in with the organisation of the Lwengera properties, but it will also be important as enabling the labour in that valley to be under one control. If you know the country, you will know how very important it is that all the labour coming from the villages in that district should be working at the same place, especially if they know they are well treated because they will then come themselves and bring their friends.

A shareholder suggested that an independent valuation should have been made. I would only say that there was considerable competition for these estates and that the presence of an independent valuer might have led to a higher price, and in any case Mr Hitchcock, Mr Bartlett and our plantation managers know as much as any others in Tanganyika about the value of an estate, quite apart from other considerations when the purchase of these properties was being discussed.

Then there was a question about a change of domicile. As Bird and Company (Africa) Limited is a wholly owned subsidiary, a logical scheme for change of domicile should certainly not be casually dismissed, and in fact the board of Sisal Estates Limited have been considering it during the past year. It would undoubtedly involve a saving for the shareholders which, assuming that prosperity continues, might be reflected in increased dividends.

PRODUCTION

Then there was a question about production. A shareholder asked why the crop for 1949-50 was estimated only at the same figure as that for 1948-49. The answer is the drought, which is still severe. It has dried up three rivers and put two decorticating plants out of action. Of course it also affects the leaf growth both in the year of the drought and afterwards. Production from the two new estates is not included in the estimate which was mentioned in my statement.

The total crop to the end of February, excluding that from the new estates, is 6,870 tons, which happens to be exactly the same figure as last year, but to illustrate a possible setback in output the figures for December, January and February last year were 1,000, 825 and 805 tons, respectively, compared with this year's figures of 905, 760 and 680.

We received a telegram from Mr Hitchcock yesterday to the effect that although there are indications of a break of the drought, production for the year may be affected more than he had estimated, but it is very difficult to give a figure.

Generally I would say that Bird and Company (Africa) Limited should not be regarded only in the light of a gold mine existing for the purpose of immediate profits only and with a life of a limited duration. It is a combination of planting and processing and plans have to be made far ahead. The management of Bird and Company have shown sound judgment, foresight and courage. Their actions have laid the foundations for a prosperous future, even if there should be a fall in the price of sisal.

The chairman moved the adoption of the report and accounts which was seconded by Mr A. A. Lough, F.C.A. After the chairman had replied to questions and comments by shareholders, the resolution was carried. The retiring directors, Colonel C. E. Ponsonby, T.D., D.L., Major R. D. K. Curling, M.C. and Mr A. A. Lough, F.C.A., were re-elected and the remuneration of the auditors, Messrs Binder, Hamlyn and Company, having been fixed, the proceedings terminated with a vote of thanks to the chairman, directors and staff at home and abroad.

SCOTTISH EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The annual general meeting of The Scottish Equitable Life Assurance Society was held on March 16 in Edinburgh.

The Right Honourable The Earl of Stair, K.T., D.S.O., presided and called upon Mr Charles Guthrie, F.F.A., chairman of the board of directors, to submit the report and balance sheet.

Mr Guthrie said:—

It is a pleasure to be able to report that the year 1949 has been a satisfactory one for the Society. Life assurance policies were issued for a net total of £3,224,504—a record in the Society's history, exceeding last year's record figure by a small margin.

The net sum received by the Society for the purchase of annuities was £266,842.

The life revenue account shows that although over £800,000 has been paid out in claims the fund has increased by £363,000. Adding to this the increase in the capital redemption fund, the total increase in the funds amounts to £445,000 and the assets as shown in the balance sheet exceed for the first time £15,000,000.

FAVOURABLE MORTALITY EXPERIENCE

With regard to claims, as the life revenue account shows, nearly two-thirds of the total is in respect of endowment assurances reaching maturity. Claims by death cost less than in the previous year, but the amount of the sums so paid out conveys little without some further information. Even a small sum paid in respect of deaths could well mean a poor mortality experience if, for example, all the deaths took place at young ages. Actually during the year 1949 the Society's mortality experience was exceptionally good, the *average* age at death under whole or life policies being remarkably high—75 years. Another way of indicating shortly how favourable the experience has been is to inform you that our results, including all classes of policies, were 40 per cent. better than allowed for in the actuarial tables which we use in our calculations. The year 1949

must be regarded as exceptional in these matters, but taking all the years since the war together our results have been most satisfactory.

The effective rate of interest earned on the funds over the year, excluding the reserve account and carry forward, was £4 14s. 1d. per cent. gross, or £3 10s. 9d. per cent. net; the latter exceeds the effective rate of interest assumed in our last actuarial valuation by about 1¼ per cent. This substantial excess is an important factor in the Society's bonus earning power.

BALANCE SHEET

Turning now to the balance sheet, as the previous year's figures are shown alongside those of the year under review as required by the Companies Act, 1948, there is no need for me to inform you as to the alterations in the investments which have taken place over the year, except perhaps to mention the largest change which is an increase in ordinary stocks and shares of over £500,000 after allowing for the different method of showing the Standard Property Investment Company shares.

The business of the Standard Property Investment Company has grown substantially in recent years and the accounts have shown excellent results. Over the past three years our loans to the company have been increased by about £1,300,000—£400,000 in 1947, about £700,000 in 1948 and £200,000 last year. The total for the three years does not fall far short of the increase in the Society's funds over the same period. These years have seen a substantial drop in the market values of Stock Exchange securities; accordingly, had it been necessary to invest this new money on the Stock Exchange in a mixture of different classes of investments some depreciation could hardly have been avoided. As it is the new money is intact and is earning a reasonable rate of interest.

The downward trend of Stock Exchange prices to which I have referred has, of course, resulted in a fall during 1949 in the aggregate value of our Stock Exchange securities, but I am glad to be able to say that there is still a substantial excess of market values over the balance-sheet figures.

The adoption of the report and accounts was carried unanimously.

HOOVER LIMITED

RECORD TURNOVER AND PROFITS

REASONS FOR DIVIDEND INCREASE

The thirteenth annual general meeting of Hoover Limited will be held at Perivale, on April 3rd.

The following are extracts from the statement of the chairman, Mr. Charles Colston, C.B.E., M.C., D.C.M., circulated with the report and accounts for the year to December 31, 1949:

Notwithstanding all difficulties we have been successful in extending our business in very substantial measure. Its rate of growth was higher than at any time in our history. The growth has indeed been remarkable. During 1949 our turnover was 415 per cent. of our total in 1938, our record prewar year. Since the end of 1947 annual turnover has actually been doubled. In 1948 we achieved record figures; in 1949 the increase over 1948 was substantially greater than our peak prewar annual turnover. The increase last year exceeded the turnover built up in the first twenty years.

Our total turnover in Cleaners was substantially more than double that of our record prewar year. This is all the more impressive in view of the fact that the retail price, apart from purchase tax, has been kept down to almost prewar level, in spite of the increase in wages, cost of materials and services. We have introduced many improvements and quality is higher than ever.

DEMAND FOR WASHING MACHINES

The electric Washing Machine has had a magnificent reception in Britain and export markets. Turnover in 1949 exceeded the total turnover of the company in the prewar record year. Sales have been rapidly rising and during the last quarter reached a rate equal to more than 175 per cent. of the total prewar record turnover of the company. Export shipments have made a marked contribution to this tremendous expansion.

The profit arising from export business has amounted to nearly double the total profit of the company in 1938, that from hard currency markets alone exceeding the 1938 total profit. Dividends remitted to us by subsidiaries in those countries amounted net to £124,000 as compared with just under £20,000 for 1948. There appears to be much misconception as to the nature and functions of profits, but there is, I believe, unanimity that those arising from exports are meritorious. The Government is right to urge manufacturers to increase hard-currency exports but exhortations are not enough; there must be incentive.

As a result of the great expansion of activities net profit outstrips by far the previous record; it has been more than doubled, from £829,072 to £1,719,378. This superb result has been obtained by the splendid work of all sections of our great organisation, a magnificent team spirit and the exceptional exertions of senior executives.

THE DIVIDEND

The board have given full consideration to the question whether some increase in dividends would be justified. A substantial portion of the profit is derived from our new products and, if they had been started as a separate company, no one would have questioned the propriety of a substantial dividend. The subsidiaries producing the Washing Machine and F.H.P. Motors have provided much-needed employment, and in view of the risk taken with shareholders' money, some additional return to them is justified.

A substantial profit has been derived from export business and subsidiaries abroad. These have involved investment and risk and it is important that there should be real incentive. In our view shareholders should derive some benefit from the risks taken to make success possible. It is of special importance that trade with hard-currency markets should be expanded. The increased hard-currency dividends earned by the company constitute an additional reason why shareholders are entitled to some benefit.

EFFECT OF INCENTIVE

The most striking expansion has taken place since December, 1947, when the incentive "A" ordinary shares were introduced. These were issued to some 80 senior executives and a considerable number were held in trust for the benefit of employees. The view that as a result the business would be extended and profits increased has been fully justified and it is important that the incentive should be a real one. A rigid limitation of dividends would mean that the "A" shareholders would receive not more than 4 per cent, and the incentive would become rather hollow.

The board have also given consideration to a letter from Mr. Frank G. Hoover, President of The Hoover Company of America, in which he says: "... As a major shareholder in your company, we have always supported your policy ... but we cannot see any likelihood of Americans making further investments in Britain and taking the risks of doing so unless there is sufficient incentive. ... We think the time has come when you can well afford to pay a higher dividend. In our opinion you would be helping your country by doing so as you would be encouraging further investment of U.S. funds in Britain. Instead of getting more in dividends we are in danger of getting less. You have been paying at an annual rate of 2s. per share, which prior to devaluation was equivalent to 40 cents. If you continue to pay the same dividend of 2s. we shall now be getting only 28 cents. ..."

BOARD'S DECISION

The board feel bound to adhere to the general policy of restraint in dividend distribution and have decided to recommend a final dividend of 1s. 9d. less tax, increasing the total for the year from 2s. to 2s. 3d., less tax, per ordinary stock unit. On that basis the "A" ordinary shareholders would be entitled to a dividend of 7.938 pence, less tax. This is very modest having regard to the great progress during the year, which to a considerable degree has been due to the exceptional efforts of senior executives. The proposed increased total distribution, less tax, amounts to less than half the additional hard-currency net dividends for 1949 remitted by our subsidiaries abroad.

It is argued that dividend limitation is necessary as otherwise the trade unions will throw over the policy of "wage-freeze." I am not in favour of a rigid "wage-freeze" any more than I am in favour of a rigid "dividend-freeze." We should not freeze industry with restrictions; we should stimulate it with incentives. Workpeople, like all other sections of the community, should be given adequate incentives to increase effort. I am in favour of payment-by-results schemes and production bonuses which will stimulate workers to make maximum efforts. So far as this company is concerned, incentives of this kind have had beneficial results for all concerned.

BURDEN OF TAXATION

It is not dividends but taxes which are a major factor in our economic calculations. In the case of many manufactured articles in general use taxation approaches and often exceeds the cost of labour. To illustrate this an analysis has been carried out by this company which yields instructive results. The average price received by the company in 1949 for its main products was approximately £20, inclusive of purchase tax, distributed as follows:—

£	s.	d.	
4	0	0	Purchase tax.
1	2	1	Income tax, profits tax, rates.
6	5	1	Wages and salaries.
5	6	11	Materials.
2	4	1	General expenses, including depreciation, maintenance of buildings, rent, power carriage, travelling, etc.
10	2		Ploughed back into the business.
4	1		Superannuation.
7	7		Dividends (net).
20	0	0	

In our case, if the dividend were to be eliminated altogether it would hardly affect the price which the public pay. How much less the public would pay for our products if the heavy burden of taxation could be reduced may be readily seen from this analysis, which shows that taxation amounts to 13 to 14 times as much as the dividend.

We have achieved a remarkable record this year, but we look not to the past but to the future. We believe we may look forward to still further growth of the company's activities.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

INCREASE IN PROFITS

THE HON. SIR ARTHUR MORSE'S SPEECH

The ordinary general meeting of shareholders of the Hongkong and Shanghai Banking Corporation was held on March 10th in Hongkong.

The chairman (the Hon. Sir Arthur Morse, C.B.E.), in the course of his speech said:

The profit for the year, after making transfers to provisions and reserves for contingencies, and after deducting special administrative expenses and auditors' fees, which are this year shown separately in the accounts, amounts to HK$17,042,477 and exceeds the corresponding figure for the previous year by just over $250,000. After taking into account the balance of profit brought forward from last year the sum available for distribution amounts to $21,321,108. As last year, your directors recommend that the sum of $3,000,000 should be written off bank premises.

After allowing for this amount, for the interim dividend of £2 per share, and for the final dividend of £3 per share which is now proposed, the balance of profit to be carried forward to next year will amount to $5,359,083, an increase of approximately $1,080,000 over the previous year.

BALANCE SHEET FIGURES

The balance sheet this year has been drawn up in a somewhat different form from that previously adopted with the result that an exact comparison with the previous year's figures cannot be readily made in the case of certain items. It will, however, be seen that the note issue has again increased and exceeds the previous year's total by over £2,000,000. Amounts due to subsidiary companies and acceptances on behalf of customers are this year shown separately from current, deposit, and other accounts, and the total of these three items exceeds the corresponding figure for the previous year by just over £2,500,000.

In this connection I may mention that the amount of the provision for bad and doubtful debts which has previously been included among current, deposit, and other accounts has this year been excluded from this heading and deducted from the figure of advances to customers.

ASSETS

Turning to the assets side of the balance sheet it will be seen that the aggregate of cash at bankers and money at call is this year slightly higher than the corresponding figure for the previous year. The total of investments shows a decrease of just over £7,000,000 as compared with last year's figure but this decrease is offset by an increase in bills receivable and items in transit, thus indicating an increase in the funds of the bank now employed in financing trade.

The amount of the provision for bad and doubtful debts has this year been deducted from the total of advances to customers and other accounts and this item, together with liabilities of customers for acceptances, now shows an increase of over £1,250,000 as compared with the corresponding figure last year. The amount at which bank premises appears in the balance sheet is after deduction of the $3,000,000 which your directors recommend should be written off this item and the increase in the total of bank premises over the corresponding figure last year reflects the further implementation of the building programme to which I referred both last year and the year before.

BRANCHES AND OFFICES

In the year since our last meeting we have only to record the opening of one new branch, that at Orchard Road, Singapore, in our up-to-date 11-storeyed building which was christened "MacDonald House" by the Commissioner-General on July 2nd.

In China a number of our offices on the coast are at present not operating owing to the conditions prevailing there, but we hope that they will be active again as soon as the political outlook improves.

In Japan the temporary office which we opened at Kure for the benefit of the Commonwealth forces has now been closed, but our branch at Tokyo has been remodelled to accommodate the bigger staff; a larger building has been rented at Kobe, and at Yokohama we are back in part of our building, although the main banking hall and our agent's residence are still held by the American Army.

Our three trustee companies, here, in Singapore, and in London, continue to grow in importance to the bank and in usefulness to the public, as their many customers will, I think, testify.

EFFECTS OF DEVALUATION

This time last year I spoke cheerfully about the progress made by Great Britain in her recovery programme. Internal progress has indeed continued and productivity and industrial output have increased by several valuable points per cent. But, as you are aware, externally things did not go well in the early part of last year, and the steady increase in the sterling area's dollar deficit, which became alarming about the middle of the year, coupled with loss of confidence and other features into which I will not go, brought about a rapid deterioration which forced the British Government to devalue the pound in terms of gold and United States dollars on September 18th.

Although it proved to be finally unavoidable, and had been expected by the best informed circles, the eventual decision by his Majesty's Government came as an unpleasant shock to most people in the sterling area, particularly because of the magnitude of the change in the rate. It achieved no permanent cure for Britain's financial problems and, being unaccompanied by any relaxation of existing restrictions on the use of sterling, it failed to restore confidence oversea.

REACTIONS IN FAR EAST

In the East the reactions of those informed on economic matters showed, I think, a general sense of dismay that matters should have come to such a pass and that the sterling-dollar difficulties should be "otherwise insoluble," as Sir Stafford Cripps put it. Reactions in the East were stronger than the head-shaking in the West and the financial standing of our country undoubtedly suffered a loss of prestige. For those responsible for the policy of this bank, the financial situation in our home base throughout last year weighed almost as heavily as the problems consequent on the confusion and uncertainty in the various countries out East.

It can be safely maintained that the new Government will continue to make every effort to ensure that the deficit in the dollar balance of payments is reduced during the present year and that the gold and dollar reserves are maintained at a safe level.

THE EASTERN BANK, LIMITED

SIR THOMAS STRANGMAN'S STATEMENT

The fortieth annual general meeting of The Eastern Bank, Limited, will be held on April 5th at noon, at the office of the Bank, 2-3, Crosby Square, London, E.C.3.

The following is an extract from the statement by the chairman (Sir Thomas J. Strangman, K.C.) circulated with the report and accounts, for the year ended December 31, 1949.

The net profits for the year amount to £118,244 as against £110,998 in the preceding year.

Current accounts are down by a little over £1,150,000 due to the closing of the last of our official wartime accounts and to the control of Iraq currency having passed from the Iraq Currency Board to the National Bank of Iraq and the consequent transfer of the account.

The aggregate of these two accounts exceeded the overall decrease of £1,150,000: our other accounts thus show an increase. Other items in the balance sheet indicate increased business activity. Thus there is an increase of £540,000 in advances and bills receivable are up by £325,000, or if various Government Treasury bills be excluded, by £475,000. The money required to meet the changes in current accounts and advances was provided by the sale of investments while the additional bills receivable were financed from our surplus cash.

PROFIT APPROPRIATIONS

The appropriations from the net profits which are recommended consist of £30,000 to premises, £50,000 to contingencies and a final dividend of 3s. 6d. per share less tax, being the same as the final dividend in the previous year. If these appropriations be approved the carry forward will be increased by over £5,000.

In view of the fact that the bank is committed to various building projects, together with the high costs prevailing throughout the East, the transfer to premises is one dictated by common prudence. The transfer to contingencies is likewise a measure of common prudence having regard to prevailing economic and political uncertainties, although in respect of our holdings of various Government Securities I am happy to say that the fall in market values was covered without recourse to inner reserves.

The devaluation of the pound followed by the devaluation of currencies in all the countries we serve (except Pakistan) did not affect us adversely. Indeed, on balance, it turned out to be to our advantage.

The cost of living continues high and housing difficulties continue. Before the war the bank provided accommodation for certain of their managers, but granted house allowances to other British members of the staff who were left to make their own arrangements. The shortage of houses in all the larger Eastern cities and the high rents prevailing have convinced the board that the problem can be satisfactorily solved only by the provision of accommodation, and although this policy will take time to put into force a start has been made, particularly in Iraq, the Persian Gulf, Singapore and Malaya.

THE NEW CHAIRMAN

The time has now come to hand over the reins to a younger man. My successor as chairman will be Sir Evan Jenkins, who, since he became a member of the board, has so fully acquainted himself with all the affairs of the bank. His experience as an outstanding administrator in India will be of the greatest value, particularly in the troublous times which lie ahead. I would end with my usual tribute to the staff, who one and all, whether in London or abroad, have produced the results placed before you.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

HIGHER NET PROFITS

MR V. A. GRANTHAM'S REVIEW

The ninety-sixth ordinary general meeting this Bank will be held on April 4th at Bishopsgate, London, E.C.

The following is an extract from the statement of the chairman, Mr V. A. Grantham:—

Compared with last year's figures, current ıd other accounts, fixed deposits and ceptances, are greater by £8,105,084, 963,294 and £7,058,158 respectively, whilst ı the assets side, cash in hand and at ınkers at £25,994,576 shows the substantial ıcrease of £6,528,940 the ratio to our call abilities being 22.13 per cent. Governıent and other securities, apart from those ıdged against our note issue, have been ıduced by £3,881,002 and this reduction is ıflected in the increased cash position and ı increased advances to customers and other ıcounts which have gone up by some 2,263,391 once again indicating the subantial extent to which we are assisting our ıstomers and taking our full share in financıg world trade with eastern countries.

TAXATION CUTS PROFITS

The net profits for the year at £515,592 ıe higher by £48,481 than last year in spite continually increasing working costs in all arts of the world. In almost every eastern ountry in which this bank operates however, orking conditions have deteriorated during ıe year and it would be natural now to ıpect diminished net returns, especially om centres where business is already having ı be restricted. It may not be sufficiently ıalised how greatly taxation in all centres ıduces the net remuneration the bank earns ır the vast services it renders in all the many ountries where it is established. Even where ınventions exist which provide relief from ıuble income tax, the application of business ofit taxes abroad, as well as at home, fectively reduces net profits to modest proortions, whilst, where no such conventions e in force double taxation operates to cut own net profits to fractional dimensions.

An interim dividend was paid in October st of 6 per cent. less income tax, absorbing 99,000 and it is now proposed to pay a ıal dividend of 6 per cent less income tax sting £99,000 net.

Recent developments in Asia render it no nger possible to take a completely detached ew of the individual areas, for, while in alaya the struggle against the insurgents ay be said to be proceeding fairly satisctorily if slowly the communist victory China has intensified the existing dangers upheaval in all the adjacent countries The gency of the danger inherent in the present uation is perhaps most clearly exemplified the continued need for food throughout ia and the threat which overhangs Indoina, Siam and Burma, Asia's ricebowl; but almost all Far-Eastern countries inflation rife to an extent which, with its underlying uses, places in peril the very existence of eir peoples and their ability to maintain emselves above the starvation line.

INDIA, PAKISTAN AND BURMA

When India decided, following the action ken by the British Government to devalue e rupee in line with sterling while Pakistan cided otherwise, the whole operation of the yments Agreement ceased and, at the oment, trade between the two Dominions nearly at a standstill. It is estimated that ring the year imports of food costing over . 180 crores have been required and the ovision of adequate food for the peoples India continues to be a major factor in country's economy. Hopes have been expressed that the inflationary tendencies noted last year have been checked.

Surprisingly Burma, still in the throes of internal strife, was able during 1949 to implement, almost to the full, the estimated exportable surplus of rice amounting to some 1,250,000 tons, but it is anticipated that the exportable surplus for the coming year will be around 800,000 tons, and the future of the country is most uncertain.

CEYLON, MALAYA AND HONGKONG

Ceylon has again enjoyed a year of modest prosperity. By a judicious handling of the proceeds of exports and a strict economy in the use of foreign balances, the Government has been able to import all food, as well as the other necessities required for the Island Dominion's well being, without unduly disturbing the cost of living.

The chief factors affecting the economy of the Federation of Malaya and the daily lives of the community in the period under review have been the continuance throughout the year of widespread banditry, the devaluation of the pound sterling in September and the reopening in November of the London Metal Exchange to free operations in tin. During the year, exports to the United States totalled some $430 million, thereby bringing into the Empire pool some U.S. $175/200 million

The somewhat delicate position in Hongkong is too well known to require recapitulation at my hands. With every new development in the Far East, Hongkong demonstrated its adaptability and continued usefulness as an *entre-pot* port without rival. Each year Hongkong's trade figures surpass those of the previous year and 1949 was no exception. As usual the bulk of the trade was with China, the United States and the United Kingdom in that order.

Little is known of the future which may await us in China, where this bank has been established for nearly a century, and we can but wait and see.

BRITISH AND U.S.A. TRADE

It has been my custom to devote my few closing remarks to the position in Great Britain in relation to the countries this bank serves through its chain of branches. In practically all these countries, inflation is present in greater or lesser degree.

While British trade, in the opening stages after devaluation of sterling, has shown considerable resilience—a resilience which has also been passed on in some measure to the countries in the Far East with currencies aligned to sterling—and the prosperity of the United States has stood up well to the shock of the appreciation of the dollar against almost all the currencies of the world, problems of real difficulty are calling for solution in both countries and it must be very clear that any marked recession in the prosperity of the United States or in the trading position of Great Britain could not fail to have serious repercussions upon all countries in the world and especially perhaps upon those in the Far East in which we are so interested. Nevertheless, trade and commerce are the very life blood of all these countries and, in spite of the many uncertainties inherent in the disturbed conditions with which they are assailed, I hope that the bank will continue to play a notable part in the furtherance of the trade of these areas, without which none of them can hope to prosper.

BARROW, HEPBURN AND GALE, LIMITED

SUCCESSFUL YEAR'S TRADING

The twenty-ninth ordinary annual general meeting of Barrow, Hepburn and Gale, Limited, was held on March 16th in London.

The following is an extract from the circulated statement of the chairman and managing director, Mr. George W. Odey, C.B.E.:—

It is again my pleasure to report that our group of companies have completed a successful year's trading. The trading profits before deduction of depreciation, directors' remuneration and provision for taxation, amounts for the year to £635,862. While this marks a decline on the profits of £823,776 for the previous year, it must be remembered that the profits of 1948 included substantial profits arising from the appreciation in leather stock values following the removal of the major portion of the Government subsidy on hides and tanning materials.

EXTENSION AND RE-EQUIPMENT

During the year under review the extension and re-equipment of the various departments has proceeded along the lines indicated in my last year's report.

The reorganisation of our upper leather tannery in Leeds, Messrs. Kitchin and Co., Limited, has now been virtually completed, and that company is now on a profitable basis and has made a very satisfactory contribution to the profits of the group. The extension of the gelatine department of Richard Hodgson and Sons, Ltd., has now been completed, and the new factory went into production in May.

The rebuilding of the limeyard and tanyard of Thomas Holmes and Sons, Ltd., has proceeded, and over one-third of this very essential work is now completed and will shortly be in use. Subject to the granting of the necessary licences, it is proposed to complete this rebuilding over the next two years, and, when completed, this will be one of the most modern and efficient sole leather yards in existence.

The extension of the tanning and currying premises of Henry Hall and Sons, Limited, is now nearing completion.

A YEAR OF EXPANSION

The year has again been one of considerable expansion. After deducting depreciation on land and buildings, remuneration of directors and provision for taxation, we are left with a balance of net profit for the year of £253,344. This, when added to our carry-forward from last year, places £466,740 at our disposal.

The board realises that shareholders may well feel that they are entitled to an increase in the Ordinary dividend. In view, however, of the Chancellor of the Exchequer's request that the limitation of dividends shall be continued, your board have decided to leave the dividend on the Ordinary shares unchanged at 20 per cent. for the year—10 per cent. interim and 10 per cent. final—which absorbs £38,500. The preference shares receive a final participating dividend of 2 per cent., making the maximum 3 per cent. for the year which, with the fixed dividend of 6 per cent., absorbs £44,550. The dividends, with the appropriation for additional depreciation, leave a carry forward of £308,207, an increase of £94,811 on the previous year.

It is, of course, very difficult to make any forecast of our company's results for 1950. We have made great progress with extending and re-equipping our factories following the end of the war, and no group of companies would appear to be better placed to meet the difficult years which doubtless lie ahead.

The report was adopted.

BOULTON AND PAUL, LIMITED

SIMPLIFIED ACCOUNTS

The deputy chairman, the Rt. Hon. Lord Wilmot, P.C., J.P., presided over the annual meeting held on March 14th at Norwich, and read the chairman's statement, of which the following is an extract.

There is a tendency today for the published accounts of public companies to become more complex. In order to comply with the provisions of the new Companies Act the amount of detail shown has had to be increased. For the protection of the public all this is no doubt most desirable, but it can have the unintentional result of befogging the general public. In order to help the ordinary reader we have therefore included a set of simplified accounts.

Although it is usual to refer to our employees at the end of the chairman's statement, I would like to emphasise that this reference is not a perfunctory one. The good relationship with the management has been well maintained throughout the past year, and I am pleased to say our employees have worked loyally and well.

GROUP'S MANY ACTIVITIES

The holding company is engaged in the following five main activities to which I will refer in turn—structural engineering, woodworking, wire netting and chain link, fencing and domestic refrigerators.

The tonnage handled during the year by the structural engineering department has been satisfactory, and there have been signs of a welcome improvement in the number of export orders. The following contracts give some indication of the work on which we have been engaged at home and for export: Government of Northern Ireland (Factory), Ulster Transport Authority (Repair Shop), General Electric Company, Limited (Turbo Shop), West Norfolk Farmers Co-operative Limited (Chemical Store), Daimler, Limited (Workshops and Offices), Boots, Limited (Diagrid Roof), Kuwait Oil Company, Limited (Structure for residential blocks), Ralli Bros. (roof for "go-down" at Mombasa). We fabricate and erect each year an ever larger number of Dutch barns and other agricultural and special structures.

The woodworking department particularly had to contend with the grave shortage of raw materials, especially softwood of the grade required for products of fine quality. However, we made good progress on the agricultural side, and extended our production to take in more of our prewar range of poultry houses, pig-huts, glass houses and other timber structures. Thanks to the high standard of workmanship of our products, the joinery and packaging business has also been good, despite intense competition.

Supplies of raw materials for the wire netting and chain link departments improved somewhat during the year and we were able to increase our sales of netting and chain link fencing to priority agricultural users. As the home demand for netting is still unsatisfied, we have not been permitted to expand our export tonnage, although we have kept in close touch with our overseas markets. Future prospects in the department depend entirely on raw materials coming forward.

The fencing department carries on a highly specialised trade in the manufacturing and erecting of protective fences and gates for enclosing factories, highways, railway tracks, city squares, tennis courts and machinery. I am pleased to say that this section is gradually picking up the momentum which it lost due to the shortage of raw materials immediately after the war.

The refrigerator department produces a domestic refrigerator of the silent, absorption type. The model has been designed to meet the need for a medium-sized unit at a moderate price and it has been well received.

Our leading subsidiary companies are engaged in woodworking, wire-netting and the steel scaffolding trade, and their activities therefore accord very well with those of the holding company. All have had a satisfactory year's trading.

FINANCIAL RESULTS

The fixed assets of the holding company amounted to £692,823, but to arrive at the nett book figure you must take into account the reserves and provisions on fixed assets of £425,831 giving a nett book value of £266,992. This book value of £266,992 is not much more than one-third of the gross-figure, owing to the substantial reserves built up through the years.

The consolidated balance sheet this year includes the figures of the South African company, which has now become a subsidiary, and these items account for the principal increases in assets and liabilities over last year.

Reserves and provisions amounting to £1,256,492 are in excess of the fixed assets of the group at £1,121,809.

The interest of the ordinary shareholders of Boulton and Paul in the concern as a whole may be expressed as follows:—

Ordinary share capital		£250,000
Reserves and provisions	£1,256,492	
Less: Depreciation provision and fixed assets, replacement reserve	121,519	
		£1,134,973
Net assets attributable to the ordinary shareholders		£1,384,973

If regard is had to tangible assets only, we should deduct from this figure of £1,384,973 the items of premiums on purchase of shares in subsidiaries £179,164, leaving an amount of £1,205,809 for the ordinary shareholders' interest in the nett tangible assets

The profit and loss account shows a profit before taxation of £155,382. Allowing for our taxation liabilities, and after bringing in the balance of profit carried forward, the disposable surplus of £202,514 compares quite well with the figure of £214,474 for 1947-8.

Your directors propose to transfer a further £20,000 to the fixed assets replacement reserve, in addition to making the usual charge for depreciation in the accounts. We also recommend a transfer of £15,000 to general reserve. After making these two reserves and providing for the usual preference dividend paid and accrued, we propose that the ordinary shareholders should be paid a dividend of 20 per cent., the same rate as last year.

Summarising the above recommendations, we propose that of the nett profit of £74,465 an amount of £39,540 (53 per cent.) be retained within the group and £34,925 (47 per cent.) be distributed by way of dividend. Although on the basis of the ordinary share capital of £250,000 the gross dividend is 20 per cent., it only amounts to 4 per cent. on the basis of the nett tangible assets of £1,205,809.

If you look at the earnings of the group (after deducting tax) rather than the dividends, the difference between the return on the nominal capital and on the nett tangible assets is even more striking: return on nominal capital, 27 per cent.; return on nett tangible assets, 5¾ per cent.

The report and accounts were unanimously adopted.

HARRODS LIMITED

LARGEST TURNOVER IN COMPANY'S HISTORY

SIR RICHARD BURBIDGE'S STATEMENT

The sixtieth annual general meeting of Harrods Limited will be held at the Assembly Room, on the company's premises, Brompton Road, London, S.W.1, on April 5th.

The following are extracts from the statement, circulated with the report and accounts for the year ended January 31, 1950, by the chairman and managing director, Sir Richard Burbidge, Bart, C.B.E.

CENTENARY

As you are well aware, the year under review marked the completion of the first hundred years trading by the House of Harrods, which event was celebrated in many ways. I would like to mention in particular the publication of a short history of Harrods and contemporary London and the erection in the middle of our premises of a replica of the original Harrods Shop. This little shop will be preserved as it has been given to the London County Council for exhibition in the Geffrye Museum. The thousands of messages of congratulation we received from all parts of the world, and the immense interest created by the little shop which was continuously crowded with visitors leave no doubt in our minds that the goodwill of your business is such that there is no reason why the successes already achieved should not be surpassed in the future, and the second hundred years show as much progress as the first.

After paying a tribute to Sir Harry K. Newton, Bart, who has retired, the statement continues:—

TRADING RESULTS

Coming now to the trading results for the year, there is no doubt that the amount of money available for spending is decreasing and that the shopping public is becoming more selective. This was especially noticeable during the first six months, but the devaluation of the pound and statements that were made at that time as to the possible effect of this on prices and supplies caused a considerable increase in trade during the autumn. The final result was that the turnover of the group as a whole was greater than last year and the largest in our history. With the exception of John Walsh in Sheffield, which, still in dispersed and temporary premises, is undoubtedly handicapped by the conditions under which it is forced to trade, sales increased at all our stores, including the two recent acquisitions, J. F. Rockhey and Company, Limited, and William Henderson and Sons, Limited. The rate of gross profit was still further reduced, and it was entirely due to the increased turnover that the gross profit of the group, £5,235,465, was £305,371 more than last year.

Unfortunately, the expense of doing business continued to increase, the result being that the net profit of £1,456,628 was £28,498 less than last year. Because the amount charged against expenses in respect of writing off the assets of Wm. Holt & Sons is less this year than last year and because the amount charged against deferred repairs reserve is more this year than last year, the provision for taxation on the profits of the year is down by £97,033 so that the disposable net profit of the group £645,936 is an increase of £68,535.

After allowing for a charge of £21,000 by D. H. Evans in respect of staff pensions and the dividend on the preference shares of the subsidiary companies, and deducting the sum of £117,437 retained by the latter out of their profits as additions to their reserves and profits carried forward, there remains to be

dealt with by Harrods Limited £493,337, against £479,139 last year.

DIVIDEND

We are again transferring £50,000 to building reserve, and after increasing the contingencies reserve by £25,000 and paying the dividend on the preference stock, the directors recommend that for the fourth year in succession the dividend on the ordinary stock be made up to 20 per cent. by the payment of a final dividend of 10 per cent. and a bonus dividend of 5 per cent., after which payment the carry forward will be increased by £9,666 to £310,634, equivalent to nearly two years' net dividend on the preference stock.

I think it is worth pointing out that our payments on the ordinary stock have been well covered by profits, as is shown by the fact that since 1946 we have purchased from the resources of the group the businesses of John Walsh, J. F. Rockhey, and now William Hendersons, thus providing assets which must increase the earning power of your business.

After dealing with the associated companies and the companies' consolidated balance sheet, the statement continues:—

PROSPECTS

With continually rising expenses, it is vital to maintain our turnover, and the success of the business in this respect depends to a great extent on the general conditions prevailing in the country. The result of the General Election and the consequent political instability cannot be considered favourable for business, and you will hardly expect me to forecast the trading results for the coming year. There are, however, two matters to which I should like to refer which will affect the coming year's results: the first affecting our profit directly, and the second indirectly, through the inability to merchandise efficiently.

In the first place, the present situation with regard to purchase tax is of the greatest concern to the stockholders. In the present stocks of the group there is an amount in excess of £400,000 representing purchase tax we have already paid. When tax is reduced or abolished, there is, under present conditions, no machinery by which the retailer can obtain a refund, and such reductions have already cost us many thousands of pounds. A joint committee, representing all sections of the retail trade, has been studying this problem for many months and has already submitted two schemes to the Treasury. Both of these have been rejected, and although the Chancellor of the Exchequer himself has agreed that it is equitable that relief should be granted, the matter still drags on without solution to our loss.

NEED FOR REMOVING CONTROLS

In the second place, we ask that immediate attention is given to the removal of the many unnecessary controls which are restricting the efficiency of retailers. The retail trade needs more than anything else scope for initiative and drive. Businesses like ours can succeed only if they are prepared to take risks: government controls discourage anybody from taking a risk as there are no gains to make up for the losses. Now that supplies of many commodities are more plentiful and the demand less acute, it can safely be left to competition and the innate fairness of traders to give to the shopping public that protection that is the object of controls.

I trust that my review has satisfied you that the internal position of your company is sound. I can assure you that all the businesses are well managed and the staffs efficient and courteous. Given increasing freedom, we shall face the difficulties that must lie ahead with confidence in our ability to overcome them.

THE MONOTYPE CORPORATION LIMITED

SUCCESSFUL RESULTS OF A DIFFICULT YEAR

SIR GEOFFREY ELLIS'S REVIEW

The annual general meeting of The Monotype Corporation Limited was held at 55-56, Lincoln's Inn Fields, London, W.C.2, on March 14th, Sir Geoffrey Ellis, Bart. (chairman), presiding.

The following are extracts from his statement:—

Our accounts this yeat show an appreciable advance on the previous year. Our order book, made up in a competitive territory, remains in good shape, but there are signs that in some countries the making-up of war and postwar arrears is almost complete. That recovery, moreover, is conditioned not only by ability to pay but by permission to import. Again, we have to remind our friends at home, whose patience we fully appreciate, that a large part of our production is still assigned for export. Competition in the printing composing machinery trade is now keen throughout the world and customers have a very shrewd idea of the relative values offered. We are not alarmed by this competition; our justification is shown in our increased sales.

POSITION IN FRANCE AND GERMANY

Last September, together with two of the directors of our French company, I made a long tour in France and met all our prominent customers. We did not find in the printing industry any evidence of present depression or pessimism about the future, but rather a keen determination to face undoubted economic difficulties and to recover the old reputation for fine printing the country has always enjoyed.

If in some parts of Europe markets are reaching a condition where demand already seems to be fairly met, there remain other centres still unsatisfied. In such conditions permission to import and to pay for imports to some extent depends on national bilateral agreements, subject often to unforeseen checks conditioned by shifting changes in the balance of trade, but we are satisfied that we are getting a good share of such trade as is permitted to be done.

In Germany the removal of our headquarters to Frankfurt has proved useful. We have been able to provide for a considerable measure of repair for moulds and accessories and have commenced to meet a consistent demand for new machines. The uncertain political conditions west and east, and the consequent inability to fix stable rates of borrowing and exchange render new business difficult. We have a long history of goodwill in Germany and we shall do all we can to sustain it. In Sweden we have made considerable headway. Strong consciousness of the need for fine printing has developed and as a consequence the demand for our production has steadily grown. Belgium, Holland, Denmark and Norway send us demands which are conditioned only by import permits. In Central Europe our sales are being maintained. In the Near East unsettled political conditions have rendered trading difficult, but we have a promising market there which will be fully covered as soon as there is some clear definition of state boundaries.

CONDITIONS IN INDIA, PAKISTAN AND CEYLON

Mr Silcock, our general manager, has just returned from an extensive tour in India, Pakistan, Ceylon and the Far East. Our branches in India and Pakistan are busy and likely to remain so. In Ceylon we are completing substantial orders. The future of printing both in India and Pakistan is very bright. In this respect, from the experience we have already gained in eastern script, we know that we can be very helpful in the future. The demand for new machines still continues keen.

At our Salfords Works steady progress has continued. During the last two years we have spent on new buildings, in round figures, £81,000, and in plant, fixtures and fittings £157,000. Our large new workshop, up to date in fitting, lighting, heating and air conditioning, is already proving its outstanding worth and has enabled us to rearrange space and processes in the older part of the Works. That we have no need to seek new capital outside is a full justification for our steady policy of ample reservation over past years and, moreover, it is a sound premium for the insurance of our future.

BURDEN OF "PROFITS" TAX

You will observe in the published accounts of many companies the item "Profit on Trading." This is completely misleading and should really be shown as a disposable trading balance with all necessary reservations to keep the undertaking in efficiency. Wherever the word "profit" occurs it is misused by agitators and others to persuade their audiences that its meaning is an actual divisible sum after meeting all liabilities. Today that balance (or so-called profit) is being depleted by income tax at 9s. in the £ and what is termed—quite mistakenly—"Profits" Tax. The latter tax is making it particularly difficult for industry to maintain its efficiency. To all but the blind or wilful it must be clear that industry is being compelled to eat some of its seed corn. It is useless for governments to exhort industry to greater efforts when the burden of taxation, often a complement of waste and extravagance, renders it impossible to make those essential reserves which efficiency must have as a base for development. Starving industry is no way of securing full employment, either now or in the future.

BALANCE SHEET ITEMS

Turning now to the consolidated report and balance sheet, capital reserves show an addition of £30,442. This is mainly due to our South African company having translated most of its reserves into new capital, with the exception of £10,000 still held for contingencies. This is reflected in the £10,000 we have allotted to general reserve. In other reserves overseas business has been increased by £45,000, fully justified by the grave uncertainties of trading in the Far East and holding up of imports into South Africa. There is a new item—future obsolescence of stock—£20,000, which is to provide for the cost of adapting new machinery and parts refused entry into its usual market and sent to another, together with type faces and accessories no longer required owing to changes in fashion or design.

In conclusion may I remind you that although your dividend is 15 per cent. on the nominal capital, the real return on the assets in our undertaking is barely 4 per cent? Government stock today yields little less.

The report and accounts were adopted.

Investment Statistics

Company Notes

Harrods.—Consolidated gross trading profit increased from £4,930,094 to £5,235,465 and net profit from £563,239 to £631,774 in the year to January 31, 1950. Net current assets at the year-end were £3,068,840 (£3,194,391); stocks rose from £2,744,145 to £2,927,899 and liquid funds declined from £3,131,671 to £2,779,962.

Tate and Lyle.—Group trading profit declined from £4,625,157 to £4,381,976 in the year to October 1, 1949; net profit amounted to £1,562,367 (£1,570,332). Advertising expenses for the year were £47,217 (£13,380). Net current assets at the year-end totalled £5,895,729 (£6,185,803); stocks increased from £5,305,633 to £6,583,305.

International Nickel.—Net earnings for 1949 were $ U.S. 32,252,314 compared with $39,108,404 in 1948 and $33,503,466 in 1947; net earnings were equivalent to $2.08 per share against $2.55 and $2.16 in the two previous years; the dividend was maintained at $2.00 per share. Net sales in 1949 amounted to $182,806,452 ($197,021,736) and capital expenditure $18,553,851 ($14,080,479).

Bradford Dyers.—Total group profit for 1949 was £1,845,388 (£1,525,354) and net profit £550,418 (£575,526). Net current assets at the year-end amounted to £4,443,242 (£4,122,718) and stocks to £2,035,694 (£1,986,049).

Hoover.—Consolidated trading profit increased from £1,140,518 to £1,962,393 in 1949; net profit was £837,206 (£409,742). Stocks declined from £1,631,306 to £1,341,658.

Matador Land and Cattle.—Profit in 1949 amounted to £243,695 (U.S. income and charges converted at $3.58 to £1) compared with £291,552 (U.S. items converted at $4.035) in 1948. The total distribution for the year is 30 per cent (same).

Orient Steam Navigation.—Combined net profit increased from £261,855 to £455,163 in the year to September 30, 1949, after depreciation £316,354 (£173,582), taxation £312,453 (£330,982), writing £50,000 (nil) off goodwill and deducting £43,532 (£8,366) profit retained by subsidiaries. The dividend for the year is 5 per cent tax free (6¼ per cent tax free).

Swan Hunter and Wigham Richardson.—Net profit of the group for 1949 amounted to £957,099 (£754,060). Sum brought to parent company's appropriation account was £500,787 (£453,957). Total proposed distribution for the year is 16 per cent (same).

Monsanto Chemicals.—Trading profit for 1949 was £810,021 (£876,700) and net profit £278,499 (£363,898), after deducting depreciation and obsolescence £185,099 (£100,105), taxation £329,593 (£405,820), and sundry charges £30,529 (£30,145). Dividend of 45 per cent is unchanged for the year, but on capital as increased by the issue in May, 1949.

Rugby Portland Cement.—Group profit for 1949 amounted to £396,393 (£355,516). Depreciation absorbed £109,763 (£94,455), profits tax £50,000 (£42,000), income tax £103,000 (£93,000), preference dividends £22,962 net (same), leaving £110,668 (£103,099) available for ordinary. The dividend recommended is 17½ per cent (15 per cent) plus 5 per cent tax free from capital reserves (same).

Meux's Brewery.—Group trading profit declined from £434,452 to £374,571 and net profit from £153,520 to £106,946 in 1949. Stocks fell from £336,834 to £276,770.

Upsons.—Total group profit fell from £1,002,850 to £930,537; taxation amounted to £357,015 (£475,083); net profit was £357,542 (£370,331). Stocks rose from £1,069,556 to £1,571,989).

Tarmac.—Trading profit rose from £340,723 to £466,443 and net profit declined from £141,361 to £135,785. A dividend of 15 per cent is recommended for the year.

Benefit Footwear.—Trading profit declined from £265,190 to £244,155 and net profit from £103,908 to £95,739 in 1949. The dividend of 32½ per cent on the deferred ordinary capital is repeated. Stocks increased from £347,813 to £547,879.

Capital Issues

Palestine Electric.—Holders of ordinary and "A" ordinary stock registered in London on March 10th are offered 800,000 £1 ordinary shares at par in the proportion of one new share for every £2 of either class of ordinary stock held. At the same time shareholders on the Palestine register are offered 224,424 £1 ordinary shares at a price equivalent to £1 sterling per share.

Peel River Land and Mineral.—Provisional allotment letters have been dispatched over the issue of 86,400 £1 shares offered to shareholders at 27s. per share in the proportion of two new shares for every £5 of stock held.

Virginia Orange Free State Gold Mining.—Shareholders of "Middle Wits" are offered at par seven Virginia OFS 5s. shares for every 10 shares held in Middle Wits. Middle Wits shareholders may also apply for £1 of Virginia first mortgage debenture stock for every five Middle Wits shares held. Free State Development and Investment shareholders are offered a stake in the Virginia flotation on a three-for-twenty basis and of the loan stock are offered £1 for every 15 "Freddies" shares.

John Baker and Bessemer.—The ICFC has taken up an issue of £150,000 in 4 per cent unsecured 10-year notes.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (a) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 14 years 2 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (h) Assumed dividend 18½% after capital bonus. (i) To latest redemption date. † Free of tax. (m) Final dividend on increased capital. Yield basis 35%. (n) Yield basis 26¾% after capital bonus.

Statistical Summary

EXCHEQUER RETURNS

For the week ended March 11, 1950, total ordinary revenue was £64,713,000, against ordinary expenditure of £60,252,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £18,713,000 the surplus accrued since April 1st is £653,911,000 compared with £923,878,000 for the corresponding period a year ago.

J. & J. MAN require an Assistant Sales Manager, age not over , 35, aside and outside experience essential. In addition to rocery ade experience, some knowledge of the Pharmaceutical dvantage—Apply, stating age, qualifications, experience alary required, to the Joint Secretary, Reckitt & Colman, Ltd., ow Works, Norwich.

OR SALE.—ECONOMIST, unbound, as new : March-June, 1946 ; July-December, 1946 (with index), 1947 ; January-June, 1948 ; -December, 1948 (with index); 1949 (with indexes). Also odd bers back to November, 1945.—Offers to Mr. E. Thompson, 11, n Way, Ruislip, Middlesex.

APABLE man or woman of high intelligence and integrity, as personal assistant to owner-manager of soundly established all radio and electrical business. State age and full details —Box 370.

ED.—London mid-April tuition in applied economics.—Box 365.

UNIVERSITY OF LONDON

Tutorial Classes Committee. Applications are invited for a Staff Tutorship in Psychology from men and women of high academic standing, with experience in conducting Tutorial classes. Additional qualifications in one or more subsidiary subjects would be an advantage. The appointment may be either as Staff Tutor, salary scale £600—£50—£1,150, or as Staff Tutor (Junior), salary scale £500—£50—£600, the initial salary in both instances being determined in accordance with the qualifications and experience of the successful candidate. Family allowances additional in either case. Particulars and application forms from Director of the Department of Extra-Mural Studies, Senate House, W.C.1. Completed application forms to be submitted before April 12, 1950.

UNIVERSITY OF LONDON

Organising Tutor, man or woman, required by Tutorial Classes Committee to work in either Middlesex or Surrey. Applicants must be qualified to take Tutorial Classes preferably in one or more of the following subjects: Literature, Economics, Psychology, Sociology, History. Salary £600—£50—£1,150, also Family Allowances, the initial salary being determined in accordance with the qualifications and experience of the successful candidate. Particulars and application forms from Director of the Department of Extra-Mural Studies, Senate House, W.C.1. Completed application forms to be submitted before April 12, 1950.

UNIVERSITY OF ABERDEEN

DEPARTMENT OF POLITICAL ECONOMY

Applications are invited for the post of Assistant in Economic History, whose duties will be mainly in Research. Salary £450 per annum with F.S.S.U. Applications to be lodged by March 20, 1950. Form of Application may be obtained from the undersigned. University of Aberdeen. H. J. BUTCHART, Secretary.

THE UNIVERSITY OF SHEFFIELD

Applications are invited for a post of ASSISTANT LECTURER in ECONOMICS, to begin duties on October 1, 1950.

Salary scale £450-£500, with Superannuation provision under the F.S.S.U., and a family allowance. Commencing salary on the scale will depend on the qualifications and experience of the successful candidate.

Applications (four copies), together with the names and addresses of three referees, and, if desired, copies of testimonials, should reach the undersigned (from whom further particulars may be obtained) not later than April 29, 1950.

A. W. CHAPMAN, Registrar.

THE INSTITUTE OF PERSONNEL MANAGEMENT

THE INSTITUTE OF PERSONNEL MANAGEMENT is proceeding to appoint a full-time Director. The Institute is an independent association of practising personnel officers, working in co-operation with the British Institute of Management. Its two principal objects are to increase the knowledge and competence of its members, and to promote and develop personnel management. Desirable qualifications are : (a) A degree or equivalent professional qualifications ; (b) Knowledge of industrial relations and personnel practice ; (c) Experience in industry or commerce : (d) Administrative experience. Salary, £1,500 per year for a person with these qualifications, otherwise a period of training at a somewhat reduced salary may be offered.—Applications, giving all necessary details, marked confidential, to Dr C. H. Northcott, Institute of Personnel Management, Management House, Hill Street, London, W.1.

HIS MAJESTY'S COLONIAL SERVICE, MAURITIUS

There is a vacancy for a Male Public Assistance Commissioner and Social Welfare Adviser to take charge of the Public Assistance Department ; to guide and to integrate into a general scheme voluntary social welfare organisations ; to create fresh social welfare organisations and to advise the Government generally on questions of social welfare.

The post is on agreement for three years. The salary is Rs. 16,000 (£1,200), plus cost-of-living allowance of Rs. 2,400 (£180) a year. Free passages. Taxation at low local rates.

Candidates should possess a wide practical experience of social welfare work and a knowledge of French. A knowledge of Indian ideas and practices would be an advantage.

Further particulars and application forms obtainable on request, in writing, to the Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting reference No. 27259/50.

ACCOUNTANT

LARGE MANUFACTURING UNDERTAKING IN CALCUTTA INVITES APPLICATIONS FOR THE ABOVE APPOINTMENT. APPLICANTS SHOULD BE QUALIFIED MEMBERS OF A PROFESSIONAL ACCOUNTANCY BODY AND SHOULD HAVE HAD SOME COMMERCIAL EXPERIENCE. THE SALARY AND CONDITIONS WILL BE COMMENSURATE WITH THE APPOINTMENT, WHICH IS A RESPONSIBLE AND PROGRESSIVE ONE. APPLICATIONS, GIVING PERSONAL DETAILS, AGE, QUALIFICATIONS AND EXPERIENCE, TOGETHER WITH NAMES AND ADDRESSES OF TWO PERSONS TO WHOM REFERENCE MAY BE MADE, SHOULD BE FORWARDED TO BOX 363.

THE BERGER GROUP of companies requires for its main U.K. training company a general Sales Manager, preferably with experience in decorative and industrial paint markets, but in any case with proved ability in large-scale sales administration and in the application of modern methods of sales management. Advertising and export sales experience are not necessary qualifications.—In confidence, please send details of age, career and salary required, to Box 362.

SUPERVISOR REQUIRED to control large Tabulation Department of Market Research Organisation. Applicants with experience in hand tabulation preferred.—Write, giving details of experience, education and age, to Box 361.

OPPORTUNITY occurs for limited number of new members to enjoy, free, exclusive privileges, plus "The Bookman" monthly magazine. Literature, specimen "Bookman", and full particulars without obligation.—Write to Dept. E., The Book Society, 13, Grosvenor Place, London, S.W.1.

Defence and Diplomacy

THAT the whole subject of defence should be under debate in the House of Commons at this moment is a product of the parliamentary time-table. But it is not entirely an accident, since there is at present a stronger under-current of anxiety about the state of the precarious balance between peace and war—which is a truer description of what is usually called foreign affairs—than at any time since the early days of the Berlin air-lift. Whether or not this country has a defence policy is a matter that well deserves examination. But there is a prior question. Defence has to be planned in the context of foreign policy—that is, of war-and-peace policy. And it is really very difficult indeed to say whether Britain has one that is coherent and if so what it is. Bits and pieces of a foreign policy have, it is true, been discussed and more or less accepted. Such are the development of the Commonwealth, co-operation across the Atlantic and—more recently and more hesitantly—closer relations with western Europe. But since the fading of the postwar hope that peace could be based upon the United Nations and the Big Three, the British people have been given no general picture of the fundamental issues at stake in the world and the means at Britain's disposal for dealing with them. This fact was never more apparent than in the general election, during which both parties—and both electoral programmes—shirked the issue almost completely.

Some people will no doubt protest that such a formulation of foreign policy is not possible, since foreign relations consist in a series of unrelated clashes or concurrences of interest between states, and that the attempt to bring the issues together would resemble the type of "laundry list" survey of international affairs to which Mr Bevin is accustomed to treat the House of Commons. "I turn now to Eritrea . . . my policy with regard to Saudi Arabia . . . as to the disturbances in the Seychelles . . ." But does such a description of foreign policy hold good today? Soviet diplomacy has introduced into foreign relations a principle absent since the French Revolution—the principle of aggressive state policy linked to a universal, missionary idea. When Communists in France can play an integral part in the Communists' struggle to dominate Indo-China, it is meaningless to speak of "unrelated clashes or concurrences of interest." Nothing is unrelated. That is the essence of Soviet diplomacy. But there is another more practical reason for believing that a unified picture of British foreign policy can and should be given. It is that the American Secretary of State, Mr Dean Acheson, is engaged—with considerable effect—on just such an attempt in the United States.

In a series of remarkable speeches, Mr Acheson has sought to make clear to the American people not simply single issues, such as the government's attitude towards the recognition of Communist China or the unification of Germany, but the whole background against which individual decisions have to be taken. He has attempted to

give a sense of perspective to a public bemused by the cries of the preventive warmongers on the one hand and of appeasing isolationists on the other. The fact of the Soviet drive to world domination must, in his view, be accepted. The Russians will not be deflected from their goal by pacts or treaties or paper agreements, all of which will be observed only so long as they serve Soviet interests. The free world can resist the universal pressure only by being strong enough to deflect it. You do not argue with a flood—you build dams. The Secretary of State's fundamental aim is thus one of "agreement through strength"—agreement with Russia brought about by the Soviet Government's realisation that it has nothing more to gain by force or pressure.

The thesis in one sense is an optimistic one. It assumes that the Russians know when to stop. But it is also an excessively difficult and challenging concept, since it requires standards of behaviour in democratic states in peacetime which they have certainly not demonstrated in the past. Mr Acheson believes that successful resistance to Soviet expansion must be based on three assumptions —that the free states can evolve unity of aim in their world policy; that they can be sufficiently well armed both to counter any local thrust the Communists may make (as in Greece, for instance) and to deter the Russians from a major act of aggression by the fear of provoking general war; and that the free world can create both in highly evolved political communities such as western Europe and in the backward areas of Asia and the Middle East "conditions which strengthen and create confidence in the democratic way of life." Unity, political and economic stability and effective defence—these are, according to Mr Acheson, the pre-conditions of western strength and hence of western survival.

*

Even so brief a summary of the Secretary of State's analysis illustrates its value as a unifying principle in the day-to-day problems of international affairs. There is no reason at all why a similar effort to disentangle the issues should not be made in this country and it is difficult to believe that the analysis would differ in any important respect. It would need the obstinacy of an ostrich to deny the fact of the Soviets' hostility—they make so little secret of it themselves. There is the lesson of Greece and of the airlift to show the effectiveness of determined defence and Russia's ghoulish concentration upon every sign of political division within the western world to underline the need for unity. There is also the fate of China to show that the need for some economic and social stability ranks almost as high as the need for effective defence. Mr Acheson has not proposed new facts. He has simply attempted to compel his countrymen to face the implications of the facts they already know. Nothing prevents Mr Bevin from making a similar attempt and there will be little general understanding and support for the nation's needs and commitments—either in defence or diplomacy—until such a lead is given.

The issue is not an academic one, a simple essay in clarification or popular enlightenment. The need to evolve a general strategy for foreign policy on both sides of the Atlantic springs from the fact that at present the prospects of united aims and united action in the western world seem rather more discouraging than usual. Mr Acheson may be making the attempt to evolve a western strategy, but his voice is almost drowned by discordant cries of the Republican Senators who believe that to drive him from office as a "pro-Communist" and a "bad security risk" would increase their electoral chances in November. Quarrels between Republicans and Democrats are, of course, for Americans alone to determine. But so long as the rest of the free world depends for its existence upon American wisdom and strength, it has the right to express its horror at the lengths to which partisan levity is being carried in Washington. It is not by such leadership that freedom will be saved. In Britain, on the other hand, silence reigns except when Mr Churchill or some other intrepid inquirer raises a problem of genuine urgency in the sphere of defence or foreign policy. Then the accusation of irresponsibility, factiousness, mischief-making and even viciousness hurled at their heads by Government spokesmen suggest that they have touched a sensitive spot. The Government is evidently not so blind as to ignore the great issues of policy. But it is clearly most unwilling to allow public discussion of them to demonstrate its own lack of decision.

So much for the leadership. The facts are not much less disconcerting. Instead of unity, the western world presents the spectacle of a series of half-alliances—Britain half committed to Europe, Germany half committed to Western Union, the United States certainly not more than half committed to the British Commonwealth, while sections of opinion in both Europe and America half hope that greater security and less trouble could be found in isolation. Similarly on the economic side, while the fundamental problems such as the dollar gap, Britain's economic instability and the rising economic claims of backward areas are still unsolved, the will to solve them by joint action seems to have diminished. There is more irritation, more impatience, more distrust in the western nations' relations with each other. As the seller's market fades, there is greater inability to distinguish between economic competitor and political friend. Nor has greater clarity of purpose in the sphere of defence made up for increased uncertainty elsewhere. It is very doubtful whether the present military programmes, in the United States and elsewhere, are enough to meet Mr Acheson's definition of effective defence—defence sufficient to counter local feints and to act as a general deterrent. If there is reason to believe that the response of the largest and most powerful of the western allies is inadequate, how can its smaller associates hope to adjust their programmes effectively?

This, surely, is a situation that cannot be allowed to drift—in aimlessness, uncertainty and recrimination. Mr Acheson has done his utmost to introduce a new note of clarity into the great debate, but the factious opposition of irresponsible men has all but drowned his voice. In this situation, a greatly needed strengthening of the western position might be achieved if Mr Bevin would break silence and attempt a reasoned statement of Britain's role in the strategy of the free world. Such a speech need not be elaborate. It need do little more than accept and affirm Mr Acheson's three preconditions of survival—unity of faith and purpose in the west, co-operative efforts to secure economic stability, effective joint defence—but it should show beyond a shadow of doubt that Britain is committed without reserve on all three issues. It is possible to understand, but hardly to condone, some of the inhibitions which probably hold the Government back. Its unwillingness to permit even the slightest modification in the present pattern of employment is hardly compatible with a dynamic international economic policy. Its lingering belief that in some ways legitimate defence is only a hairsbreadth removed from "militarism" takes the heart out of a defence policy. Above all, its wholehearted acceptance of the "grand alliance" in the west is still inhibited by the unwillingness of some of its supporters to accept the realities of the cold war, and to swallow the fact of Russia's total hostility to the west—indeed its special hostility to western socialism. As a result they will not recognise the need to join in good faith in a lasting alliance with "capitalist America."

Until the choice is made, however, the chances of western survival are small indeed. The only alternative to the close association on all fronts of the western powers would be an isolation in Europe—and in Asia—as provocative as it was defenceless. The illusion of liberals and socialists, of such men as Masaryk and Petkov, that co-operation was possible with Russia on terms of mutual respect, has been purged in the most literal fashion in the east. The western countries may be grateful that the alternative of "agreement through strength" is still available to them, but they cannot delay much longer the decision to make that policy—with all its implications—genuinely their own.

As The People Knew It

THE second volume of the official civil war histories has now been published.* Like the first, "British War Economy," which appeared nine months ago and was reviewed in *The Economist* of July 9, 1949, it is an introductory volume. It does not, therefore, give a detailed history of the social services, which will, to a certain extent at least, be dealt with in later volumes. What it does is to discuss some of the social problems which arose during the war because of the expected or actual air attacks.

In spite of his apparently limited field, Mr Titmuss's work will probably be of more general interest than any other in the long series. For here is the war as the people knew it, the ordinary people, members of families for whom the normal strains and stresses of family life were so intensified and multiplied. There can scarcely have been a family in the country which did not, at one time or another, have to grapple with one or other of the problems discussed in this book: whether or not to send the children away to a safer area; whether to take in children and mothers who were evacuated; how to find a hospital bed for a sick and aged relative; how to look after the tuberculous or mental relatives discharged from hospitals to make room for war casualties; how to find a home to replace one that had been shattered; and, above all perhaps, how to refound a home and family life after all the wartime disruptions.

Dominating all the preparations made for this people's war were the estimates made by the Air Staff in the nineteen-thirties of the weight of Germany's air attacks and of the casualties that would result from them. The "knock-out blow," which was expected as soon as war was declared, would, it was estimated, produce 50 casualties per ton of bombs dropped, an estimate which was later raised to 72. Translated into hospital beds needed, this estimate posed a quite unmanageable problem; but the Ministry of Health did aim at reserving 300,000 beds for casualties, which was to be largely achieved by the ruthless discharge of the civilian sick.

In all these preparations official policy, though guided by its experts, was not acting in advance of public opinion—except in such macabre details as the arrangements for mass burials and the issue to local authorities, in April, 1939, of a million burial forms. Anyone who remembers the ceaseless criticisms of the Government's civil defence policy in Parliament and the press during the thirties must now realise that if the Government had taken a more realistic view of air raids and scaled down its evacuation and hospital preparations accordingly, it would have been condemned as criminally complacent.

War came; the migration from the cities began; and the hospitals were emptied of many of their patients. And then began that period, brought to life again in this book, in which the evacuation scheme loomed much larger in people's minds than the war itself, when public opinion was much more concerned with the lousy heads and dirty habits of some of the evacuees than with the conduct of the war. Yet, in spite of this inauspicious beginning, the evacuation scheme justified itself as a war measure. Never, even when the bombs were falling,

20, LINCOLN'S INN FIELDS, LONDON, W.C.2

did the number of people who took advantage of it reach anything like the number eligible—although the number who made private arrangements (and used up much of the billeting accommodation) were far greater than had been estimated. But, as Mr Titmuss points out, evacuation did achieve its first aim—to save life. It acted, too, as a safety valve for those in the bombed towns, in that they knew that they could send their wives and children away from danger if they wanted to. In the latter part of the war, it became a measure of relief for families in distress, for children from broken homes and without homes, and children out of control. From being an instrument of civil defence, the official evacuation scheme became a social welfare agency.

*

The importance of the evacuation scheme is illustrated by the fact that it survived—right from the end of August, 1939, until long after the war ended. Hence the large amount of space allotted to it in this book. Yet those who were left behind in the bombed towns created just as serious problems as those who had to be found billets, schools and maternity beds in the country. As Mr Titmuss points out, for all the preoccupation of Government and people with the terrible consequences of air raids, comparatively little attention was paid to what became one of the worst problems of all—the care of those made homeless. The conditions in London's rest centres, for which the Treasury had refused to allow the London County Council to buy blankets before the war started, are a fearful example of official blindness in this respect, just as the improvements initiated by the voluntary agencies and extended by the local authorities illustrate once again the country's genius for improvisation.

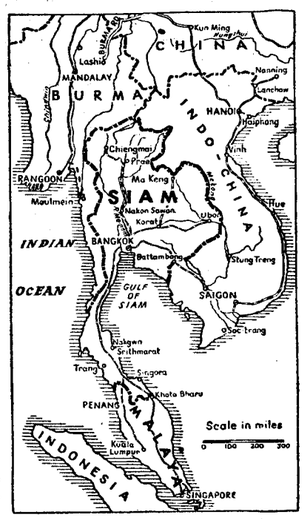
In spite of all the human implications of the problems he discusses, Mr Titmuss does not forget that he is writing a history. He does not altogether exclude the "human story"—as, for instance, that of the beetroot seller of Islington who took complete charge of a rest centre on her own initiative and made it "a place of security, order and decency for hundreds of homeless people." But for the most part he is content to describe the facts as revealed in hundreds and thousands of departmental minutes, circulars to local authorities, letters from local authorities, reports from voluntary bodies and the innumerable letters from private citizens which found their way to the Ministry of Health and other Departments. Sometimes the construction of the book involves a tiresome repetition of facts and figures, and the reader is often held up by the feeling of having just read about some particular point a short while before. But the style is always readable, and although occasionally a sentence ends in an anti-climax, there are other times when Mr Titmuss, who is clearly moved by his theme, manages to convey to the reader his sense of its greatness.

What that theme is emerges quite clearly. Here in these pages, one sees the welfare state come into being. Throughout the prewar preparations and throughout the early months of the war, the Government can be seen still trying to preserve the distinction between rich and poor. All Government help, in cash and in kind, must be reserved for those who were potentially, if not in fact, eligible for poor law relief. Here is the Treasury fighting a stiff rearguard action against the expenditure of "unnecessary money," and here are the local authorities trying to apply the old poor law rules of removal and settlement, and to recover their expenditure accordingly, at a time when, in England and Wales, there were 34,750,000 changes of address in six years, of which 20,750,000 had taken place by the end of 1942.

It was evacuation, the first evacuation, that opened people's eyes to the conditions in which a large section of the population was living before the war. The bombs did the rest, for they recognised no class distinctions; and the first attempts to deal with the homeless as though they were under the poor law soon had to give way in favour of the assumption by the state of responsibility for all victims of air-raids, rich and poor alike. It was the same with the sick. The original attempt to restrict the facilities of the Emergency Hospital Scheme to air-raid casualties and Servicemen gradually dropped until by the end of the war the Ministry of Health was assuming responsibility for finding hospital beds and treatment for all manner of civilian sick. Reading the account of the Ministry's mediations between the voluntary hospitals—whose representatives do not show up very favourably in these pages—and the municipal hospitals, one can easily understand why the present organisation of the hospital service was adopted.

*

It was inevitable that, with so much to the good and so much to the bad revealed by his study of his material, Mr Titmuss should have attempted to draw up a balance sheet. On the credit side he puts first the acceptance of fair shares, and the sweeping away of the stigma of the poor law for social casualties and the assumption by the state of responsibility for them—though he unfortunately omits to place on the debit side the breakdown, in the war, of the statutory obligation to provide shelter for those eligible for poor relief, an obligation which, so far as hospital treatment is concerned, has never been restored.



There are other credits too, notably in the field of human health, where after a setback in 1940-41, the vital statistics and the statistics for most diseases—here again the experts were confounded—showed a great improvement. Mr Titmuss does not ignore the extent to which these improvements in health were the result of a process that had been going on long before the war. Mothers bearing the healthier babies of the later war years were themselves much healthier than their own mothers had been.

But, Mr Titmuss asks, may not some of the evil consequences of the war have a similarly delayed action? It is impossible not to feel on reading his account of the stresses to which children were put, and of the extent to which many of them were deprived of affection and discipline, that here may be one cause of some of the worst faults of society today. Has the child who so cheerfully downed his satchel in September, 1939, grown into the youth with a cosh of 1950? It may not be so and Mr Titmuss, as historian, is careful not to draw any definite conclusion in his summing-up. But his final words deserve to be well pondered:

> Perhaps more lasting harm was wrought to the mind and hearts of men, women and children than to their bodies. The disturbances to family life, the separation of mothers and fathers from their children, of husbands from their wives, of pupils from their schools, of people from their recreation, of society from the pursuits of peace—perhaps all these indignities of war have left wounds which will take time to heal and infinite patience to understand.

Sideshow in Malaya?

A DECISION has been taken this week in Whitehall which shows that there is at last some awareness of the special requirements of the cold war. The post of Director of Operations in Malaya has been created, and Lieutenant-General Sir Harold Briggs, an experienced commander of Indian troops and a former commanding officer in Burma, is to fill it. The novelty lies in the decision to make this a civil position, which will enable General Briggs to co-ordinate and direct troops, police and auxiliaries in one combined operation against the Communist guerrillas. Time and again the co-operation of troops and civil forces has failed owing to their different methods of command and organisation, and the army has been embarrassed by the difficulties of drawing the line between military and police operations. It is also satisfactory that London has admitted—much later than was necessary—the need to accept advice from the spot and to achieve decisive results by new methods.

After nearly two years of fighting against some 5,000 full-time and another 10,000 part-time guerrillas it should be clear that the nature and importance of the Malaya campaign have been misjudged. A year ago it was being confidently asserted that the back of the Communist terror would have been broken by June, 1949; instead it has been necessary this month to send infantry reinforcements from Hongkong, and bombers and armoured vehicles from this country, to organise an anti-bandit month involving over 400,000 civilian and police auxiliaries, and to ask—as the planters and "unofficials" are asking—whether anything short of martial law and conscription will suffice to break the morale of the guerrillas and to prevent their reorganisation and reappearance, if the situation in south-east Asia should move still more in their favour. It is all very well for Mr Dugdale to tell the House of Commons that the latest reinforcements represent "final requirements" and that he sees no connection between the situation in Malaya and the British recognition of Communist China. Many people on the spot say the contrary: that the end of the campaign cannot be clearly seen and that events in China have had a deep effect not only on the guerrillas themselves but also on the Chinese, who form over a third of the population.

The simple facts are disturbing, even when every allowance is made for the terrible difficulties of jungle fighting, for the hit-and-run tactics of the enemy, for his excellent organisation and for the terror he can exercise against the civil population. The campaign has engaged an army of regular troops which has expanded from 8,000 to 14,000 men, as well as over 30,000 special constables and auxiliaries. In nearly two years of fighting the guerrillas are estimated to have lost 1,115 killed, 358 wounded, 644 captured and 350 surrendered—say 2,500 men. They have killed 793 civilians and 131 officers and men. During February of this year, when a special effort was made against them, 35 were killed and 35 wounded, but the number of civilian and police casualties was greater. When it is realised that the guerrillas receive no willing support from the civil population, and that they have none of the advantages of communications and fixed supply bases enjoyed by the Greek Communist guerrillas, it will be seen that there is good reason for asking whether the methods and forces so far used against them have been adequate.

There are other, more general reasons why the conduct of the Malayan campaign should receive closer public scrutiny. First, there is the need for speed in obtaining a decision. Until now there has been little evidence of close ties between the guerrillas and influences and policies outside. The terrorist campaign began in the summer of 1948 because the Malayan Communists had lost all the political ground they had won by their resistance to the Japanese during the war and in the early stages of the British return. Their resort to violence was a confession of failure to carry the trade unions and the politically conscious population with them. They must have known that they lacked the forces to establish a "liberated area," which could be built up as the centre of a Communist-led nationalist movement similar to that which exists in Indo-China. Their purpose seems to have been rather to cause as much damage and trouble as possible to the British as part of the general Communist campaign to attack capitalism by its "back-door."

Lately, however, it has become quite evident that the guerrillas (almost all of them Chinese) might expect instructions—and possibly aid—from such Communist organisations outside Malaya as the Overseas Chinese Commission and the Permanent Liaison Bureau of the World Federation of Trade Unions for Asia and the Far East. Indeed, the latter body laid down last November in Peking the strategy that the party should follow throughout south-east Asia: armed rebellion on a much larger scale, the building up in each country of a national liberation army, and no "left adventurism"—which means running the risk of a crushing defeat by premature military action. Clearly, such strategy cannot be adopted in Malaya unless the Communists can establish and hold bases of supply and command from which to equip and organise more substantial forces. Their present desperate resistance—anti-bandit month made them more not less active—suggests that they hope eventually for outside aid and for a more favourable political trend. It is, therefore, most important that they should be crushed quickly and that forces should be available to prevent any later regrouping.

Second is the fact noted by experienced observers in Malaya that the Chinese population has been deeply influenced by the Communist successes in China and by

the status which Mao Tse-tung appears to have won in the Communist hierarchy. At the back of their minds is the memory of the British defeat in 1942 and of the skill and ruthlessness that the Communists showed during 1945 and 1946 before the British regained control. In a realistic, self-interested way, many of them have taken to sitting on the fence during the present emergency, as a result of which the police have found sources of intelligence about the guerrillas drying up. This attitude among influential members of the trading community can be changed only by making it clear beyond doubt that the British intend to finish the campaign quickly and to maintain their position in Malaya. Rightly or wrongly, the decision to recognise the Communists in Peking has made them doubt the British Government's firmness of purpose.

What happens now in Malaya is no longer a local matter. The course of events there is being closely watched in neighbouring Siam, where Marshal Pibul has recently aligned himself with the west by recognising Bao-Dai in Indo-China. On the continued co-operation of the Siamese Government depends the success of the attempt to check the smuggling of supplies across the 300-mile frontier into northern Malaya. In Indonesia, Indo-China and Burma, too, the British attitude is being anxiously watched, for it is understood there as never before that what were once thought to be local wars—the business of The Hague, of Thakin Nu or of the French Government—are part of a pattern of cold war, the ruling factors in which are the policies of Moscow and Peking, Washington and London. The decisive defeat of Malaya's Communists would raise morale on this second front as nothing else could. There is, of course, no real parallel between the situation in Malaya and the events in the adjoining countries, and there is a regrettable tendency, particularly in American policy statements, to lump all together in reviews of south-east Asia. The guerrillas are terrorists pure and simple, a motley band of ruffians: they appeal unsuccessfully to the national feeling of a population in which the racial divisions are so deep that neither the Chinese nor the Malay communities wish to see the British depart. Living standards urgently need improvement, but the country is remarkably prosperous and has maintained—even increased—production of its precious dollar-earning raw materials in difficult and dangerous conditions. The lines of future political progress are clearly marked out, and the labour movements appear to be solidly behind the British authorities in the campaign. But Communist strategy for south-east Asia observes no such distinctions, and any serious turn for the worse in the economic prospects of Malaya might quickly provide it with new opportunities.

The appointment of General Briggs is presumably a sign of the Government's determination to win the race for time in Malaya, and to achieve a decisive success on the one cold war front where the prospects for offensive action are reasonably good. It is important that he should receive the fullest support from London, even if it means some further reduction of the forces elsewhere and expenditure greater than the Army Estimates allow for. It is important, too, that something should be done by Ministers to disperse the feeling in Malaya that London regards its war as a sideshow. So much has been said in recent months about the need for the west to make an ally of Asian nationalist feeling against Communism that the special reasons which justify British policy in Malaya have appeared to be forgotten, or thrust into the background. It would do good at this stage if Mr Attlee would restate in emphatic terms what he said in April last year:—

> The Government have no intention of relinquishing their responsibilities in Malaya until their task is completed. The purpose of our policy is simple: we are working in co-operation with the citizens of the Federation of Malaya and Singapore to guide them to responsible self-government within the Commonwealth. We have no intention of jeopardising the security, well-being or liberty of these peoples, for whom Britain has responsibility, by a premature withdrawal.

Technologists or Technicians

THE debate that Lord Calverley introduced in the House of Lords last week on the subject of higher technological education suffered from a certain muting of the issue, since the negotiations now going on between the Ministry of Education and the professional institutions concerning the setting up of a Royal Institute of Technology are being conducted in private. Nevertheless, several glimpses of a fundamental cleavage of opinion emerged from the exchanges between Lord Chorley, the President of the Association of University Teachers, which wishes any expansion of higher technological education to take place wholly within the universities themselves, and Lord Cherwell who, on this occasion, was acting as the spokesman for the more conservative elements in the older universities, whose attitude it has been in recent years to resist the expansion in numbers and the extension of functions that public policy seems inclined to thrust upon them. Lord Cherwell favours the creation of new technological institutes of university standing, on the lines of the world-famous institutions at Zurich and Cambridge, Massachusetts. That more and better technical education is needed is a proposition that now commands a most impressive body of support. The Reports of the Percy Committee in 1945, of the Barlow Committee in 1946, of the Parliamentary and Scientific Committee in 1947, of the Advisory Council on Scientific Policy in 1948, of the Federation of British Industries in 1949 and of the University Grants Committee in 1950 are all agreed that the country needs more and better qualified scientists and technicians. But on the means to achieve this expansion the various reports either differ fundamentally or are so nebulous that no clear line of action emerges.

This confusion arises in part out of the fact that between two words which sound and look almost alike there can be quite a wide range of difference. British industry needs both technicians and technologists. A trained technician can be defined as a man who, without aspiring ever to reach one of the directing positions in industry, is nevertheless fully competent to understand, control and maintain the technical processes committed to his charge. A technologist, on the other hand, can be defined in the words of the Barlow Report as a man "capable of appreciating the latest progress in the research laboratories and applying the results to practical

engineering or processes in industry." It seems easy at first sight to say that it is the job of the technical colleges to produce the technicians and of the universities to produce the technologists. In point of fact, however, the matter is not nearly so simple. There is a wide range in the standards of the technical colleges; some are hardly capable of producing good technicians, while at the other end some may legitimately have considerably higher ambitions. Equally the universities have, in their technological faculties, many students who are unlikely to become first-class technologists.

Perhaps the most valuable distinction that can be drawn is between the different kinds of education that can be given. Most people would agree that a university would not be doing its duty unless it gave its technological students an education in scientific principles; that a graduate course in technology requires a knowledge of fundamental mathematics or science and that unless this knowledge is acquired the student will not be able to turn the practical experience which he acquires during and after his university course into constructive channels. Not all university courses live up to these objectives, but on the strength of them the universities have more than doubled the numbers of their technological students since before the war.

But in the technical colleges progress has been less marked. To begin with there is much greater variation in standards between technical colleges than between universities. At the upper end of the scale are institutions such as the Manchester and Glasgow Technical Colleges which are closely associated with their universities and receive grants from the University Grants Committee. They are virtually faculties of their universities. Looser forms of affiliation exist between the universities of Leeds and Sheffield and certain technical colleges, but the relationship is not altogether successful and has not spread. London University also has a special relationship with the London polytechnics whereby students may take the internal degrees of the University. Again this relationship has not been extended and there are many signs that London University would like to bring it to an end. Outside these different types of affiliation there are scores of technical colleges up and down the country run by local authorities without direct contact with the universities.

★

The worst sufferers from the great width of this range are the best institutions within it, and there is much discussion of ways in which their status, both educational and social, could be raised and their students could be given some distinguishing qualification which would establish the merit of their achievement in the same way that his degree does for the graduate of a university. The National Advisory Council on Education for Industry and Commerce is a prime mover in this attempt and is understood to have made proposals which are now being discussed with various professional bodies for the creation of a Royal Institute of Technology with power to grant degrees. Such a scheme has obvious attractions. It would relieve the universities from the pressure upon them to expand their technological faculties to an extent that some of them think unwise; it would give the technical colleges a goal to strive for; in intention at least, it would raise the status of technical students who worked for and secured the new Royal Institute degrees.

But the difficulties are nevertheless considerable, and they can be seen most clearly if attention is concentrated on the nature of the education that a university, or a body of university standing, ought to provide. Is it wise to grant degrees, which would be intended to be regarded as the rough equivalent of university degrees, unless the process by which they are earned comes up to university standards? If the answer be that it would come up to those standards, then the further questions must be asked whether the teaching in these technical colleges is to be newly based on pure science and mathematics, whether teachers can be found to teach the fundamental sciences in the technical colleges, and if they could, whether the students would be able to master both the theoretical and the practical training involved?

This last question is really the crux of the matter. Not many of the students at not many of the technical colleges are capable of profiting by teaching of a university standard. Nor, indeed, is that what they want. They come to the technical colleges to take a circumscribed course of technical training related to the needs of one particular industry—in short, to learn to be good technicians. They should, indeed, be assisted and encouraged in this object, and nobody should think that it is in any way an unworthy one. But any proposal to "raise their status" by giving them a degree runs straight into the dilemma that either the degree will be something very different from what a degree has hitherto meant in this country (with some danger to existing degrees) or else the technical colleges will have to evolve into something less suited to the real needs.

★

These difficulties are formidable. Yet it would be premature to condemn the proposals outright; the dilemma in which technical education finds itself is very real and any proposals for its solution must be given sympathetic consideration. At present the professional bodies, whose influence would be undermined by a Royal Institute of Technology, are said to be opposing any suggestion that it should be more than a purely examining body. Until these arguments are resolved and the proposals published, judgment must be reserved.

It is nevertheless clear that the university faculties of technology and any new university Institutes of Higher Technology as might be set up on the Massachusetts or Zürich models are basically something very different from the courses suited to technical colleges, however much bigger and better these may be. One is either educating a man in an institution founded on research and fundamental science and all the atmosphere of higher learning that is involved, or one is training a man in a specific skill with such tools as are required for that skill. There is an immense amount to be done to improve the methods and tools by which such skills are to be taught in the technical colleges, and at the present time there is an even more urgent need for larger numbers of well-trained technicians than for more technologists. But the two ought not to be confused. Whatever is done about the technical colleges, the need will remain for a decision about the lines on which the higher education of technologists is to develop.

NOTES OF THE WEEK

Hartley Withers

Hartley Withers, who died this week at the age of 82, was Editor of *The Economist* from 1916 to 1921. Before he became Editor he had been for seventeen years a daily journalist, as the city editor first of *The Times* and then of the *Morning Post* ; for four years a banker ; and in 1915 a wartime civil servant. He was a temporary clerk in the Treasury, where (it is believed) he was closely concerned with the original excess profits duty. As he was nearing 50 when he went to the Treasury, he may have found the atmosphere of a Government office restrictive, and it was certainly with relief that he returned to financial journalism. He brought with him, apart from his wide knowledge and experience, several most valuable assets—a fund of common sense, the perfect style in which to express it, and the prestige of having written recently at least two first-class books, "The Meaning of Money" and the less widely read but not less stimulating "Poverty and Waste."

In "The Meaning of Money" he had dealt at length with the relation between bankers' deposits and bankers' advances and shocked some orthodox bankers by the simple thesis that every loan creates a deposit. With this principle fresh in mind, he was specially sensitive to the possibilities of inflation in wartime, and his main work on *The Economist* was to give warning after warning of what inflation meant and declaration after declaration that it could start as easily from a ledger entry as from a run on the printing press. "Inflation," he said, "is the tree up which I bark." It was not then an easy thing to persuade either all economists or all bankers that a currency could be inflated by bank credits, and there was a tendency to treat Withers's reasoning on this matter with a slightly superior scepticism. Events justified his warning so completely that he has to some extent suffered the fate of many men before him whose arguments were challenged by one generation and dismissed as truisms by the next. But the force of his influence in those war years was beyond question ; and as we look back to 1921 we can fairly claim for Withers that if the world's politicians had continued to heed the warnings he gave week after week in *The Economist*, and had acted on them with the necessary courage, most of our economic problems would be far less baffling than they actually are in 1950.

After six years with *The Economist*, Withers, obeying some strange restless instinct that was part of his complex fascinating personality, resigned his editorship, much to the regret of the proprietors. He spent a few more years in journalism, and the next twenty-seven in a combination of business activity with an industrious and useful career of authorship, in which he wrote and published a large number of books on commerce and finance. It is nearly thirty years now since he left *The Economist* and there are few left today who worked with him while he was editor. But for those fortunate ones who passed their early manhood in his companionship, his memory still means a great deal. No editor ever had more completely the devotion of his staff or better deserved the great affection in which they held him.

Seretse Khama

The White Paper on the case of Seretse Khama* says very little that was not already widely known. There is a somewhat fuller explanation of the Government's attitude than that given by Mr Gordon Walker in the House of Commons, and an abortive attempt is made to explain why the report of the Commission of Inquiry will not be published. The Government stand by their decision solely on the grounds of their interpretation of the local situation in Bechuanaland ; no outside considerations, either of colonial policy or of South African opinion, have apparently had any place in their counsels.

Even in this restricted context, however, the White Paper is far from convincing. Three reasons are put forward for the Government's decision to withhold recognition of Seretse's chieftainship: it would have lead to a recurrence of dynastic feuds ; by marrying against the advice of his uncle, Seretse showed himself to be "unmindful of the interests of his tribe and of his public duty" and therefore to be unfit to rule ; and Seretse would be unable to retain the support of his subjects in the face of Tshekedi's opposition. The first and third reasons do not stand up to close examination. As an article from our Correspondent in South Africa (page 659) points out, Seretse now enjoys the almost unanimous backing of his tribesmen and a dynastic feud would seem to be most unlikely. True, this may not have been the case before the Government announced their decision, but that decision has, as might have been foreseen, served to unite the tribe behind Seretse. The question of whether his marriage was a responsible act or not does not, therefore, arise, for the Government's own clumsy behaviour seems to have installed Seretse so firmly in the hearts of his tribesmen that even if he really were unfit to rule no other ruler might now be accepted.

The Defence Debates

Last week the House of Commons debated the general question of defence and this week it examined separately the estimates for each of the services. The general debate was a woolly and turgid affair, but the three estimates debates showed a most welcome improvement over previous years in official candour, in the House's grasp of essentials, and in the amount of agreement between both sides. Now that the Government has ceased to be so nervously optimistic about defence questions and is prepared to admit the difficulties and dangers which confront it, it is beginning to elicit some of the sympathy, support, and constructive criticism which it could have had for the asking, yet chose to deny to itself, at any time during the past four years.

Mr Strachey, the new Secretary of State for War, commanded a respectful hearing on Monday largely because his speech was, particularly on the question of the Territorial Army, really informative. He nailed down the point which has been causing general concern for the past year—how to dovetail the national servicemen into the framework of the Territorial Army for the period of their four-year reserve service. It has been obvious that the present composition and geographic distribution of territorial units in no way corresponds to the need for a balanced reserve. This problem is to be met by disbanding about an eighth of the territorial units, carrying through a drastic reorganisation of the remaining ones, and passing a proportion of the national servicemen into the revived Supplementary Reserve of the Regular Army. Although an improved territorial organisation does not meet the basic contention that Britain, by relying on a small front line strength and a large reserve, is planning for the wrong war, it does show that there is at least a small measure of flexibility in official military thinking. The other new line of development, which was aired during the debate by Mr Paget and others, was the possibility of a greatly increased effort to recruit colonial troops for service overseas and thus ease the strain which such operations as bandit hunting in Malaya and colonial garrison duty are putting on the British Army.

The debate on the RAF estimates elicited very little new information from the Government. It is obvious that the most dangerous moment in the re-equipping of the fighter squadrons is now past, and that one of the main problems is now the question of how many planes can be got for how much money. The Navy Estimates were introduced with great skill by the new Financial Secretary to the Admiralty, Mr L. J. Callaghan, and it is clear Mr Attlee has made a good choice in picking him to represent the First Lord in the House of Commons. He gave a number of facts about new developments in the defence against submarines, but the point on which he found it most difficult to satisfy the House was that an adequate organisation existed by which a large number of new escort vessels could be produced in the event of an emergency.

* * *

Challenge to de Gasperi

The Communist Party has begun the offensive again in Italy, and from Venice in the north to Naples in the south there have been disorders, strikes and riots, including a not very successful attempt at a general strike. There are many reasons for this new phase of violence, some of them endemic, such as the continuance of mass unemployment. The Communists have also been offered throughout the winter an excuse for taking the law into their own hands, thanks to the provocative behaviour of the neo-Fascist movement, the MSI. The extremes of right and left are now working on the fatal prewar pattern of inciting each other to perpetual acts and counter-acts of lawlessness. There is, however, reason to believe that there are special grounds for the new Communist outbreak.

Paradoxically enough it is the very success of the de Gasperi Government that is inviting these reprisals. Although the economic situation is still caught in the strait-waistcoat of deflation, the Prime Minister himself appears to be more ready now to make a frontal attack on the problem of unemployment by the way of expanding investments and of a new stimulus to business expansion. Such a policy can at least be read into the economic budget which has just become public, and into Signor Pella's budget speech. The announcement of more specific plans for land reform which was made last week may also very considerably weaken the Communist hold on the countryside.

But the Government's strength is perhaps best seen in its determination to maintain public order in face of the rowdyism of right and left. All previous regulations and enactments to safeguard public order have now been brought together in a single act which, among other things, makes meetings in factories illegal and places firm restrictions upon the right to hold processions and rallies. Signor Scelba, with his 70,000 policemen, has already shown himself a determined and impartial champion of order in the streets, and the new Bill is aimed equally at Communists and neo-Fascists. Since, at the moment, the interplay of these two forces is the most serious threat to civil peace in Italy, it is in the Communists' interest to attempt by new violence to discredit the Government and to undermine the strength and effectiveness of the public authorities.

* * *

Belgian Crisis Extended

King Leopold's decision to hand the problem of his return back to Parliament appears to restore the position virtually to the deadlock that existed before the referendum. If the Christian Social party, which has an absolute majority in the Senate only, could have restored the King's prerogatives by a parliamentary vote, it would no doubt have done so already. Without the support of the Liberals, however, it could not proceed to secure a majority in both Houses. The referendum has not changed the position.

The Liberals, with 29 seats in the Chamber, thus hold the balance, and it is clear that their attitude towards the King has become less favourable in the last week—possibly as a result of the post-referendum negotiations, during which the King appears to have relied upon extra-parliamentary advisers and presented Ministers with a *fait accompli*. But, for whatever reason, the Liberals have now decided not to support the Christian Social party in its determination to bring the King's return to a vote in both Houses. M. Eyskens, the Christian Social Prime Minister, has accordingly resigned, and he must either find a compromise which the Liberals will support or dissolve Parliament and seek a Christian Social majority in order to bring the King back—as a strictly Christian Social monarch—to the throne.

It is possible that the Liberals would accept a solution whereby the King returned, on condition that he then abdicated. M. Eyskens and the moderate wing of his party might be prepared for such a course. Unhappily for the prospects of agreement other Ministers, among them M. Van Zeeland and M. de Vleeschauwer, appear determined to secure the King's return at all costs—even the cost of national unity.

Back to Strasbourg

The task of inventing some new machinery by which western Europe might squeeze and shape itself into some new form of union is being handled in an unbusinesslike way. The general affairs committee of the Consultative Assembly of the Council of Europe has been considering this week in Strasbourg the report it has to present by April 1st on the changes in Europe's political structure that it thinks necessary. That document will not be the product of full-time work by a group of men with the legal and historical knowledge and parliamentary experience that might produce a great state document, but the result of spare-time labour by a few devoted individuals. Their views have been so often publicly expressed that they may find it difficult to accept modifications of them which logic and historical experience clearly demand. In fact, the document is unlikely to have much practical effect.

The problem of the Council in its simplest, crudest form is this. In so far as each Foreign Minister on the Committee of Ministers represents a national government, the Committee can—if the government's views agree—decide anything it likes. It has all the power it needs to frame a revolutionary policy ; what it lacks is the power to bind a minority to accept the decisions of the majority. That power, in the last resort, is bound up with the control of armed forces, which the Ministers insisted should be outside the province of the Council. In other words, the Ministers who created the Council of Europe deliberately deprived it of the possibility of doing things, knowing that its junior body—the Assembly—would persistently demand that things should be done. And of those Ministers the majority regard the committees of the Brussels and Atlantic Pacts as the places where real work is done.

It is customary to criticise the Foreign Ministers for this little conspiracy of impotence, especially Mr Bevin ; and it is true that British policy is often less candid and clear than it might be. But the fact remains—and cannot be too often repeated—that the Foreign Ministers cannot be much more adventurous until the peoples in their countries have had the problem of and the plans for European unity explained to them in simple, realistic terms that can be accepted or rejected. To reach this stage has become doubly important, for Dr Adenauer is now in the field with his

proposal for Franco-German economic and political union, in which precisely the same questions arise. It is to be hoped that the Committee of Ministers will face these facts honestly when they too meet in Strasbourg next week.

* * *

The Food Paradox

Only time will show whether Mr Maurice Webb is a good Minister of Food, but he is certainly as gifted in the field of public relations as his predecessor was inept. His first press conference established him in the endearing role of a modest beginner, willing to learn, and appreciative of the importance of "a little of what you fancy." But it also provided a demonstration of a serious dilemma, which confronts the British Government and which is oddly parallel to that of the American Department of Agriculture with its blue-dyed potatoes and homeless dried eggs. "In almost every respect," said Mr Webb, "the country is passing from a phase in which most commodities were scarce into one—not of abundance, but where conditions are easier." Tea and sugar apart, in fact, opportunities for increasing supplies have outrun the level of the ration and show every sign of continuing to do so. Unfortunately, to bring them into step by raising the ration would mean either adding to the subsidy bill—in flat contradiction to Sir Stafford Cripps's policy—or, by reducing the subsidy on the affected commodities, allowing the cost of living to rise, and thus dynamite the wages freeze. By a roundabout route the nation has come back face to face with the old paradox of poverty (or at least austerity) in plenty, and the ration-and-subsidy system devised as a guarantee against poverty, has become an impassable obstacle to plenty. At first sight, there is a case for a two-tier price system, that is to say of putting the commodities which are surplus when the demands of the ration have been met on sale at their economic, not their subsidised, price. But those experienced in working the rationing system hold the view that this can only be done with different commodities, not with differing amounts of the same commodity. In other words, butter could be off the ration and margarine on it, but to have some butter on and some off the ration would, it is said, put a strain on the probity of the retail trade which might cause the collapse of the rationing system. If this is true, then any steps to solve the problems of abundance must be taken within a wider framework of government economic policy.

The Minister's Parliamentary Secretary (whom, doubtless with the best intentions, he introduced as "the new Dr Summerskill") appears to be more fully aware of this difficulty than his chief. The consumer, he said, must not be regarded as a milch cow for the farmer's benefit—a generality which, translated into specific terms, might well mean lower farm prices at least for the more flagrantly uneconomic products. Altogether the conference strikingly juxtaposed two of the Labour Party's most vital strategic prepossessions: the fear that a rising cost of living may alienate an essential faction of the mass industrial vote and the hope, by wooing the farmer and farm labourer, that they may swing an adequate number of rural constituencies to the Labour side. For all his expressed satisfaction at the easing of the supply position, Mr Webb has no easy part to play.

* * *

Crimes of Violence

This week's debate in the House of Lords on crimes of violence produced some interesting statistics from the Lord Chancellor on the number of these crimes in recent months. The category of crimes of violence, as he pointed out, includes some, like abortion, which would not be classed as such by the ordinary man. He therefore selected from the category those that involved violence in the popular sense, and gave the figures for the last two years as follows:—

1948 ... 11,780 cases, of which 73% were cleared up.

1949 ... 12,247 cases, of which 74% were cleared up.

At first sight, there appears to be an increase, but in the context of flogging the figures tell a quite different story. For the increase, Lord Jowitt went on to say, was more than accounted for by indecent assaults on females—for which the offender was not flogged under the old law. Cases of the particular type of robbery formerly punishable by flogging numbered 978 in 1948 and 860 in 1949. The increase in the last three months of last year compared with October to December, 1948, amounted to precisely four. If the story is taken even further, it becomes no more alarming. In London and the thirteen largest cities, the number of cases of robbery with violence was 32 in October, 33 in November, 46 in December, 39 in January, and 39 in February.

Quantitatively, therefore, the position does not appear so black as has been painted. But, say the supporters of flogging—and others—the type of violence used is far worse than it used to be. On this it is impossible to get any factual evidence, and all one can do is to accept the opinion of judges and police. Even so, it does not follow that the right course is to reintroduce flogging. The Cadogan Committee considered the whole case thoroughly in 1938, and unanimously decided that it should be abolished. In Scotland there had been no flogging for these offences for many years before it was abolished in England. What, in fact, we seem to be experiencing at the moment is a wave of popular excitement—it might almost be called hysteria—like those which, as every wave of violent crime in the last hundred years. This type of crime will stop when the police have the measure of the criminals, but not before.

Planning in the Lords

The Lords' debate on Wednesday on the working of the Town and Country Planning Act brought out several problems which need early attention. The levying of development charges in cases where there is some minor change of land use both seems unjust and impedes small-scale enterprise. If an owner puts up an outhouse, or uses one or two rooms as a part-time shop, or converts his house into flats, he may be called on to pay a charge to the Central Land Board. This strikes him as novel and unfair, and has done much to make the Act unpopular. It deters just that sort of ingenuity and adaptability on the part of small owners which could serve the nation well at the present time.

Moreover, there are two associated grievances. One is that in such cases the owner may have had a right to compensation out of the £300 million fund; but it is now too late for him to claim it (many owners will not have thought of making claims in respect of possible conversions or adaptations of their property) and any claims which have been lodged will not be settled for several years. The other is that there is fresh evidence that the planning authorities are sometimes obstructively slow in reaching decisions; they lack business sense and an awareness of business needs.

Some of these defects could be lightened by administrative action, and the Government have promised to overhaul the machinery. The Act's main defects, however, could only be cured by amending legislation (or by scrapping it in favour of some different scheme altogether), and this the Government claims to be impractical at the present time. This decision is unfortunate. It was a Labour peer, Lord Chorley, who called attention to the danger of development being held up through a "strike of property owners," lacking the incentive to sell their land. Under present conditions, this danger may not be serious, but it could arise later. His solution was to allow landowners some sort of controlled profit as an inducement to sell. In practice landowners are sometimes given today the margin of profit which they are denied completely in theory. Such obscure and secret subventions are hardly satisfactory.

It is in the interest of the town planning movement itself that existing legislation should be revised. The Government ought to take better care of what was once one of its more promising babies.

Siam in the Vortex

Marshal Pibul Songgram of Siam has taken the bold step of recognising the Bao Dai regime in Indo-China and thus definitely aligning himself with the anti-Communist camp in South-East Asia. The event has not been unconnected with the recent conference of American diplomats in Bangkok under the chairmanship of Dr Jessup from the State Department, or with the fact that a World Bank mission has just left Bangkok and is drawing up its report. It must be regarded as a victory for American—and British—diplomacy as well as evidence that Marshal Pibul is not lacking in nerve for facing the difficult situation which confronts his country. Everything now depends on whether he can retain his hold on power. He has formidable enemies among Siamese politicians, and the recognition of Bao Dai is reported to have been unpopular even among his own followers, partly because Siamese nationalist feeling is offended by what seems like a concession to the French—against whom Siam has grievances of long standing—and partly because of the national habit of caution in international affairs and reluctance to come off the fence on either side as long as it can be avoided. The Chinese Communists are not actually on Siam's border, but they, or Ho Chi-minh's forces, would be if Bao Dai and his French allies were to be defeated in Indo-China. The large Chinese element within Siam—approximately a quarter of the total population—would provide a most dangerous fifth column in any conflict with China.

*

Siam at present is also following the policy of the United States in recognising Chiang Kai-shek's Government in Formosa, and has no dealings with Peking, though Chinese in Bangkok are said to have nearly all hidden or thrown away their portraits of Chiang Kai-shek and to be paying good money for pictures of Mao Tse-tung. Siam has further been giving the Malayan police very helpful co-operation on the Malaya-Siam frontier; if this co-operation were to be replaced by hostility, the British task of coping with Communist terrorism in Malaya would be far more difficult than it is, and it would be no less serious for Malaya if the rice supplies now coming from Bangkok to Singapore were to be diverted to China by political action. The risk of a sudden change in Siamese politics arises from the fact that Marshal Pibul's position is essentially that of a military leader and that he is liable to be overthrown by the same kind of *coup d'état* by army officers which brought him to power; he is exposed to the intrigues of at least two prominent Siamese politicians whom he has driven into exile and who would probably not scruple to use Communist support in order to get back into office. One is Mr Pridi, who was overthrown by the *coup* of 1947 and is now believed to be in Canton; the other is General Kach Songgram, who was one of Pibul's supporters, but quarrelled with him, and has been living in exile in Hongkong. The feuds of these leaders, none of whom is actually a Communist, could provide Communism with its opportunity to gain control of Siam. But at the moment Pibul is in the saddle and is pursuing a policy which deserves the fullest encouragement and support from the West.

State Trading in China

It is not yet certain how much foreign merchants in China will be affected by the new measures which the Peking Government introduced last week. The Chinese Communists intend to bring as much of China's trade under state control as they can, but for the moment the Peking Government seems to be chiefly concerned with internal production and trade rather than with exports. The new decree sets up six national corporations under the Ministry of Trade, covering food, textiles, general goods, salt, coal and farm produce. There are also a number of special agencies for particular products, such as hog bristles and edible oils. Imports are certainly scheduled for strict control in the near future; but the export trade, which accounts for most of the foreign merchants in China, has so far been left alone. Exporters will presumably be allowed to buy from the new state organisations in the same way as they did from private Chinese dealers.

Foreign merchants in China have been having a very difficult time. Trade has fallen to about a third of what it was a year ago; profits have been cut down to below the minimum, so that, in the case of British firms, extra capital has had to be sent to China in order to keep the businesses going; the Peking Government have imposed a number of arbitrary taxes and in one way or another have even made it impossible for those firms who would like to do so to close down their business and leave the country.

The British recognition of the Peking Government has not yet made any difference to the situation. The British Chargé d'Affaires is still discussing procedural matters with the Chinese Government, and there are no signs yet of his being able to do anything to improve the lot of British individuals and business houses. The Chinese Communists are by no means convinced that they need the help of western merchants as much as the merchants need their trade; and until the moment of conviction arrives there can be no hope of better trading relations. Recognition of the Peking regime has not, in fact, proved the blessing it was expected to be. Some British merchants who pressed so hard for that recognition are now wondering whether they would not have done better to cut their losses and get out of the country while the going was good.

Stalin's Grain Directive

The Soviet Government's directive on spring sowing, published last week, was one of those numerous and regular pronouncements through which can be traced, as *Pravda* usually puts it, the "red thread" of Stalin's solicitude for an increase in agricultural production and an improvement in its

Air Subscription Rates

Increases in air freight charges make it necessary to raise certain air subscription rates:

	Old Rate	*New Rate*
New Zealand ...	**£7 15s.**	**£8**
Australia ...	**£6**	**£6 5s.**
Hong Kong and Malaya	**£5 15s.**	**£6**

These increases will become effective for air subscriptions started or renewed on and after the issue of 1st April, 1950.

quality. It is a routine survey of past successes and failures, and a round-up of the state of the preparations for the spring sowing campaign. Praise and blame are distributed with meticulous precision ; careful lists are given of those districts in which, for instance, a failure to grow seed locally has led to shortages, or in which the distribution and storage of fertilisers have been unsatisfactory.

In spite of individual failures and shortcomings, a fairly bright picture is drawn of the progress of Soviet agriculture. In particular, last year's grain harvest of about 124 million metric tons exceeded the 1940 bumper crop. But this figure takes no account of the losses in harvesting which may amount to about 15 per cent, and much greater increases must be achieved if the increasing urban population of the Soviet Union is still to be adequately fed, if the three-year plan, begun last year, for developing live-stock production is to be fulfilled, and if the Soviet Union is to play the leading role in the world's grain markets which it seems likely to play.

The spring directive does, in fact, state that all the conditions for a further increase in grain yields in 1950 have been created, and all that now remains to be done is to improve the organisation. Presumably, this means greater and more efficient mechanisation. The directive reports that 22 per cent more tractors are available than last year, but at the same time it makes the usual complaints about the inefficiency and inadequacy of maintenance work, and once again reproves various government departments for their failure to supply sufficient spare parts. This increase in mechanisation helps to explain the recent change in agricultural policy which shifted the emphasis from small to large labour units. The directive stresses the need for " the consolidation of the brigade as the basic unit of production " ; it was for his failure to achieve this that Mr Andreyev was recently forced to make public apology.

Unlike last year's spring directive, this one makes no mention of the need to increase the communal property of collective farms which can only be done by persuading the peasants to give up their private plots. But this cannot be taken as any indication that the Government intends to give up its policy of gradually extending the collective economy until all private ownership of land is entirely eliminated. Four-fifths of the collective farms are stated to have gone over to the new Soviet system of ley-farming. This is believed to be very similar to the ley-farming which has long been practised in western Europe. Its wide and rapid adoption represents an important advance for Soviet farming and reflects the anxiety of the Government to secure a rapid increase in grain production.

West Indies Federation

The representatives of the West Indian colonies who met at Montego Bay two and a half years ago, and approved in principle the federation of their territories, appointed a committee to consider the ways and means of bringing this about. The committee, under the chairmanship of Sir Hubert Rance, has now published its report (Col. No. 255), which has appeared simultaneously with the report of the commission on the unification of the public services in the British Caribbean (Col. No. 254).

The committee, in accordance with the views of the Montego Bay conference, chose the federal constitution of Australia as its model rather than that of Canada. It discusses, therefore, a federation in which the federal government exercises those powers and functions—but only those—specifically assigned to it by the constituent units. The residual power would thus remain with the West Indian islands. This is inevitable, since the islands all have a long and famous history as individual colonies and have enjoyed varying degrees of responsible government. The wonder is that a colony like Jamaica, with a large measure of responsible government, should ever have agreed to the principle of federation, since it involves a linking up with far less advanced islands. There may even be a danger in an over-ready acceptance of federation if West Indians regard it merely as an easy way out of their economic difficulties. The committee recognises this danger and gives an explicit warning that

> Federation will not absolve the region from the necessity for physical and mental and moral effort—it may, if successful, help that effort to issue in greater productivity, more security and higher standards of living, than can the same effort exercised within the present political framework.

The point is important, for it is clear that none of the islands is at present within sight of the financial independence that can make self-government a reality. The committee, therefore, had to consider not only the relations between the proposed federal government and the different territories, but also those between the federal government and the Imperial Government. It proposes that grants-in-aid should be given to the federal government for distribution, but it recognises that so long as grants-in-aid continue the Imperial Government must exercise control over general economic and financial policy—which would be effected by the Governor-General's power to reserve assent to bills. In other words, federation does not of itself lead to dominion status or to fully responsible government. It can help towards it—but only if its constituents are willing to help themselves.

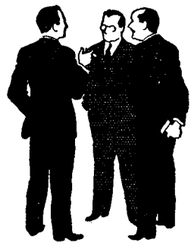
Equal Pay in London Transport

The London busmen have objected to the London Transport Executive's proposal to recruit women conductors on certain routes. It would be easy to understand their objection if there had been any question of paying the women at less than the men's rates. But the scheme, which in any case would be limited to a few areas of northwest London where shortage of staff is most acute, provides for the payment from the start of the full men's rate, and not, as under the wartime agreement, at 90 per cent of that rate during training and for the first six months of employment. This is equal pay, undiluted, and the familiar argument that women's cheap labour presents a threat to the male standard cannot be applied in this instance.

The men's case is, apparently, that the employment of more women would delay the introduction of improvements in pay and conditions, which alone would attract enough men to offset the shortage of conductors. They also contend that bus conducting is not a woman's job. This may be perfectly true, although the travelling public, who should be the final arbiter, would by no means agree with this judgment. But the argument comes a little oddly from a union which has always championed equal rights for women, and which actually resisted the employers' proposal to dispense with many women conductors after the wartime shortages had been overcome.

Behind this decision there lies, without a doubt, the men's resentment at the refusal of the London Transport Executive to concede the union's claim for sick pay, which the union substituted somewhat reluctantly for a straight application for more pay. London busmen have always had a strong, " militant " tradition—the prolonged Coronation strike in 1937 and the more recent disputes over standing passengers and Saturday overtime are examples—and there is widespread feeling that the new LTE is only the old LPTB writ large, and that nationalisation has made no difference to their conditions. But it is the unfortunate Londoners who happen to live in northwest London who will suffer by inferior services if the men persist in their opposition, and the Transport Executive must clearly put the interests of the travelling public first.



AOA Stratocruisers fly daily to USA

** You can now travel any day of the week to America by daily AOA Stratocruisers, world's largest, fastest, and most luxurious airliners. You dine on board and, after a "night-cap" downstairs in the lounge, you relax in comfort for your night's rest. Next morning you breakfast in New York, refreshed and ready for business. Only AOA offer you the facilities of 77 offices in USA, Canada and Mexico. You save 25% on special 60-day round-trip fares if you leave before April 1st. Bed-sized berths are available for an extra charge. See your local travel agent or ***American Overseas Airlines*** 35 St. James's Street London SW1 Telephone: GROsvenor 3955.

DO PILOTS TALK T.I.?

Those swooping palms, those turning wrists, more eloquent than words when flying men foregather . . . do *they* refer to TI? Rarely, if you put it like that. But when you consider that there is not a British plane in service which cannot refer to TI engineering for *something* valuable or vital . . . from precision tubes in engine and frame to aluminium skin, from oxygen bottles, components of oil-cooler or retractable undercarriage to pilot's seat or radio parts . . . who then can doubt that pilots talk TI?

The letters TI mean Tube Investments Limited, of The Adelphi, London, W.C.2 (Temple Bar 0271). They also stand for the thirty producing companies of the co-ordinated TI group, makers of precision tubes, of bicycles and components, of wrought aluminium alloys, electrical appliances, pressure vessels, paints, road signs, metal furniture . . . and essential mechanical parts for a thousand and one things which everybody uses.

Prevention of Damage by Pests Act, 1949

Prevention of Damage by Pests Act, 1949

For action before March 31st.

On March 31st, the Prevention of Damage by Pests Act comes into operation. To owners and occupiers of land and premises the important fact to note under this new Act is that it is *their responsibility to see that effective steps are taken to clear their land and premises and prevent any re-infestation by rats, mice, and insect pests.* This fact was emphasised by the Joint Parliamentary Secretary to the Ministry of Agriculture in the House of Commons when speaking on the Act (*Hansard, 15th July*, 1949).

Don't delay! Get your premises cleared AT ONCE.

The Ratin Service is the largest commercial organisation of its kind in the country. The employment by the Ratin Service of the latest scientific methods means that the natural cunning and suspicions of rats and mice are defeated, thus whole colonies are wiped out.

Write TO-DAY for our new folder explaining your responsibility under the Act and giving details of how the Ratin Service can clear your premises and keep them clear.

Advertising in the Soviet Union

Mr Mikoyan, the Politburo member responsible for food production and trade, has urged a development of commercial advertising in the Soviet Union. Startling as such a suggestion seems, it is typical enough of the Armenian, Mikoyan. He knows the United States, where he learnt much; he has long experience of international trade; and he has already successfully introduced many western techniques into the Soviet food industry.

A fairly crude form of advertising has been known to the Soviet public for some years. It has taken the form of neon signs on Moscow squares which publicise state loans and, latterly, luxury goods; there are also rather bald announcements in the newspapers. The further development of advertising, now that there are more consumer goods, is part of the drive to improve the "culture" of Soviet trade which, all too often, is a system of doling out irregular supplies of indifferent goods. If advertising is extended to the technical field, it will let factory directors know where they can best get the equipment they want, and it will help industry to overcome the difficulties caused by Soviet secrecy and the absence of good trade magazines.

Commercial advertising is, of course, as little in the spirit of Marxist doctrine as a gold-based currency or a highly developed system of piece-work. But the first law of the Politburo is to get things done and to strengthen their own country. Marx and Lenin can always be re-edited.

* * *

A Vote of Thanks

The National Thanksgiving Fund which was launched by the Lord Mayor of London this week embodies an imaginative idea. Over the past decade countless British families have received gifts of food and other tokens of kindness from individuals and organisations in the Commonwealth and in the United States. In so far as it is worth calculating so much generosity in terms of money, it is known that it totals at least £80 million. The idea behind the new Fund is to raise a sum of money which will enable the people of Britain to cast their gratitude in a permanent form. The money will be primarily devoted to developing a centre in London for students from the Commonwealth and the United States by expanding the present London House in Mecklenburg Square. This involves building a centre for married and women students and reconstructing existing houses to expand the facilities for men. The money needed falls not far short of £2,000,000, but if the appeal can be made to touch the imagination of the British people—as the Roosevelt memorial did—there is no doubt that it will be forthcoming. Moreover, to use the fund for such a purpose will go a long way towards overcoming one of London's worst problems—the inadequate facilities for the overseas student.

Shorter Notes

Correction.—In a Note on page 522 of *The Economist* of March 11th the figures for armaments being supplied by Great Britain to Egypt and Iraq in fulfilment of the Anglo-Egyptian and Anglo-Iraqi treaties were given as if these weapons had already been acquired. The 110 jet aircraft destined for Egypt will be delivered over a period of several years. So will the Hawker Furies (not jets) destined for Iraq.

*

Mr Aneurin Bevan, in view of his caustic remarks about the British press during the past few years, is the Minister whose views on journalism create the greatest interest among journalists. His address to the Institute of Journalists which took place this week had been awaited with considerable interest, since it was hoped that Mr Bevan would substantiate the charge that "the British Press is the most prostituted in the world" and would advance some constructive proposals as to what should be done about it. But Mr Bevan has a way of disappointing those in search of simple enlightenment, and nowadays he wa ks too narrow a political path to risk giving offence gratuitously. In the event he had nothing to offer beyond a general hope that the press would raise its standards, and an interesting special application of the principle of equal misery that "If Cabinet Ministers cannot have domestic privacy, then neither should the [newspaper] proprietors have privacy either."

*

A new treaty has been signed by the United States and Canada which will replace the out-of-date arrangements now regulating the generation of electricity from the Niagara Falls. At present a specific amount of water is allowed for individual power projects; the new treaty, regarded as a permanent one, reserves a certain amount of water to preserve the beauty of the falls and of the river below them, and divides the rest equally between the two countries, for use in producing electricity. It is calculated that, if the treaty is approved by the US Senate and the Canadian Parliament, it will enable the United States to develop 7.9 billion kilowatt hours of electric power a year, in addition to the 3.7 billion already obtained from this source. The American share will be mainly used in New England and the State of New York where industrial expansion is at present hampered by a shortage of electricity.

Sic Transit . . . .

It was with great grief that we learned . . . that that best natured of merchants, Mr Jacob Omnium, had "altogether retired from business"; and we were, therefore, led to infer that the ancient and greatly respected firm of Omnium, Dibs, and Rhino, of . . . Lombard Street, in the City of London, had been dissolved. We felt it a public loss, fearing that they would henceforth lose the amusement of the periodical circulars which that firm issued in the shape of letters from the senior partner . . . in which he had the happy knack of combining pleasantry with business, and good humour with misfortunes, whether they arose from a commercial crisis, a hurricane, or an act of parliament, so as to invest the dull details of sugar, coffee, and cocoa with an interest equal to one of Mr Charles Dickens's Christmas stories: they were entitled to the name of "*trade circulars made facetious.*" . . . But, however pleasing it may be at first sight to a man engaged in the active pursuits of business, to look forward to a period of quiet retirement, it is impossible to witness the termination of an eminent and ancient commercial firm, under circumstances however prosperous and honourable, without feeling the mutability of all human institutions. In a small way it is the fall of an empire—the end of a dynasty. And our sympathy for the retired merchant was only increased, when we saw that his last address, in place of being dated, as usual, either amid the lively bustle of Lombard Street, the gay leisure of Belgravia, or the rural repose of Roehampton, bore date from that dullest of earthly abodes, Upper Baker Street, where the monotony of the longest straight line of brick houses is only broken by an Atlas omnibus, and Madame Tussaud's exhibition. The active merchant of Lombard Street, resigning his "*correspondents and their commissions*" over half of our colonial empire—Lombard Street, and Belgravia, and retiring to Upper Baker Street, involuntarily called to our mind Louis Philippe, the Tuileries, Versailles, and Claremont.

Letters to the Editor

Sterling and European Payments

SIR,—Your article of March 18th on the status of sterling, "a currency in which about 50 per cent of the world's trade is conducted," raises the whole question of the wisdom of duplicating in Europe a function for which the International Monetary Fund was established under Anglo-American leadership in 1944.

Given the free convertibility of sterling plus a modest sterling area deficit with Europe, the aim of *general* currency convertibility would quickly become practical politics. The real task, linked with the sterling war-debt question, is to make sterling itself freely convertible for current transactions and agreed capital transfers.

M. Schuman has recently raised the whole issue of the finance of our common defence under Western Union, urging that the total costs should be pooled in accordance with the participants' respective resources. What is now needed in the general interest is a thoroughgoing recasting of the Atlantic and associated countries' defence finance on federal principles, not only in respect of our common defence to-day, but retroactively to cover the earlier stage, 1939-1945, of this same federal defence function.

On the basis of a medium-term funding agreement covering this earlier stage, it might well prove that America would emerge a sufficient debtor and Britain a sufficient creditor on international account to enable sterling to resume its full traditional role in world trade. Given the chronic unbalance in this trade, it is surely mistaken to view an operation of this kind as entailing any excise from the real American income of the years ahead.—I am, Yours faithfully, J. L. GIBSON

The Beeches, Gravelly Hill, Caterham

Are Refugees Safe?

SIR,—The betrayal of the secrets entrusted to Dr Fuchs has, as you say in your article of March 4th, profoundly disturbed all liberal-minded people, not only in Britain, but in the whole democratic world.

I consider your paper to be well-balanced by modern standards; however, I take the strongest possible exception to the remedial treatment suggested in your article. Why should all naturalised British subjects be penalised for the misconduct of one? Speaking from a personal point of view, I came to this country as a small boy before the war; in growing to manhood I have acquired (for better or worse) English manners, customs, the language, its way of life, and as a logical step in the sequence, British citizenship. For better or worse, like the vows of matrimony, I shall fulfil my oath of allegiance.

Secondly, the very dangerous generalisation of your article denies one of the most important fundamentals of the English judicature—the Rule of Law. If the hardly-won rights of individual liberty can so lightly be discarded in the very citadel of its birth, then my faith in the human race is indeed lost.—Yours faithfully, HENRY ADLER

40 *Kingston Road, Romford, Essex*

[The wording of our Note might perhaps have been more explicit. But if Mr Adler will read it again we think he will see that it was the Communists and the ex-Communists, not the refugees, whose exclusion from positions of public trust was being suggested for consideration. We should be very sorry if anybody thought that *The Economist* was advocating the creation of any new obstacles to the acceptance of foreign immigrants, as such, into the national life of Britain.—EDITOR.]

Television and Housing

SIR,—At a time when there is an imperative need to husband resources and restrict capital expenditure to essentials, it is astonishing that the Postmaster General should put forward a £75 million programme for new television stations. No wonder the country does not take seriously exhortations to economise when the Government set so lamentable an example of extravagance.

BBC boasts of wonderful new visual entertainment will not amuse the many unfortunate people still without a home in which to instal a television set. If the Opposition leaders had adopted this line of criticism during the Housing debate, they would not have laid themselves wide open to the charge of inconsistency and irresponsibility on which Government and Liberal speakers were quick to fasten.—Yours faithfully,

Larchfield, Churt, Surrey GEOFFREY BRACKEN

Africans in London

SIR,—In your article "Africans in London" of March 11th, you describe the conditions under which private students from Africa have to live in London and invite help from voluntary organisations. We are glad to be able to report one positive effort in that field. A large house, well furnished, and in a pleasant and central location, has just been purchased to create a home for this type of student. This will not be a hostel; it will be the opposite; a home in which every student will have the responsibilities as well as the many obvious advantages accruing to membership of a small and intimate community.

We think, with you and with many others, that the problem is acute and that it is urgent and important to find a solution, and believing that the scheme is constructive and practical, we have underwritten the financial responsibility. We invite co-operation from any of your readers who agree with us and who would like to help devoted young men in their work, which can be extended in the course of time.—Yours faithfully,

DOROTHY AND ROBERT MAYER

7 *Gloucester Square, W.2*

An Opportunity for Sociologists

SIR,—We would like to call the attention of your readers to the following project to enable European social research workers to visit the United States this summer and meet American social scientists. During the third week of June the American Association for Public Opinion Research and the World Association for Public Opinion Research will be holding their annual conferences in Chicago. Plans are being drawn up under which visitors from outside the United States to these conferences will have their fares and living expenses paid from American sources between their arrival in New York and their departure. This provision would also cover attendance at a series of two-day seminars at the universities of Chicago, Cornell, Columbia and perhaps one or two other universities. At each seminar the hosts will give a detailed account of the research on which they have recently been engaged and would discuss both their methodology and substantive findings.

It would help us greatly in securing funds for this plan if those of your readers who could take up such an offer would write to us as soon as possible. Applicants must be mature persons working currently in the field of attitude and opinion research and should provide details of their background, qualifications and recent work. This invitation is not limited to academic workers, and we hope that applications will also come from qualified civil servants and research workers in the commercial field.

Letters should be in our hands by April 8th and should be airmailed to either of the undersigned at 4901 South Ellis Avenue, Chicago 15, Illinois.—Yours faithfully,

CLYDE W. HART, Conference Chairman, AAPOR

MARK ABRAMS, Conference Chairman, WAPOR

Books and Publications

Drift or Disestablishment

"Church and State in England." By Cyril Garbett, Archbishop of York. Hodder and Stoughton. 320 pages. 15s.

"THIS book is an argument for some readjustment in the existing relationship between Church and State." Thus does Dr Garbett introduce a book which is certain to be influential within the Church of England and will, it is to be hoped, be read seriously by Members of Parliament. Dr Garbett's approach is historical, but he has a singular gift of making his history come alive and of showing its relevance to present-day problems. He has a strong affection and respect for some, but not all, aspects of the Church's heritage from the past, but he never slides into an easy sentimentalism. This attitude is exemplified in his remarks about the parochial system. Clearly he liked the days of his youth when each parish, however small, was a world unto itself, but he recognises that those days will not return. Therefore, the Church must make better use of its limited resources, must group together parishes where that is possible and must send its clergy where they are most needed.

The centre of Dr Garbett's argument is his conviction that the Church of England must be given greater freedom to manage its own affairs. Perhaps it was the rejection of the new Prayer Book by the House of Commons in 1927 and 1928 which has finally led many Churchmen to the same conclusion; for, however conscientiously Parliament may have tried to do its duty, the fact remains that

> the wish of the Church to revise its liturgy, expressed through its constitutional assemblies, was overridden by a majority which included many who were not members of the Church of England.

It is this ultimate control of the Church by men who are frequently not Churchmen, and may not even be Christians, which appears to many of its members—and understandably so—to be intolerable. Dr Garbett is ready to admit that the system does not work too badly in practice. A modern Prime Minister, for instance, usually exercises his power of appointing bishops with scrupulous attention to the Church's needs and wishes, but he may not always do so. A return to the conditions of the eighteenth century, when Whig governments chose bishops for their political reliability, is not quite impossible. Mindful of this danger, Dr Garbett believes that now is the time for the Church to make a bid for spiritual freedom. His own proposals are moderate in the extreme; they would loosen, without untying, the bonds which hold together Church and State. Their importance lies in his willingness to accept the consequences of their rejection by Parliament. He believes, and rightly, that if the Church puts forward proposals for reform which Parliament rejects, the only way for it to preserve its integrity is to ask for disestablishment.

This conclusion is the more impressive, as Dr Garbett is fully conscious of the implications of disestablishment. It would loosen the institutional bonds in virtue of which Britain is still a "Christian nation." It would leave the Church poor and weakened, one sect among other sects. The result might be the flowering of a spiritual renaissance, or alternatively it might be a further diminution in the Church's influence as it certainly would be in its scope. Dr Garbett is firmly opposed to disestablishment in principle—yet

> We shall never convince the world that we are in earnest unless we are ready, if need be, to purchase our freedom at a great price. To the last we shall hope that Parliament will give us the help we require. . . . Only if we fail, only if it is plain that all other roads are closed, must we reluctantly but firmly take the road to freedom through disestablishment and disendowment.

He believes, with reason, that a majority of Churchmen will agree with his general conclusions. Certainly they have found a temperate and firm spokesman.

Popski

"Private Army" By Lieut.-Col. Vladimir Peniakoff, D.S.O., M.C. Jonathan Cape. 512 pages. 16s.

THE rapid growth in the British Army between 1940 and 1942 of small independent units is a subject worth the attention of the military historian. What was it that brought these units into being? Was it just the need to improvise some form of striking force at a time when supplies and equipment were short? Or was it the invincibly amateur and anarchic approach of the British to warfare, which made officers leap at the chance of leading a force of their own? Or that influence of prewar experience, gained in small theatres like the North-West frontier, or among the hedgerows around Aldershot, that made British commanders ill at ease with large forces? In some cases, as in the splitting of divisions in the desert into brigade groups or Jock columns, they amounted to a serious military blunder, which Rommel exploited to the full with his own compact force. In others, and particularly in the long range reconnaissance and raiding work begun in the desert and carried later into Europe, they paid immense dividends.

Of these small forces which came into being in the Western Desert, the one which transplanted best to the European theatre was Popski's Private Army. "Popski" was the British soldier's version of Peniakoff, the name of the middle aged Belgian business man of Russian stock who formed and led it, and who has now written an excellent account of its history. In 1940 he began as an officer with the Libyan Arab Force. Later he spent some months in the Jebel Druse behind the Axis lines organising the Cyrenaican Arabs in a way which genuinely resembled T. E. Lawrence's own work. In the autumn of 1942 he then formed the PPA, which saw service first in the desert and then in the mountains of Tunisia and Italy. In the desert the PPA had, as Colonel Peniakoff hastens to state, been a mere learner, but in the mountainous battlefields of Italy it set its own standards and developed its own technique. Its major contribution to the tactics of the Mediterranean campaign from 1943 onwards was based on the Jeep. Colonel Peniakoff realised that this tiny but powerful vehicle had the same possibilities of surprise and mobility in mountainous country as had been gained in the sand by the special desert trucks of the LRDG or in an earlier war by Jeb Stuart's cavalry patrols. This possibility he proceeded to develop by meticulous organisation and care in the choice of men. "Improvisation and dash are foreign to my nature, unknown risks make me uncomfortable" he writes. It was this careful planning, he stresses, which not only brought off his greatest coups, but brought them off at such small loss that at the end of three years' bitter fighting he had to record only twelve dead among his men. He drove behind the Axis lines in Southern Italy and captured an entire enemy order of battle there; then he went over mountains, came down on Route 6 by Cassino and drove on to survey the outskirts of Rome eight months before the Allies fought their way there. Finally he operated as the chief land link with the Italian partisans in the pinewoods around Ravenna of Byronic legend. To win these successes at such small cost required "an endless conflict between my companions longing for carefree adventure and my own determination to avoid disaster."

Throughout the book there is the mystery of the author's own personality, which is as difficult to pin down as was that of Lawrence. What, for instance, is one to make of a man who, when his left wrist and forearm were smashed to pulp says "I was filled with a joyful peace, a tranquil certainty of fulfilment. I had been chasing a phantom right through the war and now, at last, I had come on to something solid. My wound was real and nothing could take it from me"? In the welter of war books this is one which must be read by anyone who is interested in that most baffling of enquiries—the discovery of truth about men at war.

The Negro-White Problem

"Negroes in American Society." By Maurice R. Davie. McGraw Hill. 542 pages. 38s. 6d.

THIS is a clear and unbiased account of what the author insists is not the Negro, but the Negro-white, problem in the United States. The book is designed as a textbook, setting the problem in its historical perspective and giving full details of the present legal position of Negroes in such fields as education, housing and civil rights. Like most people who have written on this subject, Professor Davie, a well-known sociologist, stresses the connection between the race problem and the general backwardness of the Southern States, where the majority of the Negroes live and where race tension is usually highest. Unlike Dr Gunnar Myrdal, who in his monumental work favoured a moral appeal to individuals to overcome personal and irrational prejudices, Professor Davie thinks that first the general environment of both Negroes and whites must be changed. He believes that the greatest hopes of progress lie in the gradually growing industrialisation of the South which should bring higher standards of living and of education to the whites as well as greater opportunities to the Negroes. But he feels that the real impetus towards change must come from outside the South, from the Federal Government, for even the most liberal Southerners tend to think entirely in terms of segregation. Professor Davie wishes to see the Negro problem submerged in other issues, as for instance it has been in the case of the Congress of Industrial Organisations, which has pursued a policy of non-discrimination in order to make its labour organisation more effective.

The book is most interesting when it is discussing the class feeling among the Negroes themselves, and their views on race relations. The educated Negro is the chief sufferer from race prejudice, because of the curtailment of his professional opportunities, yet this situation itself produces a vested interest in its continuance. The professional Negro becomes one of the élite amongst his own race, and is spared a certain measure of competition from whites of equal standing. Professor Davie also draws attention to the two great dangers of acquiescence and of over-emphasis which always confront the Negro leader.

Canadian Civil Servants

"The Canadian Bureaucracy." A Study of Canadian Civil Servants, 1939-47. By Taylor Cole. Duke University Press and Cambridge University Press. 292 pages. 40s.

IN this clear and readable book, the author has not concerned himself with the broad question of the relations between the public and Canadian governmental machinery, but has produced a well-documented study of the public employees themselves—how they are engaged, their employment conditions and problems, the laws governing them, and their relations with the federal and provincial governments. No book-length study of this kind has been made since Professor Dawson's "The Civil Service of Canada," first published in 1929. Although the present volume has little interest for the general reader, it should become a standard source of reference and information on the Canadian public service.

Under the heading of "Employment Problems," one of the most interesting in the federal Government is that of French-Canadian representation. Over 30 per cent of the country's population are French-Canadians, but their share of civil service positions, especially higher ones, is lower. This is a favourite subject of complaint by French-Canadian leaders of opinion. The main reasons given in reply are, first, that the standards of French-Canadian educational institutions are inadequate and that they do not train for many technical positions (the stress is still upon the humanities in the "classical education system of Quebec"). The second reason is that the competent and professional French-Canadian is not greatly interested in leaving his own province to work in Ottawa. The author's conclusion that this situation is improving is supported by a number of recent appointments of French-Canadian administrators to senior posts.

Trade Unionism has made little headway among the Canadian public employees, although there are, of course, civil servant associations. Nothing resembling the Whitley Council was created until 1944, and the Canadian version—the National Joint Council—has less power than the National Whitley Council; indeed the Canadian body has no executive powers that would impair the responsibility of Treasury Board or the Civil Service Commission.

Professor Cole, in his lucid account of wartime developments, stresses the role of the trained economist in the federal Public Service. The best of these constituted an informal "brains trust" which played such a large part in the formation of Canada's economic policies during the war, and in the transition to a peacetime economy.

Reference and Text Books

"Webster's New Collegiate Dictionary." G. Bell and Sons, Limited. 1250 pages. 50s.

THE sixth edition of this dictionary has been newly edited and has had much new material added since the previous edition was published in 1936. The definitions are well illustrated, both by pictures and examples. Particular attention has been given to technical and scientific terms. Changes in typography and general presentation make the dictionary easier to use than before, and both American and British spellings and pronunciations are given.

"The Bankers' Almanac and Year Book, 1949-50." Thomas Skinner and Waterlow. 1860 pages. 70s.

THE 105th edition of the Bankers' Almanac and Year Book provides again the world-wide survey of banks and banking institutions which makes this reference work unrivalled in the banking field. In this year's issue the German banking scene has been covered in considerably greater detail than proved possible in the 1948-49 edition. Fourteen pages compared with six pages last year are devoted exclusively to German banking and such details as are by now published in Germany on individual banks (there are still no balance sheets) appear in the International Banking section of the Almanac.

The Bankers' Almanac is of course primarily used as a reference book to obtain information about individual banks. Yet other sections of this work richly reward reading. The record of bank amalgamations in the United Kingdom, for instance, provides fascinating material for the historically minded reader, and the student of monetary history at home or abroad finds within the compass of a few pages statistical material nowhere else available so readily.

"Miscellaneous Accident Insurance." By J. B. Welson, Pitman. 227 pages. 15s.

THIS student's textbook in the Pitman series on insurance subjects should cover most of the ground to satisfy even the more exacting of the Chartered Insurance Institute's examiners. It deals clearly and comprehensively with the wide range of risks insurable under the miscellaneous accident heading. Plate glass, hail storm, private dwellings, the various forms of contingency insurance, credit and contract guarantees, are all dealt with in sufficient detail for the student's purpose. Yet this is not a dry textbook and the general reader, provided he is excused the more technical sub-sections, could look upon this book as a useful reference work on accident cover granted by the tariff companies or Lloyd's. True the businessman would not normally resort to a textbook; he will approach his insurance agent or broker. But the two parties could at times speed up matters if the business community had more knowledge of insurance matters. One practical point that springs to the reviewer's mind on having read this book: how many householders or owners of jewellery have adjusted their policies to meet higher replacement costs including Purchase Tax?

"Balance Sheets and the Lending Banker." By J. H. Clemens. Europa Publications. 197 pages. 12s. 6d.

MOST previous studies of the extent to which analysis of company balance sheets can be prayed in aid by those responsible for authorising bank loans have tended to concentrate unduly either on possible traps in the figures (when the studies have been written by accountants) or on the way to gauge the prospects of repayment from the break-up value of assets (when the studies have been written by members of the ultra-cautious tribe of bankers). Since a banker who makes an advance does not usually expect to obtain repayment only by selling up his customer, there is obviously a void in banking literature here. The explicit purpose of Mr Clemens' book is to fill it. He attains this limited objective with admirable clarity and skill, but it seems a pity that he has refrained even from summarising the more familiar points on break-up values and accounting technique which he presumably regards as outside the periphery of his subject. His book can justly be called an indispensable addition to any well-stocked banking library, but it cannot really claim to be a complete text-book—though this is a field in which a complete text book is still urgently needed.

"Design of Accounts." 3rd Edition. By F. Sewell Bray and H. Basil Sheasby. Oxford University Press. 372 pages. 15s.

THIS book made an important mark when it first appeared in 1944. It stemmed from work originally undertaken by the Incorporated Accountants' Research Committee, and was remarkable both for the lucid and penetrating comments of the authors on the principles of design in accounts and also for the many specimen forms of accounts which have proved to be an invaluable guide to management in the presentation of intelligible accounts. The third edition is more than a formal revision, for it takes into account the many and profound changes in accounting requirements resulting from the Companies Act of 1948.

"Studies in Income and Wealth." Volume XII. Conference on Reseach in Income and Wealth. National Bureau of Economic Reseach, New York. 578 pages. $6.00.

THIS formidable addition to an impressive series of studies, descriptive and statistical, is concerned rather with the technique and terminology of factual economic research in the field under survey rather than with the tangible results of that research. It is consequently of interest to a strictly limited category of professional economists and econometrists. The conference of whose proceedings it constitutes a record was convened to study the national wealth from what is, in modern times, a relatively unfamiliar angle—that of assets rather than income—and found its energies largely absorbed in the effort to establish a common ground of concept and expository method. The aim of a "consolidated national balance sheet with supporting sector sheets" remains a long way ahead.

"Colliery Year Book and Coal Trades Directory, 1949." Louis Cassier Company. 956 pages. 25s.

THIS is an immensely detailed and comprehensive assembly of information for coal traders and for students of the coal, gas and power industries. The directories cover the official and commercial sides of the industries, and the statistical tables give the fullest possible survey of British coal output in the past and the present, the character and equipment of the mines, the factors influencing production and productivity, and the export trade. They also provide a valuable comparative picture of coal mining in Britain and the principal coal-producing countries of the world.

"F.B.I. Register of British Manufacturers, 1949-50." 22nd Edition. Published for Federation of British Industries by Kelly's Directories and Iliffe and Sons. 807 pages. 42s.

THIS is the official directory and year-book of the Federation of British Industries, containing a full list of members (nearly 6,000 firms), and their addresses and the locations of their works and their products. Some pains have been taken to make the directory helpful to overseas buyers; of interest from this point of view is the list of members classified under the products and services they provide, and the list, which might usefully be fuller, of brands and trade names.

"Industrial Australia." The Union Bank of Australia. 78 pages.

A FACTUAL guide for "those who wish to take part in the future industrial expansion of Australia either by setting up a factory or by acquiring an interest in an existing Australian concern."

Take up DRAWING and PAINTING

and forget the cares of business

Men and women of all ages have learned to Draw and Paint with pleasure —and profit—by my postal tuition. It is the ideal Hobby. Pupils progress at their own pace with individual and personal guidance. Many famous Artists trained by these very methods. One exhibitor at the R.A. and Paris Salon took up Art when over 40. Another pupil writes:—"It amazes me that one can learn so much by post . . . I was scared of pen and ink, of drawing trees, and petrified at the thought of attempting wash drawing—until I read your article and 'had a go.'"

Free illustrated Brochure describes all Beginners' and Advanced Courses. Send for it today to Percy V. Bradshaw, Principal,

London Travel Survey 1949

A detailed and factual account of the travel habits of those who live within some 15 miles of Charing Cross. The methods used to ensure representative interviewing are fully explained, and the statistics from which conclusions are drawn are given in 19 analytical tables.

'a valuable sample survey . . . a mine of interesting information.' THE ECONOMIST

Obtainable, price 7s. 6d., from The Publicity Officer, London Transport, 55 Broadway, London, S.W.1.

A GOVERNMENT PUBLICATION

Problems of Social Policy

by RICHARD M. TITMUSS

The Second of the Series of Civil Histories of the Second World War.

The origins and development of Government policy concerning three main war-time social problems—the evacuation of mothers and children, the work of the hospital services and the social consequences of air attack—examined against the background of the pre-war pattern of society.

Published jointly with Longmans, Green & Co., Ltd.

British Airmanship

SOMETHING TO BE PROUD OF

The past 30 years have seen not only the development of British airlines from the first London-Paris service to a vast network covering nearly 70 countries, but also the steady maturing of something beyond machines and scientific progress. Throughout Britain and the world this has come to be known as British Airmanship and already it has earned a significance comparable with that which traditionally attaches to British Seamanship.

British Airmanship sums up the reputation for skill, enterprise and reliability which in just over a generation of air travel has become inseparably associated with British airmen — something, indeed, to be proud of.

AMERICAN SURVEY

Washington Loyalties

(From Our American Staff)

THE March issue of the *Atlantic Monthly* contains an article called "Modernise the GOP" by Senator Henry Cabot Lodge of Massachusetts, a serious attempt to tell the Republican Party what it must do to be worthy of power again. No sooner was it published than the unfortunate Senator found himself involved in the uncongenial job of defending the tactics of one of his less reputable Republican colleagues who was repeating, in its most irresponsible form, one of his party's oldest manoeuvres. As one member of the sub-committee hearing Senator McCarthy's charges of widespread disloyalty in the State Department, he finds himself compelled to pretend to believe that these are serious charges and worthy of consideration. He has had the good sense to be absent from most of the hearings, leaving his party's representation to Senator Hickenlooper, who long ago proved that he has a digestive system which can convert gossip into damning evidence. But Senator Lodge will soon have to take up a more positive position.

Senator McCarthy is the young man elected in 1946, in what must be accepted as a moment of aberration, by the voters of Wisconsin in the place of Mr Robert M. LaFollette. He appears to have made his present appearance in the limelight rather by mistake. It is standard practice for middle-western Senators to make windy speeches about "subversives in the State Department," and little notice is ever taken of them. But Senator McCarthy's staff, in preparing his speeches for a recent tour, went into overmuch detail in their documentation of stale accusations and exploded myths. They made him say that there were 57 card-carrying Communists in the State Department. Encouraged by the publicity he received, he spent six hours in the Senate giving details, but not the names, of 81 (instead of 57) "bad security risks" (instead of card-carrying Communists). This week the names of the 81 were at last produced.

The Senator's method of defining a bad security risk is a fascinating one and new to all but constant readers of the *Chicago Tribune*. It is something more tenuous than the normal theory of "guilt by association," since the only association needed to establish guilt is that of association in the same story in the *Tribune*—or, in this case, in the same statement before a committee. (Judge Kenyon, one of his first exhibits, had never laid eyes on 28 of her "Communist associates.") "Winston S. Churchill is a member of the Church of England," McCormick-McCarthy evidence would say, "one of whose high officials is an admitted fellow-traveller, the Dean of Canterbury. He was also a member of another organisation, the British House of Commons, during a period of fifteen years when a known Communist, William Gallagher, was a fellow-member." During the war, Churchill joined another organisation, "The Big Three," and attended all its meetings: one of the original members was a known Communist, Joseph Stalin. At that time also he offered the Government of Soviet Russia "any technical or economic assistance which is in our power and which is likely to be of assistance to them." He is also a member of the Conservative Party, another of whose members, called Maclean, served for some time on the staff of General Tito and wrote of him that "he possessed energy, determination and intelligence . . . a considerateness and generosity constantly manifesting themselves in a dozen small ways . . . a surprising readiness to see two sides of a question." Churchill, who is an escaped prisoner himself, wrote to this Tito, knowing him to be a Communist, a letter in which he "made it clear that he regarded him as an ally and as such promised him all possible help."

★

This is no exaggeration of the methods (which could hardly be exaggerated) of the man whom Mr Marquis Childs has called "this 10-cent store Robespierre." When faced with the sub-committee's demands for his evidence against the 81, Senator McCarthy gained time by bringing up eight new cases, only two of which concerned State Department employees, and handing a list of 25 more suspects to the chairman—"with not even one sentence of charges against them," as the chairman remarked. Mr McCarthy needed, he said, "time to document" the original group —which presumably means time to find something with which to support his charges. So far he has proved only one thing—the assertion of his first victim, Judge Dorothy Kenyon, that he was a coward. When Miss Kenyon appeared to be questioned, Senator McCarthy had neither the manners nor the courage to be present. But he has given the country a new definition of the word "loyalty." A loyal member of the staff of the State Department is, to him, one who gives confidential information about his Department to opposition members of Congress.

The hearings had not been long under way before it became obvious that the Senator himself knew very little about his subject, since he mispronounced well-known names, accused (anonymously) one of his party's best underground sources and praised, in Case 41, the same individual who had been accused, in Case 14, of shielding Communists. Indeed, his naïveté is spectacular. He appears, as do some other Republicans, to believe that a Russian spy would join every Communist and pro-Russian organisation in the country. In fact, one who knew his job would join the Republican Party, get himself elected to Congress and spend his time harrying the Administration until it became impotent

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

to act in the face of Russian expansion. He would, as Dr Philip Jessup pointed out, behave exactly like Senator McCarthy.

The Senator himself is unimportant. What he and his friends are doing to the State Department is not. For weeks a number of high officials have spent their entire time trying to keep up with his shifting charges and changing targets. The morale of officials on all levels is suffering ; no matter how clear their consciences may be, some five dollar contribution to the feeding of Basque refugee children twelve or thirteen years ago may suddenly become the basis of a charge of treason. And there is always the haunting fear that, somewhere in their desperate search for gold, the McCormick-McCarthy team may find something overlooked by the Federal Bureau of Investigation and the Department's own staff. If that were to happen, the hundreds of innocents who had been libelled would be forgotten in the wild chase after another Alger Hiss. And the harm done to American foreign policy would far outweigh anything gained by the unmasking of some minor traitor.

All this Senator Lodge must know well ; he must also know that his colleague is playing with the reputation of his country's Foreign Service in the hope of thereby destroying the public's confidence in Mr Acheson and reaping partisan advantage. Senator McCarthy is by no means the only Republican who is willing to do this—as is proved by Senator Wherry's fantastic statement that Mr Acheson is a bad security risk and by the remark, from the chairman of the Republican National Committee, that "spies infest the government of the United States." Senators McCarthy and Wherry may rant about the danger of Communism ; Senator Lodge knows how precarious the western position is and how much more precarious such performances can make it. When the investigation is complete—if it ever is—the sub-committee must report its findings. If Senator McCarthy has by then produced no more solid evidence than he has yet shown signs of doing, Mr Lodge's attitude will be watched with anxiety by all those who believe in a two-party system and in the sincerity of his attempt to rebuild the Republican Party. What Senator Hickenlooper, the sub-committee's other Republican, does hardly matters, but if Senator Lodge puts party before country and writes or signs a minority report excusing the McCarthy antics in the interests of the November election campaign, the prospects for a firm and decisive American foreign policy will be seriously weakened. His is not a pleasant choice.

American Notes

ECA Misses the Omnibus

The Senate Foreign Relations Committee does not see why Europe cannot spend its Marshall dollars and save them too. It has approved Senator Connally's amendment to the Economic Co-operation Act, declaring that Congress does not mean recipients of Marshall aid to discriminate against American business, a warning directed mainly against Britain's attempt to save dollars on its oil purchases. And it has also approved Senator Lodge's contradictory amendment, which is much more to ECA's taste, telling European countries to reduce their dollar purchases whenever possible, in order to ease the burden on the American taxpayer—and the foreign competition threatening the Senator's constituents. Mr Vorys of Ohio is the sponsor of the most important amendment approved by the House Foreign Affairs Committee, which requires that $1 billion of this year's European recovery funds should take the form not of cash, but of surplus farm commodities for which the American taxpayer has already paid. Since the recipients of aid are expecting to spend some $1.7 billion this year on agricultural products, most of which are in surplus supply, they can have little immediate objection to Mr Vorys's amendment.

Mr Vorys maintains that his purpose is to give Congress an excuse for not reducing the total authorisation ; the House Committee appears likely to follow the Senate Committee's unanimous example and grant the $2.95 billion for which the Administration asked. But this does not necessarily mean that Congress as a whole will either authorise or appropriate the full amount. The Senate may complete action on the ECA authorisation in time for it to catch up with the omnibus appropriation Bill, which it has missed in the House, on the second stage of that Bill's Congressional journey. The House Appropriations Committee has acted with unexpected speed on this novel Bill, which provides funds for the coming fiscal year for all the permanent government agencies that do not, like ECA, have to beg Congress for fresh permission to exist each year. In the past, nine separate appropriations were required and the omnibus experiment, by enabling Congress to consider all expenditures simultaneously, is expected to be more efficient and more economical.

The House, and particularly its Republican members, hoping for a cut of at least $2.5 billion in the President's estimated expenditure of $42.4 billion, will be disappointed that its Appropriations Committee has only managed to pare $1.5 billion off the $30.5 billion requested for the domestic and defence agencies, a 4 per cent reduction instead of the much talked-of 10 per cent. The recommended cuts are spread over all the agencies concerned, but about $200 million comes from the Army's civil functions, the polite name for the rivers and harbours pork barrel. Even if the House can restrain itself from filling this up again and from restoring some of the other cuts, it will still be very tempted to chop the missing $1 billion off ECA, where it will be least missed by American voters. The temptation will be especially great since the amount asked for ECA and other foreign programmes is roughly equal to the anticipated deficit, which otherwise can only be reduced by unpleasant, and unlikely, increases in taxation.

* * *

Acheson in Jeopardy?

The rumours that Mr Acheson was about to be thrown overboard to appease Congress have forced Mr Truman to reaffirm, in the most vigorous terms, his confidence in the Secretary of State and to deny any intention of replacing him. Such solidarity is lamentably lacking in Congress, where Mr Acheson's compassionate and candid attitude toward his former friend, Mr Alger Hiss, has made him a political untouchable, even to Administration Democrats. Mr Acheson is not universally popular inside the Administration either, particularly since he thwarted the ill-conceived Formosan adventure, and this may partly account for the steady stream of misrepresentation, not only from his Congressional enemies, but in the Hearst and McCormick press, which chants daily "Acheson must go."

This chorus has unnerved even the stalwarts, whose eyes are fixed on their own election prospects. Senator Lucas, the Senate majority leader, for example, has conspicuously failed to come to Mr Acheson's defence ; he represents Illinois, the home territory of the *Chicago Tribune* and is likely to be opposed by Mr Everett Dirksen, a once-reformed isolationist who has suffered a bad relapse and is campaigning against the State Department's "softness" to Communism. This charge is based, not only on Senator McCarthy's accusations that the Department is riddled with Red sympathisers, but upon an intellectually dishonest piece of hindsight: the argument that because Mr Acheson believed, three years ago, and in very good company, that an agreement with Russia was desirable, he is not fit to direct American policy today.

Yet in other quarters Mr Acheson is attacked precisely because, in the light of experience, he has concluded that, at present, the hope of a general agreement is a dangerous will-o'-the-wisp. His two speeches in California last week were designed to discourage any surrender to wishful thinking and clear the way for measures to deal with the Communist threat in Asia and the dollar gap in Europe.

Fourteen months ago Mr Acheson's appointment was hailed, not only as Mr Truman's best, but as a guarantee of smoother relations between Congress and the State Department ; now it is said that if his appointment had to be confirmed again it would be turned down. It is further argued that, in the American system, the Secretary of State must either carry political guns himself, as Mr Byrnes did, or be able to depend upon other big battalions in the Senate clearing a way for his programme. Mr Acheson's usefulness is unquestionably impaired by Republican spite and Democratic cowardice. But Mr Truman is unlikely to let him go. The President's loyalty, even to the least of his subordinates, and particularly when they are under fire, is well known. Moreover, Mr Acheson would leave a vacancy that would be hard to fill satisfactorily, while his departure would suggest to the suspicious that there was some fire behind the Congressional smoke-screen. Abroad it would revive all the old fears of the instability and irresponsibility of American leadership ; in the departments it would damage morale even more than the present campaign of vilification has done.

* * *

No Co-operation for Housing

Today it is in the middle-income group, earning between $2,800 and $4,400 a year, that the homeless or inadequately-housed are most often to be found, since existing housing legislation helps mainly the poor and the fairly rich, and since building costs are still prohibitive. The middle-income voter is often the unattached voter, and the Democrats would naturally like to win his gratitude : the Administration proposed to do so by an experiment new to America, government loans to housing co-operatives, on such easy terms that a $10,000 mortgage would cost only about $32 a month instead of the usual $63. Congress, however, failed to approve these proposals at its last session and the conservative coalition of Republicans and Southern Democrats, with cries of "Socialism," has now secured their rejection by both Houses, in spite of a personal appeal from Mr Truman. The Administration will probably leave the matter until next year, in the hope that the new Congress will be more co-operatively-minded. The present House is fairly sure to do as the Senate has already done, and approve the rest of the Administrations' Housing Bill. It extends existing programmes of the Federal Housing Administration for insuring mortgages on apartment houses and on private homes, but this is done on terms which, according to the government, are out of the reach of middle-income families.

This vote against aid for housing co-operatives was a severe political defeat for the Administration at the hands of the real estate lobby, but there is an arguable case against the proposals, quite apart from their cost. Spokesmen for the Federal Reserve Board had testified that the scheme would stimulate inflation by adding to the flow of cheap money ; modifications of its mortgage provisions, introduced to meet their objections, did not go very far. The proposals, by promoting the demand for houses, would also add to the pressure on building costs and might push them still further above the heads of the middle-income group. Finally, encouragement for the building of even more houses during the present construction boom might mean that the building slump, if and when it comes, will be unnecessarily sudden and severe.

The Administration's enthusiasm for the middle-income scheme is partly based on a feeling that it would be prudent to have new weapons against deflation ready to its hand. It insists, in the face of an unprecedentedly high rate of housing starts in January and February, that a decline in residential building is in sight, unless the government steps in even further than at present, and that the country needs 1,500,000 new houses a year for several years to come, a rate of construction far above last year's record of 1,000,000. Nevertheless, the housing shortage in general now seems to be a local rather than a national problem, acute only in certain big cities, New York in particular. As a result, Congress will probably give the real estate lobby another victory, by allowing rent control to die a natural death at the end of June, although the Senate Appropriations Committee has not yet succeeded in its attempt to kill it off prematurely by starving the rent control agency of funds.

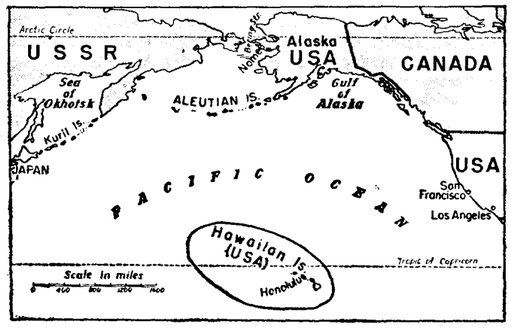
Rain to Order

The New York water crisis still persists. Bulletins are published almost daily in the city's newspapers, and travellers to the great metropolis report that it is almost as difficult to obtain a glass of water in a restaurant there as in the wilderness of London. The supplies in the reservoirs have increased from last autumn's low of less than 34 per cent of capacity to 50 per cent, but this is far less than the 92.3 per cent they contained in March last year. Unless April showers make up for a year of inadequate rainfall, next summer, presumably to be as hot and dry as usual, will have to be faced with uncomfortably low reserves.

The city has decided, however, to attempt to rule the elements and to make its own rain. The Commissioner dealing with water supplies, the Mayor, and the Board of Estimate, which has voted $50,000 to finance a six months' experiment, have all been convinced that it is worth trying to induce rain by seeding the clouds with silver iodide or dry ice. An electricity firm in California reports that it has used this method since January, 1948, to fill reservoirs supplying its generating plant. But the head of the United States Weather Bureau, who conducted experiments last year with the Air Force and is planning new tests in Florida this summer, still remains to be wholly convinced. The difficulty is to know whether the shower would not have fallen without artificial help. The legal position also promises to be complicated. The Mayor of Albany has already protested that rain made to fall in the Catskill or Croton watersheds will be partly filched from Albany's natural supplies. The State Legislature is considering a Bill which will authorise the experiments and exempt the city from any damage suits that might follow them.



This unconventional method of meeting New York's water shortage will, if it is successful, have the great advantage of providing immediate results. The other scheme, of tapping the Hudson river, which is also being considered, would take over a year to complete, and would then need constant supervision to ensure the water had been sufficiently purified. It would also require the building of new aqueducts, and the city does not wish to incur any great expense for this scheme as all the new reservoirs planned for the Delaware watershed should come into active service by 1956, bringing an additional 540 million gallons a day to New York.

The save-water campaign, with its fines for people who wash their cars with the precious liquid, and attention to leaking taps, has, it is calculated, saved nearly 32 billion gallons, or about three weeks' supply. But the city is still reluctant to adopt the most obvious remedy of installing water meters and making citizens pay for the amount they use instead of a flat rate which is generally included as part of their rent The meters would be very expensive to put in, and it is also felt that New Yorkers have been spoilt for so long that the political results of such a measure might be disconcerting for the city administration which sponsored it.

Fifty in 'Fifty?

The House of Representatives has voted to allow both Alaska and Hawaii to join the Union of 48 States which has not elected a new member since 1912. It is, however, improbable that Congress will have to decide how to arrange 50 stars on the flag before the coming Fourth of July, as the Senate has not yet even planned hearings on the fitness of these two territories for statehood. The present Congress is unlikely to admit one without the other, since Alaska is expected to send a Democratic delegation to Washington and Hawaii a Republican one. Alaska, twice as big as Texas, will have only one representative, Hawaii two, but every State, whatever its population, has two Senators. This explains the coldness of the welcome which Congress, and particularly the Senate, extends to new applicants for membership. Congressmen do not see why Alaska, with less than 100,000 residents, should have three spokesmen, while a Congressional district with 300,000 inhabitants has only one (and a small share in a Senator). Senators representing 14 million New Yorkers or 8 million Ohioans find it unfair that 500,000 Hawaiians should also elect two Senators. But it is the Founding Fathers who are to blame for this, not the Hawaiians or the Alaskans.

There are more people in Alaska than there were in some other territories when they became States. Hawaii has more inhabitants than several existing States—Vermont for one—and believes that it was promised statehood when it was annexed over fifty years ago. Failure to keep that promise would certainly provide ammunition for the Communist agitators whose influence in Hawaii is one of the excuses for

Congressional opposition to statehood. In fact, the energetic Hawaiian Legislature has shown itself well able to deal with Communism. The islands have also been most successful, as was proved during the war, in integrating their mixed population, made up in roughly equal proportions of whites, Japanese and other races (including Hawaiians). But Southerners in Congress naturally have no desire to debate with Hawaiian representatives who know from experience that racial equality is a practical proposition.

Prosperous Hawaii costs the US Treasury less than it pays in taxes and therefore has a particularly strong case against taxation without representation: its present representative in Congress has no vote. Alaska's obvious poverty is due more to lack of development than to absence of resources. As a State it would be able to borrow and would also be eligible for federal grants-in-aid, particularly for the highways which it needs so badly. Its potentialities would also receive more attention, both in Congress and in the country, and from past experience it appears likely to make rapid progress once it becomes a State. Alaska is not only the home of the national emblem, the bald eagle, but the only part of the American continent from which Russia can be seen on a clear day. Its airfields are an essential part of the national defence and their present unsatisfactory condition arises in part from the economic and political weakness of Alaska as a whole. Hawaii, the "crossroads of the Pacific," 2,400 miles distant from the west coast, is also vital to American security, which today demands bases far beyond the country's boundaries. In the air age there is little force, whatever Congressional opponents of statehood may argue, in the contention that the honour should be given only to territories actually adjoining the United States.

* * *

Half-way to Hoover

If Congress accepts the 21 reorganisation plans submitted last week by the President, it is estimated that nearly half the reforms in the government advocated by the Hoover Commission will have gone into effect. Either House may turn down a plan within 60 days; of last year's seven, only one, to create a Department of Welfare, was defeated. This group, though it does not touch such explosive issues as the rivalry between the Army Engineers and the Bureau of Reclamation, inches forward into more disputed territory than last year's batch. The Citizens Committee for the Hoover Report believes its reception may determine the future of the whole report. For this reason the Administration may later regret having, in two controversial cases, rushed in where the bi-partisan Commission feared to tread.

Many of the present proposals implement two main themes of the Commission: that Cabinet officers should be masters in their own houses, and that the day-to-day administrative work of the independent regulatory commissions should be entrusted to their chairmen, rather than left to "plural bodies" by their very nature unsuited to take executive action. The Federal Bureau of Investigation, for example, would lose its almost complete independence of the Attorney-General. Other recommendations put more flesh on the bones of the Department of Labour, picked almost bare when the Republicans controlled Congress.

*

More dispute is expected over the proposal to abolish the Maritime Commission and turn its functions over to the Department of Commerce, for the Hoover Commission, while recommending that the business of building, chartering, and selling ships be separated from its regulatory functions, took the view that the bi-partisan regulatory commissions, free of immediate political control, have a unique service to render. There are nine of these bodies, but the Maritime Commission has lost so many friends and so much influence, by its subservience to the shipping interests, that Congress is considered unlikely to challenge Mr Truman on its behalf.

The same cannot be said with assurance of the decision to abolish the post of General Counsel to the National Labour Relations Board, for this step would, in effect, repeal part of the Taft-Hartley Act. It was Senator Taft who originally decreed that the prosecution of labour cases under the Act should be separated from the judicial functions of the Board and gave the Counsel certain powers that the Board cannot overrule. By appointing to this post Mr Robert Denham, a nominal Democrat more devoted to the niceties of the Act than many Republicans, Mr Truman assured an acrimonious conflict between the Board and its Counsel and a demonstration of the unworkability of the arrangement. The unions have always hotly opposed Mr Denham. The investigators for the Hoover Commission criticised the provision as an "unstable" one, but opposed returning the job of prosecution to the Board; this, in the view of other critics, would make the Board prosecutor, judge, and jury. Senator Taft last year consented to reduce the power of the Counsel, but he is reported to have repented of his moment of weakness and is said to be determined to lead the fight to save Mr Denham's independence.

THE WORLD OVERSEAS

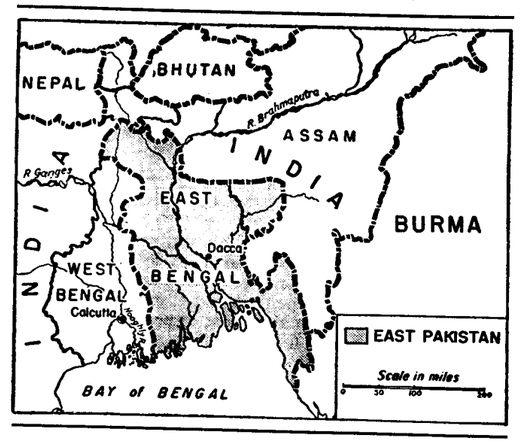
Bengal Dynamite

(From a Calcutta Correspondent)

LAW and order have been restored in Bengal; only an occasional incident now occurs. But as yet there is no peace, only a tense truce in which any incident might set off a chain reaction of murder and loot. The restoration of law and order is therefore not enough. The minorities, and especially the badly shaken Hindus of E. Bengal, must be made to recover their confidence and their feeling that they are full and wanted citizens. Until they do, the Bengal situation will continue to contain all the potentialities of an explosion greater even than that in the Punjab in 1947.

It is significant that the total casualties in the last three months have not been large. In India they do not go far into three figures, in Pakistan they do not go far into four; on the most unfavourable estimate the total figure is less than the 5,000 killed in August, 1946, in Calcutta, when there was still British Rule in India. But the 1946 riot created no refugees, while today 130,000 refugees have arrived in India and keep on coming at the rate of 5,000 a day, and in Pakistan the Chief Minister of E. Bengal says that 116,000 refugees have arrived from India.

It has thus become painfully easy, in both countries, to turn respectable people overnight into homeless wanderers, whose tales of woe are too readily believed and magnified. But while the danger is great on both sides, for reasons often beyond Pakistan's control, there is more danger in Pakistan than in India for the minorities.



Muslim Confidence in India

India is a secular state. The preamble to the constitution talks of justice and liberty and does not mention Hinduism. The doctrine that Hindu and Muslim are one is a cardinal tenet of the Congress. One quarter of the Muslims used to vote Congress and they therefore still have leadership and an ideal despite the dissolution of the Muslim League in India; there are two Muslim ministers at the centre and several in the Provinces, the inspector general of police in Bihar is a Muslim and so on. That the Muslims have fair confidence in India is indeed shown by the return of 300,000 from W. Pakistan and by the very large emigration from E. Pakistan into Assam since 1947.

Pakistan, on the other hand, is a state deliberately built on Islam. The League was specifically a Muslim League, there is a widespread demand that the constitution should be based specifically on Islam's principles. There is, therefore, a double difficulty in assimilating the E. Bengal Hindus into the body of Pakistan. It is very easy for a Muslim public, which knows how bitterly and almost unanimously opposed the Hindus were to the idea of Pakistan, to see a fifth column inside every dhoti.

The recent incidents have shown that even the Muslims of W. Bengal have been shaken; one sees hardly a fez in Calcutta (the Muslims now go bareheaded) and many factories are hit by the departure of key employees, such as boilermen. In E. Bengal it is even easier to set off the Hindus in panic flight, partly because of certain stupid rather than devilish actions of the E. Bengal and Pakistan Governments. One example must suffice. The incidents which started the trouble occurred in Khulna and Rajshahi in mid-December. By the beginning of January there were 15,000 refugees in India; yet the E. Bengal Government only issued its version at the beginning of February, and when the Hindu Members of the Assembly tried to discuss what had happened in the House, their motion was disallowed by the Speaker, and they were treated as virtual traitors.

It is only fair to say that, after a bad start, the Government of E. Bengal has been firm. It has used its troops and police, it has clamped on curfews, it has in fact succeeded in restoring order. The Government of W. Bengal has been quicker and even firmer; they have not been afraid to emasculate the great Hindu festival of Holi to reduce trouble; their communiques may have erred in the usual governmental way towards understatement but they have been informative and fair. Nehru's two visits to Calcutta have helped to allay the tension and Liaqat Ali Khan's forth-

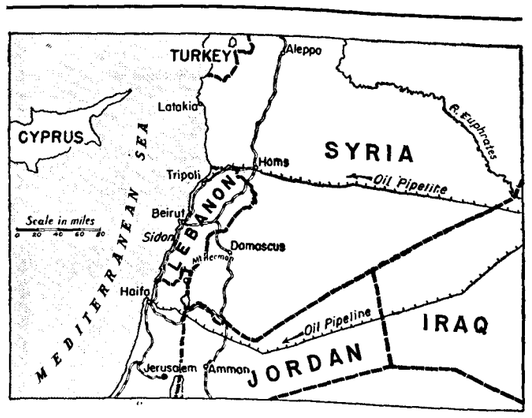
coming visit to Dacca should be of equal assistance. It is unfortunate, however, that the Pakistan Government's remoteness from the scene of action led Liaqat to refuse Nehru's suggestion of a joint tour.

However, past actions, except as a warning for the future, are not important. What is important is that, unless the confidence of the E. Bengal Hindu is restored, there will be a mass migration from E. Bengal. One and a half million came in 1948, and today the numbers are liable to be much larger because confidence has been shaken again after it had been restored—hardly any refugees came in 1949 and the present influx is therefore of people who had decided that they could live in Pakistan. If that happens, all the efforts of the governments in India will not suffice to protect the Indian Muslim against refugee vengeance and local emotions. There would be the same danger on the other side were there to be a mass migration of Muslims from India; but at present that risk is very much smaller.

The fears of their minority have indeed made the E. Bengal Government the Cæsar's wife of the subcontinent. This is true, whatever their responsibility for the present crisis. They are in a position where they have not only to be fair, but to convince their frightened and distracted minority that they are fair. This will not be easy: their

police is inadequate, their communications bad, their revenue is only £18 million for over 40 million people, their Muslims are backward, their Hindus comprise most of the middle and upper classes, so that a wide range of government actions (requisitioning of houses in Dacca, abolition of zemindari, etc.) are necessarily mistaken for discrimination. Moreover, while there is little antagonism between E. Bengalis of both communities, the presence of many Punjabi officials, who have not even the bond of language with the Hindus, and of a considerable number of Bihar refugees makes the situation explosive—much of the present trouble was caused by Biharis. And so long as the trade deadlock goes on, the shortage of coal and mustard oil, and the lack of a market for raw jute, will direct hatred against India, inevitably creating an atmosphere of suspicion against individual Hindus. But the difficulties *must* be solved; for, if the Hindus migrate, the resultant troubles will make the present quarrels look like the profoundest harmony.

Uneasiness in Lebanon



[FROM A SPECIAL CORRESPONDENT]

THE *mariage de convenance* between Lebanon and Syria—the two countries run a customs union—has for so long been subject to a cycle of tiffs, talks and reconciliations that few people take a fresh quarrel seriously. But there is current news of a rather graver outburst than usual. The Syrians have announced the breaking off of customs relations. The Syrian Constituent Assembly this week warmly endorsed its government's decision to put through an economic separation. At the same time, it resolved to "establish commercial relations with the Lebanon in the interests of both peoples and not of groups of merchants," whatever that may mean in terms of action. And the two countries' premiers are to meet before they carry their grievances to the Arab League meeting in Cairo this weekend.

On paper, they are suitable economic partners. They share a wild mountain frontier that is expensive and difficult to close with a tariff barrier. Syria has goods to sell which Lebanon needs—wheat in particular. Lebanon responds with services that Syria cannot at present dispense with, notably the services of its ports. But their union is unhappy because their tastes and needs are different. Syria has land to spare and considerable development possibilities, given some capital, some political stability and a better conception of the rudiments of good administration; it therefore wants to limit imports to essentials, to protect its nascent industries, and to establish a relatively balanced national economy. The Lebanese merchants profoundly disagree. They form the hard core of their country's economic structure. They are proverbially good middlemen and commission agents; their policy is one of large turnovers and quick returns; they thrive on a huge entrepot business with the hinterland and want the freest possible measure of trade in order to promote this. Syria's desire for restricted imports is the antithesis of their creed. This merchant community, which is largely Christian, does not represent the Lebanon's unanimous view. There are Lebanese industrialists, and they are backed by many Lebanese Moslems, who think that the Syrian thesis is right and that complete economic unity would pay. Lately, these have had the upper hand.

The recent history of the customs and currency union is that it was severely shaken when, in March, 1948, the Lebanese signed an Economic and Financial Agreement with France and the Syrians refused to follow suit. From that date, the former currency was backed in Paris, and the latter unbacked, for the Syrian Government has failed to find other backing. The two pounds ceased to be interchangeable. Lebanese turned in their holdings of Syrian pounds, to the tune of some £S44 million, which is still "frozen" in Beirut. By various routes—merchants, tourists, school fees, even migration—too much Syrian currency entered Lebanon. To Syria's financial detriment, there set in the disparity between the two currencies which is locally known as the *agio*. After a year of great uneasiness and endless discussion, an agreement was reached in July, 1949, whereby Syria was to supply the Lebanese consumer with wheat in unrestricted quantities in return for which Lebanon was to impose a 50 per cent duty on all foreign wheat. Lebanon was to do its bit by eliminating the *agio*. There was also mutual agreement to restrict the import of non-essentials on a quota basis, but to lower the tariff on textiles.

For a few months this worked well enough. But in December the Lebanese were disquieted by the news of an independent Syrian trade and loan agreement with Saudi Arabia, and of intentions to proceed with the building of an all-purposes port at Latakia. There followed a Syrian announcement that Lebanon could have no further cereals, on the ground that 120,000 tons supplied in one season was more than enough and that Lebanon must be re-exporting to "other destinations" (presumably meaning Israel). Relations have worsened from then util now.

Can either country afford to let such bad blood flow? On a short-term basis, Syria is the loser. Until Latakia is built, it must use Lebanese ports; until new pipelines give birth to new refineries on the Syrian coast it must buy all its fuel oil in Lebanese pounds from the refinery at Tripoli. It seems to have put its pistol to Lebanon's head earlier than is prudent, although from a long-term standpoint it possesses potentially the stronger of the two economies. If the rupture lasts, the Lebanon is the real loser.

Even on a short-term view, the outlook for Beirut's merchants is black, because their period of postwar prosperity is over. Their warehouses are overstocked; their sheds in the free port zone are packed with goods on which they prefer to pay storage rather than duty while searching for markets; rich refugees from Palestine have ceased to spend money on last year's scale; several local light industries have had to close; unemployment is increasing; ready money is scarce. Communism is growling, particularly among the Armenian, Greek and Palestinian communities. Their government is having no success in handling the nascent trades unions. The classic way out of this threatening morass is to keep the flow of goods going. They have immediate need to be more accommodating than they have been about the economic requirements of their Syrian partner.

From a long-term standpoint the prospects for Lebanon's economy are difficult to assess on account of the elusiveness of the invisible items in its international balance of payments. Assuming, and this is a reasonable assumption, that it absorbs 50 per cent of the visible import trade of the customs union while accounting for only 20 per cent of the visible exports

thereof, the unbalance of its visible trade amounted to £L224 million in 1948 and—at an estimate, based on figures for the first six months of 1949—to £L260 million in 1949. These huge figures are slightly mitigated in that they include both oil company imports and imports paid for by United Nations and other refugee welfare organisations. Invisible earnings to an annual total of over £L200 million are, however, necessary to make up the balance. Are they available? They come, in this ancient site of skilful trading, from a variety of sources. Emigrant remittances—the Christian business families have migrated all over the world—probably account for nearly one quarter of the total. Tourist trade would amount to more than its present 7-10 per cent if it were not so often in the hands of a get-rich-quick class. Re-exports, profits on deals in gold currencies (the import of gold into Lebanon is free) and a vast illicit export of hashish to Egypt make up a large part of the leeway. So do profits made on the authorised Beirut free market in foreign currencies, quite a proportion of which takes place at street corners. Clearly, however, even the astute Lebanese middlemen cannot hope to maintain all these resources if Syria is hostile.

For to whom else can they turn for partnership? France, though a willing partner for political and sentimental reasons, does not need many of their goods or services. Israel would eat their agricultural produce, but is innately a rival in such matters as banking and financial deals. All Islam would cleave to Syria. They would do best to hold on to their Arab League clientele, even at the cost of some sacrifices in the matter of free trade.

Seretse's Home Town

[FROM OUR JOHANNESBURG CORRESPONDENT RECENTLY IN SEROWE]

SEROWE, 40 miles from the railway line that runs through Bechuanaland to Rhodesia, is one of the largest native towns in Africa. It consists of clusters of beehive-shaped huts, protected from wild animals by stout stockades, and is dominated by two hills, on one of which stands the Residency, a simple white building set amid pleasant gardens, and, on the other, the grave of King Khama, whose dignified monument proclaims: "Righteousness exalteth a nation."

Sir Evelyn Baring, the High Commissioner and the King's representative, arrived in Serowe to address a *kgotla*, or tribal gathering, and convey to it the British Government's decision to expel both Seretse Khama, the chief-designate who had married an Englishwoman, and Tshekedi Khama, who has been regent of the Bamangwato tribe for over 20 years and is Seretse's uncle, from the Bamangwato reserve.

Sir Evelyn, who had travelled 1,100 miles by air, train and car for the purpose, arrived in Serowe to find that the majority of the 35,000 native inhabitants had melted silently away into the surrounding bush. Serowe was a dead city, and remained so during the High Commissioner's stay. In this fashion the natives demonstrated their loyalty to Seretse.

At the hour appointed for the meeting, the large *kgotla* ground, which can hold several thousand people, was deserted save for the presence of a dozen British, American and South African newspaper representatives, and two newsreel cameramen. The district commissioner and other officials made several attempts to summon the people, including the issuing of a direct order to 24 headmen to appear immediately before the High Commissioner. But only a handful of natives showed themselves, and they were obviously merely idle spectators. Among them, however, were supporters of Tshekedi, and their presence appeared to contradict the official allegation that "thugs" among Seretse's supporters had forcibly prevented the people from attending the *kgotla*.

Tshekedi's Tragedy

It is a fact that a number of native families in Serowe have been split by the dispute, wives against husbands and sons against fathers. It nevertheless seems clear, as the successful boycott of the *kgotla* emphasised, that the great majority of the tribe support Seretse. Tshekedi is very unpopular. A notable ruler, he was educated at Fort Hare, in South Africa. He believes in native self-help and the minimum dependence on the white man—though very friendly to Europeans, he is in fact a black nationalist—and he drove his people hard, raising money by levy for new schools. Increasing resentment has been his reward. There is good reason to believe that the officials on the spot expected the previous *kgotla*, at which Seretse explained his marriage, to reject Seretse and support Tshekedi—which would have saved them and the British Government a lot of trouble. They had, however, overlooked Tshekedi's unpopularity.

Tshekedi's personal tragedy is that all his ambitious plans for the Bamangwato centred on Seretse. He insisted that his nephew be educated overseas, at Oxford. He expected him to return, thoroughly equipped to defend the tribe against possible South African encroachments, and to be a greater ruler than either Tshekedi himself or the great Khama. Instead, Seretse returned with a white wife. Tshekedi, not normally given to monosyllabic utterances, declared: "She stays, I go." Before the marriage, Tshekedi and Seretse were great friends. Now, in addition to the quarrel about the marriage, they are fighting what promises to be a long and intricate series of law suits over cattle and over King Khama's considerable personal fortune.

Seretse is described by the handful of Europeans in Serowe, all of whom have known him intimately since childhood (their sons went hunting with him and their houses have always been open to him) as an amiable if not brilliant

Write for full details from The Malta Hotels Company, Ltd., Public Relations Division, 34 Grosvenor Street, London, W.1

young man. There has never been any suggestion that he has bad qualities which would make him a bad chief. But the European community are deeply divided about his marriage. They are far more disrupted than the tribe. Fierce pro- and anti-Ruth factions have been formed. They do not speak to each other, and any of the visiting newspapermen found in the company of one faction are immediately boycotted by the other side. An affair which has the widest implications for the British Empire is discussed on the spot in a thick fog of village gossip.

In accordance with tribal custom, Mrs Khama has her own home apart from her husband's, a simple but comfortable bungalow on the outskirts of Serowe. She also stays for periods with friends at Palapye Road, on the railway line. At first she refused to be interviewed, but finally her indignation at what she considers to be the British Government's shabby treatment of herself and her husband got the better of her. To visitors, she is friendly, forthright and completely unaffected. She is fully aware of the colour implications of her marriage; and she refuses to let others dodge the issue. Shortly after her arrival, some residents invited her to call on them but declined to return the visit because of the presence in her home of natives other than servants. Mrs Khama immediately dropped them. One or two did call on her but "tactfully" ignored the natives. Mrs Khama discomfited them by introducing a number of natives as "my in-laws." The visits then ceased. If one young woman armed only with determination and sincerity could break down the colour bar, Mrs Ruth Khama might do it.

Serowe has been perfectly calm since Sir Evelyn Baring's visit and the abortive *kgotla*. Despite the threat to pay no taxes, which need not at present be taken too seriously, the natives remain friendly and respectful towards the Europeans. But there can be no doubt that British prestige has suffered a severe blow, in the territory and perhaps throughout Africa. The refusal to meet the King's representative, in a country where Queen Victoria and the British Crown are still revered even more than the great Khama, was a staggering display of tribal solidarity.

Shocks for the Japanese Communists

[FROM OUR TOKYO CORRESPONDENT]

WHATEVER the long-range intentions of Moscow, the immediate effect of the Cominform blast at Sanzo Nosaka and the policy of the Japanese Communist Party has been to reduce the Party temporarily to the hysterics of a fowl running around the farmyard with its head cut off. The rank and file of the Party have been flabbergasted by the official Communist denunciation of their leaders. The leaders themselves were—and are—shaken and bewildered by the brutal attack on them by a joss which seldom rewarded them, but which they had worshipped with proprietorial and self-sacrificing devotion.

Sanzo Nosaka, Moscow-trained intimate of Mao Tse-tung, has, it would seem, lost irreparable face by his meek acceptance of moral and intellectual guilt. It was he who induced the Party to drop the unpopular "Abolish-the-Emperor" policy line, and who said: "The Japanese first must be taught democracy before they will be ready for Communism. We will move slowly." It was his aim to make the Communist Party "an organisation beloved by the people," and it was his strategy of sweet reasonableness, combined with adroit union and universal infiltration, which increased the number of Communist members of the Diet from four to 35 at last year's elections.

But now, on all the evidence, Nosaka-szn, despite his background, training and shrewd Japanese quicksilver opportunism, must step down, ostensibly if not actually, and work, if at all, in discreet retirement. In his stead, Yoshio Shiga, a gaunt Party veteran who served 18 years in Fuchu prison and who likes to use his fists as well as his tongue in dialectical disputation, emerges as the most likely new leader.

Shiga-san is vigorously challenging Kyuichi Tokuda, another Fuchu "old boy" of 18 years' enrolment, who is still secretary-general of the Party, in spite of his connections with Nosaka-san. Shiga-san's prestige, however, has never been higher in the Party as a Moscow man.

What is Moscow's game? Apparently a simple and straightforward one. It is accepted that the Soviet has become impatient with the subtle Nosaka approach and is demanding more comradely despatch, sincerity, violence, strikes, sabotage and anti-American agitation.

Regrouping of Ideologies

The Prime Minister has never disguised his eagerness to trade blows with the Communists nor his certainty of the inevitable outcome. Japanese industrialists—sensing anti-union sympathy among visiting American businessmen with capital to invest—have been quick, too, to denounce all legitimate demands for higher wages, reduced working hours and improved living conditions as dangerous Communist anarchy. (These same Japanese businessmen fawned on Nosaka-san and offered to subscribe funds to the Communist Party when they believed that he could lead them to happy, profitable, democratic markets in Red China).

There are thus strange and shifting alliances in this regrouping of ideologies in Occupied Japan. It is an open secret that, since the Party gently dropped the "Abolish-Hirohito" campaign, many purged Japanese military officers have joined the Party—officially or unofficially. The Communist Party, it must be remembered, is openly opposed to the retention of bases by the United States in Japan and to the encouragement of birth control, and is ostensibly following a strongly nationalistic Japan-for-the-Japanese line.

The registered strength of the Party is placed by the Japanese Government at 106,639 at January 31, 1950. No one doubts that this registered total includes many Government secret agents. The unregistered members, including probably many indoctrinated war-prisoners from Siberia who are regarded as "safe," are known only to the Soviet Mission in Tokyo, which still finds black-market funds for the Party but which distributed translations of the Cominform attack on the Party to all Japanese trade unions.

Industrially, the party has been losing ground in Japan under the Nosaka "learn-to-love-us" policy. More than 4,000,000 workers—or two-thirds of organised Japanese labour—now belong to trades unions which owe allegiance to conservative or moderate leadership. Nearly half of this union army has drifted away from Communist leadership in the past year, although the Communists still have a commanding voice in the affairs of the usual strategic unions—heavy industry, coal, communications, transport and education. These moderate-led Japanese trade unionists are the West's best bet for enduring democratisation in Japan. They will be the first quarry of the new, reformed and presumably more effective Japanese Communist Party, now being purposefully shaped behind the hara-kiri uproar and dexterous back-stabbing in the Party's humble Tokyo headquarters.

The Japanese have no instinct for Communism. Traditionally they fear and distrust the Russians. But they ape success—or what looks like success. And, as somebody has pointed out, the Pacific war was dictated and imposed upon the nation by conspiracy among a far smaller group of men than the local junta of the Japanese Communist Party.

We've solved some problems in our time!

TIME—1939 : PROBLEM—the magnetic mine. The answer came quickly: sweep with a loop of cable carrying heavy impulses of direct current, thus generating a magnetic field to detonate the mines. But the means? Every available mine-sweeping trawler must be fitted *at once* with batteries capable of enormous output—3,000 to 4,000 amperes at 150 to 200 volts. That was Chloride's part of the problem.

¶ The trawlers got their equipment. Car batteries by thousands, with new connections hurriedly burned in to put the cells in series-parallel, provided each ship with a fearsome make-shift battery of 1,134 cells. Later, our special 400 volt mine-sweeping batteries, designed for the job and produced in very great numbers, made sweeping safer and more certain. But the magnetic mine, as a decisive weapon of war, was already beaten—by brave men and a battery that looked like an 'electrician's nightmare.'

¶ For over 50 years we have been designing & making special types of Chloride, Exide and Exide-Ironclad Batteries for every branch of industry, transport and communications. Our battery research and development organisation, the largest & best equipped in this country—if not in the world—is at industry's service always: ready at any time to tackle another problem.

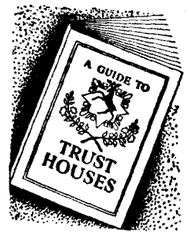
SIMON ENGINEERING GROUP



The Simon organisation has been export-minded for more than half-a-century, and since 1945 Simon machinery, plant and technical services have been sold in forty countries. Power stations in Abadan and Australia : coke ovens in eight countries from Finland to South Africa : sulphuric acid plants in Europe, the Middle East and the Indies : grain elevators for the Argentine Government : flour mills in a score of countries from Norway to North and South America : heavy gears for French and Swedish steelworks and South African and Mexican cement mills : these are examples of post-war export contracts undertaken by Simon-Carves, Henry Simon, Simon Handling Engineers and Turbine Gears.

A Sensible Policy for Process Steam—6

Why have a Boilerhouse ?

BY SPIRAX

No boilerhouse is an end in itself. Neither is there virtue in generating steam for its own sake.

Steam is generated because it is such a beautifully convenient way of conveying and distributing a concentration of heat in a readily usable form.

The steam, paid for in coal, wages, maintenance and the paraphernalia of boilerhouse expenses, is (for the most part) *for the sole purpose of being condensed at some remote points so that it will give up its mass of heat.*

If you are intent on getting your money's worth in terms of process output, then you should, besides ensuring the efficiency of steam-making, insist on getting the highest efficiency of condensation at the points of steam-usage.

There are four practical measures you can apply: we call them the four pillars of process steam wisdom.

THE BUSINESS WORLD

Commodity Schemes

THIS week the Tin Study Group has been meeting in Paris to discuss proposals for an international scheme to regulate supplies of tin coming to the market. The Dominion wool conference has also resumed its talks on a marketing organisation to succeed the present stock disposal scheme. Next month, the International Sugar Council is to meet to revise the prewar marketing scheme for sugar which is still technically in being. Commodity schemes are clearly in the air, and there are indications that the Government would go a long way in support of the principle that it is desirable to promote stability in the primary markets by regulating supplies.

But official policy on commodity schemes does not seem to have been formulated in detail ; and expediency rather than principle is likely to determine its course. No one has asked whether the purpose of commodity schemes is to maintain the sterling incomes of primary producers during periods of industrial recession—as a buttress for full employment in Britain—or whether their talk is to secure for the sterling area a stable dollar income. The distinction is important because it has a bearing on the type of scheme to be adopted. From the communiqué issued after the tripartite talks in Washington last September, it might be assumed that the objective is the narrower one of maintaining dollar earnings from primary commodities. But the only overt action by the Government is that it has twice requested that Chapter VI of the draft charter of the International Trade Organisation should be accepted by member countries immediately and, if necessary separately from the rest of the charter. The Americans have opposed these requests, on the technical ground that it would be much easier to pilot the draft charter through Congress as a whole with Chapter VI included. This chapter lays down the conditions which justify commodity schemes, such as the existence or, indeed, the prospect of a "burdensome surplus" or widespread unemployment in connection with a primary commodity. It also enumerates certain principles and safeguards which commodity schemes must incorporate.

The fact that Chapter VI—or for that matter the rest of the draft charter—has not yet been accepted has not prevented the setting up of certain international commodity schemes or the consideration of others. The international wheat agreement was signed twelve months ago and began to operate last August. The prewar tea scheme still exists, though in a topsy-turvy fashion, since the export quotas are now so high—130 per cent of the prewar standard—that supplies are in effect virtually uncontrolled. Schemes for tin and wool are being discussed and the sugar scheme is shortly to be revised. No schemes have yet been mooted for rubber or cotton, but in each case a committee exists which has power to work out a scheme should supply conditions be thought to warrant one.

In all, therefore, five commodity agreements exist or are under discussion. They can be divided into three distinct types. The first type is the wheat agreement. This is a multilateral contract with a four-year life ; it fixes a maximum price and minimum price for each season and guarantees markets for given quantities of wheat to exporters at the minimum price (when supplies are plentiful) and the same quantities to importers at the maximum price (when supplies are short). The wheat agreement does not call for control over production or trade. The second type is the "buffer stock scheme" of the kind proposed for tin and wool. Such a scheme requires a minimum price to be fixed each year. The market would function quite freely until the minimum was reached, when the controlling authority would buy supplies and hold them off the market. When the market price rose a certain distance above the minimum level, these stocks would then be sold, in order to damp down any further rise in price. The third type is the prewar "restriction scheme." Basically this is a producers' agreement to restrict exports or output each year to a given percentage of each country's supply in a datum period. It involves no direct control of prices, but price movements are affected by the degree of restriction imposed on supplies. Restriction schemes exist in formal fact for tea and sugar.

All these types of agreements have one element in common: they guarantee or seek to establish a minimum price satisfactory to the producer. But it is evident that none of the commodities for which schemes exist or are suggested has experienced any condition of "burdensome surplus" since the war ended. World production and consumption of the five commodities concerned are shown overleaf. Wheat production during the current season is 3 per cent higher than before the war ; but whereas output in the United States and Canada has risen much more rapidly than this, sterling area production has only just regained the prewar level. Stocks of dollar wheat are admittedly large and increasing. But can wheat be said to be in "burdensome surplus" so long as supplies to the importing members of the international agreement have still to be paid for at the maximum price laid down in the contract, and so long as the "free market" price of wheat is above that maximum ? There is an actual shortage of wool, for although output is above its prewar level, consumption has been far higher and the balance has come from the stocks accumulated during the war, now virtually used up. Tin output is also back to its prewar level, but world consumption last year was substantially below the prewar average. The difference is accounted for by American stockpile purchases. Until the London tin market reopened in November, tin prices were fixed at an artificially high level ; but no one can deny that the present price of £600 a ton affords tin producers an adequate margin of profit—which is not the usual mark of a "burdensome surplus." World production of tea is still below the 1934-38 average though output from the sterling area is nearly 50 per cent higher.

Again, prices are high and well in excess of production costs ; until Indonesia re-appears as a major supplier the question of surplus supplies can hardly arise. Production of sugar in the sterling area and in the world as a whole is larger than before the war, but it is still rationed in Britain. The problem is not so much a burden of supplies, but of disposing of Cuban and other dollar sugar in a world which is short of dollars. Commodity schemes have been proposed for many reasons, but not as a specific solution for the shortage of dollars.

*

In none of these cases does a " burdensome surplus " exist now or threaten in the next year or so. Why, then, the hasty preparation of draft commodity agreements ? Producers would say that agreements must be ready for use when the slump arrives. The affect of the American recession a year ago, though no slump, was an unnerving experience for them and, indeed, for the caretakers of the sterling area's dollars. But the sterling area is a net exporter of wool, tin, tea, and rubber ; it is a net importer of wheat, sugar and cotton. A buffer stock scheme or a restriction scheme for those commodities which the sterling area exports might guarantee a minimum price to producers ; but it would not necessarily mean that the sterling area could count on a minimum dollar income from those commodities. American industry would not take a charitable view of reserve prices for its raw materials which were fixed too high—as they would obviously tend to be fixed. In a recession, a sharp fall in prices of primary products is a means of inducing merchants and manufacturers to carry stocks when they would otherwise stay out of the market. If minimum prices mean that merchants and manufacturers were denied this inducement to buy, they would be unlikely to accept the risk. Hence the authority running the scheme might soon find itself carrying the whole stock.

If the object is to stabilise the dollar earnings of sterling area commodities, the best type of scheme is clearly a multilateral contract that guarantees the purchase of fixed quantities at a minimum price. Britain has, in fact, guaranteed a market for dollar wheat unti 1952 and is likely to guarantee a market for dollar sugar But it has not sought in return a similar guaranteed outle in the United States for wool or tin. Admittedly ther would be many difficulties in applying a scheme simila to the wheat agreement to the case of wool. But thes difficulties do not lead to the conclusion that a buffe stock scheme would be a good alternative for wool or tin The sterling area gets more dollars from the export o British manufactures than from exports of wool, tin anc tea. It is, of course, argued that since the schemes pro posed would be international, Britain would be at no dis advantage compared with its competitors. This argumen is dubious. If the prices of primary products are main tained at an artificially high level in a recession, the extra cost must be absorbed at the manufacturing stage (in which case industry's profits will be reduced tc subnormal levels to subsidise the profits of primary pro ducers) or if it is passed on to the consumer, the volume of sales will be reduced.

But the main question about such schemes is whether any advantage they might yield to the sterling area would be more than short lived. A series of commodity schemes designed with the main purpose of maintaining relatively high prices to producers is far more likely to encourage the creation of the very surpluses which they were originally intended to cure ; to increase rather than diminish the instabilities which, over the years, inevitably affect the primary producer ; to raise industrial costs, squeeze the consumer and encourage the quest for substitute materials and sources of supply ; and to produce all the risks of friction between the sterling area as supplier of industrial raw materials and the dollar area as the main industrial consumer. These are real risks and it is important to recognise them from the outset. No commodity scheme, whatever its advantages to producers may appear to be, can afford to neglect them. That is not to say that some degree of stability for primary producers is not an asset of real value ; but it does mean that the liabilities of excessively high prices and of the artificial creation of truly burdensome surpluses (which have been the mark of all previous experiments in this field) must be recognised and measured.

Discrimination at Sea

MORE is likely to be heard of the expression " flag discrimination " as international competition in the shipping industry increases ; in the industry itself the term is already as familiar as it was in the nineteen-thirties. The International Chamber of Shipping passed a resolution on the subject when it met in London in November, and a similar resolution was recently passed unanimously by the Chamber of Shipping of the United Kingdom.

Briefly, flag discrimination is action, generally taken by a government, designed to favour shipping of the national flag and to put all foreign ships at a disadvantage. It can take many different forms, and sometimes results from actions taken with a quite different purpose. Often difficult to identify, owing to its diverse origins and motives, it has a rapid cumulative effect because it is difficult to stop or control and leads inevitably to retaliation. Once started, the process can (if pursued to its logical conclusion) disrupt the economics of international merchant shipping, leading to a hopelessly wasteful use of tonnage, with consequent hardship to the consumer in every nation which depends to an important extent on seaborne trade.

Perhaps the simplest form of flag discrimination is the manipulation of the tariffs for port and harbour dues in favour of ships of the national flag. This was a device frequently adopted by certain countries after the first world war to foster their new merchant fleets, which had come into being largely because the fleets of the traditional maritime nations were occupied with the war. It has lately reappeared in Argentina, Brazil and Colombia. In Argentine ports, foreign ships are required to observe many formalities and regulations from which Argentine ships are wholly or partly exempt, and all of these mean delay and expense for the foreign ships. Priorities in the allocation of berths are another means of discriminating against foreign vessels in ports ; a flagrant example is the port of Beira, in Portuguese East Africa, where there is great congestion. Ships have to wait so long for a berth at Beira that the liner conferences have been forced to impose a surcharge of 60 per cent on the freight rates for goods consigned there. The priority given to Portuguese ships may oblige a foreign ship, even if she has been allotted a berth and has started loading or discharging her cargo, to make way for any Portuguese ship which may arrive.

*

Taxation of the freight earnings of foreign shipping companies is another favourite device which has been reappearing since the war. It is true that this form of double taxation is gradually being combated by the extension of reciprocal exemption agreements between certain nations. But this evil has already once been virtually eliminated, before the war. Some countries, however, perhaps because their maritime interests are not great, see little advantage in accepting the principle that shipping should be taxed once only, in the country of residence. The consequences for the foreign shipowner are obvious. Many other purely administrative measures can be used against foreign shipping. Obstacles can be put in the way of foreign ships satisfying consular or other documentary requirements. Import and export licensing machinery can be used to influence cargoes to national-flag ships ; Customs facilities can be arranged to favour national ships, both for passengers and cargo. Many governments require shippers to comply with complicated Customs regulations or tariff laws which are frequently altered ; thus shipowners as well as shippers can be penalised for mistakes which they cannot avoid.

There is, indeed, hardly an end to what can be done by administrative means ; and the field has been extended by the growth of currency and exchange restrictions. The latest example comes from Brazil, where since March 1st freight rates for all Brazilian imports have to be paid in Brazilian currency, whatever the flag of the carrying ship may be. This action sets up a rich tangle of complications. So long as the necessity for exchange controls exists, it will perpetuate conditions hostile to the re-establishment of a free freight market and tend to breed flag discrimination. For this reason the International Chamber of Shipping has urged that OEEC should free shipping services between the participating countries from exchange control, and it has emphasised the importance of extending the same advantage to shipping in all parts of the world.

*

The most serious and lately the most prominent form of flag discrimination, however, is the direction of cargoes into ships of particular flags by governmental action. It is materially assisted by the part which many governments now play in the buying and selling of bulk commodities. Many of the bilateral trade agreements signed since the war provide that the overseas shipments will be shared by ships of the two countries concerned. Argentina has concluded nine such agreements, and Brazil and India have acted similarly. Chile has introduced a novelty by proposing that if the tonnage of the contracting parties should not be available in sufficient quantities to undertake the shipment, then the cargoes concerned should be restricted to vessels of any flag in the western hemisphere.

The principle of the freedom of the seas for the flow of world commerce, and the exchange of international shipping services on a sound economic basis, are endangered by the growth of the doctrine that a nation is entitled, as of right, to carry at least 50 per cent of its overseas trade in its own merchant ships. Such a doctrine is hostile to economic efficiency. It pays no regard to the cost of transport, which ultimately forms part of the price that the consumer has to pay for goods. Unfortunately the United States—preoccupied with the strategic importance of merchant shipping and its inability to compete in normal commerce with the merchant ships of other flags in the open market—has done much to foster the doctrine by its example.

The building and operating costs of American ships have long been higher than for most other maritime nations, and "differential" subsidies were introduced by the Merchant Marine Act of 1936 to put American shipowners on an equal competitive footing with other flags. If the building subsidies cannot reasonably be said to discriminate against foreign shipowners—since they only put Americans on an equal competitive footing—they do discriminate against foreign shipbuilders. They also have the effect of bringing into existence tonnage for which no economic justification exists. Operating subsidies are then required to keep the vessels in business, and the tendency is for these subsidies to be increased when world freight rates fall. Thus the normal economic processes which would drive the least efficient tonnage off an overstocked market are frustrated. Subsidies of this nature, moreover, invite retaliation, which can be disguised in the form of losses by State-operated fleets. In practice the American shipping subsidies have a further drawback: it is scarcely possible to arrive at a fair assessment of the true level of "foreign" operating and building costs. Such assessments tend—in the circumstances in which they are made—to err on the side of underestimation, and it is comparatively simple for a government department entrusted with administering the subsidies to inflate the amounts paid above the level strictly necessary to carry out the levelling intention of the Act. The extent to which so-called "defence features" are being incorporated in the design of new merchant ships in the United States is worth noting. These features enable the government to put up a far larger share of the cost than would be warranted by the simple intention of putting shipowners on an equal competitive footing with their foreign rivals.

*

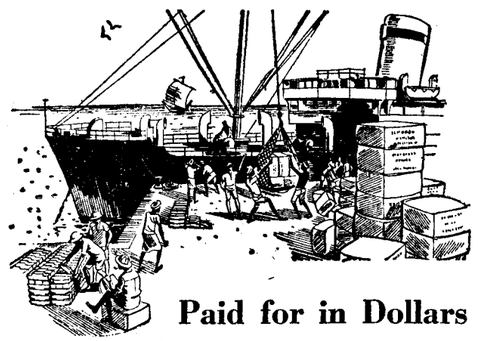
A consideration of the shipping subsidies may serve to show how difficult it is to draw the line at which flag discrimination begins. But the deliberate reservation of cargoes for ships of particular flags is blatantly on the wrong side of the line, and for the extension of this "doctrine" the United States bears a good deal of the blame. It is one thing to encourage a merchant navy to put itself in a position to carry 50 per cent, or more, of the nation's trade; but to legislate, or to make it a condition of trade, that 50 per cent of cargoes in a certain category shall be carried in ships of a particular flag is quite another thing. The "50 per cent rule" for Marshall Aid cargoes was the thin end of this particular wedge. Naturally the recipient countries were in no position to look a gift-horse in the mouth, and the application of this rule to ECA cargoes was specifically excepted by the International Chamber of Shipping from its recent resolution which called upon governments to refrain from restrictive practices which require commercial cargoes to be shipped by tonnage of particular flags. Yet the American representative at the meeting abstained from voting on the resolution, even with that exception made.

The principle has since been extended far beyond the limits of relief cargoes. The United States has decided that at least 50 per cent of all shipments under the Mutual Defence Act, as well as "stockpiling" imports, will be carried in American bottoms. Pressure is even being brought to bear on Congress to legislate for the reservation of 50 per cent of all American overseas trade for American shipping. This pressure may fail. But the doctrine which inspires it is finding eager support among countries with newer maritime aspirations—Argentina, India and South Africa. The Indian representative dissented from the ICS resolution on flag discrimination. Indian shipowners have recently presented a plan for the development of the Indian merchant navy to their government. The objective is that Indian ships should carry the whole of India's coastal trade, 75 per cent of the near trades, 30 per cent of the Far East trade which was carried by Japanese ships before the war, and 50 per cent of the remaining overseas trade of India. To achieve this the Indian Government is urged to grant subsidies and loans for the operation and the building of ships, to purchase ships and charter them out on easy terms, and to allot government cargo to Indian ships exclusively. The danger has begun to appear that India may take its cue from the United States, regardless of the economic consequences.

*

It is not easy to see how there can be an end to processes of this kind—if the doctrine underlying them continues to gain acceptance—until every nation is running a heavily subsidised fleet carrying at most half the cargo it was designed to carry. They could do irreparable damage to the economy of those maritime nations which depend largely on international shipping services, run in free competition, for their invisible earnings. It is the maritime countries of western Europe, and in particular Great Britain and Norway, which have most to lose. The Norwegian fleet, for example, derives some 80 per cent of its earnings from trading between foreign ports, and in 1947 as much as 39 per cent of the gross freight earnings of British shipping was derived from trades not touching the United Kingdom.

The consequences of flag discrimination may force themselves upon the attention of the world with increasing urgency until their nature and origin are recognised. Analogous difficulties arose after the first world war, and were for the most part gradually overcome by international agreement through the League of Nations, the international traders' organisations, and the individual states. In these days the opportunities for and the scope of discrimination are intensified by the participation of governments in commercial processes, and by the latent fears of war. Shipping subsidies and flag discrimination are the maritime counterpart of the policies of national self-sufficiency which did such damage in the years leading up to the second world war. There is a fruitful field for work by the proposed United Nations Inter-governmental Maritime Consultative Council, of which little has been heard since the draft Convention was signed in 1948. This might well prove to be a valuable instrument for breaking down the barriers which threaten to impede the free interchange of shipping services. It will, however, be doomed to failure unless the spread of doctrines of discrimination and self-sufficiency can in some ways be reversed. How can this be done? An essential first condition, at least, would be a spring-cleaning of American ideas on maritime policy. If American maritime policy were brought more closely into relation with American ideas on the liberalisation of trade in general, then at least the present retrograde movement might perhaps be halted.

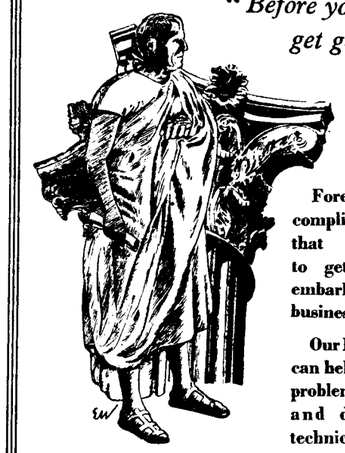


A COMPREHENSIVE BANKING SERVICE

In their capacity as private bankers, Glyn, Mills & Co. have always arranged that the service placed at the disposal of their customers should be truly comprehensive, covering all financial problems from those of the large public corporation to those of private individuals. They are equally well equipped to accept duties as Company Registrar, or to act as executor or trustee for large or small estates.

GLYN, MILLS & CO.
BANKERS
HEAD OFFICE: 67 LOMBARD STREET, LONDON, E.C.3

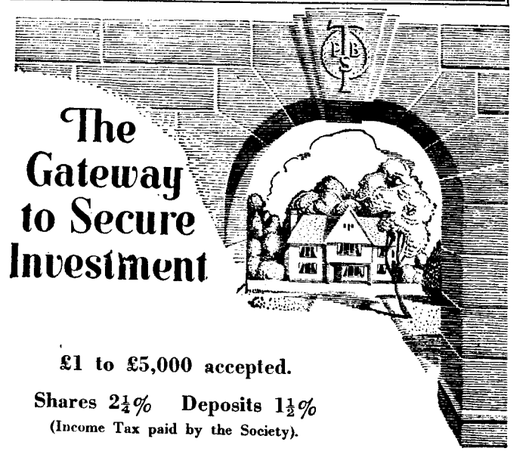
Associated Banks:
Royal Bank of Scotland · Williams Deacon's Bank, Limited



Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners—there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

The Chartered Bank of India, Australia and China
(Incorporated by Royal Charter in 1853)
HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2.
Manchester Branch: 52 Mosley Street, Manchester, 2. Liverpool Branch: 27 Derby House, Exchange Buildings, Rumford Street, Liverpool, 2.
West-End (London) Branch: 28 Charles II Street, London, S.W.1.
New York Agency: 65 Broadway, New York.
The Bank's branch system, under British management directed from London, serves:
INDIA · PAKISTAN · CEYLON · BURMA · SINGAPORE AND FEDERATION OF MALAYA · NORTH BORNEO AND SARAWAK · UNITED STATES OF INDONESIA · FRENCH INDO-CHINA · THAILAND · THE PHILIPPINE REPUBLIC · HONGKONG · CHINA · JAPAN



"Before you begin, get good counsel."
SALLUST.

Foreign trade is so complicated nowadays that it is essential to get advice before embarking on export business.

Our Foreign Branches can help in the financial problems which arise, and deal with the technicalities.

NICKEL AND CLOTHING

Do you know that nickel plays an important part in the production of our clothing? Take wool, for instance . . . the equipment used on the sheep farms, the plant for producing the yarn, the tanks for dyeing it, the machinery for weaving it into fabrics, even the sewing machines — in all these nickel is present, toughening and strengthening the metals used in their construction, making them staunch against the attacks of wear, corrosion and heat. Thus nickel is contributing to the efficiency of the tools and equipment with which Britain is achieving her recovery.

Business Notes

ABC of EPU

The broad outlines of the British attitude towards the proposed European Payments Union have been officially defined in London this week. A memorandum stating the British case has been submitted to representatives of OEEC countries and of the Economic Co-operation Administration in Paris. The first reported reaction to the British document has been one of "surprise and disappointment." The reasons for these emotions have not yet been defined, though they should soon become apparent as the payments committee of OEEC gets to work on the details of the whole scheme and takes the British reservations into account. The real battle on the Payments Scheme has thus begun. For the benefit of those who seek to follow its twists and turns in the coming weeks, it seems desirable—even at the risk of repetition—to restate the basic issues that are at stake.

The intention of the European Payments Union scheme is to achieve free transferability of European currencies within Europe and thus to multilateralise European balances of payments. Under the proposed scheme, each member country will at the end of each month notify to the Bank for International Settlements (as agent of EPU) its holdings of the currencies of other members. The agent will then proceed to set off these balances one against another, reducing each country's relation with the rest to one net credit which it will be owed by the EPU, or one net debit which it will owe to the EPU. These items, credit or debit, will be entered in the books of the EPU in terms of a new European unit of account based on gold. If the balances accumulated with, or overdrawn, at EPU by any countries exceed the quotas which will be allotted to each, or remain outstanding beyond a certain period, which may be 12 or 24 months, they will be converted into a longer-term credit or debt on which partial gold payments will be made by EPU to the creditors and to EPU by the debtors.

The gold payments thus made by and to the EPU will not necessarily balance. It is conceivable that there might be only one net creditor, who might exceed the limits of his quota and thus become entitled to gold long before the other net debtors reached the limits of their quotas. That is why the EPU will have to be launched with an initial dollar reserve. This will be provided by ECA, and $600 million has already been earmarked for this purpose out of next year's proposed Marshall aid appropriation. The basic philosophy of this scheme is thus the multilateralisation of balances of payments within Europe. In this respect it runs diametrically counter to the conception of bilateralism which has crept into many of the payments arrangements now operating within Europe; this conception has survived—indeed, was even accentuated by—the first two versions of the Intra-European Payments Scheme which the EPU is due to replace, at the latest, by June 30th next.

* * *

Sterling's "Special" Position

The difficulties peculiar to sterling which make Britain's membership of the proposed EPU subject to some reservations derive from the fact that sterling is held by OEEC countries and others as working balances and currency reserves—that is, in a way in which other currencies are not used to any considerable extent. If all sterling accumulations by OEEC countries were to be thrown into the monthly clearing, the immediate result would be to make Britain a substantial debtor to the EPU. It would convert the current sterling balances which Britain holds for countries such as Italy, France and Sweden (debts to which no gold payments attach) into an overdraft with the EPU on which gold payments would, sooner or later, have to be made by Britain. But quite apart from this question of gold losses, any such supersession of existing payments agreements by EPU would undermine the sterling payments machinery through which a very substantial volume of international trade—the figures were given in *The Economist* last week—is transacted.

This accounts for the demand by Britain for "special" treatment of sterling in the EPU. The British authorities oppose the suggestion that the EPU should be the sole lender in meeting intra-European deficits. They suggest instead that Britain should be allowed to maintain its existing payments and monetary agreements with European countries and that the EPU should be superimposed on these existing arrangements as a lender of last resort. If an EPU country having such an agreement with Britain finds itself, at the end of a month, with a net holding of sterling, it would not report the whole amount to the EPU, but only that part (if any) that was in excess of the limit (also if any) to its holding prescribed in the agreement. As a *quid pro quo* for this retention of the existing sterling agreements and for the benefits which Britain will obtain by the transferability of all European currencies in the scheme, the British Government is prepared to forgo any right to borrow from the Union while accepting the obligation, imposed on all members alike, to hold, up to the limit of its quota, any credit which arises on its account with the Union. Any such British credit would, of course, be available to finance OEEC countries' deficits with the sterling area. The desire of the British authorities to prevent any undermining of an international payments machinery which is doing good work is understandable; such an attitude on Britain's part should be readily acceptable to both the American and European representatives in Paris—provided always that its object does not go beyond this.

* * *

British Bilateralism?

The real difficulties will begin if the British attitude is inspired not solely by the constructive desire to maintain the usefulness of the sterling area mechanism but by a continued hankering for the protection which the existing bilateral payments agreements can and do provide. There seems to be an element of split-mind in the British attitude. This may be unconscious and unintended. If so, its symptoms need to be immediately removed; otherwise, the progress of the discussions in Paris may be prejudiced. On the one hand, the British memorandum expresses its complete agreement with the principle of free transferability of European currencies. On the other, the perpetuation of bilateral payments agreements, such as those with France and Sweden, and that which Britain is trying to negotiate with western Germany, would provide for unlimited mutual extension of credits—that is, of strictly bilateral credits.

The British authorities must decide forthwith where they place the emphasis in their policy: whether, for example, if Sweden continues to run a surplus with the sterling area Sweden will be called upon to finance the whole of that surplus by holding sterling, or will be allowed to compensate some of it—and, if so, how much—through the EPU machinery, against its European deficits. If Britain is genuinely in favour of transferability of European currencies—and there is nothing in present trends of balances of payments to make it hesitate—no great difficulty need be encountered in meeting the British request and in marrying the existing payments arrangements with the proposed EPU machinery. All that will be required is to make some special provision to prevent existing accumulations of sterling from being immediately converted into claims on

the EPU. If the Americans and Europeans in Paris can be disabused of their suspicion that Britain, when it talks of transferability of currencies, still does so with its tongue in its cheek, and in fact desires at all costs to retain the bilateralist twist which has inevitably been given to part of the sterling payments machinery, it should not take long to hammer out the details of an EPU which will safeguard and satisfy all the essential interests at stake. But the British authorities must recognise that the onus of disproof rests upon them.

* * *

Oil Rationing and Sensibility

A suggestion that diesel oil for road vehicles might be released from rationing was turned down in the Commons on Monday by the Minister of Fuel and Power—primarily on the ground that "it would increase the consumption of diesel oil" and would thus cost more dollars. It is true that, if the Government is able to stick to its substitution policy against American disapproval, any saving in British consumption of any petroleum product can be used to save dollars by displacing dollar oil. It will, however, come as a surprise to many people that the rationing of diesel oil is restricting consumption effectively at all. This oil is not used for private motoring. The bulk of it is used for public passenger transport, and the remainder for road haulage. Which of these "essential" or commercial users is getting less oil than he can use? The easy answer is that the Government has lately tried to cut the allowance for motor-coach tours and excursions. It has also exerted some pressure on the holders of "A" and "C" licences. Indeed, the impression has been created in the trades concerned that an attempt is being made to use the ration as a means of curbing their power to compete with the publicly-owned railway and road haulage services.

If so, the attempt has not been a resounding success. Perhaps there had been over-allocation here and there; or, perhaps, the identity between diesel oil for road vehicles and gas oil for industry makes rationing difficult to enforce. From whatever reason, the idea that consumption is really restricted to any substantial extent is still little more than a theory, open to argument. Can this have been why Mr Noel-Baker brought out his second reason for refusing to deration: "It would also discriminate unfairly against vehicles which run on petrol"? It is hard to believe that he was serious.

But it is strange how widely the question of oil rationing has become permeated with sentiment. A few minutes before he was to show this delicacy of feeling about diesel oil, the Minister announced a "special holiday bonus" on the basic petrol ration. Everybody is glad to see a better ration, even wrapped up as a holiday bonus. But it is perfectly clear that if one concession on oil rationing will cost dollars, then this one will cost dollars as well. Any additional oil consumption must cost dollars, as the Minister himself grew tired of repeating. On what criterion, then, does the Minister decide to make a concession in one direction and withhold one in another? Not a criterion of dollar cost.

The prevailing confusion was well displayed by the comment which a spokesman of the joint committee of the motorists' organisations made when expressing dissatisfaction with the holiday "bonus":

> If, as we hope, the American negotiations now in progress turn out well, we shall certainly ask for more petrol.

What, in this context, is the meaning of "turn out well"? When the Anglo-American talks are resumed, the British Government will be defending its right to use in substitution for dollar oil imports any surplus of sterling oil (within certain limits) which may arise. It is the Americans who are resisting the attempt to cut dollar oil imports and seeking more freedom to sell their oil in Britain and the soft-currency markets. Only if the American thesis prevails over the British can a surplus of oil in Britain be foreseen in the near future. This would turn out badly for the balance of payments, but well for the motorist—while it lasted.

* * *

Critics of the Purchase Tax

A discussion of purchase tax at the annual meeting of the Drapers' Chamber of Trade on Tuesday seemed to start from the premise that this tax has become a permanent feature of the British fiscal system. Purchase tax, Mr John K. Butler observed, had become "just another tax, and subject to such increases or reductions as other taxes, but certainly not to abolition. Failure to realise this can only lead to useless effort." Many organisations of traders have talked of getting purchase tax abolished; to abandon such aspirations is an important change in the climate of discussion. Mr Butler pointed out that certain features of the tax—which were tolerable at the outset on the assumption that it was a temporary measure designed to discourage expenditure on "less essential" goods in wartime—were quite intolerable as permanent things. He mentioned the very high rate on many goods; the great disparity of selling price between taxed and untaxed goods of the same type; and the method of collection, which forces the retailer to finance the Revenue.

It is probably a healthy thing that serious discussion, unclouded by the habitual assumption that the whole bad dream may one day vanish, should be directed to these questions. The observation that "the trend of demand is veering from highly taxed merchandise" is not easy to corroborate, simply because the controlled price system periodically gets out of joint and the utility supplies are therefore unpredictable. But clearly, in so far as the tax is effective in concentrating demand on utility lines, it does (as Mr Butler suggested) work in a way hostile to the development of Britain as an exporter of high-grade manufactures. The price disparities between taxed and untaxed goods (which may otherwise be closely similar) are indeed so great and so absurd that they might well tend to undermine the revenue-yielding power of the tax—if a condition of general and easy supply of utility goods were ever reached. But will it ever be reached, or, if so, can such a condition ever be maintained for long? As to the method of raising the tax, there can be no question that it asks more of the retailer than any government ought to ask. Mr Butler said of his own firm: "The amount we have invested in purchase tax is nearly equivalent to our total prewar stock." The case is indeed strong for reviewing the whole apparatus afresh.

Industry and Transport

British Airlines and the Vickers Viscount

The turbo-prop Viscount built by Vickers-Armstrongs Ltd. left on Monday for a tour of Europe. The aircraft was the first civil design to fly with gas turbine engines, and it is still the only gas-turbine air liner to have a full certificate of airworthiness; this was issued in September. With an economic range of at least 1,000 nautical miles, it is 3d. a ton-mile cheaper to operate at European fuel prices than a comparable modern piston-engined aircraft such as the Convair, and 5d. cheaper than a comparable turbo-jet airliner. The range of the Convair is 300 miles less. The de Havilland Comet is a long-range aircraft and is not intended to operate on routes of less than 1,000 miles. If airline schedules can be suitably planned, the Viscount opens up possibilities of big economies. Even given the present low average utilisation of less than 2,500 hours a year, it could make three journeys to every two of the best piston-engined airliner.

It was stated as long ago as last August that 40 of these aircraft were to be bought for British European Airways and British Overseas Airways Corporation. This being so, it is something of a shock to find that the order is still unsigned. The Ministry of Supply had arranged with the two corporations that it should negotiate a single contract with Vickers for the joint order; but the Ministry is still waiting for an indication of the number of aircraft needed. The corporations say that they have still to decide how many they need. However satisfactory it is to find them conducting their policy in an independent manner (and the pressure on them to complete this order must have been considerable), the delay is having serious consequences. Vickers have been assured that there will be an order for the Viscount; but then, they were assured of such an order three or four years ago, when work started on it as a replacement for the Viking. Yet this promise was repudiated when changes were made in the higher personnel of BEA, and for two years Vickers had no prospect of British orders except that of the Ministry of Supply for two prototypes. The company, having this experience in mind, does not propose to go ahead with quantity production of the aircraft until an order is signed. In consequence, the delivery date recedes. The Viscount could easily fit into the present pattern of international air traffic, but it now seems unlikely to be in scheduled operation any earlier than the Comet, although the Comet will introduce the need for considerable reorganisation and re-equipment of ground control.

The uncertainty puts the company in a difficulty. Much interest is being taken in the Viscount abroad, and this may well lead to the placing of orders by foreign airlines. How much longer can the manufacturers be asked to wait upon the decisions of the British corporations? That foreign operators should be the first to fly these new aircraft may seem inconceivable, but it could be the logical outcome of present policy.

* * *

Fewer Commercial Vehicles

The Society of Motor Manufacturers and Traders has protested against the decision of the Ministry of Supply that deliveries of commercial vehicles to the home market in 1950 should not exceed a total of 81,500 of which 8,787 are to be public service vehicles. This indeed is planning to the final integer. In 1949, 218,290 commercial vehicles of all types were built and 93,087 of them were exported. Exports are now at the rate of 50 per cent of output. The Society argues that to keep production at the same rate and limit home deliveries to the official figure means that in future 70 per cent of production must be exported. It regards such an increase as unattainable. If the increase is not attained, then the volume of output will have to be reduced, and this will cause prices to rise. But German, French and Italian competition is reviving, and British firms could not afford to put up their export prices.

The industry disputes the wisdom of reducing home deliveries at all. Indeed, it probably recalls the failure of past attempts in 1947, 1948 and 1949 to achieve the same end. No doubt it is disconcerting to the planning mind when output runs ahead so fast that it can only be absorbed in home investment and not in exports. But the cases of private and commercial vehicles are markedly different. Since little sheet steel goes into commercial vehicles (unlike passenger cars) the same argument does not exist for economising in scarce resources. The statement points out that the average age of goods vehicles now in use is 13½ years compared with 7 years before the war. Besides making for unnecessarily high second-hand prices and for frequent and costly breakdowns, the poor condition of many vehicles causes more time and money to be spent on their maintenance than they deserve. Orders are already booked for 425,000 vehicles for the home market, which (the industry thinks) could easily absorb an annual supply of 150,000. The statement asks that the industry should be "reasonably free" to meet the "necessary and urgent demands of the home market." As things stand, manufacturers have been given until the middle of the year to see if the necessary increase in exports can be achieved. Not all firms are affected; some are fully booked with export orders for many months ahead. As recently as November, the Ministry of Supply was known to favour a system of licensing if the deliveries to the home market could not voluntarily be cut down. It is now unlikely that such a scheme could be carried out. It remains to be seen whether the Ministry will maintain its attitude if, by the summer, some manufacturers are faced with the choice of increasing home deliveries or turning off workers.

* * *

Locomotive Policy

It is beginning to emerge that the thinking of the Transport Commission and the Railway Executive on locomotive policy favours electrification rather than diesel traction. Sir Cyril Hurcomb this week declared that some general assessment of the future of motive power must be made, and that a report from the Railway Executive was awaited. Sir Eustace Missenden, the chairman of the Executive, argued his personal view before the Institute of Transport last November, that operating and economic conditions warranted and demanded

> the early and progressive extension of electrification for main line passenger and freight traffic, as well as for inter-urban and suburban services.

The technical case for electrification tends to be taken as proved, though without any public examination of the extraordinary development of diesel-electric traction in the United States. There has, in fact, been no public review of the economics of traction policy since the Weir Committee studied main line electrification in 1929-30—practically a decade before main line diesel locomotion established itself in the United States. Perhaps an inquiry of a similar kind, taking account of new technical and economic trends in the past two decades, would be desirable now; the issues are in danger of being determined by *obiter dicta*.

Sir Cyril had no doubt of the gains in efficiency and convenience to be gained from electrification. On suburban services, the new facilities could be counted on to produce the traffic. But when he turned to main line electrification, Sir Cyril in effect set down four guarantees which he would seek before considering the investment of hundreds of millions: first, the lowest possible costs for equipment; secondly, agreement with the unions about manning electric locomotives; thirdly, "cheap and abundant electricity"; and fourth,

> a sufficient integration of the transport system as a whole ... to give us a reasonable chance of securing the traffic which we set out to gain ... without finding it diverted from the public transport system.

With all things so certain as this, main line electrification might pay a reasonable return on its investment. It certainly ought to do so; but equally, if the Commission could impose the stiffer safeguards against the use of competitive private transport which seem to be implicit in Sir Cyril's fourth point, steam locomotion could be made to pay handsomely too. It seems that commercial policy and traction policy are becoming rather mixed up.

* * *

Prospect for Coal Exports

Abnormal influences, abrupt shifts in the sources of supply and fluctuations in consumption have so confused the pattern of international trade in fuels in recent years that it is by no means easy to disentangle the secular trends. On what assumptions and within what dimensions ought the production and marketing of coal to be projected over, say, the next ten years? Mr H. H. Merrett has made a helpful attempt to answer these questions in a survey, the results

of which are outlined in the *National Provincial Bank Review* for February. Mr Merrett has considered the factors likely to influence demand between 1949 and 1958 in 17 countries in Europe and other parts of the world which together took some 74 per cent of British exports of solid fuel in 1938. These countries are likely, in his view, to require barely 55 million metric tons of solid fuel imports in 1950. This is 16 per cent less than the same countries took in 1938, and though the present tendency is for their imports to rise, they will fall again, perhaps to 80 per cent of the 1938 figure or even less in a few years. The reduction is spread over railway consumption, bunkering depots, general industry, and domestic consumption. Requirements for electricity are expected to decline slightly, and the only increased requirements are from gas works and, on a smaller scale, cement works. If the decline is apportioned to classes of fuel, steam large and through coals account for the bulk of it, but coking coal (1,000,000 tons less), patent fuel (1,500,000) and anthracite (400,000) are more unexpected reductions.

Full data which would show the nature of the influences at work are not published in the article, but what is happening is clearly the replacement of imported coal and coke by fuel oil, electric power, and indigenous coal. The technological swing from coal to fuel oil was apparent before the war; markets cut off during and after the war from British coal (notably Canada and Scandinavia) turned increasingly to fuel oil, and though the oil shortage of 1947 administered a set-back to the process of conversion, Mr Merrett expects oil fuels to continue to gain ground. Railways are tending to turn from steam to diesel power. The coal shortage, balance of payments stringencies, and the high postwar cost of coal have encouraged the expansion of coal production in some old importing countries such as Spain.

The countries surveyed do not comprise the whole of the market for British coal and coke; they represented 74 per cent of the sales in 1938. Equally, they are by no means a reserved market for Britain; Poland and Germany are formidable competitors, and South Africa is mentioned as having a good exportable surplus restricted only by the lack of return bulk cargoes to make ocean carriage cheap. The seventeen countries are the principal traditional importers of British coal and coke, and their estimated future requirement of 51 million metric tons a year gives a measure of the maximum "within which the British coal exporter can expect to operate." But ample, regular and punctual supplies at "the lowest possible prices" are needed to enable the bulk of this market to be regained and held; and there is no time for delay in bringing about these conditions of trade if the opportunity is not to be let slip.

* * *

Heavy Fuel for Diesel Ships

The Anglo-Saxon Petroleum Company has converted five motor tankers to use the grade of heavy oil normally used in steam turbines, in place of the more expensive diesel oil, and several more are being converted. On ships of this type the saving represented by the difference in fuel prices is about £10,000 a year. The company started experiments in the use of heavier fuel about 3½ years ago. No alterations were made to the engines themselves; the equipment fitted purifies and clarifies the heavy oil and then maintains it at a temperature of 180°F. One motor tanker, the *Auricula*, has been burning various types of heavy fuel successfully since the experiment started. It has saved £21,000 in fuel costs, and wear on the engines is slightly less than with diesel oil. The necessary extra equipment costs between £5,000 and £8,000. A number of ships in other countries have been, and some are being, fitted with similar plant; the British firm which supplies one essential component has between 200 and 250 orders.

The savings achieved are substantial enough to raise the question whether marine diesel engines will come to be designed to use heavy fuels as a matter of course. Patents governing the process belong to the Shell group, which is not making any charge for their use. Calculations have been made which suggest that if all the motor ships registered with Lloyds were converted to heavy fuel, the annual saving of fuel might be more than £70 million. This would change the competitive position of diesel engines in relation to steam turbines; at present fuel prices, some engineers consider that the running costs of the most efficient steam turbine are twice as high as those of a diesel engine using heavy fuel. It would also upset many calculations of the prospective competitive position of diesel engines in relation to gas turbines. The economic case for the marine gas turbine against the diesel has so far been based on the assumption that the gas turbine ran on bunker fuel while the diesel used the lighter oil. It is believed possible to apply the same technique to all slow-running diesel engines whatever their use, but experiments on fast-running diesels have yet to be made.

* * *

Government Patents

The National Research Development Corporation, which was set up under the Development of Inventions Act of 1948, has spent most of its nine months' existence evolving its own organisation and staff. It is now faced with the difficult task of establishing its position with the scientist and the manufacturer. The corporation has two functions: to own and licence all patents covering non-military research developments made in any institutions financed out of public funds; and to promote—even finance—the development of those and any other patents brought to it if the national interest requires. Unless it can inspire confidence in its ability to perform these functions, and indeed convince scientists that they need to be performed at all, the corporation will remain a body without substance, and scientists and private firms will come together without its intervention.

The services which a body responsible for Government-owned patents can perform are real, particularly if they are patents likely to be licensed abroad. Power Jets (Research and Development) Ltd. was re-formed some years ago to own and licence the master patents for gas turbine engines. The failure to define the status of these patents during the war has led to many of them being used in the United States without any payment of royalties, and on other licences the royalties are considered unreasonably low. The original British work on penicillin was not patented, but the deep fermentation process developed from it in the United States was. Royalties for the use of this process are still being paid by Britain to the American firms responsible. Had the original (scientific) work been patented, such payments would not have arisen.

The corporation will have no easy task to instil into scientific workers outside the Government the need to patent their developments. In many branches of science the tradition against patenting is deep-rooted. Equally serious psychological difficulties face the corporation in stimulating the development by industry of the patents it holds. A process may lose its commercial attraction when exclusive licences are not granted. A fruitful field for dispute lies in the demarcation between development done with the corporation's money (it has £5,000,000 last five years) and with private money. On the other hand, if the corporation holds master patents on a new field of development, the alternative to accepting its terms is exclusion from that field. In such negotiations, much depends on the type of process under discussion and the attitude of the management negotiating with the corporation. The difficulties can be unimportant; but, equally, it appears that they can be insuper-

Trade Trends

Report on Overseas Trade

The Board of Trade's regular feat of publishing detailed trade figures within three weeks of the end of each month is unmatched by any other country. But the form of the tables, designed in happier days before there was a dollar problem, has not made it easy to trace the details of trade with the dollar countries or to put the figures in the various compartments—the western hemisphere, the OEEC group, the sterling area and the rest of the world—which now govern trade policy. A new monthly publication* meets this need admirably, and will put an end to the need for tedious and usually inadequate unofficial research to discover the pattern of Britain's foreign trade.

* Includes possessions.

"Report on Overseas Trade" includes the basic trade tables which appear regularly in the *Board of Trade Journal* and the monthly *Digest of Statistics*, but its main value is a new series of tables giving exports (and imports) by commodity groups to the four main trading areas and to selected countries, and the detailed exports to the United States, Canada, Belgium, Switzerland and Argentina. Hitherto such figures had to be calculated privately from the trade and navigation accounts. The accompanying table summarises two tables which appear in the first report. It shows that Britain's export drive last year was concentrated mainly in the sterling area, and that the curtailment of imports from the western hemisphere was small. The latest data contained in this first issue of the report (which is dated February, 1950) refer to last December.

* Report on Overseas Trade: HMSO, Price 1s. 0d. net.

* * *

Indo-Pakistan Trade

Six months after devaluation, trade is still trickling across the Indo-Pakistan border at a level probably less than one-fifth of that attained before September. Apart from the ban (or virtual ban) on the import of raw jute into India and the export of coal from it, the impediments to trade arising from both sides do not take the form of outright embargo on the movement of goods so much as of mutually mule-headed restrictions on payments. At the moment, with Pakistan jute exports out of the picture, India is running a large active balance with Pakistan; the object of every trader is therefore to buy Indian rupees at, or near, the official rate of 11 Pakistan annas to one Indian rupee. As neither of the two central banks will supply Indian rupees at this rate, the commercial banks in both countries are naturally unwilling to deal on any large scale. The result is that trade is being carried on through a whole series of makeshift barter agreements—in most of which Pakistan traders (in defiance of the laws of their own country) are being driven to accept an exchange rate which puts the two rupees at par with one another.

The position is illuminated by a statistical analysis published in the February "Bulletin" of the Reserve Bank of India. This suggests that India's deficit with Pakistan on current account in the year to June, 1949, amounted to Rs. 34 crores (India receipts amounting to Rs. 83½ crores and payments to Rs. 117½ crores); the deficit was further swollen by a net movement of Rs. 14 crores of capital from India to Pakistan through the commercial banking system. In the three months to September, 1949, India's current payments to Pakistan (at Rs. 34 crores) still exceeded its receipts from Pakistan (at Rs. 14 crores), but in the next three months this deficit of nearly Rs. 20 crores was turned to a surplus of more than Rs. 9 crores; India's receipts from Pakistan in this last quarter of 1949 fell by only Rs. 3½ crores to just under Rs. 11 crores while its payments to Pakistan fell by nearly Rs. 32 crores to under Rs. 2 crores.

Nobody can be happy about this state of affairs—except, possibly, those unwise people on either side who believe there is some advantage in cutting off their own noses if this spites the other Dominion's face. What has happened, of course, is that a decision which was wide open to economic debate (that of the rate at which Pakistan should convert into domestic currency the proceeds of exports sold at world prices) has been transposed into a question of national prestige. India apparently considers that to accept any other rate than par between the rupees would seemingly endorse the suggestion that Pakistan is in a stronger economic position than India (a suggestion which all Indians stoutly deny); Pakistan has to some extent convinced itself that the foreign currency price of its exports should be determined by the foreign currency value of its rupee—instead of the other way round. Any compromise—whatever its terms—which involved any dismounting from these unhappy high horses, would be a victory for both sides.

* * *

What Next in Japan?

The engine of the Japanese economy, after its prolonged postwar reconstruction, now seems to be running strongly, registering impressive productive increases but being still subject to dangerous jolts. The most obvious cause of disequilibrium at the moment is the adverse balance of payments; although Japan's exports in 1949 were three times as large as in 1947, its adverse visible balance, at the high figure of $365 million, was actually slightly higher than in 1947, and has probably tended to increase in recent months. It is known, for instance, that the £10 million sterling balance which Japan held in November is now exhausted; Japan's purchases from the sterling area are running well ahead of the schedule laid down in the recent trade agreement (seasonal factors may account for some of the excess), while sterling area purchases from Japan are now reported to be showing a slight tendency to lag behind.

The main features of the Japanese economy in the past year, however, have not been these external stresses but its productivity and extraordinary resilience. Industrial production increased by 30 per cent in 1949 to just under 80 per cent of the 1932-36 level, even though the similar

index of textile production still stood at only 26 per cent. This increase in production and the maintenance of the level of employment took place in spite of the fact that dramatic cuts in subsidies to industry and the fixing of the disinflationary exchange rate of 360 yen to the dollar in April, 1949, confronted Japanese industrialists with the stern alternative of cutting costs or going out of business. In Japan—though probably in no other industrial country in the world—it still seems possible for the whole level of internal costs, wages, prices and profits, to revolve meekly around almost any level of the external exchange rate. The potential economic consequences of this flexibility should not be underrated. The Japanese Government, which is now rapidly reassuming control over the management of its own economic affairs, is inheriting an economy in which the standard of living (and above all of imports) may have to be cut as American subventions cease; but it is also inheriting an economy whose competitive power may be at its greatest, and whose ability to achieve a balanced payments position may be most enhanced, at precisely those moments when other great industrial powers have their difficulties increased by the onset of any acute buyers' market or the advent of world slump.

* * *

Seasonal Fall in Trade

The detailed trade figures for February which were published this week confirmed the general impression that although Britain's overall trade balance is probably looking more favourable than it has done for some time, there is little sign of a material improvement in dollar trade. The value of exports fell last month by £20 million to £156 million—largely a seasonal movement. The vehicle group alone declined by £5,000,000 to £30 million, though the shipment of motor cars and chassis (33,554 units) and commercial vehicles (10,608 units) established new records. Australia remains Britain's chief market for vehicles of all types, but in February Canada assumed second place. Machinery exports declined by £4,500,000 last month to £24 million, but for the second consecutive month well over £1,000,000 worth was shipped to Russia, mainly electrical generating plant. Textile exports as a whole declined by £2,000,000 to £29 million; almost the whole of this reduction occurred in cotton goods. Exports of wool, and rayon textiles, apparel and other consumer goods such as electrical appliances and pottery were well maintained.

The decline in imports last month from £201 million to £181½ million—also seasonal—was largely accounted for by smaller receipts of grain, meat and dairy produce. A particularly large shipment of cocoa beans was received from British West Africa as well as increased quantities of rum and fruit juice from colonial sources. Imports of raw materials showed little reduction compared with January. Supplies of non-ferrous metals, raw cotton, raw wool, hides and skins in particular were appreciably larger.

* * *

Tobacco and Turnover

Sir Robert Sinclair's speech at the Imperial Tobacco meeting confirmed many of the inferences about last year's trading conditions which had been drawn from the accounts. Last year's favourable comparison with 1948 was, to some extent, caused by factors which will not recur this year; supplies were sparingly distributed in 1948, but in 1949, when leaf supplies seemed more secure than had been expected, the level of supplies to the shops was raised. Manufacturers' stocks at the end of October were, therefore, lower than a year earlier (when they included a margin for safety). But the more important question for the group is the level of leaf stocks and their cost. Only part (though a significant part) of the extra cost of dollar leaf appeared in the 1948-49 balance sheet; devaluation occurred at the very moment of the American tobacco sales, and this year it will affect not only the price of dollar leaf but also that of non-dollar leaf. The group purchases all the suitable non-dollar tobacco that it can get, but it would obviously like to see its leaf stocks at a considerably higher level.

Sir Robert gave fair warning that devaluation "is not by any stretch of the imagination a good thing" for Imperial Tobacco. It will increase the group's manufacturing costs, and its capital requirements. The specific increase in financial commitments arising from devaluation will be covered, the chairman hopes, by the current year's trading results; in addition, the group will have to meet the additional costs arising from devaluation in its manufacturing operations, though it hopes to avoid any general increase in prices, at least in the immediate future.

No company has suffered a more direct drain upon its real resources from EPT and high taxation than "Imps," and few companies have done more to make such a drain good out of its taxed profits. There is, as Sir Robert conceded, little new that can be said on this subject, but he was entirely justified in emphasising its importance once again and to argue for a modification of taxation in so far as this falls on industry's capital and not on its income. Meanwhile, the company evidently has no immediate intention of funding its heavy short-term indebtedness; it will not ignore "any convenient opportunity" of doing so, but is disposed to wait until circumstances are opportune. The warning note is less concerned with finance than with turnover. There are unmistakable signs, Sir Robert argues, that if the duty is maintained for long at its present level, serious inroads will be made into tobacco consumption. The Exchequer has a vital interest in the receipts of the tobacco duty, and in Sir Robert's view, the protection of the revenue over the years calls for a reduction in duty "from its dangerously high level."

Finance and Commodities

Banks and Public Utilities

The latest quarterly classification of bank advances compiled by the British Bankers' Association puts in a new light the big expansion of aggregate advances which has occurred since the devaluation of sterling. In the six months to mid-February, as noted in these columns three weeks ago, the advances of the clearing banks rose by £134 million, or virtually twice the amount by which they rose in the similar period of 1948-49. This movement, though evidently reflecting the effects of devaluation upon the cost of financing stocks, has given rise to a certain amount of anxiety, partly because it followed the reiteration, last September, of the Chancellor's insistence upon the need for the exercise of restraint in the granting of credit. It is important to note, therefore, that a large part of the recent demands now proves to have come, not from the private sector of the economy, but from public or semi-public enterprises.

The quarterly classification, which embraces all banks in the Association but excludes any advances made outside Great Britain, shows that advances, thus defined, rose by £113 million in the three months to last February and by £149 million in the six months to that date. In the corresponding period a year earlier the increases were £85 million and £80 million respectively. The classified figures now reveal that in the latest three-month period no less than £36.8 million, and in the six-month period £58 million, was attributable to the demands of the Public Utilities group (which excludes Transport). In consequence, the total under this head has risen to the very high figure of £79 million, or more than twice its previous peak. This expansion reflects the heavy requirements of the Electricity and Gas industries, while the marked difference between this year's experience

and last year's is mainly attributable to the fact that in 1948-49 the proceeds of the big BEA issue were being partly used to repay outstanding indebtedness to banks.

If the requirements of the Public Utilities group are excluded from the reckoning, it will be seen that the aggregate increase in the other 24 categories of borrowers has actually been slightly less in the past six months than in the similar period of 1948-49. Among these other groups, the principal demands, over the six months, came from Retail Trade (£13.8 million), the Financial group other than Stockbrokers (£11.5 million), Food, Drink and Tobacco (£10.4 million), Agriculture and Fishing (£9.4 million), and the three Textile groups (which together absorbed £13.1 million). The only group to show any important decline over the six months was Engineering, which contracted by £8.7 million to £96.0 million, in contrast with £122.5 million twelve months ago. It is noteworthy that the large Personal and Professional group has risen since last August by only £6.5 million to £414 million, so that its proportion of the total advances made by the banks is now down to 25.2 per cent, compared with 28.2 per cent when this series of classified figures first became available four years ago.

* * *

New Issues Reviving?

The handful of new issues now in prospect hardly amounts to a full-blooded revival of industrial capital operations. But after the prolonged lull, enlivened solely by the Boots' "rights" issue, even a modicum of activity will seem noteworthy. Much the biggest issue is the long-foreshadowed stock issue by Fisons. This would seem to be on distinctly stiffer terms than were first envisaged. The first stage in the Fisons' capital programme occurred early last autumn when shareholders were offered 2,219,278 £1 ordinary shares at 21s. The board then announced that it would later raise £3,000,000 in unsecured loan stock. The total has now been increased to £3,500,000 and takes the form of 4¼ per cent first mortgage debenture stock, 1965-83 at £98 per cent.

The other large operation under way is the first issue by the East African High Commission for which lists open on Monday. The issue is of a £3,500,000 3½ per cent stock, 1966-68, issued at £97½ per cent by the Commission on behalf of the East African Railways and Harbours Administration. The operation is primarily to replace the 4½ per cent Kenya loan of the same amount which falls due on May 1st, but cash applications are invited and the terms seem designed to attract good support.

Among the smaller operations now under way is the offer this week by Leadenhall Securities Corporation of 200,000 5½ per cent cumulative redeemable £1 preference shares in Pilkington's Tiles at 20s. 6d. per share. This is typical of the return which is now needed to raise preference capital except of the very highest investment class. An equity new to the Stock Exchange (unless it offers exceptional attractions) could hardly be marketed on a dividend yield basis much below 10 per cent, and an earnings yield of twice that size. Brokers and issuing houses find it difficult to implant this new yield pattern in the mind of prospective vendors. Yet the decline in cash resources and the growing demand for bank accommodation by industry suggests that issues now postponed on the ground that the price is too stiff may not be indefinitely postponable.

* * *

Slump in Free Gold

The free market price of gold has been slipping again this week and now ranges between $39 and $39½ an ounce About a year ago, it touched a peak of around $52 an ounce. The demand for gold at that time was stimulated by expectations of world-wide currency devaluations and by an exceptional hoarding demand in China, much of it by those who had access to the US dollars which were still being poured into Nationalist China. The devaluations have come and gone, and the special Chinese demand has disappeared now that the Communist tide has swept over the whole mainland. The result has been a persistent decline in the price of gold. The free quotation fell to $38½ a few weeks ago. This was followed by a modest recovery, but the recent trend has again been downward.

Apart from the cessation of Chinese demand, the most important single factor in the gold situation has been the increased supply of gold reaching the free market through the sale of processed gold manufactured in the producing countries, especially South Africa. It has been announced in Cape Town this week that gold supplied by the Chamber of Mines for industrial purposes from the inception of the scheme in February, 1949, up to the end of February, 1950, was 1,271,285 ounces; the additional profit to the gold-mining industry amounted to £1,692,000. This processed gold was sold at a premium with the full sanction of the International Monetary Fund, but a substantial part of the supply, although ostensibly intended for industrial purposes, is either re-melted or otherwise finds its way into the free markets. The appearance of this additional supply of gold has undoubtedly played its part in causing a weakening in the price.

The free market has also been affected by continuing offerings of South American gold and by small parcels of Russian gold which have been making their way to the Middle East markets in the last few months. The Russians have also resumed selling of platinum and palladium in recent weeks, after having been out of this market since 1946. Small parcels of both metals have been offered on the Continent against dollars, and a more substantial amount of Russian platinum is now being offered in the New York market. The price of platinum has fallen well below that of gold and now ranges between $22¼-¾ per ounce. The virtual disappearance of the premium on the free price of gold is one of the factors responsible for the recent decline in prices of goldmining shares. The hope cherished by many speculators that there must ultimately be an adjustment of the official price of gold to the level dictated by a free market has ceased today to have any bullish implications.

* * *

Base Metal Movements

Movements in the non-ferrous metal market are conflicting. Demand for copper in the United States still shows no signs of weakening, though stocks in most European countries are now fully adequate. But so long as American demand continues to exceed American production—in February there was again a margin of nearly 20,000 tons—lower copper prices remain improbable. Japan has been profiting from the American demand; since last July some 30,000 tons of electrolytic copper have been shipped by Japan to the United States at prices (so the Japanese merchants claim) appreciably higher than those ruling in Japan.

Zinc also remains firm. Ten days ago, the New York price rose by ¼ cent to 10 cents a lb. (£80 a ton)—a move quickly followed by the raising of the Ministry of Supply's selling price by £2 to £87 10s. a ton. American deliveries of zinc last month were also much larger than domestic output and stocks were considerably reduced. In contrast, lead has been weak. A fortnight ago the New York price fell by 1 cent to 11 cents a lb. (£88 a ton). The British price was reduced by £9 (compared with the equivalent American reduction of £8) to £88 a ton. A week later the American price fell by ½ cent and the Ministry of Supply reduced its price correspondingly by £4 a ton. Demand for lead is not very brisk even in Britain, and the present level of consumption can be largely covered by imports from soft currency sources. The weakness in the American market is attributed to sales of

European lead, despite the import duty of £5 10s. a ton which protects the American producer. Imports into the United States last year were 20 per cent heavier than in 1948.

The main interest in tin is in the narrowing and final disappearance of the backwardation and the establishment of a modest contango. Spot tin had been hovering around £600 a ton, and on Monday three months' delivery was quoted at the same price as cash. By Wednesday, spot had hardened to £604½ and three months' delivery to £605. The main demand is believed to have come from Russia, though the new selling policy which the American Reconstruction Finance Corporation adopted last week no doubt enabled American merchants to buy more freely in Singapore. There has been no sign of purchases for the American stockpile, and the market is clearly expecting these to be superimposed on the current commercial demand. In this they might be disappointed.

* * *

Strangers in the Cup

The Ministry of Food mission which went to India, Pakistan and Ceylon last month to discuss the 1950 tea contract and the reopening of the London tea market next year seems not to have been very successful in either endeavour. Since its return a fortnight ago no official announcement has been made, though the Minister of Food stated in the Commons last Monday that he hoped to make one in "a few weeks' time." Unofficial reports suggest that the Ministry may have to pay 5d. a lb. more for tea this year, but the maximum quantity it may procure from the three Dominions is said to be down by 50 million lb. If these reports are sound, they hardly suggest much chance for the reopening of Mincing Lane in 1951.

The Ministry of Food is faced with three difficulties. The first is to get enough tea to maintain a reasonable ration. Last year, total supplies from India, Ceylon and Pakistan amounted to 465 million lb. The response of the growers depends on the price the Ministry offers. The trend of prices in both Colombo and Calcutta since devaluation suggests that the new contract would have to be raised by about 6d. a lb. to secure an adequate quantity. Mincing Lane would hardly be able to reopen next year unless the Ministry's imports during the current year reached 480 million lb., of which at least 425 million lb. would have to come from India and Ceylon.

The second difficulty is the subsidy, now 8½d. a lb. If the Ministry had to pay 6d. a lb. more and the retail price of tea were not increased, the subsidy would reach 1s. 2½d. a lb. London tea brokers have devised a scheme whereby the subsidy could continue if importing were returned to private hands. But if the market were to be efficient it could hardly be fettered with the administration of a retail price subsidy. The resumption of private trade would thus, in all likelihood, involve raising the retail price of tea by 1s. 2½d. a lb. The Chancellor, it will be recalled, has no room for altering the import duties, for since last year's budget Commonwealth teas enter Britain free of duty, and foreign teas pay only 2d. a lb. duty.

The third difficulty is the embargo which India and Ceylon have placed on the resale of their teas purchased by Britain. Since these two Dominions are by no means eager to see the re-establishment of a London market which would compete with their local markets, they are likely to retain that embargo if they can. For these various reasons, the chances that the London tea market might be reopened are slim.

* * *

Indonesia and the Rubber Market

Indonesia's currency revaluation has had a profound effect on the rubber market. Native rubber producers in Indonesia have feared such a move for some time and have been holding quite considerable stocks. An additional incentive to hold rubber was created when the export bonus scheme was allowed to peter out. Up to last September, shippers and producers were permitted to keep for their own use 15 per cent of their foreign currency earnings from the direct export of rubber. This inducement was reintroduced last month, but the proportion which shippers and producers could keep was reduced to 10 per cent.

Contrary to expectations, the reintroduction of the scheme did not evoke any substantial increase in exports. Rubber producers in Indonesia were more concerned about the prospective cut in the domestic currency than with the attractions of keeping 10 per cent of the foreign proceeds of exports. In this appreciation they were right. From the market's standpoint, the important question is when these hoarded supplies—estimated at some 70,000 tons—may be unloaded. Shippers are likely to wait at least until the new currency has settled down. Meanwhile, spot rubber in London has remained steady at around 1s. 4¼d. a lb.

Shorter Notes

The British Transport Commission's application for increased freight charges, submitted to the Transport Tribunal by the Minister on November 28th last as a matter of "extreme urgency" remains undecided. Since last week's debate on transport, the Tribunal's report (dated February 6th) has been published. It advises the Minister to authorise the one-sixth increase in freight rates which was sought. At the same time, it describes the anticipated economies of the Commission in 1950 as "disappointingly small," though it has no grounds for rejecting the estimates. Proposals for a differentiation of freight rates in favour of coal are left for consideration when the Charges Scheme is presented.

*

Britain agreed this week to buy 32 million lb. of dried eggs from the United States. This quantity represents nearly two years' supply for Britain at last year's rate of consumption and will provide an outlet for one-third of the American surplus stock. Dried eggs do not store well and these supplies are believed to be well over two years old. The Ministry of Food has admitted that they would not be suitable for the normal retail trade, but will be distributed to manufacturers and caterers. The total cost is said to be $7,000,000, of which $3,000,000 will be provided by ECA and a similar amount by the American Treasury (as a subsidy for the disposal of surplus foods), leaving Britain a net expenditure of $1,000,000 of earned dollars. The dried eggs are part of the *quid pro quo* which Britain promised last September when E.C.A. resumed its dollar grants for Canadian wheat.

*

Approval from the Share and Loan Department will in future have to be obtained before dealing may take place on the London Stock Exchange in any South African securities introduced in Johannesburg. The Stock Exchange Council is thus amending for South Africa securities Rule 161 (1) (e) under which dealings are allowed in London without any application to the Share and Loan Department provided that the security is quoted on a recognised stock exchange here or abroad. The new procedure for South African securities will require publication of particulars in the British press. Dealings in other securities under Rule 161 (1) (e) are not affected.

*

In the absence of a more reasonable approach by Poland to settle its prewar sterling debt, the London credit facilities of £2,500,000 recently due for renewal have been allowed to lapse. Prolonged negotiations on Anglo-Polish trade in 1950 have finally been concluded. Britain will import at considerably higher prices, food worth £16 million, including larger quantities of eggs and bacon. A timber agreement remains to be negotiated.

ABRIDGED PARTICULARS.

The Subscription List will open at 10 a.m. on Wednesday, 29th March, 1950, and close on the same day.

FISONS LIMITED

(Incorporated under the Companies Acts, 1862 to 1890.)

SHARE CAPITAL

Authorised:		*Issued:*
£3,500,000	in 4½ per cent. Cumulative Preference Stock and Preference Shares of £1 each	£3,258,900
£5,000,000	in Ordinary Stock and Ordinary Shares of £1 each	£4,438,556
£8,500,000		£7,697,456

LOAN CAPITAL:

Authorised:		*Now Offered:*
£3,500,000	4¼ per cent. First Mortgage Debenture Stock 1965/83	£3,500,000

With the exception of the above-mentioned Debenture Stock and a secured loan of £152,200 raised by a subsidiary, neither the Company nor any of its subsidiaries has outstanding any debenture, mortgage or other secured loan capital nor has any such subsidiary any other borrowings outstanding other than inter-company borrowings.

ISSUE OF
£3,500,000 4¼ per cent. First Mortgage Debenture Stock 1965/83, at £98 per cent.,

PAYABLE AS FOLLOWS:

On Application	...	£50 per cent.
On Allotment	...	£48 per cent.
		£98 per cent.

(Firm applications on sub-underwriting terms have been received from Sub-Underwriters for £1,172,000 of the Stock and in respect of these applications allotment will be made in full.)

The Prospectus shows (*inter alia*) that:—

(*a*) The Stock will be constituted by a Trust Deed in favour of Alliance Assurance Company, Limited, as Trustees.

(*b*) The Stock will be secured by (i) a first specific charge on the whole of the present freehold and leasehold properties of the Company together with the buildings, fixed plant and machinery thereon, excluding certain properties and plant and machinery having an aggregate book value of £102,795; (ii) a first specific charge on the Company's holding of shares in certain subsidiaries, which shares have a book value of £2,778,657, with a covenant by the Company to procure that none of such subsidiaries and no subsidiary of any such subsidiaries shall create any mortgage or charge in favour of or borrow or lend any moneys from or to any party other than the Company or *inter se*; (iii) a floating charge according to English law on the undertaking and other properties and assets, present and future, of the Company, including any uncalled capital.

(*c*) The Company will reserve the right to create in priority to the floating charge securing the Stock (i) charges whether specific or floating on current assets for securing temporary borrowings from bankers in the ordinary course of business, provided that the principal amounts so secured at any one time shall not exceed in the aggregate £3,500,000; (ii) specific mortgages or charges on freehold and leasehold properties, together with all buildings, fixed plant and machinery thereon acquired after the date thereof for securing principal amounts not exceeding two-thirds of the cost thereof as defined by the Trust Deed.

(*d*) The Stock will be redeemed on or before 30th June, 1983, by the annual operation of a Cumulative Sinking Fund of 1½ per cent., commencing in the year ending on 30th June, 1954, and to be applied in the redemption of Stock by purchase on the market at or under par, exclusive of accrued interest (less Income Tax) and expenses (but so that on any such purchase any amount in excess of £100 per £100 Stock shall be provided by the Company otherwise than out of the Sinking Fund) and, failing purchases, by drawings at par.

(*e*) The Company will reserve the right, on giving not less than three months' notice, to redeem the whole or any part (to be selected by drawings) of the Stock at any time after 30th June, 1965, and on or before 30th June, 1975, at 101 per cent., and after 30th June, 1975, and before 30th June, 1983, at 100½ per cent., in both cases together with accrued interest. In the event of the voluntary liquidation of the Company before 30th June, 1983, any Stock not previously redeemed will be repaid, with accrued interest up to the date of repayment, at 101 per cent. if such liquidation takes place on or before 30th June, 1975, and at 100½ per cent. if such liquidation takes place after that date.

(*f*) Interest on the Stock will be payable on 30th June and 31st December in every year, the first payment to be made on 30th June, 1950, and to be at the rate of £1 1s. 2d. (less Income Tax) per £100 nominal of Stock, representing interest on the full nominal amount thereof to that date from 31st March, 1950.

(*g*) The profits (before deducting Taxation) of the Group for the financial year ended 30th June, 1949, attributable to Fisons Limited, are equivalent to more than four times the gross interest payable on the Stock.

(*h*) The net tangible assets of the Group attributable to Fisons Limited, including the net proceeds of the Stock now being issued, are more than three times the nominal amount of the Stock together with the maximum premium payable on redemption prior to final maturity.

Copies of the Prospectus (on the terms of which alone applications will be considered) and Forms of Application may be obtained from:—

IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND) LIMITED

DANGEROUSLY HIGH LEVEL OF TOBACCO DUTY

RESERVE ALLOCATIONS—SUBSTANTIAL TAX REMISSION URGED

EFFECT OF DEVALUATION

SIR ROBERT SINCLAIR'S REVIEW OF TRADING POSITION AND PROSPECTS

The forty-eighth ordinary general meeting of the Imperial Tobacco Company (of Great Britain and Ireland) Limited was held, March 21st, at Bristol.

Sir Robert J. Sinclair, K.C.B., K.B.E. (the chairman), who presided, said:—Ladies and gentlemen,—Before proceeding to comment on the accounts, may I refer for a moment to paragraph 9 of the directors' report? We therein record with regret the retirement of Sir Ernest Wills, who has been a member of our board for 28 years. We are very sorry indeed that the time has come when he felt it necessary to resign to make way for a younger man, and I am sure you will all join with me in expressing to him both our thanks for his services to the company as a director and also our best wishes.

During the year under review we have elected to the board Mr John Anstey and Mr Ernest John Partridge. Mr Anstey is a member of the senior management of our John Player and Sons branch and Mr Partridge, as you all know, is the secretary of the company, having succeeded Mr Anson in that position in 1946. Both Mr Anstey and Mr Partridge, I am glad to say, are young in years although comparatively old in experience of our business. They have shown outstanding ability, and I hope the board will have the advantage of their knowledge and judgment for many years to come.

COMMENTS ON THE ACCOUNTS

Now to turn to the accounts and the directors' report. The principal variations shown in the accounts are set out and commented upon in the directors' report. I will not, therefore, go through the figures in detail, but will concentrate upon the main features. There are, I think, two outstanding figures in the accounts before you. Firstly, the very considerable increase of £6,000,000 in the value of our stocks; and, secondly, the increase in trading profit.

Stock-in-trade is mainly composed of three items—unmanufactured leaf in bond and in transit; leaf in course of manufacture and stocks of our manufactured products; and general materials and stores. The last item in itself represents quite a considerable figure, but it is nevertheless small in relation to the other two and does not show any significant change compared with the previous year. The second item, duty-paid stocks, which of course includes a large element of duty, represented a smaller quantity of stock than a year ago, and the reason will be clear when come to deal with the increase in trading rofit. The increase, therefore, in stock-in-ade arises from changes in the value of our ocks of unmanufactured tobacco. As the ectors' report indicates, the quantity of lar tobacco in our stocks was rather less the quantity and proportion of non-ar tobacco had increased. The increase alue of these stocks was mainly attributo two factors—firstly, a rising ten- of leaf prices in the sterling area, and dly, devaluation of the £—and to a lesser extent to an increase in quantity. So far as the accounts before you are concerned, devaluation affected the figures only in respect of leaf purchased between September 18 and October 31, 1949. Since that period of six weeks fell in the middle of the leaf tobacco sales in America, these purchases were quite substantial. The full effect of devaluation will not, however, be seen until next year's accounts are presented, and I will have more to say on this subject when I am dealing with the outlook for the current year.

Before I leave this item of stock-in-trade I ought, I think, to make it clear that in present circumstances our leaf stocks generally are perforce kept down to what we regard as the bare working minimum. Naturally the quantity varies slightly from year to year, since the date when our accounts are closed falls in the middle of the American buying season. We should like to see our stocks considerably higher than they are, but the fact is that we buy all the suitable tobacco that we can obtain from non-dollar sources while our purchases from the dollar area are limited by the allocation of dollars made to us by H.M. Government.

TRADING PROFIT: FACTORS AFFECTING INCREASE

As you will have seen, the trading profit for the year under review showed a substantial increase. This item, of course, reflects a great variety of factors, some of which are peculiar to the year in question and others are not. Broadly speaking, the increase that we show this year is attributable to a combination of economies in production and increased turnover. There were, however, certain non-recurring factors which affect the comparison with the previous year; perhaps the most important of these was the fact that in 1948 we had to bear the cost of reducing prices immediately following a reduction in duty in Southern Ireland, with a consequent loss on the sale of manufactured stocks which had borne the higher duty, and in the year under review no similar loss was sustained.

It may perhaps be surprising to some that we were able to increase our turnover in 1949, when general trading conditions were by no means easy. But the explanation is simply this. In 1948 we were very apprehensive about future supplies of leaf, and in order to avoid the risk of a too drastic and sudden reduction in the level of supplies we kept our sales substantially below our quota. Our worst fears as regards the leaf supply position were not realised, and the result was that during the latter part of 1948 and the early part of 1949 we increased appreciably our manufactured stocks without letting our basic leaf stocks fall below the safety level. We were thus able, particularly during the second half of 1949, to increase the general level of our supplies to the public and to make substantial special allotments to holiday resorts. I indicated a year ago that this course might be possible. In the result our manufactured stocks at October 31st last although at a perfectly sound level, were lower than a year before.

The item of trading profit to which I have been referring is, of course, the gross profit for the parent company, and it should, I think, be looked at in combination with the trading results of our subsidiary companies. Although they do a certain amount of outside trade—and it is very important from the point of view of maintaining a truly competitive position that they should—their primary and most important function is the provision of many of the principal stores and materials required by our manufacturing branches.

The net profit resulting from our trading operations and including income from investments shows this year an increase of £730,000. The directors have transferred £1,500,000 to leaf replacement reserve and have added £600,000 to the general reserve—£217,000 from profits and £383,000 from subsidiary companies. The prudence of such provisions and, indeed, their necessity will be obvious. They are consistent with the policy adopted in recent years of providing from our own resources part of the increased capital we require, and the incidence of devaluation this year clearly warranted some special provision. After making these appropriations, a dividend at the same rate as last year is recommended. The interim and final dividends together make 32 per cent. for the year on our issued ordinary capital. The amount represented by 32 per cent. is, of course, subject to reduction by 9s. in the £, or nearly half, for income-tax. It is, moreover, the fact that the issued ordinary capital is only about a quarter of the working capital of the company, as measured by book values. It will, therefore, be clear that the ordinary dividend, after tax, represents quite a small percentage on the capital actually employed.

GIFT TO STAFF AND WORKPEOPLE

You will observe that the directors have decided in accordance with our long-standing practice to make a gift to staff and workpeople over and above their ordinary salary or wage. The amount of the gift is on this occasion the same as last year—namely, 15 per cent. of the total salary or wage received from the company during the 12 months ended October 31, 1949. As in past years, the directors reserve to themselves a discretion to grant or withhold a share in the gift in any case that may appear to them to require exceptional treatment. This gift is made in recognition of good and loyal service. And I am happy to say that that description is no mere figure of speech. Our relationships with our employees are excellent; yet I do not feel that any firm can afford in these days to rest on their oars in the matter of promoting the spirit of mutual trust and understanding among all engaged in the business. We certainly will continue to do our best to maintain our position in this respect and to neglect no opportunities for still further improvement. This is vital to efficiency; and members of our management individually and collectively recognise that it was never more important than it is today that industrial efficiency should be maintained at the highest possible level. To do that is, after all, a function of management, research, administration, productive, and selling effort—in fact, a team operation—and no team can function well unless there is leadership, unless the line of authority runs clear, and unless there is mutual understanding and respect between its members.

THE CURRENT AND PROSPECTIVE POSITION

From the point of view of our company, whose trade is not in the export market, and of whose raw material a considerable proportion comes from dollar countries, devaluation of the pound, however necessary that recognition of unpalatable facts may have been, is not by any stretch of the imagination a good thing. It immediately increases the replacement cost of dollar tobacco and therefore increases our capital requirements, and it must also increase our manufacturing costs. As I have already said, the accounts before you contain only a partial and, indeed, relatively small reflection of the effect that devaluation must have.

It may be that next year our accounts will show a change in practice as regards stock pricing in so far as it is affected by devaluation. It is, however, premature to be specific about the form of the accounts to be presented next year, and I must confine myself today to saying that we hope in our trading operations in the current year to go a considerable way towards providing for the inevitably increased commitments arising from devaluation. We must, moreover, aim to meet the additional cost of devaluation in our manufacturing operations; but so far as I can see we ought to be able to avoid any general increase in prices, at least in the immediate future.

I have referred at previous annual meetings to the necessity to provide what we can out of revenue to meet additional replacement costs of fixed and other assets. That necessity remains—and unless and until there can be a substantial reduction in general costs, of which unfortunately there is all too little evidence today, it is likely to continue. And if we are to meet that situation we must continue, year by year, to build up our reserves. Yet the present taxation system makes it extremely difficult to do this to an extent adequate to the needs. In another capacity, I have frequently alluded to the very real danger, under present circumstances, of a running down of industrial capital—a danger which arises directly from the incidence of corporate taxation under the present system.

I would like, if I may, to digress for a moment on this topic because it is, as I see it, one of supreme importance. The difficulty (and it is a real one) stems from the fact that E.P.T.—no doubt, a very wise and necessary provision under war conditions—was yet so constructed that it prevented industry from accumulating additional reserves to meet the additional replacement costs resulting from inflation. And that inflation took place, for the most part, during the period in which E.P.T. was in operation. One could not perhaps have cavilled at the Excess Profits Tax if provision of reserves for capital expenditure had been exempted. But they were not. After the war, therefore, industry started a long way behind scratch in its endeavour to meet replacement costs, and the difficulty of catching up has unfortunately been made much greater by the fact that sums put to reserve have got to bear income-tax and profits tax; and even although the rate of profits tax on such sums is less than that on distributed profits, the result is that just over 10s. out of every £ put to reserve goes in tax. Numerous representations on this subject have been made and I feel there is little new that I can say. Yet I am sure I would not be presenting you with a fair view of the company's position (or of our views upon it) if I failed to stress the importance of this particular aspect. It is, I think, vital for industry that this running down of capital—for in this respect it is capital and not income that is being taxed—should be checked. And it would seem to be eminently fair as well as sound practice to give substantial remission of tax on sums put to reserve with the corollary that if and when they are taken from reserve and applied to purposes other than capital expenditure, they should bear additional tax to make up the full rate.

Turning to trading prospects in the current year, I think you will appreciate that to us the first and most important consideration must be the supply of leaf. In this regard we have been forced to live rather from hand to mouth. We are using a considerable proportion of non-dollar tobacco, and the proportion may be expected to rise, although possibly slowly because of the natural difficulties to which I have alluded in previous years. At the same time, I would emphasise that the marked increase in recent years in price of many sterling area tobaccos is a source of considerable concern to British manufacturers. Although these prices may have been largely due to artificial conditions of scarcity, a continuation of the tendency can hardly be without danger to the long-term stability of these markets. While I am on the subject of leaf supplies I would like to refer to the recent discussions in London with representatives of the Rhodesian tobacco-growing industry. These discussions were, I believe, most useful and contributed materially to a better understanding of the problems facing manufacturers and growers respectively.

The other essential consideration in any review of trading prospects is, of course, the quality and price of our manufactured products. On this I can only say that it has been and will continue to be our aim to give to the public the best possible value and to maintain the quality and reputation of our brands in so far as the circumstances of the day permit. The load of duty carried by manufactured tobacco sold in this country is fantastically heavy. I have referred on previous occasions to the law of diminishing returns and there are unmistakable signs that, if the duty is maintained for long at its present level, serious inroads will be made into the manufacture and sale of a commodity which brings solace and pleasure to so many. Incidentally, I might mention that the level of tobacco consumption *per capita* in this country is only about half that in the United States, and is appreciably less than that of a number of other countries. One cannot, of course, ignore the vital importance of the tobacco duty to the national Exchequer, but I believe it to be on the grounds of maintaining as far as possible the revenue from that source over the years that there lies the strongest argument for a reduction in duty from its present dangerously high level.

I hope that in alluding to these important and, indeed, serious matters of general concern I have not painted the outlook for this company in unduly sombre hues. I am certainly not going to be, in the phrase of a great master of English prose, "a slave to the worst hypothesis." I try to be a realist, yet I see no ground for pessimism. Your company has considerable resources and, although we should not ignore any convenient opportunity for funding some part of our short-term indebtedness, there should be no necessity to do this until circumstances are opportune. In research and technical efficiency we can fairly claim to be progressive, and you, ladies and gentlemen, can reasonably feel confidence in the team spirit that animates the whole company and its subsidiaries. As we are placed, I cannot see grounds for anticipating an early restoration of the ordinary dividend to its level of two or three years ago, but unless wholly unforeseen circumstances arise I would hope that we may be able to maintain the current rate.

The report and accounts were unanimously adopted and the dividend recommendations were approved. A resolution having been unanimously passed that their re-election should be taken *en bloc*, the retiring directors were duly re-elected.

VOTE OF THANKS

Proposing a vote of thanks to the chairman, Mr F. M. Arkle said he was sure it would be the wish of stockholders that he should thank Sir Robert Sinclair not only for occupying the chair at the meeting, but for the way he had conducted the affairs of the company for the twelve months under review. They were indeed fortunate in having as their chairman a man of his calibre. In spite of the fact that a great deal of his time was occupied at headquarters with the higher business affairs, he found time to make visits to branches and subsidiary companies where he could see things for himself. By those appearances at the factories and offices he was maintaining that personal contact which was so essential in industry today. He, the speaker, would also like to say with what pleasure those visits that Sir Robert made were received by all and sundry in the organisation and the way his personal charm and his general manner endeared him to them all. In addition to his company duties Sir Robert had occupied the position of President of the Federation of British Industries for the last twelve months, and the Grand Council had nominated him to hold that post for a further twelve months.

Mr A. B. Mitchell seconded the motion, which was carried by acclamation.

THE ROYAL VISIT

The chairman, in acknowledgment, said he deeply appreciated the generosity of the terms in which the resolution had been proposed and seconded and the cordiality with which stockholders had received it. His task in the chair today, and indeed throughout the year, had been made easy by the work of the team, which was the company. It was a team which he was very proud to lead, and he could assure them that he would do his best to merit their confidence and that of the stockholders. Although it perhaps properly came within the category of a notable event to be recorded in the review next March of the year 1950-51, he thought it would be fitting now to refer to the recent visit of Her Royal Highness the Princess Elizabeth to the Wills Factory here. The enthusiasm and warmth of loyal affection evoked by Her Royal Highness throughout the offices and factory was most moving and inspiring to all who saw it. Her Royal Highness was graciously pleased to express appreciation of the arrangements made by the branch on that occasion, and he felt that the stockholders would be glad to know that they were such as to do credit not only to the branch, but to the whole company, and that they would share the pride they all felt in having had what was at once a great honour and a great privilege. (Applause.)

The proceedings then terminated.

LONDON & LOMOND INVESTMENT TRUST, LIMITED

INCREASED GROSS REVENUE

The nineteenth ordinary general meeting of London and Lomond Investment Trust, Limited, will be held at 116, Old Broad Street, London, E.C.2, on April 12th.

The following is the statement by the chairman, The Hon. W. B. L. Barrington, circulated with the report and accounts:—

The gross revenue from investments was £110,538 as compared with £108,840 in the previous year and included only £481 as against £2,402 in respect of dividends of an exceptional nature such as special bonuses and other non-recurring distributions and arrears of dividends on preference stocks held. The percentage earned on the ordinary stock is increased to 23.52 per cent. The general reserve has been raised to £150,000 by the transfer of £15,000 from profit and loss account and the directors recommend that the dividend on the ordinary stock

should again remain unchanged at 14 per cent. These appropriations involve a small encroachment of £1,384 in the total amount carried forward at the credit of profit and loss account.

VALUE OF INVESTMENTS

At January 31, 1950, the total value of the investments as stated in the balance sheet was £1,974,033, which was £108,598 more than the aggregate amount of their book value at that date. My usual summary shows the position this year to have been as follows:—

Appreciation in value of Investments	£108,598
Share Premium Account ...	40,000
Capital Reserve	532,305
General Reserve	150,000
Profit and Loss Account ...	19,349
	£850,252

which means that at January 31, 1950, after providing for the final dividend recommended, each £100 of Ordinary Stock was represented by net assets of approximately £427. This compares with £532 at the close of the previous financial year.

ASSOCIATED PAPER MILLS, LIMITED

PRICE UNCERTAINTY AFFECTS PROFIT

PRIVATE PURCHASE RESTORED

MR L. W. FARROW'S STATEMENT

The twenty-eighth annual general meeting of The Associated Paper Mills, Limited, was held on March 17th, at Winchester House, Old Broad Street, London, E.C., Mr L. W. Farrow, C.B.E., the chairman, presiding.

The secretary, Mr Barrington C. Gain, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to October 1, 1949:—

In opening my remarks I must first of all record with great regret the death on January 28, 1950, of Mr R. A. Barton, a director of the Garnett subsidiary since 1935 and of The Associated Paper Mills, Limited, since 1942. Mr Barton had since 1913 held the position of manager of the Garnett Mill under the previous owners and had continued in that capacity after the purchase of P. Garnett and Son, Limited, by your company. Mr Barton's long and varied experience in the paper-making industry, abroad as well as in this country, had made for him a wide circle of friends and business associates who, with your directors, will feel much sorrow at his passing.

TRADING CONDITIONS

Last year I informed you that the trading results of your company for the first four months of the year to October 1, 1949, were lower than those for the preceding year. Upon reference to the accounts you will observe that the trading profit (after providing for depreciation) has in fact fallen by more than half. This is due largely to methods of procedure by the Paper Control which have adversely affected trading conditions throughout the year to October 1, 1949 For example, prolonged expectation of the introduction of new prices orders by which selling prices would be reduced has on at least two occasions seriously hampered the normal flow of business by encouraging customers to defer placing orders for their requirements. Reductions of the controlled selling prices of your company's products have inevitably led to losses on finished papers held in stock, although these have been minimised as far as possible.

Your company has continued to suffer from the refusal of the Board of Trade to take into account, in fixing these selling prices, the wages increase granted by the whole trade to the workpeople in July, 1948, to which I referred last year. These disadvantages are inherent in a system of industrial control by State regulation. The export side of your company's activities, which in the past has been of not inconsiderable importance, has shown a marked decline due partly to the ending of the 'sellers' market in various countries.

CONTROL RELAXED

I am pleased to say, that as from April 1, 1950, private, as opposed to Governmental, purchase of wood-pulp will be permitted, and that as from February 8, 1950, control of selling prices has been relaxed for approximately 25 per cent. of home produced papers and boards, although the percentage applicable to the papers made by the group will be much less. These events mark quite a big step towards the freeing of the industry from official control, and it is to be hoped that the time is not far distant when the industry will be left free once again to manage its own affairs.

Owing to the impact of the unfavourable conditions, particularly on the esparto section of the paper-making industry, your directors after careful consideration of the many factors involved, felt obliged to cease production at the Dalmarnock mill of Brown Stewart and Company, Limited, as from August 13, 1949; it had for some time before this date been operating at a loss.

PROFITS AND DIVIDEND

Turning now to the accounts, you will observe that the trading profit of the group after providing for depreciation is £153,370 lower at £123,189, and that the net profit (before taxation) is £154,312 lower at £99,385 after crediting a reserve for deferred repairs no longer required amounting to £1,137. The charge for taxation is £68,168 lower at £72,829

Having regard to the fact that the directors consider the trading conditions for the year have been abnormal, and should not recur to anything like the same extent, a sum of £35,000 has been transferred from the contingencies reserve to the credit of profit and loss account. This reserve has been built up in recent years, when dividend payments were limited at Government request, with a view to it being available in circumstances such as I have described above.

After this transfer has been made, contingencies reserve stands at £180,000, general reserve at £125,000 and capital reserves at £131,000 a total of £436,000, and having regard to the satisfactory liquid position of the group your directors have decided to recommend the maintenance of the dividend for the year to October 1, 1949, at the same rate as that for the preceding year—namely, at the rate of 10 per cent., plus a bonus dividend of 5 per cent., making, with the interim dividend already paid, a total of 20 per cent. for the year In view of the remarks, sometimes of a threatening nature, which continue to be directed by Government spokesmen towards those engaged in carrying on business and earning profits under private enterprise, I would again point out that this total of 20 per cent. represents only ¼ of 1 per cent. on the capital originally invested in your company, owing to the effect of past reductions of capital.

STRONG FINANCIAL POSITION

From the consolidated balance sheet you will see that the financial position of the group continues to be very strong notwithstanding the less favourable trading conditions. Current assets amounting to £1,030,659 exceed current liabilities by £684,992, as compared with an excess of £796,370 last year, and over £62,000 has been spent on fixed asests, such as plant, etc., during the year.

In the period under review your directors were able to take advantage of favourable money market conditions to effect the redemption of the outstanding five per cent. mortgage debenture stock of the Garnett subsidiary by means of a conversion issue of three and a half per cent. mortgage debenture stock of your company. Arrangements have also been made to pay off on May 15, 1950, the outstanding bond of the Brown Stewart subsidiary amounting to £9,000. Holdings of Government securities standing in the books at £95,000 at October 2, 1948, were realised during the year without loss.

Under the heading of revenue reserves you will observe a new item in "income-tax on initial allowances on plant purchased." This represents the amount of taxation benefit which will accrue to the group in the tax year 1950-1951 through initial allowances under the Income Tax Act, 1945, and if not spread would tend to reduce the tax charge for that year at the expense of future years. Accordingly, this reserve together with additions for subsequent years, will be used to spread the allowance equally as far as possible over the estimated life of the plant concerned.

ALLOCATION OF PROFITS

As usual I give below a table showing how the profits for the year to October 1, 1949, as compared with those for 1938-1939 have been dealt with, taking the total net profits before taxation as equivalent to 100 per cent.

	1938-39 Per cent.	1948-49 Per cent.
Taxation	39.6	70.2
Retained in business ...	22.8	—
Dividends to shareholders	37.6	58.9
	100.0	129.1
Withdrawn from reserves		29.1
		100.0

I feel that I must be reticent in giving any indication of what the results for the year to September 30, 1950, are likely to be. The profits for the months of October, 1949, to January, 1950, inclusive, are estimated to be approximately at the same level as those for the corresponding period of the previous year; it was in the subsequent months in the last financial year that the substantial decline in profits took place.

I would like again to express the thanks of the directors to the managers, staff and workpeople of this company and its subsidiary companies for their continued cooperation and endeavours on behalf of your interests.

The report and accounts were unanimously adopted and the proposed dividends were approved.

The retiring directors, Mr L. W. Farrow, C.B.E., and Dr H. A. Harrison, were re-elected, and the remuneration of the auditors, Messrs J. B. Boyd Wrigley and Company, having been fixed, the proceedings terminated.

JUTE INDUSTRIES, LIMITED

HIGHER GROUP PROFIT

MR W. G. N. WALKER ON THE OUTLOOK

The twenty-ninth annual general meeting of Jute Industries, Limited, was held on March 20th at the Association of Jute Spinners and Manufacturers, 5, Cowgate, Dundee, Mr. W. G. N. Walker, chairman and managing director, presiding.

The following is the chairman's statement, circulated with the report and accounts for the year to September 30, 1949.

The jute industry, at the time of writing, is going through a critical period, and it is difficult to forecast so far in advance of our annual meeting what effect the present relationship between India and Pakistan may have on our business. I shall, therefore, only deal now with the financial aspect of my survey. A supplementary statement will be made at the annual general meeting which will be circulated to stockholders after the meeting has taken place.

You will, I am sure, be pleased to see that the company has had another year's successful trading. The group trading profit figure, which exceeds that of the previous year by £110,123, is considerably higher than your directors believed possible this time last year and must be regarded as one which is unlikely to be repeated in the current year.

MODERNISATION POLICY JUSTIFIED

The policy of progressive modernisation adopted by your board in past years has been fully justified, and it is this, combined with sound organisation, that has in a large measure been responsible for the increase in the year's trading profit.

The parent company's balance-sheet and the consolidated balance-sheet have been prepared on similar lines to those of last year and call for little comment. Dealing with the assets side, the company's properties have been maintained in a good state of repair and a provision of £50,000 has, as last year, been made for depreciation. The increase of £20,000 on last year's figure in the provision for depreciation applicable to plant and machinery arises by reason of the large sums expended on capital additions during the year. The stock valuation as at September 30, 1949, is lower than at the same date in the previous year, in spite of the price level being higher.

If you will refer to the liabilities side you will note that your directors have decided to create a stock reserve by transferring from profit and loss account an amount of £100,000 in order to provide against the effect of a probable fall in prices in the future. A sum of £75,000 has been added to the reserve for reconstruction of buildings and modernisation of plant, making the total amount of this reserve £490,000. After a survey of the work still to be carried out, your directors have added a further £30,000 to the provision for deferred repairs.

TAX EQUALISATION RESERVE

A new feature of the accounts is the creation of a tax equalisation reserve. The initial allowance on plant and machinery, which was raised from 20 per cent. to 40 per cent. on expenditure incurred on or after April 6, 1949, is in essence merely an advance of the normal annual allowances. Thus, when in any year heavy capital expenditure is incurred, the tax for that year is reduced but the tax to be provided in future years will be based on amounts greater than the real profits of these years. In other words, where the amount expended on new plant varies from year to year there is a corresponding variation in the taxation charge quite apart from changes in the profit level. Your directors have, therefore, thought it prudent to spread the tax relief on initial allowances over future years.

This results in there being a higher charge for taxation in the accounts under review than would have been the case if provision had been made in respect of the profits for the year as reduced by the full initial allowances. The increased provision of £25,000 has been transferred to the newly created taxation equalisation reserve which will be added to and drawn upon in succeeding years with the effect that the charge for taxation in each of these years will be more nearly related to the profits for the year.

AN ORDINARY DIVIDEND

In view of the improved financial position now attained by your company and the satisfactory trading results of the past year, made possible by the forbearance of the stockholders over many years, the directors feel justified in recommending the payment of a dividend of 5 per cent. on the ordinary stock. This recommendation carries with it, in accordance with the articles of association, an additional 2 per cent. (making 10 per cent. in all) on the 8 per cent. non-cumulative participating preference stock. The directors consider that the increased distribution, although small, compensates stockholders to some extent for the lean years experienced in the past and at the same time acknowledges the need for restraint imposed by the economic crisis through which the country is passing. In making these recommendations I would warn stockholders that trading conditions are more difficult today than they were during the year under review.

RAW MATERIAL SUPPLIES

Addressing the meeting the chairman said with your permission I will take the accounts and the statement which was circulated with them, as read.

Those of you who have a knowledge of our industry will realise why I departed from the normal practice of circulating a full statement with the accounts. I had hoped to be able to give you more specific information regarding our future raw material supplies, but no agreement has been reached between India and Pakistan which would enable me to give you any reliable forecast.

At this time last year supplies of Indian manufactured jute goods were plentiful, but supplies of raw jute in Dundee were so short that the spinning and manufacturing sections of the home producing industry were working at a much reduced level of activity. During the spring and early summer of 1949, shipments of raw jute from India and Pakistan showed an encouraging improvement and by July the Jute Control was able to lift restrictions on the consumption of raw jute by spinners. With yarn quotas for weaving also increased, the Industry set about the task of making good the reduction in its labour force sustained in the previous November.

THE INDIAN-PAKISTAN DEADLOCK

On September 17, 1949, however, H.M. Government devalued the pound sterling, India followed suit and devalued her rupee, but Pakistan, the country of origin of three quarters of the world's raw jute supply, did not. The Governments of India and Pakistan failed to agree on an exchange level for their individual currencies, and official trading between the two countries virtually ceased; our supply problems were with us once more.

The result of this deadlock is that the Indian mills are now unable to meet their share of the world demand for hessian, and consuming industries in this country are having great difficulties with their supplies, many customers being compelled to change over to substitute materials in whole or in part. The shortage of Indian manufactured goods is a serious blow to the merchanting and bag sewing section of our organisation and will have an adverse effect on the profits earned from this source.

United Kingdom spinners are today entirely dependent on Chittagong for their supplies of raw jute. The Pakistan Government are making every effort to improve the port facilities and lines of communication, but development is in too early a stage to enable Chittagong to deal with the volume of traffic which is called for at the present time. In view of the uncertainty of the Pakistan-India position the Jute Control reintroduced last December a raw jute quota system for spinners, thus restricting yarn production to the level operating at that time. Since March 1st, however, the Control has authorised an increase of 4 per cent. in raw jute consumption.

SHORTAGE OF INDIAN MANUFACTURED GOODS

The shortage of Indian manufactured goods has forced the Board of Trade to divert supplies of yarns and cloth of Dundee manufacture to the essential food and agricultural industries in the United Kingdom at the expense of our "bread and butter" customers, such as the carpet and linoleum industries, which are considered by the Board of Trade to be of less vital importance to the country as a whole. The necessity for this action is appreciated but, nevertheless, very much regretted, as it is definitely against the long-term interests of the home producing jute industry.

Your directors have pursued a policy of progressive modernisation which it is their intention to continue. They will consider the manufacture of any materials which appear to be competitive to jute in the long term and will endeavour, while adhering to jute as their main production, to diversify the activities of the company to an even greater extent than at present.

ATTRACTIVE WORKING CONDITIONS

Your company has continued to do much to make working conditions and amenities attractive, and the introduction of modern labour saving machinery has enabled considerably higher wages to be paid, at the same time reducing the cost of manufacture. You will be interested to know that today no less than 94 per cent. of our spinning production (excluding heavy waste yarns) is made on modern types of machinery installed since 1930.

I told you last year that the experimental stage of automatic weaving was nearing completion. Mechanical developments have been slower in this section of the industry than in spinning; this is understandable because it is impossible to achieve satisfactory results from automatic weaving unless the quality and preparation of yarn for weaving have been brought to the highest possible standard. At today's date 10 per cent. of our weaving production is being made on automatic looms, a percentage which will continue to increase.

SHORTAGE OF LABOUR

The jute industry is seriously short of labour, largely because Dundee was scheduled as a development area under the Distribution of Industry Act, 1945. I do not dispute in any way the advisability of spreading industry in an endeavour to ensure that the area does not in time of depression fall back to the situation obtaining during the interwar years. Nevertheless, care should have been taken in 1945 when estimating labour availability, to see that the introduction of new enterprises was not planned to a degree which would prevent the rehabilitation of the jute industry after its drastic wartime concentration.

Today there can be no doubt that new industries have been brought into the Dundee area on a scale out of all proportion to the labour available. The jute industry, a basic industry upon which the general welfare of the country depends, is only running at approximately 60 per cent. of its 1939 production. Moreover, the new industries introduced since 1945 are little more than half way towards the recruitment of their planned labour force. The jute industry in Dundee, well aware of the labour problem, has gone ahead with the installation of labour saving machinery and has spent no less than £2,300,000 on buildings and machinery between June, 1945 and September, 1949, and will have spent a further £1,000,000 by the end of this year in order that the maximum amount of production may be attained with the minimum amount of labour. Despite this noteworthy effort the jute industry is faced with a serious and ever increasing shortage of labour and is thus hindered from expanding its production for sale in the home and dollar markets. I hope that the Government sponsored bodies and officials concerned will take action before the situation deteriorates further.

INDISPENSABLE PRODUCTS

The products of your company are indispensable to the operation of many industries in the United Kingdom, and the prior claim of these industries on our present output has made it necessary for the Board of Trade to limit the extent of our direct export performance. This limitation is such that our American subsidiary company has been forced to purchase large quantities of jute cloth from European countries and India—cloth which before the war was all manufactured in Dundee—thus depriving the United Kingdom of valuable dollar business at a time when the earnings of dollars are a matter of life and death to us all.

In conclusion, I would like to convey my personal appreciation to the directors, all of whom hold executive positions in your company, to all management, staff and employees, at home and overseas, for their loyal co-operation and hard work and to whom credit is due for the successful results which have been achieved over the past year. We are indeed fully conscious of our responsibilities, not only to our employees and stockholders, but also to our customers whose productions depend upon the continued success of our enterprise.

YEAR'S PROSPECTS

I realise in view of my previous warning that stockholders will be anxious to have some indication of how this year's trading is going to turn out. It is difficult, if not impossible, to give any accurate forecast, but I am hopeful that we shall be able to put before you at this time next year results which, though likely to be lower, should still be satisfactory.

The report and accounts were adopted; the proposed dividends were approved; the retiring director, Mr J. Ernest Cox, was re-elected and the remuneration of the auditors, Messrs. Dewar and Robertson, C.A., was fixed.

At a subsequent extraordinary general meeting a special resolution was passed adopting new articles of association.

THE SCOTTISH LIFE ASSURANCE COMPANY, LIMITED

FURTHER STEADY PROGRESS

MR CHARLES R. MUNRO ON THE OUTLOOK

Mr Charles R Munro, C.A., chairman of the board of directors, presided at the annual meeting of The Scottish Life Assurance Company, Limited, held in Edinburgh on March 22nd.

In movin adoption of the report and accounts for year 1949, the chairman said:—

For the company 1949 has been another year of continued steady and very satisfactory progress. While not quite reaching the record figure achieved in 1947, the net new business of 1949, at £3,611,000, shows a substantial increase of £217,000 over last year. This is especially creditable to our field officials in view of the contraction in expendable incomes which becomes more and more evident as time goes on. Life Assurance differs from many less valuable commodities in that the purchaser has to be persuaded to buy, and the personality and capacity of the seller play no small part in the result.

When we consider the daily risks which we run, and all the inventions of man which go to make this life uncertain; and the financial changes which have taken place since the war, making it almost impossible to save by the hitherto ordinary methods, the importance of the service rendered by this company with its efficient and energetic field men and agents becomes clear. It is all the more necessary for everyone to take advantage of the facilities which companies such as ours afford and make provision for their dependants.

INCREASE IN PREMIUM INCOME

The life premium income shows a further satisfactory increase of £70,000 to £989,000 and is now nearly 60 per cent. in excess of that in 1945. The gross rate of interest earned on the fund was £4 5s. 6d. per cent. as compared with £4 7s. 9d. per cent. in 1948, and the net rate, after deduction of income tax, was £3 11s. 4d. per cent against £3 12s. 11d. per cent. This reduction is partly accounted for by the fact that during the early part of the year a considerable sum was left on deposit with our bankers.

Claims by death, at 69 per cent. of the amount expected by the table of mortality, are again light.

Under our original Memorandum of Association, the company had no power to transact capital redemption or annuity certain business. Under the new Objects Clause adopted last year, powers were taken to this effect, mainly in order to enable the company to issue contracts under the popular "Capital Annuity" scheme. Business under this scheme was begun in the latter half of the year; the figures shown in this account therefore cover only a short period.

In spite of the heavy fall during 1949 in almost all classes of Stock Exchange securities, the market value of our assets is still in excess of the value at which they stand in the balance sheet.

The London office is now established in the new premises at 6, Old Jewry, E.C.2, the purchase of which I mentioned last year.

THE CURRENT YEAR

In these uncertain times it would not be fitting to end on a note of too much optimism, but with the ever-increasing difficulty in saving or investing there can be no better way of providing for the future than by life assurance. 1950 has begun well, and there is no reason to believe, unless unforeseen circumstances arise, that the volume of business will not be maintained.

The motion, having been seconded by Mr R. M. Guild, W.S., was adopted.

TROJAN (HOLDINGS) LIMITED

A BIG IMPROVEMENT

The thirteenth annual general meeting of Trojan (Holdings) Limited, was held on March 22nd at Croydon, Mr F. L. Blow (the chairman) presiding.

The following is an extract from his circulated statement: Last year I intimated that there should be a marked improvement during the coming year; this has proved to be correct, and the present prospects of the Holding Company are good.

TROJAN, LIMITED

The progress made by this company during the 12 months under review can be seen at once in the increased turnover, which is more than three times as much as that in the 12 months ended October, 1947, and nearly one and a half times more than in the 12 months ended October, 1948. The increase in wages and salaries over the same period is under 50 per cent. These satisfactory increases in turnover are due to the rise in production resulting on the completion of this company's development work, mainly on our own products of commercial vehicles, and on Mini-Motor units; in the case of the latter, production has reached 600 a week.

It will be seen from the accounts that this company, which in the last accounts presented to you made a large loss, has during the 12 months ended October 31st last made a profit, and is now well on a profit-earning basis.

MINI-MOTOR (GREAT BRITAIN), LIMITED

On May 20th last year the Holding Company acquired a controlling interest in Mini-Motor (Gt. Britain), Limited, by a purchase effected out of the resources of the Holding Company, with some assistance from that company's bankers. The Mini-Motor Company now holds the selling rights of the Mini-Motor auxiliary cycle unit throughout the world with the exception of Italy, of France and French colonies, and of the Argentine.

The volume of business transacted, as will be seen in this company's accounts for six months from May, 1949, to October of that year, augurs well for the future.

Thousands of units have already been sold in the home and overseas markets. Many letters of satisfaction and appreciation have been received and customers' accounts of experiences have appeared in the trade press: all these clearly indicate that the cycle auxiliary unit is proving a great success.

Our best thanks are due to Mr Monk for his strenuous application to the many-sided demands of the company at this stage of activity. The company has been well served by him, and by the whole of the executive staff and other employees. We thank them all, heartily.

Mr F. J. Dykes, M.A., as a director retires, and offers himself for re-election. Mr Dykes has given very valuable service to the board and to the company in many directions. We are indebted to him for his wide practical knowledge.

The report was adopted

SECOND BRITISH ASSETS TRUST, LIMITED

MR W. H. FRASER'S REVIEW

The seventy-first annual general meeting of the company was held at Edinburgh on March 22nd. Mr W. H. Fraser, the chairman, presided. The following is his review.

Our American office, which was opened in 1936, has now been discontinued. Our investments in the United States are relatively small compared with what they were in 1936, and this, coupled with recent changes in tax laws here and in America, has removed the great advantages which the existence of an American office has afforded in the past.

From the balance sheet you will see that during the year the directors called up the uncalled liability on the 156 partly paid shares and, following on payment of such call, each of these shares has been converted into preference and ordinary stock in the proportion of £2 preference and £3 ordinary stock, the latter being transferable in 5s. units.

CAPITALISATION PROPOSALS

In order to bring the company's share capital rather more into line with the assets representing it, the directors propose that the sum of £312 standing at the credit of share premium account, and £49,641, part of the revenue balance carried forward—together £49,953—should be capitalised and applied in paying up in full 49,953 of the unissued £1 ordinary shares to be issued, credited as fully paid, to the holders of the company's ordinary stock as at the date of passing of the resolution after referred to, as nearly as may be in the proportion of one share for every £7 (28 units of 5s.) of stock. Shares representing fractions will be sold and the proceeds rateably divided among the stockholders entitled thereto. Thereafter the shares will be converted into stock transferable in units of 5s., which will rank with the existing stock as from the commencement of the company's current financial year, but will not participate in the final dividend for the year to December 31, 1949. The terms of the resolutions required to effect the foregoing proposals will be submitted at an extraordinary general meeting, to be held immediately after the annual general meeting and following on a special resolution which will also be submitted, to provide that Article 44 of the Company's Articles of Association (which requires a class meeting to be held where any issue of shares is made, for which the quorum is one-third of the issued capital of the class), shall not apply in the case of an issue made in terms of Article 112, which deals with issues of shares following on a capitalisation of reserves.

VALUATION OF INVESTMENTS

The valuation of our investments, in spite of a small reduction, is satisfactory, the appreciation being 23.81 per cent., against 29.87 per cent.—a reduction of only 4.7 per cent. on last year's figures. As before, we have not included in our valuation the premium ruling in London over the current exchange rate for dollar securities. You will see that our holdings of dollar securities have been considerably increased during the year—our Canadian and American securities now representing some 20 per cent. of our total valuation.

Ordinary income shows a small increase, but, as there have been practically no receipts in respect of arrears or other non-recurring income, total income shows a small reduction. Income for the present year is likely to show little change. We must expect some reduction in dividends from our equity holdings in sterling securities, but this should be offset by the increased income to be expected in a full year of devalued currency from our dollar investments. We have now had ten years of expanding income. He would be a bold man who would prophesy a continued expansion during the next decade. At the same time we need not be unduly discouraged. We have built up a strong position, and I have no doubt that we shall meet and overcome our future troubles, which we are bound to encounter, as we have met and overcome them in the past.

BRITISH ASSETS TRUST, LIMITED

MR W. H. FRASER ON POSITION AND PROSPECTS

The fifty-second annual general meeting of the company was held at Edinburgh on March 22nd. Mr W. H. Fraser, chairman of the company, presided.

The following is his review.

In previous reports I have referred to the fact that although we won our case before the United States Supreme Court in December, 1944, and thereby avoided a very large tax payment, the change of law in the United States Revenue Act of 1942 left our future tax position unsettled. The Tax Court concerned has now given an adverse decision, but, owing to the Double Tax Agreement of 1945, the decision only affects us for 1942-4. The percentage of our funds in U.S.A. is now much smaller than in 1936, when our American office was opened, and this, coupled with the recent changes in tax laws, has removed the great advantages which the existence of an American office has afforded in the past. We have therefore closed the office. I should like to take the opportunity of thanking all those concerned with its successful operation during the 12½ years of its existence.

EFFECTS OF DEVALUATION

The most important economic event of the year so far as this country is concerned was the devaluation of the £. Whilst an immediate benefit accrued, both to our valuation and our income, it is clear that devaluation alone will not get us out of our difficulties, and unless steps are taken to reduce government expenditure it may well prove that the wrong thing was done at the wrong time in the wrong way. Meantime the immediate result of devaluation through our dollar holdings has been that our income has been helped to the extent of some 1½ per cent. on the ordinary stock, while, in a full year, assuming no material change in the amount of our U.S.A. holdings, the increase should be about 4½ per cent.

The balance-sheet shows no major change, the appreciation being 37 03 per cent., compared with 47.32 per cent. a year ago, a reduction of 7.0 per cent. on last year's figures.

REVENUE ACCOUNT

Turning to the revenue account, the fall in income which I anticipated a year ago has not, I am glad to say, materialised. The gross income is practically unchanged, although the figures a year ago, as I then pointed out, included some £36,000, and for the previous year some £49,000 of non-recurring income, compared with only £2,472 for the year under review.

Expenses of management show an increase, but most of this is non-recurring and represents fairly large repairs and renewals which have had to be made to the office, including rewiring of the building, renewal of the heating system and the carrying out of various repairs to the caretaker's house.

We have given the usual tables showing the distribution of our investments between fixed interest securities and equities, but once again these cannot be taken as very reliable, due to the uncompleted nationalisation of certain industries.

Income for the current year seems likely to show little change, and I look forward to being able to present to you another satisfactory report in a year's time.

SCOTTISH AMICABLE LIFE ASSURANCE SOCIETY

FURTHER RECORDS

MR E. I. MAVOR'S REVIEW

The one hundred and twenty-fourth annual general meeting of the Scottish Amicable Life Assurance Society was held in Glasgow on Wednesday, 22nd March, Mr E. I. Mavor (chairman of the ordinary board of directors) presiding.

In moving the adoption of the report and accounts, the chairman said that, as a result of the reduction which had taken place in the purchasing power of money, the individual's need of life assurance had greatly increased. Cover which might formerly have been regarded as adequate might now require to be doubled to achieve the purpose which it was intended to serve. It was a grave misfortune that in present-day circumstances so few could afford the full amount of life assurance which their needs prescribed, but every married man, as a rough test of what he was achieving, could measure his premium outlay against the standard of one-sixth of income permitted for purposes of tax relief. The record level of new business transacted by British offices during the last few years showed that life assurance had in fact been accorded a remarkably high priority in many a sorely strained family budget.

This increased demand for life assurance had been fully reflected in the Society's new business figures, which continued to establish fresh records from year to year. In 1949 the net sums assured under new individual assurances exceeded £5,000,000 for the first time in the Society's history. The steep increase in recent years had been composed entirely of Whole Life and Endowment Assurances—a factor which had contributed substantially to the growth of premium income.

GROUP ASSURANCES

For group assurances and group pension policies, the results displayed from year to year were liable to greater fluctuation than for individual assurances. Although the number of new schemes arranged with the Society was fully maintained in 1949, the prevalence of smaller schemes had led to a considerable fall in the relative sums assured and annuity benefits. In the opening months of 1950, however, last year's figures for this class of business had already been passed and the Society's specialist organisation was constantly expanding to meet the demands of those who required expert advice on staff pension problems.

Apart from group pension schemes providing for the future retirement of present employees, the Society was prepared to underwrite on favourable terms the pension liability of an employer or of a firm's own pension fund in respect of groups of employees who had already retired. Such an arrangement offered, in effect, an insurance against exceptional longevity, which could easily constitute a serious strain upon the resources available in private hands to meet the payment of continuing pensions. Several schemes of this type had been instituted during the past year.

PREMIUM INCOME EXCEEDS £2,000,000

Annuity considerations, amounting to almost £570,000, were received in respect of new annuities granted during 1949, of which nearly two-thirds were effected under the Society's new scheme of "Capital Protection Annuities." The Society's premium income had for the first time passed the £2,000,000 mark and already approached £2,250,000.

The gross interest revenue for 1949 represented a return on the combined funds of £4s. 7s. 8d. per cent.; the corresponding net return was £3 14s. 10d. per cent.

The continued rise in expenses was the result of the Society's greatly increased business and of the higher level of salaries introduced since the war. The claims by maturity were very similar in amount to those arising in the previous year. The claims by death again reflected the favourable mortality which the Society had experienced during the current quinquennium. As a result of all the year's operations, the Society's total funds had increased by almost £1,880,000 and now exceeded £22,000,000.

VALUATION OF INVESTMENTS

On the assets side of the balance sheet, there were no striking changes in distribution to record, other than those which followed from the investment of the year's increment in the funds. While the results of a valuation of the Society's Stock Exchange Investments as at December 31, 1949, reflected the general fall in security values, the market values at the close of the year remained in excess of the values shown in the balance sheet.

The Society had now entered its 125th year, at the end of which a valuation of its assets and liabilities would fall to be made for the purpose of assessing the rate of bonus for the current quinquennium. Although the chairman refrained in these uncertain times from offering any prediction regarding bonuses, he reminded members that since the start of the present quinquennium the Society's interim bonus had been maintained at 30s. per cent. per annum—the same compound rate as was declared for the ten years 1936-45.

The report and accounts were adopted.

THE ENGLISH ELECTRIC COMPANY, LIMITED

INCREASED TURNOVER

Sir George H. Nelson (the chairman), presiding on March 22nd at the thirty-first annual general meeting of the English Electric Company, Limited, said:

The turnover for 1949 was up by nearly £6,000,000 on the 1948 figure, which was £5,000,000 better than for 1947. The increase of net profit arose from increased turnover and not from any increase in prices. The outstanding feature in the consolidated account of the group was the increase of £1,098,004 in the total reserves, which now stood at £6,079,768. Those reserves, together with the issued capital, were fully employed in the business, being represented, not by cash, but by plant and buildings or by stocks and work-in-progress. They were a contribution by the ordinary shareholder to the general strength of the company, but one on which he received no interest or other direct benefit.

The first of four 32,000 kW. generators which the company were installing in the Loch Sloy station was supplying power to the grid system. It was the first major station of the present Scottish National hydro project to commence generation.

The past year had been notable in the electric traction field for the inauguration of the Liverpool Street-Shenfield electrification, for which the company had supplied all the electric motor and electrical control equipment The Canberra aircraft which the company designed and manufactures had been the subject of world-wide interest and comment. The permanent expansion of the company's business and activities had necessitated the appointment of Mr H. G. Nelson as deputy managing director.

The report was adopted, and the final dividend of 6 per cent. (making 10 per cent. for the year) declared on the ordinary stock.

TEMPERANCE PERMANENT BUILDING SOCIETY

CHAIRMAN'S SPEECH IN RESPECT OF YEAR 1949

The ninety-sixth annual meeting of the Temperance Permanent Building Society was held on Thursday, March 16th, at the Caxton Hall, London.

Mr Cyril W. Black, J.P., M.P., F.R.I.C.S., chairman of the society, in the course of his speech, said:—The year which has recently closed has witnessed steady progress in the development of the society's business, but has been in the main a period of consolidation.

INCREASE IN ASSETS AND MORTGAGES

The total assets at the close of the year amounted to a figure of £24,371,572—an increase of £1,813,941. The amounts due to shareholders and depositors increased by £1,692,630 to an aggregate of £22,718,032.

Restrictions on new investments have been removed, and the society is willing, until further notice, to receive investments on share or deposit account by any one individual to a total of £5,000, a husband and wife counting as one for this purpose. The current rates of interest payable are 2½ per cent. tax paid by the society on share investments, and 1½ per cent. tax paid by the society on deposit accounts. In the case of an investor liable for income tax at the full standard rate of 9s. in the £, these rates are equivalent to gross yields of £4 1s. 9d. per annum in the case of shares, and £2 14s. 6d. per annum in the case of deposits.

At these current rates of interest, investments with the society cannot in my opinion be bettered by any other investments available at the present time. In a record of nearly 100 years' successful business, it is the proud boast of the society that every investor has received both his interest and his capital on the due dates and that not one penny has ever been lost by the investing public as a result of any investments made in this society.

The amount advanced on mortgage during the year aggregated £6,810,354, nearly 90 per cent. of the total being in amounts of not exceeding £3,000. The average amount outstanding on the mortgages of the society at the end of the year was only about £900, from which it will be obvious to you that the society's funds are invested in properties (consisting principally of private dwelling houses for owner-occupation) of moderate size and value for which there is always likely to be a steady demand and a reasonable freedom from violent fluctuations in value.

Furthermore, our mortgages are spread over very wide and diverse areas, so that any adverse factors which might at any time affect any particular area of the country would only have a limited effect on the business of the society.

It is probably hardly necessary for me to say that your directors have subjected mortgage applications to an intensive and rigid scrutiny, and have only accepted mortgage business with which they have been entirely satisfied.

RESERVES AND TAXATION

Appropriations of £50,000 and £26,394 to general reserve account and contingency account respectively have been made—the total of the general reserve account, contingency account and balance of profit carried forward amount to over £1,380,000, representing more than 6 per cent. of the aggregated share and deposit capital.

I feel compelled to refer again to the crippling incidence of taxation to which our profit and loss account bears eloquent testimony. The taxation with which we are afflicted is now on such a scale as to make it very difficult to make allocations to reserve on the scale we would desire.

The balance of profit available for strengthening the position of the society has only been secured at the cost of a most rigid scrutiny by your directors of the various items comprised in management expenses.

TRIBUTE TO STAFF

I am very glad to pay my tribute again to the splendid work done during the year by our managing director, Mr. Ronald Bell, his executive colleagues and the members of the staff. During yet another year they have shown a loyalty to the interests of the society which is beyond all praise, and the satisfactory position we are now able to report to you is due in no small measure to their faithful and enthusiastic labours.

THE OUTLOOK FOR BUILDING SOCIETIES

You would, no doubt, expect me to say a little in conclusion regarding current business and the future trend of events in so far as they relate to the operations of a society such as ours. Our business, in common with many other enterprises, is subject to-day to the influence of political considerations to a degree unthought of before the war. Since the war it has been the policy of the Government to make the local authorities very nearly the sole providers of new houses and flats, and the opportunities given to the private builder to erect houses or flats on his own account for letting or sale have been negligible.

I do not think that the fact is sufficiently realised by the public that every house or flat completed by the local authorities carries a minimum subsidy of £22 a year for sixty years which is being provided by the taxpayers and ratepayers, aggregating over the period a total minimum subsidy of £1,320 for every house and flat built. This subsidy is granted irrespective of the need of the occupier of the house or flat, and the policy results in many citizens who are comparatively well off having their rents heavily subsidised by taxpayers and ratepayers who are less well off.

Furthermore, the policy of not allowing the private builder to erect houses for sale has resulted in the prices of all existing houses being kept at a scarcity level because the demand much exceeds the supply and, in the absence of the building of new houses for sale, this excess of demand over supply is bound to continue indefinitely. We in the building society movement consider it is not in the national interest that those families who prefer to buy their homes should be compelled by Government policy to rent, and the majority of citizens must surely be opposed to the subsidising of the rents of a privileged minority, irrespective of whether the circumstances of the individual family to be housed justifies the grant of a subsidy or not.

While the present restrictive policies continue there is no possibility of a satisfactory rate of house building being achieved. This unsatisfactory rate of house building is now becoming so obvious that it will inevitably lead to a widespread demand by the public that many aspects of present Government policy should be modified or reversed, and that the private builder, in co-operation with the building societies, should be allowed again to play a free and unfettered part in solving this great social problem of the housing shortage.

The report and statement of accounts were adopted.

BIRMINGHAM AND DISTRICT INVESTMENT TRUST LIMITED

CONTROLS RESTRICT INVISIBLE EXPORTS

The sixty-sixth annual general meeting of The Birmingham and District Investment Trust Limited was held on March 17th in London.

Mr H. C. Drayton, chairman and managing director, in the course of his speech, said: Our investment revenue amounted to £525,000 against £522,000 last year, and our traffic receipts amounted to £67,000 against £93,000, a decrease of £26,000. If you pass the directors' recommendation of an ordinary dividend of 12 per cent., there will be £200,000 to be transferred to undivided profits account, as against £217,000.

The decrease in our revenue is accounted for in the main by the drop in our traffic receipts. I have informed you in the last two years of the position and I told you that the year ended December 31, 1949, would be the last year in which we should be entitled to receipts from traffic. From now on our revenue will be derived solely from interest on investments.

COMPARISON WITH 1938

Before the war the standard of living in this country was higher than it is today. One of the reasons for that was that we were able to purchase our food and raw materials from abroad by the aid of what are called invisible exports. In 1938 our interest, profits and dividends totalled £175,000,000; in 1947 they were £47,000,000, and in 1948 they were £66,000,000, showing an increase in these two years of £19,000,000. Also in the Board of Trade returns under the heading "Other"—the only designation used—in the year 1948 those "other" items were £120,000,000 as against £6,000,000 for 1947. These items were made up as regards 1947 as to a debit of £14,000,000 on films and a credit of £20,000,000 on oil royalties, insurance, commissions, banking, etc., and in 1948 these same items were a debit of £10,000,000 on films and a credit of £130,000,000 made up of the above items.

These increases in the two years show private enterprise as well as we would expect it to do under present regulations and controls. Today, in spite of the help received from the officials in getting permission to work the controls and regulations, there is no doubt whatsoever that they are a handicap to producing more invisible exports and I do make the plea that those controls and regulations should be lifted as far as it is possible to do.

FREEING FOREIGN EXCHANGE

Personally, although it would be taking a very grave risk to free foreign exchange entirely, I think it might be worth the gamble, as I believe that at first blush certain people might transfer their money to other countries, but after that they would start to bring it back to this country. Anyway, we should, under free exchange, know exactly where we stood and what the £ was worth, whereas today we can only make a crude guess.

With regard to the company's prospects for the current year, there will be a decrease in revenue owing to the non-receipt of traffics, but I shall be surprised if our revenue from investments does not show an increase although I do not expect that increase to make up entirely for the decrease in traffics. A satisfactory aspect of our revenue account is that I do not think your dividend of 12 per cent. for the year ended December 31, 1950, will be in jeopardy.

The report was adopted

MARCONI'S WIRELESS TELEGRAPH

A YEAR OF PROGRESS

The fifty-second annual general meeting of Marconi's Wireless Telegraph Company Limited, was held on March 22nd in London.

Sir George H. Nelson, F.C.G.I., M.I.Mech.E., M.I.E.E., the chairman, in the course of his speech, said: The profit for the year amounts to £140,483, an increase of £7,757 over 1949, which, although modest, shows an upward trend in spite of the increasing and intense competition in our particular sphere. Your directors recommend a dividend of 7 per cent., less tax, on the ordinary shares.

Our order book has shown a marked increase, and our exports have been maintained at a very high level. During the year new designs of equipment have been introduced throughout the extensive range of the company's products, and these have met with a very favourable reception from our customers throughout the whole world.

In the field of broadcasting we have produced new designs of short-wave and medium-wave high power transmitters, for which we have already received substantial orders. These transmitters show considerable improvements in efficiency. New designs of sound studio equipment have also been produced and marketed during the year.

Marconi television cameras which are being used by the B.B.C. have achieved some outstandingly successful broadcasts, notable among these being the pictures transmitted on the night of the General Election from Trafalgar Square, and from the Royal Covent Garden Opera House on the occasion of the visit of their Majesties the King and Queen.

The report was adopted.

INTERNATIONAL COMBUSTION (HOLDINGS), LIMITED

CONSIDERABLE INCREASE IN PRODUCTION

The sixteenth general meeting of International Combustion (Holdings), Limited, was held on March 21st in London, Mr G. R. T. Taylor (chairman) presiding.

The following is an extract from his circulated review:—

A new company has been formed to take over the operating side of the business, thereby resulting in your company becoming solely a holding company, and its name has been changed accordingly.

A further expanded output has been responsible for an increase in the profit for the year under review.

The preference dividend and an interim dividend on the £351,698 ordinary stock in issue on July 15, 1949, having been paid, your directors recommend that the sum of £100,000 be transferred to general revenue reserve, and that a final dividend of 11 per cent. be paid on the £879,245 ordinary stock in issue at September 30, 1949. These dividends represent the same amount as was distributed last year, and will leave a balance of £118,758 to be carried forward against £95,486 brought in.

During the year a steady flow of orders received has been maintained. Our main products consist of equipment required for the raising of steam for the generation of electricity in the most efficient and economical manner, and in this connection we are keeping abreast of our programme, so that we are in a position to take our fair share of this vital and very important work.

A considerable increase in production has kept pace with the amount of orders received, and has been accelerated by the coming into operation of our overseas factories in Australia and South Africa. Production during the current year to date shows an even greater increase upon the previous year.

The report was adopted.

BRITISH HOME STORES, LIMITED

ANOTHER SATISFACTORY YEAR

The annual general meeting of British Home Stores, Limited, was held on March 22nd in London, Mr Horace Moore, chairman, presiding

The following is an extract from his circulated statement:

Your directors are pleased to be able to report another satisfactory year's trading. Profits of the group before taxation amounted to £811,335 against £675,457 in the previous year and £250,000 has been appropriated to general reserve.

TEN YEARS' PROGRESS

In 1939 we had 3,300 employees, now we have 4,500. Our turnover is many times greater. We then had 58 stores, now we have 72. Profits have increased from £102,165 to £811,335. During these years your directors decided that their best possible policy was to devote their time and thought to the building up of the business on the soundest possible long-term lines. They have believed that if such a policy was properly carried out results would follow. They decided, firstly, to give the public the best possible value rather than to look for profit. In consequence customer support and goodwill has improved immeasurably and increased turnover and profits have followed.

Secondly, they considered that we could expect progressive results only if we built up a good and contented team of employees and, to this end, we have devoted much time, thought and money to what I will call "Investment in Manpower." In the third place it was considered that the support of the first-class manufacturers of the country was essential to make the progress we visualised. To offer the best possible value on our counters is a mutual problem, and our suppliers have been quick to appreciate that our joint success depends on satisfying our customers. When this is achieved large volume sales and orders automatically follow. Ingenuity and ideas have to be pooled and long-term plans formulated.

I am pleased to be able to tell you that great strides have been made, and year by year the quantities of merchandise delivered to us by individual firms continue to grow. To-day we number amongst our suppliers a large majority of the firms who are the acknowledged leaders in their respective fields of manufacture. We thank them for their confidence and the support they have given to us, without which we could not have progressed thus far. Fourthly, we arranged to improve the amenities, plant and equipment of our existing stores. Lastly, we decided to make plans for future expansion when that is possible.

These days the future appears just as uncertain as ever, but having travelled safely so far through the hazards of the last 10 years, your directors feel we shall be able to meet whatever lies ahead with modest confidence.

Resolutions covering the issue of three new ordinary stock units for every ten held were carried unanimously.

Investment Statistics

Company Notes

Raphael Tuck.—A group trading loss of £61,869 has been incurred for the year ended April 30, 1949, against a profit in the previous year of £68,341. Loss attributable to the parent company is £62,896. After crediting income tax recoverable of £32,000 and £30,777 transferred from stock reserve a loss of £7,974 remains. Carry forward of the parent company £37,109 (£45,083). Ordinary dividend nil (15 per cent). The 5 per cent preference dividend is paid.

Anglo-American Corporation of South Africa.—Preliminary figures show an estimated profit for the year to December 31, 1949, after taxation, of £2,886,000 against an adjusted comparable figure of £1,599,000 for 1948. The latest profit figure includes approximately £1,000,000 arising from the shares in Springbok Colliery. The dividend is raised by 10 per cent to 40 per cent plus a 20 per cent bonus (same).

De Beers Consolidated Mines.—The preliminary statement reveals a fall in net profits from £5,971,398 for 1948 to £4,941,568 in the latest period. Net profit is struck after deducting taxation £1,525,000 (£1,800,000) and providing £750,000 (£600,000) for capital expenditure. The dividend of 3s. per share plus a bonus of 1s. 6d. or 90 per cent is repeated. Effective rate of South African non-resident shareholders' tax is 6.3 per cent.

Shell Oil Company.—Sales in 1949 totalled $816.4 million, compared with $830.4 million in 1948. The fall was entirely attributable to lower revenues from crude oil; both refined products and chemicals showed an increase. Net income was reduced from $111.4 million ($8.27 per share) to $76.4 million ($5.67 per share). Dividends were maintained at $3. Capital expenditure was reduced from $122.7 million to $93.2 million.

Halifax Building Society.—The report for the year ended January 31, 1950, shows that total assets have increased from £148.2 million to £154.5 million during the year. Balances due on 218,659 mortgages increased from £103.9 million to £113.9 million. Mortgage balances thus account for less than 74 per cent of total assets, and the remainder consists very largely of cash and liquid investments. Share accounts rose from £96.1 million to £101.9 million, but deposit accounts were unchanged at £42.9 million.

Callaher.—Group profit subject to tax for the year ended December 31, 1949, was £1,192,025 against £1,449,941. Net group profit, after tax, £569,058 (£664,103). Dividend 32½ per cent (same).

Cammell Laird.—The preliminary figures show the parent company's net profit after unstated deductions for taxation, depreciation, debenture interest and sinking fund at £436,976 for 1949 against £409,831 for the year ended December 31, 1948. Reserves, £250,000 (£200,000). Parent company's carry forward, £194,162 (£192,673). The dividend is slightly higher at 9½ per cent on the ordinary capital, raised to £3,550,000 by the 100 per cent bonus issue against 12½ per cent less tax and a tax free bonus of 3 per cent (or 18 per cent approx.) for 1948.

Union Corporation.—The preliminary announcement reveals a rise in group profits after UK taxation from £685,203 to £831,070. Taxation requires £675,000 against £646,800. Exploration reserve receives £200,000 (same) and £47,728 is written off new issue expenses. Carry forward £213,008 (£182,666). An unchanged dividend of 6s. per share or 48 per cent is paid on the capital, enlarged during the year by the offer of 232,000 12s. 6d. shares at £10 per share.

Hadfields. — Preliminary figures show group net profits for the twelve months ended September 30, 1949, at £332,092 against £185,733 for the previous nine months only after deducting £115,498 (£141,301) UK taxation. The net figures include profits relating to earlier years of £161,206 (£54,366). The dividend of 17½ per cent is equivalent to 13 per cent paid previously for nine months only.

Capital Issues

Pilkington's Tiles.—Lists opened and closed on March 24th for the issue of 200,000 5½ per cent. cumulative redeemable £1 preference shares at 20s. 6d. per share.

Fisons.—Lists will open and close on March 29th for the issue of £3,500,000 of 4½ per cent first mortgage debenture stock, 1965-83, at £98 per cent, of which £1,172,000 has been taken firm. In addition to this loan stock, capital consists of £7,697,456 in £3,258,900 4½ per cent cumulative preference stock and £4,438,556 in £1 ordinary shares. Group profits less minority interest subject to income tax for years to June 30th: 1940, £315,744; 1948, £588,092; 1949, £464,512. Group assets as at June 30, 1949: Fixed assets, £6,156,913; trade investments, £772,111; total current assets, £5,851,777; net current assets, £372,674.

East African High Commission.—Lists will open and close on March 27th for a cash and conversion issue of £3,500,000 3½ per cent redeemable loan stock, 1966-68, at £97½ per cent for the East African Railways and Harbour Administration. The issue is designed to replace the £3,500,000 Kenya Government 4½ per cent loan due on May 1st.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (n) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 14 years 2 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (h) Assumed dividend 18⅛% after capital bonus. (l) To latest redemption date. † Free of tax. (m) Final dividend on increased capital. Yield basis 35%. (n) Yield basis 26⅛% after capital bonus.

Statistical Summary

EXCHEQUER RETURNS

For the week ended March 18, 1950, total ordinary revenue was £66,152,000, against ordinary expenditure of £71,852,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £18,713,000 the surplus accrued since April 1st is £648,211,000 compared with £946,868,000 for the corresponding period a year ago.

GOVERNMENT OF PAKISTAN

Applications are invited for the post of Director of the Central Statistical Office to be set up by the Government of Pakistan. This Office will be responsible for the collection, compilation and analysis of statistical data relating to agricultural, trade, industrial and labour statistics, research with a view to improving statistics, technical advice and co-ordination of statistical work being done in the departmental cells, graphical representation of statistics, etc.

Applicants must possess high qualifications and experience in statistical work. Pay will be fixed according to qualifications in the grade of Rs. 1,300-1,600 per month plus allowances as admissible under the rules. In the case of a highly qualified and experienced non-Asiatic, the starting salary may be fixed at or above Rs. 2,000, depending on the qualifications and experience of the candidate, and the appointment will be on a 3 years' contract basis.

Application, on the form to be obtained on request, should be made to the High Commissioner for Pakistan, 35, Lowndes Square, London, S.W.1. Closing date April 15, 1950.

UNIVERSITY OF LONDON

Tutorial Classes Committee. Applications are invited for a Staff Tutorship in Psychology from men and women of high academic standing, with experience in conducting Tutorial classes. Additional qualifications in one or more subsidiary subjects would be an advantage. The appointment may be either as Staff Tutor, salary scale £600—£50—£1,150, or as Staff Tutor (Junior), salary scale £500—£50—£600, the initial salary in both instances being determined in accordance with the qualifications and experience of the successful candidate. Family allowances additional in either case. Particulars and application forms from Director of the Department of Extra-Mural Studies, Senate House, W.C.1. Completed application forms to be submitted before April 12, 1950.

UNIVERSITY OF LONDON

Organising Tutor, man or woman, required by Tutorial Classes Committee to work in either Middlesex or Surrey. Applicants must be qualified to take Tutorial Classes preferably in one or more of the following subjects: Literature, Economics, Psychology, Sociology, History. Salary £600—£50—£1,150, also Family Allowances, the initial salary being determined in accordance with the qualifications and experience of the successful candidate. Particulars and application forms from Director of the Department of Extra-Mural Studies, Senate House, W.C.1. Completed application forms to be submitted before April 12, 1950.

NATIONAL COAL BOARD

Applications are invited for two appointments in the Production Supplies Sub-Department at the Board's London Headquarters. Salary about £1,500 per annum, according to qualifications and experience.

Candidates must have a sound experience in Supplies work covering the principles and practice of purchasing, stock control, storekeeping and management.

For one post a specialised knowledge of purchasing in large organisations of both engineering and general stores is required (experience in the legal aspects of purchasing would be an advantage); the requirements for the other post being a specialised and practical knowledge of stock control and storekeeping in large organisations covering all kinds of plant, equipment and general stores.

Apply, in writing, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates), to National Coal Board, Establishments Branch (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope TT/201. Original testimonials should *not* be forwarded. Closing date April 3, 1950.

WANTED, for weekly newspaper, Assistant Editor. Must be of highest character and sound on economics. Good background of experience essential.—Apply Box 366.

PRIVATE-SOCIAL-SECRETARY available for position requiring initiative. Must be interesting and responsible post.—Box 383.

For interview by Employers, students are selected from among those who have completed their Course with the full London College Diploma. In accordance with our established custom, no fees are charged for this service. Please write or telephone to: —

The Appointments Director,
THE LONDON COLLEGE OF SECRETARIES
170, Queen's Gate, London, S.W.7. KENsington 3228.

OXFORD UNIVERSITY INSTITUTE OF STATISTICS

Applications are invited for research posts in applied economics. Candidates are expected to have qualifications in economics and statistics and will be required to take part in the Institute's research programme. The salary will be on the scale £450—£900. Application forms may be obtained from the Secretary, Institute of Statistics, 91, Banbury Road, Oxford. The closing date is May 1, 1950.

UNIVERSITY OF BELFAST

The Queen's University Lectureship in Economics. The salary scale is £800 x £50 to £1,150 plus F.S.S.U. Initial placing to depend on qualifications and experience. Applications by May 15, 1950 Particulars from G. R. Cowie, M.A., LL.B., Secretary.

BIRMINGHAM REGIONAL HOSPITAL BOARD

APPOINTMENT OF PUPIL ADMINISTRATIVE ASSISTANTS

Applications are invited for the appointment of two pupil administrative assistants on the staff of the Board's headquarters. In the case of men, the appointments are open to persons who have completed their National Service or are exempt therefrom and who have not attained the age of 26. Applicants must be well educated and the appointments will offer scope for promotion on the passing of intermediate and final examinations approved by the Board for the purpose. The salary will be in accordance with the General Division which is a "wage for age" scale, particulars of which can be obtained on application to the Board. The appointments will be subject to the National Health Service (Superannuation) Regulations 1947 to 1949, and to a medical examination. Applications, stating age, full particulars of education, academic qualifications, if any, and experience, should be addressed to reach the Secretary to the Board, 10 Augustus Road, Birmingham 15, not later than March 31 1950.

ASSISTANT INDUSTRIAL RELATIONS OFFICER

The Gas Council invite applications for the appointment of Assistant Industrial Relations Officer. Candidates should preferably be University Graduates between the ages of 30 and 40 and should have experience of secretarial and committee work and a knowledge of Wage Structures and Conditions of Service in Industry and of Wage Negotiating Machinery in general. It is intended that the post shall carry with it membership of the pension scheme to be established by the Gas Council, and the successful candidate will be required to pass a medical examination. The commencing salary will be in accordance with qualifications, but will be not less than £900 a year.

Applications, giving full particulars of the candidate's qualifications and experience and the date on which he would be able to take up his appointment, should reach the undersigned not later than April 15, 1950.—F. G. Brewer, Secretary, The Gas Council, 1 Grosvenor Place, London, S.W.1.

PLANNING Manager (28-40) is required by a Slough manufacturer engaged in batch production on an extensive scale. Considerable experience in the Planning Department in a Company of repute is essential. This position calls for an unusual attention to detail, ability to command the respect of the Sales and Works Department and to secure the fullest co-operation of the Planning and Progress Staff. All applications should give details of the person's education and experience, together with the salary earned in each position.—Box 356.

B.SC. ECON., Research experience Statistics, Productio Efficiency, requires temporary post July-September. Fluer French, German. Interview, work anywhere.—Box 371.

B.SC.(ECON), 27, seeks progressive position, experienced preparin economic and statistical reports, special knowledge food an agriculture. Overseas offers welcomed.—Box 374.

Thin Ice

OF all the forces which the Government can bring to bear upon the national economy, the budget is nowadays well understood to be the most potent. It sets the framework within which all other economic policies must fit; and the shaping of this framework each year is the Government's most important economic act. Unfortunately, the more widely these truisms are understood, the less are the chances, it seems, that this vital economic process will be decided by economic considerations and the more is it likely to be dominated by politics. The risk that next week's budgeting will be narrowly political has been increased by the electoral deadlock; yet never was there greater need for wide economic statesmanship, for courageous objectivity removed from the mere exigencies of party politics.

Though the budget is the most potent means of changing the shape of the national economy, it cannot produce large changes quickly; if such changes are to be effective before Marshall Aid ends in 1952, they must be envisaged in the budgeting of 1950. So, too, must the adjustments which will be forced on British industry if and when the Government gives ground—as it may soon have to do—to rising demands that it should permit a wider convertibility of sterling. During this year and next, greater freedom of trade may be expected to join with the ending of the seller's market and the rehabilitation of German and Japanese industry to intensify competition in all markets, including the home market. If British industry is to be toughened in time to meet these strains, now is the moment to set the plans in motion.

Now, moreover, is the time to survey afresh the whole pattern of economic and fiscal policy, for only now are the domestic policies of the past four years beginning to show their real effects. During these years the nation has been enjoying the first comforts and anticipating the fuller promises of the welfare state without having to bear, and without even being able to appraise, their true cost. These policies were launched in a period when there was almost bound to be full employment, when over-employment was and is a greater risk than under-employment, and when their natural repercussions upon British costs and upon the balance of payments were absorbed or obscured by a generous stream of North American gifts and by the fact that the non-dollar world hungered for sterling goods at almost any price. It is only now, as these easy conditions begin to wane, that the British people will measure and start to pay the real price of the social services which they demanded. It is only now that the searing effects of penal taxation upon the natural sources of initiative, efficiency and venture capital will begin to show their first effects upon the standard of living.

These are among the reasons why this coming budget, which could be the means of preparing to grapple with the many problems that are emerging, demands a new order of economic statesmanship. It is not on this plane, however, that most of the preliminary forecasts

and discussions have been pitched. Everywhere it seems to be taken for granted that next Tuesday's budget will be more bedevilled by narrow party politics than any of its recent predecessors. A demeaning cynicism, which has been spreading among observers of all parties, dismisses all lofty appeals as "unrealistic" or politically "impossible." Certainly it is true that public opinion has been so sheltered from economic realities in recent years (and for that the Opposition is not much less to be blamed than the Government) that any new approach would require great courage. In particular, so long as the cardinal precept of political "realism" is that nothing must be done that might conceivably alter the existing pattern and level of employment, there can be no major change in the character of economic policy. If to this overriding political condition there is added the assumption (which Sir Stafford Cripps has often affirmed) that there is no scope for any major reduction in Government expenditure, then indeed is it politically "impossible" perceptibly to change the shape of the national economy by any deliberate act short of draconian controls, or to help it to meet sterner economic conditions as they emerge in the world.

*

On such political hypotheses, the only feasible policy is the present policy, and that is now seen to rest upon the thin ice of the fast-thawing wage freeze. Here is the Chancellor's dilemma. To stave off the collapse of this foundation calls for tax concessions or increased subsidies; to grant them may give rise to further inflation and thus make the eventual collapse the more certain. If Government expenditure were not already at astronomical levels, there might be room for concessions financed by additional taxation of luxury expenditure and by steepening the progression of direct taxation; but even the Chancellor now admits that the practicable limits of taxation have been reached, if not surpassed. No addition to taxation can now come to the Chancellor's rescue; it would be met either at the expense of savings or by economies in consumption of the most heavily taxed goods—notably beer and tobacco. Nor does there seem to be much scope for the Government to appeal to disgruntled trade unionists by some purely political gesture aimed at profits or capital. Any such move would blatantly disregard the fact that its direct economic consequences would weaken rather than strengthen the forces of disinflation. But even in this direction, the possibility of any dramatic action is presumably ruled out by the slenderness of the Government's majority.

Thus the room for budgetary manoeuvre is narrowly circumscribed by the hard fact that in fiscal affairs, as in economic affairs, the easy postwar phase is over. Expenditure is rising while the yield of revenue is falling. The immediate prospect was surveyed in some detail in *The Economist* four weeks ago, and there is no need now to recapitulate or revise the estimates given then. The main picture is clear. In the coming year, expenditure "above the line" will be about £3,450 million, without allowing anything extra for supplementary votes. Ordinary revenue, on the existing basis of taxation, is unlikely to surpass £3,850 million. Even on the most optimistic estimation, the prospective surplus "above the line" will be much below the £550 million realised last year. Some reduction might be admitted without running any desperate risk of further inflation. But the "Economic Survey" shows that the surplus in 1950 will not be enough (together with the growth of the National Insurance Fund) to make good the deficiency in private savings. The budget surplus, together with the accumulations of the insurance funds and private savings, has to finance the investment programme at home and a small net investment abroad. To do so without further inflation, the contribution from private savings would have to rise by 27 per cent in 1950, whereas it fell by 26 per cent in 1949.

Thus, if the Government accepts the estimates of the "Economic Survey," it has not, strictly speaking, any free margin at all for even minor tax reliefs—except such reliefs as a cut in the beer duty (which might actually increase the yield of taxation by checking the decline in consumption) or such as might be financed by economies in subsidies. On the contrary, a close adherence to the formula for disinflation professed in the past would require measures to augment the budget surplus, merely to keep the economy on a roughly even keel. If the Chancellor still has any regard for his past professions, he would have to admit that any budget which offered concessions in the hope of persuading the unions to go slow in their wage demands would have to be several degrees less austere than those of the past two years.

*

A budget fashioned within the narrow limits set by the so-called "realities" of politics would be patently inadequate. But this very fact could strengthen the hand of a Chancellor determined to shake off the fetters of party politics. To gain time by popular budgeting might or might not be politically advantageous to the Government, but it would certainly be dangerous for the country. The ice must give way eventually, and then the whole superstructure of rigid wages and artificial prices and of policies which seek at all costs to avoid any transitional unemployment, will begin to break up as rising costs undermine Britain's position in an increasingly competitive world market.

A statesmanlike approach—or even one which took the long view of party political interests—would begin the dismantling process now. It would squarely face the fact that the policy of the bare minimum of disinflation (deliberately kept short of the real disinflationary dose which would give the British economy room to move) and of sustained overfull employment is a prescription for economic paralysis and the loss of all the natural resilience which a healthy economy should possess. It would recognise that these ill effects are greatly aggravated when Government expenditures force taxation to the very limits of taxable capacity. Present policies and the automatic increases in the demands of the existing social services mean that taxation must remain indefinitely at these crushing levels. Public authorities now absorb in central and local taxation and in social insurance contributions appreciably more than 40 per cent of the net national income. But if the Government is now talking of applying the brakes to the growth of expenditure—"ordinary" expenditure will this year be fully 25 per cent above the comparable figure of only three years ago—it is doing so merely because it knows the impossibility of trying to force the ratio of taxation to income any higher. There has been no suggestion of economies designed to produce any perceptible reduction in this ratio; on the contrary, the Government's apologies for imposing any discipline at all demonstrate that the promised pause is merely *pour mieux sauter.*

Such is the prescription of party politics. Yet, especially at this ending of the postwar phase of easy trading and liberal external aid, the Chancellor has a duty to the community which transcends party appeals, precarious though the electoral and parliamentary balance may be. He has a duty to appraise these policies afresh, and to explain their implications objectively and frankly. There can be little doubt what the objective conclusion would be. The true social costs of maintaining overfull, as distinct from full, employment, and of keeping social expenditure based on perfectionist standards at the very limits of taxable capacity, are bound to be disproportionately high. When these costs are fully shouldered by the British people and British industry—as soon, at last, they will have to be—they may prove shatteringly high. They may be just supportable in good economic weather. But the nation, with the Chancellor's guidance, ought now to be thinking of what could happen if the weather changes.

A Policy for Asia?

THE Russians show some signs of passing through a phase of "giddiness through success." There is certainly more evidence of over-confidence than of apprehension in their sabre rattling in Germany, the incitement of European Communism to new violence and the detailed plans for sabotage and disruption throughout South East Asia. Nor is it difficult to understand the reasons for this new mood of assurance. The Communist victory in China was its starting point; but it has been steadily reinforced by the appalling confusion and disarray into which the defeat of Chiang Kai-shek plunged American diplomacy.

It was an unfortunate historical accident that the debacle in China coincided with a period of intense division between Democrat and Republican. Up to the time of President Truman's electoral triumph in 1948 the main issues of foreign policy had been concerned with Europe, and the President, lacking control of Congress, worked closely and continuously with leading Republicans, Senator Vandenberg at their head. The autumn elections of 1948 restored Democratic majorities in both Houses of Congress; bi-partisanship grew steadily weaker, a process accelerated by the serious illness and withdrawal of Senator Vandenberg. This was the situation into which the Communist triumph in China burst with such explosive force. The Republicans, who had been waiting for an issue upon which to attack the President, took up the Chinese disaster with fierce satisfaction. Soon their extremists were embellishing the tale of the State Department's failure with sinister accounts of the Communist influence that had made it possible. The attack, which began more or less within the bounds of reasonable discussion, degenerated into the hysteria and unreason of the McCarthy witch-hunt. When, above all, sober analysis and a careful redrafting of policy were needed in the State Department and in Congress, the air was acrid with the fires prepared for offending Democrats. The free world, dependent upon America for leadership, looked on aghast; the Kremlin took comfort and issued new battle orders.

The disruption which seemed imminent in the western camp has mercifully been checked. For this much of the credit must go to the American Secretary of State, Mr Acheson, who, in the midst of a campaign of vilification, steadfastly carried on with the policy that should have been adopted by all branches of the American Government—the calm appraisal of past errors and the attempt to deduce from them a new policy to meet new conditions. In a series of outstanding speeches, crowned by the address given at Berkeley, California, and devoted wholly to the problem of American policy in Asia, Mr Acheson has recently attempted to put before the American people the framework of an effective foreign policy, based not upon panic fear but upon logic and good sense.

*

His effort would, however, have come to little had not the President and the more responsible Republican leaders realised just in time that their disagreements were bringing about chaos. In the midst of a painful illness, Senator Vandenberg found time and courage to write a letter to Mr Hoffman, recalling the principles of bi-partisanship and reminding the American people that the free world's survival depended wholly upon effective American leadership. The President, in return, welcomed the letter warmly and made two appointments of vital importance. Mr Cooper, Republican ex-Senator from Kentucky, and Mr John Foster Dulles, second only to Senator Vandenberg as adviser upon foreign affairs, were invited to serve as consultants to the State Department. With these appointments, the President implicitly admitted that a bi-partisan foreign policy had once again become a major concern of the Administration.

It is clear that the first aim of the new team must be to establish a common purpose in American policy towards Asia. Unity in Asian policy will be the test of the new arrangement; happily, there is good reason to suppose that it will be brought about. Mr Dulles's influence is likely to be decisive in this issue. In his statement accepting the President's invitation he said:

> Secretary Acheson, in his recent California speeches, discussed the nature of Soviet-American tensions in terms that were profound and enlightening and with which I am in full accord.

There is thus at least a chance that the policy proposed in general terms by the Secretary of State in recent weeks will now become the agreed foundation for dealing with the troubled world of Asia.

The policy is based upon three principles, of which the first determines the rest. It is, quite simply, that a vast revolution is in progress among the peoples of Asia, who aim to secure national independence and economic and social advance. Both these aims are entirely consistent with the designs of American policy and both, in their genuine forms, can count upon American interest and support. Mr Acheson clearly does not shirk the more radical aspects of this vast revolution. He supports the Asian people not only in their desire for indepen-

dence, but also in more controversial aims such as better education and "more widespread ownership of the land." To this general principle there is one exception. The Chinese revolution has been side-tracked by the Communists into the blind alley of Soviet domination. The American aim is, therefore, modified. Recognition and trade must depend upon the new regime's accepting certain minimum standards of international behaviour. The Secretary of State would be ready, no doubt, to accept the representative of Communist China in the United Nations—and here Mr Dulles agrees with him—but only if the Chinese attempt no adventures in south-east Asia, and if they are ready to trade on a basis of mutual respect.

With this one exception, the United States supports the new Asian states wholeheartedly in their desire for independence. The two remaining principles of American policy cover the methods by which American support and sympathy can become practically effective. First, the United States will be ready to adapt its assistance to accord most fully with local needs. As Mr Acheson proposed in his speech at Berkeley, American aid

> must be within the prudent capabilities of [American] it must be fitted into the responsibilities of others and it must be within the prudent capabilities of American resources.

It was with this aim in mind that the Secretary of State first sent his Ambassador-at-large, Dr Jessup, to survey the Asian scene and to preside over a conference of American envoys at Bangkok; then he established a technical mission under the former head of the ECA Mission to China, Mr R. Allen Griffin, to determine by local surveys what type of aid was needed at once.

This may be called the short term principle—to revive confidence and hope by injecting into the Asian situation the immediate help needed to stay internal disintegration or hold back Communist infiltration. As a policy it leads without noticeable transition to the second longer term principle, that the development of Asia's economic and social resources should be assisted by the free nations working in concert, offering not only economic aid, but also their technical and administrative resources and fitting their programmes into the larger framework of the United Nations.

*

This, then, is the ground plan of an American policy for Asia upon which a bi-partisan edifice may now be built. Since it is barely issued—certainly not fully armed—from Mr Acheson's brain, it is perhaps too early to judge of its likely success. It is enough at this stage to be grateful that anything like a policy has emerged at all after Mr McCarthy's "night of the long knives." Yet a bi-partisan policy for Asia sets the pattern not only for the United States but for the rest of the free nations. They in turn must consider the new lead that they are being given and assess its strength and weakness.

The shortcomings are obvious enough. In the first place, there has as yet been no fundamental discussion of the issues between the powers most closely concerned. It is almost a truism to say that the closest possible co-operation between the United States and the British Commonwealth is essential to the success of western policy in Asia, yet the form of such co-operation has not been considered so far. Mr Acheson has expressed his interest in the Commonwealth Conference which is to meet in Sydney next month to discuss economic assistance to south-east Asia—the Spender Plan—and to which other interested powers such as France and Holland are apparently to be invited. But it is to be hoped that American "interest" will be quickly transformed into participation.

A further difficulty lies in the comparative inadequacy of the resources available for a forward policy in Asia. The United States can call upon $100 million voted by Congress for use in the Far East; their Export-Import Bank can make available some sizeable loans (such as the $100 million recently granted to Indonesia), and there are some remainders of unspent ECA funds that can perhaps be used. Hopes that considerable funds would be available under the President's Point Four policy of technical assistance have been damped first by the small figure proposed—$45 million—and then by the action of the House of Representatives in halving it. Hitherto, the bulk of outside aid to Asia has taken the form of Britain's releases of sterling balances, but these releases have gone mainly to assist India and may in future be cut. Thus the policy for Asia lacks the elements that were the backbone of the Marshall Plan—the estimates of need and the estimates of available assistance.

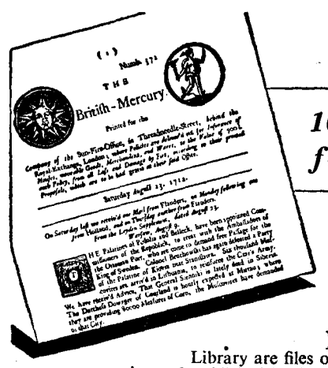
*

The gravest difficulty, however, lies with the recipients themselves. The debacle in China showed that no amount of aid can help a regime unable to help itself. In the short run, the free nations have no choice. They must deal with what they have—whether it is the wavering regime of Bao Dai or the inexperienced centralising politicians of Jakarta. The policy of immediate support—for instance, the American arms now arriving in Indo-China or the $10 million granted to Siam for rearmament—is undoubtedly correct and essential. But, in the longer run, the free world cannot afford a repetition of the Chinese debacle, in which a government committed fully to national independence lost the support of the people because its economic and social outlook was too conservative and static. The greatest difficulty underlying Mr Acheson's admirable analysis of Asian nationalism lies in the fact that the new nationalist regimes are not necessarily committed to those economic and social changes which are as much a genuine Asian aspiration as independence itself. With Communism pressing down upon the frontiers of south-east Asia, nationalism is not enough. Mr Acheson has recognised this fact, but neither the United States nor its western associates have as yet any very clear idea what conclusions should be drawn from it.

Certain points are obvious. The Bao Dai regime cannot hope to win sufficient support unless the French go much further in transferring genuine sovereignty to Viet Nam. The Americans have also shown some awareness in recent months that more direct supervision of the aid they give may be necessary. Stern notes have been sent to both the Philippines and to South Korea deploring the local mismanagement of economic assistance. But these exceptions do not add up to a consistent picture of the type of Asian regime which is capable of fulfilling its people's aspirations not only to independence but to economic advance as well. Nor do they suggest the most effective way in which the outside powers can help to bring such regimes into being.

The struggle in Asia will be long. The free nations are accepting a challenge that will last a generation and more. So far they have done little more than recognise that a policy is necessary and they are fortunate that the American Foreign Secretary has stated its broad outline in so clear and so comprehensive a form. But if their co-operation must last over the decades, it must begin to be effective at once. In strict realism, the Sydney Conference should include American representatives and should make a frontal attack upon the three main problems—unity of general policy, the scale of resources available for aid, and the best methods of outside influence and guidance to be applied in each individual case. The Communists have already held such a council of war with their trade union leaders in Peking. It is now for the free nations to embark upon a council no less resolute and well prepared for defence and peace.

Defence Policy—III



The Mathematics of Security

THE first article in this series put forward the argument that if the "cold war" is to be won—that is to say, if another killing and shooting war is to be avoided—there will have to be a higher state of military preparedness on the part of Britain than used to be thought necessary in time of peace. In the second article it was argued that the needs of strategy, when translated into terms of military formations, involve an expansion of the front-line strength of the Army from about five to at least ten divisions, that the functions of the RAF should be to provide a first-class fighter force and a tactical—but not a strategic—bomber force, and that the Royal Navy should concentrate primarily on protecting the sea lanes from submarines.

These articles have not stopped to count the cost either in men or in money. They have proceeded on the assumption that the right way to go about planning an effective defence policy—and it cannot be repeated too often that "effective" means one that prevents war from breaking out—is grst to attempt an assessment of what is needed, on a minimum basis, without frills, and from that to deduce what the cost would be. This is the opposite of the usual procedure, which is first to fix a sum of money that the country could "afford," and a manpower budget that it would "tolerate," and from these data to deduce how large the armed forces can be. That may be appropriate for defence *in vacuo*, but it is absurd when, as now, the potential enemy has named himself, when the alliances are ranged and when the risk can be calculated with some precision. Yet the question of cost remains, and it is with this that the present (and final) article is concerned.

The problem of manpower is by and large the problem of the Army. The Royal Navy, which in the coming year will contain less than three per cent of national servicemen, has few recruiting difficulties and its manpower ceiling is actually to be reduced by 13,000 to a total of 127,000. The RAF is much more dependent on national service and in the coming year national servicemen will constitute about 35 per cent of its strength. But the RAF is not a consumer of manpower on anything like the scale of the Army, and although it has a considerable problem in training men for skilled tasks, it has, according to the Secretary of State, succeeded in increasing the strength of its front-line formations by economies elsewhere. Moreover, if defence policy is co-ordinated with the United States in such a way as to keep the demands of Bomber and Transport Commands to a minimum, there does not seem on the face of it any necessity for a major expansion in the total strength of the RAF—although there is a continuous need to increase the front-line strength.

The Army presents a much more bewildering problem. The British Army of today is a very large force. In the coming year it will contain some 180,000 regular troops, about 170,000 national servicemen and about 70,000 colonial and Gurkha troops. Yet out of a force of well over 400,000 men it is apparently impossible on the existing organisation to produce more than five or six divisions. Moreover, although expenditure on War Office account (which excludes contracts placed through the Ministry of Supply) is running at £300 million, the divisions which are in existence have hardly advanced at all in fire power or mobility since 1945, except for a small supply of new tanks and some reorganisation of artillery support.

10/- an issue for Editor

IN the British Museum Library are files of the 'British Mercury,' a journal published in the 18th century by the Sun Fire Office.

Old minutes of the Sun shed interesting light on journalistic customs of those days, for it was recorded in 1710, 'that David Jones do write our paper and that he be allowed 10s. per paper.' The 'Mercury' provided valuable commentary on current affairs 50 years before the first of our national newspapers appeared.

Upon such foresight was founded the tradition of the Sun Insurance Office for leadership in public service through the medium of insurance.

A 301.5

On a purely mathematical basis an army of between 420,000 and 460,000 could produce a force of ten divisions with their ancillary troops. A mathematical calculation does not, however, take account of the Army's two main difficulties. In the first place, it is undertaking a number of static garrison duties which make it impossible to concentrate military units into mobile formations. In the second place, nearly half the British troops are national servicemen undergoing eighteen months' military service, of whom perhaps only a third are really fit for duty in front-line formations. It has already been argued that great efforts should be made to overcome the first disadvantage by handing over static police duties, as far as possible, to local forces, even where this involves greater financial assistance to colonial governments. But the second problem is much more intractable. On the one hand, the 180,000 regular British troops could not by themselves possibly meet the existing strategic commitments, let alone undertake the expansion and reorganisation which, it has been argued, is essential to winning the "cold war." On the other hand, to double their numbers by calling

up youths for eighteen months' national service produces only a slight accession to the front-line strength and enormously increases the static commitments of the regulars for training, administration and welfare.

There are three possible ways out of this dilemma. One method would be to introduce a system of selective service whereby, say, 50 per cent of the present intake of national servicemen were selected by ballot for a three-year engagement instead of for eighteen months. This would provide the same number of national servicemen serving at any one time, and it would have the advantage that they would be fit for duty in mobile formations for at least two-thirds of their period of service, and that fewer regular troops would have to be tied down on training and administrative duties. The Government have explicitly rejected this course as being impracticable and there is a strong feeling in Britain that an arbitrary method of selection such as the ballot is unfair. However a glance at the present selection method, which results in the deferment or exemption of nearly half the eighteen-year-old youth of the country, on grounds of occupation, shows that there is a haphazard form of selective service in operation at the moment.

The second and more drastic method is to raise the period of national service at its present intake level from eighteen months to three years. This would have the effect of doubling both the number of national servicemen in the Army at any one time and the length of their effective employment in front-line formations. The obvious disadvantage of this course is that it would create a corresponding decrease in the number of young men available for productive employment, and that it would create a large gap in the lives of the country's youth at an important period of their lives.

The third method, which involves far fewer political and technical difficulties than the other two and would produce better soldiers, though a less precisely calculable number of them, is to make an all-out effort to raise the strength of the regular Army, which is now not only not rising, but will begin to show a slight fall this year. It is true that the Government have made considerable efforts to stimulate recruiting by the use of propaganda and improvements in quarters and living conditions. But beyond that they have been content to ascribe their difficulties to the blessings of full employment, and there is a depressing tendency to believe that the problem can be solved only when there is again a fair measure of unemployment. This may be so, but as the accompanying graph shows, there was no apparent connection between the level of unemployment and the level of recruiting into the Army in the years between the wars. If the Government accept the view that the only way to win the "cold war" is to have a large regular Army, they have no basis for the belief that they can wait until there is a slump and pick up recruits on the cheap. They must offer competing attractions to civil life in a time of full employment and accept the fact that to get a large number of regulars will involve making soldiering into one of the most profitable and well-paid professions in the land—not merely on a par with industrial employment, but considerably better. (It should be pointed out here that it is the problem of expanding the regular Army, not of an all-round expansion of the services, which is at issue. To raise the level of pay for the regular Army is not an automatic argument for raising all service pay. The difficulty of imposing a differential policy is one more argument for a strong Ministry of Defence.) The obvious objection to raising the pay of the regular Army has hitherto been the policy of wage stablisation, but that objection seems likely to be removed by the breakdown of the policy. Certainly if there is a significant rise this year in the general level of industrial wages, the present scale of Army pay will begin to act as a strong deterrent not only to recruiting but to staying in the Army at all.

★

It is impossible to say exactly what additional financial and economic burdens would follow on a more realistic and dynamic policy. The Royal Navy must obviously spend at the rate of about £200 million until it has mastered the technique of anti-submarine defence or until the aeroplane has again caught up with the submarine. It may be that to bring its escort fleet into a state of complete readiness will involve a still higher expenditure for a limited period. The budget for the RAF is unlikely to go down, but unless the costs of aircraft production rise very steeply there seems no reason, on the face of it, why it should go up. The Army on the other hand will probably have to spend more, partly on increased pay, partly on re-equipping its front-line formations. It is possible that such increases in

the defence budget as would follow on an improved and reorganised defence policy would not be as severe as the alarmists or the opponents of a forthright defence policy have argued, since what is chiefly needed is the imposition of an effective joint plan and concentration upon the strategic essentials. It is possible that, with a sufficiently drastic reorganisation, the increase might amount to little more than £100 million a year, or about the same as the supplementary estimate for the health service which was voted the other day. It might be wiser, however, to suppose that a larger sum would be asked for and that the total of defence costs would amount close to £1,000 million a year.

This is an enormous sum, which nobody should contemplate with any complacency. Unquestionably, it greatly complicates the already very difficult financial problem of the British state, and there are plenty of people who will simply rest upon this fact and declare that the country cannot afford such a defence budget. It is as well to be quite clear what this means. It is quite consistent for a pacifist to hold such a view. It is equally consistent for a Communist or a fellow-traveller. But those who do not fall into either category, those who would vote the expenditure for a shooting war if matters went so far, are merely being purblind if they talk about not "affording" enough defence expenditure to win the "cold war." They are, in effect, expressing a definite preference for infinitely higher expenditures at an early date. Even those who believe that the internal salvation of the British state depends upon a sharp reduction in the total of government expenditure must also believe, if they can think straight, that an increase in defence expenditure is necessary to its external safety. Eventually there may be a common defence budget for the Atlantic Pact nations, and since Britain's expenditure, relatively to its resources, is the highest, this might bring some relief. It is also possible —indeed it is vital—that it will eventually be practicable to shift the main burden of the ground defence of western Europe on to Britain's continental allies. But, as will be argued in a later article, it is not a possibility at present, and it is in the present and the immediate future that the dangerous period lies.

Any increase in defence expenditure will inevitably bring it into sharp competition with the costs of the welfare state. Here also clear thought is necessary. In the first place, it is not the cost of wars—past or future—that has brought the budget to its present sorry pass. The figures were given in an article in *The Economist* of April 1st, but they will bear repeating:

	Social Services Expenditure	Defence, War Pensions and National Debt Charge
	As Percentage of National Income	
1920–24 (average)	5·7	12·8
1925–29 „	7·5	12·0
1930–34 „	10·9	11·0
1935–38 „	10·1	11·1
1949–50	17·5	12·8

If the taxpayer's back is breaking, it is not defence that has loaded on any of the last straws.

Secondly, the modern democratic state may or may not be able to survive without spending 17½ per cent of its income on welfare services. But in the present posture of world affairs it certainly cannot survive without spending enough to defend itself. In the most literal sense, defence expenditure is more necessary to the democratic welfare state than the social services themselves.

Stalin the Heretic

THE single combat between David and Goliath must have been an exciting spectacle for those who witnessed it, and it has provided for later generations an encouraging example of success for the small man over the heavyweight. Our sympathies are naturally with David, yet many readers of the traditional account must have felt sorry, too, for the poor giant; Goliath is indeed a pathetic figure, standing there with his great spear, but unable to get to close quarters with his antagonist and having his skull split by the impertinent slinger. Similarly in the current ideological conflict between the Soviet colossus and diminutive Jugoslavia, it is hard to refrain from a feeling of pity for the mighty autocracy which has so far, for whatever reason, failed to get near enough to Tito to liquidate him, and has now to endure a most damaging bombardment of doctrinal buzz-bombs launched from Belgrade.

The western world has been preoccupied with the question of possible ways of aiding Jugoslavia if it were subjected to a Russian military invasion, and it is no doubt the fear of world-wide complications that has hitherto deterred Russia from using force. But ideologically Jugoslavia is on the offensive and it is the Kremlin that stands in need of protection. Tito and his followers are not content to defend themselves against the denunciations of the Cominform; they arraign Stalin as a heretic, a leader guilty of deviation from the true faith. He is no longer for them the unique and infallible interpreter of Marx and Lenin; on the contrary, he has erred and strayed from their ways like a lost sheep and is no more worthy to be called a *vozhd*. The Titoites attack with weapons which neither Mr Churchill nor Mr Bevin nor Lord Vansittart can ever use, weapons drawn from the Marxist-Leninist armoury. Western statesmen may accuse Stalin of such lesser offences as aggression, treaty-breaking and enslavement, but only the hyloists of Belgrade know how to press home the more serious charges of incorrect analysis and dialectical ignorance. Marxist-Leninists are covered by the panoply of their theory against all the arguments of liberalism—which they know to proceed merely from the class interest of capitalist exploitation—but it is quite another matter when their own scriptural arsenal is turned against them.

There is, of course, nothing new in criticism of Stalin's regime from within the Communist camp. Trotsky carried on a campaign of opposition for years and caused great annoyance in the Kremlin. But he was a homeless exile, without any kind of state power and with only a handful of followers, often reduced to publishing his diatribes against Stalin in the capitalist press. Tito, on the other hand, is ruler of a country of substantial size and strength, and has the resources to provide an adequate sounding-board for verbal blows at his adversary. Such, for example, was the election speech delivered on March 18th by General Djilas to

some 20,000 teachers and students assembled at the University of Belgrade and representing the "new intelligentsia" of Tito's Jugoslavia. The presence of the President of the Serbian Academy of Sciences as well as of the Rector of the University emphasised the dignity and importance of the occasion.

Before this great concourse, with an audacity born of centuries of defiance of the Ottoman empire, the Montenegrin leader hurled against the Communist Party of the Soviet Union the dreadful accusation of "revisionism." Here indeed the gloves were off, with no pulling of punches. But the non-Marxist reader is perhaps a little mystified and would like to know why the insult is so dire; this would take long to explain, but it is sufficient to say that to call a bishop a bigamist would be a mere pleasantry compared with calling a Bolshevik a revisionist.

*

Djilas was less esoteric when he came to describe the situation in Russia. Declaring that a proletarian socialist revolution would always be threatened by two dangers—from the reaction of the defeated bourgeoisie and from the growth of a new bureaucracy—he claimed that Russia had fallen a victim to the second. Capitalism had indeed been crushed there, and what was now happening did not mean a return to a capitalist form of society; but social relations in the Soviet Union had not kept pace with the growth of the forces of production. With the development of a socialist system the bureaucrat should become less and less important, because the resistance of the expropriated bourgeoisie must weaken with the passage of time and the rise of a new generation without roots in the old society, while the organisation of production ought to be left to an increasing degree to the free association of the producers themselves. Without the free initiative of the masses representing the basic force of production, the mere abolition of private ownership of the means of production would not bring about genuine socialism. But in Russia, said General Djilas—who ought to know—the bureaucracy had become all-powerful, and the symptoms of its rule were to be found in the stifling of all initiative and freedom of discussion among the people; in the non-Marxist leader-cult with forms similar to those of absolute monarchy; in differences of income ranging between 400 and 15,000 roubles a month and thus exceeding the inequality to be found in a bourgeois society; in the nationalist glorification of Russia coupled with the belittlement of the cultures and historical roles of other nations; and in the Soviet exploitation of other socialist countries and assertion of inequality among socialist states.

General Djilas ridiculed Soviet claims that the transition to socialism had already been completed in Russia; this was only the propaganda of a bureaucracy which wanted to conceal its privileged position from the masses and to keep itself in power. What had happened was a crisis in the middle of Russia's socialist development; the phenomena to be observed there had sprung from socialism itself. Such degeneration was not inevitable and Jugoslavia was determined to avoid it. Russia had gone wrong because it had been for a long time a backward country isolated among capitalist states; its relatively weak revolutionary forces had only been consolidated by means of a "bureaucratic centralism" and the creation of a state that was above society. The danger for socialism was that the bureaucracy tended to get out of control. In a bourgeois society the bureaucrat thought of himself as a little man because the real power was with the capitalists; but under socialism he considered himself a great genius called to give orders to the people. Socialism had become a historic reality which capitalism could not destroy, but it had developed "internal contradictions" the solution of which was essential to its future development.

In the international field these contradictions were driving Russia into policies of expansion and aggression. Just as the contradictions of capitalism produced imperialism, so those of socialism in Russia were leading to exploitation of other countries and rivalry with capitalist powers for spheres of influence at the expense of weaker nations. These measures helped socialism "only to the degree and form which coincide with the narrow, hegemonistic interests of the privileged bureaucrats,"; the new bureaucratic imperialism could not fail to clash with the aspirations of peoples for freedom and equality.

The Titoist position today is thus a claim to hold the Marxist-Leninist faith pure and undefiled and a repudiation of Moscow's right to represent or interpret it. Stalinism is denounced as the great heresy, the disastrous deviation which has landed Russia in the ditch, while Jugoslavia continues to advance along the high road of progress. The criticism that the Jugoslav Communists level at the Stalinist regime from Leninist premises is very effective and damaging, for there are many features of the present Soviet system that were not merely unknown in Lenin's time but are directly contrary to his teaching.

*

If there is a weakness in the Titoist case, it lies in a doubt whether the Belgrade regime is entirely proof against a *tu quoque* rejoinder. Leader-worship, excessive nationalism, police tyranny and bureaucratic privilege have certainly not been absent from postwar Jugoslavia, even though there has not been lately the all-embracing totalitarian oppression that prevails in Russia. The question is whether a revolutionary regime based on the theory of proletarian dictatorship and the practice of single-list elections can avoid a bureaucratic deformation, even if its leaders wish to do so. Ideologically the issue is whether the rejection of Stalinism can stop at Lenin.

There is so far no sign of any such doubts in Belgrade; but it is something that the existence of contradictions in socialism, as well as in capitalism, is now officially admitted by Communists. Formerly it was only the bourgeois system that suffered from contradictions, and all evil in the world was simply and solely due to private ownership of the means of production. This is still the Stalinist attitude; the Soviet world is essentially without sin, and if anything is wrong with it—requiring a few million people to be sent to correctional labour camps—it can only be laid to the account of "relics of capitalism" or to the influence of agents of the Wall Street imperialist warmongers. But the Titoists allow that socialism can develop vices of its own. One touch of contradiction makes the whole world kin, and with people who share with us such human imperfection—even though they remain very sure of themselves and their brave new era—the west should be able in time to find a common language.

NOTES OF THE WEEK

May Meeting

The need for a united western strategy is becoming steadily more widely accepted. With each new manifestation of Soviet hostility—whether it be the shooting down of planes or the organising of provocative demonstrators in Berlin or the reinforcement of the Chinese Communists with fighter aircraft—the western powers have a warning that they are enveloped in a global hostility that demands as global a resistance. Oddly enough, however, the last six months have on the whole been a period of rather more Allied disunity than usual. Three main issues have bedevilled understanding and, so far, the way to greater concord is not in sight.

Anglo-American relations continue to be troubled by the two countries' differing approach to the problem of the dollar gap. The caution and defensiveness that characterise British exchange control spring, in the British view, from lack of faith in America's future disposition to behave like a creditor, but, in the American view, from isolationism and indifference to the great dream of an integrated Europe. Relations between France, Britain and America are clouded by the problem of Germany, the Anglo-American view veering more and more to the acceptance of the Germans as partners, the French seeking to keep a check on this development, and, by separate action in the Saar, successfully doing so. Possibly the most acute divergences may arise over the third issue—the war in Indo-China, of which France is bearing the brunt and now wishes to share the cost. Yet between French readiness to fight for its "rights" in Indo-China—otherwise why, ask the French, should they fight at all?—and American views that real independence for the Vietnamese is the condition both of success and of effective aid, a great gulf is fixed.

Here, then, ready made is an agenda for the May meeting of the three Foreign Ministers—the dollar gap, the German problem and the situation in the Far East. The last of these is certain to reach the conference table, for the French give it the highest priority. Germany, too, is certain to be considered, but reports from Washington suggest that, at the moment, Anglo-American economic differences are not held to be suitable material for the Three Power talks.

* * *

The Libau Incident

On April 8th, an unarmed American naval patrol aircraft with a crew of ten left Wiesbaden on a training flight to Copenhagen. It did not reach its destination and a widespread search which began next day failed to discover any trace of it. Four days later, the Soviet Foreign Minister, Mr Vyshinsky, handed a strongly worded Note to the American Ambassador in Moscow, claiming that an American B29 four-engined bomber had flown in over the Soviet base at Libau in Latvia, refused to land when invited to by the Soviet authorities and opened fire upon Soviet fighters sent up to head it off. They returned the fire whereupon, the Note alleges, the American plane made off. The incident, in the Russian view, constituted "an unheard of violation of the elementary rules of international law."

There is, unhappily, every reason to suppose that the Russians shot down an unarmed plane which was wandering off its course. The fact that the aircraft was missing was made public long before the presentation of the Soviet Note and no Soviet protest can transform an unarmed naval aircraft into an armed Army bomber. The Russians are abnormally sensitive about their Baltic installations and have been known to take Scandinavian vessels into custody when at least fifteen miles distant from the Baltic coast. It seems only too likely that the "trigger happy" attitude of the Jugoslavs in 1946 has now been repeated and the unarmed American plane was shot down into the sea. On the evidence available, there seems to have been a grave and unpardonable breach of the laws of humanity.

In 1946, the American Government behaved with the greatest restraint and kept in severe check the wave of anger and resentment aroused by the Jugoslav incident. It would certainly be the course of wise diplomacy to repeat the moderation in the present distressing case. The Russians' chief tactic in the cold war at present is to intensify in the world a belief in imminent conflagration. A severe but unimpassioned handling of the incident on the Allied side will prevent the Russians from turning it to propaganda account.

Peacemaking in Delhi

The Delhi agreement between the Prime Ministers of India and Pakistan announced last weekend is a feat of statesmanship and moral courage. Not only have Mr Nehru and Mr Liaquat Ali Khan expressed confidence that Moslems can live safely in India and Hindus in Pakistan, but they have defended this act of faith boldly and frankly before their parliaments. Until they met there was danger of disastrous war; now in Mr Nehru's words "We have stopped ourselves on the edge of a precipice and turned our backs on it." Both the spirit they have shown and the undertakings they have signed are genuinely democratic and humane; in countries where communal strife flourishes so much on ignorance and prejudice the agreement will give just the shock to public opinion that is needed to bring it to its senses.

Obviously the minorities are not going to find their security and prospects improved overnight; but they can at least feel some hope of seeing justice done against those guilty of violence and incitement. There will be adequate machinery for investigating and preventing disorder, in the shape of minority commissions for West Bengal, East Bengal and Assam; and the inquiries that have been promised should explode some of the inflated figures and stories that have been passed around by the malicious and the frightened.

It is not for the outsider to apportion praise and blame for what has happened. Decent as well as bad Hindus and Moslems have been involved in the terrorism. A tense atmosphere and old traditions have to be overcome before communal friction ceases to influence relations between two states whose foreign political and economic interests are in many ways inseparable. The Hindu is not yet accepted as a citizen in East Pakistan; and in India the Moslem is, in practice, only half accepted. The East Pakistanis are genuinely afraid of India, because they realise that Eastern Bengal could be occupied in a matter of days; therefore they distrust their Hindu neighbours who, by that very fact, are impelled to look across the frontier to India. The average Moslem, it is true, does not hate the Hindu, but the Punjabis and Beharis in administrative positions do. Moreover, opinion in Pakistan pays quite exaggerated attention to such extremist elements in India as the Mahasabh, some of whose leaders have just been arrested without any noticeable public protest being made. The risk in India is not from such people, but from the possibility that continued tension on the scale of the last two months might make Congress think that no Moslem could be a loyal citizen of India.

For observers on the spot it is extremely difficult to find out the truth about the disorders. News passes slowly and in snowball fashion. When a thousand people were being killed in the Goalpara district of Assam on February 19th

a correspondent who was in the capital—Shillong—two days later heard nothing about it. What happened in Calcutta and Dacca hit the newspaper headlines; whereas in fact events there were probably grossly exaggerated while worse things were happening in the villages.

Not the least important outcome of the Delhi meeting is the prospect that the two Prime Ministers will meet more regularly. It is difficult to believe that this will not lead to a new attempt to use the opportunities of conciliation and settlement of the Kashmir question that the United Nations is now offering.

* * *

Trouble Ahead

Slowly, and, so it seems, inexorably, the Government is approaching the most serious industrial crisis of its career. The responsible alliance between the Government and the General Council of the TUC to hold down costs of production and the cost of living—an alliance that forms the basis on which most of the Government's domestic economic policy rests—is being gradually broken up by the actions of individual unions. Last week the Union of Shop Distributive and Allied Workers rejected wage stabilisation and decided to put forward a demand for a £6 minimum wage (in accordance with advice tendered last year by Lord Beaverbrook) for all adult workers. In one sense this is merely a further illustration of the fact that the General Council of the TUC, when it reaffirmed its support for wage stabilisation at a special meeting last January, did not know the minds of the rank and file. The executives of USDAW supported the policy at that time, but this week found their action rejected by a majority of 138,547 to 107,497. If this had happened last January, the vote of 657,000 in favour of stabilisation cast would have been turned into an adverse vote of about 30,000.

It is not only among shop workers that the signs of restiveness are increasing. Both the National Union of Teachers and the National Union of Journalists decided at their Easter conferences to press for salary improvements. Demands for improvements in the minimum rates for railway workers and miners are to be discussed by their unions again in the near future, and demands for improved wage rates will be put before the annual conference of the National Union of Agricultural Workers in May. No doubt the miners, railwaymen and farm workers would claim that their demands are legitimate within the terms of the agreement between the Government and the TUC which admitted wage increases for cases of personal hardship. Mr Sam Watson, the chairman of the Labour party, may have been indicating the means by which the Government and the TUC hope to escape from an upsurge of general wage demands when he declared in a recent speech that the only justifiable claims at this moment were those for lower paid workers, and that it was up to the union leaders to say so bluntly to the higher paid men. In face of the rising pressure, there is little that the General Council of the TUC can do beyond renewing its appeals for restraint and loyalty, since it has no coercive power over the unions and since so many of the union leaders are themselves divided on the issue.

*

By far the greatest recent encouragement to the opponents of wage stabilisation has been the decision of the Confederation of Shipbuilding and Engineering Unions to proceed with a ballot of their members on whether to pursue strike action or arbitration to achieve their claim for an all-round increase of £1 a week. This is not only a defiance of the wage stabilisation policy, but also an open flouting of the Ministry of Labour's interpretation of the Conditions of Employment Order. It is this Order that makes strikes illegal unless 21 days' notice of a state of dispute has been given to the Minister, and which gives discretion to the Minister, not to the union, to decide whether a dispute shall go to arbitration. The ballot papers will not be returned before June 30th, so that the Ministry, which has made considerable efforts to reconcile the employers and the unions, has three months to decide on its next move. But if the unions in the confederation, more particularly the Amalgamated Engineering Union, will not listen to the counsels of their own political leaders, it is difficult to see how the Ministry can effectively take action.

Economics of Population

The Report of the Economics Committee of the Royal Commission on Population*, written in 1945 and published last week, does credit to the perspicacity of its framers. It would have been very easy, even for the distinguished signatories, to go seriously wrong about the developments of a postwar period that had barely opened when the report was drafted. There are, indeed, some instances when hindsight raises the reader's eyebrows—such as the confident assertion regarding the effect of population trends on the school-building programme, that "the child population has passed its peak," or the dismissal as comparatively unimportant of the fiscal problem posed by an ageing population, on which the proliferation of the health service might well induce second thoughts. Moreover, as the economists themselves point out in their preface, the emphasis laid on the relation between population trends and unemployment reflects rather the preoccupations of the 'thirties than the problems of chronic inflationary pressure. On the whole, however, the report provides sane, shrewd and valuable summing up of the economics of present-day demography. The prospect that the population will cease to grow, the prospect even of a smaller population, is on economic grounds to be regarded with equanimity; the balance of payments problem, the modern equivalent of the law of diminishing returns as Malthus and John Stuart Mill saw it, makes it overwhelmingly probable that greater numbers would mean lower standards, and *vice versa*. Loss through diminishing opportunities of specialisation in a smaller economy need not be serious, and the gain through the cessation of the need to devote resources to equipping new millions with capital could be considerable.

On the other hand the actual transition is bound to be sticky. There is the danger that

> we may not succeed in turning over to an economy based on a reduced rate of investment activity without substantial unemployment during the course of this transition

or, as the last five years show to be more probable, that the whole advantage to be derived from a reduction in necessary investment may be thrown away for fear that someone will in fact lose his job. There is the reduction in the margin of error available to those making economic decisions —the closing down of the reliable forced draught to economic activity. There is the reduction in mobility just at the time when adaptation is most necessary. All these disadvantages are multiplied if the decline is rapid and prolonged. A considerable decline is inevitable, however family-raising habits may change in the future, merely on account of that lowering of the birth rate which has already taken place.

> Thus [says the report] the possibility that a moderate decline in numbers would be advantageous on balance . . . does not supply a cogent argument against prompt action to encourage parenthood.

* Papers of the Royal Commission on Population. Vol. III. HMSO. 64 pages. 1s. 6d.

Labour and the Co-operatives

To judge from the tone of the debates at the Co-operative Party's Easter conference, the party, like the girl in a popular song, knows whom it is going with, but, unlike the song, does not know where it is going. The Co-operative movement is anxious to move in step with the Labour party, but it is mortally afraid that, in the process the Labour party may tread on its toes, by advocating socialist policies which conflict with the movement's commercial interests. It insists upon being consulted before, and not after, Labour policy is made and upon having a voice in its formulation. This attitude is understandable. The Co-operative movement, which claims 10 million members, has often felt slighted during the first term of office of the Labour Government and it considers it has a right to be treated as at least an equal partner in the political triumvirate of the Labour party, the TUC and itself.

To some extent the worst period of tension is now past. Relations with the Labour party have recently improved and there is new machinery for consultation and contact. Above all, the Co-operative movement regard the Labour party executive's decision to substitute "mutualisation" of industrial assurance for nationalisation in the election programme as a major concession. This, however, was essentially a negative victory, and generally speaking, the main concern of the Co-operative movement is to safeguard its existing trading interests against encroachments, whether by private or public enterprise. From the public point of view it is all to the good that there should be a brake on some of the wilder flights of fancy in which Labour politicians like to indulge, but the Co-operative movement will be expected to make some positive contribution to socialist thought if the alliance is to be fruitful.

The Co-operative party's statement of policy *Building the New Britain* contains many interesting points, but it does not contribute any idea of great novelty or vitality. Criticisms of nationalised industries are a familiar feature of any left-wing document, as are protests against the high salaries paid to the officials of public boards, and the Co-operative party has little new to say about this subject. Its most original idea is the suggestion that the state should extend the area of voluntary collective action and co-operative enterprise as an alternative to the public corporation form of nationalisation. In the heart searchings about the future of socialist policy which are at present taking place within the Labour party, this idea may receive some attention, but the Co-operative movement will have to overhaul its own machinery and rise above its tendency towards parochialism if principles are to be applied over a wider field.

Hands Across the Adriatic

That Marshal Tito should come to friendly political and profitable economic relations with his Italian neighbours is most desirable. That he should eat the fiery words of the past and seem to appease the west by suddenly conceding Italian claims to the whole free territory of Trieste is obviously impossible, for his policy is to appear equally independent of both Moscow and Washington. And that American and British influence should be thrown into the scales for Count Sforza and against Tito, when the latter is the sharpest thorn in the Cominform's side, is clearly unlikely. These things being so, it is surprising that the Italian Foreign Minister, Count Sforza, should have indulged last week-end in a piece of public diplomacy which was justifiable only if there were reasonable prospects of it succeeding.

The main purpose of Count Sforza's speech was to suggest that the Trieste problem should be discussed directly between Rome and Belgrade, and so removed from the hands of the Big Four, who have so far failed to solve it. That is a useful idea and should be followed up. But whereas in one paragraph he suggested that the Three-Power Declaration of 1948 (favouring the return of the whole Free Territory to Italy) must not be regarded as a *Diktat* to which Jugoslavia must submit, he insisted in another paragraph that "substantial acceptance" of that declaration must be the starting point for a general agreement.

Perhaps Count Sforza was playing the Latin game of presenting political possibilities in the form of a dilemma. Now that Marshal Tito is regarded by Mr Stalin as a dangerous renegade it can be argued that there is no logical reason why Moscow should not join with Americans, British and French in granting Trieste to the Italians. Rather than that the Italians should appear to be party to such dictation, it is suggested that they should get together with the Jugoslavs and find their own solution. This subtle approach has very little to do with the facts, which are that a sudden lining up of the Russians and the west against Jugoslavia is out of the question, that Italian public opinion wants more than Tito can give without losing face, and that long and careful diplomatic preparation must precede any bargain between the claimants.

Much of Count Sforza's speech was conciliatory and wise but its main point has brought from Belgrade a testy refusal to give up zone B (now occupied by the Jugoslavs). But *Borba* has been allowed to write that the problem of Trieste must be solved by mutual agreement, and Marshal Tito has told a correspondent of *The Times* that the question was not "of great current importance." Both parties may find it useful to recall that it is still United Nations business.

* * *

Spring Peace Offensive

The spring offensive of the international Communist movement led by the "partisans of peace" is now well under way. The plans were discussed and the operational orders issued by the Permanent Committee of the World Peace Congress when it met in Stockholm from March 15-19. They are now being carried out, for example, in the French, Italian, Dutch and Norwegian ports where the first shipments of American arms and equipment are arriving, and western Europe must expect some lively examples of "direct action for peace" by Communists and their allies in the trade unions. So a movement which began two years ago with professions of pacifism among the intellectuals has been transformed—as could be foreseen—into a mass action in support of Soviet foreign policy.

The present lines of appeal have some interesting features. First is the attempt to put across a new "popular front" policy; the World Congress for Peace appeals, through the Cominform newspaper, to

> all social, religious groups and workers of culture, all honest people, who, irrespective of their views concerning the reasons for the strained international situation, are alarmed because of it, and seriously desire to see peaceful relations restored between the peoples.

The basis of this broad collaboration is the demand for an international agreement to prohibit and prevent the use of atomic weapons. And to this demand has been added the new suggestion that the government which first uses the atomic weapon shall be regarded "as a war criminal."

So far so good; millions of non-Communists might say "Aye" at this point. But they should read and think further. They will then discover that the main aim of the

MR HARTLEY WITHERS

A Memorial Service for the late Mr. Hartley Withers will be held at St. Dunstan's Church, Fleet Street, London, E.C.4, on Thursday, 20th April, at 12.30 p.m.

"peace front" and the "600 million" supporters claimed for it, is to frustrate the working of the Atlantic Pact. Again to quote the Cominform newspaper, whence all directives flow:

> the full wrath of the people, in all its resoluteness, must now be directed again the Anglo-American imperialists—the provocateurs of a new war.

Whatever industrial and political action is now intended by the partisans of peace, their propaganda line is now clear. They will seek to mobilise against the Americans all sentiment in favour of international control of atomic weapons; and the majority of people to whom they appeal will either not know or not believe that no such system of control is compatible with the present theory or practice of Soviet internal policy.

* * *

The Cost of Equal Pay

Theoretical arguments about the effects of introducing equal pay for women can now be flavoured with a pinch of fact. The Treasury has supplied the staff side of the Civil Service Whitley Council with figures showing the cost of introducing equal pay into the Civil Service. The figures are published in the *Whitley Bulletin* and concern the cost of introducing equal pay gradually over a period of 18 years—a scheme for which the staff are pressing in order to overcome the understandable reluctance of the Treasury to introduce an immediate scheme for equal pay.

Out of a total of 687,000 non-industrial civil servants a scheme of equal pay would apply directly to 143,000 women who are in the same grades and doing the same work as their male colleagues and to 102,000 women such as typists and telephonists where the grade is made up entirely of women. If the full scheme were in operation it would cost £7,000,000 to give equal pay to the 143,000 women at an average cost of £31 a year for each woman in the Post Office grades and £53 a year for those in other Government departments. No figures of cost are given for the exclusively women's grades where consequential increases would follow, but assuming an average rise of £30 a year each, this would add another £3,000,000, bringing the total extra cost of introducing equal pay to £10 million a year.

It is interesting to try to assess what effect, if any, such an increase in the cost of female labour would have on the recruiting policy of the Civil Service. It is often argued that the effect of equal pay would, in general, be to decrease the opportunities for employment for women since their higher sickness rates and the likelihood of early retirement or marriage make their employment an uneconomic proposition if they have to be paid the same rates as men. Such arguments do not however apply with much force in the Civil Service. The vast majority of women civil servants are to be found in the lower clerical grades doing finicky but routine jobs with little prospect of promotion. It would be extremely difficult to get men to do these jobs at all well, and the efficiency of the organisation is not seriously impaired by the high turnover that results from its being largely staffed by girls who marry after, say, five or seven years' service.

In the higher grades such arguments do not apply, but the proportion of women is so small as hardly to affect the issue. If, therefore, equal pay ever does come into effect, the taxpayer can expect the cost of Civil Service salaries to rise by something like the whole £10 million.

* * *

Old People in Distress

Last week's debate in the House of Lords on the plight of old people covered a great deal of familiar ground. The need to provide for those falling between the local welfare authorities and the hospital authorities; the need for more home helps; the need for more old people's clubs and visitors for the lonely; the need for more hostels and homes—all this has been emphasised often enough. Much of it, too, has been written into legislation, and some of it is now a matter of administration. On paper, there is ample justification for the Government's view, as expressed by Lord Kershaw, that old people are infinitely better cared for than they used to be.

But the tone of Lord Kershaw's speech was far too complacent. Although in theory the needs of old people are well catered for, in practice the provision of accommodation and services is nowhere near adequate; nor, in view of the shortages of money and resources, could it be anything else. In the meantime, some of the statutory props that supported old people in distress have been abolished. Children are no longer under an obligation to maintain their parents. More important, there is now no personal obligation on any official to see that an old person—or for that matter any other person—is not destitute, and destitution under the old Poor Law was interpreted very widely to cover the cases of dying alone and unattended which Lord Saltoun described in opening the debate.

When the National Assistance Bill was in committee an attempt was made to transfer the personal responsibility placed on the former relieving officer on to officials of the Assistance Board, but the Government rejected the proposal. Yet the warning given then, that unless this were done there would still be cases of avoidable distress, is being justified—particularly as regards hospital accommodation. Many doctors deplore the absence, in the National Health Service Act, of a statutory obligation on someone, be he an official of a hospital or of the Assistance Board, to find a hospital bed—an obligation that used to rest on the municipal hospitals and the relieving officer. This is not to say that cases of distress did not occur before his office was abolished. But the Government would have been wiser to retain the personal obligation that rested on him as a prop until the new services for the old were adequate for all their needs.

* * *

Investment in the Land

Farmers, landowners and agricultural economists are in general agreement that the land of Britain requires a large investment of fresh capital if it is to be farmed at its most productive level, that is to say at the highest possible level of production consistent with the lowest possible level of costs. Generous rebates of taxation, spread over a period of ten years, are granted for most types of farm improvements and the Government hopes that this will be sufficient inducement for landowners to spend some £50 million on new fixed equipment during 1950. While a high rate of investment—although not conducted at such a breakneck speed as to inflate further the costs of capital improvements for agriculture—is certainly desirable, it is less certain that capital improvements are necessarily being applied with the right end in view.

Now that the back of the agricultural expansion programme has been broken, it is not enough from the national point of view to demonstrate that a capital improvement will result solely in increased production. Lt.-Col. Burrell, speaking last week to the Central Landowners Association, rightly emphasised that priority should be given to those schemes which "will best enable the farmer to make the best and most economical use of his available labour." In other words emphasis should be on productivity rather than production.

It is not clear in what way the Government can take a stronger lead in directing the flow of agricultural capital along the right channels, except by more closely relating farm prices to the long-term needs of agricultural productivity. One aspect of its failure to do this can be seen in the investment applied to milk production. Many farmers in remote areas have installed new cowsheds and dairy equipment, encouraged by the sheltered market, high prices, and the equalisation of transport costs. From a national

World or Worldkin?

"Be no longer a chaos, but a world, or even worldkin. Produce! Produce! Were it but the pitifullest infinitesimal fraction of a product, produce in God's name!"

Thomas Carlyle

ASSOCIATED ELECTRICAL INDUSTRIES is something quite sizable in worldkins: and its function is precisely to extirpate chaos. Its member companies are amongst the most famous in the land, employ 53,000 people in 30 factories in 20 towns. They "produce, produce" not pitiful fractions but £50m. worth of electrical equipment every year. And production of an infinite variety. The resources of the earth from iron and rubber to germanium and krypton are processed and applied to everything electrical—a turbine casing develops out of a foundry ladle, a glass bulb from a handful of sand. And all of it quality equipment, the best that scientific knowledge and experience can create, the best that money can buy.

WHAT does it ADD UP TO?

Factory floor space (sq. ft.)	10,000,000
Number of employees	53,000
Output per year	£50,000,000
Years of experience	50
Expenditure on research	£1,000,000
Exports per year	£15,000,000

It all adds up to **AEI**

'TOO IMPORTANT TO MISS'

Offerings from five continents—in greater variety and volume — make this year's Canadian International Trade Fair a vital observation post and trading centre for businessmen of all nations.

The revaluation of currencies makes it more important than ever to compare world sources of supply, and see where your money buys the most. Shifting patterns of trade provide many opportunities to explore and establish new business connections.

Truly international — entirely devoted to actual business — packed with industrial goods, crammed with consumer products . . . for men of affairs everywhere, *the C.I.T.F. is too important to miss!*

For full details, and information regarding reduced railway rates in Canada, consult:

Miss M. A. Armstrong, Exhibitions Representative, Canada House, Trafalgar Sq., London, S.W.1. Tel. Whitehall 8701, or your nearest Canadian Trade Representative.

LIVERPOOL: M. J. Vechsler, Canadian Government Trade Commissioner, Martins Bank Building, Water Street.

GLASGOW: J. L. Mutter, Canadian Government Trade Commissioner, 200 St. Vincent Street.

BELFAST: H. L. E. Priestman, Canadian Government Trade Commissioner, 36 Victoria Square.

point of view, most of this investment is almost certainly uneconomic now that the milk target has been reached. The effect of a high and distorted price level is also often visible in the over-mechanisation of farms where questions of economic operating costs have been overlooked. It cannot be emphasised too often that the object of agricultural investment should be to lower the cost per unit of output rather than merely to raise output. Higher productivity will pave the way to higher production: mere production will end by presenting the nation with a far higher domestic food bill than it can afford.

Apartheid Restated

A clear exposition of *apartheid* has at last been made in South Africa. On Good Friday, the congress of the Federated Dutch Reformed Churches of Southern Africa, which has been meeting at Bloemfontein, adopted a resolution defining *apartheid* as the complete racial and territorial segregation of the black from the white races. All Africans, according to the resolution, should be moved from European areas to native reserves, where they should be encouraged and helped to develop their own industrial, agricultural and social life. They should be gradually granted the opportunity to govern themselves in their own reserves. The resolution stressed the point that this policy would mean a thorough reorientation of the economic life of South Africa. Established native labour would have to be systematically eliminated from European industries and resettled in native industries; at the same time, native labour would have to be replaced by European labour which would have to be increased by selected immigration and by bringing in the "poor whites" at present kept on relief.

The influence of the Dutch Reformed Church on the Nationalist party is known to be great, and its pronouncements have had almost as much authority as those of the party caucus. Dr Malan, however, has now said that this resolution represents the ideal rather than the practical working out of the policy. It is in many ways a remarkable statement; its language is more temperate than might have been expected and it has faced squarely—and accepted—the full economic implications of the *apartheid* policy. Whether or not the European sections of the population will accept these implications as readily remains to be seen. South Africa's wealth has to a large extent been built up on the cheapness of native labour, and to replace that labour completely with Europeans—which is indeed a fundamental assumption if *apartheid* is not to be simply another form of oppression—would mean at least doubling, if not trebling, the cost of labour. It would also mean a transformation of the European way of life in South Africa by bringing to an end the semi-luxury in which such a large proportion of the white population lives. If, in addition, the European population is to bear the cost of the capital development of the native reserves (which is another welcome implication of the resolution), the total cost of *apartheid* in this form would be prohibitive, as Dr Malan has clearly decided.

Although many will disagree with the fundamental conception of *apartheid,* the Dutch Reformed Church is to be congratulated on stating the facts and implications of the doctrine more clearly than anyone else in South Africa has yet dared to do. Moreover, by drawing attention to the severe sacrifices Europeans ought to accept, it has put *apartheid* in a light in which all too few South Africans are disposed to regard it.

Disappointment with the Wafd

When the Wafd took over the government of Egypt in January with an enormous majority, its friends looked forward to quick fulfilment of election promises: abolition of martial law and of mail and cable censorship, reduction of the cost of living, speedy advancement of several projects for increasing cultivatable areas. Perhaps, on the two latter counts, too much was expected in too short a time; but three months have not been too short for one efficient and hardworking minister. At the Ministry of Education Taha Pasha is setting an example to his colleagues by his activity in opening new schools and executing plans for technical education. The Ministries of Health and Social Welfare are also proceeding with the laying of piped water to villages. Elsewhere politicians seem to be fully occupied with discussing Nahas Pasha's evidently poor state of health, and trying on his badge of office.

Thus, Nahas's faithful rural backers are still pleased with their idol; but he has lost popularity in the towns largely because of a rise in the cost of living. The index was falling when he took office, but his government, to gain popularity, at once passed a law increasing the cost of living allowance to certain higher categories of white collar worker. Many Wafdists who are now reinstated in the civil service were thus rewarded for their loyalty; but a cold winter, some rare frosts, and the effect of the devaluation of sterling upon the price of paraffin have since January sent up the cost of vegetables and of the oil on which most of Egypt cooks.

Educated Egyptians, if thoughtful, are also exercised by the continuance of martial law and spy fever. Why does a government with immense popular backing retain martial law? Why encourage war hysteria against Israel, when it has no intention of resuming a campaign for which the Egyptian people never had heart? Why need it stop the entry of every newspaper, periodical or book that carries a breath of criticism of Egypt? Nahas Pasha has the power to relieve the strain of living in a police state at odds with foreign countries. Yet the only audible protest comes from the elder statesman Sidky Pasha, who has no popular following because he does not blink at hard facts. Does Egypt, he lately asked the newspaper *Akbar el Yom,* really want to exterminate the Jews?

> Would we do that? What does no peace with the Jews mean. By this policy we are making enemies of the American, embarrassing the British, and delaying the settlement of our case without gaining anything.

* * *

Soviet Bits and Pieces

Throughout the Soviet Union and eastern Europe the approach of May Day is being used to launch yet another intensive drive for greater industrial production. Such devices as publicity for local Stakhanovites and shockworkers and the encouragement of "socialist competitions" are already known and in wide use, but in the Soviet Union a more original note has been struck. A brigade leader at the Parizhskaya Kommuna footwear factory, called Korabelnikova, and a senior foreman at the Bauman leather factory called Kuznetsov have devised a scheme primarily designed to make supplies of raw materials go further. They have undertaken to work for definite fixed periods with raw materials "economised" during the remainder of their normal working time. Their "initiative" has been officially blessed by an article in *Pravda;* and the Ministry of Light Industry has decided to apply the scheme in all factories under its supervision. For instance, Tass reported that the morning shift of the Parizhskaya works started on March 31st "in an unusual manner"; so much glue, thread and nails had been saved that the foremen were able to issue enough for the day's work without making any application to the stores department.

According to Soviet reports workers from all over the country have been making pilgrimage to Moscow to learn Kuznetsov's methods from the master himself; and many reports have come in of their successful application. For example, the Lvov electric bulb factory has produced 5,000 bulbs from economised materials; the Tashkent agricultural

engineering works has produced a cotton harvester entirely from economised metal ; and even engine drivers are striving to make journeys entirely on economised fuel.

If Soviet industry is really as highly and effectively mechanised as it is made out to be, it is difficult to see how the opportunities for such saving occur, especially in engineering and metal industries. But if such economies are being and can be made—especially, so it is said, in shoe, garment and textile factories—then it seems likely either that wastage in the past has been large or that quality is now uneven. Soviet propaganda does not, indeed, ignore the need for better quality, and *Pravda* has added to its praises of the new economy movement a warning against "ostentatious display, hustle-bustle and individual record-breaking," all of which (in spite of Stakhanov) are "wrongful practices." It is curious that the Russians should be trying to save raw materials by a variant on their shock methods which offers so many disadvantages.

* * *

Study of Students

PEP (Political and Economic Planning) has undertaken a valuable piece of research* into the social and educational background of university students. It has achieved only a limited degree of success, but this is ascribable partly to the inadequacy of the records kept by the universities themselves, partly to the restricted resources available to a voluntary organisation, and partly to the necessity for using figures for the year 1947-48 when there were still a large number of ex-service students. In spite of all these difficulties, many interesting facts have been revealed.

*University Students. A PEP Broadsheet No. 310.

As far as the previous education of students is concerned the survey shows that at Camford (a tiresome pseudonym for Oxford and Cambridge) 52 per cent of the men entering that year and 51 per cent of the women came from fee-paying schools. It also shows that 21 per cent of the men and 30 per cent of the women came from local authority schools. At the five other universities or university colleges covered by the survey, not more than 25 per cent of the students came from fee-paying schools, while from 40 to 80 per cent came from local authority schools. Two indications of future trends are given in the survey. The first is based on the returns of the University Grants Committee and is reproduced below ; it shows that the proportion of primary schoolchildren entering the universities is rising. The second indication is taken from a comparison of the number of winners of university and college scholarships at Oxford and Cambridge over 20 years. This shows that

PERCENTAGE OF EX-PRIMARY SCHOOL STUDENTS ENTERING UNIVERSITIES

Year	Oxford and Cambridge		Other English Universities		London		Wales	
	Men	Women	Men	Women	Men	Women	Men	Women
1938-39..	18	21	58	63	25	21	88	88
1947-48..	33	38	75	59	46	38	93	89

in 1927-28 to 1933-34 entrants from local authority schools won only 13 to 14 per cent of the scholarships, but that by 1947-48 this proportion had risen to 29 per cent.

As far as the social origins of the students are concerned, the survey is less successful, since it covers only four universities and colleges. It does, however, reveal that the professional and managerial classes provide the social background of two-thirds of the students at Camford and from 25 to 44 per cent elsewhere ; that clerks, shop assistants, salesmen, and manual workers account for 17 per cent of the students at Camford and 40 per cent of the students elsewhere. It also shows that women students on an average come from a higher social class than men students—presumably because middle class parents are prepared to make greater efforts and sacrifices to educate their daughters than are as yet acceptable to other parents.

Shorter Note

A report published in the current issue of *The Lancet* of an association that was found in Melbourne last year between inoculations of children against diphtheria and whooping cough and subsequent attacks of poliomyelitis is of obvious importance. It should be emphasised that there was no evidence that immunisation "caused" poliomyelitis or that the children concerned were infected by the contamination of the immunising agent or the syringes—that they developed poliomyelitis at all could be explained quite simply by the occurrence of a severe epidemic at the time. The significant finding, *The Lancet* points out, was the association between the site of the injection and the site and degree of the subsequent paralysis. It seems, in fact, that inoculations, particularly against whooping cough, may have to be added to tonsil operations, heavy exercise and other physical disturbances as being likely to determine whether paralysis will ensue from an attack of poliomyelitis and, if so, its location and severity. The Ministry of Health's studies of experience in this country will be awaited with interest.

The Great Exhibition

The interest taken in the proposed Exhibition of 1851 is manifestly on the increase. Meetings of most of the suburban parishes, and in most of the towns, and of many societies, have taken place to assist in promoting it. Several bodies of workmen have subscribed—some more than once, and everywhere there appears a strong desire to promote this great national or great social undertaking. . . . We take it for granted, as the rule, that only things will be exhibited which are supposed to be useful, agreeable, or convenient. The bulk will be made to sell. Things that are of no use, whatever time and trouble they may have cost their makers, should find little place in such an exhibition. It is not to be a cabinet of curiosities, or a museum of wonders, but an exhibition of what each people of the world can do to promote the ease, convenience, and happiness of themselves and others. If the arts of multiplying and increasing food are susceptible of exhibition, then their produce, in our judgment, should have the first place. To feed mankind easily, cheaply, and healthily, is the greatest of arts. Then comes the arts connected with clothing and sheltering them, and everything that can conduce to these ends cheapily, comfortably, and beautifully, should have the next place. Furniture, utensils, the fine arts, the luxuries that can be at present enjoyed only by a few, are of minor consideration, but nevertheless of great importance, as showing what may possibly be enjoyed by all, and so far what all ought to try and enjoy. Every contrivance that lessens labour in procuring any of these things will of course have its appropriate place ; and all contrivances that embellish and dignify toil, while they lessen it, must be especially welcome. . . . That the Commissioners should please every one is not to be expected ; but we are sure that they will spare no exertions to secure success, and will conscientiously do that which to them seems best calculated to promote the great social and Christian task they have taken in hand.

Letters to the Editor

Germany and the Spender Plan

SIR,—Your article about Germany holds out to west German industry, as a compensation for the embargo on certain exports to the Communist countries, the prospect of participating in the south-east Asian "Spender plan." However, according to a recent issue of *Deutsche Kommentare*, the Indian importers found out in Bonn that German industrial exports to India are not for the time being a practical proposition. The German industrialists, short of capital, cannot afford to grant long-term credits, while the Indians are unable to obtain the release of their sterling balances to buy non-British goods.

Thus, the ambitious Australian scheme, if it is to succeed in promoting the development of the south-east Asian countries as well as in providing markets for west German industry, will need a very broad international monetary foundation. A multi-continental economic operation of such a scale requires the dollar assets of a Marshall plan to support the imaginative projects of the Spender plan.—Yours faithfully,

GEORGE A. FLORIS

"How Green," Hever, Kent

International Law

SIR,—In your review of Sir Eric Beckett's book "The Atlantic Treaty," the question is asked, with reference to the Soviet Union's system of defensive alliances, "is there legally, any real distinction between a defensive system secured by a criss-cross network of bilateral treaties and one secured by a single multilateral treaty ?" Legally the answer is probably no, but surely it is essential to realise that in point of fact the Soviet alliances are solely and explicitly aimed at an attack by Germany or any of her late associates, while the Atlantic Treaty is aimed at "any aggressor."

An interesting legal point overlooked by your reviewer is the inclusion of Portugal, a non-member of Uno, in the Treaty: should she be attacked we are committed to aid her, although collective defence under the UN Charter can only be undertaken to assist a member of that body.

The point where the Treaty seems most likely to be inconsistent with the Charter is shown by Article 5, which provides that "any such armed attack and all measures taken as a result thereof shall immediately be reported to the Security Council. Such measures shall be terminated when the Security Council has taken the measures necessary to restore and maintain international peace and security." The trouble, of course, is that if Britain and the United States, both members of the Security Council, are committed to go to war against the USSR, a third member of that Council, in the event of an attack on another nation, the Security Council can hardly meet and take the necessary unanimous steps to restore peace. By undertaking the obligations of the Treaty, Britain and America seem to have overlooked the force of the critical sentence in Article 51 of the Charter, which, while recognising the right of self-defence, lays down that the measures taken "shall not in any way affect the authority and responsibility of the Security Council under the present Charter to take at any time such measures as it deems necessary in order to maintain or restore international peace and security." The operative word here is clearly "shall," which strictly limits individual nations' freedom of action. It seems significant that in the commentary on the Treaty, this passage of the Charter is reproduced word for word except for the substitution of the word "do" for "shall," which of course alters the whole sense of the sentence.—Yours faithfully,

HARVEY R. COLE

44 *Avenue Road, Regent's Park, N.W.8*

Television and Housing

SIR,—A letter under this heading in *The Economist* of March 25th condemns the putting forward of a programme for new television stations as though the sole object of this were to create entertainment. Television, however, offers considerable possibilities for export. It is possible that within reasonably short time many countries will set up television networks, thereby creating a market for both transmitting and receiving equipment. The United States has a well developed television industry and an extensive network of stations ; if this country is to compete successfully it must not only possess an adequate manufacturing organisation, but must also have that practical experience which can only be gained under operational conditions. For this, several television stations and a large number of viewers are necessary. It is also to be remembered that television is closely linked to radar, and that failure to develop television would make it more difficult to develop and produce radar equipment rapidly on a large scale.

Whilst strongly condemning unnecessary capital expenditure, I would, however, suggest that in this case there are weighty arguments on the other side.—Yours faithfully,

WALTER BACON

23 *Andover Road, Southsea, Hants.*

Industrial Canteens

SIR,—Your article "Industrial Canteens" raises several controversial issues. I am fortunate—or not so fortunate—in having been at the "receiving end" of a large number of industrial canteens in the Birmingham—Black Country area. On the strength of these experiences I cannot feel, as you do, that the British working man has been converted away from his "sandwich routine," certainly not in the older industrial communities, where the mid-day "snap" is still by no means an exception. "Full employment," you write, "has resulted in canteens becoming competing attractions (for labour)." Here again I am doubtful of the argument in practice, however much it may be stressed in text-books. Where is your "general agreement" that a good canteen necessarily leads to reduced absenteeism ? So far as my own experience goes it has little, if any, effect. As you remark, canteen complaints occupy much (far too much) time at works councils: it is amazing how badly food can be prepared and served up !

But the important feature of so many works canteens—and commercial eating places—which you do not mention is the abominably low standard of cleanliness in the serving, if not in the preparation of the food. The blame may lie in the management's refusal to recognise the defect or in the worker's acceptance of it, but the fact remains that its effect on the nation's health is not inconsiderable. To combat this the official cleanliness campaign should be intensified and the use of "expendable" wax paper cups encouraged.

Lack of space permits me only to mention briefly my final point, the social significance of the works canteen. It is not fully appreciated that the lunch-hour is about the only time in the working day when the two main sections of factory society can meet socially. Yet what happens ? They are very carefully segregated into the works canteen and the staff canteen, the latter only too often having privileges which it does not necessarily deserve and which are known and resented by the workers. Though the top-line management and the workers may be on the best of personal terms, the petty snobbery of so many lower staff grades has to be experienced to be appreciated ! It is unfortunately only too true, I feel, that the relatively recent introduction of the works canteen system helps intensify this antipathy, instead of bringing to

both sides the realisation that they are in truth not only equal but interdependent.—Yours faithfully, JOHN CLEWS

The University, Edgbaston, Birmingham

[Mr Clews's first point can be disputed on the figures. The number of insured persons employed in those industries suitable for canteen-feeding, total—at a generous estimate—well under ten million. The Ministry of Food estimates industrial-ration meals at about 69 million a week. We agree that there is considerable variation between localities and industries, but the overall figures speak for themselves. The precise effects of better diet on involuntary absenteeism in industry as a whole or of superior canteens in enabling certain firms to compete for scarce labour, are, of course, matters of opinion.—EDITOR.]

Farm Costs

SIR,—The article in *The Economist* of April 1st, mentions new direct agricultural subsidies of about £7,000,000 a year. Before considering the subsidies, however, should not efforts be concentrated on cost reductions wherever possible.

Taxation on agricultural fuels (an essential raw material) is a case in point. Of approximately 370,000 farm tractors in use in the United Kingdom in 1949, some 105,000 farm and market garden tractors were petrol driven. They consumed about 48 million gallons of petrol fuel; and approximately 10 million gallons was used in stationary agricultural engines during the year. Though the remaining tractors, consuming vaporising oil or diesel oil, ran on tax-free fuel, no less than £2,170,000 was paid in duty by the petrol tractors and machinery, at the high rate of 9d. a gallon. This is an unjustifiable extra charge on farming costs which is within the power of the Government itself to remedy.—Yours faithfully, E. E. HENDERSON

Uphill Farm, Wendover, Bucks.

LSD

SIR,—The British monetary system of pounds, shillings and pence, to a foreigner, is the most unpractical and antiquated in existence.

British manufacturers out to capture trade in the "dollar" countries, are sending out beautifully illustrated catalogues, but persist in quoting articles in your currency; for instance an article priced at £2 19s. 11d. In order to understand such a price the customer abroad has to convert it into dollars, to do which the following tedious operations are necessary:

	£
1/– equals 1/20 of £1 equals	0·05
19/– equals	0·95
6d. equals 1/2 of 1/– equals	0·025
3d. equals 1/2 of 6d. equals	0·0125
2d. equals 1/3 of 6d. equals	0·0083
Hence £2 19s. 11d. equals	£2·9958

At current rate of exchange of US$2.80 to £1 we finally find that £2.9958 equals US$8.38824, which to the nearest cent is $8.39. At this stage we catch our breath and shout *Eureka.*

If it is too much asking John Bull to change his traditional system of "bobs" and "coppers" just to please us, then for the sake of improving his chances of obtaining a fair share of the "dollar" trade, he should get off his high horse and compel his manufacturers to quote foreign buyers in dollars, and *only* in dollars.—Yours faithfully,

CARLOS GARCES CORDOBA

Cali, Colombia, South America

[*Eureka* indeed, but why quote in dollars only.—EDITOR.]

Books and Publications

A Social Democrat Dissents

"Disagreements: A Polemic on Culture in the English Democracy." By R. C. Churchill. Secker and Warburg. 276 pages. 12s. 6d.

SELDOM can a book have been given a more honest title or one which more accurately summarises its strength and weakness. Mr Churchill disagrees brilliantly and on the grand scale. He disagrees with the Marxist theory of the disinherited and cultureless proletariat, and skilfully debunks the Gollancz-Lehmann-Strachey group of public-school revolutionaries. He disagrees with the Conservative mourners for the vanished glories of the country house, whom he has little difficulty in deflating. He disagrees with the back-to-the-landers, from Morris to Massingham, not merely on the practical grounds that only a fraction of Britain's present population could go back to the land and survive but on the historical grounds that life in the Rural Ages suffered from most of the ills which that return is supposed by its advocates to cure. He disagrees magnificently with the champions of Faith, whether Catholic or Protestant, and has plenty of evidence, of a singularly and deliberately sickening kind, wherewith to demonstrate that it is Faith, as opposed to the ordinary decent ethic which survives Faith's decline, which has generally most encouraged men to behave worse than beasts. His polemics are a joy; witty, pungent, well-documented, zestful without malice and lit by compassion without sentimentality.

The book has, however, formidable liabilities to match its assets. It is hard to say, when the last adversary has been overthrown, just what the battle is about. The idea of "culture" remains desperately hazy, extending beyond its usual meaning to include whatever Mr Churchill approves of in the whole realms of the intellect, of the emotions, and of human and social relationships; and these components "slip, slide and perish, decay with imprecision" from chapter to chapter. Mr Churchill is an equalitarian; he is also something of a Puritan (indeed, his main positive thesis is the continuity and basic importance of the democratic Puritan tradition, and he pours an ascetic's scorn on the idea that food, drink, everything the French sum up as *la douceur de vivre,* have anything to do with culture). One is never quite certain whether he is judging the merits of any historical period and its *Zeitgeist* according to its cultural achievements in the more usual sense or according to the degree of freedom, safety and self-respect enjoyed by the sober and decent common man—a very different canon. Coupled with a strong tendency to ramble, this confusion makes for a remarkably untidy book.

He himself offers no cut-and-dried answer to the enormous question of the Good Society. In so far as he has an answer at all, it is to be found in his unfashionable and obstinate faith in humanism and in progress through education, bringing with it a popular reaction against the, in his view, entirely undemocratic lowering of cultural standards by plutocratic philistinism. (Lord Northcliffe is his arch-villain.) Here, perhaps, is where his all-embracing definition of culture hampers him most. If—and how enormous an if—the fear of war and the consequent pressure towards totalitarianism are abated, the political aspects of "culture" may indeed be safely entrusted to the common sense and decency of the common man, however urban and mechanised. But what about art, and litertaure, "culture" as generally understood? Mr Churchill is very severe on Dr Joad with his despair of the "untutored townsman" and his conviction that most people, so far from loving the highest when they see it, are instinctively moved to heave a brick at it; and he makes some good individual points against that view. But it is noticeable that all his examples of spontaneous democratic culture are drawn from a past in which the ersatz muck now democratically preferred was not available. No one has forced the muck on the public; it was offered and freely chosen. A minority rejects it, a minority would always have rejected it, and of that minority a proportion (steadily diminishing with the widening of the educational ladder to the professions) were manual workers. The majority wallows. Dr Joad has made this point, and a hundred others equally relevant, in his "Decadence," a book whose argument hangs like a No Thoroughfare sign over Mr Churchill's hopeful escape route. Mr Churchill may have answers for them; he is a bonny fighter, and Dr Joad is not invulnerable. But it is a pity that he did not put the demolition of "Decadence" high on the agenda of his programme of disagreement.

The US and the Americas

"The Americas." The Search for Hemisphere Security. By Laurence Duggan. Holt, New York. 242 pages. $3.00.

THIS is a candid and succinct account of the progress of inter-American relations, from the formulation of the Monroe Doctrine, through big stick and dollar diplomacy to the Good Neighbour policy and the ratification of the Treaty of Reciprocal Assistance at Bogotá. The author, equipped for his task by years of specialised study, maintains a realistic approach to the problems of the various south American countries, and their interaction on continental solidarity; he assesses with patient impartiality the achievements and losses in co-operation during this long period of wooing and rebuff. His conclusion is that

> The United States has come to accept the thesis that its policies towards Latin America should be subordinated to the great design of furthering peace, democracy and the general welfare. . . . The American republics must not only achieve an order which will meet their own needs, but they must harmonise that order with the larger design of the United Nations.

Mr Duggan believed that it was the duty of the United States, as the senior partner in a free union of republics, to ensure in Latin America that standard of living in which true democracy can flourish; and that the way to do this was to encourage the diversification of economies which had hitherto been tied to a few export products.

The view point from Washington tends to throw into prominence the central and northern republics of Latin America, while a London perspective would put the River Plate countries in the foreground. Although the author is fully aware of the pitfalls of generalisation, and often qualifies his general statements, yet he does mainly regard his southern neighbours as backward peoples with a pitifully low standard of living and high degree of illiteracy, dominated by feudal, land holding oligarchies. But when the English reader is told that in Latin America authoritarianism has never had popular support "because the dictators have never been able to give the people anything except hopeless poverty" he immediately thinks of Argentina, where the present regime relies very largely on support from the *descamisados* whose standard of living has been enhanced to the point at which inflation and industrial demands have reached a crisis. Again, the assertion that the United States is "the essential customer of the Latin American producer" does not square with British knowledge of the protracted trade discussions between Britain and the River Plate countries. In spite of a large measure of industrialisation, it is one of the ironies of world planning that the long term result of ERP may be the strengthening of Latin-America's overseas markets at the expense of her trade with the United States. But Mr Duggan's conviction was that prosperity in south America, however achieved, will finally result in demand for north American goods, and in this he was probably right. His untimely death has deprived the State Department of a sincere and experienced advocate of pan-American peace and unity. His tact and knowledge must have been invaluable during the long and delicate negotiations that have led to the closer understanding between a group of nations of widely dissimilar social and economic tradition, and his book will be appreciated by all who look to federation and co-operation as a solution of the present world-wide unrest.

Australian Political Development

"The Parliamentary Government of the Commonwealth of Australia." By L. F. Crisp. Longmans, Green, in association with the Wakefield Press, Adelaide, 1949. 344 pages. 21s.

PROFESSOR CRISP is less interested in the theory of government than in its practical aspects, and it is this which gives his book a particular value for the English reader who often finds it hard to assess the significance of Australian innovations in the usages and conventions of Parliamentary Government. The book, moreover, is written with knowledge and insight, and while the author is prone to indulgence in academic reflections on the state of the nation, his account of the practical working of Australia's federal government is by far the best that has appeared in recent years.

There was, Professor Crisp reminds us, "no Damascus Road miracle" about Australia's federal conversion. On the contrary, a decade of drafting and hard bargaining lay behind it. Free from external pressure, Australia's founding fathers took their time: and that is one reason why their solution has about it a solid and satisfying air of permanence. Their memory is neglected but their methods might be profitably studied by the impatient federal dogmatists of our time.

In essentials, Australia opted for the British system of government whose flexibility made it readily adaptable to the exigencies of federation. In fact, neither the Senate nor the office of Governor-General has made any distinctive contribution to Australian political life. Professor Crisp mercilessly exposes the impotence of the former, and expresses the opinion that the latter has become an ever more satisfactory keystone to the constitutional arch with each encroachment upon the initially very restricted discretionary authority of its incumbents. The decisive factor has been throughout the nature of the electorate and of the parties working through the well understood but mostly undefined conventions of cabinet government.

The character of Australian democracy does not appeal to the fastidious, and from Bryce onwards it has received in

A CRITIQUE OF WELFARE ECONOMICS

By I. M. D. LITTLE — *Probable Price 21s. net*

This book begins with a critical examination of the concepts of Welfare Economics. The interpretations which have previously been put on the theory are rejected. A new interpretation is suggested; and held to be indispensable to a proper understanding both of the limitations of the theory, and of what can be learnt from it. An exposition, in non-mathematical terms, of the most important theorems is then given. Various applications, such as the proposal of marginal cost pricing in nationalized industries, and the problem of the valuation of the national income, are discussed. Throughout an attempt is made to assess the realism of the theory, and hence to estimate the relevance of its conclusions to economic policy, and to politics.

OXFORD UNIVERSITY PRESS

consequence few bouquets from political observers ; Professor Crisp does not add significantly to the number. He is pained by the anti-intellectual bias both of the electorate and of the party organisations and is rightly disturbed by an ever increasing indifference to local government. Radio and press, both overwhelmingly anti-labour, contribute little or nothing in the field of political education. Yet no one can read this book without sensing that, for all its superficial vices, Australian democracy is a hardy plant. The highly geared organisation of the parties, the zest and acrimony of party conflict suggest above all a robust vitality. And in his comments on the composition of the parties and their programmes Professor Crisp though not impartial—for he is generally careful to see that the Whig (anti-Labour) dogs get the worst of it—is nearly always enlightening. For anyone, therefore, who wishes to know how the caucus exerts its power and to judge the extent to which it controls the policies of Labour governments, who seeks to understand why the anti-Labour parties prefer, under changing and confusing names, to keep their separate identities, or who tries to assess the influence of an unassimilated anti-Socialist Irish Catholic wing on Labour Party policy, Professor Crisp's book can be confidently recommended.

Seventeenth Century Finance

"Les Financiers sous Louis XIV." By Jacques Saint-Germain. Paris: Librairie Plon. 291 pages.

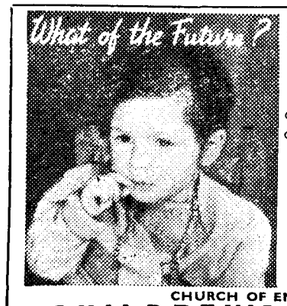
THE scale and intensity of the European wars of the latter half of Louis XIV's reign made unprecedented demands on the administrative and financial resources of the combatants. One of the most interesting questions is the differing responses of the governments of France and England to the challenge presented by so expensive and widespread a war. In England a successful answer was found, partly through the financial genius of Montague, whose Bank Charter Act established efficient machinery for the raising of loans from the City. Government credit was good, while the profits of the export trade—in particular the steady accumulation of bullion from cloth exports to Portugal—gave the moneyed interest a surplus which it could well afford to lend to a government whose war was in the interests of foreign trade.

The French story of weak government credit, corruption and maladministration provides a painful contrast, for with the death of Colbert there had passed away both the methods of sound accounting and the plans for financing war from booming exports M. St. Germain has skilfully portrayed the dislocating effects on French economy and society of the methods by which a succession of weak finance ministers provided for the war. Heavy taxation injured production ; rapacious speculators grew rich by demanding and getting exorbitant interest rates, by making fraudulent gains from government lotteries and by creaming fat profits from army contracts. One method of raising money, the pernicious effects of which are rightly emphasised by M. St. Germain, lay in putting up for sale large numbers of civil service posts. Under the genial direction of Pontchartrain, the Contrôleur-Général, to whom is attributed the irresponsible opinion that "*Toutes les fois que votre Majesté crée une charge, Dieu crée un sot pour l'acheter,*" the numbers of useless civil servants multiplied in their thousands. But Pontchartrain ascribed foolishness to the wrong party. The office-holder bought security and an easy income. The government gained immediately but mortgaged the future, while French economic life was injured both by the steady flight of investment from industry into government funds and by the increased restrictions which the creation of new offices inevitably involved.

Blocks of offices were usually sold for cash down to smart businessmen who resold at an exorbitant price. M. St. Germain has painted his picture of a government at the mercy of corrupt speculators as a backcloth to his central figure, Paul Poisson de Bourvalais, whom Saint-Simon described as a "*fameux financier, soutien de l'Etat comme la corde l'est des pendus.*" Bourvalais, like so many of his fellows, rose from obscurity to wealth and power. He farmed taxes and sold newly created offices under the shadow of his protector, Pontchartrain. He acquired lands, paintings by Raphael and Rubens, classical statuary and Japanese lacquer. He built a great château and acquired a sumptuous hôtel in the Place Vendôme, built at this time and peopled entirely by government financiers. His fortune, like that of the other parasites, provoked increasing disgust, and the crisis came when he and his like pillaged the French treasury over-successfully and forced it to find a respite in bankruptcy. Public anger led to judicial inquiries after 1715, but astute bribery by Bourvalais enabled him to ride out the storm.

M. St. Germain has done original work on the career of Bourvalais ; but his choice of subject has perhaps led him to over-emphasise the seamy side of French finance in this period. There were some financiers who were not parasites and whose credit operations were invaluable to the monarchy. Foremost among these was Samuel Bernard, the greatest financier of the period, who stood between France and defeat in 1708, and who tried unsuccessfully to secure the establishment of a Bank. Though M. St. Germain has given a list of his sources, it is to be regretted that his interesting book has neither footnotes nor an index.

Icelandic Travel



"Iceland, Yesterday and Today." By Horace Leaf. Allen and Unwin. 205 pages. 15s.

MR LEAF spent a large part of the summer of 1946 in Iceland, travelling over most of the country with a curious and observant eye. The record of this journey, liberally interspersed with historical information, comprises the book. It is an interesting book but it never seems to get under the country's skin. It is descriptive rather than interpretative. For example, the economic difficulties of the country are almost entirely overlooked. There is mention of various schemes of hydro-electrification, harbour construction and so forth but no realisation of the very serious results of postwar inflation, particularly when this is allied to dependence on a single crop—herring. Nor does the new and considerable strategic importance of the country find an adequate reflection in Mr Leaf's pages. The omission of such grave matters weakens the implications of the book's title.

AMERICAN SURVEY

Total Economic Diplomacy

(From Our American Staff)

THE President's appointment of Mr Gordon Gray to help to "mobilise the resources of the Government and the experience and thinking of our people" in finding a solution to the problem of the dollar gap is the first official recognition of the need for a universal programme to be ready in two years when the Marshall Plan is finished. It is no more than a preliminary step, since Mr. Gray, who had hoped for a holiday between leaving the Army Department and going to the Presidency of the University of North Carolina, can, in any case, only work at the problem until the end of July. It is too early yet to know how he proposes to handle his job, but a careful reading of Mr Truman's letter of March 31st suggests that he will be fully occupied for the next four months in producing a comprehensive agenda for those who will have to make final recommendations, in cataloguing the innumerable remedies which are now being canvassed and disposing of those which, however superficially attractive, are politically unacceptable.

The President told Mr Gray to "advise and assist in co-ordinating and stimulating the activities of the various governmental agencies which can contribute" and to "obtain the views of experts and interested groups outside the Government." This will be quite an undertaking. Mr Gray is likely to discover that the activities of government agencies, in particular, need more co-ordination than stimulation. Among the experts, any research foundation worth its salt has already started work on the problem or is planning to begin shortly. The Twentieth Century Fund and the National Planning Association are making a joint study of the dollar gap, with Professor Calvin Hoover, who was one of the members of the Harriman Committee, and Professor Donald Humphrey, also of Duke University, as co-directors, while the Brookings Institution is tackling the job on its own. The "interested groups" are just as interested, with the National Association of Manufacturers and the Chamber of Commerce in the lead, and other bodies concerned with exports and imports, and representing both management and labour, following behind. The growing unemployment figures may dilute the enthusiasm of some of these groups for "the necessity for developing an import surplus," which the NAM accepted last spring ; if so, Mr Gray's task will be harder than it would have been if it had begun, as was recommended in many quarters, last autumn.

Mr Hoffman refuses to be discouraged by the growing signs that both labour and industry—though willing to make general statements about accepting imports—will still run to Congress for relief in specific cases. [For instance, the Danbury hatters, who once fought for freedom, are now considering whether they will refuse to trim imported hats.] In his letter to Senator Smith last week Mr Hoffman estimated that Europe, by 1953, must save a further $1 billion on imports and expand its earnings by somewhat less, which would bring trade between the United States and western Europe to a balance at between $3 billion and $3.5 billion. He thinks most of these additional earnings will come from tourism and non-competitive imports, leaving about $400 million to be found from imports competitive with American products. Although he points out that this is a very small fraction of American total production, he expects it will be necessary to develop special retraining programmes to deal with the unemployment it will cause in the United States.

Nobody else has such specific ideas on the level at which the gap should be closed, but the two main schools of thought—high and low—are both represented on the Senate Foreign Relations Committee, where they met head-on during the hearings on the third year of Marshall aid. Senator Connally comes from Texas, which produces cotton and oil—both materials traditionally exported ; he spoke, though he probably little realised it, for those who believe in a high level of imports and exports. Senator Lodge, coming from a State whose industries have to compete with imports of foreign manufactures, argued in favour of encouraging Europe to search for non-dollar supplies, thus taking the pressure off Massachusetts textiles, wool and shoes. Senator Lodge's ideas are not at the moment respectable in orthodox economic circles, but perhaps by the time all the surveys are finished and the findings have come in, his views may be nearer to realities than is admitted now.

★

It is difficult for the United States of the nineteen-fifties, however much it may want to, to take over the economic role of nineteenth century Britain. It has never needed imports as Britain did, and statistical calculations that imports are low in relation to the American national income, when compared with the past, are irrelevant. Scientific development during the last thirty years—and particularly the direction into which it was forced by the shortages of the war period—has made the United States largely independent of many raw materials—among them rubber and fibres—from overseas. In another crisis it could probably become almost completely independent. A voluntary effort, however determined, to import manufactured goods which compete with satisfactory domestic products, is likely to falter at the first onset of economic recession, as was demonstrated in the spring of 1949.

The export of private capital, the traditional function of a creditor nation, is now not nearly so attractive an undertaking as it once was. However "undeveloped" a country may be, it is usually sufficiently developed to understand the

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

techniques of high taxation, political pressure and expropriation which can be practised on foreign firms without the risk of retaliation by their governments. Mr Elmer Davis remarked when Point Four was first proposed that the shortage of venture capital was caused by the fact that there were no venturesome capitalists. There is no reason why there should be many, when public sentiment against "exploitation" has made it impossible to earn enough from successful ventures to offset the losses of the failures and when high taxes on income mean that speculative investment may produce large net losses, but never large net profits. There is, indeed, no parallel between nineteenth century Britain and twentieth century America. The solution of the dollar gap must come from new ideas—not from old ones refurbished.

Many new ideas are being offered for sale, some of them already well known. Point Four is the only one which has reached the stage of being defined in an Administration Bill and it has had rough treatment in Congress whenever it has been mentioned. As first conceived, it certainly included the possibility of government investment, but it has now been reduced to a programme of producing, in those areas which are not at present promising prospects, the technological climate to which private capital might, with suitable guarantees against legal hazards, be attracted. Apart from Point Four, changes are contemplated in tariff rates and administrative procedures, but nothing has happened yet. Nevertheless, these and other methods of increasing American imports—among them teaching the American public the merits of foreign goods and the foreign producers the intricacies of the American market and subsidizing domestic industries which suffer—will be high on Mr Gray's agenda. Other more erudite schemes are also being considered, such as the suggestion that creditor nations should accept the currency of debtors for the surplus of exports not covered by imports and that the currency so acquired should become valueless after a certain time unless spent upon imports.

★

It is to be presumed that, when Mr Gray has delivered to the President a clear picture of the problem and of all the feasible solutions, the successor to the Harriman committee of 1947 will be appointed. Although Mr Gray, after his successful time as Secretary of the Army, is personally and professionally acceptable to both parties, he is only one individual and a Democrat. Senator Vandenberg, with all the authority of an elder statesman speaking from a sickbed, asked for another Harriman committee "equally unpartisan and equally impeccable in character to resume independent, advisory studies of our new responsibilities as the world's largest creditor nation." Its appointment would mean that Mr Acheson's concept of "total diplomacy" was under way on the economic front.

Up to the present, American economic policy has not been total. The British loan was an attempt to solve postwar problems through one country; the Marshall Plan tried to do it through a number of countries in western Europe. Both provided partial solutions, but both made assumptions about the eventual return of world trade to its old channels which Mr Truman admitted to be wrong when he said that "prewar patterns of trade have been destroyed." The appointment of Mr Gray recognises that new patterns must be created. On what level of United States trade will they be built? Is the rest of the world to be encouraged in the future to buy all that it wants from the United States and must the United States plan to import, and its debtors plan to export, enough to pay for these needs? Or will the United States only take from abroad what it can use without annoying American industry and must other countries find alternative channels of trade for anything above this level? At the moment, every other country is redirecting its economy toward the task of exporting to America, at some risk of distorting its natural shape and increasing its dependence on the United States. No country is preparing itself for permanent independence of the American market. The first problem of the various committees which, in the next year or eighteen months, will follow the appointment of Mr Gray, will be to decide whether American imports are to settle at the highest or the lowest level at which the gap can be closed. When that decision has been made the closing of the gap will be easy to plan—though not so easy to execute.

•

The Marginal Farmer

[FROM A CORRESPONDENT IN IOWA]

FARM economists, mortgage bankers and insurance men in this corn belt State feel that agriculture in this area is still prosperous, with at least 75 per cent of the farmers able to ride out hard times, even though prices of farm products continue their decline, which has already lasted two years. Though the realised net income of farm operators in the United States last year was 15 per cent lower than in 1948, 1949 was still one of the best years of the century. Farm mortgage debts have never been lighter, and farmers have more and better buildings and machinery than ever before. That is true over the whole nation, and is still more true for this rich western region.

Nevertheless, the picture appears different to undercapitalised farmers; to farm bankers who lend on chattel mortgages and short-term notes; and to officials of the Farmers Home Administration, which makes loans to needy farmers when banks will not. The latter see tighter credit, more distress sales, and many farmers caught with overextended short-term debts and equipment. They are visited by former countrymen who yearn to return to the supposed security of farm life, and take up their time with wistful loan applications. They see farm equipment dealers who bought their stock at peak prices, facing the prospect of having to sell at a sacrifice if demand should follow farm prices and incomes down. Dealers generally buy new farm equipment outright from the manufacturers, not on consignment as automobile dealers do, and prices of used farm machinery have already dropped sharply.

Both pictures are correct—one for the average, one for the marginal corn belt farmer. Iowa boasts one-fourth of the grade A farm land in the country, as well as prosperous commercial and industrial cities and towns—yet in 1947 11 of its 99 counties were the poorest in the country. All the 11 were in south-central Iowa, where per capita incomes were lower than the average for the State of Mississippi, which is generally reckoned to be the poorest in the Union. Since then, there has been some improvement in southern Iowa. Marginal farmers are not necessarily poor managers. Many of them are, but many simply entered farming at the wrong time, and made large purchases of farm machinery at the top of the market.

Ten years of good times have made possible a revolution in farm living standards, bringing them up to city levels

for those who can afford such conveniences as plumbing, lighting, and heating, and above city levels in refrigeration and use of power for transportation and odd jobs. On the fringe of farms close to cities, direct competition with city standards has been acute. Labour moves on and off the farm in response to it, and wives and children bring pressure on the farmer if he himself tries to ignore it.

The cost and depreciation of the equipment needed to maintain these new standards are high, and make a farmer more vulnerable to price declines than he was in the days when he was more nearly self-sufficient. Changes in farming techniques—the greater use of machinery, fertilizer, and hybrid seed—have increased the capital required and the risk involved in farming, as well as the efficiency and the yield in good times. It is harder to get started in farming now, and if the balance of prices continues to move against farmers, it will be harder for the marginal operator to hang on than in simpler times when farming took more brawn and less business judgment and capital.

★

This squeeze on the marginal farmer began at a time when the Democratic Administration was searching for ways to revive the farmer-labour alliance which made the New Deal victories of the early nineteen-thirties so sweeping, and which showed signs of reviving in the 1948 elections. The solution put forward by Mr Charles Brannan, the Secretary of Agriculture, however, does not consist of aid to the marginal farmer. Instead, he proposes price support for farm products at such high levels that even the marginal farmer will benefit somewhat, whilst the commercial farmers, who are more vocal and influential, will benefit vastly more. Consumers would benefit, in spite of the heavy cost in taxes, by being allowed to buy surplus foods at market levels instead of seeing them burned or dumped or stored—apparently in perpetuity—as at present.

The farm organisations that oppose the Brannan Plan also ignore the marginal farmer (though Mr Kline of the American Farm Bureau Federation has correctly pointed out that their problem is "not a price problem"). Their concern is to keep price supports moderate enough to encourage normal economic adjustments by farmers and to avoid antagonising a Congress elected overwhelmingly by consumers, by asking too much in special favours for farmers.

At the moment the costly system of farm price supports reflects political realities and economic myths. The myths are that farming is somehow more fundamental than other industries, since everybody must eat, and that consequently an unprosperous agriculture would lead straight to a general depression. Some reasoning even reduces this legend to a mathematical formula. Farm income constitutes about one-seventh of the national income, therefore, it is argued, a dollar in government payments to farmers will automatically generate $7 in general prosperity. A leader in the *Des Moines Register* ridiculed this by proving that income from fisheries (and most other things) also varies with the national income, fisheries in fact more exactly than farming, only by a 1,700 to 1 ratio instead of a mere 7 to 1. But there are few fishermen. There are 6,000,000 farmers, strategically distributed across the politically over-represented rural areas of the country. Since the prolonged farm depression of the nineteen-twenties, commercial farmers have become strongly organised both by regions and commodities, a development that, in terms of political influence, has more than offset the fact that the actual number of farm voters has been declining while the total population grew rapidly.

The truth is that bad times usually begin in the heavy industries and in construction, which depend on the expected prosperity of other industries, and hence are doubly sensitive to changes in economic climate or psychology. Farms produce for consumers, and farm output continues relatively unchanged in good times and bad, with wide swings only in unsupported prices.

But there is one point at which farm prosperity or depression directly affects heavy industry. Farmers are major consumers of steel and rubber, of farm machinery, tractors, and tyres. The *Des Moines Register's* Iowa Poll (an opinion sampling poll conducted much like Dr George Gallup's American and British Institutes of Public Opinion) has four times asked a weighted sample of Iowa farm operators roughly this question:

"Which of these items of farm machinery do you definitely plan to buy this year?"

	Total Units	Corn Pickers
*Dec., 1945	456,000	63,700
*Apr., 1947	421,000	50,400
*Apr., 1948	306,600	22,500
Feb., 1950	169,000	11,700

* If you could get them.

Despite the decline, 169,000 units is a very substantial market, and the falling-off in actual purchases is nothing like so sharp as the falling-off in plans to purchase. So far at least, that is about the measure of the much touted "farm depression."

American Notes

Closing the Ranks

In appointing Mr John Foster Dulles to be an adviser to the Secretary of State, the Administration has shown a welcome, if tardy, willingness to bury its own domestic hatchets in the interests of greater unity on foreign policy. The vulnerability of the State Department to Congressional attacks on its Chinese policy has shown that it was an error, if an understandable one, to allow resentment of Mr Dulles' campaign tactics to exclude him from Mr Acheson's councils. After Senator Vendenberg, now incapacitated by illness, Mr Dulles is the Republican party's most respected expert on foreign affairs; had Mr Dewey won the Presidency in 1948 he would probably have become Secretary of State. Senator Vandenberg is believed to have insisted that Republican co-operation could be assured only if Mr Dulles was brought into the formation, as well as the execution, of foreign policies, thus putting bi-partisanship on a firmer and more permanent footing than in the past.

The appointment of Mr Dulles and Mr Cooper, to be followed, perhaps, by that of Mr Lapham, the former head of the ECA mission to China, provides Mr Acheson with new and much needed assistants who will not be burdened with administrative detail. It will also allow the Secretary to depart for the meetings in London and Paris with the assurance that the cold war waged by his critics in Congress will be kept within bounds. Not all Republicans agree with Senator Vendenberg that Republican co-operation on foreign affairs is best entrusted to men without Congressional responsibilities. Senator Taft, since Mr Vandenberg's illness the most authoritative spokesman for the party in Congress, believes that only members of Congress can pledge Republican support for Administration policies. Mr Dulles, though he carries much weight with church and peace groups and is certainly immune from the charge that he is as far to the left as any Democrat, derives his political influence only from the waning star of Mr Dewey; he has never been elected to any public office. It will be one of his urgent tasks to discover what policies his own party is prepared to support. Mr Dulles is not expected to accompany Mr Acheson and Mr Cooper abroad but will be consulted on the policies they will discuss, and has already begun consideration, with Mr Butterworth, of the urgent problem of a Japanese peace treaty. His aid will be particularly valuable in working out a policy for the Far East, an area where bi-partisanship has either failed altogether or has merely resulted in demoralising drift.

The speed with which the Administration has taken up Senator Vandenberg's initiative will lift foreign policy—just in time—out of the election arena. It will also revive confidence in the State Department and help to isolate the isolationists of the Republican party. In this it has the assistance of Senator McCarthy, whose craven refusal to throw off the cloak of Congressional immunity and repeat, off the floor of the Senate, his charges against Mr Jessup, Mr Service, and Mr. Lattimore, has revolted many members of his own party. The reaction was deepened by Senator Tydings' announcement that a summary of the Government loyalty file on Mr Lattimore—technically not even an employee of the State Department—cleared him of charges of Communism or espionage. Mr McCarthy has only one more rather worn card up his sleeve: his belief that Mr Louis Budenz, a former party member who has seen the light, will testify that Mr Lattimore's Chinese policy was the product of Communist party membership, rather than independent study—a charge Mr Lattimore has indignantly denied.

* * *

Wall Street and Business

A sustained, but unspectacular upward movement on Wall Street has this week carried the Dow Jones' Industrial Average to a new peak for the postwar period—at 213.94—the highest point touched since 1930. A securities market which has maintained a consistently rising trend for the space of ten months or so is clearly vulnerable to correction, but yields are still good. As much as six per cent is still obtainable on a wide range of high-grade equities, compared with the long-term Treasury rate of 2½ per cent, and the relatively narrow return from industrial bonds. On Wall Street, there is a growing conviction that opposition to the "cheap money" policy is again diminishing. Institutional funds have been moving from bonds into equities, and this movement has been fostered by legislative changes in the State of New York, where Governor Dewey is now expected to approve the Bill which permits trustees to invest at least one-third of their available funds in issues that are outside the present "legal list." This development promises to bring a substantial, though not precisely ascertainable, volume of new money into equities. Of even greater importance are the moves now under way to authorise insurance companies to invest in common stocks.

By all comparative tests, industrials are "cheap" on Wall Street still. Earnings on first-class stocks, at about $7 a share, are substantially higher than in 1929—and so are dividends at almost $3.50 a share on the same high-grade issues. Given a much greater degree of political stability abroad, it would be possible to envisage stock values materially higher than today. But confidence is lacking, and probably the most that can be expected is a continuation of the slow upward movement, and intermittent bouts of nervousness.

The industrial prospect still seems to be reasonably good. The Securities and Exchange Commission and the Department of Commerce have revised their estimates of the likely decline this year in business spending for plant and equipment. Originally the total was put at 15 per cent below 1949, and 21 per cent below the record reached in 1948. The new forecast is that such spending will be only 11 per cent below the 1949 figure, and 16 per cent less than in 1948.

The business outlook is somewhat patchy at least in non-durable consumer goods and retail trade; but industrial output is still rebounding from the low levels reached during the recent coal strike. There is a heavy demand for durable consumer goods, and the construction industries are running at a high rate of activity. In so far as slackness is likely to appear within the next few months, it looks as though it may be offset by Mr Truman's recent decision to appoint as Secretary of the Air Force one of the strongest advocates of "70-group" air strength. In view of General Eisenhower's evidence before Congress, defence expenditure may well rise again by an annual rate of several hundred million dollars above the projected level of $13,500 million for the budget year 1950-51. There is an undercurrent of nervousness still; but there is no sign of depression in the months ahead.

* * *

Displaced Persons—and Bills

President Truman has returned to Washington from Key West—the retreat that permits not only rest, but an uninterrupted survey of the problems of government—to find that Congress at last has carried out his campaign pledge to liberalise the discriminatory Displaced Persons Act adopted in 1948. A bi-partisan majority has finally vanquished Senator McCarran, a Democrat, and approved a Bill even more liberal than the House version passed last June. Like the House Bill, the Senate version extends from December, 1945, to January, 1949, the date by which DPs must have been displaced to qualify for admittance to the United States, and extends the programme for a year until June, 1951. The number to be admitted is raised to 344,000 DPs, compared with the figure of 339,000 approved by the House, and 205,000 provided for in the 1948 Act. The bias against Catholics and Jews that has been so widely criticised was eliminated, partly by extending the "cut-off" date, and then by eliminating, over Senator McCarran's opposition, the requirements that 30 per cent of those admitted must be Balts, and that 40 per cent of the total must be agricultural workers. The new restrictions sought by Senator McCarran—such as one limiting immigration whenever unemployment reached a certain figure—also went into the discard, in a twelve-hour session that had to deal with 135 amendments.

In general, however, the record of Congressional accomplishment at the half-way mark of this session gives little cause for Fair Deal satisfaction. Only five other "major" Bills have been passed: those on Korean aid and the removal of federal taxes on margarine, and three that in one way or another have caused the Administration pain. One was the housing Bill that was stripped of its Administration-sponsored plan for stimulating co-operative housing for the middle-class, another increased the permitted acreage for peanuts and cotton, and thus the liabilities of the farm programme, while the third, the Kerr Bill, freeing independent producers of natural gas from control, illustrates the embarrassments of success. In the first three years of his Presidency, when Democratic chances were at such a low ebb, Mr Truman could, without contradiction, identify the Republicans as the friends of the "interests." In the past two years, however, the Democrats have acquired wealthy friends and the Republicans—more of whom voted against the Bill than for it—will make the most of this if the President fails to use his veto.

From Key West the President has fired off certain campaign salvos at Congress that will be repeated during his "non-political" campaign tour in May. He has pressed the substance, if not the name, of the Brannan farm plan, and urged action—which is not likely to be taken at this session, though it should be, to allow the States to follow suit—to make unemployment benefits more uniform and more generous. With the session half gone, however, pride of place in the Senate is to be given to the foreign aid Bill rather than the attempt to force a civil rights measure through the Southern blockade. Mr Lucas, the Democratic majority leader, relies on little more being approved than the appropriation Bill, renewal of the foreign arms programme, reduction of some excise taxes, and extension of social security. In the campaign locker will remain the bulk of the Fair Deal which Congress has neither the time nor temper to approve: health insurance, repeal of the Taft-Hartley Act, a new farm programme, and civil rights. It is a position Mr Truman found easier, and more profitable, to exploit when the Republicans controlled Congress.

* * *

Bridges Convicted

The year's fourth long and stormy Communist trial has ended with the conviction of Mr. Harry Bridges, the powerful leader of the longshoremen on the west coast. He and two members of his union were convicted of conspiracy and perjury for swearing in 1945, when Mr. Bridges applied for American citizenship, that he had never been a member of the Communist Party. Mr. Bridges himself was sentenced to five years' imprisonment, and two of his lawyers were given short sentences for the contempt of court into which their excessive zeal led them.

The jury's verdict comes as the climax of a long history. Mr. Bridges came to the United States from his native Australia in 1920; by 1934 he was organising a general strike in California, and by 1937 he had secured a charter for his International Longshoremen's Union from the Congress of Industrial Organisations. His success—which was due in part to the unenlightened labour attitude of west coast employers—was followed by a series of crippling strikes, and efforts to have him deported as a Communist began in 1939. Decisions differed, however, and although Congress passed an amendment to the immigration law to cover his

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

case, the Supreme Court in 1945 found the evidence against him "extremely tenuous" and overruled the Attorney General. Three months later he applied for naturalisation.

The immediate effect of the trial will not be to remove Mr Bridges from the labour scene; the verdict is to be appealed, and it may be two years before a final ruling from the Supreme Court opens the way to deportation proceedings. Moreover, there is no assurance that his removal will guarantee labour peace on the coast. Under the Bridges leadership, the longshoremen's union has toed the party line of opposition to the Marshall plan, and support for Mr Wallace's campaign in 1948, and its relations with the Congress of Industrial Organisations are strained. A right wing group has been making some progress in efforts to dislodge Mr Bridges and his associates from union control. The union is, however, the only strong CIO body on the West Coast, and if it is weakened by internal divisions, it may invite a bitter jurisdictional struggle between the CIO and unions, under the leadership of Mr Dave Beck and Mr Harry Lundeberg, that are affiliated to the American Federation of Labour.

Steel in the Dock

The only fruit of last January's investigation into the increase in steel prices that followed the pension victory of the steelworkers is likely to be yet one more inquiry. The Republican and Democratic members of the Committee on the Economic Report, which conducted the four-day hearings, are split solidly along party lines. The single conclusion on which they agree is the desirability of further research into the degree of competition now existing in the steel industry. The report of the Democratic majority puts steel firmly in the dock on three counts: for an untimely and unjustified increase in prices that may set off a business depression later this year; for refusal to supply the committee with adequate information; and for monopolistic price fixing. Yet the indictment is based on such a strained selection of the evidence presented that, in the view of Senator Flanders, a progressive industrialist with no brief for the steel companies, a reading of the report, and the minority dissent, may have the unintended effect of stimulating sympathy for the prisoner at the bar. The unbroken party line-up on the report can hardly reflect credit on a committee created to analyse and report on economic problems in an impartial and constructive fashion.

The majority report, signed not only by the chairman, Senator O'Mahoney, long a vocal enemy of monopoly, but by Senator Douglas, an economist of repute, puts forward the view that in the steel industry decisions closely affecting the public interest are taken, not as a result of free competition, but with an eye to the profits of the two largest enterprises, while the smaller concerns obediently fall in line. Curiously, the report, though it denounces the price rise, ignores the testimony of the smaller steel companies—whose profits last year declined while those of the US Steel Corporation and the Bethlehem Corporation rose to record heights—that they would have raised prices even more had they not feared the competition of the giants.

The majority made three controversial recommendations: that the steel industry, and others in which control is concentrated, be required to provide regular information about prices, costs, profits, and output; that price increases should not take place until after a 30 day cooling-off period, in which the economic consequences could be assessed; and that an inquiry should be made to determine whether steel had not become so similar to a public utility, and so important to full employment and the national security, that Congressional legislation was needed. Nominally, this would be directed toward reviving competition, but in the view of the minority all three recommendations could lead only to governmental price fixing. Not even Senator O'Mahoney harbours any illusions that they will be adopted at present.

The report furnishes no basis for judging whether the steel industry was justified in putting up its prices. It may serve, however, as a warning to the industry that the Fair Dealers will get it if it does not watch out, particularly if there is no change in its deplorable public relations and the conviction of fair-minded critics that its decisions are often short-sighted. Meanwhile, steel, in an election year, must resign itself to its place in the dock. Next month Mr Celler takes Senator O'Mahoney's place as inquisitor, while there are reports that the Department of Justice is preparing an anti-trust suit against the industry.

Crime Pays

Senator Kefauver is trying to establish the claim of the Judiciary Committee, rather than the Interstate Commerce Committee, to conduct an inquiry into "crime syndicates," but nevertheless these syndicates are engaged in what are today among the most lucrative operations in interstate commerce. The chief crime syndicates are those controlling slot machines (as fruit, pinball and other gambling devices are called officially) and with off-the-course betting, but this type of racketeering, it is alleged, is also to be found in the laundry world, on the stock exchange and in many other reputable places. The syndicates are run by "tygoons"—a synthesis of "tycoon," or financial emperor, and "goon," or gangster—who have organised some of the biggest and most efficient businesses in the United States, with all the machinery of head offices, trade associations, monopolies and price-fixing. It is surprising that no one has yet suggested that the racketeers of the nineteen-fifties might be attacked through the anti-trust laws as the bootleggers of the nineteen-twenties were through the income tax laws.

Kansas City has just had its 23rd gang murder in three years, and the connections of the victim with the local Democratic machine may account for some of the tardiness in giving a green light to investigations that may unearth political scandals. The press had already been turning unwelcome publicity on the tygoons, who like to pretend that they are respectable citizens and that the obvious connection between death by violence and the organised gambling, by which they make their living, is purely coincidental. Mr Frank Costello, "the elder statesman of the rackets," has an office on Wall Street and issues press releases in his own defence when he thinks he has been seriously maligned. He lives, and appears to exercise political influence, in New York, but his slot machine organisation operates in California, Chicago, New Orleans and Miami. Control of gambling is a state, not a federal, matter and the tygoons can thus often escape local justice by crossing state borders.

The federal Treasury collected over $20 million in taxes on Mr Costello's slot machines last year, but they are illegal in most States. So is off-the-course betting, but Americans spend about $15 billion a year on it, and slot machines are to be found in bars everywhere. It is estimated that they bring Mr Costello an annual income of $2 billion. It is also estimated that he spends $400 million a year on the bribery of public officials. The tygoons certainly could not operate on their present scale unless there was widespread connivance by law enforcement agencies and confidence in those agencies is being seriously undermined by the success of the crime syndicates. Local authorities believe, with some justification, that, if the tygoons are to be controlled, federal assistance is needed, although the Department of Justice is said to feel that local governments are not trying as hard as they might, either within their own communities or by co-operating with other cities and states. Two suggestions, for which there is much support and which Senator Kefauver's committee is sure to consider, are that the federal government should be given power to prohibit both the shipment of slot machines across state boundaries and the leasing of telephone wires and other facilities for the transmission of the racing information essential to off-the-course betting.

THE WORLD OVERSEAS

Unemployment in Federal Germany

IN one of those big round, woolly phrases with which the Germans like to assert that nothing is, or ever was, their fault, a leading economic journal in the Ruhr recently declared: "German unemployment is a world-problem of the Occident." This is also the attitude of the Bonn Government, which has irritated the Economic Co-operation Administration by arguing that unemployment is a matter of fate—and Allied aid.

The German Government is, of course, not wholly wrong. The whole of the west is involved in the causes of unemployment, and deeply anxious to remove them. The task of disentangling truth from distortion is, however, hard. In Britain an investigator could, generally speaking, rely upon official data, and he could assume that the Government had one single-minded attitude to unemployment—it is against it. In Germany, however, the question is bedevilled by the presence of the civil occupation authority, which can be used as a scapegoat *vis-à-vis* the home public, and by Bonn's efforts to use the unemployed as a political lever against the western powers. For these reasons, German statistical assertions are likely to be unreliable.

The British investigator faces an additional handicap. He is likely to be exasperated by the way in which German politicians—with one eye on American favours—contrast Dr Erhard's free-enterprise Republic with a maliciously distorted picture of a "National-Socialist" Britain. In a recent survey of unemployment written for an association of business men by a former employee of Dr Goebbels, the author compares Crippsian Britain with the Third Reich of Drs Schacht and Funk. Britain, he maintains, is not attempting to balance its payments by exports, but is hiding a huge "structural" unemployment crisis by exploiting the sterling balances—which, like Dr Schacht, it "forced" on the area under its control—and by political blackmail to extort ever bigger "subsidies" from American, Canadian and sterling area taxpayers. Such distortions are irritating to the British whatever their politics.

How Real is the Emergency?

What is, then, the real position? In the first place, German statements often convey the false impression that unemployment only began after the currency reform of June, 1948. The Trade Union Confederation, at its conference last January, declared that unemployment had risen by 1,300,000 since this date. (Even business men accept the same fallacy in another form: they constantly argue that currency reform abolished savings, and ignore the fact that savings had already been rendered worthless by inflation.) The truth is that widespread unemployment existed before the reform brought reality back to the German economy. It was hidden so long as wages were worthless. The shortage of money following the reform induced many individuals, particularly women, to register at the labour exchanges who had previously found means of livelihood on the black market.

The more recent increase in unemployment, while real, is also probably exaggerated; in some cases, for instance, workers leave their names on the register after taking employment; they do so by agreement with the employer who reduces the wage by the amount of the dole. But the rise in workless during the winter was undoubtedly serious. After gaining nearly half-a-million since November, the total reached a record of 2,000,000 in February. The figure at mid-March stood at 1,950,000, which is 12.4 per cent of the labour force. The total of employed persons is 13¾ million in a population said to number just over 47½ million.

This figure, however, must be considered in relation to the trend of employment and production, and the additions to population in the Federal Territory since the war. For the total of registered *employed* has in fact risen since 1948. True, the increase has been less than 300,000, and the spectacular rise in west German production to about 92 per cent of the 1936 figure has been achieved by longer working hours—since most workmen were on short time during the inflationary period—and by greater productivity. There is still room for improvement in output per man, which has not yet reached the prewar figure; on the other hand, the Bonn politicians tend to confuse their friends abroad when they declare that Germany is only producing 75 per cent of its prewar output; for this figure represents output per head of the total population, not of the working population alone.

Penniless Refugees

The increase in employment, though small, supports the main contention of Dr Erhard that German unemployment is not due to an economic slump, which could be more or less safely removed by inflationary financing, but chiefly to what he terms "structural causes." These are, indeed, so important that, when they are considered, a total of 2,000,000 workless appears astonishingly small.

The main structural cause is, of course, the influx of Germans expelled from the territories east of the Oder-Neisse line and from Czechoslovakia, swollen by a constant dribble of refugees from the Soviet Zone. Next in importance is the fact that persons born during the years of the birthrate boom stimulated by the Nazis are now entering the labour market at the rate of over half a million a year.

Varied and exaggerated figures regarding the number of expelled Germans in the west are bandied about in public speeches. In the rather more objective columns of the official statistical returns the total is given as 7,750,000. Guesswork places the number who have come from Soviet Germany as 1,000,000. The total population is said to have risen from 39.3 million in 1936 to 47.7 million today. There has, however, been no census since 1946.

The worst feature of the refugees as possible workers is not that there is an undue proportion of women, old people and invalids among them. On the contrary, the proportion of young people and men is rather higher than in the population as a whole, and a large number of them have found work in the west. A recent report of the German Iron and Steel Federation acknowledges that the Ruhr was only able to achieve its extraordinary rise in production—which has trebled since 1947—because it secured young workers from the ranks of the refugees. The worst factors are, rather, that the refugees came penniless, and that many of them are officials of the Nazi State or Party, and dispossessed farmers for whom no jobs can be found. These are the men who represent a dangerous hotbed of nationalist ideas. They are

the people who have organised themselves into *Landsmannschaften* according to their place of origin, including one for the part of Poland which Hitler annexed outright and named the Warthegau. They are the people who keep Germany's face turned to the east.

In all the *Laender,* there is a direct connection between the number of refugees and the total unemployed. For example, in the "frontier areas" of Schleswig-Holstein, where refugees are most thickly concentrated, the unemployed amount to over one-third of the number who are in work.

It may be doubted, however, whether the Adenauer Government wholeheartedly wishes to settle the refugees in permanent employment. As a leading Christian-Democrat member of the Bundestag recently frankly declared: "It is necessary to keep awake in the refugees a desire to return to their homelands. The German eastern territories must be restored to an all-German Reich. For this purpose the goodwill of the western powers must be enlisted." For this purpose, too, German Ministers indignantly reject schemes for emigration, and insist that the British High Commissioner shall secure the eviction of a further 250,000 Germans from Poland.

Critics of Government Schemes

None the less, prodded by the ECA mission, by the High Commission and by the Social-Democrats, the Bonn Government has produced a scheme for reducing unemployment by 1,000,000. It proposes to organise the financing of a plan to spend DM 3.4 billion, which chiefly consists of DM 2.5 billion for building. There is undoubtedly a good deal of "eyewash" about the scheme. German industrial and banking circles are highly sceptical about it. Looking ahead, they are anxious that the Government should concentrate on long-term schemes for creating permanent new jobs and strengthening German industry. They do not object to having a pool of unemployment at present, but are anxious to train recruits for the years to come. The number of young persons entering the labour market will rise to a peak of nearly 800,000 in 1953 and 1954, but will suddenly drop to 150,000 in 1956. Therefore everything must be done, the industrialists urge, to rejuvenate staffs in the next few years.

As for the financial aspect of the plan, critics rightly suspect that it will not be possible to raise the specified proportion of funds from the public. Reacting strongly to any interference by the state, business circles fear that the Government's scheme—far from being inflationary—will merely reduce the volume of credit available for financing the present boom in imports and trade in consumer goods. The Government takes a different line. It has roused the displeasure of the ECA mission and the High Commission by arguing that the currency would be endangered if the unemployed were given jobs, since they would spend more; if Germany is not to face the alternative of inflation or large-scale unemployment by the end of the Marshall Plan, it must obtain foreign capital and more raw materials.

More Industrialisation Needed

The retort to Bonn has been that there are better ways of stopping over-spending than keeping men out of work. Nevertheless, there is some truth in the German argument, given the special German circumstances. Apart from the structural causes of unemployment, past experience shows that controls would not work, that higher taxes would be evaded, and that public confidence in the currency is extremely fragile.

Above all, the German contention must be admitted that the Federal Republic is, broadly speaking, another Britain, that must industrialise itself to the utmost in order to live. Bonn is justifiably criticised for not producing any plan for intensifying its backward agriculture; but it is on firmer ground when it uses its unemployment problem to press for the lifting of restrictions on exports to Communist-dominated countries, and an end of all remaining limits on industrial production. If and when this aim is attained, Bonn will pass on to press for its paramount objective—the return of the east German territory.

Israel's Balance Sheet—I

THE exodus of Jews to Israel continues. Last month the Iraqi Government gave sudden permission to Iraqi Jews to emigrate. Registration of those wishing to leave for Israel began in earnest this week. About 80,000 out of a total of some 120,000 are expected to wish to go. Meantime, from farther south, another flow is exceeding expectations. The unnumbered Jews from the fastnesses of the Yemen are still emerging and wanting transport and upkeep; 38,000 have already entered Israel; the numbers still to come are unguessable. The two converging streams place a fresh load upon the nation's already overburdened resources. More acutely than hitherto they raise the question: Can Israel convert itself into a stable economic unit? Can it, given a few years of peace, organise itself into paying its way in a competitive world? After surveying its prospects on paper, any arithmetician must shake his head. But reasoning based on statistics, without allowance for imponderables and for psychology, can be notoriously misleading. The fact is that when a resilient and able people is faced with no alternative between turning the corner and extinction, it contrives to turn the corner. The Jew inside Israel has no other place to go to; the Jew outside Israel is committed to helping a foundation that must not fail. Israel's enemies are deluding themselves if they underrate the capacity of these two forces to build a permanent state.

Open Door For Immigrants

The main outlines of Israel's problem are fairly well known. It consists of the triple job of balancing international payments, of combating inflation and of simultaneously keeping the door open to every immigrant who wants to come in. In the 22 months since May, 1948, 380,000 have arrived; the population of the country has, therefore, doubled and great numbers of the new mouths are, and must for some time continue to be, publicly-assisted consumers. Further, their needs must be met at a time when the national finances are weighed down with the aftermath of war. Israel's total defence budget is undisclosed, but so long as the state is living a life of continuous armistice, defence is thought to be costing it about half as much again as its ordinary expenditure (which is running at about £140 million per annum). Again, exports, three quarters of which at present depend on the citrus crop, must for nearly a decade be handicapped by the total destruction—chiefly through wartime loss of pumps and through consequent lack of irrigation—of 15,000 out of 50,000 acres of orange groves. Lastly, the inflation caused by two wars (1939-45 and 1948-49) places any new Israeli products at a disadvantage in markets which they are entering just as the sellers' boom is over.

International payments, therefore, do not balance and show no prospect of balancing without tapping extraordinary resources. The unbalance of visible foreign trade is formidable; it ran at £176.5 million for the year 1949 (imports: £187 million; exports £110.5 million). But before this discrepancy is condemned, one or two mitigating factors must be borne in mind. Development calls for much capital equipment, and for the consumption, during its erection, of goods that, viewed in terms of years, may justifiably be regarded as investment goods. The import figures for the first nine months of 1949 show 26 per cent of capital equipment, as against 35 per cent of raw materials and 39 per cent of consumer goods. Secondly, not all the imports called for payment in foreign exchange. In the first nine months of the year, out of £159.8 million worth of goods imported, £19 million worth were gifts, or capital transfers in kind, or immigrants' personal property.

Foreign Exchange Gap

On the credit side, invisible items—tourism, shipping, insurance, etc.—accounted for some £17 million over the year as a whole. But all items on export and service account combined do not, on 1949's showing, meet more than 23 per cent of foreign exchange requirements—a proportion that is alarmingly low. The balance is made up of precarious or impermanent contributions, the greatest of which, are in order of importance, gifts from world Jewry to Israel's several national institutions and funds, releases from its accumulated sterling balances, and drawings upon dollar loans, of which by far the largest is a $100 million loan from the Export-Import Bank of the United States.

The following estimate of the major balance of payment items for 1949 was prepared during the autumn by the United Nations Economic Survey Mission for the Middle East:

ESTIMATED BALANCE OF PAYMENTS FOR ISRAEL, 1949

£1 000,000

Payments		Receipts	
Imports:—		Exports	10·3
(a) involving exchange commitments	42·0	Tourism, etc.	7·6
(b) Donations, etc., in kind	20·0	Donations, etc., in kind	20·0
(c) Shipments under Export-Import Bank loan	6·0	Gifts received via national institutions & funds	27·0
Invisibles	10·9	Release of sterling balances	8·0
		Drawings on Export-Import Bank loan	6·0
	78·9		78·9

The final figures so far available bear out these proportions, and the table is therefore worth study as a guide to the outlook for the years immediately ahead.

To take the worst aspects first: if mass immigration continues, cash-financed imports must rise. It is calculated that, for the present, they will do so at a rate of £110 million per annum for every 150,000 new arrivals. Again, the blocked sterling balances are not an inexhaustible asset; though much maligned, they have in fact been something of a store-house of nest-eggs. But when Britain's recent release of £7,000,000 for the fourteen months to December 31, 1950, is exhausted, only a further £18 million will be left in London. Yet again, the services of foreign loans will, within a year or two, become an extra item on the debit side. Servicing of the Export-Import Bank loan is due to begin three years after it is taken up.

What are the chances of offsetting these debits by increasing earnings on current account? The outlook for tourism is not promising if Jerusalem remains a divided city; a figure of £110 million is hoped for in 1950, but may not be achieved. Exports offer the principal hope. That they will rise considerably as citrus groves are recovered or replanted is clear from a comparison of 1949's export of 5,000,000 cases with 15 million exported in 1938. (Only abut 10,000 of Palestine's former 60,000 acres under citrus are located in Arab Palestine—in the Gaza area.) Resumption of exports from the Dead Sea Potash works will also improve the picture. The industrial diamond industry, Israel's second biggest export item, is hard pressed by competitors in Belgium and Holland. Other industries now established or building include pharmaceutical works, precision instrument making and similar manufactures demanding skill and know-how. But it is difficult to see that their earnings will do more than offset a fraction of the nation's outgoings. Israel aims at an export target of £115 million in 1950. In view of the forthcoming need to service dollar loans it is worth noting that, while the citrus crop retains its present preponderance, considerably more than half of total export earnings will come from Britain, which is a 75 per cent buyer of Israel's citrus in the raw as well as of its by-products—fruit juices, oils and fruit cellulose. Dollar earnings appear promising only from industrial diamonds, which yielded $4,856,000 in the first nine months of 1949.

Prospects of American Funds

These forecasts show beyond doubt that, even if immigration remains at the level for which the Jewish Agency has budgeted, and which is 150,000 per annum, Israel, to be solvent, must for years remain dependent for more than half its foreign exchange requirements upon foreign aid, whether lent or given. They also show that if immigration is to rise to the "million in five years" mark that some enthusiasts in Israel and America seek and predict, that dependence will entail an even deeper dip into American Jewish pockets than has been made so far.

American giving, as is well known, has always been generous in the extreme. Even under the mandate some 60 per cent (1939) of Palestinian exchange expenditures were covered by gifts and by investments or other capital transfers made for sentimental rather than commercial reasons. Since Israel was founded, American Jewry, asked by the United Jewish Appeal (which collects for disbursement throughout world Jewry) for $250 million in 1948 and again in 1949, raised in the first of these two years $150 million and in the second just over $100 million, about half of which was allocated to purposes inside Israel. The sharp falling off last year greatly worried the Israeli treasury. And no wonder, for in terms of moneys actually allocated to Israel, it represented receipts at an annual rate of only about £127 million, as against a rate of £140 million in the previous year. But giving is said to be rising towards its old momentum as 1950's "entirely new campaign structure" gets into gear. There is, however, evidence to show that, now that the state is established, its benefactors feel inclined to invest in it rather than to give to it. A great deal of Israel's hope for the future therefore depends upon its capacity to attract such investment. A second article will attempt to show how it plans to do this by combating its present over-high production costs and how far it is likely to be able to direct its huge new population into work that assists it to pay its way.

(To be continued)

Norway Cuts its Subsidies

[FROM OUR OSLO CORRESPONDENT]

IT is a nice paradox that the Labour Government which was so successful in the general election last October has already been obliged to modify one of the most important aspects of its policy. Food subsidies have had to be cut and will probably be cut still further before 1951. Announcing the Government's decision on April 2nd, the Norwegian Prime Minister, Hr Einar Gerhardsen, said that if subsidies were continued at the present level, they would amount in all to approximately 1,050 million kroner (£52.5 million) for the next budget-year, July 1, 1950-June 30, 1951. It was, however, impossible for the Government to spend more than the 600 million kroner (£30 million) which had been spent on subsidies last year, and as a result there would be a total rise in prices of about 450 million kroner (£22.5 million) in food, clothing, shoes, fishing equipment and other items.

The Prime Minister said that the rise in prices was caused partly by devaluation, partly by the rise in prices on the international market and partly by the increase in the costs

of agricultural production. Representatives of the Norwegian trade unions, the employers' organisation and the farmers have declared that they would do their best to get Norway through a difficult period, and that they had all agreed that if the cost of living index passed the 165.6 mark before September 15th all parties concerned would get together for a conference to review the system of prices and wages.

The Prime Minister also announced that the political parties had agreed to send representatives to meetings starting after Easter to agree on such other steps as might be necessary to attain balance in Norway's internal as well as in its external economy.

Cost to Average Family

Norway has therefore decided to take some of the medicine it needs, but it would probably have been much more efficacious if it had done so a long time ago. The rise in prices is considerable. Margarine will rise from the equivalent of 5½d. a pound to 1s., bread from 3d. a pound to 4d., butter from 1s. 4d. a pound to 3s. 7d., coffee from 2s. a pound to 3s. 7d. The total rise in food prices will cost an average family of four about £15 more a year.

The new prices do not mean new burdens upon the nation as a whole; in one way or another, chiefly by taxation, the total cost of the goods has been paid for. Still, the revision of the subsidies may be the cause of unrest and strikes. The general opinion is that, had a conservative or liberal government been in power, they would have been threatened with a general strike the day after the new prices were announced. So far not a single factory has stopped, but the Communists are working hard to use the situation for their own ends. The arrival of the first shipload of arms from America may be the signal for the start of the first strike and demonstration. The situation is not pleasant, but labour has finally seen that the steps taken were unavoidable.

Mistakes in the Past

Norway's economic problems are both immediate and long term. Reserves of foreign currencies have nearly come to an end. There is not more than about 300 million kroner (£15 million) left. At the same time, there is a short-term debt in foreign money of about 400 million kroner (£20 million) which may be presented for payment on very short notice. The balance of payments with other countries show a deficit of 1,200 million kroner (£60 million).

There are many reasons for Norway's present very serious position. The Labour Government must take the responsibility for some major mistakes. When it took over control in Norway after the German occupation there was a flow of paper money. The Government carried through a currency reform, but it came late and was just a change of notes —new notes—and not real currency reform. The excess money was still there. It made people believe that they were well off—and it made the Government believe it was well off, too. Being well off, the Government decided to work for three things at the same time: reconstruction, a better standard of living for industrial workers, fishermen and farm hands, and a programme of social reforms.

In the matter of reconstruction there was certainly much to do. Half of the ships had been lost, Finnmark and Northern Troms totally devastated and many other places in the country had been damaged. New houses had not been built for five years, railway reconstruction alone asked for 500 million kroner. Defence forces had to be rebuilt. At the same time an enormous demand for consumer goods had been built up during the occupation years.

Disincentives at Work

All political parties agreed that it was necessary to maintain peace in industry and agriculture, to keep full employment and to increase production as much as possible. Wages have gone up—many industrial workers today have a standard of living which is 15-20 per cent higher than before the war. Female workers in industry earn 20-30 per cent above prewar standard. When cream became unrationed, for instance, the shops easily sold about double the prewar quantity. Ships and railways have handled record traffic: when Norwegians were allowed 500 Danish crowns for one trip a year, the number of Norwegians in a position to use that opportunity proved much too large. And if people were unable to buy anything else for their money, they bought a day or two off from work. A factory at Drammen, publishing its statistics a few days ago, reports that its workers averaged 37 days off work last year. Those who preferred to earn just enough to exist, found out that the basic needs of life —bread, margarine, sugar—were very cheap. Those who worked overtime and did everything to increase production discovered that only a few thousand more kroner added to their income meant very heavily increased taxes. Thus the tendency to take odd jobs and not to put the income on the declaration sheet became more and more popular. Industry also discovered that it paid badly to show a good surplus on accounts. Taxation took too much. Experts quickly found out how much could be used on all kinds of costly office equipment and welfare work without cost to the firm itself. The result is that the taxation system has led to an unnecessary waste of money and work on the part of industry and shipping.

Government Activity Spreads

The Government planned a propaganda campaign for saving, but experts told them that it would not pay as long as increased taxation was the only answer from the Government. No doubt a campaign for saving would have been a fiasco, as in Great Britain. That does not mean, however, that no saving takes place in Norway. But it has to a large extent moved from the private individual to the Government. The Government continues to take over shares in industry and mines and becomes from time to time the big entrepreneur in many branches of commerce. In spite of its unhappy experiences with state-management, it goes on shutting its eyes to the consequences. The lot of the hospitals is an example of their policy. Several private hospitals exist in Norway, but the great majority are owned by the Government or by towns or counties. Most Norwegians are members of the insurance funds. These funds pay for treatment in hospitals, but the hospitals today cannot manage to keep things going without financial assistance as costs are too high. The official hospitals get 14 kroner (14s.) a day for each patient, the private, 10 kroner. Thus the private hospitals are sooner or later crippled and cease to exist. And this takes place at a time when Norway is short of hospitals and the authorities are unable to meet the demand for new beds. The state wants control or ownership; so it goes on swallowing more and more and putting it under the control of a nearly paramount bureaucracy.

During a period of overfull employment, the Government continues to enter on new enterprises. It spends money freely at a time when inflation is a serious threat; it grants industrial labourers three weeks' summer holiday with pay at the same time as the country can only be kept on its legs by means of Marshall aid; and it has crippled private savings by heavy taxation at a time when it wants consumption to be reduced.

The many contradictions in Norwegian policy can only be understood if it is kept in mind that those who are responsible for it are socialists with a background of Marxist thinking. They have gone against the private individual's instinct for self-preservation and enterprise instead of using this enormous dynamic power for the benefit of society. Sooner or later they are bound to find out what is wrong, but the lesson is proving costly.

Finland's New Government

[BY A SPECIAL CORRESPONDENT]

THE new Finnish Cabinet, which took office on March 18th, contains neither Social Democrats nor Communists. The former had governed the country since July, 1948, and might reasonably have been expected at least to share in the next government. The latter, encouraged both by increased Russian pressure on Finland and their own apparent success in the Presidential elections in January, also had high hopes of being included in the new Cabinet. They had, in fact, advocated a coalition of themselves, the Social Democrats and the Agrarians. They have been disappointed. A coalition has taken office, but it is composed of Agrarians, representatives of the Swedish party, and two Liberals. It commands 108 of the 200 seats in the Diet. On most issues it will be supported by all except the Social Democrats and the Communists. On important issues that is, on issues which touch on the country's independence—it will be supported by the Social Democrats as well. The new Government thus has a fair chance of lasting until the next general elections in July, 1951.

But it will not have an easy time. It will be subjected to probably more Communist pressure than the outgoing Social Democrat Government. For just at present the Finnish Communists, largely as a result of the reorganisation of the party and a tightening of its discipline, are in an aggressive mood. In the somewhat apathetic voting for the Presidential elections, their vote fell less than that of their two chief rivals. Current Russian pressure, exercised through the Notes on the "war criminals" Finland is alleged to be harbouring and—a more serious matter—through the virtual refusal to negotiate a new trade agreement with the Finns, is stronger than for a long time.

The country's economic position has, moreover, deteriorated in recent months. Although the cost of living has remained practically stable for the last year, while the standard of living has risen, there are various signs that all is not well. Production has fallen off since the autumn. Unemployment is higher than for several years: at the end of February there were 55,000 registered unemployed in Finland, compared with 38,500 a year earlier. The import surplus is rising rapidly: imports in February at FM 6,100 million exceeded exports by FM 1,900 million, whereas the previous February's deficit had been only FM 520 million. But perhaps the most serious aspect of the situation is that only about 14,300 million cubic metres of timber were felled in the season just ended—barely half the previous season's figure. With forest products accounting for about 90 per cent of all Finland's exports (88 per cent last year, as against 93 per cent in 1948), this deficiency must have an adverse effect on the country's trade. Indeed it is a reflection of the difficulties the trade is already encountering; the cut was so small because the previous year's timber had not been sold.

Such are the considerations which prompted the leading Agrarian newspaper to refer to its party's new task as "clearing up the bankrupt's estate left by the previous Government." How it will set about this task was outlined by its head, Mr Kekkonen, on the day he assumed office. His main task, he said, is to balance the state economy, to settle the rent problem and to assure the profitability of agricultural production—not a surprising aim for the leader of the Agrarian party, but one which will prove difficult to realise in practice. It is on this recurrent issue, which several times came within an ace of overthrowing the Fagerholm Government, that the main tussles on domestic policy are likely to be fought. This conflict was continued right up to the end of the Social Democrats' tenure of office: in their last "caretaker" days in early March, they rejected claims for higher prices for farm produce.

"Trusting Relations" with Russia

The primary object of the new Government in the political field is to "restore trusting relations" with the Soviet Union. This will be as difficult to achieve as Mr. Kekkonen's other aims in internal affairs, not least because it will depend almost entirely on factors over which the Finns have no control. There is no reason to believe, in spite of an injudicious flirtation with the Communists a year ago, that the Agrarian leaders will, in this vital matter of Finno-Russian relations, be any more likely to accept conditions which the previous Government could not. A main aim of Finnish policy at present is to prevent the Communists from regaining a place in the Cabinet and thus to deny them all opportunities of getting "within," to start their customary boring. On this issue all non-Communist Finns stand resolutely together, for they consider it a major threat to their country's independence. However, since such Communist participation in the Government is one of the prime conditions of what the Kremlin interprets as friendly relations, Mr Kekkonen, even though his Cabinet contains several members of the executive of the Finnish-Soviet Friendship Society, is likely to be disappointed in his aim.

The new Government's term of office should also cover the vital preparatory stages of the transition of certain sectors of Finnish industry from paying reparations to paying their way. By far the most important of these is the metal-working industry. It now employs nearly twice as many men as it expects to do in more normal conditions. It will not be easy to reduce its size, find and keep markets for its products—the Russian satellites and Pakistan are under consideration—and transfer its surplus workers to other jobs.

The prospect before Mr Kekkonen is thus grim. Just at present the Communists are lying low, although they have already announced their disagreement with the new Government's statement of policy. There are indications, however, that they may make the May Day celebrations the occasion for a trial of strength with the Government: their paper has started campaigning for a worthy demonstration then. This summer may be hot in Finland.

Dr Malan and the Press

[FROM OUR JOHANNESBURG CORRESPONDENT]

SOUTH AFRICAN English-speaking journalists have been described by the Prime Minister, Dr Malan, as "the most undisciplined in the world," and the Government has decided to set up a committee to inquire into the South African press. This brings to a head a sustained Nationalist campaign against the English-speaking journalists which has included a threat by Mr F. C. Erasmus, the Minister of Posts and Telegraphs, to refuse to transmit messages he deems politically "slanderous," and a suggestion by Mr Eric Louw, the Minister of Economic Affairs, that foreign journalists who "misrepresent" the Government abroad should, if possible, be deported.

The Nationalists have pointed to the recent inquiry into the British press as a justification for their decision. But the issue here is rather different. Though much has been said about alleged distortion and misstatement in the South African press, Dr Malan made it clear that his ire is chiefly directed against "false reports" sent overseas by South African journalists who, according to him, thus line their pockets by defaming their country. The allegation about "misrepresentation abroad" first received prominence at the time of the Durban racial riots last year. The Nationalists declared that correspondents in South Africa of overseas newspapers had ghoulishly seized on the riots to blacken South Africa's name abroad. This statement was vigorously challenged by the correspondent of the *New York Times*, among others, without any very adequate reply being forthcoming. But for a time the Nationalists switched their

attention to another target. A careful course of listening to the BBC news, as relayed by the South African Broadcasting Corporation, convinced them that the BBC—which Dr Donges, the Minister of the Interior, referred to obscurely as "his master's voice"—was wilfully including items that might sully South Africans' ears, such as extracts from speeches by General Smuts. "No one is going to dictate to us what is good for South African listeners and what is not," said Dr Donges. The SABC relays of BBC news, begun during the war amid Nationalist pro-German protests, are to cease as soon as a substitute news service can be organised. This decision has been taken without consulting the listening public who pay licence fees.

Caricature of Facts

Thus the Nationalists appear to have two chief objects in view. They want to stop what they call "false reports"—otherwise criticisms of the Government—leaving the Union and being published abroad; and they also want to exercise control over news and comment entering the country from overseas.

In the debate on the motion for a committee of inquiry into the press, Dr Malan and others made repeated references to the "need for discipline." What this means was explained by the Prime Minister. He said that the majority of the correspondents of overseas papers were South African journalists employed by the English-speaking press in the Union. They augmented their salaries by selling overseas stories they "would not dare to print" in South Africa. In this way, according to Dr Malan, the English-speaking press is really "subsidised" from overseas—presumably on the theory that if the proprietors did not wink an eye at their employees' dubious extra-curricula activities, they would have to pay them more. It seems hard to believe that this caricature of the facts comes from a man who was himself formerly a journalist. It is, of course, true that the majority of South African correspondents of overseas papers are journalists employed on the South African press, and also that most of them are English speaking. It is also true that their South African employers are aware of their outside activities. The point is that they would not long remain the accredited correspondents of overseas papers and agencies if they were supplying "false reports" whose distortions would soon be found out. Their most eager unmasker would be the Nationalist Government, but the fact is that no satisfactory evidence of "false reports" has ever been produced, despite several challenges by the correspondents who have been maligned.

The Voice of South Africa

It seems impossible to avoid the conclusion that the real objection is to reports which are only too correct—for example, of speeches by General Smuts and speeches by the Nationalists themselves, which the Government finds embarrassing to be published overseas. Dr Malan hinted in the debate that the newspaper proprietors, or their editors, should act as unpaid censors for the Government, and should use their power as employers to put a brake on what correspondents of overseas papers wrote. This would be "self-discipline of the press." If the South African newspaper proprietors or editors agreed to do so, they would soon find that nothing would please the Nationalists short of deletion of perfectly factual reports. A speech by General Smuts, or an indiscretion by a Nationalist Cabinet Minister, is a fact. If a recent revealing discussion in the columns of Dr Malan's old paper, *Die Burger*, is any guide, the Nationalists have a very odd conception of the true role of a correspondent of an overseas paper. One correspondent asked if it was really intended that he should not, in his dispatches, quote statements by "liberals" and others which were critical of the Government. *Die Burger* replied: "Overseas this voice or that voice must not be heard, but, as far as possible, the voice of South Africa—its thousands of separate voices in one." Read for this the voice of the Government, as interpreted by the State Information Office.

"Discipline" Among Journalists

Having this philosophy, it is perhaps not surprising that Dr Malan regards the English section of the South African press as "undisciplined." The Nationalist Afrikaans press certainly could not be accused of lack of discipline. The Nationalist papers have an editor-in-chief, Dr A. L. Geyer, who is a member of the Cape Nationalist Party executive and who is to be the next High Commissioner in London. The majority of Nationalist journalists are not members of the South African Society of Journalists, and on one occasion explained their non-membership by saying that they were not journalists at all, but "crusaders." When the United Party was in power the English press, though in general supporting the Government, often criticised it. Most Nationalists simply could not understand it. Being a crusader apparently relieves one of such obligations as treating news on its merits, as news. *Die Transvaler*, published in Johannesburg, ignored the Royal visit to that city altogether. More recently, it implied in its headlines that South Africa had devalued the pound, and Britain had decided to follow suit.

The Nationalist-appointed State Information Officer is Dr Otto du Plessis, who was to have been the South African envoy to Holland until the Dutch objected on the ground that when the Germans were shooting Dutch hostages during the war Dr du Plessis allegedly praised the "New Order." Dr du Plessis, who works in close contact with Dr Geyer, has explained that the primary function of the State Information Office is to tell the world about South Africa. This job, as the Office at present interprets it, would be much easier if it were not for the activities of the overseas papers' South African correspondents. Thus in his speech on the protectorates, Dr Malan referred to Britain as a "foreign power," and was so quoted by the newspapermen, both English and Nationalist Afrikaners, who took down his words. But an "official" version issued in Britain used the words "an external power." Unfortunately the local correspondents of overseas papers cabled the version published in all the South African papers, including the Nationalist ones—thus "misrepresenting" the Government again. Nationalists have expressed the hope that as time goes on, the State Information Office will tell South Africans about the world as well as telling the world about South Africa, thus presumably terminating an undignified and unnational dependence on such foreign tainted sources as the BBC. Dr du Plessis has made a polite appeal that as and when the Office extends its activities, the South African press will "co-operate."

Official Dislike of Press Criticism

South Africa has a long tradition of attempted Government interference with the freedom of the press. Lord Charles Somerset, Governor of the Cape until 1827, banned all discussion of Government policy. Kruger, before the Boer War, suppressed two newspapers, the *Critic* and the *Star*. General Hertzog sought to prevent newspaper criticism of Hitler and Mussolini on the ground that they were heads of "friendly States." Some of Smuts' Ministers, both during and after the war, were very touchy about press criticism. The Smuts Government's relations with the United Nations over the Indians and South-West Africa were not much happier than Dr Malan's, and suggestions by some of the English newspapers that all the fault might not lie with the United Nations were resented. No one objects to a press inquiry. The real danger is that, whatever its results, South African politicians will continue to resent frank reporting and discussion of their policies at home and abroad, and will try to coax or bully the press into pretending that on certain fundamental issues South Africa is not out of step with democratic beliefs and practices elsewhere in the world.

A BUSINESS DECISION OF THE HIGHEST IMPORTANCE

Choosing an Advertising Agency

One of our oldest clients is said to have chosen us at random, out of the telephone book. But that was twenty-five years ago and today the telephone book is a more formidable affair.

Modern conditions demand a different technique. Presenting your goods and your good name in the world's markets; interpreting your message in terms of interest to the public; working to a balanced and co-ordinated plan with management, are matters which call for a thorough assessment of the resources of the agency under examination—the extent of its services, its experience, its talents, and above all, its people.

Its people! If it conforms to the best standards of agency practice it will offer you a team of people who will act in your advertising interests like a department of your own. **Yet no two exactly like a department of your own** for each member of it is also a member of some differently constituted team serving some other client. This brings a widening and deepening of experience which makes for independent thinking, a continual flow of new strength, which passes all through the agency and is made contributory to its work.

The Pritchard Wood organisation invites examination of its services, its people and its work and, as an interim measure, those interested may care to write for a copy of our new prospectus entitled "Choosing an Advertising Agency," which tells more about our outlook and the way we work.

It's good style to write on

Whatever your style, whatever your pen, you will write more easily, more fluently, on the satin-smooth, non-greasy surface of Waldorf Club, the British made quality stationery at a popular price. Waldorf Club notepaper is made in two colours, Ivory and Cobalt, and in two sizes with envelopes to match. Pads are also available.

write for samples!

A full range of Waldorf Club sample sheets will be sent to you on receipt of your name and address and 2½d. stamp to cover part cost of postage, etc. Please write to: Newton Mill Ltd. Dept. 20D, 24 New Bond Street, London, W.1

Horse Sense

Whether horses can learn to obey the coloured lights of traffic signals — whether, indeed, they can even distinguish one colour *from another — may be debatable points.*

There is no indecision however when it comes to assessing the value of A.T.M. Electro-matic vehicle-actuated signals for the control of street traffic and the safeguarding of pedestrians.

Electro-matic control delays nobody longer than is absolutely necessary for safety, and the flexibility of the system renders it capable of adaptation to every type of road layout and every form of traffic. *Police not required for regulating traffic are released for* duty elsewhere.

The missing volume

ONE of the most important volumes in the Social History of England has—so far as our knowledge goes — yet to be written. It will deal with the Twentieth Century Housewife and the way her life has been transformed by the introduction of scientific labour-saving devices. Naturally enough, this is a subject of the greatest interest to Hoover Limited, since it is difficult to believe that in this Twentieth Century any two mechanical appliances have done more to ease the lot of the housewife than the Hoover Cleaner and the Hoover Electric Washing Machine. Nor should it be forgotten that Hoover F.H.P. Electric Motors are used in many other domestic appliances. It seems fair, therefore, to assume that if the missing volume ever comes to be written, a special chapter will be devoted to the activities of Hoover Limited.

THE BUSINESS WORLD

The Balance of Payments

THE new White Paper on the Balance of Payments perforce deserves study rather for its detail than for the highlights. It relates to the calendar year 1949, the main estimates for which were given in the recently issued Economic Survey, which also gave forecasts for 1950. It has also been outdistanced in some important respects by the previously published quarterly statement on the dollar balance of payments of the sterling area and the end of March gold and dollar reserves. For all that, the new White Paper provides some very solid and rewarding fare.

The two tables on the current account supply far greater detail of the transactions of the United Kingdom than was provided in the Economic Survey, more particularly by splitting up the always intriguing item of "invisibles" and by sub-classifying the figures so as to show the distribution of current transactions with the several broad currency regions—the dollar area, other western hemisphere countries, rest of sterling area, OEEC countries and the rest. The year 1949 ended with a current account deficit of £70 million, the product of a visible trade deficit of £180 million and a surplus on invisible account of £110 million. The surplus on invisible account was approximately equal to that achieved in 1948, but the maintenance of the figure is remarkable in view of the deterioration of the item representing the Government's overseas expenditure. The net expenditure under this head was £94 million in 1948, but rose to £145 million in 1949. Military expenditure in Hongkong and Malaya, together with new commitments under the Western Union Defence pact, may explain some of the increase. But the figure of military expenditure for 1949 was burdened by the payment of £55 million to India and Pakistan under the agreements of 1948.

This substantial deficit on Government account was supplemented in the invisible account by a somewhat larger net expenditure on travel than in 1948—£35 million instead of £33 million. The British are not yet more toured against than touring. Net expenditure on films fell from £10 million in 1948 to £6,000,000 in 1949—but films still represented a drain, the bulk of it in dollars. On the other side of the account, shipping helped to restore the balance by a net credit of £88 million, against £76 million. This item applies to dry cargo only, tankers' disbursements and tanker freights being included in the omnibus item "others" which now provides the greatest single contribution to the invisible account. Interest, profits and dividends (excluding the profits of insurance, shipping and oil companies) yielded a net £56 million last year, compared with £65 million in 1948. The main item in the category of invisible transactions is the residual "others" which last year contributed £152 million, or £45 million more than in 1948. The principal components in this substantial total are the overseas transactions of British oil companies, insurance, commissions, royalties and private remittances.

* Provisional.

shows that the overall deficit of £70 million incurred in 1949 was the product of deficits of £275 million with the dollar area, £20 million with OEEC countries and £35 million with "the rest," offset by surpluses of £45 million with the rest of the Western Hemisphere (mainly Latin America) and £215 million with the rest of the sterling area. The greatest relative improvement is that shown by invisible items with the dollar area, where the United Kingdom's deficit fell from £51 million in 1948 to £14 million in 1949. It should be noted at this point that the considerable surplus with the rest of the sterling area was accompanied by a repayment of only £25 million in sterling area balances held in London. The most important change shown in the geographical distribution of current items is the transformation of a surplus of £100 million with OEEC countries in 1948 into a deficit of £20 million in 1949. Liberalisation of imports by the United Kingdom and the switch from dollar to non-dollar imports provide the main explanations of this considerable change.

It is in its revelations about the capital transactions of the United Kingdom that the Balance of Payments White Paper is, as usual, most instructive—and also more illuminating than the Economic Survey. The full details of this capital account are given in the appended Table II. An attempt has been made in this account to allocate the net gold and dollar deficit between the United Kingdom and the rest of the sterling area. Some of the allocation is necessarily arbitrary—as for example in the allocation to the United Kingdom of the dollar cost or proceeds of goods processed in the United Kingdom. The whole of British oil companies' dollar expenditure is also allocated to the United Kingdom. The result is to give excessive weight to the United Kingdom's share of the sterling area's dollar deficit; this should be borne in mind when comparing the United Kingdom's direct dollar deficit of £280 million for 1949 with the overseas sterling area's deficit of £31 million only.

The net change in United Kingdom external capital assets last year—other than the items required to cover the dollar deficit and the changes in banking liabilities—represented an investment of £296 million. Of this, £67 million was in the non-sterling area and £229 million in the sterling area. The most important items under the former head were the £60 million revaluation payments that had to be made after the devaluation of sterling to countries holding sterling assets covered by gold or exchange guarantees. As a matter of book-keeping, these payments are treated as "investment." But since their result is the building up of a claim against the United Kingdom, this procedure has decidedly paradoxical effects; due note should be taken of the more than dubious nature of these "investment" operations. The net drawings allowed by Britain under the Intra-European Payments Scheme are another "investment" which will never yield direct dividends or be capable of repatriation, since the drawings were outright gifts. The repayment in sterling of the South African gold loan of £80 million is another and more genuine item on the credit side of the capital account. When the loan was made in 1948, the gold appeared under item 8 in the capital account and was used to help to cover the dollar deficit of that year.

The main item in the capital account is the omnibus category 17 which, like many of the really large figures is discreetly veiled under an anonymous residuary heading "other capital transactions." It showed a net "investment" of £165 million in the overseas sterling area last year compared with £189 million in 1948 and £231 million in 1947. These figures, it should be noted,

24. Net increase in sterling liabilities	38	− 129	− 213	− 125	110	− 15
25. Total overseas disinvestment	370	600	105	15	55	70

* Provisional.

do not include repayments of sterling balances, which are shown separately in the third main section of the capital account table. These "other capital transactions" include sales and redemptions of securities by countries in the overseas sterling area and an estimate of commercial investments and the movement of funds from the United Kingdom to the overseas sterling area. The movement of funds includes money taken out by emigrants. This, again, is a statistical monster masquerading as United Kingdom investment. The capital leaves the United Kingdom, it is true, but so does its owner. The remittances on that capital will not in future help the balance of payments on current account. This item would also include the "hot money" which has gone to Australia in anticipation of a revaluation of the Australian currency. Many reservations have to be made, therefore, if these figures are included in the total of United Kingdom capital invested abroad. This global item is further sullied by offsetting items representing that part of the dollar deficit of the overseas sterling area which was financed by drawings on the IMF on the part of the countries concerned.

The sterling liabilities included in the third section of Table II comprise the net liabilities of banks in the United Kingdom to their overseas offices and holders of other overseas accounts. They also include funds held as cover for overseas currencies and certain liabilities of the British Government expressed in sterling or sterling area currency. The capital value of payments due to India and Pakistan under the Pension Annuities Scheme of 1948 is included in these liabilities. Private holdings of securities and sterling balances of the IMF and of the International Bank are excluded. The changes in these sterling liabilities last year amounted on balance to a reduction of £15 million, made up of an increase of £10 million in the sterling holdings of non-sterling area countries and a fall of £25 million in those of sterling area countries. The following table shows the total of UK sterling liabilities since the end of 1945, divided between sterling and non-sterling countries. For purpose of this classification Egypt, the Sudan, Israel and Jordan are included in the non-sterling area for the whole period. It will be seen that over the second half of 1949 the total liabilities rose by £110 million, all but offsetting the precipitate decline in the first half of last year.

The terminology of the Balance of Payments White Paper, and especially of the capital account, has acquired a traditional formulation which may prove deceptive to the uninformed student of these documents. The net figures showing the total overseas disinvestment year by year do not in fact represent a diminution in external assets, or an increase in external liabilities. Some of the reservations have already been mentioned—the treatment as an investment of payments made under revaluation guarantees is one example and the inclusion among investments of capital taken with them by emigrants is another. But the main reservation arises on the other side of the account—in the treatment of ERP receipts as one of the items used in calculating ultimate net disinvestment. Except in so far as ERP receipts were in the form of repayable loans, this is not a liability which Britain will be called upon to discharge in future years. Some account of these receipts must appear in the balance of payments and any alternative treatment of this item would have caused serious complications. But the existence of Marshall Aid, and of many other reservations, should always be borne in mind by any who are tempted to take too literally such terms as "net changes in UK external capital assets" and "total overseas disinvestment." In balance of payments nomenclature, the words of Humpty-Dumpty clearly apply: "When I use a word it means just what I choose it to mean—neither more nor less."

Arithmetic of the Subsidies

THE subsidies are among the most formidable of our modern economic *esoterica*. They began as a defence against wartime inflation; they were extended after the war as an instrument of social policy; now they are held in some circles almost as an article of religion. Discussion about the subsidies would be easier if their mechanics were not so difficult to understand. The food subsidies represent the difference between the cost to the Ministry of Food of buying supplies and the receipts from selling them. Their cost, therefore, depends on how much of the subsidised foods is consumed, the prices which the Ministry pay for them, and the prices which are charged to the consumer. If rations are increased and prices are unchanged, the cost of subsidies is bound to rise. This is the present dilemma; food is more plentiful, but to increase the rations at present prices would mean a bigger loss to the Ministry of Food and a bigger subsidy from the Exchequer to square its books.

Next Tuesday the Chancellor of the Exchequer will tell the country what he proposes to allow for food subsidies in the year 1950-51. They have become the biggest single item of social expenditure in the budget accounts, and successive Chancellors have boldly declared that they could not be allowed to grow. But not until last year was a real attempt made to cut them, and even then the reduction aimed at was a mere £20 million from the actual expenditure of 1948-49. The first table shows the total payments in the last four years, and the way in which they are split between home-grown food and imported food.

The first essential truth about the subsidies is that they have become the means of making increased dependence upon home grown food acceptable to the consumer. Sixty per cent of the total subsidy payments contemplated for 1949-50 was to be used in equalising the cost of producing food on British farms with prices which the consumer could supposedly afford to pay. In this

sense, high farm policy and increasing subsidy payments have gone together.

The subsidy total for 1949-50 is provisional. Last April, the Chancellor declared that the cost of the subsidies for the ensuing year was not to rise above £465 million. In the second table an attempt is made to see how closely the estimate was realised in the financial year just closed and what the yearly cost of subsidies would be at the current rate of rations (of course, with no changes in prices) and also at the prewar level of consumption. Column 2 gives an estimate of the actual cost of the subsidies based on consumption between April, 1949, and March, 1950. It exceeds the official estimate only very slightly. The subsidy on bacon was much higher than expected last November when the official estimates were published, but the subsidies on

TABLE I—SUBSIDIES ON HOME PRODUCED AND IMPORTED FOOD

* Provisional.

flour and meat have proved to be smaller. This calculation, however, contains a margin of error. The figures of food consumption from which the estimates have been derived include deliveries for export and also to manufacturers, generally at unsubsidised prices. Allowance has been made for such deliveries at full prices where information about them exists. For those foods where such information does not exist an estimated allowance has been made in the adjustment at the foot of column 2. Moreover, the amount of subsidy per unit for each foodstuff is rounded off and here an error of up to £10 million might creep in. Clearly the total of column 2 — £467 million — must be considered a maximum figure; the true total might well be nearer £440 million.

The third column of the table shows what the annual cost of subsidies might be if current levels of consumption were maintained for the next twelve months and prices were unchanged. The total amounts to £508 million. But £37 million is to be saved from the feedingstuffs subsidy and £4,000,000 from the fish subsidy. The fertiliser subsidy is also to be halved but since an approximately equal sum is to be spent on agricultural development, there is no net saving. If the loss of £11½ million on potatoes is also excluded the total would be reduced to £456 million. But how far are the assumptions of unchanged rations and prices likely to be true?

Increases in the prices of butter and bacon have already been announced by the Minister of Food, and this week the butter ration has been raised and bacon reduced. These increases in prices will not in fact reduce the total current cost of subsidies. When the new agricultural prices were announced last month it was estimated that the higher prices for meat and milk would involve the Ministry of Food in an additional expenditure of about £12 million—or approximately one-third of its saving on the feedingstuff subsidy. This amount had to be passed on to the consumer or the total subsidy bill raised. The Minister of Food chose to pass it on,

not directly, but by reducing the subsidy on butter by 4d. a lb., saving approximately £12 million a year, to offset the increased cost to the Ministry for meat and milk. The increase of 2d. a lb. in the retail price for bacon yields no direct saving to the Ministry; the subsidy remains at 1s. 2d. a lb., but the higher price which Britain is to pay for home produced bacon and for Canadian bacon (5 per cent in terms of sterling) will be borne by the consumer. The Ministry of Food will make a slight saving on its purchases of Canadian wheat from July, after the four-year contract has expired. But 12½ million bushels, which should have been bought this year, have been postponed, and will have to be bought at the old price of $2 a bushel. The maximum price Britain will have to pay for supplies under the wheat agreement is $1.98 a bushel. The total saving will amount to only £1,000,000 unless Britain can buy wheat below the maximum price; in that event the saving on present reckoning might amount to £7,000,000. Tea prices are likely to increase. Negotiations with India and Ceylon are still in progress, but Britain may have to pay at least 4½d. a lb. more to get adequate supplies from these two countries, an addition to total costs of £8,000,000. Vegetable oils and oilseeds have been falling steadily for eighteen months, but the price paid for colonial sugar has risen by 12 per cent (for dollar sugar by much more since devaluation) and that for Canadian cheese by 6 per cent. Denmark reduced its price for butter by 5d. a lb. last October, and for bacon by 8s. a cwt. in January in accordance with the terms of its contract. Lower prices have also been obtained for other foods, including Russian grain.

TABLE III—INCIDENCE OF SUBSIDIES ON RETAIL PRICES AND WEEKLY EXPENDITURE

* From May 21st the retail price of bacon will be raised to 2*s.* 5*d.* a lb. The subsidy remains unchanged at 1*s.* 2*d.* a lb.
† From April 23rd the retail price of butter will be raised to 1*s.* 10*d.* a lb. and the subsidy reduced to 1*s.* a lb.
‡ Only particular grades included in index. § Domestic use only.

The subsidy bill, however, is not determined by purchase prices alone; in any case, the Ministry of Food holds appreciable stocks and can therefore average out any increase in costs. The level of consumption is equally important in determining the cost of subsidies. The Minister of Food has already reduced the bacon ration from five to four ounces a week. But the meat ration is likely to be increased temporarily when home killing reaches a peak in spring and in the late summer. The margarine ration could be increased to five ounces a week—raw material supplies are adequate and the four-ounce ration is not being fully taken up. Consumption of both eggs and milk will decline when peak production has passed, though the annual consumption of each will be higher than in 1949-50. The sugar ration might be increased again to 10 oz. a week, especially if ECA funds could be used to buy Cuban sugar. Tea, however, might have to be cut to 2 oz. unless Britain manages to buy as much as last year. If allowance were to be made for all these possible changes in prices and rations, the total cost of subsidies for the new financial year would be roughly £425 million.

The last two columns of Table II are mainly of theoretical interest and show the potential maximum of the subsidy bill at the present time. Column 4 shows the cost of subsidies on the assumption that consumption of individual foodstuffs per head were at the prewar level. The welfare subsidies have been retained, but the indirect subsidies, the subsidy on fish and various trading profits of the Ministry of Food have been excluded. The total annual cost of subsidies calculated on the prewar pattern would then be about £480 million. But this does not allow for the increased consumption of certain foods during and since the war. It is clearly impossible to say how much of this increase would remain after rationing ceased. Some arbitrary adjustments—they are no more than that—have been made to allow for these factors, and the adjusted estimates are shown in column 5. The total of £510 million sets an ultimate limit to the cost of subsidies provided that prices which the Ministry of Food pays for its supplies do not rise. It is not in itself a staggering figure. After all, it is only twelve months since the subsidies were running at an annual rate of £525 million with prospects of a further increase.

The largest item in the subsidy bill for 1949-50, as officially estimated last November, is £100 million for bread and flour. Columns 3 and 4 of Table II show that as the consumption of other foodstuffs increases, that of cereals (and with it the total cost of its subsidy) falls. The next two largest items are butter (£53 million) and milk (£51 million). At present, both subsidies are running slightly above these rates; on prewar consumption, the butter subsidy would cost £88 million while milk would cost its present subsidy or rather less. The meat subsidy comes next at £41 million, shell eggs at £31 million and bacon at £30 million. A five-ounce bacon ration would cost £65 million a year and four ounces £50 million; shell eggs are costing £45 million a year at the present rate of consumption. The cheese subsidy costs between £25-£27½ million, margarine about £17 million, tea and potatoes each about £15 million, cooking fat £6-£8 million and fish £4 million. Set against these trading losses is a net credit of £32 million, which presumably represents the Ministry of Food's profit from the sale of cocoa, coffee and other less essential foodstuffs. The welfare subsidies amount to £37 million, of which the national milk scheme accounts for £22 million.

Any adjustment to the total cost of subsidies will affect the cost of living. This effect can be measured in two ways: by the movement of the official interim index of retail prices or by the increase in the actual weekly

expenditure of a family. Table III shows the incidence of subsidies on retail prices. The subsidy is greatest on butter, where the retail price would be doubled if the subsidy were taken off. Cheese comes second, followed by flour and bread, bacon, margarine, shell eggs and cooking fat. Subsidies on the remaining foodstuffs range between 20 and 25 per cent of their retail price. The effect of changes in the subsidies on the index of retail prices depends on the weight given to each particular food in that index. These weights are shown in column 5 of Table III and the effect on the total index is shown in column 6. If, for example, the subsidy on potatoes were taken off, the index would go up by 0.2 of a point, while the Exchequer would save £15 million. If the consumer paid the full price for bread and flour, the Government would save £100 million but the index would rise by 1.7 points. Since so much attention is paid to the official index in wage discussions with the unions, it is important that changes in subsidies should be contrived to get the maximum saving from a given rise in the index. This relationship is shown for each food in columns 6 and 7. On this criterion, the Government should take off the subsidy on meat: the index would rise by less than half a point but the Chancellor would save over £40 million. For a rise of 0.6 of a point in the index, the Government could save well over £40 million on eggs. Potatoes would come third, followed closely by bacon, eggs and flour. These figures show that the Government, if it had the mind, could lop £100 million off the food subsidies and produce little more than a one per cent rise in the index of retail prices. Indeed, by altering the tobacco and beer taxes—tobacco has a weight of 116 and alcoholic drink 101 compared with a weight for the total food component of 348—the total index could be made to fall and still leave the Exchequer a net saving. Such is the ludicrous result of juggling with the excise taxes (of which the subsidies are a negative variety). The possible combinations to achieve any predetermined result are numerous. But this table shows that the Minister of Food last week did not achieve the maximum saving in his rearrangement of the subsidies. An increase of 4d. a lb. on butter means a rise of 0.42 of a point in the index and a saving of £12 million. A rise of 2d. a lb. on bacon raises the index by 0.13 of a point and gives an equivalent saving of £6 million. Thus for a total rise of 0.55 of a point in the index, a total saving of only £18 million has been secured. Better results could have been achieved by halving the meat subsidy. The housewife, however, is not concerned with the movement of an official index; she is more interested in the increase which would occur in her weekly expenditure if subsidies are reduced; the extent of the relief given by existing subsidies is shown in columns 8 and 9 of Table III.

These figures show the possibilities which exist for dealing with the problem of limiting food subsidies. Even granted the very modest reduction in world food prices which has taken place in the past year, the subsidy problem seems by no means so intractable as it did twelve months ago. The world is gradually moving from an era of shortage to one of adequacy. If the Chancellor takes no further steps to reduce the cost of food subsidies, this year's bill might be around £425 million. On the other hand, a saving of £25 million, bringing the total down to £400 million, could be effected quite easily without causing serious hardship and without making the index of retail prices rise significantly.

Business Notes

Cue for Electricity?

After the recent successes in the trustee market—the Uganda loan lived up to expectations by opening at 1½ premium on Thursday, while the East Africa loan is now at par compared with its issue price of 97½—there are all the signs of a resumption of big borrowing after the Budget. Normally, this week would have seen all the symptoms of pre-Budget uncertainty in the gilt-edged market, with the complications of international politics thrown in for good measure. Instead, the Funds have been positively cheerful—so cheerful, in fact, that many City observers have concluded that a little timely spring cleaning is being administered to the market to provide the right background for a loan by the British Electricity Authority.

It could well be so. Figures of bank advances have in recent months shown something of the BEA's heavy financing of its capital programme, on which roughly £100 million a year is being spent. Its first visit to the market, late in 1948, raised £100 million at what was, even then, the markedly favourable rate of a shade over 3 per cent. This loan—3 per cent 1974-77—now stands at 92⅞ to yield £3 8s. 5d. to final redemption. Its proceeds have long been exhausted; indeed, a large part of the issue must have gone to pay off existing bank accommodation. The BEA's report for the year to March, 1949, revealed that temporary borrowings had reached £50 million in October, 1948, when the first public stock issue was made; the year-end balance sheet showed no outstanding bank loans.

BEA seems likely to be an annual visitor to the market for round sums of a £100 million or more. No doubt the authority, for its own financial comfort, could do with more than this sum in its next loan operation. But it will have to pay between ⅜ and ½ per cent more for a thirty-year stock than it offered in 1948. And there is probably even less room than there was six or twelve months ago for deferring (or reducing the size of) the operation in the hope of a slightly lower rate in the near future. If it is coming to the market "in one piece" soon after the Budget, a little refurbishing of the price structure in gilt edged will certainly not come amiss to BEA.

* * *

"Dissaving" and the Budget

For the first time since the National Savings Movement assumed its present scale, the Committee has had to report a net "dissaving" in a complete financial year. During the period to March 31st last new savings fell short of withdrawals (as defined by the Committee) by nearly £68 million, whereas in the previous year there had been a net surplus of £37 million and in 1947-48 one of no less than £190 million. On the face of it, some two-thirds of the deterioration last year was due to an increase in withdrawals, since these rose by £67 million, while new savings declined by £38 million. In 1948-49, when new savings dropped by £182 million, recorded withdrawals also declined, by £29 million.

These figures, however, overestimate the deterioration in the trend of dissaving, for they take no account of redemptions of Defence Bonds at maturity (as distinct from prior encashments at the request of holders); these redemptions amounted to £106 million in 1947-48 and to £52 million in 1948-49, but to only £1,000,000 in 1949-50. If these repayments are counted as additional withdrawals (and certainly they represent funds in the hands of "national" savers which might be expected to increase new savings or reduce ordinary withdrawals more or less correspondingly), gross annual dissaving declined from £914 million in 1947-48 to £831 million in 1948-49 and then increased moderately, to £847 million, last year. On a similar basis of computation the movement showed a net surplus of new saving over gross dissaving of £84 million in 1947-48; this had already turned to a net deficit of £15 million in 1948-49 before deteriorating further to a net deficit of £69 million last year. Throughout the whole period, of course, interest accruing on the amount remaining invested (but not counted in the figures of new savings) has been substantially exceeding interest paid out, but not counted in withdrawals, on encashed savings certificates. Even last year, therefore, the total amount standing to the credit of "national" savers increased by some £33 million, to over £6,120 million.

The deterioration in the record of National savings over the past two years (which last year at any rate was chiefly due to deterioration in the balance of Post Office Savings Bank accounts) is one of the reasons for the decline in aggregate private savings recorded in the latest Economic Survey. This estimated that net private savings (including sums required to finance inventory revaluations and all other savings by companies other than provision for depreciation at present Inland Revenue rates) declined from £966 million in the calendar year 1948 to £712 million in 1949. The survey also estimated that net private saving thus defined would have to increase by some £193 million to £905 million in 1950 if the investment programme was to be financed without inflation and if present tax rates were left unaltered. The experience of the National Savings Movement last year suggests that only a quite unexpectedly large increase in the undistributed profits of companies could bring private savings within reach of this target level.

National Film Finance

No doubt the first report of the National Film Finance Corporation (published on Thursday) will first be examined for the answers to two simple questions: how near is the corporation to the temporary exhaustion of its £5,000,000; and how much of the money that has been lent has to be considered as lost? To the first, at least, a simple answer is given. The corporation has approved loans of £4,485,025, but £741,700 of this has not yet been drawn; thus £3,743,325 has actually been advanced, £48,335 has been repaid, and about £600,000 is still available for further loans. These figures are to last Monday. It is still too early to expect much money back, and plainly the moment is not very far off when the corporation will be unable to undertake new operations on any large scale unless Parliament adds to its funds.

To the second question the answer can only be of a notional kind; but the corporation makes provision for losses of £750,000 on what has been lent so far, observing that this "is the best assessment possible on the information at present available." The figure includes specific provision of £91,000 for four loans to producing companies "where losses are expected." The remainder of the figure is not specific. But since, out of £3,700,000 actually out on loan, not less than £2,750,000 is in the hands of the British Lion group, it seems inevitable that the arrangement with this group will get more public attention in the future than it has had in the past. The report discreetly shows awareness of this. It recalls that when the organising committee was formed which preceded the National Film Finance Company and

A revolution in office dictation!

The Dictaphone TIME-MASTER

No discs, no cylinders — TIME-MASTER records on a tiny plastic belt!

NOW DICTAPHONE puts an entirely new type of dictating machine at your service—the TIME-MASTER with its plastic MEMOBELT. The Time-Master gives you perfect, crystal-clear recording. Yet the machine is the *smallest ever* and so easy to use, so dependable!

A real time saver! Odd moments between calls, interviews, conferences—they need never be wasted. With a Time-Master, you can *instantly* record letters or sudden thoughts without calling for your secretary.

Clear, uniform recording on the MEMOBELT. You can slip MEMOBELTS in and out in a second—tiny plastic belts, each taking 15 minutes perfect recording. And they can be sent by post in a standard envelope, up to ten at a time for a 2½d. stamp.

Only the Time-Master offers all this!
Streamlined machine, only 4½ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back spacing, rapid place finding. 4. Simple, automatic operation. 5. Mailable, filable, expendable MEMOBELTS, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd. (Dept. O), 107 Kingsway, London, W.C.2.

the present corporation, one of the first matters put before it "as a matter of urgency" by the Treasury and the Board of Trade was the question of a loan to the British Lion group.

The idea at first was a loan of £1,000,000. It was soon raised to £1,600,000; but an investigation by accountants showed that this would be quite insufficient for its purpose, and the decision was taken to lend £3,000,000 to this one organisation. The relationship was a special one from the start, quite different from the relationship with the many other distributors and producers who received smaller loans to finance specific projects. It has not (the report makes plain) lent itself as well as have the other arrangements to close control of the uses to which the money is put. Control of the production costs of British Lion has been, the report observes, "less effective than elsewhere"; full information is "not always provided," and approved budgets are "too frequently" exceeded. And there is a reminder to the producers concerned that "financial as well as artistic success is vital if the industry is to flourish and their own work be supported."

* * *

Which Mandate?

The Film Finance Corporation is an instrument (or "creature," as Sir Stafford Cripps might say) of Government policy. It was set up to keep film production going at a time when production was (as the report says) "in some jeopardy through increasing difficulties of finance." It was to do this by making loans to people who—in the words of the Act—

> are not for the time being in a position otherwise to obtain adequate financial facilities for the purpose on reasonable terms from an appropriate source.

And in carrying out its duties it was to accept "directions of a general character" from the Board of Trade. In the circumstances the corporation can perfectly well maintain, as it does, that some loss of public money is inseparable from the purpose for which it was formed:

> The mandate to protect the funds has been to some extent subordinate to the mandate to get the films made.

But the burden proved a heavier one than the Government, at least, expected when the corporation was set up. The financial stringency of 1948 became not less but more acute in 1949, revenues shrank, and the share of production finance which came from distribution guarantees and bank lending shrank still further. This was one cause of difficulty, but the corporation is frank and does not conceal its opinion that money was not the only thing lacking. It "has not received enough propositions of merit," and observes a little acidly that although it pretends to be neither a censor nor an arbiter of taste, it "cannot be indifferent to the content of films in which public money is being invested."

A report as terse and lucid as this can do a great service. Few people would pretend that the device which has been used to keep film production going, at a risk to the public purse which can still prove heavy, ought to be regarded entirely without misgiving; the corporation makes no such pretence. It states its task, the drawbacks, and the methods pursued. These are expounded with great frankness and with an economy of words which matches the corporation's quite remarkable economy in staff and establishments. The accounts are a model of clarity, and the speed with which they have been presented within a few days of the end of the financial year is perhaps without precedent.

* * *

America and Foreign Competition

At the post-devaluation rate of exchange the average industrial wage in America works out at just under £20 a week compared with just under £6 a week in Great Britain and much less than this in most other manufacturing countries. In these circumstances it is inevitable that, six months after the world-wide readjustment of exchange rates, foreign competition should be beginning to make some inroad into the overseas sales—and to some extent even into domestic sales—of some American industries and therefore into America's substantial export surplus.

An illuminating article entitled "Currency Devaluations—Six Months After" in the current newsletter of the National City Bank of New York contains a careful stocktaking of this developing position—and also glances at some of the troubles which lie ahead. The bank estimates that America's export surplus, which was running at a seemingly irreducible rate of $5 billion a year just before devaluation, dropped to an annual rate of $3½ billion in the last quarter of 1949; at the present moment it is almost certainly running at a lower rate still. In the four months following devaluation, indeed, the United States actually ran an import surplus with the sterling area (other than Britain) and with Latin America. Naturally enough, however, only a few of those countries which are now enjoying a dollar surplus are throwing their markets further open to an influx of American goods; most of them are taking the opportunity to bolster up the inadequate level of their gold reserves. Little relief is therefore being accorded to the export sales of inessential American goods, some of which are plainly beginning to feel the fire of foreign competition at home as well.

America is swinging over from a position in which it ran an enormous export surplus financed by its own generous subventions to a position in which both the export surplus and the subventions will begin to dwindle away; the burden is in effect being passed—as in time it had to be—from the American taxpayer to those American manufacturers who occupy marginal positions in the schedule of comparative costs. The National City Bank, with its eye on the unbalanced Federal budget, apparently wants to hasten this process; it argues that "the conclusion is a natural one that United States aid can now safely be reduced." European countries, which have enjoyed some non-recurring advantages since September and are rightly struggling to build up their dollar reserves against the possibility of American recession, will regard this view as premature. It is even more important, however, that the United States should realise that it is inconsistent with any attempt to grant discriminatory protection to those American industries to which the burden at present borne by American taxpayers must eventually pass.

* * *

The Oil Talks

Any long delay in resuming the Anglo-American oil talks seems unlikely. The British negotiators have been back in London for some time. The counter-proposals made by the State Department have long since leaked out in the customary manner, and indeed their substance has been outlined to a Congressional committee by Mr Willard L. Thorp, Assistant Secretary for economic affairs. What remains? Yet no firm date for resuming the talks seems to have been fixed, and even the presumption that the next round will be played in London is still no more than a presumption.

Mr Thorp made it clear that the United States Government regards the British Government's substitution programme as "discriminatory" and supports the right of the American oil companies to "compete" anywhere in the sterling area for the market for refined products (some 4,000,000 tons a year) in which sterling oil is now being substituted. The British memorandum of February said: "We are substituting British companies' oil not because it is British but because it saves us dollars." The American answer takes this as an offer. Since (it says) the British as well as the American companies' oil costs dollars, there is no reason why the cuts should fall on the American companies

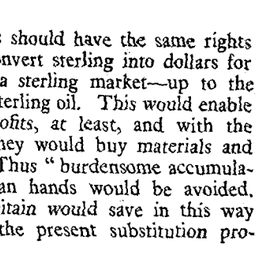
alone. Instead, the Americans should have the same rights as the British companies to convert sterling into dollars for each ton of oil they sell in a sterling market—up to the average dollar cost of a ton of sterling oil. This would enable them to send home their profits, at least, and with the remainder of their earnings they would buy materials and services in the sterling area. Thus "burdensome accumulations" of sterling in American hands would be avoided. Mr Thorp contended that Britain would save in this way just as many dollars as by the present substitution programme.

Further, he outlined a similar arrangement for the American companies' trade with countries outside the sterling area; here the American companies desire to trade in sterling, and the American Government supports them. They should, it is contended, be allowed to trade in sterling in third countries as freely as British companies, with rights of convertibility to the same average extent in relation to their volume of trade. The rest of their earnings from this trade they would spend on sterling goods and services. This is not a strikingly new idea, and the British memorandum answered it in February somewhat tartly:

> It is open to the US companies to maintain their outlets in third countries by accepting payment in local currencies. No doubt inconvertibility of local currencies makes this unattractive. . . . The US companies might reasonably look for assistance to the countries using the oil and to others primarily interested.



In one way (a way adverse to Britain) the form of the American proposals is as important as their content. They are Government proposals and, if accepted, would necessarily be worked out in general terms applicable to all American companies equally. Yet their merits must depend on the position, the trading interests, and the particular conduct of each company, and these vary greatly. Specific agreements with individual companies might be safe enough. But is it possible to define a general procedure of this kind by which it could be said that any concealed or deferred loss of dollars was ruled out?

* * *

Cables Scheme Passed

After the stormy entry of the original Cables scheme, the revised scheme was approved with lamb-like docility last week. Less than 60 per cent. of the ordinary stockholders voted. Only 61 stockholders, representing £10,515 of ordinary stock, registered their disapproval. More than 5,000 members, holding £4,056,472 of ordinary stock, voted in favour. The final stages of implementing the scheme are to be speeded up. The company is anxious to rid itself of the heavy dividend payments on the preference capital. Option forms for both classes of stockholders have already been posted. Sir Edward Wilshaw hopes to make the scheme operative by June 5th, but has again made it clear that a minimum of £4,955,834 of the new ordinary stock must be taken up either by ordinary or preference stockholders. Whether this total is reached will not be known for certain until the end of the month; the last day for exercising options is April 28th. The attainment of the minimum cannot, however, be in doubt, owing to the Globe Telegraph's substantial holding of ordinary stock.

Sir Edward has also announced that the 3½ year unsecured loan stock to be offered to ordinary stockholders will be a 3 per cent stock to be issued at par. This stock will, of course, be unique in the market. The nearest gilt-edged issues to it are 2½ per cent National War Bonds, 1951-53, now yielding £1 18s. 4d. per cent to March, 1953, the latest redemption date, and 2½ per cent National War Bonds, 1952-54, which yield £2 2s. 10d. per cent to redemption at March 1, 1954. There appears to be ample margin between the yields on these issues and the Cables unsecured loan stock to attract support in the market and so facilitate the success of the company's ingenious plan, outlined in previous issues of *The Economist*, to maintain the value of this stock.

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk — and all that it means to your dependants — without this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon. PA/4

Please send me full particulars of 'General' Personal Accident Policies.

CORRESPONDENTS IN ALL PARTS OF THE WORLD

It is this facet of the scheme to which the present ordinary stockholders must largely look to realise £295 cash for every £100 of ordinary stock held.

On the other hand, in reiterating his wish to attract as many ordinary stockholders as possible to leave their money with the company, Sir Edward has pointed out that his original estimate of 6 per cent for earnings on the new ordinary stock, after the unsecured loan stock has been paid off, may prove to be conservative. He now considers that it may be possible to count on increased net revenue as a result of higher income from investments and bigger cuts to be made in expenses. In addition there will not be the same need to plough back profits into the business as in the case of the old company. These are hopeful and pleasing second thoughts. He and another of the three managing directors have relinquished their posts, so that saving in administrative expenses is apparently starting in earnest—and at the top.

* * *

Peak Price for Rubber

On Tuesday rubber reached its highest price for 22 years. In London it was quoted at 1s. 7¾d. a lb.—a rise of nearly threepence within a week and only a fraction of a penny below the peak touched in 1928. There was a strong demand for spot supplies in all three centres, London, Singapore and New York, but not all of this demand was for immediate consumption. According to reports from the Far East, Chinese dealers have been indulging in considerable speculation and are buying up available supplies. The real explanation of the behaviour of the market during the past ten days will not be known until the export figures covering this period are available. It is possible that heavy Russian buying may have contributed.

Supplies from Indonesia are on a relatively small scale. Hoarding is apparently continuing owing to the uncertainty about the currency and political conditions. The recent publicity given to the seriousness of the bandit war in Malaya was probably a further factor inducing people to hold stocks of rubber, while American reports suggest that manufacturers have been buying on a considerable scale to replenish their inventories. In the first two months of this year world production of natural rubber totalled 237,500 tons while consumption amounted to 252,500 tons. These figures at least show the foundation of the strength of the rubber market at the present time. But they give no indication that the present high price has any solid foundation. If Indonesian production is being hoarded, these supplies will come on to the market at some later time. Again, the Board of Trade holds some 62,000 tons of rubber which it might be willing to unload. Since it bought these supplies at a fixed price of 1s. 6d. a lb. some years ago, it could make a useful profit and replenish its stock when prices were lower.

* * *

The Development Areas

The development areas at their worst moment had 932,000 unemployed; this was in July, 1932, and by July, 1938, the figure had come down to 553,000. This unemployment was almost removed by the war, and last June, at 119,800, it was only about an eighth of the worst recorded figure. The President of the Board of Trade, who recapitulated these figures in the Commons debate on the second reading of the new Distribution of Industry Bill, went on to say that since June there has been a "seasonal" increase in unemployment which has affected the whole country, and the development areas have had their share. Thus their total of unemployment had risen again in February to 144,500, or 4 per cent of their insured population; and, naturally enough, no one questioned the view which he expressed that 4 per cent "is still too high."

The house showed, indeed, no serious division on development area policy, and the Bill, which will give the Government certain additional powers of influencing the distribution of industry to help the development areas, was given its second reading unopposed. The main room for difference of opinion was on a question which may seem academic now but might prove to be sharply practical if the state of trade should change. How has unemployment in the development areas been conquered? The President said that since the Act was passed (in 1945, by the Conservative government) rather more than half of the new factories completed in Britain—whether measured by building costs or by area—have been put in the development areas. Some 1,359 factories, representing a total building cost of £92 million, have been licensed in the areas since 1945, and 986 of these have been completed and 279 (among which, however, are some very large industrial schemes) are under construction. The Government financed nearly half of the completed factories, but these were of the smaller kind, since the Government money spent on building them was about £20 million, or less than a third as much as private firms have invested. Mr Wilson pointed out that the development areas in the nineteen-thirties got only 7 per cent of the number of new factories opened in Britain.

Perhaps it was inevitable that Mr Wilson's speech should leave the implication that the conquest of unemployment in the areas was largely the result of these official measures. But was it? Mr Lyttelton pointed out, fairly enough, that comparisons between efforts to solve the unemployment problem in a world boom and similar efforts made in a world slump "are apt to be a little invidious." And, in fact, the test of the development area policy and of the technique that has been evolved—as, indeed, of employment policy as a whole—is still to come.

* * *

Power Jets and American Royalties

Some discussion has arisen over a note on page 672 of *The Economist* of March 25th which suggested that, because the position of the British gas turbine master patents was not clear when the first engines and drawings were sent to the United States, many patents are being used in America without payment of royalties. Power Jets (Research and Development) Ltd., the firm responsible for the ownership and licensing of all British Government gas turbine patents, states that the American Government has already paid £200,000 for the use of its engine designs up to September, 1945, and that payment for the use of patents after that date is under discussion. The company denies that the status of the original patents was undefined. So far as Power Jets are concerned, the current negotiations are sub judice, so it is impossible to say how much money is now involved. The first royalty, however, was not much more than a token payment; for purposes of comparison it is worth while to mention the £1,250,000 which was paid shortly after the war by a British textile concern for an American spining process which was a far less revolutionary development than the first Whittle engines.

Mr Robert Schlaifer, in a recent American publication on the development of aircraft engines, relates that when the Wright Aeronautical Corporation applied in 1941 to the then private firm of Power Jets Ltd. for a licence to build the Whittle engine, it had to drop negotiations because the US Army made a direct deal with the British Government. The negotiations with the Wright Corporation would presumably have followed normal business procedure, but it is generally agreed that the patent position of the engine and drawings which were sent to the General Electric Company in 1941 as a result of inter-government negotiation was not legally watertight; in a legal sense there were probably no patents at all. What did exist was a moral obligation which the American Government has recognised.

The US Government indemnifies its major contractors against patent infringement, and it is, therefore, the US Government which conducts negotiations with Power Jets about the payments due for the use of British master patents by Government contractors since 1945. In the meantime, no money is being received by Power Jets in respect of the period since September, 1945, although those American firms which have licensed engine and component designs from British firms, like Rolls-Royce and Armstrong-Siddeley, are paying royalties to those firms.

It seems clear that the American Government's indemnity does not cover civil applications. There are several such projects (e.g., for gas turbine locomotives) in the United States, and at least three turbo-jet aero engines have been approved for civil use although no civil airframe has yet been designed for them. It is not easy to say what Power Jets patents enter into projects which are still under development, but it is said to be almost impossible to build a gas turbine without using some of the patents. The bare fact that a position has arisen in which the British patent owners must do their own detective work seems amply to justify the statement that there was a "failure to define the status of these patents" when the original designs were sent to the United States.

* * *

Cotton Spinning Re-equipment

Two of the time-limits for the cotton spinning re-equipment subsidy expired on April 6th, and it ought now to be possible to form at least a rough idea of the extent to which the spinners are taking advantage of the scheme. The Act of 1948 laid down that concerns or groups could not be approved for subsidy unless they made application before April 6th this year; and no discretion was given to vary this time-limit. But, while it also laid down that contracts to buy and instal the equipment must have been entered into by April 30th, 1949, discretion was given to extend this limit "in special circumstances"; and in fact (so poor was the response by the appointed date) the Board of Trade gave a general extension to April 5th this year.

It follows that the spinners must by now have placed their contracts for machinery, equipment, and work which they wish to qualify for subsidy. The curious thing is that many of the plans of modernisation have yet to be approved for subsidy, and a fair number of plans have still to be submitted. Presumably the contracts for machinery which have been made in respect of these schemes contain escape clauses to cover the contingency that the plans might not be approved.

The position today is that 29 groups have been registered with the Board of Trade (a year ago there were only 16) and these groups together control 289 mills with some 21.5 million spindles. Since the total of spindles in place last year was 35.6 million, this is a substantial proportion of the industry. This result suggests that in one of its purposes—to concentrate cotton spinning undertakings into larger groups—the Act has not been ineffective. But the number and size of the groups do not by themselves give any idea of the amount of re-equipment which is likely to be done. For this it is necessary to look at the re-equipment plans themselves.

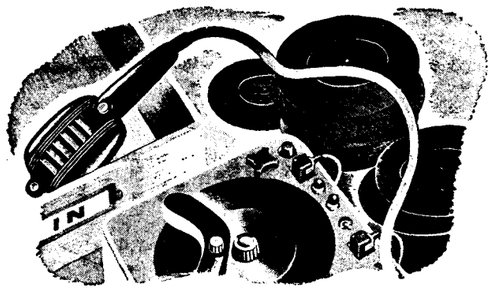
Plans have so far been submitted by 22 of the groups, and the remaining seven are expected to follow soon. Board of Trade approval has been given to plans for 95 mills, and this number may rise shortly to 109. These 109 mills represent about 40 per cent of all the spindles in the registered groups; thus the expenditure so far proposed, amounting to £10.7 million for the 109 mills, should mean the modernisation in one way or another of about a quarter of the spindle capacity of the whole industry. More plans are on their way through the procedure, and it can probably be roughly estimated that the total of expenditure envisaged in the plans approved may go up to £15 or £16 million. The subsidy is limited to a quarter of the approved expenditure. Thus the Government, which has paid out so far only about £250,000 in these subsidies, is not likely to have to spend more than about £4,000,000. When the Bill was introduced it was thought that the cost might be as high as £12 million. But, though the whole operation has gone more slowly and less far than the authors of the Act expected, the possibility that it might be almost wholly ineffective can now be ruled out.

* * *

The Comet in the Tropics

The development trials of the Comet enter a new and critical stage when the aircraft goes to Africa at the end of the month for its tropical trials. These are routine procedure in the development of any civil aircraft likely to fly in tropical countries, but they have particular significance for turbo-jet engines. The take-off performance of a turbo-jet under tropical conditions—where the air is warm and, at high altitudes, thin—is inferior to its performance in temperate climates. It is much less easy to compress the air to the point necessary before it is fed into the combustion chambers; and the power output of a turbo-jet is directly related to the degree of compression achieved and the amount of power consumed in obtaining it. The tests will determine the degree of loss of take-off power by a four-engined civil aircraft in those climates. It will then be possible to say by how much the all-up weight of the aircraft has to be reduced to enable it to take off unassisted, or the supplementary power required for it to take off fully laden. The weight of the aircraft can be reduced by carrying either less fuel (reducing the range) or less payload. Alternatively, the take-off power of the aircraft can be raised, as de Havilland plan to raise it, by attaching rockets. The company has developed the Sprite rocket for the purpose, since the Comet was intended to be the principal aircraft on the Commonwealth services of BOAC. The usual objection to using rockets on civil aircraft is that they cost £200 to £300 for each take-off, but these figures have presumably been obtained from military practice and refer to "hot" rockets which work on quite a different principle from the de Havilland "cold" rocket. de Havilland now pay 25s. a gallon for the peroxide which actuates the rocket. This means that a take-off would cost about £100, but when the supply is put on a fully commercial basis the price of peroxide will fall.

The Comet's costs are in any case so far below that of a comparable piston-engined aircraft that the extra take-off cost will not be a decisive handicap. Its direct operating costs are about 20 per cent less than that of a comparable piston-engined aircraft. Its capital cost is high, but five Comets, costing £450,000 each and flying on 2,000 mile stages, can cover the same number of passenger miles in the year as eight or nine Constellations at (before devaluation) about



Danger and **TEMPTATION** *shadow their lives*

OFTEN BOUND to spend nights in fishing ports away from home, deep sea fishermen face temptations made doubly strong by absence from their families. Deep Sea Mission Institutes in fishing ports help the fishermen by providing wholesome company and recreation, comfortable coffee bars, good accommodation at low prices — and deeply appreciated daily religious services . . . The Secretary receives donations gratefully, or will gladly on request send you full details of the Mission's labour of love among the fishermen.

DESIGN WITH

& REDUCE COSTS

COLCLAD is a composite plate in which a layer of stainless steel is bonded to a weldable carbon or low alloy steel. Special methods of manufacture ensure a uniform thickness of cladding. If protection is required on one side only COLCLAD offers equivalent corrosion resistance of solid stainless steel at considerable reduction in price. Easier fabrication and availability of plates in sizes larger than can be obtained in solid stainless steel, reduces production costs.
To assist YOU in adapting COLCLAD to YOUR products our technical staff is at YOUR service.

Polythene

Polythene was essential for the development of another great achievement of British research — radar. The illustration shows the radar installation at the port of Liverpool. Polythene, or polymerised ethylene, is a tough yet flexible plastic with remarkable qualities as an electrical insulator. The name is generic for a range of solid polymers of ethylene, a gas derived from alcohol or petroleum. Ethylene will not polymerise easily, that is, the molecules will not join together in long chains, but in 1933, I.C.I. chemists found that under extreme pressure they could be made to do so. This was in itself a major scientific achievement, but equal skill and more patience were needed to develop polythene to the stage of commercial production. The pressures used — sometimes exceeding 10 tons per square inch — had never been employed before in chemical processes, and at the beginning there were many explosions, one of which almost wrecked the laboratory. The process was finally mastered in 1936, and the first plant manufacturing polythene came into production on 1st September, 1939, the day the Germans invaded Poland. Never was a product more timely in its arrival. Today it is finding many uses, the most important being the improvement of submarine telephone and telegraph cables.

Progress that makes you think

Making the most of our own fuel resources is vital to this country. Between the wars the steel industry reduced the amount of coal required to make a ton of finished steel from over 60 cwt. to 41 cwt.

Since the war progress has again continued. For 1948, the figure was 39½ cwt.; for 1949, 37 cwt. The 21 million tons of coal used for the record output last year was thus actually less than was used in 1948.

This is just one way in which the steel industry keeps down costs by the best use of raw materials and plant.

STEEL is serving you well

For a full report on development of fuel economy write to Steel House, Tothill Street, London, S.W.1.

BRITISH IRON AND STEEL FEDERATION 50

£300,000. Its potential earning-power is augmented by the fact that it is simple and easy to service. But, since difficulties in arranging schedules and organising ground crews have prevented most of the past or present air liners from ever being utilised to their full physical capacity, a revolution in airline organisation will be needed to get full use from a turbo-jet.

Expanding Grain Supplies

Grain production regained its prewar level more quickly than any other staple foodstuff. In 1947 the world crop of wheat was only 80 per cent of the size reached in 1938; last year it was substantially larger. So, too, for maize, barley and oats. World maize production in 1947 was 3 per cent smaller than before the war; in the following year it was 30 per cent larger. These tremendous increases which took place within two seasons were due mainly to favourable weather. But acreage also showed a substantial, though less marked, expansion and higher yields were a further contributory factor.

The fact that world output of grains is now substantially larger than before the war has not meant that importing countries have been able to procure enough to meet their requirements. Statistics on world production of and trade in grain crops recently published by the Commonwealth Economic Committee* show that in 1948 the United States grew 42 per cent of the world's total compared with 32 per cent before the war. Western Europe accounted for only 15 per cent against 23 per cent in 1938, and eastern Europe for 11 per cent against 15 per cent. These figures reveal quite clearly that supplies of grain depended on the availability of dollars. In the summer of 1947, the United States shipped wheat to Europe (because the European crop failed) under its foreign relief programme. In the following year the Marshall Plan came into operation. To the extent that these relief funds were available, western Europe was able to buy its much-needed supplies from America. But permanent trade requires a sounder basis than unilateral grants for its development.

Since the war, the United States has become the world's largest exporter of wheat; the quantity shipped from it in 1948 was twice that from Canada—the largest exporter in prewar days. Argentina has remained the chief exporter for maize, despite the great increase in production in the United States. But one interesting feature in recent years has been the appearance of Russia in the world grain market on a very large scale. Russia has a number of ports fully equipped to handle grain shipments and its internal transport system is reported to have been developed with this end in view. Russia's entry into the grain trade has important economic implications for those countries short of dollars, but still more important political implications for the countries of western Europe.

More Oils and Fats

The devaluation of sterling last September did much to reduce the discrepancies between sterling and dollar prices for certain oils and fats but it did not eliminate them. Prices still vary from one trading area to another, not merely because certain currencies are short, but rather because of the maintenance of bilateral trading, fostered by government contracts. In this respect Britain is the worst offender. One-third of its imports come from British West Africa under contract; the trade is controlled at both the buying and the selling end. The entire output (for what it is worth) of the groundnut project also comes to Britain, at a fixed price which in this instance is appreciably above what might be considered a world level. Supplies from India and Ceylon, however, are no longer purchased under contract and other countries can compete with Britain. But the scope of such competition is so limited that the formation of proper world prices is well nigh impossible.

Nevertheless, the general trend in prices for fats and oils during the past eighteen months has been downwards and world production has been expanding. In an article in the current issue of *Progress*, the magazine of Lever Brothers and Unilever, Mr J. C. A. Faure estimates that world output of fats and oils last year amounted to 21.5 million metric tons compared with 21.6 million tons before the war. But since world population has increased during this period, the supply per head has declined from 22.3 lb. prewar to 20.0 lb. in 1949. Output this year is forecast at 22 million tons, or 20.5 lb. per head. Though production has regained prewar level, exports are still some 20 per cent smaller: the main deficiencies are in industrial oils an marine oils. Some countries have, of course, fared better than others. It can be seen from the accompanying table that supplies in Belgium and in the United Kingdom, even after allowing for increases in population, are now rapidly approaching their prewar level while supplies in the Netherlands and France are still significantly below. In western Germany they are very much below their prewar average. But supplies in each of these countries except Belgium have been increasing in the past two years.

SMT Preference Premium

At meetings to be held on April 26th, the board of Scottish Motor Traction is to recommend to its preference and ordinary stockholders the repayment of its 1,000,000 6½ per cent £1 preference shares at 5s. premium. The new recommendation is to be substituted for the original proposal passed by the company on September 16th last year for the repayment of the preference stock at par. It substantiates rumours, current in recent months, that a premium would be paid, though the amount recommended is higher than has lately been expected. This result is entirely due to the efforts of certain big insurance companies which, as large holders of the preference stock, have confronted the company—according to Sir Andrew Murray, the chairman of SMT—with the risk of "prolonged and costly litigation" in their determination to defeat the original intention to repay the stock at par.

Sir Andrew has stated that although the extra payment will cost the company £125,000 it will be made from capital

UNION CORPORATION LIMITED.

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS FOR THE YEAR 1949.

After providing £675,600 for United Kingdom Income Tax and Profits Tax the profit for the year is £831,070, plus £182,666 brought forward, making a total of £1,013,736. The Directors have placed £200,000 to the credit of Exploration Reserve Account, have written off New Issue Expenses amounting to £42,728 and have declared a final dividend of 4s. 0d. United Kingdom currency per share free of United Kingdom Income Tax, absorbing £372,000, and making, with the interim dividend of 2s. 0d. per share, a total distribution of 6s. 0d. per share free of United Kingdom Income Tax or £558,000 for the year, leaving £213,008 to be carried forward.

Holdings of shares, debentures and other securities have been taken into the Accounts at cost or under but in no case above the market value of December 31st last, or, where no market price exists, above the Directors' valuation. At present market prices these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to write down the book cost of certain holdings below both cost and market price.

During the year the Directors offered 232,000 reserve shares to shareholders at £10 per share in the ratio of one new share for every seven shares held.

A copy of the Corporation's Annual Trade Cycles Chart, revised to date, is enclosed with the Report.

GOLD INTERESTS

Summary of the operating results for the past year of the Companies operating in the Witwatersrand in which the Corporation is largely concerned:—

—	East Geduld Mines, Ltd.	Geduld Proprietary Mines, Ltd.	The Grootvlei Proprietary Mines, Ltd.	Marievale Consolidated Mines, Ltd.	Van Dyk Consolidated Mines, Ltd.
Tons milled	1,754,000	1,257,000	2,061,000	675,000	1,199,000
Yield per ton dwt.	5.99	3.58	5.00	5.64	3.46
Working Costs per ton	20s. 6d.	24s. 10d.	22s. 8d.	36s. 9d.	28s. 5d.
Working Profit per ton	38s. 4d.	10s. 2d.	26s. 6d.	19s. 6d.	5s. 2d.
Total Working Profit	£3,359,000	£639,000	£2,737,000	£659,000	£310,000
Net Profit	£1,774,000	£969,000	£1,484,000	£421,000	£280,000
Dividends: Total ...	£1,485,000	£858,000	£1,120,000	£281,000	—
Per cent.	82½	58⅓	39½	12½	—

The net profit figures include revenue from other sources. Thus East Geduld Mines' dividend income in 1948 on its Shareholding in The Grootvlei Proprietary Mines was £52,640 and Geduld Proprietary Mines' dividend income in 1949 on its shareholdings in East Geduld Mines and The Grootvlei Proprietary Mines was £580,983.

On Van Dyk, work is still proceeding on No. 5 Shaft and Sub-vertical Shaft for the opening-up of the southern portion of the property. The payment of dividends has been suspended in order to finance this Shaft and initial development therefrom.

ST. HELENA GOLD MINES.—By 31st December last No. 4 Vertical Shaft had reached a depth of 2,753 feet. Development work from No. 3 Incline Shaft was delayed by water-bearing fissures, but a total of 19,241 feet was completed on the 2nd, 3rd, 4th and 5th Levels North and South of the Shaft. Of this footage 7,935 feet were on Basal Reef, of which 3,620 feet or 46 per cent. were payable with an average assay value of 18.3 dwt. over 15 inches. In October last it was decided to instal a reduction plant to treat about 80,000 tons per month and this plant should come into operation by about the middle of 1951 at an initial milling rate of approximately 50,000 tons per month.

To provide funds to bring the Mine to production, 2,500,000 reserve shares of 10s. each were issued at 37s. 6d. per share, one-half being offered to shareholders and the other half to the companies associated with the formation of the Company in accordance with the Flotation Agreement.

THE WITHOK PROPRIETARY COMPANY.—The Corporation retains a substantial share interest in this Company.

POTCHEFSTROOM MINING AREAS.—During the year this Company sold prospecting and option contracts covering approximately 1,185 morgen on farms Stilfontein No. 39 and Hartebeestfontein No. 44, District Klerksdorp, to the Stilfontein Gold Mining Co. Ltd. and undertook to subscribe or procure subscribers at par for 20 per cent. in the initial capital of the Stilfontein Company. Shareholders of the Potchefstroom Company subscribed for these shares in full. The Company retains a large area under option in the Potchefstroom and Klerksdorp Districts, but drilling has given disappointing results.

CAPITAL MINING AREAS.—This Company was formed by the Corporation during the year to acquire prospecting contracts over farms in the Bethal, Ermelo and Standerton Districts, Transvaal: a borehole is being drilled on one of the farms.

WESTERN KROONSTAD AREAS.—This Company holds prospecting contracts over a large area in the Kroonstad and Bothaville Districts of the Orange Free State and is engaged on a drilling programme.

ORANGE FREE STATE.—In addition to its interests in St. Helena Gold Mines and Western Kroonstad Areas the Corporation itself holds mineral rights and prospecting contracts over certain farms in the Orange Free State.

OTHER INTERESTS

BAY HALL TRUST. The net profit for 1949 was £75,066 and a dividend of 6 per cent. free of tax was declared. The Trust's investments as at December 31st last showed an appreciation of £1,037,031 over book cost of £2,135,201.

BRITISH ENKA. The expansion of this Company's productive capacity is now substantially completed and the financial results for 1949 will benefit by the expansion.

CENTRAL MINERAL EXPLORATION. This Company continued its prospecting operations in the Miala Area in Tanganyika Territory.

CHROME MINES OF SOUTH AFRICA. This Company continued to mine chrome ore at its Zwartkop and Tweelagte Mines in the Rustenburg District, Transvaal, and at its Groothoek Mine in the Leydenburg District, Transvaal, and substantial tonnages were sold to overseas buyers.

SAN FRANCISCO MINES OF MEXICO. The installation of additional plant to bring the mill capacity up to 720,000 tons a year is now complete and the plant is being gradually brought into operation. The fall in base metal prices early in 1949 reduced the dollar earnings of the Company but its earnings expressed in sterling will be increased by the devaluation of sterling which took place in September last.

SOUTH AFRICAN PULP AND PAPER INDUSTRIES. During the year the output of this Company increased. The net profit for the year after making provision for taxation and depreciation amounted to £290,852. Dividends totalling 1s. 9d. per share have been declared. The Company is installing two additional paper machines at its Factory, which will almost double its present output and make possible the production of a much wider variety of papers. To provide funds for this expansion the issued capital of the Company was increased in October, 1949, from £750,000 to £995,000 by the issue of 190,000 shares of 10s. each at 25s. per share.

TSUMEB CORPORATION.—This Company continues to show good progress and the Mine has developed substantial ore reserves.

Copies of the full Report and Accounts can be obtained on application at the London Office, Princes House, 95, Gresham Street, E.C.2.

reserve funds. It will not affect the distribution to ordinary stockholders of 3 per cent British Transport stock 1968-73 at the rate of £4 nominal in respect of each 5s. stock unit held by the public. In fact, he makes it quite clear that the ordinary stockholders have much to lose by delaying the reconstruction scheme. Not only has the dividend to be paid on the preference stock until it is repaid, but in addition the interest received on the compensation stock is liable to profits tax when paid to the company.

The preference stockholders of SMT look like winning their premium by the judicious exercise of their nuisance value. This raises the possibility that the same line of action might be taken by preference stockholders in other companies threatened with repayment of their capital at par. Since the Wilsons and Clyde Coal and Chatterley-Whitfield decisions in the House of Lords last year, their strict legal entitlement—unless the Articles of Association state otherwise—has been to repayment at par. But if companies seeking to repay high-coupon preference capital at par can be made to succumb as SMT has done, the effect of these judgments will be so much the weaker.

* * *

Gas Turbines on the Roads

Although the Boeing Aircraft Company has announced the completion of preliminary road tests of a lorry using a gas turbine power plant, this is not taken by British gas turbine engineers to mean that the use of the gas turbine for road haulage has been mastered yet. The company has been working for some time from the basic design of its turbo-supercharger, fitting combustion chambers between the compressor and the turbine to give a gas turbine of about 200 brake horse-power. The Rover Company has already demonstrated that a small gas turbine can easily be made to propel a road vehicle. The Boeing announcement is interpreted as a counter-gesture to the Rover demonstration and the subsequent dispatch of the car to the New York exhibition of British cars opening today.

But the problems which face the Boeing company in developing a gas turbine for road use are less awkward than those which face a British company. In Britain a double-decker bus is the lightest vehicle likely to need an engine of 200 b.h.p., which is as small as the present small gas turbines go. In the United States a power unit of this order is normal for heavy commercial vehicles. One British firm working on a gas turbine engine which will be suitable from the outset for passenger cars (without the need for further basic development) considers that the two main difficulties are to get a reasonable fuel consumption and to build the engine at reasonable cost. This firm is constructing an engine of 40 b.h.p., which would be appropriate for a mass-produced car. Such an engine, to be commercially practicable, should sell for not more than £120; but its cost in materials alone is between £30 and £40.

Shorter Notes

The North of Scotland Hydro-Electric Board is to put up overhead transmission lines between Aberdeen and Dundee to link up the electricity supplies of the two cities. The scheme will cost £372,000.

*

Steel production in March was at an annual rate of 17,147,000 tons and pig iron production at an annual rate of 9,696,000 tons. Both figures are higher than the rate of output in February, and that for steel is the highest yet recorded. Total output of steel ingots and castings in the first quarter of the year was 4,169,600 tons; this is 207,000 tons higher than in the same period last year.

COMPANY MEETINGS

NATIONAL PROVIDENT INSTITUTION

GROWING DEMAND FOR LIFE ASSURANCE

The annual meeting of the National Provident Institution for Mutual Life Assurance will be held in London on April 18th.

The following are extracts from the address which will be submitted by the chairman, Mr Vincent W. Yorke:—

Once again I have the pleasure to report that we have had a year of activity and progress. Our new business in 1949 reached a new record of £4,389,071 after deducting amounts reassured. This is the result of *sustained effort by our staff, both in the field* and at head office, but it has also been affected by the conditions of the time, among other things the increase in the cost of living, and the lower value of money in terms of goods, for example.

One reason for increased new business is *the wider appreciation of the value of life* assurance as an investment. It is in conditions such as those ruling during the last year or so, with a general downward trend in the market prices of most classes of Stock Exchange securities, *that one is made particularly* aware of the merits of a security with four outstanding qualities which may be expressed in everyday language as follows: Absolute security of capital—easy building up of the capital by instalments—some relief of income tax on the instalments—a guarantee that the capital sum will be available in full at once if death should interrupt the regular payment of instalments.

I am glad to say that in spite of the increased new business our expense ratio was *again reduced last year, the ratio falling to* £16 7s. 10d. per cent. after excluding the special expenses involved in the valuation and distribution of profits early in 1949. Needless to say, the bonus distribution was warmly welcomed by our members, to whom the increased rates of bonus gave considerable satisfaction. Under today's conditions a bonus of 40s. per cent. per annum on whole life policies (or even more at the higher ages) and of 30s. per cent. to 40s. per cent. per annum on endowment assurances is a matter for some pride.

PROFITABLE INVESTMENT POLICY

The gross rate of interest earned on our funds last year increased to £5 9s. 2d. per cent. and the net rate after deduction of tax to £4 3s. 4d. per cent. A number of causes have contributed to the production of these very satisfactory rates, but the principal one *has been our decision in recent years to* spread our investments more widely and to take a larger stake in countries overseas. These investments have been made in Dominion and United States Government stocks, debentures and ordinary shares.

There are special attractions in the *ordinary shares of leading industries in those* countries, since the yields obtainable are often higher than those for corresponding industries in this country, and we also derive benefit not only from the absence of dividend *limitation but also from the provisions for* relief from double taxation made in the treaties between the United Kingdom and those countries. Such investments call for great care in selection and subsequent supervision.

During the summer months we exchanged some of our British Government holdings into shorter dated stocks and thus lessened to some extent the impact of the fall in market values. The downward movement of gilt-edged prices affected other types of fixed-interest securities and preference shares, while home ordinary shares fell during the year for this and other reasons. In spite of this there was still at the end of 1949 a very satisfactory margin between the market value and the balance sheet value of our Stock Exchange securities.

A year ago I reported that this margin was higher than it had ever been before, and it *is at times like the present that this* "hidden reserve" shows its great value in meeting fluctuations in market values. We know well that these fluctuations must occur, and I consider that our financial position is just as strong in relation to today's conditions as it was a year ago in relation to the conditions then ruling. I feel, therefore, that we may continue to look to the future with confidence, and I think that the fact that we are continuing interim bonuses at these same increased rates into 1950 may be taken as an indication of our hopes for the future in the absence of any major disturbances.

POLICIES FOR INCOME

There are now several types of policy available under which the benefits are a series of so-called "income payments" not subject to income tax under present tax regulations. These policies are particularly valuable for covering the years of education for children, and we have a number of policies which adapt the "income" aspect of life assurance to different types of risk. Examples of these are the "Family Protection" and "Magna Carta" policies. These are established and popular types of contract, and we have recently added a new policy to this group—"The Particular Policy for Parents." We also issue contracts which provide a pension after retirement in the form of a series of tax-free payments. The professional man who has to create his own pension for his later years could hardly find a better way than this to arrange his plans. An example of this is our "N.P.I." policy.

TRADE INDEMNITY COMPANY, LIMITED

INCREASED DEMAND FOR CREDIT INSURANCE

Mr C. H. FALLOON'S SPEECH

The thirty-second ordinary general meeting of the Trade Indemnity Company, Limited, was held on April 13th at 95, Gresham Street, London, E.C.

Mr C. H. Falloon, the chairman, in the course of his speech, said: The first of the underwriting accounts for consideration is that for 1947, which is closed at the end of the third year with a favourable balance of £57,621. This is £16,324 more than the corresponding figure a year ago, and is transferred to the profit and loss account.

The 1948 underwriting account shows a satisfactory balance of £51,666, which is carried forward. In the second year of this account the additional premiums earned have exceeded the claims notified, resulting in a net increase of £18,307 in the balance brought forward from 1948. In normal times we expect claims to exceed additional premiums in the second year of an account but these are not normal times.

1949 UNDERWRITING ACCOUNT

When we come to examine the 1949 underwriting account you will notice a very marked increase in the gross premium income. This, at £312,062, is roughly 50 per cent. up on the corresponding figure in 1948. After reinsurance the company's retention of £109,645 is up 40 per cent.

Expenses have also increased from £42,238 to £51,540, but, with an expanding business and the increase in staff necessary to handle it, that was inevitable. Another result of our expansion of business is that we have outgrown our existing accommodation at Bilbao House and have recently acquired new offices on the ground floor of Palmerston House, Bishopsgate. We hope to move in in the course of the next few months, when the necessary alteration and decorations have taken place.

The claims notified on the 1949 account are very moderate, but it must always be remembered that the critical year of an account is the second. Nevertheless, the balance of £54,388, which is carried forward, is a satisfactory one.

PROFIT AND LOSS ACCOUNT

As I have already mentioned, the form of the profit and loss account has been revised with the object of giving a clearer view of the profit for the year. For this purpose the account has been divided into two parts. In the first part is shown interest on investments and transfer fees amounting to £21,464, to which is added the amount transferred from the 1947 underwriting account of £57,621. Against the resulting total of £79,085 are set the necessary reserves for payment of income tax and profits tax, amounting to £43,399. The net profit of £35,686 is then carried down to the second part of the account and is added to the balance brought forward from 1948, which is £129,594. This gives a total of £165,280, out of which your directors recommend payment of a dividend of 10 per cent., less income tax, which will absorb £13,750, leaving £151,530 to be carried forward. It is not proposed to transfer anything to the general reserve or the contingency reserve this year, as, for reasons which I will refer to later, it is considered wise to build up the amount carried forward.

The balance sheet follows very closely the form in which it was presented last year. Investments have been increased during the year by £40,759 and now stand at £694,694, which in aggregate is less than the market value as at the date of the balance sheet.

GENERAL PROGRESS

You may remember that at the last annual general meeting I predicted that we could look forward to the Trade Indemnity playing a still more active part in the commercial life of this country. In the 12 months that have passed since then, there has been a remarkable increase in the demand for credit insurance. You have seen from the figures of premium income how the business has expanded. Similarly, the estimated turnover of insured transactions has gone up from £162,000,000 in 1948 to £267,000,000 in 1949. I would add that the demand comes from many of the largest industrial concerns as well as from the smaller medium-sized undertakings which gave us the bulk of our business in the past. Also, it is extremely gratifying that the demand is for the insurance of the whole of the applicants' transactions as opposed to being confined to a section of the business or selected accounts. This gives us a much better spread and eliminates the obvious disadvantage of selection against the insurance company.

There are, undoubtedly, several reasons for this increase in demand.

Partly, it is the result of persistent efforts by our outside staff and a number of enlightened insurance brokers to educate people up to the idea of insuring credit risks.

Partly, it is due to the progress we have made in providing the types of cover which meet the varied requirements of merchants and manufacturers.

Partly, it is due to the difficulties, existing and foreseen, in the conduct of business on prudent lines with prices at their present level.

Again, in certain directions the export drive has had a marked effect on the volume of credit facilities required by manufacturers in this country. Suppliers of materials and components to manufacturers who export a substantial part of their products find themselves involved in very heavy commitments. These are not direct export risks, but it is of importance from the point of view of maintaining the even flow of goods for export that they should be adequately catered for. We play a far from insignificant part in covering such risks.

ENHANCED PRICES AND HIGH CREDIT LIMITS

Returning to the subject of enhanced prices and the high credit limits which they involve, I should like to sound a cautionary note about the current situation. What I am going to say I have said before and it has been said by others. Nevertheless, it will bear repeating.

With prices at their present levels, many—perhaps I am justified in saying most—concerns are compelled to operate with a much lower safety factor than before the war. Due to heavy taxation and inadequate depreciation allowances, real capital resources have not increased by anything like the same rate as costs and prices and, speaking generally, the financial position is intrinsically less stable than it was a dozen years ago. Sooner or later we are bound to have a readjustment and it is for that reason, apart from any standstill agreement over dividends, that your board recommend a further build-up of the amount carried forward.

The report and accounts were adopted.

MAPLE AND COMPANY, LIMITED

TURNOVER AGAIN A RECORD

The sixtieth annual general meeting of Maple and Company, Limited, was held on April 13th in London, Mr C. C. Regnart (the president) in the chair.

The following is an extract from the president's circulated statement:—

Turnover of our whole group has again shown an increase, so that last year's all-time record in the history of your company has been substantially exceeded. Freedom of design and manufacture has materially helped in this direction and our own factories have been able to take advantage of producing once again a certain amount of furniture, not stereotyped and universal, but designed as heretofore, in the Maple studios.

I feel it is my duty to refer to the very serious reaction which must result from the continued restrictions on production in our industry; for a decade we have been prevented from producing the best furniture, by which I mean furniture requiring the skill of the best type of upholsterer and cabinet maker, and practically no apprentices have been articled to the trade in consequence. Now that hardwood has been freed from control, if only purchase tax were abolished and other controls lifted it would help a crippled industry not only to survive but to revive; in no other way can the craftsmanship be maintained and the antiques of the future be produced; machine-made utility furniture has and will serve a useful purpose, but it will sap the life blood of the industry if it continues to enjoy freedom from purchase tax and other controls to the exclusion of the rest and best of the products of our industry.

The Government have set up a development council in the furniture trade, presumably to teach us our business, yet we are prevented by restrictions from teaching this body what we already know. Let us hope before long wiser counsels will prevail and opportunities will be available once more to revive the art of domestic furnishing and give scope to the individual artist to produce articles worthy of reproduction in a future age.

PURCHASE TAX

Purchase tax, though reduced in some cases remains our biggest handicap in certain departments where 66 per cent. and 100 per cent. are surely penal taxes and entirely unnecessary today. Your board still feel that if it be imperative to extract more revenue from the already ravished retail trade, a universal sales tax would be much fairer and a more equitable method of collection and a very much smaller handicap to the country's retail business.

The handicap of which I spoke to you in my last review regarding the restriction of lighting in our shop windows has been successfully avoided by the connecting up of our window lighting with our own plant instead of using the public supply. Thus our largest advertising medium has been fully retained.

The hotel contract department and the exhibition department have been even more successful than last year and orders in hand give me no worry for 1950. Your board have placed the importance of the export drive on a very high plane.

In regard to the future, with reasonable political and international conditions prevailing and the absence of any financial crisis, your business should continue on the successful plane of last year, and I am glad to say that since the new trading year commenced, the trend in this direction has been evident.

The report was adopted.

UPSONS LIMITED

(Dolcis Shoe Company)

INCREASED TURNOVER

The 30th annual general meeting of Upsons Limited was held on April 6th in London, Mr Thomas Norton Bird (the chairman) presiding.

In the course of his speech, the chairman said:—

The profit balance was £833,913 which compares with the previous year's figure of £907,839. The net profit after taxation and pensions contribution is £357,542. Our total turnover for 1949 exceeded that of 1948, which was in itself a record, and I am glad to be able to report that unit sales of shoes, underwear and all other merchandise substantially exceeded those of last year in every department of our business. The accounts show that the company has experienced a year's good trade which ended with our affairs in a sound position.

With the balance brought forward of £207,018, we have a total of £1,040,931 now to be considered. The directors recommend a final dividend of 12½ per cent., making 20 per cent. for the full year on the ordinary shares.

I feel that I must refer once again this year to the heavy burden of taxation. The heavy taxation of working directors and senior staff who live for their business is discouraging; they are prevented from saving in a suitable manner for the latter years of their life and the life of their dependents. It is the same with craftsmen and pieceworkers whose stimulus to aim high is seriously affected. It is the same with our shareholders who, having saved and invested their capital, are entitled to payment for the use of their money. It is most desirable that both shareholders and employees should be encouraged to persevere with mental and physical action, enterprise and initiative, and there is nothing more effective than a good reward both in dividend and wages earned and retained.

Controls in many forms have remained with us but I am glad to be able to say that the Board of Trade has accepted the principle of decontrolling our industry as quickly as possible.

EXPORT TRADE

We have continued to make a substantial contribution to the export trade. Our total exports for 1949 are greater than those for 1948. We have obtained a desirable increase in hard currency areas which has compensated for a decrease in some of the soft currency areas. Prewar, as a company, we were much more noteworthy as importers than exporters but, in the national interest, we have set ourselves a certain export target even though this yields us a smaller rate of profit than that which we can earn with the same merchandise at home. I am sure that you will agree that this is the right policy for us to follow at the present time. There are, however, still many impediments to international trade whether they be in restricted supplies of essential raw materials at home or in tariffs and other barriers abroad. It is necessary for the Government to back us up in our efforts to overcome these difficulties and I am glad to note that the Dollar Exports Board is beginning to take a lively interest in these problems.

We have progressive plans for steady development during the coming year—just how successful they will be I cannot say but no effort will be spared to make them effective.

The report was adopted.

CABLE AND WIRELESS (HOLDING) LIMITED

AMENDED SCHEME APPROVED

By an Order of the Court a meeting of the ordinary stockholders of Cable and Wireless (Holding) Limited, was held on April 5th in London, to consider an amended Scheme of Arrangement.

Sir Edward Wilshaw, K.C.M.G. (the governor), in the course of his speech, said: In April, 1949, at the annual general meeting of the company, I stated that your directors considered that it would be in the best interests of the stockholders to distribute a substantial portion of the compensation to stockholders. On November 25th last, a Scheme of Reconstruction was submitted to you which went even further than that, and in fact proposed the distribution of the whole of the compensation award. This scheme was, however, rejected by the ordinary stockholders of the holding company, but approved, by substantial majorities, by the stockholders, shareholders and debenture stockholders of the underlying companies.

I undertook at that meeting to endeavour to bridge the gap between the various divergent opinions. A sufficient number of proxies in favour of the scheme has been lodged with the directors to ensure its adoption.

FUTURE POLICY

As regards the future conduct of your company in its role of an investment trust, my colleagues and I feel strongly that subject to the duty of your directors to earn dividends for their stockholders, the functions which our company should properly fulfil extend far beyond that of mere collectors of dividends, and that a duty is laid upon us to do our utmost to ensure that the funds at our disposal are used to the best advantage in the interests of industry in this country and in development overseas under private enterprise. In the latter sphere I believe that this company has a contribution to make out of experience gained over a long period in this field.

Your directors, therefore, in considering the policy to be adopted in the future, will not be content merely to hold investments, receive dividends from them and pass them on to the stockholders. This, to their minds, would not provide the maximum benefit which can be obtained from a more progressive and imaginative policy. Your directors believe that your company, with its widespread interests in the investment field spread over many countries, can be of material assistance not only to those countries but to the business community.

In the Explanatory Statement I said that the terms on which the 3½-year unsecured stock would be issued would be fixed just before option forms were despatched to ordinary stockholders, and the board would be guided by independent advisers and would endeavour to issue the stock on terms which should, in the absence of unforeseen circumstances, ensure that the market quotation opened at not less than par. The board has therefore decided to issue the stock at par bearing interest at the rate of 3 per cent. per annum.

At the meeting and at a subsequent extraordinary general meeting a card vote was taken.

NOTICES

THE UNIVERSITY OF SHEFFIELD

Applications are invited from graduates of any University for the Douglas Knoop Research Fellowships. Fellows will be required to undertake research in Economics or Economic History in the University of Sheffield. The value of the Fellowships will be £425 a year, and they will normally be tenable for three years.

Application (three copies) indicating the line of research proposed by the applicant, and including the names and addresses of three referees, and, if desired, copies of testimonials, should reach the Registrar, The University, Sheffield, 10 (from whom further particulars may be obtained) by June 1, 1950. Official application forms are *not* provided.

A. W. CHAPMAN, Registrar.

UNIVERSITY OF LONDON

The Senate invite applications for the Chair of Social Administration tenable at the London School of Economics and Political Science. Applications (ten copies) must be received not later than May 22, 1950, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

WELL established firm of Engineers handling Earth Moving Equipment requires outstanding executive capable of taking on Managing Directorship of its interests in India. Applicants should have a Civil and/or Mechanical Engineering background and should be accustomed to dealing with all the commercial and financial problems of running a Group of Companies from Headquarters in India. Applicants should enjoy excellent health. Salary up to £5,000 per annum. Applications giving full details of experience, etc., to Box 392.

YOUNG GERMAN ECONOMIST (man, 27; graduate of Bonn University), with business experience, desires suitable employment (commerce, accountancy, banking, social research or welfare work).—Box 399.

RHODES UNIVERSITY COLLEGE

GRAHAMSTOWN, SOUTH AFRICA

Applications are invited for the post of:

(i) LECTURER IN ECONOMIC HISTORY

from July, 1950, or as soon thereafter as possible.

Salary scales:

SENIOR LECTURERS	Men:	£600 x £25—£850 p.a.
	Women:	£550 x £25—£700 p.a.
LECTURERS	Men:	£550 x £25—£700 p.a.
	Women:	£425 x £25—£575 p.a.

Plus a variable cost of living allowance, at present about £57 p.a. for single persons and £100 p.a. for married persons.

Previous experience and academic qualifications may be taken into account in fixing the initial salary.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. The closing date for the receipt of applications is May 31, 1950.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for the post of Research Assistant in the Department of Industrial Relations. Applicants should have an Honours Degree in Economics and previous research experience would be an advantage. Salary £450 p.a. The post is not permanent. Six copies of application, with the names of three referees, should be sent to the Registrar, University College, Cardiff, not later than May 30, 1950.

(Signed) E. R. EVANS,
Registrar.

University College, Cathays Park, Cardiff.
March, 1950.

Investment Statistics

Company Notes

Colvilles.—Consolidated trading profit increased from £3,637,875 to £3,935,431 and group net profit declined from £1,306,927 to £1,244,572 in 1949. Taxation increased by £256,537 to £2,171,936 and depreciation absorbed £103,374 more at £518,923. The dividend of 13 per cent for 1949 is unchanged.

Ford Motor.—Group net profit fell from £2,922,657 to £2,604,776 in 1949. The taxation charge was £2,436,843 (£2,661,398). The 10 per cent dividend for the year is unchanged, absorbing £495,000 (same); special appropriations amounted to £657,250 (nil) after writing back £750,000 (£500,000) from reserves.

Currys.—Group trading profit increased from £419,081 to £526,512 in the year to January 28, 1950. Net profit amounted to £220,729 (£146,331). The dividend for the year is 25 per cent. Stocks rose from £687,026 to £768,606 on the year.

Beyer Peacock and Co.—Group profit increased from £283,248 to £355,624 and net profit from £131,781 to £145,706 in 1949. The distribution of 6 per cent for the year is unchanged. Stocks and work in progress were valued at £1,107,211 (£936,918) at the year-end.

General Steam Navigation.—Trading profit of the group rose from £1,274,143 to £1,382,193 and total profit from £1,370,272 to £1,448,145 in the year to September 30, 1949. Net profit declined from £445,596 to £421,267. The dividend of 10 per cent is unchanged for the year. The fleet plus payments on account of new tonnage, less depreciation, was valued at £3,934,732 (£2,959,486) at the year-end.

Boulton and Co.—Consolidated trading surplus for 1949 was £413,183 (£212,085) and net profit £154,750 (£82,139). The total distribution for the year is 15 per cent (12½ per cent). Stocks increased from £536,693 to £607,150 at the year-end.

Cow and Gate.—Group trading profit increased from £986,532 to £1,078,798, total profit from £1,021,965 to £1,117,541 and net profit from £261,072 to £336,052 in the year to September 30, 1949. The dividend for the year is 15 per cent. Stocks rose from £1,076,704 to £1,325,171 on the year.

Selfridge (Holdings)—Group trading profit amounted to £765,859 (£748,291) and total profit to £770,712 (£785,717). Net profit declined from £314,490 to £289,217. The 14 per cent distribution is unchanged. Group stocks at the year-end were £661,591 (£669,123).

British Aluminium.—Total profit of the group fell from £2,088,973 to £1,803,595 including £143,228 (£140,265) profit on sale of investments, £35,564 (£100,143) income from allied companies and other trade investments and £67,574 (nil) profit on exchange. Bank overdrafts increased from £240,209 to £1,017,490; stocks were £5,452,171 (£4,393,019). Net current assets were higher at £3,959,278 (£3,841,735).

Cerebos.—Trading profit for the group in 1949 amounted to £985,441 (£971,798); net profit was £388,191 (£400,173). The dividend of 40 per cent is unchanged. Stocks at the year-end were valued at £489,270 (£486,658).

Brush Electrical Engineering.—Net current assets of the group increased from £7,261,130 to £8,211,711 in 1949; after deducting £144,696 (£396,745) deposits and amounts received or invoiced on account, stocks and work in progress were valued at £4,968,369 (£4,852,306) at the year-end. Group capital commitments at December 31, 1949, amounted to approximately £350,000.

Swan, Hunter, and Wigham Richardson.—Group trading profit rose from £2,112,734 to £2,321,308, total profit from £2,181,936 to £2,370,688 and net profit from £754,060 to £957,099 in 1949. Net current assets at the year-end were £6,824,029 (£6,176,195).

British Paints (Holdings).—Consolidated profit in 1949 amounted to £649,315 (£597,132) and net profit to £282,350 (£274,314). The total distribution for the year is 17½ per cent (15 per cent).

Schweppes.—Consolidated trading profit increased from £547,660 to £684,407 in 1949. Net profit amounted to £252,192 (£161,467). The ordinary dividend is 12½ per cent (same).

Textile Machinery Makers.—Consolidated net profit increased from £993,503 to £1,287,231 in 1949. The dividend of 6 per cent for the year is repeated.

Capital Issues

Clayton Dewandre.—Shareholders are to be offered £1 of stock for every £4 now held. The price of the offer remains to be determined.

Uganda Loan.—The issue of £3,100,000 3½ per cent stock, 1966-69 at £98 per cent has been heavily oversubscribed. The stock opened at 1 premium on Thursday and subsequently rose to 1½ premium.

Montevideo Gas and Dry Dock Co.—Ordinary shareholders are to be offered at par £407,750 six per cent first mortgage convertible debenture stock.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (n) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. ' Assumed average life 14 years 1 month.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly (h) Assumed dividend 18⅜% after capital bonus. (l) To latest redemption date. † Free of tax. (m) Final dividend on increased capital. Yield basis 35%. (n) Yield basis 26⅛% after capital bonus

Statistical Summary

EXCHEQUER RETURNS

For the 8 days ended April 8, 1950, total ordinary revenue was £66,332,000, against ordinary expenditure of £68,049,000 and issues to sinking funds £104,000. Thus, including sinking fund allocations of £104,000 the deficit accrued since April 1st is £1,821,000 compared with a surplus of £15,000,000 for the corresponding period a year ago.

At the Limit

IN one important respect, Sir Stafford Cripps is to be commended for last Tuesday's budget. He has resisted the pressures—and no doubt they were considerable—to produce a budget aimed at buying support from the voter at the next general election. This, by all present prospects, seems likely to take place long before April next year, but if the Chancellor was sensible of this possibility, he betrayed no hint of it. There were no popular concessions, not even the penny off the pint. None of the arguments which have marked the Chancellor's earlier budgets was missing. Once again, the House of Commons was treated to a magisterial demonstration of the present risks of inflation and of the "absolutely vital" necessity of maintaining a budget surplus. There were no vindictive swipes at capital and no distribution of fictitious benefits from non-existent surpluses.

For this, at any rate, the Chancellor deserves thanks. But beyond this refusal to step outside his austere role, there is little to put on the credit side. This year's budget will be taken as the final illustration of the fixed and rigid mould into which the British economy, and with it the British fiscal system, has been forced. There was nothing to give away in relief to the taxpayer, because revenue is no longer rising and expenditure still increases. Since the Chancellor detects a smaller risk of inflation this year, he has contented himself with budgeting for a "true revenue surplus" of £413 million, compared with £518 million in the past year. No doubt this will be more or less satisfactory if everything goes as the Chancellor plans. But will it? There is at least room for doubt, in a world which is becoming more competitive, and in which Britain will soon have to earn the whole of its living. When the Chancellor claims that "our very considerable success proves the value and efficacy of our budgetary planning" he is asking for too much credit for his mild doses of disinflation in the past. He regards his main function now to avoid the pitfalls that are supposed to lie on either side of a "narrow path" between inflation and deflation—a growing external deficit and pressure on the pound, on the one hand, and unemployment on the other.

This is far too simple a view of what is needed. It is based on the estimates and forecasts of the "Economic Survey" and these are only a set of hypothetical sums. Some of the hypotheses may turn out to be right, and some of them might even be bettered. But this kind of budgeting, to the first decimal point, with the limits of taxable capacity reached and exceeded, and the demands on the public purse still rising and still unchecked, gives the most frightening hostages to fortune. Only a little has to go wrong to upset all the nice figuring. That is not to say that there is, on the immediate horizon, any sign of squalls. The Chancellor has budgeted for another year without any major change in the economic climate—another year of full employment, rising productivity, expanding

exports, and rising reserves. He may be right ; if he is, a large part of the success will be due not to planning but to devaluation, which most certainly was not planned.

Long before the Chancellor sat down, the House had absorbed the drift of his demonstration that this was to be a " No change " budget. " Adequate correctives " had been applied in time last year to reduce inflationary pressure—among them a cut in house building which turns out to be notional and is to be restored. Indeed, the Chancellor went further than this, for he announced that the Government has fixed the house-building programme for the next three years at 200,000 houses, to which the rest of the capital investment programme " will have to conform." This is a most inadvisable commitment. In a matter of such fundamental importance as capital investment, there should be no absolute priorities—and certainly none which automatically involve an increased burden for housing subsidies. If the nation needs, as it may, 200,000 houses a year for the next three years, it should first make up its mind about rent policy, which is now chaotic and inequitable.

The Chancellor's " major " changes were few, and, as was necessary within the rigid definitions he had set, self-balancing in character. The first is the reduction, by one-sixth, of the tax levied at reduced rates, which should do something to increase the incentives of workers with moderate incomes (though not those with the smallest). This relief, however, has to be balanced by new taxation, and it is here that the Chancellor has entered a distinctly doubtful field. By doubling the duty on petrol, he has adopted a course that has long been supported by those who argue that it would be better to let the price system reinforce the effectiveness of rationing. No doubt the private motorist with an increased basic ration will find it easy enough to transfer one-third of the income tax he saves this year back to the Chancellor. No doubt the road transport industry will be moved to make some economies in consumption (the farmers, of course, are to have an indemnity for the increased costs that fall upon them). But the increase will come at a difficult moment, and though Sir Stafford sought to minimise its effects by declaring, of passenger transport alone, that it should not lead to many additional applications for fares, the effects will spread far beyond passenger transport. To suppose that as much as £70 million can be absorbed with no effect on costs and prices would be fanciful.

*

The argument might stand a better chance of being accepted if the Chancellor had not proposed to make an unprecedented departure in the principles of the purchase tax by levying 33⅓ per cent on commercial vehicles. The argument here is that the industry has sold more commercial vehicles on the home market than the planners had demanded ; all efforts to control by administrative methods the number of vehicles going to the home market had failed, and the " excessive volume " is to be curtailed, so the Chancellor intends, by fiscal measures. It is asking too much to expect the public to believe, despite Mr Jay's disclaimer, that this new tax, and the doubling of the petroleum duties, has no connection at all with the predicament of the Transport Commission. Both measures will increase the cost and impede the development of road transport.

These new impositions on motor transport, though of minor importance against the menacing fiscal background illustrate precisely the Chancellor's dilemma. He has no room for incentive budgeting (even if he believed in it) because he can do nothing about the mounting level of expenditure. So his budgeting has to be bilateral—a concession here against a new tax there. Each year the warnings are given that no extra expenditure can be afforded ; each year the appeal is renewed that " the very greatest care and restraint " must be exercised in proposing any new charges on the Exchequer—as if it were no longer the Chancellor's plain duty to smother them at birth.

But he sees his task in quite a different light. He argues that the nation is not being crushed by taxation, and points for proof to the rise in industrial activity " to the highest levels ever known in the country." Of course, the two things can be made compatible in the short run—it is possible to enjoy a boom and to be overtaxed, at least for a spell. The combination of good luck that the Government has enjoyed coupled with the inflationary spending in which it has indulged has sustained the output of British industry and maintained overfull employment. But it has also put industrial adaptability, higher efficiency and the cutting of costs at a discount. Indeed, the argument that taxation is not excessive is itself belied in other passages of the Chancellor's speech where he recognises, belatedly and wisely, that the limits of taxable capacity have been reached and that revenue is already falling.

A Chancellor who sees these danger signals owes the country a much sterner duty than the kind of tightrope budgeting in which Sir Stafford indulged last Tuesday. The best that he can offer is the hope that the nation's output will increase to meet the automatic increase in the cost of the social services. " Even then," Sir Stafford admitted, " I have no doubt that the individual will want to retain a very considerable portion of that increase for his own spending." He will indeed ; in fact, all the signs suggest that he is already trying to anticipate the increase before it has been earned, by demanding higher wages. So long as the expenditure of the Government is regarded as untouchable and uncuttable, so long will the force of inflation and the fact of economic inflexibility prevail. The redistribution of incomes has reached its limit ; important sources of revenue show unmistakable signs of waning ; expenditure defies the Chancellor's mild efforts at restraint ; the whole of the nation's output and more is pledged. The only relief which is conceivable this year is an increase in output above present expectations. If this comes, the nation may succeed in stretching its economic and fiscal strait-jacket by an extra half inch to ease its cramped muscles. But these conditions cannot last much longer. It will be hardening of the arteries, not cramp, that will soon afflict the British economy. The Chancellor may claim to be satisfied by the precarious equilibrium which he hopes to maintain this year in the budget accounts. He should instead be looking for, and fighting for, a real reduction in Government spending. One of the most frightening things of our time is that he is quite prepared to let expenditure press up to the very limit of income and to promise, in advance, that any increase in what the nation earns can be used for social services. It is a recipe for ever-increasing Government expenditure, and for a permanent structure of high taxes with no hope of relief—a guarantee, in sum, of ultimate economic decay.

African Dilemma

IT has been known for some time that Dr Malan would seek to reopen negotiations with the British Government on the transfer to the Union of South Africa of the three British-administered Protectorates—Swaziland, Basutoland and Bechuanaland. The South Africa Act of 1909 foresaw the eventual incorporation of the territories in the Union, and between the wars negotiations were carried on between the two Governments to establish the conditions and methods of the transfer. The South Africans claim that a very great measure of agreement was reached in 1939 and both Government and Opposition are now anxious to secure the transfer of sovereignty which was clearly forecast in the Act of 1909.

The legal and practical justification for Dr Malan's initiative is, therefore, not in doubt. It is, nevertheless, a source of deep embarrassment to the British Government. Even if the issues raised by the proposed transfer were confined to South Africa, they would be troubled enough. It is true that incorporation of the three Protectorates would almost automatically turn them into native reserves within the Union and that conditions in existing South African reserves, such as the Transkei, compare favourably with conditions in the Protectorates. No doubt Dr Malan would guarantee at least equivalent privileges and safeguards. The difficulty lies rather with the climate of opinion not only in South Africa but in Africa at large.

In the last five years, two strong and contradictory currents have been flowing in Africa. The first is the growing demand of the African for the political rights to which western education has encouraged him to lay claim. In west Africa, the pace of constitutional advance has been remarkably rapid and even in colonies of mixed population such as Northern Rhodesia, the political representation of the African has advanced. The stirrings of pan-Africanism—the dream of " Africa for the Africans "—have been fostered by Communists and other political extremists, but even Africans who are not touched by such political fevers are more conscious of their rights. It may be that this mood is not generally to be found within the Protectorates with their traditional tribal life, but the case of Seretse Khama is a reminder of how speedily opinion can be inflamed.

At the same time, the policy of the foremost power in Africa—the Union of South Africa—has under Dr Malan's Government of Nationalists grown steadily more illiberal. The original reason for creating the Protectorates lay primarily in the natives' intense suspicion of the actions and intentions of the Boer republics. The prospect of transfer was clearly held to depend upon the development of more confident relations between white and black. The contrary, as is notorious, has come about. The official policy of the Nationalist Government is *apartheid* which should entail the total segregation of the two races ; yet full segregation is doubly impossible, first—as Dr Malan himself admits—because it is impracticable " with an economic system largely dependent upon native labour " ; secondly, because no redistribution of land in South Africa is conceivable that would create reserves adequate for 8,000,000 Africans while leaving the position and the privileges of the white South Africans intact. *Apartheid* has thus become not partition, which, however painful, may be said to be working itself out in India and Palestine, but slave status for the majority, who find themselves very largely barred from advancement in the mixed community in which they live and have no real community of their own in which to withdraw.

*

This, then, is the tragic dilemma in Africa today. Just as the African is beginning to grow decisively in political consciousness, the most explicit and vigorous exposition of " white " policy denies him those rights. However little the people of the Protectorates at this stage are concerned with opportunity and advancement—it must be admitted that tribal disciplines on the whole encourage the desire for neither—they will hardly support a move to transfer them to an authority which may irrevocably bar these things in the future. Moreover, any such transfer would exacerbate the troubled state of race relations throughout British Africa.

This is the factor that gives such delicacy to any contacts between the British and South African Governments. Willy-nilly, Dr Malan has become a symbol, a manifestation of racial conflict and oppression, and by being thus manifest, South African policy tends to crystallise extreme emotions and policies in other areas where problems similar to those confronting South Africa arise. It is not only a question of the exaspera-

tion of self-conscious African opinion. The white settlers, too, have their extreme wing and in recent years a tendency to support South African policy as the best protection for the tiny white enclaves in Africa against the surrounding black sea has become more apparent in Kenya, in the Rhodesias and in Tanganyika. The voice of fear speaks on both sides—the Africans' fear of living in perpetual oppression, the Europeans' fear of being swamped by the more backward masses all around.

This vicious spiral of fear and counter-fear must be broken if the history of Britain's association with Africa is not to end in disaster. What appears to be needed at this point is a firmer and more forthright lead from London. The Government has recently given the impression of fumbling and uncertainty in its African plans—an impression which the handling of the Seretse case has done nothing to diminish. The old sense of direction seems to be lost. As a result, liberal opinion in Africa is uncertain and divided. Its extent should not be underestimated. Such extremists as the European Electors' Union of Kenya are not typical. Nearly

all serious commentators in the central and east African colonies recognise the necessity of finding a *modus vivendi* with the African. Yet the European settlers are in some ways as uncertain of British intentions as the Africans themselves. If the African is beginning to question his own future chances of progress, the white settler wonders whether the transfer of political power in West Africa may not presage a similar transfer to the black majority in central and east Africa. Everywhere, corrosive suspicion is at work.

The declared purpose of British policy should be clear, even if its detailed application presents appalling difficulties. It is that the political future of colonies of mixed settlement shall not be determined on a racial basis. For the African such a declaration means that no barriers based upon the colour of his skin shall stand in the way of his economic, educational and constitutional advance, that *apartheid* is not and never will be the policy of the British Government, that citizenship in the fullest sense of the western tradition remains the British aim. Equally for the white, the declaration should lay down that no disabilities shall attach to him because of his race. He will not be turned out of his farm or his business, compelled after years of work to abandon his effort at colonisation and become an underprivileged member of an aggressively African community. Most important of all, perhaps, would be a statement of the rights and privileges which all races would enjoy as constitutional guarantees, placed for all time beyond the reach of a majority vote in parliament or assembly. In the drafting of such a bill of rights and responsibilities, the British Government would be well advised to call in the assistance of liberal opinion in Africa. A conference of moderate Europeans and Africans, able to work out jointly an acceptable programme—a Charter for Africa—would, as nothing else could, act as a counterweight to the spreading fear of acceptance of *apartheid*.

The implementation of some aspects of an agreed policy should not present too grave difficulties. The steady extension of economic and educational opportunities is well known to be the first demand of responsible opinion in the colonies. The Colonial Office has certainly attempted to shape its policies in that direction and the amount spent in the colonies upon the education and health of the African has increased very greatly in the last decade. It is true that an economic colour bar can still be found, notably in the Northern Rhodesian coppermines, where, although it is two years since the Dalgleish Commission recommended that skilled jobs should be open to the Africans, so far nothing has been done. A barrier like this can undo at a stroke the goodwill created by admirable work in other fields. The ending of the colour bar in industry would clearly be high on the reformers' list. But in this sphere of general economic advance, the limiting factor is all too likely to be shortage of capital. Firm guarantees of security for the future may encourage more European investment, but the need is to secure every possible assistance from the agencies of the United Nations, from the sections of the Economic Co-operation Administration dealing with colonial investment and from the officials administering funds under President Truman's Point Four. Even if the sums are not vast, they can help to keep a sense of momentum in colonial development and hold out the promise of possible progress to the African

Successful political development almost certainly depends upon the same sense of the possibility of progress. *Apartheid* is a political dead end for it leaves the African in permanent political frustration. The constitutional aim must, therefore, be to offer a definite line of political advance to the African and the incentive and the opportunity to qualify himself for political responsibility. A franchise based upon qualifications of property and literacy for both white and black has been proposed and deserves careful consideration. The safeguards offered by Second Chambers are also relevant, and, if constitutional guarantees of a precise kind are to be a means of allaying inter-racial suspicion, American experience with the safeguards presented by a Supreme Court is worth examination. Franchises no doubt must vary from region to region. Yet the underlying principle is the same—that capacity and responsibility, not race, shall finally determine the granting of political rights.

These issues carry the British Government far beyond the immediate problem of the Protectorates, yet they are in fact more urgent than Dr Malan's request that the matter should be reopened. Prolonged negotiations against the background of suspicion and fear prevailing in Africa will aggravate a grave situation at every turn. Only if the broad lines of British policy are firmly redrawn, liberal opinion in Africa mobilised and a joint declaration of policy achieved, can the question of the Protectorates be considered in a rational light.

Arms of Our Allies

THE first total estimate of the cost of giving western Europe the defences it needs is now staring planners in the face. Even for finance ministers hardened to the billion dollar reckonings of the European Recovery Programme, or for defence ministers who feel that they can depend on allies as never before, the figures are bound to be deeply disturbing. To split up the burden they represent according to the national incomes or the populations of the member nations of the North Atlantic and Brussels Pacts may break up and clarify the problem of how the bill is to be met, but it does not solve it. The trend of thinking among the poorer countries at the moment is clearly towards such a pooling of resources by common bookkeeping and such a standardisation of equipment and weapons between the Atlantic nations as would ensure, in the long run, the greatest possible efficiency and economy of resources in the use of men and supplies. But there is much fundamental political action and military thinking to be done before this can happen. Moreover, it is not the long run that the military planners are worried about; their first task is to provide western Europe with adequate defence forces quickly, and before the economies to which the grand alliance opens the way can possibly be achieved. They want risks taken and work done which ministers have to balance against the claims of economic recovery and —in some cases—of party politics.

EUROPE'S DEFENCE PROVISIONS—1948-49 FIGURES

In other words, the time has come in western Europe when no Finance Minister drawing up his budget, no Defence Minister calculating his estimates can lose sight of the fact that he will be judged not only by opinion in his own country but by his colleagues in allied countries. Indeed, such pressure has already begun to make itself felt. Among the Foreign, Defence and Finance Ministers who attended the Western Union meeting in Brussels last weekend, there was a good deal of plain speaking for and against the contributions made by individual governments, in which eagerness to defend what had already been done contended with anxiety to insist that no fresh expenditure was possible for the time being. In such a situation the British, without being complacent or arrogant, can hold their heads high. Not only does their policy of aiding and sharing with allies go back over four years, but the chief reason for the increase of £20 million in the British defence estimates for this year was London's readiness to provide western allies with jet aircraft and other equipment. This country has, indeed, given practical proof of its belief in a defence policy of "fair shares"; its senior staff officers and civil servants think steadily of defence in European terms, even if the terms are not precisely those that continental friends prescribe. And the time has come when it is fair and reasonable to ask what our allies are doing.

To answer this question in anything but the most rough-and-ready way is impossible. Although rough figures of expenditure, manpower, aircraft, and ships are available, their conversion into fighting power, formations, reserves and—above all—industrial war potential cannot be done, for obvious security reasons. Moreover, in the case of most of Britain's continental allies it has to be remembered that they were occupied for five years by the Germans, and that their armed forces and war industries have had to build up in most cases from scratch. With so little official information available, there are obvious risks of distortion and unfairness; but the attempt has to be made.

The first point that strikes the British observer is that military service everywhere is for one year against the British eighteen months. So far as can be judged, there is no serious intention to increase the period, even though an increase would do much to improve the technical efficiency and service of the conscript—notably in France. It will be argued, for instance in Holland, that facilities for longer training are not yet available; but the possibilities and value of para-military training do not seem to have been thought of, much less investigated.

The second point of contrast between conditions in this country and on the continent lies in the attitude of public opinion. The speeches of European ministers responsible for defence often give the impression that they expect—indeed fear—resistance to any appeal for a greater national effort in defence. In France, where resistance to all defence expenditure is automatic in the case of the Communists—the largest single party in the Chamber—this caution is understandable. In Holland it may be explained by weariness with an Indonesian war which, for most Dutchmen, is now regarded as a defeat. In Belgium there is no obvious explanation of this kind. In every country there has perhaps been a tendency, especially since the signing of the Atlantic Pact, to wait and see what the Americans will do. And

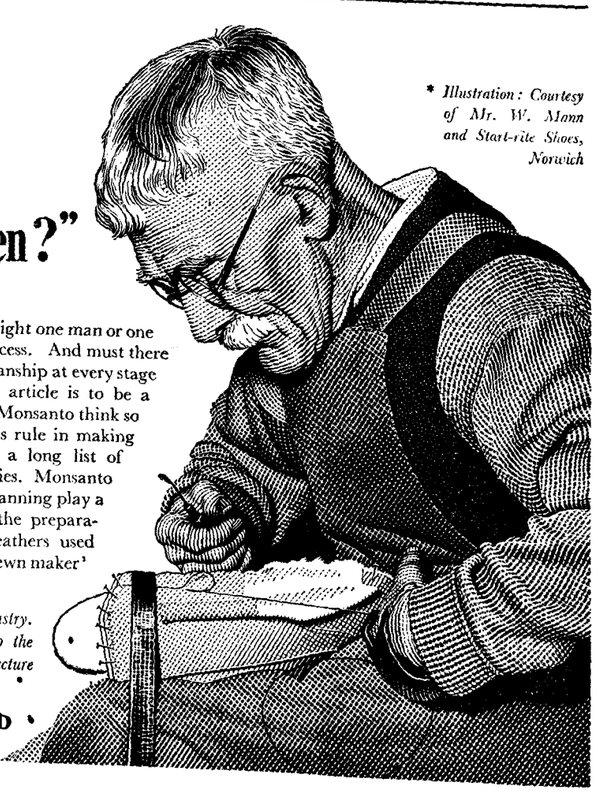
* Previous issues of *The Economist* have contained articles about defence policies of western European countries: Holland, January 14th; Norway, January 21st; Denmark, February 18th; Belgium, March 11th; France, April 1st.

before the Atlantic Pact was signed it was argued that it was useless for western Europe on its own to do anything. The time for such arguments has now passed; and what European public opinion has been unwilling to take from its own ministers it will now be asked to take from the Atlantic Council.

When it comes to a comparison of figures, the results are scarcely more reassuring for the British. It is true, as the accompanying table shows, that the percentage of government expenditure devoted to defence is higher in the case of Holland than in the case of Britain; but elsewhere there is a marked discrepancy. Here again it will be argued on the Continent that the British cannot claim that all their expenditure is in fact allocated to the defence of Europe; for their commitments outside Europe are extensive. The Belgians, for example, use this argument effectively against both the British and the French. "Admittedly," they say, "we spend 3.2 per cent of our national income against Britain's 7.6 per cent and Holland's 7.7 per cent; but all we spend is for Europe, whereas the British and the Dutch are, or have been, fighting abroad. As for the French they spend less than 5 per cent of their national income on defence and a quarter of that is swallowed up by Indo-China." Such arguments show, incidentally, the urgent need for some central political body to build up that broader European attitude which would see in the defence of the sterling area, its markets and its raw materials, a common western and not an exclusive British interest.

If conditions and plans in individual countries are examined it is difficult to resist the conclusion—with every risk of being unfair—that the most realistic and thorough appraisal of defence needs has been made in Norway, in extent one of the biggest, in manpower one of the weakest, of the allies. A six-year plan costing in all £135 million provides for an air force to keep the way clear for the arrival of allies, armoured units to defend airfields and vital ports, 120,000 local defence troops, twelve months' training for specialists, and nine months for soldiers, sailors and airmen. The policy, as in Denmark, is to hang on until help arrives. Clearly, the more thoroughly this is done the better for European defence; it will at least reduce the need to disperse troops along the enormous line from North Cape to Sicily. And if that is well done the ally will have done its uttermost. But it is as well to realise that no contribution of Scandinavian manpower to the main body of a west European army is likely.

If one turns to Belgium in search of this contribution one finds that there is one division in Germany below strength, a second to come (its mobilisation plans have been drawn up) and a third to be found this year if the budget provides the money. There is in addition a home defence force, with a gendarmerie of 10,000 as nucleus, and an anti-aircraft home guard of some 3,000 part-time officers and men. This year's contingent is said to be 74,000 strong, excluding NCOs, of which 42,000 are conscripts. Military service lasts a year and the period allotted for the training of reservists is quite obviously inadequate in modern conditions. A comforting element is a small but flourishing air force equipped with new British fighters.



In Holland it is unfair to judge the prospects until it can be seen more clearly what has been lost by the effort in Indonesia and what is to be gained by the return

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship'. But . . . have you ever stopped to ask yourself . . .

"Who are Britain's Craftsmen?"

Introducing Billy Mann. Fifty-three years a 'hand sewn maker'. He produces a special type of light fashion shoe for ladies. One of the reasons why Footwear ranks high as a special item in the Export List. *

But . . . does craftsmanship mean only handcraftsmanship? The production of the fine grade leather used by the 'hand sewn maker' is also the work of craftsmen . . . although one may be unable to spotlight one man or one part of the process. And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so and follow this rule in making chemicals for a long list of British industries. Monsanto chemicals for tanning play a vital part in the preparation of fine leathers used by the 'hand sewn maker'

* *Illustration: Courtesy of Mr. W. Mann and Start-rite Shoes, Norwich*

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture

of the 84,000 men who were there two years ago. It is said that these cannot be integrated with the home forces and that they will therefore have to go on the reserve without training. Here again, training is for one year only, with an annual draft of some 50,000 men. The most that the Dutch will promise is a "few divisions" by the end of 1952 or later; indeed the defence minister, introducing the defence estimates for this year, described the present military expenditure as "in the long run intolerable."

Clearly the major responsibility for manpower—as well as resources and production—falls within Europe on the French and the British. (What this means in terms of British expenditure and divisions has been discussed in recent issues of *The Economist*.) The contribution of French industry to war production is hidden to the layman. Eventually its capacity is likely to be considerable, but at the moment the equipment of the French army is virtually dependent on $300 million worth of deliveries from America between now and July. That army will consist—when the equipment has been distributed and men trained in its use—of five "ready" divisions (two armoured and three infantry) and of two divisions in the making, one airborne and the other consisting of mountain troops. One good authority in France believes that, given American aid, ten good divisions could be ready by 1952.

This rough and ready survey of the few facts that are available to the layman suggests three conclusions. First, the need for a special effort to implement Atlantic Pact plans has not—generally speaking—been grasped by public opinion in the European countries allied to Britain. War weariness, lack of political leadership and a vague desire to see the job done by one big body rather than by a few small nations have all played their part in this failure. Secondly, there is the fact that the dependence of the allies for equipment and arms on the Americans—and in the second place the British—will last for some years. The third point is most crucial of all: on present plans and performance there is no sign at all of western Europe being able to produce that main land force of thirty or more divisions which its plans demand. It has been argued in *The Economist* that the British contribution to that force must somehow be raised above the present figure of divisions available, at any rate until the military effort of the allies has increased. But if the doctrine of fair shares is to govern the effort of those who are combining to defend western Europe, then it is time for a more sustained and enthusiastic effort across the Channel.

NOTES OF THE WEEK

Budget and Politics

The budget, one Cabinet Minister is reported to have remarked, will mark the watershed of this session at Westminster. If the Government can cross it in safety, they will emerge into easy going for some months and the prospect of a summer election will recede. On Tuesday Sir Stafford Cripps negotiated with considerable skill the more tortuous bends leading to the crest. He produced a budget acceptable to most of his party, though there remains an undercurrent of anxiety within the Labour party, which was clearly voiced in the speech of a new member, Mr C. A. R. Crosland, that his failure to make substantial reliefs in favour of the lowest paid workers makes a new wave of wage demands inevitable. But one has only to contrast the relief with which Labour members heard of the tax changes on Tuesday with the shocked resentment with which they greeted last year's Budget to realise how much more closely Sir Stafford has conformed to their view of what a Chancellor ought to be. Labour MPs will be able to go back to their constituencies and point out that the housing cut has been restored, that food subsidies are to be kept in being at the present level, and that the Health Service is still a happy free-for-all.

The Tories for their part have found very little in the budget on which they could base an attempt to arouse the country against the Government, and so prepare the electoral climate for another general election. Indeed, though they are promising action on a number of points in the Finance Bill, and have castigated the whole principle of high Government expenditure, it is far from certain that their leaders are by any means agreed that it would be to their advantage to defeat the Government on a major issue, for instance a clause in the Finance Bill, at this stage. It is difficult to assess the exact strategy the Tories are following, because in the end more cautious policies may be swept aside by Mr Churchill's impatience or belligerency. It is to be hoped, however, that their planning will not be based on the fallacious view which some of them apparently hold that if the Labour Government were defeated, and Mr Attlee asked for a dissolution, the King would not necessarily have to grant this, but could call upon Mr Churchill to undertake the task of trying to secure Supply from the Commons. The action of Lord Byng of Vimy who did take this course in a similar situation in 1926 as Governor-General of Canada has been cited as a precedent favouring such action. It is, however, a thoroughly bad precedent, which has been condemned by most constitutional authorities and was condemned by the vote of the Canadian people themselves at the general election in late 1926. The principle that the King acts only on the advice of his ministers has been immensely strengthened since William IV last used the Royal Prerogative in this way; and if Mr Attlee, even though defeated in the House of Commons, advised a dissolution, it would appear that the King would be bound to take his advice.

* * *

Wage Restraint Now

If Sir Stafford has occasioned some anxiety within the Labour party, he has caused disappointment to those trades union leaders who are still loyal to the Government's policy of wage stabilisation, and who expected some large gesture in return for their continued co-operation in imposing restraint upon their members. It is true that they have some added weapons in their armoury—tax relief for the lower income groups, retaliatory action against Mr Lord, Sir John Black and other industrialists, and the retention of food subsidies at their present level—with which to meet their fellow travelling or merely intransigent colleagues, but the concessions to organised labour have not been great enough to affect the gradual dissolution of the "wage freeze." It is probable that the unions which have hitherto supported wage stabilisation will go on supporting it, those who oppose it will go on opposing it, and that Sir Stafford has done very little to affect the argument.

The Chancellor gave no indication in his budget speech that he has any idea of how a coherent policy for wages can be established. He gave a general warning:

If we try, by catch-as-catch-can methods to advance

anywhere and everywhere along the wage front we shall undoubtedly succeed in destroying full employment . . . through inflation.

But while expressing sympathy with the condition of the lowest paid workers he admitted the difficulty of advancing their earnings, without upsetting the relative balance of earnings, within each industry. He also made a statement which, if it means anything, would destroy any personal incentive to higher productivity and economic efficiency:

> We have not yet found the solution for this problem of how to get the increased earnings corresponding to the increased production into the right pockets so as to eliminate cases of personal incomes that are too low.

In other words Sir Stafford appears to favour a policy, though he does not yet know how to implement it, by which the lower paid workers who tend to contribute least to improved productivity should reap the rewards of improved efficiency on the part of their more highly skilled or efficient brethren.

On the wages front as it actually exists, the Railway Executive has refused for the fourth time within 18 months to make any concessions to those railwaymen whose basic wage rate is under £5 a week. It is expected that the claim will again go through the process of arbitration before drastic action is taken. It is possible that, for the sake of peace, the claim might eventually succeed, at least in part, although the behaviour of the National Union of Railwaymen has done much to prejudice their case. It is also possible that the dispute in the engineering industry may reach a peaceful settlement. The Confederation has been left in no doubt of the dangers of its proposed ballot on strike action or arbitration, and conversely the Minister of Labour has expressed his willingness to mediate in the dispute. If the union leaders can swallow their pride and their fear of their own rank and file, they may welcome agreed settlements.

* * *

Dockland Disturbances

The perennial trouble spot in industrial relations—the London docks—is again inflamed by two unrelated but equally irresponsible disputes. The outcome of a dispute over the opposition of the National Amalgamated Stevedores' and Dockers' Union to a proposed scheme for permanent employment was still unknown as *The Economist* went to press. But on Wednesday a lightning strike broke out and spread rapidly through the docks over the expulsion of three dockers from the Transport and General Workers' Union, for their part in last summer's dock strike. The body which has organised the strike is the unofficial Port Workers Committee which was responsible for the long duration and bitterness of last summer's dispute, and which is now making a renewed effort to spread the disaffection to other ports. Unlike almost every other industrial dispute, the recurring trouble in the docks is caused not by pressure for higher wages but by quarrels over jurisdiction and terms of employment. The present strike is aimed not at the employers, who are not even a party to the argument, but against the officials of the dockers' union. It is, however, a clear indication that there will be a recurrence of trouble in dockland as soon as the weather is sufficiently clement to enable the dockers to engage in strikes without personal discomfort. Unfortunately, there are no signs that the Government, the Dock Labour Board, or the Transport and General Workers Union have made any good use of the winter months to try—either by the introduction of a reorganised machinery of conciliation or by severer disciplinary measures—to reduce the likelihood that labour relations in the docks will be as disturbed this summer as in the last two summers.

The stevedores' dispute is based on the resentment of a craft union at an arrangement which threatens its prestige and power. The Shaw Savill and Albion Company has for some time been proposing to employ stevedores as part of their permanent staff on a weekly instead of a daily rate of pay, in the interests of better organisation, more stable labour relations and an increased sense of security for the workers. With no logical argument to support them, but spurred on by the prospect of a loss of power and identity, the stevedores' union has done everything to obstruct the launching of the scheme until the moment has come when the first ship on which the company are to try it out is actually lying off the Pool of London. The company propose to go ahead with the scheme unless the union is prepared to take the matter for settlement to the national joint council of the dock industry. It is more than possible that the stevedores' union will call a strike and thus link their dispute to the internal quarrels of the dockers.

* * *

Atlantic "High Council"?

For over two years the British Government has steadily suffered the embarrassment of appearing to "drag its feet" in the pursuit of European integration, while its colleagues in Europe showed every sign of being ready to tear down the track and its American friends hopefully and urgently waved the starting pistol. Yet the hesitations felt by the British have been neither ill-founded nor irresponsible. They fear on economic grounds a union of competitive industrial producers, all in deficit with an even more competitive industrial producer across the Atlantic. They have political fears of a closer European union which might weaken their links with the Dominions just as Communist pressure in the Far East grows more intense, and which might even—more ominously—encourage a recrudescence of isolationism in the United States. A frank question to the British Treasury or Foreign Office would no doubt prompt the reply, "The kind of 'integration' you press us to pursue in Europe will achieve the end of political instability, effectiveness in the cold war, balanced trade, multilateral exchanges, free currency and an expanding world economy only if the Americans are party to it. There can be no European defence—without America. There can be no positive solution of the dollar gap—without America. There can be no stable world market—without America. In fact, the whole waging of the cold war is inconceivable if the main aim of European and American diplomacy is to create conditions in which each can be independent of the other."

Obviously, however, to have made such an answer at any time in the last two years could have involved Britain in the gravest political misunderstanding. It would have laid the Government open to the charge of shuffling off its responsibilities, of passing the buck to Uncle Sam, of demanding unspecified new dollar subsidies on top of the advances already made. Nor would Britain's allies in Europe have been altogether loth to contrast their own willingness to act as good Europeans with the British "hankering for extra-European status."

There can, therefore, be nothing but the warmest welcome in this country for M. Bidault's call for the setting up of a Council of the Atlantic Pact governments to ensure the "integration" of western policies at the highest level. His bold speech will crystallise ideas and suggestions that have been forming in the last three months. Two pressures have no doubt brought the French Prime Minister to his present view: first, the realities of European defence which the continued consultations of recent months have unveiled; secondly, the growing Communist threat on non-European fronts. There is as little solution for Indo-China in a purely European setting as there is for, say, Britain's long-term relations with its Asiatic Dominions. So often in the past, the political and economic interests of Britain and France have seemed to diverge; here at last is an issue on which policies can be identical. The examination and consolidation of M. Bidault's proposal should be the first concern of the officials preparing for the Three Power meetings next month.

Leopold's Offer

The inconclusive outcome of the Belgian referendum—in which the vote for the King's return was only 57.6 per cent—had the result that many people feared and predicted at the time. The political crisis dragged on inconclusively and while statesmen attempted—without success—to form cabinets, opinion in the country became more violently and stubbornly divided between supporters and opponents of the King.

These repercussions seem at last to have had their impact on the King in his Swiss exile. When M. Van Zeeland's efforts to form an all-Catholic cabinet, designed to bring the King back unconditionally, failed last week, Leopold himself moved to end the deadlock. He broadcast to the Belgian people, declaring that the monarchy must be above party, appealing for national unity and offering to transfer his royal prerogatives temporarily to his son, provided Parliament brought the Regency to an end.

It was M. Spaak, the Socialist leader and firmest of the King's opponents, who first evolved the formula of a temporary transfer of powers to Prince Baudouin. The King, however, did not adopt the suggestion in its entirety and his modification unhappily leaves the door open for further political divisions and misunderstandings. M. Spaak had proposed that the temporary cession of powers should be brought to an end in the autumn of 1951 by the abdication of the King in favour of his son, who would by then have come of age. The King, however, speaks of bringing to an end the delegation of powers "with the consent of the Government at a moment which I deem commensurate with the interests of the country." There is thus a loophole in his offer for the repetition of the present crisis in which the King's desire to return to power is blocked by one political party and supported by another.

The general reaction to the King's offer is on the whole one of doubt. The Catholics are now divided between the extreme wing who wish for the King's immediate unconditional return and those who are ready to explore the compromise. The Socialists and the Liberals are anxious to clarify the more obscure aspects of the King's intentions. What is a time "commensurate with the interests of the country"? What precisely would "the consent of the Government" entail? A majority of one Catholic vote? A two-thirds majority? The consent of the three parties? It is difficult to believe that confidence can be genuinely restored until such queries are answered.

* * *

New Customers for China?

Official spokesmen in eastern Europe are always on the look-out for new ways of showing that their countries can get along perfectly well without western—and particularly American—cooperation. At present the Poles, the Czechs, and the east Germans are being told that Communist China can become a most valuable new trading partner. Its present difficulties are ignored and the country is portrayed as possessing all the essential conditions for the development of a sound and productive economy; it is said to possess "huge hidden resources of all known minerals." A Polish mission has already returned after concluding an interim agreement, and a recent official Polish statement held out "great hopes of further expansion" of trade with China.

On his return from Moscow last week Herr Handke, the east German Minister of Trade, said that he had held preliminary trade talks with Chinese representatives in Moscow, and that a German mission would shortly go to Peking to conclude an agreement. The east Germans are being told that Communist China, with its 15-year plan beginning next year, will provide a ready market for their machinery and technical equipment. It is also being hinted to the west Germans that, although the obstructive attitude of the western powers towards east-west trade at present prevents them, too, from enjoying the advantages of increased trade with China, the east Germans will in fact negotiate in Peking on behalf of all Germany.

How much reality is there in all this? Before the war, China played only an insignificant part in the foreign trade of Germany and eastern Europe. In 1929, in the case of both Poland and Czechoslovakia, imports from China comprised only 0.1 per cent of their total imports; throughout the 'thirties they hardly ever rose to more than 0.5 per cent. German imports from China represented 2.7 per cent of total imports in 1929, 2.4 per cent in 1935 and 3.3 per cent in 1938. The corresponding percentages of German exports to China are 1.4, 2.2, and 2.7. Even if the Chinese Communists are able and willing to do better than this and to buy whatever capital equipment Germany and eastern Europe are able to export, what can they offer in exchange? Before the war one of the most important of China's exports was oil seeds and vegetable oils; in 1932 these accounted for about 75 per cent of China's exports to Germany, and did, in fact, provide a considerable proportion of Germany's imports of oil seeds. But China has a long way to go before it again reaches its prewar production of oil seeds; and the same could be said of the other principal Chinese prewar exports—cotton, metals, bristles, and tea. In the case of bristles it appears that the Soviet Union is going to corner most of the Chinese supplies for re-export to Europe and the United States.

It is true that during the prewar years China was continuously at war; but conditions can hardly be called tranquil now, and the amount of reconstruction that must be undertaken is colossal. China may eventually become an important market for Germany and eastern Europe, which may benefit from the trade that used to go to the western Powers. But unless these countries are prepared to advance large long-term credits they will have to be content with only modest exchanges for some time to come.

Mr Evans and the Farmers

Last weekend the public was treated to the novel spectacle of a newly appointed junior minister deliberately and cheerfully talking himself out of a job. Shortly after his appointment as a Parliamentary Secretary to the Ministry of Food, Mr Stanley Evans startled his colleagues by asserting in public that care must be taken to prevent a situation in which "consumers become the milch cow to be milked irrevocably and continuously by our friends of the countryside." This led to a protest from the National Farmers' Union which was only stilled by the use of all the considerable diplomatic qualities of Mr Evans's Minister, Mr Maurice Webb. Last week, Mr Evans deliberately returned to the charge by asking at a press conference a series of provocative questions (which had they been couched in Latin would have been prefaced by *nonne*) "Can the British farmer's present privileged position be maintained? Do high subsidies conceal a good deal of inertia and inefficiency? The British taxpayer has not a bottomless purse out of which he can subsidise the industry." Within forty-eight hours he was out of office.

Mr Evans had committed two major offences. In the first place he had criticised the policy of his senior colleagues, and had therefore no option but to resign. It is possible that his appointment to the Ministry of Food had been made with the hope that he might prove a useful critic of established policies and practices in the administration of the food and farming subsidies, and that the evidence which confronted him when he had access to the files burst his never very strong barrier of reticence. If that is so, Mr Evans would have been in a stronger position if he had resigned first and made his

criticisms afterwards, rather than transgress an accepted rule of the constitution. But his political sin was far more heinous. Every query and most of the statements which he made about the dangers of the Government's present farming policy were to the point and have been made time and again in *The Economist*. But to apply the unfashionable criterion of economic efficiency to farming, and to question the lavish methods of exacting a high output from agriculture at a time when the Labour party is attempting by every means to increase its strength in the rural areas, is a sin which will not be lightly forgiven.

In spite of the promptness of the Government's action to efface the impression of Mr Evans's words, the farming community may well begin to suspect that the Labour party —as distinct from the Government—is beginning to waver in its support of the present agricultural policy. This is a reasonable suspicion. It can be argued that the cost of living is almost certain to be the dominant issue at the next election, and that the entire support of the rural areas will count for nothing as against a wave of disillusion and resentment among Labour voters in the urban areas. The subsidies can no longer cushion the full shock of rising prices. Henceforth, as recent events have shown, any increase in the prices paid to British farmers will mean higher food prices in the shops, and Labour members who can view the tribulations of the taxpayer with dry eyes, feel a lively anxiety at a prospect of a rise in the cost of living of their urban constituents. Mr Evans may find more supporters on the back benches than his leaders have reckoned ; but, unfortunately, if the question of farming costs is discussed in the context of election strategy, farmers are likely to be treated merely as scapegoats for the troubles of the urban consumer, and the emphasis on the need to find the basis for an efficient and economic policy for agriculture, so trenchantly expressed by Mr Evans, will be overlooked.

* * *

A New Rent Policy

The Government's housing policy is faced with a permanent dilemma—on the one hand how to bring down housing costs and on the other how to raise controlled rents in a way that is equitable to both landlord and tenant. For the solution of the second difficulty Professor F. W. Paish has some interesting suggestions to make in an article in *Lloyds Bank Review* for April. Starting with a vigorous attack on the injustices to both landlords and tenants which have resulted from the continuance of the Rent Restriction Acts he goes on to discuss the economic disadvantages of the present policy. He makes the familiar point that the present level of controlled rents first involves the deterioration of houses since landlords cannot afford to maintain them adequately ; and secondly that it adds to the immobility of labour by making tenants unwilling to move from controlled to uncontrolled premises. But he goes on to make an interesting diagnosis of the causes of the extreme pressure on local authority housing, on furnished accommodation and on houses for sale. He estimates that some 8,500,000 out of a total of 13 million houses are rent controlled and that their rents in terms of real income are about half what they were in 1939. These artificially low rents encourage an uneconomical use of house room since tenants can afford to underoccupy their houses and have no incentive to see them fully occupied by sub-letting. This pushes up the demand for the 4,500,000 other houses.

By way of remedy Professor Paish elaborates and develops a scheme first put forward by Mr Harrod. This is to sweep away the whole ganglion of the Rent Restriction Acts and to allow rents to rise to their full market value. Of the increased return, say, 25 per cent would go to the landlord to cover the increased cost of repairs ; the remaining 75 per cent would go to the Exchequer by way of taxation and would be redistributed in compensation for higher rents to those most in need in the form of larger family allowances, old-age pensions and reduced taxation. Since owner-occupiers would benefit from the increased allowances and tax concessions he suggests that they should also contribute as a class sufficient to cover their collective benefits. Assuming an average rise in controlled rents of 10s. a week and an average contribution by owner-occupiers of 7s. 6d. a week, about £55 million more a year would come into the hands of private landlords and about £280 million a year would accrue to the Treasury for redistribution.

The economic advantages of such a scheme are obvious but it would be immensely difficult to get it accepted by the Government. Acceptance would involve abandoning the concept of a general control operated for the benefit of those who are vaguely classified as "workers," in favour of an accurate apportionment of financial assistance to those who really need it, the lower paid workers, families with children and old people. Since the Government has so far refused to consider need as the basis of assistance in the matter of food subsidies, or the National Health Service, it is unlikely to give way in the matter of rents.

* * *

Periodicals and Waste Paper

A dispute arising over "sale or return"—the system of newspaper and periodical distribution, discontinued during the war, whereby newsagents can return and get credit for copies which they cannot sell—has led to the resignation of Hulton Press Ltd. from the Periodical Proprietors' Association. The points at issue were, first, whether a new periodical could be launched successfully without permitting sale or return for a limited initial period ; and secondly, if sale or return were thought to be essential, whether it ought to be undertaken in the present precarious state of paper supplies, since newsagents will order far more generously if they do not have to take the financial risk of having unsold copies left on their hands. The PPA's view is that it should be perfectly possible to start a new periodical without sale or return, but that if it is not, then the periodical should not be started at all—the overriding factor being the shortage of paper. To this Hulton Press have replied, first, that although there may be other ways of launching a periodical, sale or return for a short period is the quickest and most economical ; secondly, that sale or return is merely one of the many ways in which a publisher can use extra paper and that it is no more wasteful than, for example, increasing the number of pages of a periodical or adding to the substance of the paper used—both of which are regarded as legitimate by the PPA. To strengthen their case Hulton Press have undertaken not to use more paper between March and June than they did during the last period before rationing was removed.

If the PPA had been concerned mainly with conserving paper, Hulton's undertaking on consumption would seem to destroy its case. But since this argument seems to have been entirely ignored, it becomes a little difficult to avoid the impression that the PPA's real concern is with maintaining, not paper supplies, but the *status quo* in publishing practice ; for what it is trying to control is not the amount of paper used, but the way in which it is used.

If paper should again become really scarce, then rationing would have to be reimposed, and for this reason no publisher wishes to see paper squandered now. Nor is there any desire among publishers to revert to the wasteful and inefficient methods that were associated with the selling of periodicals before the war. But equally the present restrictive covenants imposed by the PPA prevent the growth of a properly competitive spirit and certainly hamper the launching of many worthy publishing ventures. British periodical publishers and wholesalers might well study the methods of their American counterparts who, by

using accurate and detailed market research, are able to sell a very large volume of periodicals without recourse to unlimited "sale or return." If the PPA really wishes to promote the health of the periodical publishing trade, it should pursue with greater vigour and on a larger scale the tentative experiments which it has so far made in this direction. Simply to condemn the use of "sale or return" is not enough.

* * *

Europe's Coal Surplus

European coal producers face a novel type of postwar problem—what appears to be the biggest surplus of coal and coke since the early thirties. In the present quarter they are estimated by the coal committee of the Economic Commission for Europe to have more than three million tons of exportable coal and coke of which they cannot dispose, either through ordinary bilateral trade agreements or within the allocations made by the committee. Of this total, 1,800,000 tons will be in France, including the Saar, 1,100,000 tons in Belgium, and the remainder in western Germany and Britain.

At the same time seven countries need a total of 661,000 tons of fuel, which they declare they cannot obtain from European sources either because qualities are wrong or because of payments difficulties. The Italians, for instance, have a deficit of 275,000 tons of steam coal ; but they cannot buy any of the 866,000 tons of surplus Belgian steam coal because they lack hard currency. They refuse to avail themselves of the French surplus of 332,000 tons because they object to its quality ; Italian engine-drivers are said to complain that they are nearly asphyxiated by the fumes of French coal. Only about a third of this declared surplus of 661,000 tons is in fact "absolute" in the sense that there is a real shortage of certain special types of coal and coke. But the French, who are both importers and exporters of coal, are sufficiently concerned to be thinking of reducing their imports from both Germany and Britain.

An unexpected decline in consumption is partly responsible for the sudden coal surplus. In France, where the amount of coal available for export has risen from 230,000 tons during the first quarter of the year to 2,054,000 during the second, the internal sales of coal for domestic heating have been between one and two million tons less than during a normal winter. Heavy rains have greatly increased the supply of hydro-electric power and led to a corresponding decline in the amount of coal consumed in thermal power plants.

Yet, even if the present coal surplus is partly due to exceptional circumstances, there is no doubt that the European producers' postwar policy of concentrating above all on getting high prices will continue to force importers to cut their imports to a minimum, and will stimulate the substitution of other types of fuel. Belgium's export difficulties are due not only to the hardness of its currency but also to its high prices—even after a recent drop. Already Switzerland has substituted oil for coal on a large scale and, as the plans for developing refining in Europe get under way, the competitive threat of oil will grow more serious. In short, the present coal surplus in Europe, although partly due to seasonal factors, should be a warning that expanded production will not lead to expanded sales unless producers bring their prices down as part of a campaign to stop the present tendency to use other forms of fuel.

Curtain Raiser for Torquay

The fourth session of the contracting parties to the General Agreement on Tariffs and Trade (GATT), which

Comfort first and fast . . .

to Germany

KLM now offers you a quick and convenient travel route to Germany by air. Fast, frequent services operate (via Amsterdam) from London, Manchester, Glasgow and Dublin to

Hamburg Dusseldorf Frankfurt Nuremburg Munich

Enquiries and Reservations from all Air Travel Agents, or from KLM Royal Dutch Airlines, 202/4, Sloane St., S.W.1 (Tel. KEN. 8111) and at Manchester, Glasgow and Dublin.

KLM ROYAL DUTCH AIRLINES

Our inns are a part of our heritage.

They are what our forefathers made them—

centres of social life where a man may take his ease,

meet his friends and discuss the topics of the day.

Long may our inns stay that way.

beer is best

Issued by the Brewers' Society, 42 Portman Square, W.1

ended a six-week session at Geneva early this month, was mainly a preparatory meeting for the tariff cutting conference to open at Torquay on September 28th. The negotiations at Torquay are expected to be on an even larger scale than those conducted in the two previous rounds at Geneva and Annecy.

The most unwieldy question facing the delegates in Geneva was the growing evidence that international trade shows little sign of returning to "normal." It has, in fact, been moving in the opposite direction. Some countries, Italy and France for example, after "liberalising" their trade by reducing quantitative restrictions, have replaced these measures by tariff duties that in certain cases stifle trade even more effectively than before.

An even greater curb to the freedom of international trade, the delegates found, is the large increase in import restrictions, which have to a great extent nullified the effect of tariff concessions. The number of countries applying such restrictions has swelled until all but nine out of 86 nations now require import licences or exchange permits. Most of these restrictions have been applied for balance of payments reasons permitted under the General Agreement; but in some instances their object has been to protect home industries. This form of discrimination was studied at Geneva and will no doubt be included in the general review of quantitative restrictions that has been postponed until the Torquay meeting. Another point of contention, put off until the autumn conference, is the American insistence that Japan be granted most favoured nation treatment by the contracting parties.

One of the most important concrete actions taken at the Geneva session was the agreement to a British proposal that the life of the International Trade Organisation (ITO) and GATT be prolonged for another three years. In other words, all tariff concessions made so far and also those to be negotiated at Torquay will remain binding until 1954. Another step forward was the admission to GATT of western Germany and Indonesia.

What has worried some of the delegates most of all is the failure of the US Congress to ratify the Charter of the ITO. The American Administration has promised that it will be considered at the present session of Congress, but some observers are gloomy about its prospects in an election year. Perhaps the pessimists will take some encouragement from the State Department's announcement last week that at Torquay it intends to take the very practical step of trying to lower tariffs on about 2,500 items.

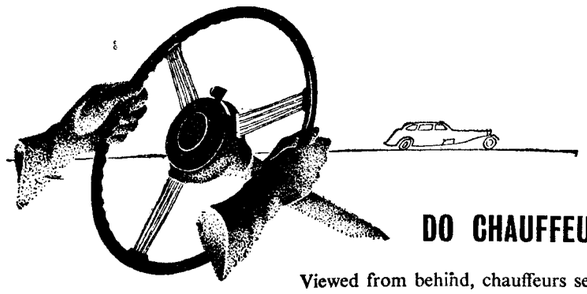
* * *

Arab League into Arab Menace

Once again the Arab League has papered over the cracks in its fabric and even its best friends are being forced to the conclusion that this is virtually all that it is good for. At its twelfth meeting it has produced a resounding security pact and some unanimous resolutions; but, on examination, none amounts to more than whitewash for fundamental disagreements. Jordan, which has been freely named the nigger in the woodpile, is by no means the sole source of these. For instance, a provision forbidding military alliances between any two League members is clearly aimed at Syria and Iraq. Similarly, the collective security pact, when setting up a "permanent military staff committee for making joint defence plans," turns a deaf ear to the opinion of which Egyptian generals make no secret, that they cannot and will not discuss military matters with the Iraqi army. Another article of the pact binds contracting states not to conclude "any international agreement which shall contradict this treaty, and not to adopt an attitude—in its international relations—toward other states which would be inconsistent with this treaty." For the moment this clause is obviously directed against possible Jordanian flirtations with Israel, and some people are glad of its implication *vis-à-vis* Soviet Russia. During the meeting the Syrian Minister of National Economy made to an Egyptian newspaper the statement that "if America continues to bring pressure on the Arab states to adopt a policy that would only result in Judaizing the Arab people . . . there will be only two courses open to the Arab world; either to sign a non-aggression pact with Soviet Russia or to be eradicated as they were in Palestine." Undoubtedly the clause would serve against anybody's pact with Russia, but it could equally well serve to quash any new treaty which an Arab state might want to make with a western power, such as Britain.

What purpose does such a meeting serve? Arabs are prone to do their thinking in compartments and to see no inconsistency in proclaiming one view and acting on another. Individually, they stand a chance of acting thoughtfully and with common sense. Collectively, they seem to be at the mercy of any one irresponsible member who—himself unaffected by the consequences of his oratory—may set all his colleagues off on a tack that does some of them incalculable harm. An example of this process is the way in which Egypt and Saudi Arabia, whose total trade is little affected by the volume of their trade with Israel, are pushing a boycott that harms Israel little but spells economic disaster for Lebanon and Jordan. Indeed, upon recent showing the League has become a menace to certain of its individual members. Its friends do wrong to boost it with praise of its solidarity, as Mr Bevin did in a recent debate in the House of Commons. The time to praise it will only come when—if ever that day dawns—it stops looking backwards over its shoulder at old feuds, and situations that are out of date, and turns its head to see what is best for the future of its needy peoples.

* * *



Capital Punishment in Scotland

The evidence heard in Scotland by the Royal Commission on Capital Punishment was much more interesting and important than might be expected from the small space allotted to it in the English press. There are fundamental differences between Scottish and English practice in murder trials, and it is difficult not to agree with the opinion expressed by the Muir Society that

> where murder is concerned the law in Scotland is more advanced, juster and more humane than it is in England.

Quite apart from the difference in procedure, which, the Muir Society claims, enables a jury in a murder trial to be far less prejudiced than it is in England, Scots law is flexible enough to allow far greater discrimination in each particular case. This does not mean that the trial judge is given a discretion in the sentence to be imposed; in Scotland, no less than in England, the death sentence is automatic once a verdict of guilty of murder has been brought in. What Scots law does allow is a verdict of culpable homicide instead of murder, which carries with it a sentence of imprisonment instead of the death penalty.

This power to reduce the crime to one of culpable homicide is not, it should be pointed out, the result of any attempt to define statutorily degrees of murder. The jury are directed and give their verdict, according to the facts and circumstances of each particular case. One circumstance which allows the reduction of the crime is provocation—including provocation which would not be considered strong enough to reduce the crime to manslaughter in the English courts. Another is the modern interpretation of the McNaghten Rules, which has been discussed before in *The Economist*. Between those who are legally sane and responsible for their criminal actions and those who are legally insane and irresponsible, Scots law now recognises a third class whose responsibility is diminished owing to their mental disability.

DO CHAUFFEURS TALK T.I.?

Viewed from behind, chauffeurs seem taciturn. Seen from the side they prove to know a lot — which is why many passengers prefer the front seat. And talking to chauffeurs takes you straight to TI, since there's hardly a car on the road today which could do without its TI components. Some of these, like the axles and the steering column, are merely vital. Some, like bumpers, tubular seats or windscreen frames, are decidedly convenient. Some, like special enamels and fittings, make all the difference to looks . . . (Chauffeurs know a lot about traffic signs, too. So do TI. They make most of them.)

The letters TI mean Tube Investments Limited, of The Adelphi, London, W.C.2 (Temple Bar 0271). They also stand for the thirty producing companies of the co-ordinated TI group, makers of precision tubes, of bicycles and components, of wrought aluminium alloys, electrical appliances, pressure vessels, paints, road signs, metal furniture . . . and essential mechanical parts for a thousand and one things which everybody uses.

TI THE SURNAME OF A THOUSAND THINGS

British Airmanship

SOMETHING TO BE PROUD OF

The past 30 years have seen not only the development of British airlines from the first London-Paris service to a vast network covering nearly 70 countries, but also the steady maturing of something beyond machines and scientific progress. Throughout Britain and the world this has come to be known as British Airmanship and already it has earned a significance comparable with that which traditionally attaches to British Seamanship.

British Airmanship sums up the reputation for skill, enterprise and reliability which in just over a generation of air travel has become inseparably associated with British airmen — something, indeed, to be proud of.

FLY BRITISH

ISSUED BY BRITISH OVERSEAS AIRWAYS CORPORATION AND BRITISH EUROPEAN AIRWAYS

Unequalled in strength, durability and performance, the 'Fort' is the culmination of unrivalled experience in tyre manufacture.

DUNLOP 'FORT'

In a Class by Itself

50H/104

The effects of Scottish practice can be seen in the following statistics of crimes and sentences:—

	Indictments for Murder	Verdicts				
		Found Insane	Culpable Homicide	Murder	Other, incl. Not Guilty and Not Proven	Execution Carried Out
1919	18	-	8	3	4	1
1920	15	2	6	2	5	2
1921	25	2	5	-	18	-
1922	20	1	7	2	10	-
1923	11	2	3	3	3	3
1924	11	4	3	1	3	-
1925	10	3	3	1	3	1
1926	10	1	4	-	5	-
1927	14	5	4	1	4	-
1928	17	6	2	3	6	2
1929	9	5	2	1	1	-
1930	10	5	1	-	4	-
1931	6	3	2	-	1	-
1932	6	1	1	4	-	-
1933	5	1	2	1	1	-
1934	20	7	4	1	8	-
1935	8	2	3	1	2	-
1936	16	5	9	-	2	-
1937	9	6	2	-	1	-
1938	9	5	4	-	-	-
1939	8	3	3	-	2	-
1940	7	2	3	-	2	-
1941	11	2	4	-	5	-
1942	10	3	5	-	2	-
1943	6	4	2	-	-	-
1944	7	1	3	3	-	-
1945	19	4	7	4	4	1
1946	22	5	7	6	4	1
1947	8	3	2	1	2	-
1948	8	1	3	3	1	1

It is clear from these figures, first, that Scottish juries are reluctant to convict for murder if there is a possibility of a lesser verdict and, secondly, that the death sentence is reluctantly carried out. From 1929 to 1944 Scotland had, in fact, an experimental period of abolishing capital punishment, and the effect on indictments for murder can be seen from the first column. An outbreak of gang warfare in Glasgow at the end of the war led to murders and was met by the resumption of executions. This, according to the Scottish police, shows the value of the death penalty for dealing with the gangster murderer—though it is arguable that it would have been more constructive to have prevented such crimes, which could have been expected, from breaking out. What is certain is that, in the light of the Scottish evidence and statistics, many executions that have taken place in England were senseless and unnecessary.

* * *

Absenteeism Among Shock Workers

Revealing evidence about the effect on workers of the Stakhanovite, or shock-worker, system has been inadvertently provided by the Polish Government's drastic measures and propaganda against absenteeism. A bill has been introduced under which any worker who stays away from work for more than four days a year without proper justification is liable to varying degrees of punishment, including reductions of wages between 10 and 25 per cent. At the same time, owing to the alarming proportion of workers going on sick leave, special committees with arbitrary powers are visiting the surgeries of medical officers in the industrial areas of Poland to ascertain whether patients have good reason to apply for sick leave and the doctors to grant it.

Writing on the situation in the official *Trybuna Ludu* of April 12th, Dr. I. T. Wolanski states that it has been noticed that many of the doctors' waiting rooms, in Silesia particularly, are suddenly deserted by their patients on the appearance of the official investigators. He reveals also that 11 million persons entitled to free health benefits (enjoyed only by workers and state officials) paid 70 million visits to doctors in 1947, 20 million of which involved hospital and surgical treatment.

What is more, Dr. Wolanski states that in January, 1950, the Government had to pay sick relief benefits amounting to 51 days for every 100 insured workers; whereas in 1949 the rate was 50 days and in 1947 42 days per 100. This alarming increase reached in February the figure of 59.9 days per 100 workers. In Silesia, it is disclosed, the average worker is absenting himself on grounds of sickness for more than 12 days a year.

This abnormal rise in absenteeism among Polish industrial workers—whether due to genuine illness or not—coincides with the Government's intensive drive to enforce the Stakhanovite and other pressure systems for increased output. Throughout similar production drives in the Soviet Union, the authorities have always carefully avoided publishing any data which might indicate resistance by the workers or an adverse effect on their health. It is clear, therefore, that only grim necessity has compelled the Beirut regime to resort to publicity in order to appeal to workers' consciences. The Polish Minister of Light Industries, Mr Stawinski, has explained that the bill, and its punitive measures against absentees, are necessary because the state is suffering losses amounting to "billions of zlotys each year."

Dr. Wolanski virtually accuses doctors of aiding and abetting absenteeism through what he calls "their destructive liberalism" and of taking "a light-hearted view of the question of labour discipline," which is "disorganising production." He points out that absenteeism increases notably in the spring, when workers are anxious to put in time digging their allotments. The new bill means that the Polish worker will have to submit to even greater regimentation than before. It remains to be seen whether his remarkable resistance to the introduction of Soviet methods will prevail over the Communists' determination to get higher production.

Uncle Leopold

If "words be the counters of wise men and the money of fools," the politicians of the continent seem to belong to the latter class. They are the dupes of words, and believe such pleasing sounds as Constitutionalism and Liberalism to be *real* actual freedom and genuine humanity. . . . We regret that the liberal party of Belgium are not sensible of these truths, and have engaged in a plan to subvert the existing scheme of communal and other schools in that country because favoured by priesthood. It is well known . . . that there was a severe contest betwixt the Government of the Netherlands and the priesthood of Belgium on the subject of education before 1830; and the revolution was then promoted, not to say caused, by the attempts of the Government to remodel the education of the country in spite both of the people and the priesthood. The present Government, at least the Sovereign of Belgium, faithful to the principle that placed him on the throne, has ever since his accession acted very much in accordance with the wishes of his people. He has respected their communal and municipal rights, of which they have ever been proud, and they in turn have respected his power. In the midst of disturbance Belgium has remained quiet. The efforts made to agitate her have recoiled on the agitators. She has been prosperous, and the people have been contented. Between the Sovereign and the community a harmony of feeling—a mutual deference to their respective views and interests—has grown up, and his throne remained unshaken when revolt was all around him. His rule has been the reverse of rigid, and it is impossible to imagine a better testimony to its merits than the contentment and prosperity of the people. At present, however, his Ministers, not understanding the principles of government so well as Leopold, are promoting, in the name of liberalism, a scheme which is exciting the discontent of the people, and . . . may endanger the peace of the State.

Graduates in Employment

It seems that the welfare state and a "planned" economy have bred an insatiable appetite for those with degrees in economics. Out of 183 vacancies notified to the Oxford Appointments Committee* 84 per cent were from the civil service or semi-governmental agencies. The fact that only seven of these vacancies were filled by Oxford candidates reflects the insistence of employers on a training in statistics; this is not emphasised at Oxford to the same degree as at Cambridge and the other universities.

The vacancies for arts graduates in industry and commerce increased by 18 per cent over 1948. It is difficult to draw any conclusions from this figure since the employment prospects of arts graduates from Oxford and Cambridge are fairly good in large firms compared with those graduates from the provincial universities. But the opposite may well be true of small firms, who would look more to their local universities. It is still, however, the case that medium and small-sized firms, where lie the big new fields of the employment of graduates, have not yet overcome the practical difficulty of absorbing inexperienced young graduates and giving them the initial introductory training. Even with these reservations an increase of 18 per cent in demand is encouraging.

The most specific information given by the report relates to employment in teaching, a subject to which the committee directed special attention. The findings are disturbing enough on the arts side. In science and mathematics they are alarming. Out of 897 men taking their finals in mathematics, physics, chemistry, biology and engineering between 1945 and 1949 only 49 became schoolmasters, and of these seven or eight have since left teaching. The quality of these men is even more to be deplored. In 1949 five young mathematicians took up teaching: one had taken a second class degree, one a third, one had honours in the shortened school, two had pass degrees. In physics six new graduates took school posts—four had thirds, two had fourths. Three chemists, all with seconds, went into schoolmastering and no biologists went at all. It is small wonder that the schools are being forced to drop some of these subjects from their curriculum, and to lower the standard of teaching in those that they retain.

* * *

Exploited Daughters?

The Easter conferences have, besides their more weighty merits, that of serving as fruitful hunting grounds for amateurs of absurdity. The conference of the National Union of Women Teachers undoubtedly provides this year's gem. Its brightest facet must be credited to Miss E. M. Hamlyn, whose onslaught on the medical profession, for granting certificates authorising the daughter of an ailing mother to remain at home to help in her "pernickety and imaginary illness," was of considerable psychological interest; but she had worthy support from those other delegates who attacked the "unhelpful" magistrates—"kindly old men" who had the impertinence to question the absolute priority of school over home—demanded female school attendance officers who would "go into the homes" (with or without search warrants?) and "get these girls back to school," or deplored any attempt to relate technical training for girls to the home as "just another aspect of the back-to-the-sink movement."

What sort of notion, on this evidence, does the unmarried woman teacher build up for herself of the world as it is, life as it is lived, and the future place of their charges in both? Many a professional woman today, educated with all those privileges of complete domestic irresponsibility which the conference's delegates claim for the exploited "little mother," wishes bitterly that her training had been a little more "home-centred," and resolves that her daughter shall be otherwise equipped to face reality. Such an attitude is perfectly compatible with the view that a proper home-help service for the mother handicapped by illness, crippled by accident, or convalescent from childbirth, offers a better solution for all concerned than does the binding of burdens on the shoulders of schoolchildren. (But who, among pupils formed by these crusading anti-domestics, is going to embrace the career of home help?) Nor need one condone that selfishness and irresponsibility which undoubtedly does account for a proportion of poor attendance records at school. But the schoolteachers' claim to be judges in their own cause, their arrogant dismissal of whatever medical or legal opinion is not subservient to their own, and their simmering animus against home, parents, and (in several contexts) the male sex, make up a scarcely less unpleasant picture than does the callousness of the problem parent.

* Annual Report of the Oxford University Appointments Committee for 1949.

Shorter Note

The decision of Lord Reading and Lord Rennell to withdraw from the Liberal Party in the House of Lords and to apply for the Conservative Whip was not unexpected. For some time before the election it was clear that they were not in sympathy for the strategy of the Liberal Party—in particular with the policy of putting up a large number of candidates. Lord Rennell has always spoken more as an independent than as a member of the Liberal Party; but Lord Reading has taken an active part in Liberal Party politics and was the instigator of an abortive Bill to provide new safeguards for the liberty of the subject which was one of the Liberal Party's most important contributions to the postwar debates. Their resignation will seriously weaken the Liberal Party in the House of Lords at a time when many Liberals were beginning to feel that it was in that chamber that Liberal policies could be most effectively advocated.

Letters to the Editor

Parliament and the Consumer

SIR,—Mr Herbert Morrison, speaking to housewives, is quoted in the *Daily Herald* of April 18th as follows:—

> We want the voice of the consumer to be effectively heard. So please use the machinery set up to push your grumbles home. If you think that the consultative committees are ineffective write to your MP about it.

This, surely, represents a change of policy, and one of public interest and great importance. Clearly if Mr Morrison intends the Member of Parliament to be a higher court of appeal from the consultative councils, then:—

1. The consultative councils are shown to be, in constitutional theory, the nonentities which they have so far proved to have been in practice.

2. "Matters of day-to-day management" (which are inevitably matters of policy to the people in the locality) must inevitably come within the ambit of Parliament.

On the first point, the consultative council could never have functioned as an acceptable forum for the effective protection of the consumer. However good the selection of members of the council, the body as such was bound to fail on the fundamental count that the protection could not even appear effective. It clearly has had neither the necessary power nor the local prestige to stand up to these vast new monopolies. As Member for Bath I have no standing or powers based on the sections of the relevant Act, and I have, therefore, no constitutional means to afford protection for the consumer against the monopolist, but at least I am in close touch with those who pay for gas in Bath—closer than a body of 24 members meeting at Taunton which has to cover the whole of the area from Worcestershire to Cornwall, and from Hampshire to Herefordshire. Moreover, the powers under the Act of even that body are virtually non-existent, and any prestige they may hope to attain has certainly not yet been developed.

On the second point, when the population of any "Eatanswill" wants electricity, gas, or a better train service from the monopoly, the issue to them is one of policy as to price, or as to priority, or both. Clearly they are a local community much smaller and more cohesive than the "Area" set up under the Act, and they look to their member for such matters of policy. Now the member for Eatanswill has, under present circumstances, no responsibility for the financial soundness of the monopoly, and he will be subjectively on the side of his local community.

This consideration must lead to the conclusion that if the Member of Parliament is in future to be the higher court of appeal from a consultative council, then we need to think out a machinery by which that higher court of appeal can exercise its function in the objective atmosphere and with the objective procedure of the House of Commons, rather than in the inflaming atmosphere of the constituency. Moreover, the members of such higher court of appeal must reconcile the responsibility for distributing the fruits of extended services and of lower prices with its opposite responsibility—that for making ends meet "one year with another."

It may be that the atmosphere and procedure of Parliament, which has worked successfully in the case of the Post Office, cannot be satisfactory also for these other national monopolies—although no such evidence has yet been adduced. If so, surely there is a case for developing some new procedure whereby Members of Parliament may act as a court of appeal in relation to the responsibility for ensuring that the undertaking does not lose money.—Yours faithfully,

House of Commons I. J. PITMAN

Partition of Germany

SIR,—The struggle between Russia and the western powers about Berlin is expected to flare up again. We must not and shall not give way to pressure. The psychological effect not only on Germany but on the whole of western Europe would be fatal to our cause. On the contrary, everything possible should be done to make it clear to Russia that our determination to hold Berlin has not weakened in any way.

Our short-term policy is thus sharply defined. Our long-term policy, however, requires careful examination, especially before a decision is taken regarding the incorporation of western Berlin into Federal Germany as one of her constituent states. We are holding on to our position in Berlin, not because we need it, but because Russia needs it. Berlin is one of the trump cards in our hand for a general peace settlement to end the cold war.

Our long-term policy must depend on the outlines of the general settlement at which we are aiming. Three possible solutions can be ruled out as impracticable: (*a*) Russia will not allow a unified Germany under the dominating influence of the western powers; (*b*) we will do our utmost to prevent a unification of Germany dominated by Russia; (*c*) the so-called neutralisation of Germany can only mean the situation described under (*a*) or (*b*) and is therefore out of the question. There remains a fourth solution which is the only practicable one short of war: the final division of Germany between the east and the west, and in this respect a compromise does not appear impossible.

From an historical and geopolitical point of view Russia stands today farther to the west than is acceptable in the long run. Whereas Berlin and the Mark Brandenburg had originally come into existence as a march against the east, as a starting point for German expansion, the Altmark, Anhalt and the province of Saxony, Thuringia and the Land Saxony west of the Elbe were German territory long before the 13th century. Magdeburg, Halle and Leipzig, Erfurt, Weimar, Jena,

WHEN THE PRINCIPAL TIME-STUDIES HIMSELF—

Recently, the head of a business checked-up on his own movements for a day. He was horrified at the time lost while he left his desk to seek information in other rooms—while he waited for the busy switchboard operator to answer him—while he waited for staff to come to him; or while he went to see them, rather than get them away from their busy desks.

He realised that these needless wastages applied equally to each of his executives and staff.

He has now CUT OUT THE WASTAGE, by installing "Modern" Internal Phones, giving instant intercom throughout his building. He has proved that "Modern" Intercom saves far more than its modest rental cost—and helps the business to run more smoothly.

Why not find out how "Modern" will help you? Rentals from 1s. 6d. per week per instrument. Systems available if you have 2 rooms or any number up to 60.

Full information from:
MODERN TELEPHONES
(GREAT BRITAIN) LTD., TELESOUND HOUSE, 101, TOTTENHAM COURT ROAD, LONDON, W.1.

COUPON.—For full details, cut this out, ask your secretary to attach to your business letterhead and post to Modern Telephones (Great Britain) Ltd., (Dept. CI/2), Telesound House, 101, Tottenham Court Road, London, W.1.

Gordon & Gotch Advertising Ltd.

Zwickau, Chemnitz and Dresden are worth while considering—even from a purely German angle—as compensation for the loss of western Berlin. How much of these territories and how many of these towns could be obtained in exchange for Berlin cannot be foreseen. The uranium mines Russia is working in Thuringia will constitute an especially difficult problem. Nevertheless, the closing of the gap in the Iron Curtain and the complete control of Berlin would—one can assume—induce Russia to make considerable sacrifices with regard to the final frontier of her zone.

Our aim should be to act in this matter only in agreement with the Federal Government. This appears not impossible but will be easier to achieve if effective intra-European organs with executive power in the field of investment, finance, currencies, exports, custom tariffs, patent rights and defence are being established and if western Germany, taking her share in the activities of these bodies, sees in United Europe a reality which is worth much more than the phantom of a German reunification.—Yours faithfully,

Longcroft Lane, Welwyn Garden City R. W. BERMAN

Nationalisation in the Sudan

SIR,—Your correspondent's article published in *The Economist* of April 8th suggests that Sudanisation and the nationalisation of the Gezira Scheme are new policies adopted in haste under recent political pressure, and that pursuit of the first was the primary reason for the second.

The policy of Sudanisation, that is, the replacement of non-Sudanese staff by qualified Sudanese as they become available, began to take definite shape after the Anglo-Egyptian Treaty of 1936 and has since been steadily followed. The change in the political climate in recent years has admittedly quickened the pace; but it is not the wish of thinking Sudanese, nor is it the Sudan Government's policy, that the pace should be determined without regard to the effect on the efficiency of the Government machine. So far from being satisfied with third-rate staff, the Government is fully aware that this task of training and guiding Sudanese through this period of transition demands staff not only well qualified technically but also imbued with a high spirit of human service. Furthermore, there is no evidence to support your correspondent's assertion that better qualified and more experienced non-Sudanese are being passed over in favour of Sudanese. The official directive says that promotion is to be given "to the man who has served the Sudan best and who is able to give it the best service in the higher post, irrespective of his origin and creed."

The decision not to renew the Sudan Plantations Syndicate's concession when it expires in June, 1950, was taken six years ago. It had become clear before the war—and it is abundantly clear now—that the promotion of social welfare in the Scheme and the fostering of self-management by the tenants was not only socially right but was also necessary if the Scheme was to continue to be a successful agricultural organisation; and the Government took the view that, in spite of good will, this function of social development could not be married with agricultural management by a company whose aims were necessarily commercial. But in taking the decision the Government was also mindful of the natural wish of the Sudanese to participate in the management of an enterprise so vitally important to their country. As regards Sudanisation in the Scheme, an (all Sudanese) Select Committee of the Legislative Assembly has recently endorsed the policy of promotion by merit in the following words:—

> . . . your Committee, while insisting that every effort should be made to train Sudanese for higher executive posts as soon as possible and to promote them to such posts when they are fully qualified, support the principle that promotion should be strictly on merit, particularly in the Gezira Scheme where continued efficiency is so essential to the prosperity of the country.

There are two other points in your correspondent's article on which I must comment. First, his statement that strikes have become a national pastime is unwarranted. There have been only three strikes of any consequence in the last two years, and two of these lasted for only three days. Secondly, the Sudan is not alone in trying to make up for time lost through the war with the result that the volume and complexity of the work put on the civil service has greatly increased. The manner in which it has responded and its solid achievements in economic and social development contradict your correspondent's adverse stricture on its morale.—Yours faithfully,

Khartoum A. L. CHICK, Financial Secretary, Sudan Government

The Zemindars

SIR,—Excellent though your Calcutta correspondent's appreciation of zemindari and its abolition, in your issue of March 4th, was, there is one error of emphasis that calls for correction.

None will lament the passing of the system, least of all those who were in any way concerned with its administration between the two wars. But there will be some regrets for the zemindar. The majority were, as your correspondent says, idle; but few—a minority and not a majority—were vicious; and very, very few, at least in Bihar and Bengal, were drunken. Evictions and rack-renting ended for practical purposes, in Bihar and Bengal, long before the zemindars succumbed to their mortal illness. And, even of that district of North Bihar spoken of by the great finance member whom your correspondent quotes, the memory that lasts is not the constant and vexatious litigation indulged in by most zemindars (their tenants were as bad), nor the worthlessness of some, but the kindliness, the courtesy, and right living according to their own principles of the many.

The tenants will not always find the exchange of the personal landlord for the impersonal Sarkar Bahadur a change for the better.—Yours faithfully,

Boma, Ndola, Northern Rhodesia R. N. LINES

BURGH ISLAND HOTEL

is RE-OPENING ON 12TH MAY

Our winter programme of extensive restoration and alteration now being completed, we have pleasure in announcing the opening of a bigger and even better Burgh Island Hotel this year.

We look forward to welcoming our many patrons of past seasons, as well as new friends from home and overseas. All can be certain of an even higher standard of comfort and service than hitherto. Burgh Island, only 500 yards from the mainland which is easily accessible, and set amidst the lovely scenery of South Devon, makes the perfect setting for a luxurious holiday resort. That Burgh Island Hotel offers luxury at modest prices can be proved by writing for an illustrated brochure and terms to:—

The Manager, Burgh Island Hotel, Bigbury-on-Sea, South Devon.
Telegrams or 'Phone: Bigbury-on-Sea 272.

A TEST WORTH MAKING

(1) Think of three important events in national or international Politics, Economics, or Social Questions which occurred during, say, the past decade.

(2) Try to find full details of these happenings in any of the newspaper or periodical files, scrapbooks, history books, reference works, etc. at your disposal and note the hours, days, weeks it took you for each item.

(3) Then turn up KEESING'S—the living reference tool on current affairs (established 1931) and within a few seconds you will have in front of you the complete and authentic data, no matter whether you were looking for an event, or speech, agreement, figure, date or statement, etc.

As long as it is an important FACT in World or Home Affairs, you will find it recorded in KEESING'S—from 1931 right up to last Saturday (thence weekly until Doomsday)—and mark: it's the perpetual index that makes all the difference.

N.B. If you still lack KEESING'S, just write for free particulars.

KEESING'S PUBL. LTD., KEYNSHAM, BRISTOL.
Please supply free details of your service.

Books and Publications

Balkan Nationalism

"Macedonia." By Elizabeth Barker. Royal Institute of International Affairs. 129 pages. 5s.

CHATHAM HOUSE can be congratulated on its recent publications on Balkan affairs. It has followed up its edition of the Soviet-Jugoslav correspondence with an excellent study of Macedonia, which for the last fifty years has been the central problem not only in the relations between the Balkan states but also in great power policy in the peninsula. Miss Barker gives a clear and balanced picture of the main political and national factors, both internal and foreign, which have made the Macedonian problem so intractable. The story of the earlier years, of IMRO and the Supreme Committee and of the rivalry of Serbia and Bulgaria, has been told before, though not so intelligibly or impartially. What is quite new for the English-speaking public is her account of the policy of the Communist parties of the Balkan countries, and of the Soviet Government and Comintern towards Macedonia, both between the world wars and since the rise of Tito.

The experience of the Communist parties shows how difficult it is to fit Balkan nationalism into any general ideological framework. In order to win support among their own peoples, the Communists of Jugoslavia, Bulgaria and Greece had to some extent to adopt the national point of view of their respective countries. Having adopted nationalism in order to win "the masses" for a policy whose aim was to replace all nationalism by "proletarian internationalism," they ended by succumbing to their own tactical slogans and became nationalists themselves. Even in 1941, under the Bulgarian Fascist occupation of Jugoslav Macedonia, the proscribed and persecuted Communist parties of Bulgaria and Jugoslavia quarrelled bitterly as to which was to direct Communist activities in the province.

The attitude of the Comintern and of the Kremlin was always opportunist and often ignorant. They supported the Bulgarian point of view in the 1920's because they believed that the internal situation was more favourable to revolution in Bulgaria than in other Balkan states. In 1943 they supported the Jugoslavs because the method of resistance adopted by the Jugoslav Communists was more helpful to the Soviet war effort than that of the Bulgarian Communists. In 1948 when they decided, from wounded vanity and from suspicion, to break with Tito, they reverted to a pro-Bulgarian policy. The results of this change have been disastrous for Moscow. Jugoslavia has been forced into co-operation with the west, Albania encircled, the Greek rebels deprived of support, and the Greek Communist party hopelessly compromised in the eyes of Macedonian Greeks. Stalin has hitherto proved no more capable than Nicholas II, Francis Joseph, Mussolini or Hitler of finding a "scientific" remedy for Balkan nationalism.

A Wan Revival

"An Inquiry into the Principles and Policy of the Government of the United States." By John Taylor. Routledge and Kegan Paul. 562 pages. 35s.

THIS is the first volume of a series of "rare masterpieces of philosophy and science" which is being edited by Dr W. Stark. The selection of John Taylor's "Inquiry" for the honour of a reprint in such a handsome, if expensive, format certainly deserves a welcome. It is perhaps a matter for dispute whether his philosophy of agrarianism has that "special significance for the present" which the publishers desiderate in the works they select for revival. Much of what he has to say, ranging from his overestimation of rural virtue to his undeviating hostility to paper money, has more charm than applicability. Nor is the United States likely to heed in 1950 the injunction it ignored in 1814, to instal annual elections for Senators and representatives, and to make re-election to the Presidency impossible. In other words, much of what Taylor had to say was out of date even when he said it, and is entitled to the same decent obscurity as we now accord to the first of Locke's Treatises of Civil Government. What remains relevant, truthful and compelling is Taylor's Actonian awareness of the menace of ill-controlled or concealed power, and his analysis of the threat which economic concentrations can present to political democracies.

When a book needs revival, it is generally worth while asking what has caused its neglect, and one does not have to read far in the "Inquiry" to realise that Taylor's style and treatment leave a good deal to be desired. His logic lacks the cold, clear fury which arguments based upon similar premises acquired in the hands of Calhoun. Nor has it the limpid simplicity of the Jeffersonian spring from which so much of his thinking is drawn. Lastly, it suffers from the fact that in form it is not self contained but is an answer to John Adams's "Defence of the Constitutions of Government." This makes it often laborious and needlessly involved; it is as if, every time we wanted to read Locke, we had to refer to Filmer. This is where helpful editing might have made for easier reading, but unfortunately the text is provided with no footnotes and the introduction is written in such general terms as to be of very little use towards an understanding of what follows. The reader is left with no alternative but to wrestle with this somewhat involved, frequently prolix, yet rewarding exposition for himself.

The African View

"Africa: Britain's Third Empire." By George Padmore. Dennis Dobson Limited. 266 pages. 12s. 6d.

MR PADMORE'S book has been given valuable publicity by being banned from the East African Colonies and the Gold Coast. This is a pity, for it is hardly worth so much attention. It is, at best, an anachronism, stemming from the days when we were all divided into easy categories of imperialists and anti-imperialists, and one could be quite sure that every deed of an "imperialist" was inspired by the most sinister and malicious motives. Indeed, so anachronistic is Mr Padmore that many of his quotations are taken from books written a decade or more ago, and many of his facts and figures are deplorably out of date, yet stated as if they were still the facts today. The author might legitimately argue that he does not like the trend of colonial policy in these years, but he forfeits all sympathy when he supports his argument with statements which manifestly no longer apply.

The general design of the book is to conjure up a picture of Britain deliberately "exploiting" the Africans, refusing them their political rights, depressing the prices of their produce, rooking them of their mineral wealth. "Socialist" when applied to the Labour Government must always be put in inverted commas, and Mr Creech Jones must be seen as the champion hypocrite. No wonder that there is a temptation to toss a book like this aside in a fit of temper, or to dismiss it with a shrug. Yet beneath the childish oversimplification is something significant. Mr Padmore is himself a black man, and he states what many of his people believe. Beliefs like this are the very backbone of the nationalist movements of Africa and we ignore them at our peril.

German Management

"Manager von Morgen." By Herbert Gross. Droste-Verlag. Dusseldorf. 295 pages.

HERR GROSS is a leading financial journalist in postwar Germany. As an outspoken advocate of free enterprise he is apt at times to state his case more uncomprehendingly than would be acceptable to writers in this country who would support Herr Gross, but not without qualifications which he

would brush aside. In his latest book his approach is very much more detached. His self-imposed task is to collate American thought on the status and functions of management in the modern state and industry. If he draws little on British sources it is because this is a field of study to which British economists have contributed little. For all its Germanic approach in many ways, it remains eminently readable and covers topics now in the forefront of discussion in Germany. The author opens with a sustained and well-reasoned argument against Mr James Burnham's "The Managerial Revolution," a work he opposes for its defeatist attitude to finding a workable solution for an efficient industrial economy in a politically democratic state. His readers obtain a very fair impression, not always lacking criticism, of Mr Peter Drucker's writings on the place of management in an economy that still uses the investor's savings but otherwise accords him little influence. The German managerial class is further given a first introduction to the excellent work in this field carried out during and since the war by the Harvard Graduate School of Business Administration.

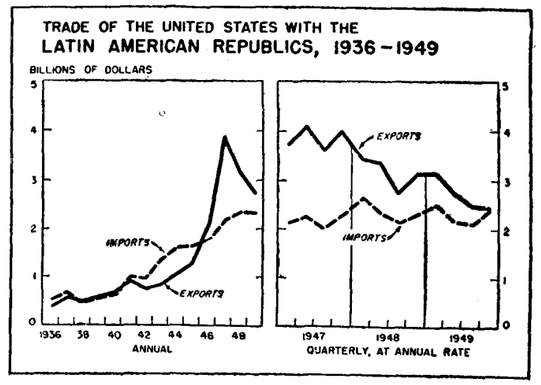
Herr Gross sets great store by the personal factor in management. He cites and supports numerous examples of increased output attained by putting workers in the picture, by giving facts that encourage personal interest in the dulling routine of mass manufacture. None of the European economies, and least of all the German, he holds, have made anything like the use of this latent reserve "that costs no Marshall dollars" and has become the normal equipment of the American factory manager, although he perhaps overrates the efficacy of profit-sharing schemes in industry as an incentive to higher output. It is less easy to follow Herr Gross—who throughout his book stresses that management is the first job of the manager—in his more philosophical dissertation on management. Thus, he makes a surprising plea for managerial activity in the political arena. But one sentence will suffice to show that he has heart and head in the right place when he writes of the present day German managerial class "that builds resplendent villas for itself while its employees continue to live in squalor."

Shorter Notices

"The Twentieth Century." By Hans Kohn. Victor Gollancz. 242 pages. 12s. 6d.

PROFESSOR KOHN has produced one of those clear, compact expositions of the "isms" of our times which entitle him to be considered for the role of the American Joad. "The Twentieth Century" is a backward look at the forces which have contributed to the maelstrom of our times since the over-auspicious dawning of this half-century. It contains much that it is useful to have compressed into such a convenient form, even if there is little which the well-informed student will find either novel or remarkable. Chapters on Imperialism, Racialism, Fascism, Nationalism, Communism all contain useful expositions of these diverse creeds. One cannot help regretting that Democracy receives by comparison rather skimpy and superficial, perhaps even too laudatory, an appraisal. The note of hope on which Professor Kohn ends his analysis would have gained in conviction if he had looked deeper, not merely into the enemy's camp, but into the problems inside our own.

"United Kingdom Policy: Foreign, Strategic, Economic." Appreciations by Sir Charles Webster, Major-General Sir Ian Jacob, E. A. G. Robinson. Royal Institute of International Affairs. 100 pages. 4s.



THIS booklet from Chatham House is good value for money. It consists of three papers prepared for a critical and well-informed audience—the British Commonwealth Relations Conference held in Canada last September. Sir Charles Webster opens in magisterial style with a sketch of British foreign policy since 1945, which is readable, fair, and comprehensive, but less than candid about Britain's decline in power. Sir Ian Jacob attacks his subject with the freshness and authority of one who was Military Assistant Secretary to the War Cabinet throughout the war. Mr Robinson, a member of the Economic Planning Staff for two years after the war, treats the economic problems with clarity and great independence. Politicians, business men and students will be saved much reading by studying this book; and its circulation abroad would remove a good deal of misunderstanding.

AMERICAN SURVEY

Warmth for Latins

(From Our American Staff)

THE arrival in Washington of President Gonzalez Videla of Chile, flown from Santiago in President Truman's own aircraft to be welcomed by flag-hung streets and cheering schoolchildren, marked a return of the warmth which has been lacking in inter-American relations for several years. It is a matter of opinion whether the drop in temperature was the result of inattention, of American preoccupation with affairs in Europe and Asia, or of a belief that Latin America could safely be left to stand on its own feet for a while. And various explanations of the present rise in temperature, and of its significance, are also being given. When the visit was first announced, President Videla was supposed to be coming to celebrate the completion of a steel plant built with $12 million loaned to Chile by the United States. Political commentators mentioned the need, in the light of the cold war, for repairing the inter-continental bastions which had developed cracks during the last five years of diplomatic neglect. On the day after the Chilean President's arrival in Washington, the leading New York newspapers discussed the changing position of his neighbour, President Perón of Argentina.

Source: US Department of Commerce.

Meanwhile, official explanations of the visit aroused old echoes as well as starting new ones. President Truman said: "We want to be good neighbours to our sister republics in the western hemisphere, and we want to be helpful to other democratic countries in the world to attain peace and to maintain that peace." President Gonzalez Videla, replying, described his country's "firm" policy as "one of friendship and solidarity with the United States, on the basis of equal sovereignty." There was no doubt that he considered the last phrase as important as the first. Mr Truman was also quoted as telling the Chilean President, in an extemporaneous moment: "We have absolutely reversed our earlier policy by alliances with European countries, hoping to maintain peace in the world." He is said to have been speaking of the North Atlantic Pact, and it may be that the effort to explain that pact to a Latin American stirred echoes of Washington's farewell advice and Monroe's doctrine which tangled his tongue. However cryptic the manner of its doing, the new policy toward Latin America is now officially bracketed with the better advertised European policy.

Mr Acheson started on this new policy early in 1949 when he succeeded General Marshall as Secretary of State, and already some progress has been made toward repairing the damage done by the State Department's pre-occupation with Europe during the two preceding years. But the fascination which other continents exert on press and public has meant that there has not been adequate comment on the new attitude toward Latin America. Its background is important. The Good Neighbour policy, set going by Mr Roosevelt shortly after his first election and in a period of extreme isolationist sentiment toward Europe, came to a stuttering halt soon after the end of the European war. It was not openly abandoned, but dragged along in a series of awkward moves as the belligerent Mr Braden, Assistant Secretary for American Republic Affairs when Mr Byrnes was Secretary of State, tried to continue a policy designed for war into a period of confused, turbulent and changing peace. Mr Braden resigned six months after Mr Byrnes was replaced by General Marshall, and the office he occupied was combined with one dealing with European affairs.

By the time Mr Acheson succeeded Mr Marshall, European reconstruction had advanced far enough to allow the new Secretary of State to devote a little time to repair work in Latin America. First, the region was once more given its own Assistant Secretary of State to watch over it; this time his province was named Inter-American Affairs—the prefix is not without significance. This post was filled by Mr Edward Miller, young and active, born in Puerto Rico, speaking Spanish fluently, associated with the New York firm of international lawyers which Mr John Foster Dulles adorns.

All these changes obscured the confused situation still further. Yet the spending of money for Latin American purposes went quietly on and remnants of the Good Neighbour Policy were kept pinned together until a new policy could be worked out to take account of the changed position of powers on both sides of the Atlantic. In September, 1949, the House Committee on Foreign Affairs was told that two types of programme were still in operation: one under the Inter-Departmental Committee on Scientific and Cultural Co-operation, which had spent $17,752,000 between 1940 and 1948 on agriculture, civil aviation, and intellectual exchanges; the other under the Institute of Inter-American Affairs and its predecessors which had encouraged health and sanitation development, agricultural improvement, and education, at a cost of $58,953,000.

Private funds began to flow south immediately after the war. Between 1945 and 1948 the money invested by the United States in Latin America, private and public, increased

by more than 25 per cent from $4.3 million to $5.8 million. This was, however, in no way comparable to the spending which was going on in Britain and Europe, and complaints began to be heard from the south. The United States had made general promises of aid at the Bogotá Conference in 1948—when would that help be forthcoming?

The first evidence of a new policy and a new attitude came in a speech that Mr Acheson made before the Pan American Society in September, 1949. He did not present it as new, saying that "in a family of nations as in families of individuals you should expect nothing more sensational than growth," but the added inch of a growing boy marked on the door frame can hardly be counted as nothing. The next move was a round of visits which took Mr Miller, the Assistant Secretary, to most of the southern republics. From the speeches and reported conversations the American public has obtained some light on a situation that is too often presented merely as a series of squabbles. Two main conclusions emerge: first, the entire fabric of inter-American relations is more stable and more closely woven than it was two decades ago, and second, the new policy is at once rooted in the old, and a part of a wider foreign policy which includes countries on the other side of the Atlantic.

*

The improvement in basic relationships must be credited in part to the Good Neighbour policy which, whatever its shortcomings, did play a real, if sometimes awkward, part in helping the southern countries to make their way toward that twentieth-century industrialism that is the accepted measure of an adult nation. Four other factors helped: the shift from the loose paternalism of the Pan American Union to the more vigorous and democratic activity of the Organization of American States; the practical co-operation during the war when the building of airfields and steel mills took the place of speeches; the meeting of all the American states within the United Nations, which gave the southerners a welcome feeling of superiority because of their experience in Geneva, while the United States, lacking that experience, was prone to fumble; and last but not least, the intransigence of Argentina which provoked her fellow Latins into more joint ventures with what they like to call the northern Colossus than they might otherwise have been willing to undertake.

As for the policy itself, its keynotes are mutual defence, mutual support, and improvement of multilateral trade so that the lines of commerce run not only north and south, but also east, west and between the southern countries. Mr Miller put it succinctly in a recent speech:

> In the Organisation of American States we have machinery for the discharge of our common business. In the treaty of Rio de Janeiro we have agreed to act together for the maintenance of our common peace and security. Experience shows clearly that we need the other American Republics and they need us. . . . Today we are especially concerned with improving material standards of living in the Americas. But there is a limit to what we can do.

Unnoted in the United States, the speech was widely publicised throughout Latin America. Both the political and the economic foundations of the new policy are already being tested, the first by the charges of conspiracy to promote revolt in the Caribbean brought against Guatemala, Cuba, and the Dominican Republic by a committee of five fellow nations, the second by the ability of Belgium to lay down steel imports on the wharves of Brazil and Chile at prices lower than those charged by the newly completed steel mills in those countries.

American Notes

Mr Truman's Colours

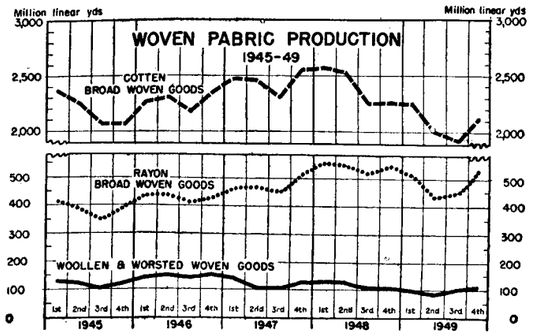
Mr Truman is a President who seems to be galvanised by adversity and heavy odds, but puzzled how to use success. He performed a political miracle in 1948, when even his own party gave him up as lost, and the great foreign policy measures of his Administration were achieved in years when the Republicans held control of Congress, a situation that in the past has often led to paralysis of government. It may be that the prospect of the mid-term elections, that frequently sap the majorities of the party in power, will inaugurate another period of activity. It is thought that the Democrats may lose 25 to 30 seats in the House, not enough to lose control of Congress as they did in 1946, but enough to push farther into the never-never land the carrying out of the radical campaign promises on which Mr Truman was returned in 1948, and which, despite heavy Democratic majorities, have been gathering dust in Congressional pigeonholes ever since. Such losses might even threaten the international programmes of peace and reconstruction on which the President, at the beginning of his sixth year of office, has set his heart.

The bipartisan foreign policy, that the Democrats now realise it was a mistake to neglect, is receiving Mr Truman's personal attention; he has promised Senator Bridges—an ally of Senator McCarthy, to whom it must have been painful to make any concession—that the Republicans will be consulted on the formulation, as well as the execution, of foreign policy. A new organisation of the Senate Foreign Relations Committee, to bring its members into close and continuous contact with policy-making officials of the State Department, has been suggested by Senator Connally and well received.

*

After five years of office, Mr Truman's self-confidence is far removed from the humility with which he took up Mr Roosevelt's burdens in 1945. He announced on his return to Washington that the country had never been more prosperous, and that he meant to take the lion's share of the credit. The first half of his statement, at least, is borne out by the monthly report of the Council of Economic Advisers, though they caution Congress that the first quarter's upturn does not promise sufficient economic growth to avoid a steady, slow increase from year to year in unemployment. One of the chief pillars of present prosperity is the housing boom, that in the first three months amazed the experts by surpassing last year's figures by 57 per cent. It will continue to be fed by federal funds, for the new Housing Act authorises $4 billion in fresh credit for private building.

Bipartisanship and prosperity, however, admirable and welcome though they are, are not fighting slogans that will crowd the polling booths in November. Mr Truman's decision to veto the Kerr natural gas Bill—dear though it was to such old-line Democrats as Senator Connally and Mr Rayburn, both from oil and gas-producing Texas—shows that he realises it would be folly to haul down the radical colours under which he campaigned to victory in 1948. The "non-political" tour through the North-West fixed for May would have been deflated in advance if the Republicans could have argued that the President was propelled



"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

by the natural gas interests. The important consuming and voting majorities in the North are now safe; the vote in Congress was too close to hold out any hopes of overriding Mr Truman's veto. In a small way, the Bill forced the President to choose between the Northern and Southern wings of his party as the civil rights programme did two years ago; he has given the same answer.

* * *

Textiles in Distress

To judge from the disappointing levels of clothing sales during March and the first week of April, an unusual number of American women must have joined the Easter parade in last year's spring outfit. Textile manufacturers, already feeling that they have not been getting their fair share of the nation's prosperity, are hoping against hope that the early date of Easter is to blame and that a few warm days will clear shop shelves and cupboards. They are not, in fact, nearly as full as at this time last year, for retailers learned caution during the summer recession. This means that there is less choice to tempt prospective purchasers; textile manufacturers have naturally drawn attention to this explanation for the disappointing contrast between the tightness of purse-strings where clothes are concerned and their looseness when it comes to television sets and other durable goods.

Source: US Department of Commerce.

Changing social habits are part of the trouble. A new dress is perhaps less essential when the potential wearer is going to watch television at home instead of going to the cinema; the growing fondness for sleeping without pyjamas means that each American man buys an average of only one-third of a pair a year. Cotton has taken the place of rayon as woman's favourite fabric this spring. It is cheaper, although this may not always be so if a new rayon spinning and finishing machine turns out to be as revolutionary as its inventor claims. And cotton manufacturers, more used to adapting themselves to declining demand than are rayon makers, have produced new designs and weaves that have caught fashion's fancy. Even nylon is no longer a word for shop assistants to conjure with, although its great drawback, its warmth in summer and its chilliness in winter, may be overcome by a new metallic process, "milium," which can, it is asserted, be applied to all fabrics. It makes them reflect heat without losing their porosity, so that the same lightweight garment may keep the wearer warm in winter and cool in summer.

If buyers can be induced to believe in such an apparent impossibility, rayon may soon be well on the way to replacing wool entirely. Already there is a growing demand for rayon fabrics, and for rayon yarn to be mixed with wool, for men's suits, from manufacturers squeezed between the rising price of raw wool and the customer's refusal to buy expensive clothes. Even so, rayon output declined last year for the first time since 1938 and processors have been selling surplus stocks of undyed goods at below cost price; many weavers, heeding this warning, have already cut their operations from a six- to a five-day week.

The woollen industry's long-standing complaints against the Administration's trade agreements programme are becoming even louder as the new tariff negotiations draw near. But other branches of the textile industry are also complaining that it is being asked to bear the whole brunt of the Administration's effort to make other countries self-supporting. As far as cotton is concerned, however, the trouble, so far at least, arises not so much from imports into the United States as from the sharp decline in American exports of textiles since 1947, caused by attempts to save dollars and by foreign competition in export markets. Japanese cotton goods, made on machinery and with raw cotton supplied by the American taxpayer, and likely to play a larger part than American in foreign trade this year, are a harder pill to swallow than the fact that Britain exported more cotton textiles in 1949 than the United States, reversing the 1948 relationship.

* * *

Governor's Mansion to Let?

The New York Democrats, though they would like to share it, take with a pinch of salt the view that Mr Dewey, having publicly recognised that he cannot be a candidate for the Presidency in 1952, will wash his hands of public office entirely by declining to run for a third term as Governor. It has been argued that the candour of the four lectures recently delivered at Princeton University by Mr Dewey marks his elevation into the ranks of the elder statesmen with no ambitions of their own, and that his appointment of a number of his close advisers to other offices in the State was a mark of his own determination to retire. If this is Mr Dewey's intention, he has laboured hard in the session just concluded at Albany to leave a promising political legacy to whatever Republican candidate is chosen: and he has neglected to prepare the Republican leaders in the State, a majority of whom have now committed themselves to support the man they believe can defeat any candidate put forward by the divided Democrats.

Thanks to one renegade Democrat in the State Senate, Mr Dewey has been able to present New York with its own Republican rent control Act, a step that has probably undermined the Administration's case for continuing federal rent controls. The Dewey Act covers the whole State, but the political benefits will be reaped in New York City, which accounts for over two-thirds of the controlled dwellings in the State, and is overwhelmingly Democratic. Mr Dewey has been shrewd enough to appoint a Democrat, Mr McGoldrick, as rent administrator. New York was the last big city to come under federal rent controls, and may be the last to abandon the principle; it temporarily supplemented the federal law with city legislation. With the housing boom reaching new heights, the need for rent control is more and more confined to the big cities; the Administration apparently has been forced to concede this.

Whatever Republican runs for Governor of New York next November, he will point with pride to a law that freezes rents—with minor exceptions—until after the election, when landlords will be able to raise them upon proof of hardship or that they are actually out of pocket. The second issue Mr Dewey has been nursing also involves a battle between state and federal powers, this time over control of the hydro-electric developments on the St Lawrence and Niagara Rivers. Three of Mr Dewey's aides have been appointed to the State Power Authority with directions to fight any "little TVA" in New York, and particularly to oppose the

Seaway into the heart of the country that Mr Truman is determined shall accompany the development of St. Lawrence power, and that New York and Buffalo fear would leave their wharves derelict.

The other main achievement of the session is the long delayed authorisation of the Thruway, the six-lane highway to connect New York City with Buffalo on Lake Erie—and thence with New England and points south—without any impediments such as traffic lights, level crossings, and speed limits. To begin work on this new artery, Mr Dewey has abandoned one of his cherished principles, that capital improvements should be paid for out of current income. To the irritation of other Democrats, who would have liked to make a campaign issue of this defection, the Thruway decision has been warmly welcomed by the Mayor of New York who, by virtue of the size of his budget and the number of his votes, usually chafes at Albany's leading strings.

* * *

Southern Liberals in Jeopardy

The first of the year's primary elections, in which members of the two parties choose the candidates that will oppose each other in November, has gone off quietly in Illinois. There the question was not whether Senator Lucas would be chosen by the Democrats, and Mr Dirksen by the Republicans, to contest the Senate seat, but whether the Senate majority leader, burdened by responsibilities in Washington, will successfully repel an opponent who for a year has been cultivating the voters' suspicions of deficit financing, foreign spending, and Communist influence in the State Department. Mr Truman's speech in Chicago in the middle of May, the only one frankly billed as political, will provide an opportunity to give Senator Lucas a helping hand.

In the one-party South, however, the primary is the decisive contest, and the Administration is worried about what may happen to Senator Pepper in Florida and Senator Hill in Alabama on May 2nd. The Democratic high command was not sorry to find that there were sound reasons for giving priority to the Marshall plan authorisation over the long-heralded attempt to secure Senate approval for a Fair Employment Practices Commission that would protect Negro employment rights. Senator Pepper, though an outrider on the Democratic left, has had to respect Southern convictions on the race issue ; he publicly opposes FEPC, but has always refused to take part in a Southern filibuster against civil rights measures. Engaged in the hardest fight of his 14-year-long political life, Senator Pepper expects to receive such Negro ballots as are cast and would be glad to be relieved of an embarrassing decision before the primary. In Alabama, Senator Hill himself is not in jeopardy, but a postponement of the vote will help him to coax the Dixiecrats, the Southerners who left the Democrats in 1948, back into the fold. Unfortunately for Mr Truman, Senator Hill's all too explicit explanation of how seniority inside the Democratic party helps the Southerners to block civil rights measures has given the Republicans what they consider proof of Democratic hypocrisy on the Negro question.

*

Senator Pepper is no favourite at the White House, for he defended the Russians as long as they could be defended in the United States, sympathised with Mr Henry Wallace, and joined the anti-Truman movement at Philadelphia. But for him to go down to defeat would lose a reliable Administration vote and discourage even hardy Southern liberals from venturing into politics. It would rejoice the Republicans, for Mr Pepper's opponent, Mr Smathers, one of his former protégés, has turned sharply right, and his anti-welfare state campaign has persuaded many Republicans to enter the Democratic primaries. Mr Smathers' sharpest weapon is Senator Pepper's former friendly attitude toward the Russians, which he is exploiting in a manner that would do credit to Senator McCarthy. Senator Pepper's margin six years ago was only 10,000 votes, but belated Administration support, coupled with the realisation that only an Administration Democrat can procure for the State the federal funds it needs, may save his political skin this time. Whatever happens in Florida, the Administration has been awakened in time to the need for coming to the assistance of Senator Frank Graham, another Southern liberal whose primary takes place in September.

* * *

Coughs in Carloads

The makers of Old Gold cigarettes some time ago changed their slogan, "Not a cough in a carload," to "A treat instead of a treatment," in deference to the Federal Trade Commission's complaint that all cigarettes contain nicotine and that all of them irritate the throat. That complaint, first voiced in 1942, has only just led to a formal "cease and desist" order against such misleading advertising. This order, against which an appeal can be made in the federal courts, applies also to the manufacturers of Camel cigarettes, who used to claim that their brand encouraged "the flow of the digestive juices" and relieved fatigue. Similar orders are known to be on the way to other tobacco firms, but the makers of Chesterfields are apparently thought to be justified in announcing that "They satisfy." The FTC supported its argument with tests made at its request by the Food and Drug Administration. It also found that some of the testimonials offered by the companies in proof of their advertisements came from people who did not smoke at all and sometimes could not even read what they were alleged to have written.

The FDA and the FTC do not, however, always see eye to eye on the question of coughs. Last autumn, with the approach of the open season for common colds, the FDA hastily permitted the sale of the new anti-histamine cold pills over the counter without a doctor's prescription. While there is no evidence that the Federal Trade Commissioners are amongst those who suffer from drowsiness and other ill effects after taking this remedy, the manufacturers of these pills have also now been charged with unfair and deceptive advertising. The FTC does not consider that the evidence proves their claims either that the drugs are absolutely safe or that they are an effective cure for the common cold.

*

Cigarette and drug companies spend a larger percentage of their income on advertising than do any other businesses, except cereal manufacturers. The FTC has recently been given greater power to force them to spend this money honestly. Last February the Supreme Court, in the Morton Salt case, ruled that a company subjected to a "cease and desist" order can be compelled to file annual reports to show that it is complying with the order. Previously the FTC had to carry out a fresh investigation every time it thought an order was being violated. The maximum penalty for such a violation used to be only $5,000 ; now it is $5,000 for every day that the order is violated. The FTC has America's dairy farmers to thank for this welcome gift which took the form of an amendment to the Bill repealing federal taxes on margarine and was their last shot in the battle they have waged for sixty years on behalf of those taxes. Once they realised that the battle was lost, their main concern was to prevent the margarine manufacturers from passing off their product as butter. It is doubtful whether all the members of Congress who voted for the amendment realised that, in the opinion of the FTC, it is applicable to all types of business, not simply to margarine-making firms who advertise their products on posters decorated with cows and dairymaids.

Fraternity on the Campus

The ex-service students in America's universities have carried the fight for democracy onto the college campus and have been winning new victories in the "Greek letter" fraternities, long criticised by both college authorities and students, not only for their childish and sometimes cruel initiation ceremonies but also for the snobbish standards by which many of them choose their members. These standards are set by the national organisations of the various fraternities, not by the present students who make up only about 10 per cent of the total membership. But today there are 150,000 student members in 2,786 local chapters in 250 colleges all over the country, a record which had not been expected in the postwar years. The fraternities regard themselves as instruments of student self-government and, in theory at least, set standards of scholarship for their members and make rules to curb excessive drinking and so on. The present students have evidently decided that they are worth bringing up to date and a much publicised beginning was made at Amherst College last year.

There the local chapter of Phi Kappa Psi "pledged" a Negro student and, after refusing to repudiate him, was expelled by the national organisation. Numerous student chapters protested and a Negro fraternity set an example by abandoning racial discrimination and inviting white students to join. About half the fraternities have restrictive provisions in their constitutions and apply them on religious and social, as well as racial, grounds, but a few months ago the National Interfraternity Conference, to which 58 fraternities belong, recommended that such provisions be eliminated. Many of its members will, however, be in no hurry to follow this recommendation, which the conference itself at first rejected. It was the student members, who were not even officially represented, that induced the delegates, all alumni (past students), to reconsider their decision.

The alumni objected to the recommendation because it infringed the right of each fraternity to select its own members. The same objection was advanced by Princeton alumni to the proposal, which has now been approved, that all this year's sophomores should be asked to join the 17 eating clubs for upper class men (undergraduates in their last two years) which take the place of fraternities at that college. In the past about 10 per cent of the students have been condemned to outer social darkness by failure to achieve membership, but this year the sophomores threatened to boycott the clubs entirely if the usual invidious distinctions were made. The Princeton alumni are largely responsible for the management and financial solvency of these clubs, and in the fraternities the alumni owe much of their influence to the fact that they pay, to a great extent, for the 2,100 fraternity houses, valued at $100 million. These comfortable and even luxurious boarding houses are apparently sometimes the only form of residential accommodation. A group of students from various colleges are now working for the establishment of "inter-group living units," to promote co-operation on the campuses between students of different faiths and races.

Shorter Note

Resolutions have been introduced in both Houses of Congress, sponsored by well known liberals from both parties, calling for a bipartisan inquiry into US policy in Germany. Its chief object would be to find out whether there is any factual basis for the persistent rumours that anti-democratic groups and propaganda are reappearing in Germany and are obstructing American policy there. Particular concern is caused by the danger that such anti-democratic elements may ally themselves with totalitarian Communism in the east, and that the old cartels may regain their influence.

French Communism—I

The Ideological Core

(From Our Paris Correspondent)

THE now daily news of violence and agitation in the ports and industrial centres of France shows how the French Communist party is now committed to a programme of sedition and sabotage unparalleled even in the autumn of 1939, when the party threw its full weight into a classical Leninist campaign against "the imperialist war." In those days the Communists, with a party membership of about 100,000 and with 60 odd deputies in the Chamber, were still weaker than the Socialists, their former colleagues of the Popular Front. The party, although familiar to Frenchmen since 1920 and waxing stronger every year, still wore the appearance of an unpatriotic, fanatical minority, the agents of Moscow and the allies of Berlin. Soon afterwards, indeed, the Daladier government outlawed the Communist Party, imprisoned all its seizable deputies, deposed its trade union officials, banned its newspapers, occupied its premises and confiscated its assets. This was at the end of September, 1939. From then onwards the French Communists operated clandestinely—first against the war effort; then, when the Republic had fallen, against both Vichy and London; finally, when Hitler had invaded the Soviet Union, as staunch neo-patriots against the Nazi occupying power.

In 1950 things are very different. The Communist Party with its affiliated groups is the largest element in the present parliament, holding some 180 seats out of 620. Its membership, although much reduced since 1947, is still probably half a million. It controls the *Confédération Générale du Travail,* by far the strongest trade union organisation. It has adherents in all departments of French life: scientists, lawyers, university professors, civil servants, engineers, doctors can be found among them just as well as the proletariat of the town, the country and the docks. Probably the only profession without Communists is the Catholic Church; and even there a few demagogic priests act as apostles of the Communist "peace." To be a believing Communist is, indeed, normal in France. One is or one isn't; that is all. And "Communist" means unquestioning follower of *"Staline, le père des peuples."* French Titoism is still negligible.

A State Within the State

The existence on French Republican territory of a large and senior contingent of the Bolshevik world cadre is not a matter that can be shrugged off with negative talk about preserving the integrity of the French State against "separatists" and "foreign nationalists," although such preservation is obviously vital. For the presence in the heart of Paris of the P.C.F.'s Politburo, Secretariat and Central Committee; of the headquarters of the World Federation of Trade Unions; of a hundred and one "front organisations" ranging from the Partisans of Peace to the Union of French Women is nothing less than a living token of the spiritual schism in French society. It is a sign, too, that France, if it has preserved democratic liberty, is no longer a fully sovereign state.

Almost every day *l'Humanité, La Vie Ouvrière, Ce Soir* and other Communist organs print incitements to sedition or calumnies of ministers in office which, under a working constitution vigorously supported by public opinion, would entail a prompt prosecution and the severest penalties of the law. In France, it seems, the rule of law is emasculated by the repugnance felt for any measure, even if it be statutory, that may be interpreted as unrepublican. Further, the legal aspect of sedition has hitherto been blurred by the tacit assumption that Communist organs are themselves an established feature of the French body politic, a kind of illustrious para-state with its own field of autonomy. There are indications that the Republic is now joining battle in greater earnest with the "separatists," as General de Gaulle calls them. The recently enacted law which accurately defines sabotage of national defence and punishes it with penal servitude is a true assertion of authority; so is the new provision that newspapers may no longer cry sedition behind the shield of the parliamentary immunity of a director who is also a *député.* It is nevertheless doubtful whether the French authorities will seek to do more than ward off the assaults of their Stalinist enemies.

Social Unity Undermined

The general run of opinion seems to be that French Communism in 1950 must be "contained" internally, just as, externally, the Atlantic powers plan to contain the Soviet Union (the *patrie* of the French Communist for whom France is merely his *pays*). "Things are not going too badly," says the man in the café, twiddling his glass. "Of course we are in a state of disguised civil war checked only by a strong police force. But if we can avoid real war, inside and out, our economy will gradually recover and in a few years, five or ten perhaps, we shall be out of the wood." This optimism, which roughly represents the political thinking of the Third Force and the American Economic Cooperation Authority is, with a dash of European integrationism, about the sum of good cheer that can be mustered for the French future. What political grounds are there for these bright thoughts?

Of the majority of the French population *qua* individuals it is doubtless true to say that poor economic conditions are the sole obstacle to a revival of its traditional intelligent and easy going happiness. Maturing national investment and increasing productivity would, other things being equal, spell a return to the happier times of not so long ago. But other things are not equal and, in particular, economic improvement alone will not bring social unity or restore the general will of the French people—things impossible to define in material terms but none the less conspicuous by their absence.

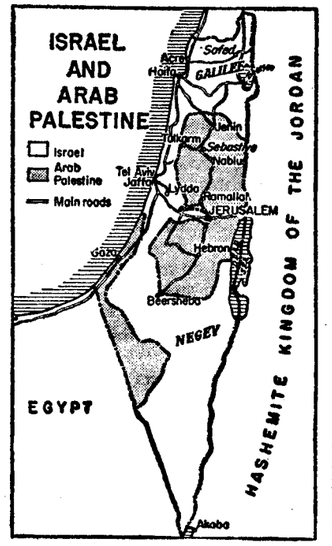
Creed of an Elite

French Communism is not, indeed, a simple function of poverty. Poverty and "proletarianism" (real and imaginary) may be—although this is not always the case—the general circumstance of Communist electoral support, of the Communism of the millions. But parliamentary Communism is not Communism itself, but its mere instrument or adjunct. A surer index of Communism's true essence is the fact that Stalinism is the creed of the *élite ouvrière,* of the most creative and best paid section of the French workers. Of these *militants,* who form the bulk of the 100,000 "dependables" that are reckoned to exist in France, A. Rossi, one of the leading observers of French Communism, has written:*

> The essential fact is that the bolshevisation of the French Communist party made possible the creation of a new type of Frenchman hitherto almost unknown in the history of our country. This fact by no means represents a purely positive value; for it implies at once the elevation and degradation of man and contains in the new qualities that it brings a principle of death. But its victory over the existing prevalent morality is definite in a France, where the *grande bourgeoisie* often lacks greatness and where the working class itself borrows the tastes and ideals of the *petite bourgeoisie.* The new Frenchman fashions himself according to a foreign image, replaces Descartes by a primitive rationalism, which knows no defence against the devouring mystique of the Soviet Union. This Frenchman is nevertheless considerably in advance of the rest of the population, which is driven backward to the past by its sufferings, longing for the easy times gone by. This prevalent regression forges such (Communist) Frenchmen by thousands.

The Sovietised Frenchman

The evolution—in France of all places—of a kind of inspired but spiritually gelded sub-man seems at first sight a fantastic notion. But there is no doubt of the success of *"bolshévisme à la sauce tartare"* among active, thinking, urban Frenchmen. Attempts are sometimes soothingly made to link 20th century French Communism with the anarcho-syndicalist working class tradition of the nineteenth century, or even with the name of Jaurès who, as the founder of the then Socialist *Humanité,* has the posthumous privilege of having his name appear at the head of every day's ration of Stalinese. But this facile counterfeit, although useful to the Party in its popular front mood, fails to conceal the historical fact that the French Communist Party was founded at the Congress of Tours in 1920, when it accepted, against the opinion of Léon Blum and the Socialist leaders also participating, the "twenty-one conditions" of the Second Congress of the Comintern. Henceforth the French Party was to be a loyal servant of Moscow. The first condition: "daily propaganda and agitation must be truly Communist in character and in conformity with the programme and decisions of the Third International" . . . is certainly as scrupulously fulfilled by the French Politburo of today as of then. French Communism is, therefore, whatever be the confusions of the outer rings of its followers, something essentially alien, primitive and rigid. Its doctrine and practice have during thirty years moulded the Soviet Frenchman, a simplified being who feels himself at the head of the nation and "in the vanguard of history."



An Individualist People

In the two articles that follow certain aspects of French Communism will be considered, especially its appeal to various social types and its uneven distribution throughout the French electorate. Meanwhile it is interesting to note to what extent the main ideas of Marxism (the economic class, class-struggle, class-morality, "History" and so on) are accepted also by non-Communist elements. This distortion of reality, from one side or other of the barricade, is indeed both the symptom and the perpetuator of the division within the nation. For, when the anti-Communists have also caught the collectivist bug, it becomes virtually impossible for them to tackle the problem of recreating the French community. Inasmuch, that is, as social divisions, *le patron, l'ouvrier* and other abstractions, are considered as real by Frenchmen, they are real. Inasmuch as the "class" is felt as an entity, it must inevitably supersede the creative freedom of individuals and the spontaneous formation of groups. The significance of General de Gaulle lies in his definite refusal to entertain the idea of internal conflict. Whether, as a matter of history, he has in the past done more to unite Frenchmen or to divide them; whether, in practice, he will find a way to give the nation the right kind of momentum, are separate questions. The fact remains that he and M. Paul Reynaud are, on their different planes, the spokesmen of non-Marxist views and unity in a people which is by nature individualist and not collectivist.

* *Physiologie du Parti Communiste Français.*

Israel's Balance Sheet—II

THE previous article set out in detail the extent to which Israel must for years depend upon foreign financial help—either given or lent—in order to balance its international payments. Only partially can it help itself, either by tightening its belt or by increasing productivity, or both. It has gone a long way towards the first objective, though not yet as far—judging by British experience—as it is possible for a healthy nation to go. The main means of producing the second result is plentiful new investment. At present the supply of capital does not nearly correspond to the numbers entering the country. New investment is sought both from home and from abroad. For overseas Jewry is by no means the sole source of the capital invested since the state was inaugurated. Of £I.80 million of new investment made in 1949, nearly half came from Israeli sources (in a proportion of 56:44 of public to private investment) and a little over half from abroad (in a corresponding proportion of 67:33).

A socialist state has therefore had to swallow some of its antipathy to the employment of private capital in pursuit of private profit. In view of the straits which the country faces on international account, it is out to attract foreign investors in particular. Indeed, the government has by its recent investment law offered the foreigner favours which have raised among home investors murmurs against undue discrimination. Umbrage has been taken at a provision whereby new residents need for seven years pay no Israeli taxes upon income derived from abroad. Other complaints are heard because foreign investors have been freed from the obligations to offer foreign currency for compulsory sale to the Israeli treasury and because they may own and draw on deposits in foreign currency in Israeli banks. That this law, which is a siren call to the western investor, was passed in the Knesset (Parliament) by 117 votes to 3—only the 3 Communists dissenting—should dispose of fears that Israel, while under present management, will align itself with the eastern *bloc.* Several western firms of repute—Phillips of the Netherlands for electrical fixtures, Kaiser Fraser for motor-car assembly, the Geneal Tire and Rubber Co. of Ohio—had sought agreements for factories even before the law was passed.

But a law, however enticing on paper, will not attract the commercial investor unless business conditions are promising. At present, Israeli wage rates are abnormally high in terms of dollars or sterling, still too high for the investor whose concern is money-making, not sentiment. They remain so despite the fairly successful efforts made to lower them since the national austerity campaign started a year ago.

Since then, the cost of living has been reduced by 15 per cent and the wage level—which is pegged to it and which underwent cuts in July and October—by 12 per cent. But real wages seem to their earners to have fallen little if at all. The onslaught on costs is, however, only part of the battle. Even more herculean is the task of training backward newcomers—ex-Yemenis, for instance, whose demands are small—and of introducing them into an employment market that has long been dominated by the high standards—almost the highest in the world—of the Histadruth (Jewish Federation of Labour). The rank and file of old Histadruth members would be scarcely human if they were not jealous of these standards. But mere logic now asserts that the Government (of which their party, *Mapai*, is the backbone) cannot simultaneously preserve their standards and employ all the newcomers whom it is committed to letting in. Either they must accept some dilution in order to admit the immigrant trainee who wants work, or else they must shoulder the responsibility of dividing the Israeli nation into old-time "haves" and immigrant "have-nots," as well as of committing it to costs that place it at a disadvantage in world markets.

Spreading the Immigrants

The organisation of greater productivity therefore calls not only for more investment but for a considerable psychological effort. It also demands the physical effort of shifting the multitudinous newcomers to the places and jobs that will most quickly and directly produce new goods. They must be dispersed, when they leave the immigration camps, over rural as well as urban districts. Problematic numbers of them are ex-middlemen who, wishing for no other calling, cling to city lights and bustle and sink themselves in unproductive small trading in the slums behind Haifa or Tel Aviv-Jaffa. This last now has a population of over 300,000, or 30 per cent of the national total. If no more than at present is done to disperse the people who make their way out of the immigration camps without a proper assignment on their work-card, the figure will reach 400,000 in little more than a year.

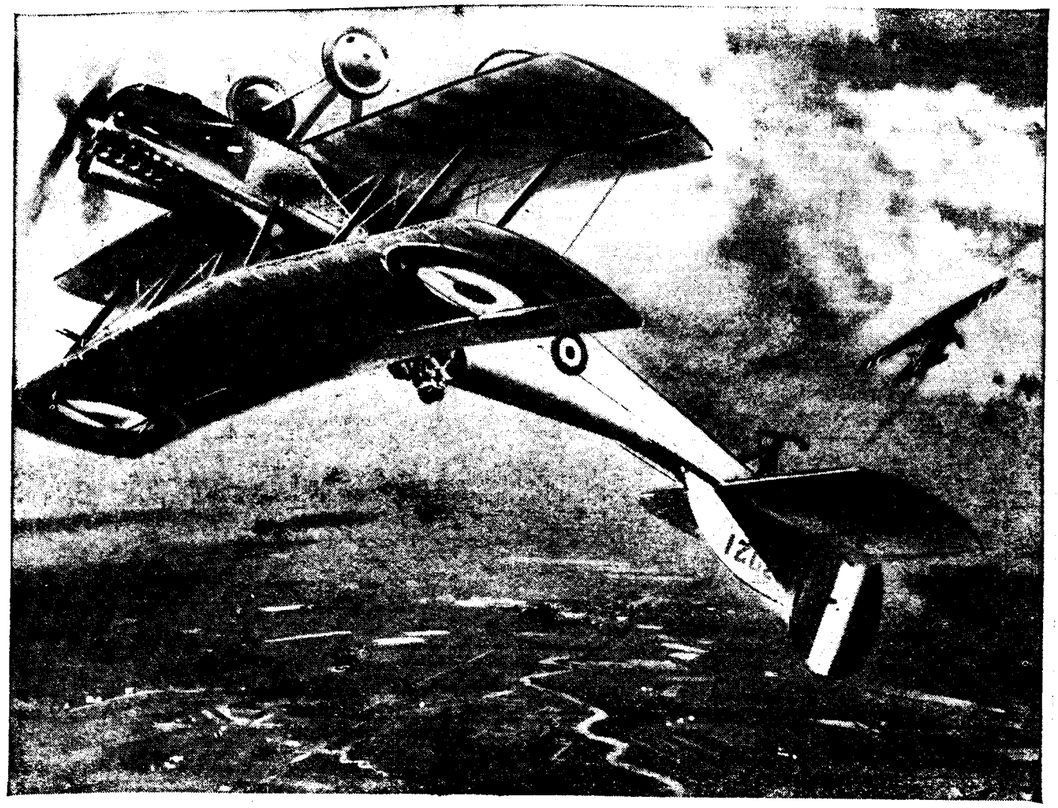
Theoretically, the Planning Department of the Prime Minister's office, which is calculating on a basis of four urban families to every rural family would like to see, by 1958, a distribution whereby only 15 per cent of the total population would be left in Tel Aviv-Jaffa, 10 per cent in each of Haifa and Jerusalem, 20 per cent in Galilee and 10 per cent in the Negev. But to bring about this redistribution will cost an immense effort—how great can be realised only after visiting Jaffa's congested back streets as well as the immigration camps through which a flow that has since August been 85,000 strong is passing in relentless volume, though with commendable speed.

Effect of Arab Boycott

Psychologically and physically as well as financially, therefore, the task which the Israeli government has set itself by its policy of boundless immigration is extremely formidable. One thinks of a juggler whose problem is which ball to push next.

How are all these people to get work? Does the Arab boycott greatly aggravate the government's problem? What would happen were American gifts to fall in 1950 or 1951 by as much again as they did last year? These are the questions that tumble from the mouth of any witness of the juggling operation. The first no one can answer. A comparison of the numbers listed as "settled" in deserted Arab villages, new Jewish villages, new factories, old factories and so on, plus the numbers still in camps, with the total number of immigrants, reveals how many of the people who officially rank as "absorbed" are unaccounted for and must be living most precariously. As to the Arab boycott, this is affecting Israel much less adversely than it affects some neighbouring Arab states. The Palestinian Jewish community's trade balance with most of them was adverse; Lebanon and Jordan in particular are losing more as sellers of foodstuffs than Israel is losing by their purchases of its manufactures. A considerable fuss has been made by the Israelis about the ill-effects of the Iraqi and Egyptian refusal to let crude oil through to the Haifa refinery, but here Britain and Iraq, not Israel, are the real sufferers. Israel derived no royalties, little in the way of customs dues and only a modicum of labour and income tax from the refinery's operations. From the Israeli standpoint the chief current drawback of the stoppage is the irritating eyesore created by the great, idle refinery dominating an industrial district that should be humming with activity. A potential disadvantage is the impossibility of starting the secondary industries which they hope to develop from the refinery's waste products.

The Tonic of Peril



The answer to the question on American giving is simple. Were the contributions to fall further the country would have to face one of two unpleasant alternatives: either the close control and virtual stoppage of immigration, or else bankruptcy. If it could stop the clock, cut out immigration and consolidate at its present level, the total balance of international payments could be cut to half the present figure and the gap between incomings and outgoings could, by an effort, be met out of borrowings and earnings. But to most of American Jewry, and to some (though not all) Israelis, such a stoppage is unthinkable. It is too like a return to the bad old days when a Jew had nowhere to go. The contributions are therefore likely to continue in a volume that corresponds to the tightness of the corner that Israel is in. So will national effort and sacrifice. Heredity proves that the Jews are tough; environment that the Israelis are healthy, educated, and filled with national-racial solidarity. Peril tends to be a tonic to such people.

Land Reform in Italy

[FROM OUR ROME CORRESPONDENT]

THE Land Reform measure sponsored by the Minister of Agriculture, Signor Segni, and now very shortly to be introduced into Parliament, follows in general the outline given in *The Economist* of May 7, 1949. The long delay must be largely ascribed to opposition inside the Christian Democratic Party. As recently as February, a prominent deputy of the party, Signor De Martino, received the support of 150 deputies for an alternative and much less radical project. This was dropped when the Prime Minister, Signor de Gasperi told the party group, in so many words, that either drastic land reform must be put quickly into effect, or parliamentary Government would prove unworkable. The reform which, to denote its character better, is now called Real Estate Reform (*Riforma Fondiaria*) will provide for the compulsory surrender, against compensation, of portions of estates having an annual income of 30,000 lire or more according to 1938 tax returns, reckoned roughly (by private experts) to correspond to 750,000 lire of actual present revenue—say £400.

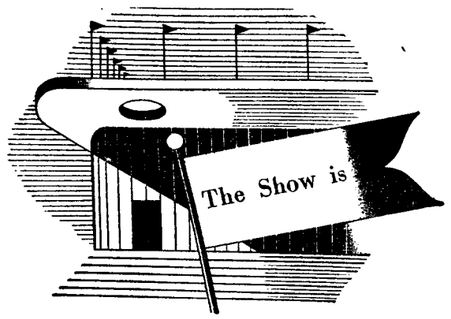
The expropriation is progressive as the revenue of the estate is larger, but also varies inversely with the average revenue per hectare of each estate. For example, an estate of 300,000 lire (1938) revenue whose average revenue a hectare is 1,000 lire, is liable only to 55 per cent expropriation, whereas an estate of 200,000 lire revenue with an average of 650 lire per hectare is liable to 65 per cent. The maximum expropriation quota of 95 per cent is reached at a revenue level of 300,000 lire for estates with the lowest hectare average, but only at 1,200,000 lire for those with

We've solved some problems in our time !

WANTED—*an unspillable aircraft battery*. That was 1916. On the western front, British artillery observation pilots, harried by enemy fighters, were learning new evasive manœuvres in a very hard school. With them, right way up or upside down, went the batteries used for W/T communication with the gunners below. Every so often, inverted batteries lost their acid and put the wireless transmitters out of action.

¶ Chloride Batteries solved that problem quickly—and finally. A battery with each of its necessary gas vents constructed in the form of compartments within compartments, so as to make an acid trap, was soon in action: the first truly non-spillable battery, and the forerunner of every such battery made since.

¶ For more than half a century, each year has brought its quota of problems to this company. In industry, transport and communications here and abroad, we can point to tens of thousands of our Chloride, Exide and Exide-Ironclad Batteries each giving satisfactory service in the special job for which we were asked to design and produce it. Those are answers which time has proved to be right.



¶ Our battery research and development organisation is the largest and best equipped in the country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

the highest average. Thus, it is claimed, the inefficient will be much harder hit than the efficient, while, in practice, estates of very large territorial extension, containing much non-producing land, will be drastically broken up. Sales or gifts of land effected after January 1, 1948, are invalid for purposes of the reform except sales to peasants or gifts by way of marriage dowry. With that exception, estates are assessed as at the beginning of 1948, the date of entry into force of the Republican Constitution with its pledge of land reform. Subsequent sales are treated as attempts to evade the reform. Compensation is payable at the value shown for the land, and agreed by the taxation offices, in March, 1947, increased by ten per cent, and is effected as to one-quarter in cash and the remainder in 5 per cent bonds redeemable in 25 years.

The Real Estate Reform, applicable to the whole of Italy, has not yet been presented to the Chambers, but the Government has presented several measures which are an integral part of it. In January, an advance application of the general project was devised for the Sila plateau in Calabria, to procure an immediate break-up of several huge estates. On the model of the Sila law, a so-called Sample Law has now been laid before the Chamber to empower the Government to execute the main features of the reform forthwith in sample areas where large properties exist side by side with a multitude of landless labourers. The expropriations in the sample areas have been forecast at 500,000 hectares (1,200,000 acres) affecting 8,000 estates and providing land for 100,000 landless families. When the general reform has been completed, the land rendered available for peasant ownership should be from two to three times as much as this advance or sample portion.

Another law, already presented but not yet approved, sets up a fund for the south (and also a much smaller fund for the north), into which the Treasury will pay about 100 billion lire yearly for ten years. This device is intended to remove the detailed operations of equipment and development of the expropriated land from the sphere of parliamentary discussion and of normal budgetary auditing. The proposal has roused protest on constitutional grounds from the Court of Auditors, but the Government contends that only an autonomous body able to devise and carry out rapid expenditure programmes can see the measure through to success. The fund is not primarily concerned with the property aspect of the reform (payment of compensation to the expropriated and receipt of purchase prices or rents from the new assignees), but with road building, irrigation and housing—the necessary condition of any economically reasonable settlement.

Communist Thunder Stolen

A year ago Government spokesmen were emphatic that to detach land from existing units and to transfer it naked to new proprietors would be foolishness. The emphasis has shifted, and it is now said explicitly that the change of property rights is the prime aim of the reform. It is added, somewhat vaguely, that the new owners, once in enjoyment of their titles, will put their backs into the job of making the land assigned to them an economic proposition. Opponents of the reform, who are numerous, powerful and vocal, talk as though land now being rationally farmed will really be parcelled out in complete disregard of productive and technical needs. They predict that within a short time the disgusted and disappointed beneficiaries will throw their new possessions on the market. But the whole process will be carried out by local agricultural committees in combination with official experts. Unless political agitations spread any atmosphere of panic, there is at least as much danger that the reform will be frustrated by gentleness (as has been the case with a 1946 law for the compulsory surrender of misused and neglected lands) as that it will be recklessly implemented. None the less, the reform is described by the right wing as recklessly demagogic and ruinous for agricultural stability. A few southern landlords have threatened open resistance, but the serious opposition will probably take the form of pressure upon the local executants of the reform.

To the Communists, this reform represents a mean attempt by the Christian Democrats to capture their own thunder. The nearer it gets to the executive stage, the greater the efforts of Communism to rally the landless and poor peasants behind demands for still more radical measures. The Communists are, however, themselves embarrassed by the fact that the Italian peasantry has some idea of what has happened to small peasant property in sovietised countries. Hence, as can be read in the January number of *Rinascita* (monthly review of the Communist intellectuals) the accent is to be put clearly—in propaganda for the peasantry—upon advocacy of land reform for the benefit of the individual peasant without any premature exaltation of the merits of co-operative farming for which at present he has no liking.

Perón and the Press

[FROM A CORRESPONDENT RECENTLY IN ARGENTINA]

LAST July President Perón, speaking to the national convention of the Peronista party held in the Luna Park stadium in Buenos Aires, told his supporters that "toleration should be allowed in graduated doses, but must eventually be brought to an end, not violently, but by giving a turn of the screw from day to day." Ostensibly he was referring to schisms within the party camp. Events in Argentina during the past months show that the principle is being extended to cover other aspects of the national way of life. The turn of the screw policy is evident in the attack on the independent press conducted by the egregious Señor Visca, head of the "anti-Argentine activities committee," and in the increasingly severe application of the *desacato* (disrespect for constituted authority) law. A further example is to be found in the extension of the clandestine censorship of mail and telephone conversations and of official control of messages from radio correspondents.

The Visca committee, drawn from both houses of the Argentine congress and including members of the lower-house opposition (there is no opposition in the Senate), was originally appointed last year to investigate charges that the Buenos Aires police used third-degree methods to extort confessions. Shortly after its appointment the Government-sponsored newspaper *Democracia* (the principal Peronista mouthpiece, with a circulation of some 300,000—a big figure as Argentine circulations go) published a series of sensational "exposures" of foreign financial aid to the opposition candidates and press during the 1946 presidential elections which brought Perón into power. On a Peronista motion in congress the investigation of the paper's charges was entrusted to the already-existing committee—its original purpose being in the meantime conveniently forgotten. There the matter remained in abeyance, until last November, during the long summer parliamentary recess, Visca suddenly assumed dictatorial powers, paid surprise visits to Buenos Aires newspaper and news-agency offices and to certain banks and commercial firms. Opposition members of the committee protested, pointing out that the committee had not met in session since the previous September. A statement from the Casa Rosada (Argentine government house), however, gave Visca the green light, and Perón's drive to gag press criticism proceeded apace.

Pretexts for Suppression

About 150 papers and periodicals were forced to suspend publication, either through cutting off newsprint supplies, or on some other pretext. More than forty papers were shut down for omitting, in the first days of the New Year, to print the caption "Year of the Liberator

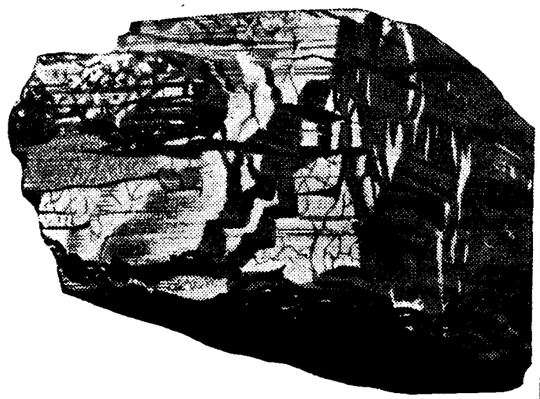
General San Martin" in the dateline on each page, in commemoration of the centenary of San Martin's death. Most of the journals suppressed were provincial papers with only a local circulation. Practically all the Argentine popular press, including the four Buenos Aires evening papers, is now owned by Peronista interests. *Vanguardia,* the Socialist party paper, was closed down a couple of years ago on the pretext that its printing works were "insanitary," and has not been allowed to resume publication. The two independent papers of any weight which still dare to criticise Perón's policy are the internationally-known Buenos Aires dailies *La Prensa* and *La Nación.* Both have had their stocks of newsprint appropriated and are now dependent on handouts from the Government pool, enough being allowed them from time to time to keep their presses working for a fortnight ahead. *La Prensa,* accused of violating import regulations and of irregularities in its bookkeeping, has had its importer's licence revoked. It remains to be seen to what extremes Perón will go in his move to stifle criticism from these influential papers. The suppression of either might have a boomerang effect even on Argentine opinion favourable to the regime.

La Prensa, the most staid newspaper in Argentina—possibly in America—displays no news or editorial matter on its front page; but to a great part of Argentine opinion it is more than a mere newspaper—it is a national institution. The simple phrase "I saw it in *La Prensa*" is usually sufficient to settle any point in dispute. *La Nación* was founded by the Argentine statesman and patriot Bartolome Mitre. But the move to gag both papers was carefully prepared by a heavy campaign of defamation launched months ago by the Government press and radio; a potential charge of *desacato,* too, is an ever-present danger, and editorial commentators are at pains to avoid mentioning names. Rather significantly, during the past weeks even foreign press comment, if critical of Perón's policy, has been ignored by the independent papers, although it is still cabled out by the agencies and presumably released by their local offices.

Definitions of Disrespect

Desacato was an offence under the Argentine penal code before Perón came into power, but was restricted to disrespect for the authority of the executive and judicial branches of the government. Perón pushed through legislation extending the scope of the law to include "disrespect" for practically any government official, and it is now his main weapon in the restriction of free expression of opinion. Following the Santa Fé elections last year the Radical candidate for the governorship of the province, Dr. Rodriguez Araya, a national deputy, was accused of committing *desacato* in his election campaign speeches, impeached by congress and expelled; fearing arrest he took refuge in a foreign embassy, and later escaped to join the ever-growing band of Argentine political exiles in Uruguay. In the recent elections in Tucumán province the Radical candidate for governor had to conduct his campaign from prison, where he had been consigned over two months before polling day of a charge of *desacato*; after the poll he was released. In the Buenos Aires province elections, held concurrently with those in Tucuman, the Radical candidate, Dr. Ricardo Balbín, leader of his party in the national Chamber of Deputies, was followed about by police on polling day and arrested, immediately after casting his own vote, on a six-months old warrant issued in Rosario; he was spirited away to this up-river city, released about a week later but immediately rearrested on another *desacato* charge and imprisoned again in a neighbouring town. His lawyer was arrested also.

At times the interpretation of "disrespect" has its aspects of the ludicrous. Visca in a recent statement put *La Prensa* in the pillory—although no charge was made—for "daring to criticise" Perón's economic policy. Light comedy touches, too, are not wanting. Last spring the inauguration of a motor race in Santa Fé was attended by the governor of the province, a Peronista. After the preliminary speeches the chairman of the local automobile club lowered the starting flag. This, however, was an affront to governmental dignity. The governor, enraged at not having been invited to start the race, had the club functionary arrested for *desacato*! *La Nación* referred to this incident some days later in a humorous leader headed "The Latest *Desacato*." One wonders if, were the incident to occur today, the paper would comment in similar terms.



Telephone-Tapping

Under the Farrell-Perón military government, preceding the 1946 elections which made Perón constitutional president, it was widely known in Argentina that telephone-tapping and similar police measures were being resorted to. Listeners were planted in the exchanges and conversations recorded. After Perón's election it soon became evident that these practices had not been abandoned—or not entirely so. During the bank strike early in 1948 a number of persons, including some foreign press correspondents, were arrested on charges of being concerned in "anti-Argentine activities. Several were deported. No secret was made of the fact that the "evidence" was obtained from recorded telephone conversations. In the same year an American press correspondent was denounced in an official radio broadcast for criticising, in a private letter to a friend in the United States, Argentine government control of the radio-stations. How the letter came into official hands was not, however, disclosed—and in fact the affair was soon dropped, perhaps because the authorities realised that they had let the cat out of the bag. The "revelations" published last July by *Democracia* included facsimiles of a large number of letters, some from well-known Argentine politicians of the opposition parties, others signed by Mr Spruille Braden, American Ambassador to Buenos Aires for a few months in 1945; the latter included letters on Washington State Department stationery. It is more than a presumption that this mass of private correspondence was obtained from official sources in Argentina.

Watch on Cable Services

More recently, further instances of this clandestine censorship have come to light. Foreign press correspondents in Argentina find that letters addressed to their papers or agencies disappear mysteriously in the post. Early in March, issues of *The Times* containing an article on Argentine affairs and a leading article on the persecution of *La Prensa,* forwarded by air mail to subscribers in Argentina, failed to reach the addressees. There is no open censorship of cabled press messages, but the cable companies are held responsible for matter transmitted. Official censors attend the wireless transmitting stations and here again, should the censor not be on the premises, the station owners are held responsible for transmissions. It is said in Buenos Aires that the authorities have acquired or have on order from abroad 3,000 machines for recording telephone talks, and that 10,000 letters are being opened daily in the mails. The latter figure may be an exaggeration; but it may equally well be an underestimate. It is no exaggeration to say that Perón's totalitarian technique is, little by little, converting Argentina into a police state on the most approved nazi-fascist model.

NICKEL AND OUR COAL

Do you know that nickel plays a vital part not only in the production of coal but also in its conversion to light, heat and power? The cutters, conveyors and miners' lamps that are used in the mining of coal, the railway engines and the road vehicles concerned in its distribution, the plants converting it to steam power and electric current—in all these, nickel is present, toughening and strengthening the metals used in their construction, making them staunch against the attacks of wear, corrosion and heat.

Thus nickel is contributing to the efficiency of the tools and equipment with which Britain is achieving her recovery.

SIMON ENGINEERING GROUP

Simon exports are no mere post-war growth. Though immensely increased since the war, they began over sixty years ago. Simon machinery was first installed in foreign flour mills in 1885; the first Simon grain elevator in the Argentine was built in 1909; Simon-Carves built coke ovens in Spain in 1900 and coal washeries in Canada in 1911. To-day there are Simon representatives in most of the principal countries of the world, and Simon associated companies in France, Belgium, Holland, Australia, New Zealand, South Africa and South America. Simon exports of machinery and technical services have gone to forty countries in the last five years.

The Budget

THE best that can be said of Sir Stafford Cripps's budgeting this time is that it keeps faith with the principles by which he has been guided in his two previous budgets. This means that, once again, he has been deaf to the siren voices of specious pleading for the "distribution" of the realised surplus which many people still persist in believing to be a fund available for tax relief. More important, it also means that he has followed the logic of the Government's own estimates of the prospective shape of the national economy in the coming year, and so has not allowed the pleadings of the trade unions and the threats to the wages policy to seduce him from the effort to maintain a mild disinflation. He has also resisted any temptation to resort to accounting subterfuges or to try to appease government supporters by mounting a new attack upon capital or profits. The worst financial dangers which the political deadlock might have threatened have not materialised.

There is very little else, however, to be said in favour of this budget; in every other sense it is dominated by politics—and especially by the underlying assumption that, because the social outlays are sacrosanct, there can be no perceptible scope for reduction in the total of Government expenditure. This being so, the pattern of prospective revenue and expenditure which confronted the Chancellor followed closely the lines recently sketched in these columns, and left him with no possibility of granting any net tax relief so long as the formula for disinflation was retained.

As the estimates given in the "Economic Survey" had foreshadowed, the prospective "above-line" surplus on the old basis of taxation showed a large reduction from the realised surplus of £549 million for 1949-50. Estimated expenditure for Supply services, as already known, showed an increase of £81 million at £2,918 million, while the requirement for Consolidated Fund services (after raising the fixed debt charge by £5,000,000 to £490 million) is put at £537 million, roughly the amount actually spent last year. Prospective ordinary expenditure thus totals £3,455 million. Contrary to most expectations, the prospective decline in ordinary revenue was put at only £28 million, so that the estimated total, at £3,896 million, offered a prospective "above-line" surplus of £441 million—or at least £40 million more than was envisaged in the discussion in *The Economist* last week.

As will be seen from the table on page 900, the Chancellor's apparently reassuring estimate rests, however, upon the substantial yield still expected from special sources of revenue. It had been generally assumed that credits from the three special items—surplus stores, trading services, and miscellaneous receipts—which last year exceeded estimate by £92 million, would this year fall more or less correspondingly. The fall actually expected proves to be no more than £14 million—owing mainly to an expected further rise (by no less than £37½ million) in the yield from trading services. This unexpected gain, it should be noted, will do little or nothing to increase resistance to current inflationary pressures, since much of it represents the mere transfer of surpluses already realised.

If these special credits are excluded, the official estimates of revenue align quite closely with the more cautious of the unofficial guesses. Income-tax, after allowing for the loss resulting from last year's tax concessions (mainly the doubling of the "initial" depreciation allowance), is expected to yield £22 million more

THE TAX CHANGES

	Estimated Effect for 1950-51	Estimated Effect for a Full Year
	£	£
INLAND REVENUE		
Income Tax:—		
Reductions in the reduced rates of tax from 3s. to 2s. 6d. and from 6s. to 5s.	— 72,000,000	— 82,000,000
CUSTOMS AND EXCISE		
Customs:—

Total Excise	+ 10,450,000	+ 14,160,000
TOTAL CUSTOMS AND EXCISE	+ 73,800,000	+ 81,500,000
TOTAL	+ 1,800,000	— 500,000

* The effects of these changes have been taken into account in computing the yield on the existing basis; the additional revenue in 1950-51 is estimated to be £90,000 in each case.

and surtax £5,000,000 more; but all other major sources of revenue are expected to be somewhat less buoyant. The assumed increase of £5,400,000 in death duties falls short of the estimated additional yield which should accrue from the operation, in their first full year, of last year's tax changes. Customs and excise in the aggregate are expected to fall by £10 million—prospective declines of £11 million on tobacco and £10 million on alcoholic liquor being partially offset by an expected further expansion of the yield from petrol, purchase tax and entertainments. Despite the additional yield from last autumn's increase in the tax on distributed profits, the estimate for profits tax and EPT combined shows a fall of £27 million, which the Chancellor attributed mainly to the dwindling of EPT (which last year provided £36 million).

Although the above-line estimates looked better than most people had expected, the opposite was true of the below-line accounting. As will be seen from the following tables, the expected saving on war damage payments

amounts to no more than £11 million—apart, of course, from the fact that, after last year's £62 million special settlement, no further payments have to be made to the public utilities. Moreover, the biggest single item of below-line expenditure—loans to local authorities—will rise further. As last year's heavy excess over the original estimate under this head was at least partly due to borrowings by local authorities in anticipation of requirements (in consequence of the arbitrarily low rates at which the Public Works Loan Board lends), it had been assumed that the new system of control would ensure a reduction in borrowings this year. The Chancellor explained, however, that in the past the local authorities have been partly financing their housing outlays by drawing upon internal reserves which are now exhausted. Moreover, since the Government has decided not to impose the cut in housing which formed so important a part of the "consequential measures" projected after the devaluation, no savings can be envisaged in the local authorities' aggregate need for finance. Chiefly for these reasons, the total of below-line expenditure is put at £520 million which, after allowing for below-line receipts, leaves the net expected outlay at only £37 million less than last year's net requirements of £487 million. In consequence, the Chancellor faced a prospective "overall" deficit of £9,000,000, in contrast with last year's realised "overall" surplus of £62 million.

The Inflationary Background

In many comments upon the budget, this unexpectedly adverse prospect on the "overall" reckoning has been taken to imply that the Chancellor's room for manœuvre was even narrower than might have been deduced from the estimates given in the "Economic Survey." The Chancellor himself lent some colour to this argument by declaring that "if we are to continue to avoid inflation and so make it possible to continue full employment, we must secure an overall balance in our budget, which means an above-the-line surplus large enough to meet the below-the-line liabilities." In fact, as several recent

articles in *The Economist* have tried to explain, this argument is in principle unsound. A "true" budget surplus on current account is needed to make good the deficiency in private savings; and the requisite size of that surplus is determined by the extent to which those savings fall short of the expected investment outlays for the community as a whole—including such outlays made or financed by the Government itself. The statistical test of how large a surplus is needed to prevent inflation is not, therefore, to be found in the size of the below-line account, but in the shape of the "combined capital account" for the whole community, on the pattern of the estimates given in the "Economic Survey."

This showed that if the pressure of inflation is to be prevented from rising, the spontaneous flow of gross private savings, apart from depreciation provisions, will have to expand substantially; on the official estimates, they would have to rise from £712 million for the calendar year 1949 to £905 million for the current calendar year. This was the sum estimated to be required, after crediting the amount of the "true" budget surplus (with taxes at last year's rates), to finance the domestic investment programme and the £50 million assumed net investment abroad. In principle, the fact that the below-line expenditure proved to be larger than had been expected does not affect this analysis, since any portion of that expenditure which represents (or finances) capital outlay is presumptively already reckoned in the investment programme. In this case, however, one adjustment is needed: the "Economic Survey" estimates assumed that housing outlays would be cut as planned. To that extent—but only to that extent—the state of the below-line account does indicate a greater need for savings than the earlier official estimates implied.

If it can be assumed that the requirement for the current fiscal year will not be very different from that for the calendar year (and if the Chancellor's hopes for exports are to be realised, it will certainly not be less) then the revised official estimates suggest that savings through all channels except the budget surplus would need to rise by appreciably more than £200 million. In other words, if the likely rise was, say, only half that sum, this would mean that strict adherence by the Government both to its own definition of disinflationary objectives and to its own estimates would have compelled it to take steps to increase its "true" budget surplus by at least £100 million (and to show, incidentally, a roughly corresponding "overall" surplus).

If the implications of the statisticians' forecasts are as embarrassing as this, the Chancellor ought not, perhaps, to be judged too harshly for refusing to accept them in their entirety; for, as a later article demonstrates, the technique of estimation of these elusive concepts leaves much to be desired. Influenced, no doubt, by the tactical need for keeping some balance between the opposing political pressures, Sir Stafford ignored the indicated "statistical" need for a bigger surplus and relied instead upon various empirical tests of the temperature of inflation. From these he judged that the condition is now "less inflationary than any time since the war" and that the risk of increased inflation could be averted if he kept his prospective "above-line" surplus merely intact. Most of his arguments in this context looked reasonable—in the sense that neither he nor anyone else can definitely prove or disprove them at this juncture. But one of them involved a real contradiction. Sir Stafford looked to an increase in undistributed profits to support his budget formula; yet he had explained earlier in his statement that company profits, after their ten-year rise, had begun to turn downwards in 1948 and that, for the future, there was need to reckon with "the shift which is now taking place from the earning of large profits towards the payment of more money in the form of salaries and wages."

The Tax Changes

For this reason among others, this budget may have given some hostages to inflation; but the Chancellor has at least kept within the limits that he set himself. The tax changes are few, and there is nothing spurious in the neat balance between concessions and new burdens, though political considerations have plainly dominated the choice on both sides. To permit some gesture to the trade unions, the Chancellor had to find new sources of revenue. By raising the duty on petrol and on heavy oil used in road vehicles from 9d. to 1s. 6d. a gallon, he expects to secure £68½ million this year and £73 million in a full year. A further £8,000,000 this year and £11½ million in a full year is to be found by imposing a 33⅓ per cent purchase tax on commercial vehicles. The yield from these two new taxes, the details of which are discussed below, will cover with a little to spare the one major tax concession.

This takes the form of a reduction of one-sixth in the so-called "reduced rates" of income tax that are applied to the first slices of taxable income: the 3s. in the £ previously charged on the first £50 in income becomes 2s. 6d. and the 6s. on the next £200 of income becomes 5s. These reliefs will cost £72 million this year and £82 million in a full year. They will benefit all income-tax payers, and are therefore welcome; but it is questionable whether they represent the most judicious expenditure of the money they will cost—whether from the standpoint of promoting incentive among workers or

from that of averting the threatened disintegration of the wage-freeze policy. The disgruntled workers with the strongest case for wage increases are the lowest-paid groups who will gain little or nothing from these concessions; this budget has nothing to offer those who are within the income-tax exemption limit. At the other end of the scale, the single man earning about £600 a year or more and the married man with two children earning about £700 or more will secure the maximum relief of £11 5s. in any case. In other words, it is only between these extremes that the change will give any direct incentive by reducing the effective rate of tax on marginal earnings.

Apart from this income-tax change, the only significant relief is a gesture made in the hope of preventing a fall in the yield from beer duty—but by strengthening the beer instead of by conceding the substantial cut in the duty which the brewers have been demanding to enable them to reduce the price. More barley is to be allocated to permit a raising of the basic gravity of beer by 3 degrees, roughly a 10 per cent improvement which restores about half the deterioration from pre-war strength; and the duty will be reduced to enable the brewers to sell the better beer at the present price. This will cost the Exchequer £2,750,000 this year and £3,250,000 next year. The very minor changes in other taxes—affecting, among other things, football pools of the "fixed odds plus" system and articles for war memorials—have no perceptible financial effect.

Thus is the balance between impost and relief maintained. As the table on page 898 shows, the tax increases will in the aggregate provide £76½ million this year, and £74¾ million of this will be given away. The balance in the first full year will be even more precise, the losses then exceeding the gains—but by a mere half-million. This tidy arithmetic faithfully fulfils the objective of protecting the surplus. On the final reckoning, the Chancellor has £2,000,000 to add to the original prospective surplus raising it on the conventional definition to £443 million and on the alternative classification to £413 million, while reducing the "overall" deficit to £7,000,000. Compared with total Government expenditure of nearly £4,000 million, this prospective result, as the Chancellor said, can be regarded as "substantially an overall balance." It is a pity that the same cannot be said with assurance of the nation's overall capital account.

The Petrol Tax

No doubt the private motorist will feel that he is financing the Budget. In fact, however, trade and industry will find most of the new revenue which is to come from the petrol tax. Consumption of motor spirit is now at the rate of about 5,000,000 tons a year, and the motorist's standard ration, together with his summer bonus, has been taking only about 470,000 tons of this. The rest goes to the supplementary ration (itself much larger than the standard ration in total), public service vehicles and taxis, goods vehicles and other users. In the Chancellor's calculation this distribution is to be changed; the present summer ration for private motorists is to be maintained through the year, and it is hoped that the stiff tax will "persuade" business and professional users to save the necessary petrol. The new standard ration will take perhaps 770,000 tons. "Business" users will consume, say, 4,230,000 tons. In addition, diesel oil is used in road vehicles to the extent of 925,000 tons; and ninepence a gallon more will have to be paid on this quantity also.

The truth is that the "private" motorist has long been a relatively unimportant consumer of petroleum. The Chancellor appears to recognise this fact; he expects marginal economies in commercial use to make possible a relatively large increase in the standard ration. He pointed out on Tuesday that in the commercial field rationing cannot effectively restrict consumption, and that Britain is "one of the very few countries that have not yet tried to persuade users to economise in petrol . . . by means of price increases." These are ingenious points. But they do not explain why he has cast his net so wide, adding to the costs of many road users whose consumption is inelastic and many who can hardly be considered as competitors for the motorist's petrol—and even bringing in the consumers of diesel oil, a commodity not usable in motor cars at all. Only the need to raise revenue can explain this. Indeed, it seems clear that the increase in oil taxation is intended first and foremost to raise money, and the other reasons—perhaps, indeed, the increased motoring ration itself—are afterthoughts. Even the patent desire to help the railways against road competition may be an afterthought.

Petrol rationing has become so burdensome in relation to its importance that a bold and severe use of the price mechanism could in some ways be justified if it brought rationing to an end. But any such attempt would have to be preceded by careful inquiry, and qualified by great care not to increase the general level of costs avoidably. It would have to be sharp, and it would have to accompany or follow other disinflationary measures. Clearly nothing of the kind is being attempted now. All that has happened is that a Government has once again had to turn to oil as a tax-carrier. The oil trade, which has not yet been permitted to charge the public the full increase in the landed cost of petrol which followed from devaluation, must have found some irony in the terms in which the increased tax was announced; for some months now the Government has been virtuously "protecting" consumers against a justifiable commercial increase of ¾d. a gallon.

The farmers, who will not have to pay purchase tax on tractors, are to be compensated by a grant for the tax they will have to pay on the petrol used in "agricultural operations." Thus the anomaly which taxes the petrol-driven tractor and leaves the kerosene-driven tractor exempt is at least not to be widened. But, if agriculture is spared, the incidence on industry is severe. The tax does not fall on diesel oil for use in stationary engines, but it does fall on diesel oil for road vehicles, which is precisely the same oil. All the light petroleum products (i.e. all those lighter than kerosene) pay the same tax as motor spirit whether they are used on the roads or not. Substantial quantities of them—perhaps 200,000 tons a year—are used as process materials in various industries, and the case for exempting these materials from the petrol tax has long been cogent. Instead, they are now to pay twice as much tax as before. The structure has become more complicated, and more inequitable.

Fewer Commercial Vehicles?

The decision to impose a 33⅓ per cent purchase tax on commercial vehicles is evidently related to the assertion in the "Economic Survey" that "the goods

vehicle fleet is now numerically sufficient to meet the country's basic needs." This is an unsupported contention, which the manufacturers of commercial vehicles would not, of course, accept; it appears that the industries and trades which use the vehicles would not accept it either, for they incurred strong disapproval by buying 100,000 vehicles last year instead of the 50,000 which the planners meant them to buy. In Sir Stafford's words—

> The over-investment in this item was illustrated by the fact that the forecast for 1949 was £35 million, whereas the actual expenditure turned out at £72.5 million.

More humble forecasters would have taken this to mean that the forecast was wrong. Instead, it seems to be held that the manufacturers who sold and the traders who bought the vehicles were wrong. Heavy fiscal measures have been called in to try to make the home investment fit the forecast in future; the new tax on commercial vehicles—from which buses, farm tractors, and some others are exempt—is intended to "assist" the industry to "achieve the desired diversion of its output to exports."

The flaw in this argument (which the manufacturers of commercial vehicles have been pointing out for some time) is that exports have lately been limited not by the volume of output but by the limitations of demand in overseas markets. If this is so, it seems to follow that it is the competitive position of the manufacturers, and not their desire to export, that needs to be fortified. But the artificial restriction of their home market may be expected to weaken their competitive position instead of strengthening it. Whatever the rights and wrongs of this particular argument, few people will welcome the entry of the purchase tax into the field of capital equipment for trade and industry. The purchase tax has often been used to support some real or apparent economic requirement of the moment, but experience has shown that when the requirement is past and forgotten, the tax tends to stick. The motor trade has every reason to fear this; and the trading community as a whole can only expect a further addition to its costs.

More Housing?

If previous utterances on the housing programme meant what they said, the Chancellor's statement on housing could only imply yet another sharp twist in the winding road of capital investment policy. The provision of permanent houses and flats has been running at a rate of about 200,000 dwellings a year. It was to be cut as one of the "consequential measures." The "Economic Survey" repeated the warning last month; the rate was to be brought down to about 185,000 a year. Now the programme is to be the completion of 200,000 houses a year from 1950 until 1952. In fact, as the "Economic Survey" argued, it takes time to cut a housing programme, and there is no serious reason to suppose that the belt-tightening announced in the autumn has yet had much effect. It is true that the number of completions fell from 216,683 in 1948 to 192,374 in 1949; but the rate rose towards the end of the year and 50,200 dwellings were completed in the fourth quarter. The number of houses under construction rose from 187,836 at the end of 1948 to 195,404 at the end of 1949.

In effect, therefore, the cut in housing was an intention which has been abandoned before it could be carried very far. What has persuaded the Chancellor to drop it? An economic reason? The hope that he held out of better timber and material supplies was not at all specific. He spoke of factory building "tailing off somewhat"—but the context suggested that he referred primarily to the Government-supported programme of factory building in the development areas. There has been no sign that the other building requirements of industry are approaching satisfaction, or that the rate of industrial building in general can be cut further without doing harm.

Yet the housing programme is to be fixed, it is to have "a special preferential place," and "the rest of the capital investment programme must conform." This is an unexpected doctrine to come from such an austere quarter. It leaves many questions unanswered. Are the extra houses to be built in the development areas, to employ the labour released from factory-building? To suppose this implies a degree of flexibility which is unusual in the building trade. Is the restriction of licences for repair and maintenance to be relaxed also? Or is it to be tightened up still more? The "Economic Survey" talked of reducing fixed investment all round, but no measures in this field can mean much unless they are persevered in for a year or two at least.

The National Income

THIS is the season of economic stocktaking, when the "Economic Survey," the annual White Paper on the National Income, and the Budget follow in rapid succession. It is not easy to keep afloat in this flood of facts and figures which the official statisticians release each spring. But it is important to make the attempt, particularly in the case of the National Income estimates, to reach some understanding of how they are made, what they show, and how reliable they are. This is no simple exercise. The National Income may be merely the summation of the many millions of separate incomes of the community; but some of these separate incomes are known promptly and accurately, and others have to be guessed. So the figures are a compound of the reasonably precise and the frankly hit-or-miss. To get greater precision means waiting longer and making the already formidable collection of statistical tables even more complex. The foundation of the White Paper is the belief that the national income approach is the soundest way of studying the real character of economic factors and the changes which occur in them. This view is undoubtedly right, and those who hold it can, by hard reading and hard thinking, make important use of the White Paper.

For many reasons, the White Paper is, and is likely to remain, a tough economic discipline. It shows each year improvements in content and presentation which, though commendable, are disconcerting to those who look for continuity. Its figures are also subject to a continuous process of revision. An example is to be found in the writing-up of the total of "gross personal saving" for 1948, originally estimated in the White Paper a year ago at £220 million, and now revised to £409 million. Figures for savings and capital investment are notoriously subject to error but it may be thought that an alteration of this order deserves some

word of explanation, if only to assist the reader to give the proper weight to the estimates which are now put forward (and will, in many cases, be altered a year hence) for 1949. Successive White Papers have made no secret of the technical difficulties in producing accurate and up-to-date information. But would not these problems be better understood if the text were to describe not merely the latest year's estimates but also the changes which had been made in those for the preceding year? A separate chapter headed "Where we went wrong last year" should be an annual feature of the White Paper.

There are several ways of looking at the national income. It can be measured by the value of what the community makes (that is, the gross national product) or by what each section of the community receives in wages, salaries and profits (that is, the national income) or by what each section of the community spends on consumption, public service and investment (the national expenditure). These concepts are not identical but they largely cover the same economic area, since payments to the various factors of production account for the value of current output, and those payments are in turn spent by consumers (either directly or on their behalf by public authorities) or saved and invested. This broad identity is illustrated in the table below and chart overleaf.

According to these estimates, the gross national product increased last year by 8 per cent to £11,076 million; of this increase more than half was recorded by manufacturing and other industry, whose real output (after allowing for changes in prices) increased by about 6½ per cent. For trading enterprises as a whole, output last year increased by £743 million to £9,475 million. The White Paper purports to show that the share in industrial output distributed to wage and salary earners declined last year (though their total payments increased from £5,385 million to £5,659 million) from 62 per cent to 60 per cent of the whole; and it describes the increased share of "Other incomes and depreciation" (which absorbed £3,816 million against £3,347 million) as "a shift to profit." This item, however, is the familiar *omnium gatherum* which has appeared in earlier White Papers; it includes profits of companies and public enterprises, and the income of farmers and professional men. This year, however, it has been stripped (so far as trading enterprises are concerned) of the automatic increase in profits which results from the rising prices of stocks and work in progress. This is an improvement in presentation, but it is a pity that the reasons for the change and the method by which it has been calculated are not more lucidly and more accurately described in the White Paper. It is, at first sight, surprising to be told that the element in profits which corresponds to increased price levels for stocks was as high as £400 million in 1948, and only £75 million in 1949; nor would accountants and businessmen accept as it stands the statement in the White Paper that "this element of inventory revaluation enters into 'profit' as normally understood."

Personal incomes last year are estimated to have risen from £9,754 million to £10,166 million before tax, to which the net income of public authorities (after making tax transfers) together with company reserves added £60 million, compared with £174 million in 1948. The result (as shown in the third section of the table) was an increase in the national income (strictly so-called) from £9,928 million to £10,226 million. This is a figure struck after provision for depreciation, for which last year the statisticians have allowed an increase by £200 million to £975 million, to reflect the increase in initial tax allowances on plant purchased from April last year. The amounts allowed for depreciation are tax allowances, and they include nothing in respect of additional provision for depreciation.

The fourth section of the table divides the gross national income (that is, including depreciation) between consumption, public spending and investment. This table, unlike the others, is given in terms of market prices, and not in terms of factor costs. The figures in it are increased by the extent of indirect taxes, and diminished by subsidies. Included in the total sums paid for goods entering into personal consumption—£8,402 million last year against £8,108 million in 1948—was a payment for taxes, less subsidies, of £1,440 million last year compared with £1,464 million in 1948. Some tax element also enters into the capital investment account, which is estimated to have absorbed £2,465 million in 1949 compared with £2,590 million in 1948. There are

GROSS NATIONAL PRODUCT	1948	1949
	£ m.	£ m.

Less Indirect taxes	−2,184	−2,183
	10,703	11,201

(*a*) Includes depreciation, but excludes "inventory revaluation."

two elements in this fall. One is the lower allowance for the cost of replacing stocks in 1949, because prices increased less rapidly than in 1948. The other is the fact that new investment in fixed capital was lower, after excluding depreciation provisions, by about £55 million. But the volume of stocks increased last year, and there was also a net improvement of £80 million in the overseas deficit, both of which called for finance.

Of all the sections of the national income estimates, the savings and investment account is really the key to economic policy. It is hoped to devote more detailed attention to it on a later occasion, and also to compare in some detail the trends of profits as recorded in the White Paper with those shown by *The Economist's* estimates. These more or less recondite matters will, therefore, be left over. They affect the broad division of the national income, and therefore the examination of the next table, showing its division between various factors of production, must be somewhat sketchy. Since all shares nowadays must be "fair shares," and since pointed attention cannot be drawn to one class of incomes without inviting furious denunciation (not to mention the resignation of junior ministers) the changes shown in the national share-out touch the very quick of political sensitiveness. The figures (to which percentages have been added, in replacement of a very inadequate table in the White Paper which purports to show changes in different classes of income) are given opposite.

The broad pattern of changes in the distribution of the national income in 1938 (when wages received 37.4 per cent of the national income) is now well appreciated. The process of redistribution continued last year, when wages increased their share by 1 per cent, and salaries by nearly half of one per cent. In this table the "inventory gains" excluded from "other incomes" in the earlier table have been added back to profits, but the depreciation provisions are excluded. On this basis, which is a perfectly proper one, the share of the national income going to company profits last year was reduced from 17 per cent to 15½ per cent. This result seems rather difficult to reconcile with earlier observations in the White Paper referring to "a shift to profit" in 1949.

The discovery that personal saving in 1948 was not so critically low as last year's White Paper had suggested is welcome, though unexplained. The statisticians now seem satisfied that "in each of the last three years personal saving has been of the order of £400 million." Of last year's increase of £412 million in personal incomes, taxation absorbed £100 million more, some £294 million was spent, and only £18 million added to savings. The figures are given overleaf, with a comparison of the 1948 figures as originally presented and as now revised.

Apart from these disconcerting changes—which show how vulnerable any measurement of the margin of

PERSONAL EXPENDITURE AND SAVING

	1938	1946	1947	1948		1949

Less Personal expenditure	—4,304	—6,790	—7,513	*—8,004*	—8,108	—8,402
Gross personal saving	217	802	440	*220*	409	427
Percentages						
Personal expenditure	*95·2*	*89·5*	*94·5*	*97·3*	*95·2*	*95·2*
Gross personal saving	*4·8*	*10·5*	*5·5*	*2·7*	*4·8*	*4·8*
Personal disposable income	*100·0*	*100·0*	*100·0*	*100·0*	*100·0*	*100·0*

personal saving is—there is another point not apparent from the figures as they stand. The total of £427 million in 1949 is an estimate of gross personal saving; to get at the net personal saving it is necessary to deduct the amount of taxes paid on capital, which represent dissaving. This figure is put at £253 million in 1949. Thus well over half of the gross amounts estimated to have been saved by individuals was offset by taxes paid out of capital to the state.

Among the riches, and the difficulties, of the White Paper, the attempt to measure consumers' expenditure is not least ambitious. There is evidence again that the pattern of expenditure has shifted further towards the prewar shape. Total personal expenditure increased by about 4 per cent, and the "volume" of purchases by perhaps 2 per cent after allowing for price changes. But outlays on beer and tobacco, entertainments and "other services" all fell. The following table shows consumers' outlays as index numbers based on 1948:—

PERSONAL EXPENDITURE ON CONSUMERS' GOODS AND SERVICES

(1948=100)

	Outlay (At Market Prices)			Volume (Revalued at 1948 Prices)		
	1946	1947	1949	1946	1947	1949
Food	80	92	107	92	99	104
Alcoholic drink	89	89	94	103	102	96
Tobacco	78	89	99	118	103	97
Rent, rates and water charges	92	97	103	96	98	102
Fuel and light	86	91	103	95	100	101
Durable household goods	69	90	111	79	96	109
Other household goods	75	88	113	90	94	111
Clothing	72	83	111	81	91	106
Books, newspapers, etc.	83	94	107	86	94	106
Private motoring	127	138	126	136	143	119
Travel	84	92	100	98	96	100
Communication services	95	98	104	96	98	102
Entertainments	102	97	97	103	97	97
Domestic service	80	92	101	86	94	100
Other services	87	97	96	97	103	93
Other goods	79	94	104	85	97	104
Total Personal Expenditure	84	93	104	97	100	102

To sum up, 1949 was a year in which the consumer (and particularly the wage-earner) spent more, the Government spent more, and about the same amount was set aside for new capital investment. It was a year in which the principle of dividend restraint was fully observed—gross dividends in fact fell slightly from £715 million to £710 million—and trading profits (after depreciation) fell. The conclusions are not repugnant to common observation. No doubt some of the figures will be changed—and perhaps radically—in next year's White Paper. But if many of the figures are conjectural and some of the methods of presentation fussy, the White Paper is still a document of prime economic importance. When it is read and understood by one out of every hundred adults, the country will have made real progress in economic understanding.

International Banking

A SURVEY BY THE FINANCIAL TIMES

CONTINUING its authoritative reviews of major industrial and commercial activities, THE FINANCIAL TIMES publishes with its issue of April 24, 1950 a Survey of International Banking. An introductory article by Lord Linlithgow, President of the Clearing Banks Association, discusses the Role of Banking in British Recovery, and in other articles the main aspects of World Banking are critically examined:

CONVERTIBILITY OF STERLING

FINANCING GOVERNMENT DEBT

THE FUTURE OF INTEREST RATES

STERLING AREA MECHANISM

THE CHANGING STRUCTURE OF BRITISH BANKING IN POST-WAR YEARS

Separate Articles upon Banking in Canada, South Africa, India, Pakistan, Australia, New Zealand, France, Belgium, Italy and Switzerland.

Everyone responsibly concerned with international commerce should read this acute and factual analysis.

Business Notes

The City and the Budget

The City, nowadays, is so conscious of the deadlock which astronomical Government expenditure has imposed upon the national finances that it can no longer be heartened by any budget which fails to ease this paralysing grip. Had the Chancellor essayed any new drive against capital or profits, the markets would doubtless have taken fright; but they are too oppressed to show positive response to the mere avoidance of evils that might have been. The general reaction to the budget may develop later, but so far the only clearly discernible effects have been confined to those specific sections of the market directly affected by the tax changes or by disappointment at the absence of anticipated changes.

Before the budget, possible reductions in taxes had as usual played on the imagination of the more hopeful. The most confidently held expectation had, of course, been that of a cut in the beer duty; in the event, the meagre relief from the change in gravity of beer proposed by Sir Stafford was regarded with disdain. Brewery shares proved to be the most vulnerable of all on Wednesday. A like disappointment in respect of the tobacco and entertainment duties prompted a more moderate set-back in these market spheres, but here the hopes had never been strong. Elsewhere, oil and motor shares temporarily sagged more than any others in view of the doubling of the duty on petrol and oil. But these shares —like most others except breweries—rallied later, since few people appeared unduly concerned at the probable consequences for the companies directly affected. Some sharp fluctuations took place in the shares of commercial vehicle companies following the imposition of purchase tax, but in the end prices were practically unchanged. The recent firmness in gilt-edged has not been disturbed by the budget, but on Thursday misgivings about the likely effect of the petrol tax on industrial costs may have been reflected in the shading of prices; a more significant influence, however, was doubtless the fears of another big dock strike. But if the budget has provided no grounds for optimism about the gilt-edged prospect, this section of the market has not exhausted the mild tonic it received from the improvement in gold and dollar reserves—and from the knowledge that the authorities must be concerned to keep it in trim for the impending electricity issue.

* * *

New Limit for Subsidies

None of the decisions announced in the budget speech is intended to affect the estimates of above-line expenditure already submitted to Parliament. In particular, although the bill for subsidies is to be reduced to £410 million, this was the figure assumed in the estimates and resulted from the steps envisaged by last autumn's "consequential measures." The Chancellor hoped that "no further increases of price in the basic foods will be necessary, anyway for some time to come." After these changes, the current annual rate had become £410 million; and this, in the Chancellor's words, is to be not only a ceiling but also a floor. If the Ministry of Food has to pay more for its purchases, the increased cost will be passed on to consumers. On the other hand, if the Ministry's purchase prices fall, the benefit will be reflected in lower retail prices. This does not mean, of course, that, if Britain buys cheaper meat from Argentina or Australia, the retail price of meat itself will necessarily fall. The saving to the Ministry may be passed on by reducing prices of other foodstuffs—in the same way as the increased prices for home-produced meat and milk, which were announced earlier this year, are to be borne by consumers of butter and bacon.

Twelve months ago, the Chancellor limited the subsidy bill to £465 million; this compared with the £568 million which would have been required in 1949-50 if 1948-49 subsidy rates had been maintained. The saving was effected by raising the retail prices of meat and cheese by 4d. a lb. each, by raising the price of butter by 2d. a lb., that of margarine by 1d. a lb. and by reducing the import duties on tea and sugar without reducing their retail prices. The actual cost in the past financial year is believed to have been well below the maximum; in an article in these columns last week it was estimated at £440 million. From the beginning of the new fiscal year, the subsidies on animal feeding stuffs and fish were discontinued, saving the Exchequer nearly £41 million. Last autumn, too, a small economy was effected when prices of dried and frozen eggs and raisins were raised; according to the Chancellor, certain administrative savings have also been made. These reductions bring Sir Stafford's estimate of the total cost of subsidies for 1950-51 down to £410 million. This figure suggests that the general level of rations this year will be higher than in 1949-50—but certainly not so much higher as was assumed in last week's article, when the total cost of subsidies for 1950-51 was estimated at £425 million. Mr Douglas Jay, however, suggested on Wednesday that if the general supply of food increased during the year, certain retail prices would have to be raised to keep the total cost of subsidies at its new limit. This policy may be put to the test sooner than was anticipated. Two days after the Budget, India announced that the Ministry of Food has agreed to pay 4d. a lb. more for tea this year.

The savings, past and prospective, on subsidies since April, 1949, have been partly due to the lower purchase prices which the Ministry of Food has been able to secure—probably not more than £35 million of it. The rest has been or will be achieved by raising the price of butter by 6d. a lb., meat and cheese by 4d. a lb., bacon by 2d. a lb. and margarine by 1d. a lb.—an increased cost to the average consumer on present rations of nearly 7d. a week.

Argentina Thinks Again

Anglo-Argentine negotiations in Buenos Aires are now going ahead at full speed; both sides have sensibly agreed to refer the question of the meat price to a separate committee to prevent it becoming a King Charles's head at every meeting between the parties. It is important that this one problem should not hold up the whole course of the negotiations, for both sides have to make up their minds whether they are going to denounce the agreement before April 30th; unless one or other of them does so before then, the 1949 trade agreement—though not the prices written into it—will be automatically extended for another year. Two weeks ago it was reliably reported that Britain did intend to denounce the agreement unless it received evidence of a more co-operative attitude on the Argentine side. Argentina, which is still desperately dependent on sterling area supplies of coal and oil, has therefore found itself in the unaccustomed position of working hard for a compromise.

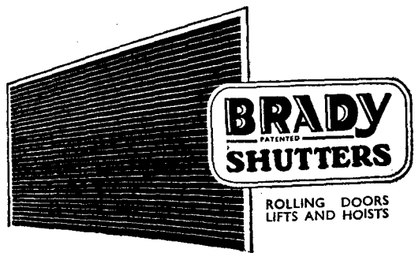
Meanwhile, the Buenos Aires press has published a summary of Argentina's reply to the official British note accusing it of non-compliance with the terms of last year's agreement. Up to a point this reply has a ring of sincerity. It is quite true that Argentina's failure to grant licences for "unessential" imports from Britain and its less excusable failure to honour its commercial debt commitments have been due not to wilfulness but to shortage of foreign exchange. The Argentine note itself declares that the Banco Central's sterling holdings have run down from £60 million last June to £12 million now; this £12 million is much less than Argentina's outstanding sterling debts. The depletion of Argentina's sterling reserve, however, is due not to a blameworthy shortfall of British purchases—as the Note alleges—but to a shortfall of Argentine agricultural production which is attributable to the system of discriminatory exchange rates under which Argentine agricultural interests are forced to exchange their sterling earnings for less than half the pesos that favoured industrialists get for theirs. This week, incidentally, General Perón himself went to the microphone, expressed sorrow at the shortfall in production and helpfully informed farmers that the new constitution gave him power to order them to step up their output. General Perón's strong words may have been prompted by the report that Britain is suspending coal shipments to Argentina because the National Coal Board has not received £500,000 for coal already sent. If this is so, the writing would indeed seem to be on the wall for the Argentine Five Year Plan. General Perón may well realise in private, even if he does not admit it in public, that there can be no recovery of Argentina's exports—and therefore no assurance that any Anglo-Argentine trade agreement will work out properly—until a fairer exchange structure is set up to reinforce his own broadcast orders.

* * *

Future of Steel Control

The steel distribution scheme is once more under Government review. The case for abolishing it has been argued repeatedly by the British Iron and Steel Federation, and the arguments have grown steadily harder to meet as evidence has piled up of adequate (not to say abundant) supplies of most kinds of steel. Now the trade union side of the industry has come out openly for abolition in an article in *Man and Metal*, the journal of the Iron and Steel Trades Confederation, of which Mr Lincoln Evans is secretary. *Man and Metal* concedes that earlier demands "may, perhaps, have been a little premature," but points out that the improvement in steel supplies recorded in the "Economic Survey" has strengthened the case:

> Every scrap of evidence available points to the fact that the steel shortage, except for sheets and tinplates, is now virtually over, and the Government should now discontinue, or at least modify, controls for which we are convinced there is no further need. Their unnecessary retention cannot do the slightest good and might well do a good deal of harm.



This is plain speaking. Discussions on the future of steel allocation are going on now, and it may appear shortly whether the door at which the confederation has decided to push is already opening.

Perhaps inevitably, the steel distribution scheme is a complex and cumbersome affair, and its decease is unlikely to be mourned by anyone who does not desire the control for its own sake. The present system is that an "availability" of steel is determined each quarter by the iron and steel division of the Ministry of Supply in consultation with the industry, and on this basis the Materials Committee makes a division of steel supplies between the interested government departments. These departments are numerous, and all sit on the committee. The lion's share goes to the Ministry of Supply as foster-parent to most of the steel-using industries, and the process of sharing out is then repeated between the numerous divisions of the Ministry of Supply. It is probably impossible to say how many people are kept in work by this procedure. It is not the civil servants who are the most numerous, but the employees of industrial firms—suppliers and users of steel—who keep the meticulous records which are required to show what happens each quarter to each authorisation.

All this clerical work would only be justified if it were

It's an old-fashioned word

"Service" as understood in industry has lost a lot of its old meaning — but the Brady service is still exceptional, and as famous as the Brady Shutter. The roller shutter is not a new invention but, in the Brady roller Shutter, there is a lot that is new — new patents, new materials, new finishes — which have greatly extended their usefulness. In factories, offices, hotels, houses, on commercial vehicles and aeroplanes, we can show how a Brady Shutter helps the job along, as efficiently as Brady hand and power operated lifts.

A Sensible Policy for Process Steam—8

Process heat transfer decides plant earnings

BY SPIRAX

The earning capacity of a process steam plant is good or bad or indifferent according to what happens *at the actual point of steam usage*, where the transfer of heat from the steam to the process takes place.

The rate at which the heat is able to get to the stuff you are processing is the final deciding factor of output economy.

If the heat had only to pass through the metal wall of the process heating unit, life would be easier. But between the steam and the metal are formidable obstructions. They are stagnant films of air and water, clinging to the condensing surfaces and putting up an astonishing resistance to heat flow.

These films are at the root of sluggish heating, unsatisfactory output and excessive steam consumption. They are present in the steam spaces of all process heating units of whatever kind, shape or size.

The methods of dealing with the films, and reducing their resistance to good heating performance, are well tried and immediately effective.

NOTES ALREADY APPEARED: *Jan.* 14, "A sensible policy for process steam"; *Jan.* 28, "Who controls your steam stores?"; *Feb.* 11, "Do you get full value from your steam?"; *Feb.* 25, "What steam costing will tell you"; *March* 11, "Meter your steam to get the facts"; *March* 25, "Why have a boilerhouse?"; *April* 8, "Four pillars of process steam wisdom"; **STILL TO APPEAR:** *May* 6, "Resistant films v. process economy"; *May* 20, "The air film handicap on output"; *June* 3, "Removing the air film handicap"; *June* 17, "Water film against process output"; *July* 1, "Individual steam separation"; *July* 15, "How are your steam traps chosen?"; *July* 29, "Better steam trapping, better output economy"; *Aug.* 12, "The steam circulation system"; *Aug.* 26, "Steam pressures under control"; *Sept.* 9, "Thermostatic control simplified"; *Sept.* 23, "Intelligent use of 'waste' heat from steam"; *Oct.* 7, "Flash steam on the agenda"; *Oct.* 21, "Better condensate return systems"; *Nov.* 4, "A place for the automatic pump"; *Nov.* 18, "Heat transfer summing up"; *Dec.* 2, "The more you know about process steam"; *Dec.* 16, "Two instructional courses for steam executives"; *Dec.* 30, "For advice on process steam problems"

really necessary to direct the flow of steel. But for most types of steel such direction is no longer necessary or, in practice, possible. The Iron and Steel Federation at one time employed a busy department in attending to the complaints of steel users who could not get the steel which they were authorised to buy. A complaint has now become an extreme rarity, but not because authorisations are sparingly given out; on the contrary, it has become just as exceptional to hear of a firm wanting an authorisation but unable to get one. Sheet and tinplate are exceptions, and the only question remaining at issue may now be whether provision can be made for the management of these two groups of commodities without preserving too much of the present apparatus of steel control.

* * *

The Budget and Tax Avoidance

As the Chancellor threatened in his Budget speech two years ago and as Mr Glenvil Hall forecast in the House last November, the Government has resorted to retroactive legislation to stop tax avoidance by means of restrictive covenants of the kind which has lately attracted so much publicity. In the autumn of 1949 two leading motor manufacturing companies each entered into agreements to pay over sums of approximately £100,000 to their managing directors in consideration of their agreeing never to offer their services to other firms in the motor industry. The Budget, therefore, lays down that cash and other benefits received as consideration for restrictive covenants of this kind shall be charged to surtax for 1949-50 and subsequent years, the charge being based on the value of the benefits grossed up by reference to the standard rate of income-tax. In the case of large sums this means that over 95 per cent of them will be paid over in tax next January; if the two managing directors are already paying tax at 19s. 6d. in the £ on their marginal income (i.e., a surtax rate of 10s. 6d. in the £) they will receive one hundred thousand sixpences instead of one hundred thousand pounds from the deal. In view of the possibility that tax avoidance arrangements on the lines of these restrictive covenants might be widely extended throughout industry, it was obvious that this gap had to be closed for future years. Retroactive legislation, however—of which there have been several regrettable instances in recent years—represents an ugly departure from the traditions of British constitutional practice; on the long view, it is likely to be more harmful to the well-being of the community than any fostering of resentment among those who are outraged by these incidents.

The resort to tax-free covenants last year was prompted of course by the present punitive rates of income-tax and surtax. The Chancellor's speech did, however, contain one hint of possible relief to a section of the community which is particularly hard hit by these rates. At the present moment employees of concerns which run superannuation and retirement schemes can secure income-tax relief to the full extent of their contributions under these schemes—provided that they are drawn up to conform with the regulations laid down under sections 19 to 23 of the 1947 Finance Act. Professional and self-employed persons, however, have been unable to enjoy these tax advantages. The Chancellor has now announced the setting up of a committee to examine this problem; this committee will be under the chairmanship of Mr Millard Tucker who is, of course, already chairman of the committee examining the question of the assessment of profits for tax purposes.

Brazilian Bonds Redemption

The Brazilian Government has not waited long before deciding to apply its rising sterling holdings—now standing at over £45 million compared with £35 million after sterling's devaluation—towards the redemption of its bonded sterling debt. Its decision to do so came as a complete surprise to the market. It was announced last week-end that six issues with a nominal value of £17 million are to be redeemed and, as the table below indicates, the news provoked some spectacular price movements. The "Plan A" five per cent funding bonds, 1914, jumped on Monday from £75½ to £99. Other plan "A" bonds, though not

BRAZILIAN BONDS TO BE REDEEMED

Issue	Amount Outstanding Plan "A" £ mn.	Amount Outstanding Plan "B" £ mn.	Price April 14th "A"	Price April 14th "B"	Price April 20th "A"	Price April 20th "B"
5% Funding Loan, 1898	2·6	1·0	90	80	99½	80½
5% Funding Loan, 1914	4·2	4·1	75½	76	99	79
5% 20-year Funding Loan, 1931	0·5	0·2	98½	79	99½	80
5% 40-year Funding Loan, 1931	2·3	1·4	77½	78	99½	79½
Lloyd Brasileiro 4% Sterling Bonds	0·1	...	98½	...	99	...
4% Loan, 1911	0·5	0·4	86½	49	99	50
TOTAL	10·6	7·1				

yet on the redemption list, have also risen sharply. It will be recalled that, under the Brazilian debt agreement of 1943, bondholders were given two alternatives. Under "Plan A" they had to accept a cut in interest rates but were not asked to make any capital sacrifice. Under "Plan B," interest rates remained unchanged but the face value of the bonds was cut to 80 per cent, except that, for the four per cent 1911 loan, the cut was to 50. Hence it was among the "Plan A" bonds that Monday's market response was most violent.

Other Brazilian bonds were firm, partly in the hope of further redemptions in the early future and partly in anticipation of the cumulative effect of sinking fund purchases. The sinking funds operate at a constant rate based upon the amounts of debt outstanding at the time of the agreement. Hence an unchanged amount of money is applied to purchases from a steadily declining amount of bonds.

The prospect that redemption would proceed smoothly was later rudely shaken, however, by an unfortunate confusion about the repayment of a seventh issue. On Wednesday afternoon Messrs N. M. Rothschild and Sons announced on receipt of a cable from Brazil to the effect that the 6½ per cent 1927 sterling loan (of which some £4 million is outstanding) would also be redeemed. But by the time the Stock Exchange had opened the following morning, a further cable had countermanded the earlier instructions. This new information was promptly made available to the market, whereupon dealings were temporarily suspended in the issue in question. This regrettable display of wavering on the part of the Brazilian authorities requires explanation.

Record Trade in March

Britain's overseas trade reached record levels last month. Exports amounted to £184.3 million, the highest figure yet recorded—some £28.5 million more than in February and £8,400,000 more than in January, the previous peak. March had an extra working day (27 instead of the usual 26), but even when allowance is made for this fact, exports were still at a record level. On this basis they were 17 per cent larger than the average for 1949. Re-exports at £6,700,000 were also high. Total exports for the first quarter of this year thus amounted to £534 million compared with £475 million in the first three months of 1949.

This expansion in exports is no mean achievement. But imports, too, reached a record level in March of £221.3 million, nearly £20 million more than the previous peak last June. Since devaluation the cost of imports has been high; for the first three months of this year it totalled £604 million against £538 million in the corresponding

period of 1949. Thus, despite the great efforts made by the export industries, the cumulative excess of imports (reckoned c.i.f.) over total exports (reckoned f.o.b.) in the first quarter was £7,000,000 more than twelve months ago. The visible deficit for the first three months of this year reached £70 million compared with £63 million in the first quarter of 1949.

British exports to the United States and Canada showed a welcome recovery in March. Sales to America, which had been declining since November, again expanded, and their average value for the quarter (in terms of US dollars) was higher than in the previous three quarters, but still significantly below their level of a year ago. A sharp

BRITISH EXPORTS TO USA AND CANADA
(Monthly Averages—$ Mn.)

expansion also occurred in shipments to Canada, which for the three months had almost regained (in terms of Canadian dollars) their level of the first quarter of 1949. Total earnings from these two markets reckoned in American currency, however, was still more than 10 per cent below the level of a year ago.

* * *

IMF and Gold

Ever since last autumn the International Monetary Fund has been considering South Africa's request that gold producing members of the IMF should be allowed to sell one half of their output on the free market as monetary gold without going through the subterfuge of processing it and selling it as ostensibly manufactured gold intended solely for industry and the jewellery trade. The verdict of the IMF is due to be given in the near future, and confident reports from Washington suggest that it will reject the South African request. For South Africa this will be a defeat of little significance because the free gold price has now fallen to a point at which accession to its request would have proved worthless. At the present free price of about 38 dollars an ounce it has in fact ceased to be profitable to process newly mined gold in South Africa. Any substantial sales of newly mined gold in the free market would rapidly obliterate what is left of the premium. Mr Havenga, the South African Minister of Finance, referred to this question this week when he pointed out that over the past twelve months the gold mining industry had been able to make a profit of nearly £2,000,000 as a result of these premium sales. He added that those sales might have had some influence in bringing down the free price of gold, but said that surely the South African Government was not to be criticised for that. Mr Havenga confirmed that the report on gold sales drawn up by officials of the International Monetary Fund was now completed, but that before it was submitted to the Governors it had been circulated to gold producing countries in order to see if some way out of the impasse, presumably created by the negative nature of the IMF report, could be found.

In the course of his speech Mr Havenga also announced that the foreign exchange reserve of the South African Reserve Bank had recovered so well that the Government could readily meet its programmed imports for the rest of the year. If the position continues to improve it will be possible to liberalise import licensing so as to meet all legitimate demands of commerce and industry. The latest weekly South African Reserve Bank statement shows a further increase of over £2,300,000 in the gold and foreign exchange holding. At the end of March the foreign exchange reserve, mainly sterling, stood at £77,997,000 and the gold stock at £58,768,000. The ratio of reserves to public liabilities was 69.1 per cent.

* * *

BAT's Bumper Profits

The changes in magnitude revealed in the consolidated accounts of British American Tobacco for the year ended September 30, 1949, are staggering. There is an increase of trading profit from £23,953,208 to £30,679,595 and the direct effect of devaluation accounts for a further £1,786,488 brought to credit for the year. Although the report indicates that inflationary tendencies are rife in the wide trading world of BAT, no other clue is given to such a phenomenal rise in profits. In the result, it is perhaps surprising that the company has not restored the dividend to 15 per cent, tax free, from which it was cut to 14.166 per cent, tax free, last year. But a note to the accounts explains that the company has had to meet heavy demands for finance from subsidiary and associated companies, and that " profits earned are very largely required not only to finance expansion of business, where this is possible, but also to assist the maintenance of the real capital of the group in face of continuing inflationary tendencies in many parts of the world."

The effect of devaluation is more easily discernible in changes in the consolidated balance sheet which shows a rise from £152,846,851 to no less than £191,029,744 in total assets. Some £33 million of this increase is attributable to current assets, of which stocks have risen from £83,665,080 to £106,799,017 and cash from £21.6 million to £27.7 million. The report explains that the higher sterling value of overseas assets at post-devaluation rates of exchange accounts for £11,226,000 of the rise in net current assets from £81,850,155 to £103,744,513. This amount has been transferred direct to reserves, which rose by £21,758,000 over the year.

* * *

Dearer Copper and Zinc

A strong demand for copper in the United States has at last forced smelters to increase their price from 18½ cents a lb. (equivalent to £148 a ton) to 19½ cents (£156). For the past six months deliveries in America have averaged well over 100,000 short tons a month, an offtake well in excess of supplies coming forward. Producers' stocks of refined copper have consequently declined sharply and at the end of March they amounted to little more than 60,000 tons. On Wednesday, the Ministry of Supply, following the New York market, raised its selling price of electrolytic copper by £9 to £162 a ton. Consumption of copper in Britain, however, has fallen appreciably in recent months and stocks at the end of January amounted to 130,000 tons compared with 115,000 tons twelve months earlier. In Europe, too, the demand for copper appears to be much less buoyant than in the United States.

Stocks of zinc in the United States are also being drawn upon ; at the end of March, the estimate was 59,800 short tons against 67,400 tons in February. Twelve months ago, however, stocks of zinc were only 28,200 tons. Nevertheless, the market is firm and in contrast to copper, consumption in countries other than the United States is increasing. This week the American price rose by half a cent to 11 cents a lb (£88 a ton) and the British price by £4 to £95½ a ton. In certain quarters it is held that a shortage of zinc might develop within the next two or three years, if industrial activity persists at its current level. World stocks of zinc concentrates have fallen during the past two years and the opportunities for expanding mine production are said to be limited. But

part of the recent demand for concentrates has come from the American stockpiling authorities who are known to be holding large quantities, while mine output, particularly in Australia, has been restricted until stocks of concentrates held at the mines were reduced from their abnormally high wartime levels. Thus, while there is reason to suppose that the zinc market may remain firm in the immediate future, the prospects of a long term shortage should be discounted.

Mission to Japan

A party of eight representatives of the British cotton industry will leave for Tokyo on May 2nd, led by the chairman of the Cotton Board, Sir Raymond Streat. They will meet in Tokyo a group of American representatives with whom they will make a survey of—presumably—the Japanese cotton trade and its prospects. But their terms of reference have not been precisely set out, or not, at least, in public. Even the question of preparing a report on the results of the mission is to be left to the full Anglo-American cotton trade committee in Washington to consider after the Japanese visit is over.

For the British industry this joint mission is the result of some two years' patient persuasion of the Americans, who remained for a long time unconvinced that a common Anglo-American policy towards the Japanese cotton industry was necessary at all. Indeed, many American exporters of cotton textiles are still more concerned with sterling area trade restrictions than with Japanese competition, and the previous discussions have suggested that American support for any attempt to control the course of Japanese export trade will be conditional on a benevolent attitude by Lancashire towards American exports to some Commonwealth countries. A curious factor in the situation is that by far the largest buyer of Japanese textiles last year was the United Kingdom itself. Japanese exports of cotton piece goods were 171 million yards in the third quarter of 1949; and 61 million of these went to Britain. The United States took 600,000 yards. The British purchases consisted largely of Japanese grey cloth which, after finishing, supplied a large proportion of the British exports to African markets.

* * *

New Deal for BETRO

Bodies and services for the promotion of export trade tend to proliferate, and it is a welcome change for an arrangement to be announced which will lead to less, rather than more, overlapping. The "engagement to render mutual aid" which has been agreed between the Federation of British Industries and the British Export Trade Research Organisation is of this character. The FBI has a large number of overseas offices; BETRO has a smaller number. The overseas offices of the FBI are now to undertake certain kinds of work for BETRO, and will house its representatives, so that it should be able to undertake a greater volume of work more effectively at lower cost. At the same time the federation has undertaken to promote the wider use by its members of the organisation's service for market survey and research; and it is reasonable to expect that this will provide the larger volume of work that is wanted.

The export trade organisation, for its part, is to drop those of its activities which have overlapped with work done by other bodies such as the Board of Trade and the FBI itself. For example, such matters as the finding of possible agents, the credit-worthiness of customers, tariff inquiries, and patents will be left to the FBI; they are, indeed, "bread and butter" to the FBI, as its director, Sir Norman Kipping, observed on Thursday. This is all to the good; the functions of BETRO will be confined to market survey and research for export, and this will give it a clearly defined field in which it can be useful.

BETRO has done some good work since it was formed in 1945, but it has suffered at times from a lack of precision in its purposes, and there is little doubt also that its position as a Government subsidised body has hampered it in gaining the confidence of industry. One last payment is to be taken from the Government to tide over the period of reorganisation and (it is hoped) expanding work that is now opening. After that the organisation will ask for no more Government money; it will rely on the subscriptions of member firms and the fees charged for work done. Government subsidies to BETRO in the past five years have amounted to £106,000.

Stilfontein Issue

A great deal of new capital will be required to bring the new gold mines in South Africa into production, and mining companies have been examining for some time various ways to attract it. Attention so far this year has centred in the OFS field, where "rights offers" to shareholders have brought in sufficient new money to meet the requirements of development for some time. This week the Klerksdorp group, which is situated in southern Transvaal, has announced its intention to the market in its turn. Although mines in this area have not received the publicity given to their neighbours in the OFS, their potentialities were recognised by the spirited rise of New Pioneer shares last year. More recently, attention has been switched to Stilfontein, which has made some big purchases of heavy equipment in recent months, and has been able to accelerate its development programme; its expected date of production has now been advanced to the end of 1952. Though the company appears to have enough funds for the rest of this year, it has now decided to raise the £2,000,000 needed next year for the erection of milling and reduction plant and other projects.

With the Kaffir market in its most undecided frame of mind since devaluation, Stilfontein has decided to strike a new and enterprising note in gold mining finance. It intends next month to make a public offer in London and Johannesburg of £2,000,000 5½ per cent convertible unsecured loan stock redeemable not later than June 30, 1960, at 103 per cent. Conversion may be made into ordinary 5s. shares between October 31, 1950, and January 1, 1952, on the basis of 16 ordinary shares for every £25 of stock; thereafter, until July 1, 1954, a further £25 of stock will be convertible into 11 ordinary shares. The final date for the first conversion offer will allow consideration of possibly six months' developments on the reef; if these match up to borehole performance, the conversion rights should be valuable. The issue is being underwritten, but there should be support on a sufficient scale from the mining houses to make the issue a success—though how many issues of this scale could be financed by present resources is another matter. It is doubtful if the institutions can be tempted by this backdoor method to sally too far into a field where risk capital has previously been considered the appropriate medium of finance.

Radio Component Exhibition

The Radio and Electronic Component Manufacturers' Federation held its seventh annual exhibition in London this week. The price of radio and television sets depends to a very large extent on the ability of the component manufacturers to produce valves, resistors, formers, transformers and insulators of high performance and accuracy at low cost. A radio receiver contains between 40 and 50 components, a television set 200. Component manufacturers have been able to keep down the prices of their standard components with the help of very long runs, and even the components made to an exceptionally high degree of accuracy for limited orders show little price increase on 1938.

The component industry has a far wider market than radio and telecommunications; the market widens as radio and electronic engineering is applied more and more widely in industry, particularly in control mechanisms of all kinds. The development first of radar and then of guided missiles has opened up new military markets, and these, though not at the moment on the scale that they reached during the war, will expand again as new weapons under development are put into production in the next year or two. Military influence is evident at the exhibition not in the form of actual exhibits, but in the tendency to reduce size wherever possible, sometimes at the cost of making production more difficult.

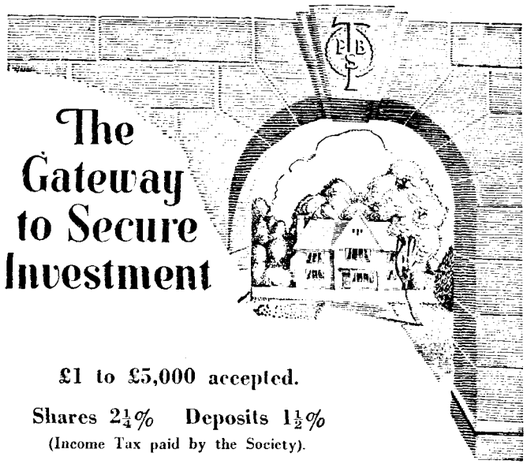
The exhibition was well attended by overseas buyers. The export of components has developed rapidly since the war, partly because of the temporary disappearance of Germany as an exporter. It has been further stimulated by the desire of many countries to build up a radio industry. Some of these countries are not yet able to produce their own components for radio receivers or build their own transmitters, telecommunication equipment, navigational aids or industrial electronic equipment. Britain exported nearly £6,000,000 worth of valves and components last year; Argentina and the British dominions were the best customers.

British exporters have noticed a revival of exports from western Germany in recent months. The scale of this revival is not yet great, but German capacity is believed to be large enough to provide for a considerable volume of exports before long. Some concern is being expressed (perhaps naively) about the price policy of German manufacturers. British prices are level with those of other countries, and the British exporters fear that German managements will under-cut where they find it necessary to get business. Sweden is thought to be the first market threatened. The Swedes have been developing a radio industry since the war on the basis of imported components from Britain and the United States. Their imports from Britain were valued at £153,000 last year, and sales were stimulated by an exhibition held in Stockholm. But the customary links between Swedish and German traders are strong, and the British firms may find it difficult to keep the whole of this trade. Similar customary attachments will probably lead to the loss of some of the South African market. South Africa was the British industry's second largest customer last year, taking components to the value of £342,000. But it may be possible to make up elsewhere the expected losses in these markets. The federation thinks it should be possible to improve on the £74,700 worth of components sold to Canada last year and a components exhibition may be organised in Toronto to start a Canadian sales drive.

* * *

Insecticide Risks

Two new insecticides will be generally on sale this season. One kills insects which come into contact with sprayed surfaces; the other is absorbed into the plant's system and makes it poisonous to all sap-sucking insects. Each remains effective for much longer than other insecticides and the potential demand for both is large. They have one great disadvantage: they are more dangerous to handle than nicotine, previously the most dangerous insecticide in general use, and for a limited time after spraying they taint the crop. The manufacturers have formulated stringent precautions which, if observed, would counteract the risks. A paper in the *British Medical Journal* not long ago described the dangers to a wider, and disturbed, public.



The dangers are probably not being over-rated. The active principle of the contact insecticide is an organic phosphorus compound, *parathion*. In the 20 per cent concentrations in which it is generally marketed, it can easily kill workers who handle it carelessly. The manufacturers say that when an area has been sprayed with a concentration of one part in ten thousand, neither workers nor farm stock should be allowed into the area for three to four weeks. The symptoms of poisoning, headache and giddiness, are slight and may not be appreciated in time for medical treatment. In the United States there have been several deaths from handling parathion and the writer in the *British Medical Journal* described cases of serious illness among workers who had picked pears ten days after the spraying. No accidents have occurred in Britain, but comparatively little parathion has been available. Ten insecticide manufacturers—all the big firms with the exception of Boots Pure Drug Company and Shell Chemicals Ltd.—will sell parathion compounds this season. The largest suppliers will be the Murphy Chemical Company and Plant Protection Ltd. The second type of insecticide, like parathion, is based on phosphorus and it is only a little less dangerous to handle. There are no risks from contact after spraying but, because the insecticide is absorbed into the plant system, the plant itself and its crop (in Britain, primarily hops and strawberries) will be tainted until the compound is broken down into non-poisonous chemicals within the plant. No fruit should be harvested within six weeks of spraying. Pest Control Ltd. are the sole suppliers of this systemic insecticide this season, but Plant Protection will be using experimental quantities of a similar preparation which will not be available yet commercially.

Albright and Wilson Ltd., at present the only British source of the phosphorus intermediates used, have completed plans for a new factory to expand their output. Monsanto Chemicals, already large suppliers in America, will soon sell parathion in bulk in this country. There is no doubt, therefore, that the supply will increase. The manufacturers are selling these dangerous insecticides not to the public but only to contractors and growers. Certain relatively harmless phosphorus insecticides are sold in the normal way. Two of Pest Control's products which are more concentrated and, therefore, more dangerous to handle than the average, will only be sold to contractors who can provide medical and technical supervision.

It is to be hoped that the industry will soon draw up a standard to guide its members' selling policy on these dangerous though useful compounds. Whether the Ministries of Health or Agriculture will intervene will probably depend on the results of this first season in which the insecticides are widely used. If the recommended precautions are taken there need be no accidents, but they are stringent precautions, and in the past less difficult conditions have not been observed. At least one of the four deaths which occurred in Great Britain last year in applying a dangerous weed killer, was caused by a worker failing to wear protective clothing. There also seems to be need for an inquiry into whether the public should be protected in some way against the possible harvesting and marketing of crops within the danger limits laid down by manufacturers. The Medical Research Council is at present studying the general question of toxicity.

Shorter Note

As this issue of *The Economist* went to press it was announced that Treasury bills would henceforth have a currency of 91 days instead of three calendar months as hitherto. Treasury deposit receipts, which have hitherto had a life of five, six or seven calendar months will henceforth run for 154, 182, or 210 days. This eminently sensible—and long overdue—reform will mean that both bills and TDRs will now mature on the same day of the week as that on which they are taken up. Day to day fluctuations between excessive ease and excessive stringency in the money market—involving constant sales or purchases of bills by the authorities—should be considerably reduced except on those occasions when bank holidays throw out the timetable.

PEARL ASSURANCE COMPANY LIMITED

Chairman: **G. R. L. TILLEY, M.A., F.C.I.S.**

Points from the Annual Report and Balance Sheet for the year ending 31st December, 1949.

POLICYHOLDERS' FUNDS £174,113,200 **GROSS INCOME £33,405,018**

INVESTMENTS

The funds show an increase of £8,402,522. The market value of the investments exceeded the price at which they stand in the balance sheet.

LIFE BRANCHES

In the Ordinary Branch sums assured under new policies issued during the year amounted to £15,941,417. Premium income in the Industrial Branch was £14,284,814, an increase of £204,901.

FIRE AND GENERAL

In these Branches the premium income was £3,975,077.

REVERSIONARY BONUSES

ORDINARY BRANCH—£1 6s. 0d. per £100 sum assured on policies entitled to participate in full profits.

INDUSTRIAL BRANCH—A sum of £1,463,696 has been allocated to policyholders in the Industrial Branch, making a total allocation up to date of £16,189,203, all of which has been applied to improve the contractual terms of the policies.

	2,107,987	096

LARGER EARNINGS AND EXPENSES

Aly Shamsy Pasha, the President, in the course of his speech, said:—

Our profit and loss account shows earnings at £E.1,793,607, as against £E.1,740,348 for the previous year. On the other hand, our expenses amount to £E.1,203,877, as against £E.1,169,323 in 1948.

The increase in expenses of £E34,554 is due in part to the normal increases in salaries and allowances, but also to the expenditure incurred on repairing and renovating all our premises in Egypt and the Sudan, which is included in our general expenses. As you are aware, such costs are nearly four times greater than in 1938. We hope, however, that the figure under this heading will be substantially less next year. I can assure the shareholders that we exercise the closest scrutiny over our general expenses in order to prevent extravagance.

The net profits amount to £E589,730, against £E.571,024 for 1948, which enables us to propose a dividend 1 per cent. greater than the previous year, i.e., 20 per cent. per share. This will absorb £E.585,000 and leave abut £E.5,000 to be added to the carry forward.

DIVIDEND POLICY

We consider that the results justify this increase and we would not have proposed it if we did not think that it could be maintained. But shareholders should not interpret this decision as an *indication* that our policy is to increase the dividend regularly. We have been criticised in the past for the conservative policy which we have adopted in the distribution of our profits and especially in the allocations which we have made to our inner reserves, but our prudence in this matter has been justified by events.

You are no doubt aware that there has been a marked fall during the year 1949 in the price of gilt-edged securities on the London Stock Exchange. Due to the policy of accumulating reserves to meet such a contingency, we have been able to distribute 20 per cent. this year in spite of the fall in the market quotation of some holdings in our portfolio. You may rest assured that the margin between the figure at which the securities are shown in the balance sheet and their market value is still substantial and fully sufficient, so far as can be foreseen, to meet any market fluctuations which the future may have in store.

PROBABLE CHANGE OF STATUS

I mentioned here two years ago that if the Government were to approach us with the object of legally conferring on our bank the functions of a central bank, we should be found prepared to contemplate arranging for measures more suitable to present conditions as regards the monetary circulation, the banking system and credit in general, recognising that these are matters in which the supreme guiding principles are the concern of the State. I added that at all events your board remained fully conscious of the responsibilities it bears towards the shareholders, without losing sight of the general interests of the country.

Since that date our attitude has undergone no change, and we have to inform you to-day that the Government has invited us to enter into negotiations with a view to converting the bank into a central bank. The discussions began on February 23rd last, and if they result in a draft agreement reconciling the various interests involved, we shall not fail to call you to an Extraordinary General Meeting in order to submit the matter for your examination and eventual approval.

Report and accounts were adopted.

Copies of the President's address in full will be available at the National Bank of Egypt, 6 and 7, King William Street, London, E.C.4.

LONDON ALUMINIUM COMPANY, LIMITED

SALES MAINTAINED

The annual general meeting of the London Aluminium Company, Limited, was held on April 19th at Birmingham, Mr Duncan Campbell (chairman and joint managing director) presiding.

The following is an extract from his circulated report:—

The trading profit to December 31, 1949, amounted to £149,464, compared with £303,045. After adding to this profit the income in respect of rents, interest and dividends received, and deducting charges, there is a profit, subject only to taxation, of £112,376.

Some years ago we realised that when the war was over there would be a phenomenal demand for aluminium cooking utensils, and arrangements were made accordingly, but we also realised the day would come when the demand would fall off to normal requirements, and we developed plans, laid down long before, to equip ourselves to produce plant for the dairy, brewery and chemical industries, both here and overseas. That this was a wise policy is proved by the fact that although the total sales for 1949 were comparable with 1948, the holloware sales during the year suffered a sharp fall, whereas the heavy engineering showed a satisfactory increase.

As the trading figures for the half-year to June, 1949, were almost exactly comparable with the same period in the preceding year, your directors felt justified in declaring the same interim dividend. I am optimistic regarding the future of this company.

The report was adopted.

PARIPAN LIMITED

HEAVY TAXATION BURDEN

The thirtieth annual general meeting of Paripan Limited was held on April 19th in London.

Mr Percy M. Randall, the chairman, in the course of his speech, said: The profit for the year 1949, before providing for taxation, amounted to £46,989, as compared with £42,145. After providing for the heavy burden of taxation (you will notice that it is more than half the profits) the net profit remaining amounted to £22,430, practically the same figure as for the previous year. We recommend a final dividend of 30 per cent., less income tax, on the ordinary shares which, together with the interim of 10 per cent., makes a total dividend for the year of 40 per cent.

Most people have heard of the Town and Country Planning Act, 1947, but few people appreciate its far-reaching and frustrating effects. The position at the moment is that your company can continue to use its Egham factory as fully as in the past, but cannot carry out any extensions either for manufacturing or welfare purposes. We can, however, repair existing buildings.

In order to safeguard our position the directors are hoping to acquire a building site at Egham with the help of the local authorities, so that if a "life" were imposed on our present factory we should not be forced to leave the Egham district.

Notwithstanding the absurd frustration brought about by our legislators, we have every confidence in the future prosperity of your company based on its high reputation in the trade for the quality of its products.

The report and accounts were adopted.

LEWIS'S INVESTMENT TRUST, LIMITED

FIGHTING THE BATTLE OF HIGHER PRICES

LORD WOOLTON ON PURCHASE TAX ANOMALIES

The twenty-first annual ordinary general meeting of Lewis's Investment Trust, Limited, was held on April 14th in London.

The Right Hon. Lord Woolton, P.C., C.H., D.L., LL.D., chairman and senior managing director, presided, and in the course of his speech said:

We attain our majority today, and it is fitting that we are able to submit for your approval a net profit, after tax, greater than any we have previously achieved. The net profit of the parent company for the year, after tax, is £341,746, which compares with £333,852 last year.

We shall ask you to approve a dividend on the ordinary shares at the same rate of 20 per cent. as last year.

Our balance sheet continues to get stronger year by year, and although we are a holding company and derive our income from rents and dividends, we have still been able to accumulate in 21 years reserves of £1,188,602, as compared with our issued capital of £3,180,290.

The total revenue of our principal subsidiary, Lewis's, Limited, was this year £1,910,399. This compares with £1,913,241 last year and £1,908,794 two years ago.

Our sales again increased, but so did the expenses of doing business, while the percentage of gross profit earned continued to fall. We were able to maintain our profit only because the increase in our turnover was sufficient to counteract the unfavourable movements in expenses and gross profits. But the margin between profit and loss is now so narrow that any fall in sales is likely to have quite disproportionate effects; and that may be brought about by either a fall in public buying power or a drop in the price level of merchandise.

All retailers will agree that public reaction to the high level of retail prices has become perceptibly sharper, and customers are certainly more selective in spending what appears to be the reduced amount of purchasing power which taxation leaves at their disposal. Almost at the beginning of our trading year coupon rationing was abolished. Prior to the event and whatever may have been the truth about the supply position, there was certainly no shortage of Jeremiahs prepared to prophesy disaster as soon as the artificial machinery was removed for imposing what in spite of the disparity of human needs we euphemistically called "fair shares." In fact, nothing of the kind happened.

In my speech last year I gave a number of examples of articles which we had been able to reduce substantially in price as a result of controls being relaxed or removed. I then looked forward to increased opportunities of pursuing the same objective in other fields. Unfortunately, last September sterling devaluation intervened, and the effects of that step are only now being reflected in retail stocks. Over a wide area of merchandise it is now more a question of maintaining retail prices and preventing them from rising further beyond the high levels they have already reached.

I am doubtful whether those in official circles realise how much retailers regret high prices. Success comes to us in proportion to the volume of trade we can do with our capital investment. High prices—whether due to high production costs or to purchase tax—reduce this volume and render us less able to do our job. We are having to fight the battle of higher prices with the flexible weapons that we have forged from generations of experience rendered useless by being encased in a solid mass of Government orders and regulations. These determine the margin of profit on almost every article we sell and so render any merchandising of goods or averaging of profit impossible to achieve. I am so confident that producers and distributors in combination could, if they were given freedom to operate on a broader basis, make an impression on prices even in the face of devaluation, that I again plead for the removal of detailed control of margins at least in non-food merchandise. Governments will be wise to trust the traders to bring down costs. There are two reasons for leaving this task to traders—they know how to do the job, and the present high prices are dangerous to them because of the loss that occurs when prices fall.

PURCHASE TAX ANOMALIES

The principal difficulty stems from purchase tax and the distinction which is drawn between so-called utility and non-utility merchandise. In the original conception of the scheme utility goods covered what were deemed to be necessaries, while the term general or non-utility described goods which were held to be luxuries. As it was thought to be necessary in the national interest that the production and purchase of luxuries should be discouraged, the latter were made subject to purchase tax while the former were left tax free. The principal object of the tax was rigidly to discourage the production of goods that were deemed unnecessary in wartime. The collection of revenue from the tax was of secondary importance. The tax remains, but its object has now been completely reversed. The line of demarcation between utility and general merchandise was, and continues to be, usually one of price. Below a given figure of production-costs the article is deemed to be utility and therefore free of purchase tax. Above that level it is non-utility and subject to tax at a rate of anything up to 100 per cent.

Where devaluation is beginning to have a sinister effect on this plan is that in such cases a rise in the cost of raw materials makes it impossible for the manufacturer to produce utility goods at a profit under a ceiling price, and there is no alternative but to bring the article into the non-utility category. The consequent rise in retail price, as a result of the operation of purchase tax, is out of all proportion to the rise in the cost of raw materials or to any real value.

In the field of cotton goods it has become impossible even for an expert to tell the difference between what is described as utility and non-utility respectively. For example, a particular type of utility towel, when such can be obtained, is delivered to sell retail at 3s. 7½d. An identical towel will arrive from another supplier which, because it is described as non-utility, cannot be sold at less than 6s. 11d.

CONTROL REMOVAL

The outstanding lesson from the experience of the past year is that the anticipated disasters do not follow the easement of controls. The fact that coupon rationing was dispensed with so easily and without perceptible interference with the ordinary mechanics of distribution proved only that it had been kept in existence far too long. I have no doubt that if freedom were extended to produce more of what is now called utility merchandise the public would benefit through more efficient use being made of the available supplies.

I realise that this raises an issue of purchase tax, but the effect of forcing manufacturers to produce the lower qualities of non-utility merchandise, upon which purchase tax is chargeable, is to raise the cost of living to the lower income groups. It thus defeats what must be the aim of the Government in this major matter of public policy. In fact, one set of controls is defeating the purposes of the other, and all are embarrassing to both traders and public.

STAFF PENSIONS

I draw your attention and that of the staff to the provisions for pensions. During the year we paid out of the pension fund a total of £29,064 in pensions to 383 pensioners. This fund, which is in the hands of trustees and outside the control of the group, now has accumulated funds amounting to £841,824.

Mr S. H. Leake, O.B.E. (deputy-chairman and joint managing director), seconded the resolution, and the report and accounts were adopted.

ORIENT STEAM NAVIGATION

LARGER PROFIT

SPEECH BY MR I. C. GEDDES

The fiftieth annual general meeting of the Orient Steam Navigation Company, Limited, was held on April 18th in London.

Mr I. C. Geddes, the chairman, said that the operating profit for last year was greater than that for the previous period of 15 months. This was partly explained by the inclusion of the new steamer *Orcades* in the fleet, and partly because charges for deferred repairs to ships after their war service had been less.

After providing for preference dividends and for a dividend of 5 per cent. free of tax on the ordinary shares, £250,000 had been transferred to reserve and £216,307 would be carried forward to next year. This result showed an improvement on the 1948 account, but even so better results would be necessary if the position were to be regarded with satisfaction, since the older units of the fleet would soon have to be replaced by more expensive vessels. The company's traditional policy was to invest a considerable part of any surplus in maintaining and expanding its business, and this was a policy which it was proposed to pursue. Under existing conditions to regard the present cash surplus as available for distribution among shareholders would be improvident. The company was, in addition, bound by an honourable understanding not to increase the rate of dividend.

He regretted the necessity for the increase in freight rates in the Australian trade during the past year, due to the mounting costs of building and running ships and the continuing delays in port, all of which were rooted in the virus of slow working. He hoped it would be possible to avoid an increase in passage rates.

Speaking of his recent visit to Australia, he said that he had been much struck by the prevailing feeling of confidence there, which he believed to be a direct result of the removal of many controls following the change of Government. Given a wide measure of freedom, the individual would find his own incentive. Here lay his best chance of getting his head out of the ruck and of helping his country and himself.

The report was adopted.

NORTH BRITISH AND MERCANTILE INSURANCE

ALL-ROUND PROGRESS

The annual general meeting of the North British and Mercantile Insurance Company, Limited, will be held on May 11th.

The following is an extract from the statement issued to the shareholders by the Rt. Hon. Lord Brand, C.M.G., D.C.L., Chairman of the General Court of Directors, in connection with the accounts for the year ended December 31, 1949:—

The feature which will immediately strike you in connection with the Fire Account is the exceptional growth in the figures as compared with those of last year. The explanation lies to a large extent in the conversion of the dollar currencies, in which our important United States and Canadian operations are conducted, into sterling at the new official rates. This is the main factor influencing the increase in our Fire income from £10,486,387 in 1948 to £13,152,569 last year, but the result is also contributed to by further progress in our operations in nearly all the world-wide territories in which we transact business.

Losses at £5,778,362 absorbed 43.93 per cent. of income, as compared with 42.93 per cent. in 1948, when they amounted to £4,502,529. Commission, expenses of management and taxation total £6,115,190, compared with £4,742,551 in 1948, and the ratio to income is 46.50 per cent., compared with 45.23 per cent. The foregoing are the salient features in a very successful year's work in the Fire Department, which has resulted in the transfer of a profit of £1,519,644 to the Profit and Loss Account.

The Casualty Department is mainly made up of the business of The Railway Passengers Assurance Company, and its Centenary Year, 1949, has been marked by further steady progress and by an underwriting result which can be regarded as very satisfactory. The Casualty business as a whole has produced premiums of £3,499,449, being £333,011 in excess of those for 1948. Losses amounted to £1,717,538, against £1,636,918, and commission, expenses and foreign and colonial taxes were £1,323,112, compared with £1,157,487. After providing the necessary addition to reserves for unexpired risks, the underwriting profit is £376,263, compared with £264,470 for 1948.

Nearly all our Marine business is dealt with by The Ocean Marine Insurance Company Limited. Premiums for the year 1949 amounted to £1,661,290, against £1,494,343 in 1948. Claims were £1,132,855, as compared with £900,671 in the previous year, and expenses of management and foreign and colonial taxes came to £264,435, against £168,850 in 1948. We have transferred £214,126 from our ample Marine Fund to Profit and Loss Account.

The end of the year 1949 marked the close of another quinquennial period in the Life Department. The net new business transacted during the year amounted to £8,258,500, compared with the 1948 figure of £8,837,299. Group Life Assurance, a class of business which shows considerable variation from year to year, accounted for more than one-third of the reduction, the amount of such business accruing in respect of new and existing Group Life Schemes being £1,862,975, against the 1948 total of £2,082,874. The premium income continues to expand, but the net rate of interest earned on the Life Fund shows a slight contraction.

Turning now to the Valuation, the Actuary's report shows a very satisfactory surplus, out of which it is recommended that a bonus at the rate of £1 6s. per cent. be paid for each of the five years covered by the investigation. An interim bonus at the same rate is recommended. In the light of the satisfactory results, and bearing in mind the strength of the Valuation basis employed, we have confidence in the future profit-earning capacity of the Fund and an interim bonus at the same rate is recommended in the case of policies becoming claims, either by death or maturity, before the next Valuation is made.

The dividend it is again proposed to pay is 7s. per share on the Ordinary shares.

INNS AND COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR

MR WALTER WALLACE ON TAXATION BURDEN

The fifteenth annual general meeting of Inns and Company, Limited, was held on April 14th in London.

Mr Walter Wallace, joint managing director, in the course of his speech, said: The company has had another successful year's trading, the net balance of profit at £204,673 being over £12,000 in excess of the profit for 1948. The business continues to expand, giving an increased annual turnover. All departments show satisfactory results. The results from the increase in turnover more than counteract any fall in prices.

This year's accounts cover the first full year of the company since the capital was increased for the purpose of acquiring additional freeholds. While not all of these lands have yet been brought into production, your company has been able to increase its service to customers and reduce transport costs. The result is that customers are able to effect considerable saving on the various works on which they are engaged and this saving is of national importance and should be encouraged.

As large quantities of sand and gravel are supplied by your company and the demand is likely to continue for many years, it is obvious that the policy pursued by your board is fully justified.

A reserve has been established for redemption of preference shares, although by the terms of issue the company is not called upon to make redemption until February 28, 1967, at the earliest. The general reserve now stands at the substantial amount of £110,000. The carry forward is £28,637, which in two years has been increased by over £21,000.

Taxation bears heavily upon the industry of the country and in some respects some of the departments of your company are under exceptional burdens, so heavy in fact that taxation eats into capital. During the war the company was on more than one occasion successful in obtaining special concessional treatment, but that came to an end with the cessation of war activities.

Representations have been made to the Board of Inland Revenue by your company and in February last two of your directors attended the committee on the taxation of trading profits and gave evidence in support of their application for a change in the basis of this taxation. Your directors were well received by the committee and the board look forward, with some hope, to a satisfactory report from the committee and legislative action thereon.

GOVERNMENTAL INTERFERENCE

I would point out the dangers confronting industry from the continued menace of governmental interference. The sand, gravel and quarrying industries carry on business under so many controls and regulations and have to obtain the consent, permission, and act under the direction of such a variety of departments and authorities that the conduct of your business is difficult and made very much more expensive than it need be.

A very considerable, probably the major part, of the time and activities of your managing directors and the heads of the various departments, often with the concurrence of professional advisers, paid for by your company, is taken up in attempting to comply with the requirements of the various authorities.

All this additional activity is unproductive, except of considerable delay. What a few years ago could have been resolved upon at a board meeting, and immediately thereafter carried out, may now take several years before the company is free to commence the particular operation. The national capital expenditure economy plans have not so far caused us any anxiety; on the contrary, the company has experienced a continued expansion in the demand for its products and services.

In conclusion, he said that the directors had elected Mr S. M. Jervis, the secretary, to the board. He had rendered valued service to the company prior to and since its incorporation.

The report was adopted.

NOTICES

UNIVERSITY OF LONDON

The Senate invite applications for the Tcoke Chair of Economic Science and Statistics tenable at the London School of Economics and Political Science. Applications (10 copies) must be received not later than June 1, 1950, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

WANTED to purchase Manufacturing Wholesale and Retail Grocery, Provision and Fruit and Vegetable Businesses. Must be good established running concerns. Price in accordance with Assets per Accounts. State turnover, and location, etc. Completely confidential.—Box 668, Robertson & Scott, Edinburgh, 2.

MANUFACTURERS of famous National brand of Hosiery and Underwear require General Manager for its sales organisation. Commencing salary £2,500 to £4,000 dependent upon experience. Applications will be treated in confidence and will be seen only by the Chairman of the Company.—Box 408.

GERMAN Manufacturer of Branded Optical Products seeks investor in Great Britain for the introduction of new lines, already well established on the Continent.—Please reply to Box No. 6110, Klaiber Advertising Agency, STUTTGART, Charlottenstrasse 11, Germany.

EASTERN ELECTRICITY BOARD

CHIEF ACCOUNTANT'S DEPARTMENT.
ACCOUNTANCY ASSISTANT.

Applications are invited for a Senior Assistant's appointment in the Chief Accountant's Department at Ipswich.

The duties will include the critical examination and presentation of statistics, forecasting and budgetary control. An Accountancy qualification and experience in the Electricity Supply Industry will be an advantage.

In accordance with the National Joint Council Salary Agreement, dated March 23, 1950, the commencing salary will be not less than £570 per annum, or more than £630 per annum, and conditions of employment will be as laid down from time to time by the appropriate negotiating bodies.

The successful applicant will be required to contribute to a Superannuation Scheme and may be required to undergo a medical examination.

Applications, stating age, education, qualifications and experience and details of present appointment and salary, should be addressed to:—

The Chief Accountant,
Eastern Electricity Board,
Broughton House,
Broughton Road, Ipswich, Suffolk,

so as to arrive not later than ten days after the appearance of this advertisement.

Investment Statistics

Company Notes

Ford Motor.—Consolidated trading profit declined from £6,284,342 to £6,030,300 in 1949. Turnover was £50,926,146. Stocks, work in progress and stores were £7,684,378 (£8,970,917) and net current assets £18,745,675 (£17,383,269) at the year-end. Fixed assets increased from £6,267,930 to £6,751,829.

Peninsular and Oriental.—Group operating profit in 1949 amounted to £11,260,076, compared with £11,553,244, *estimated on a* twelve months' basis for the previous period and £11,926,076 actual. Total profit was £12,443,418 (£13,045,295 estimated for twelve months). These figures are struck after making provision for reconditioning of fleets and appropriations to reserves for contingencies. Net profit declined from £4,159,165 (twelve months' estimate) to £3,399,517. A dividend of 12 per cent is recommended for the year.

Associated Portland Cement.—Consolidated trading profit rose from £5,204,105 to £6,129,325, total profit from £5,475,859 to £6,328,700 and net profit before taxation from £3,426,708 to £4,148,178 for the year to December 31, 1949. UK taxation absorbed £3,004,085 (£2,254,678) and overseas taxation £154,672 (£129,800). The 22½ per cent dividend for the year is unchanged.

Alpha Cement.—Trading profit increased from £512,551 to £778,298 and net profit before taxation from £327,360 to £575,215 in 1949. Taxation amounted to £424,700 (£225,000). The dividend has been raised from 10 per cent to 20 per cent for the year.

British Portland Cement.—Group trading profit in 1949 amounted to £1,808,743 (£1,552,498) and net profit before taxation to £1,291,270 (£1,101,791). The taxation charge was £956,814 (£768,414). The dividend of 22½ per cent for the year is unchanged.

British American Tobacco.—Trading profit of the group in the year to September 30, 1949, increased from £23,953,208 to £30,679,595, not including £1,786,488 (nil) attributable to devaluation profit on exchange. Total group profit was £34,288,178 (£25,644,883). Net current assets at the year-end amounted to £103,744,513 (£81,850,155); stocks were £106,799,017 (£83,665,080) and cash £27,717,749 (£21,639,573).

Monsanto Chemicals.—The balance on group trading account in 1949 amounted to £959,127 (£997,756) and net profit to £296,384 (£375,172). Stocks increased from £1,446,038 to £1,588,791 on the year.

British Oxygen.—The balance of group profit after depreciation, directors' emoluments and pensions and overseas taxation was £2,032,378 (£2,403,174) in 1949. Stocks increased from £4,368,875 to £5,360,795; bank loans are up from £5,000 to £2,120,539.

Control Systems.—Consolidated trading profit increased from £247,353 to £272,254 and net profit from £105,177 to £119,679 in 1949. The distribution for the year is 25 per cent. Net current assets at the year-end were £870,209 (£780,221).

Union Corporation.—Dividends and interest from investments amounted to £1,089,992 (£946,707) and total profit to £1,548,997 (£1,371,143) in 1949. The book value of investments other than gilt-edged was £5,669,005 (£4,208,174) at December 31, 1949.

Cunard Steam Ship.—Consolidated net profit declined from £4,246,652 to £3,501,642 in 1949; £2,406,215 (£2,950,709) has been transferred to group reserves. Taxation absorbed £2,881,594 (£3,242,437). The dividend of 10 per cent for the year is repeated.

Wm. France, Fenwick.—Group net profit in 1949 was £130,606 (£165,889); taxation amounted to £162,073 (£177,354). A dividend of 15 per cent plus 3 per cent capital accretion distribution is recommended.

Associated Fisheries.—Consolidated profit declined from £929,267 to £730,048 and net profit from £257,724 (£122,835) in 1949. A final dividend of 5 per cent is recommended on the enlarged ordinary capital.

London and Thames Haven Oil Wharves.—Group net profit in 1949 amounted to £100,682 (£99,669). The dividend for the year is 10 per cent (same).

United Glass Bottle.—Group trading profit in 1949 increased from £1,168,273 (adjusted) to £1,315,311 and total profit from £1,191,945 to £1,340,230. Net profit declined from £516,132 to £474,479. The 15 per cent dividend for the year is repeated.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 't'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'.
(n) Net yields are calculated after allowing for tax at 9s. in £. (t) Flat yield.
* Assumed average life 14 years 1 month.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (k) Assumed dividend 18½% after capital bonus. (l) To latest redemption date. † Free of tax.
(m) Final dividend on increased capital. Yield basis 35%. (n) Yield basis 26⅔% after capital bonus.

Statistical Summary

EXCHEQUER RETURNS

For the week ended April 15, 1950, total ordinary revenue was £38,268,000 against ordinary expenditure of £61,649,000 and issues to sinking funds £130,000. Thus, including sinking fund allocations of £234,000 the deficit accrued since April 1st is £25,332,000 compared with a surplus of £6,702,000 for the corresponding period a year ago.

MINISTRY OF EDUCATION—H.M. INSPECTORS

Applications are invited from men and women for posts as H.M. INSPECTOR. Candidates, who should preferably be under 50 on December 31, 1950, should normally possess good educational qualifications and experience in Adult Education. Applications will be specially welcomed from candidates who have qualifications in Economics, Philosophy and Psychology.

The posts, which are permanent and pensionable, carry a salary scale for the London area of:—

£900 x £30—£1,050 x £35—£1,225 x £50—£1,370 (Man)
£800 x £30—£1,100 x £35—£1,200 (Woman)

The salaries of Inspectors working outside the London area are less by £40 at each point of the scale.

In special cases successful candidates may be appointed at a commencing salary above the minimum.

Further particulars, together with the application form, may be obtained on application in writing to the Secretary (Inspectors' Section), Ministry of Education, Curzon Street House, Curzon Street, London, W.1.

The closing date for applications will be July 31, 1950.

ACCOUNTANT FOR SIERRA LEONE PRODUCE MARKETING BOARD

Applications are invited for the post of Accountant to the Sierra Leone Produce Marketing Board, engaged in the purchase, export, processing and marketing of Sierra Leone Produce and in the development of the agricultural industry. The Accountant will be responsible for the keeping of all books and accounts in connection with the Board. Applicants should be Chartered, Incorporated or Corporate Accountants. The salary of the post, which is non-pensionable, and for one tour in the first instance, is £1,000 per annum, plus expatriation pay of £300 per annum. A cost-of-living allowance is at present payable at the rate of 12½ per cent of basic salary. Quarters are provided where available and rental is charged at the rate of £90 per annum. An outfit allowance of £60 will be paid on first appointment. Free passages are provided on appointment and when proceeding on leave at the end of a tour of duty. Leave on full salary is granted at the rate of seven days for each completed month of resident service. The selected candidate will be required to pass a medical examination of physical fitness to serve in the tropics.—Applications, giving full details of age, education, experience and professional qualifications, should be addressed, in the case of applicants in the United Kingdom, to The Managing Director, Sierra Leone Produce Marketing Company, Limited, 5, Buckingham Gate, London, S.W.1.

ROYAL BANK OF CANADA

DIVIDEND No. 251

NOTICE IS HEREBY GIVEN that a DIVIDEND of 2½ per cent., being at the rate of 10 per cent. per annum upon the paid-up Capital Stock of the Bank, has been DECLARED for the three months ending May 31, 1950, and will be PAYABLE at the Bank and its branches on and after June 1, 1950, to shareholders of record April 29, 1950.

By Order of the Board,
B. STRATH, London Manager.

6 Lothbury, London. E.C.2. April 19, 1950.

Atlantic Council

THE three Foreign Ministers are preparing to meet at a time of growing international tension. The deadlock in the United Nations remains unbroken, and while Soviet pressure increases in Europe, Communist victories in the Far East continue, by their success alone, to undermine the security of China's neighbours. Moreover, there is an ill-defined but definite feeling on both sides of the Atlantic that the initiative in international affairs has for the time being slipped from western hands. Eighteen months ago, it was the Soviet Union that was hard put to explain away the Marshall Plan and to keep restive satellites from going Tito's way. Today, perturbation has passed to the other camp; whatever Senator McCarthy's antics may mean to the American people, to the outside world they seem to reflect a certain loss of American nerve. The restoration of confidence and the regaining of lost initiative must, therefore, be the major themes of the forthcoming conference.

It is not really surprising that this should be the chief need. The truth is that the western powers are still living on the momentum they created two years ago while they were dealing with what seemed, at that time, the most urgent matters for international action. The emphasis was almost purely European. It was in Europe that the war appeared to have left the people most susceptible to revolutionary forces and it was also in Europe that political and economic organisation seemed most faulty and out of date. The programme was, therefore, to enlist American support for a measure of external aid—economic aid through the Marshall Plan, military aid through the Atlantic Pact—and on that basis, to rebuild and integrate a Europe that could stand on its own feet. Both the Western Union Pact and the Council of Europe were set up with this purely European intention.

The policy gave a blanket cover to a number of different interpretations. Some of its keenest supporters on the Left, for instance, saw it as a means of breaking away from "American capitalist tutelage" and of securing neutrality in the cold war which they still tried to attribute to "provocative American imperialism." Even those of its exponents who had no bias against the United States believed that the conditions which had made American intervention essential would pass and that once the policy had put Europe on its feet, "normal" relations with America would return.

The world, however, has followed another course. Normal conditions seem further away than they did in 1947. Soviet hostility confronts all things western—and it confronts western social democracy with particular venom. The scale of Russian armament and mobilisation has put the cost of adequate European defence far beyond the combined pockets of the Western Union powers. The dollar gap has been revealed not as a temporary dislocation of war but as a fundamental fault line in the structure of world trade. Above all, the problems of postwar readjustment have lost their primarily European aspect. The world at large is in turmoil and external pressures

contribute to Europe's instability. These were not the conditions with which the western powers believed they had to contend in 1947, nor do they resemble in any way the forecasts made at that time. The west is thus dealing with a new situation with old weapons. The general lack of confidence and sense of direction springs in great measure from this fact.

The essence of the new problems is, quite simply, that they cannot be solved in Europe alone. In some respects, attempts to do so make them more insoluble. To give two crucial instances, the economic integration of Europe—however desirable on other grounds—cannot be accommodated to the overriding aim of securing equilibrium in dollar trade if goods have to be diverted to the European market away from the dollar market. Similarly, any attempt to regard Britain or its currency as "primarily European" can cripple the effectiveness of the Commonwealth and the sterling area in such vital security regions as South East Asia or the Middle East.

The corollary of this fact—that Europe's problems can no longer be settled purely in Europe—is that they can be solved only with the full and permanent co-operation of the United States. Any one of the problems which have forced themselves on the west in the last two years—the scale of the Russian military effort, the estimated size of the dollar gap after 1952, the pressure of Communism on backward areas—points to the same conclusion: the effective partnership of the United States, the Commonwealth and Europe in seeking a common solution begins to make sense, whereas action in isolation does not.

It is the French Prime Minister, M. Bidault, who, with the logic of his nation, has been the first to draw this conclusion openly and clearly. He has called for an "Atlantic High Council" in which the United States will not be spectator, guide and external provider, but a fully committed participant. The reaction in the United States will no doubt be made explicit during the coming talks, but the possibility of advance was clearly forecast in Mr Acheson's speech last weekend. Mr Bevin's indisposition has no doubt prevented the taking up of any firm position by the British Government; but it can hardly be other than most cordial support for M. Bidault. It is true that the British mind is somewhat divided. There are officials who still believe that Britain can gain more from an exclusive partnership with the United States, leaving Europe on one side. There is still a group in the Labour Party which hankers after "European neutrality between the two rival blocs." There is perhaps even a smaller group of Conservatives who would be glad in the name of empire to show both Europe and America the door. But these are all small minorities. British opinion in general would support wholeheartedly the idea of a full partnership of the west.

The aim should, therefore, be to set up an Atlantic Council, representing the United States, the European participants in the Organisation for European Economic Co-operation, Britain and those British Dominions which desire to participate. Canada would clearly be a founder member, since it is already a signatory of the North Atlantic Pact. Australia and New Zealand, whose wars are generally European, would no doubt wish to participate. Other Dominions could be kept in close touch and consulted without formal commitment. A secretariat for the new Council could be built upon the permanent secretariat of the OEEC to which, as the Marshall Plan phase closes, American officials could be added. The ECA missions in Europe abound with men whose international experience eminently qualifies them for the task, and they would find in the team already working in Paris a secretariat which has succeeded in gaining the growing confidence of eighteen nations. The strategic and defence decisions of the new body would be carried out by the present military organisation established under the Atlantic Pact and in due time it would seem to be the course of reason to fuse the Western Union military structure with the wider Atlantic unit, since the essence of the new partnership would be full and equal participation, not external aid.

*

No one will deny that the proposals entail some difficult political decisions. The French Socialists are already protesting bitterly that M. Bidault has deserted the Council of Europe. Much thought needs to be given to the role which this essential but subsidiary body should play. It is quite clear that Europe has special problems—social, cultural and economic—which can best be solved regionally. The chief aim of the Council of Europe might well be to strengthen its representation by including industrialists and trade unionists and then to work out concrete plans for economic integration—not, certainly, in ECA's "twenty-two months" but possibly in ten years. The problem of the industrial future of the Ruhr is another predominantly European interest. Another whole range of activity could lie in the unification of social security systems and the study of taxation. But the universal problems of defence, of foreign policy, and of international trade lie beyond the Council of Europe's competence. It will work all the more seriously with a modest but concrete programme.

Membership, too, presents some difficulties. If this wider Atlantic Council is to be called into being as the political arm of the North Atlantic Pact—and this is the simplest procedure since the United States has already agreed to Article 2 of the Pact which allows for such a development—can neutral countries, such as Sweden and Switzerland, participate? And what of Germany's role? Would admission imply an immediate right to rearmament? The difficulty can no doubt be overcome by allowing for differing privileges and obligations of membership. It would, however, seem essential to concede Germany the right to foreign representation and to a Foreign Minister.

The chief obstacle to effectiveness will, however, remain the problem of sovereignty and, no doubt, for the crusaders of Atlantic Union a council of sovereign states is a disappointing answer to the challenge of the times. But is it so certain that sovereignty only cedes to a frontal attack? May it not be diminished by an infinite multiplication of acts of co-operation which create the habit of confidence and concession? All those who have worked closely in the OEEC agree that, in a hundred ways, joint actions are possible now which would have been inconceivable in 1947. The habits of co-operation which an Atlantic Council may foster can lead in time at least to the degree of unity and understanding that prevails within the British Commonwealth, and that, after all, is no small thing. The federalists can at least console themselves that the pressures of the time are all on their sides, that an instrument of unity can in itself be a great impetus towards unity, and that it could be true of the Atlantic venture—as it once was of an island's resistance—that if the peoples are given the tools, they can finish the job.

Economic Realities

THE budget debate is over, and the Government has survived the Opposition's challenge by the narrow but decisive margin of five votes. It would be pleasant to record that the debate had brought some advance in economic understanding—some sign, however slight, that the two parties, so evenly divided, might share some common aims of economic policy and have the public courage to state them. But the Chancellor of the Exchequer pursued to the end the doctrines on which he had claimed to found his budget: to maintain full employment and the social services, and to retain "a fine balance" between inflation and disinflation. He twitted the Opposition for failing, amid all their "gloomy forebodings," to say where they would cut Government expenditure. But Mr Churchill was not to be drawn. He was not going to supply ammunition for the next election; besides, he did not know what financial secrets Whitehall would reveal if he gained access to them.

All this is more than a little unreal. Both sides have succeeded in putting their negative cases. A long roll of Opposition speakers has denounced the size of Government expenditure, expressed fright at a level of taxation which is drying up the resources of industry, and said nothing in even general terms of remedies. Spokesmen on the Government side (apart from a few who seem to think that the Chancellor is running the risk of active deflation) have shown nothing but the most supreme satisfaction with the broad lines of the budget and the condition of the British economy. Both sides have been behaving with a clumsy stealth, their eyes glued on the constituencies, and their minds full of the next general election, anxious above all to avoid making a free gift of slogans to the other side.

Mr Churchill, in the meditative but inconclusive ending to his speech, touched on national policies to meet national needs—only to reject the notion that they could now be contrived by a coalition of the parties. In this judgment, he is undoubtedly right, yet again it is negative.

> Here we are, in the supreme economic crisis of our whole history, watching each other like cat and mouse. And who shall say who is the cat and who is the mouse?

Even this apparently simple question lacks a positive answer. But how long is this situation of stalemate to last, with one side bemused by the successes it claims for its policies and the other fearful of risking failure at another election? How long (in Mr Churchill's words) have we got to go on with neither one side nor the other having the power to do anything to grapple effectively on its merits with the national needs?

This is the fundamental dilemma. The stalemate exists because neither side is willing to present the country's real economic problems in political terms. Even if the Government recognised privately (what they would never admit in public) that public expenditure was too high, they would keep to their so-called planned course, proclaiming confidence that all was well. As for the Opposition, there is a distinct jolt between the ideas proclaimed in their pre-election manifesto that social services could be increased and taxes reduced and their present condemnation of the Government's enormous outlays. Obviously, the Chancellor's claim that the scope for economies is negligible is unacceptable. But the major savings in public expenditure that are needed do involve changes of policy, and there is no doubt that to transfer expenditures which are now met out of the public purse back to the pockets of individuals would involve awkward regressive effects on the poorer sections of the community. Both sides recognise this; the Government side plays on it, and the Opposition is inhibited by it. It is this inescapable consequence of economy, this apparent conflict with "fair shares," that prevents the Opposition from bolder courses and confirms the Government in its self-satisfaction.

This spell has somehow to be broken. Mr Churchill had no doubt that substantial economies could be made and passed on to the taxpayer, to the benefit of production and savings, and with effectual safeguards for the weak and the poor. All he earned for this claim was laughter from the Government benches, and the Opposition will get no better acknowledgment from the country until the claims are given precision and the safeguards are defined.

*

Given the present political deadlock, it is the first duty of parties and people to address themselves to realities. The Budget debate abounded in artificial economic ideas which need to be stripped of their pretensions immediately. The first of these was developed at length by the Chancellor. It is that, in his budgeting, he has had the supremely delicate task of keeping to the narrow line between inflation and deflation. He claims that this hairbreadth nicety is needed because in the past there was a "so-called safety margin" of unemployment, which, of course, he is determined to prevent. Inflation would increase British costs, reduce the competitive power of British exports, make it impossible to pay for imported raw materials, and thus cause unemployment. Deflation, quite simply, would produce unemployment and have no advantages.

But the gap between these two dangerous reefs of inflation and deflation is wider than the Chancellor supposes—there is, fortunately, more resilience and more freedom of individual decision in the British economy than he assumes for the purpose of this particular argument. Even if the gap were as narrow as he assumes, and even if the decisions about navigating the economy through it were as critical as he claims, he would lack the means of doing so. The economic charts by which he purports to trim his course by half a point to port or starboard are not precise affairs with every shoal marked and every sounding accurate; they are more like the maps of the old navigators, drawn freehand with a mixture of fact and fancy, and with cherubs in each corner, puffing their cheeks and giving the ship a fair wind. An economy which knows so little about itself, and assumes that the fair winds will forever continue, needs steering with a sharp lookout, not kept dogmatically on a set course, come what may.

There are other matters in which a touch of humility would make economic planning more tolerable and more

acceptable. When the planners put down a figure for sales of commercial vehicles on the home market, they are not dealing in final truth, but in an exercise in hypothetical arithmetic. If the industry produces more and sells more—as it has done—a planner of humble mind might begin to wonder how it was that his plans went wrong, and sit down to work out his sums again. But this is not the footing on which the imposition of a one-third purchase tax on lorries has been forced through Parliament. It is that the industry has committed a public mischief in making the arithmetic look foolish. So a heavy and damaging fiscal bludgeon is brought into play which—it is hoped—will re-establish the divine rightness of planned guesswork, at the mere incidental cost of making the transport of goods more expensive.

The same rich confusion of substance and shadow is to be observed in the efforts of the Government to control particular prices. During the budget debate, the Financial Secretary to the Treasury declared that a simultaneous reduction in purchase tax and food subsidies "would raise the cost of living index very steeply indeed." What he really meant, as his later explanation made clear, was that abolition of the purchase tax would reduce the cost of living index by little more than a point, whereas the reduction of the food subsidies by a corresponding amount would raise the index by six or seven points. This argument is no doubt technically quite accurate; to do these things would have these particular effects on the cost of living index. That is just a syllogism. The substance of the argument ought to be about the nature of the cost of living index—or, to give its more accurate official description, the interim index of retail prices—and whether it is a representative measure of the cost of living. All that Mr Jay has asserted is that the index is not an accurate measure of the incidence of purchase tax, which is hardly surprising since purchase tax is not borne by food, rent and rates, fuel and light, services and drink and tobacco.

But perhaps the crowning performance was that of the President of the Board of Trade in his references to the utility scheme. Mr Wilson has not attempted in recent months to conceal his anger with Lancashire, and the cotton industry, which respects the need for voluntary co-operation with the Government, can hardly be blamed for failure to conceal its alarm at these outbursts. Mr Wilson threatens to re-impose price control on non-utility cotton goods because they are pulling production away from utility goods. The explanation for this change is a matter of simple economics: prices of utility cotton goods have, until quite recently, been too low. The increased cost of raw cotton resulting from devaluation has pressed against the price margins fixed by the Board of Trade for utility lines. The political pressure has been to keep utility prices as stable as possible, because they affect the index of retail prices, whereas prices of non-utility goods (often barely distinguishable from utility, except for the fact that they carry 66⅔ purchase tax) are not measured in the index. The economic pressure, quite naturally, has been to increase non-utility output, in order to cover the losses on utility lines. The Government must make up its mind what it wants. Is it a large output of utility goods, at fair prices (to manufacturers and consumers), or is it low prices (to doctor the retail price index) and an output so small that the consumer is forced to buy non-utility goods?

None of these, perhaps, is a point of fundamental importance against the alarming background of excessive Government expenditure and against the critical tasks which face the British economy during the next few years. But they illustrate habits of thought which have grown thick roots in the past five years, and they do not exaggerate the prevailing mode of fobbing off economic realities with a few political clichés. If this is all that the Government can offer until their tiny majority is erroded by sickness or until the country unmistakably demands a change of economic thinking, this period of stalemate will be barren indeed. The country does not expect a bi-partisan policy in home economic affairs; the tensions are too great and the area of agreement between the parties is too small. But it may deal hardly by a Government which turns policy and debate into electoral propaganda.

From Delhi to Karachi

THE statesmanship of Mr Nehru has never showed itself to greater advantage than during the last few weeks. Faced with a tumult of popular agitation in India for strong action against Pakistan, with the resignation of two Bengali Ministers from his Cabinet in protest at his "weakness," and even with threats against his life from Hindu extremists, he has firmly pursued in relation to the communal crisis in Bengal a policy of wise moderation and conciliation which has produced an easing of the tension with Pakistan at a moment when it seemed only too likely to break down into actual war.

Mr Nehru's initiative in halting the rake's progress of India-Pakistan politics towards irremediable catastrophe has, indeed, come none too soon. Fortunately the very urgency of the situation in Bengal brought out all the qualities of large and generous idealism which have always been characteristic of his leadership. In Kashmir, once an armistice had been effected between the contending military forces, the political deadlock could drag on for a long time without an acute threat to international peace, but the Bengal rioting with its massacres, reprisals and flights of refugees was rapidly bringing relations between the two nations to breaking-point. The conference between the two Prime Ministers in Delhi and the successful outcome of their negotiations retrieved a situation that at one moment appeared to be hopelessly out of control.

It is now for Pakistan to reciprocate, by loyal fulfilment of the spirit of the Delhi agreement, the move for peace which Mr Nehru has made at so much cost to his immediate political popularity in India. The agreement on minorities has relaxed the tension for the time being, but a permanent improvement depends on the manner in which it is implemented. It is now for both sides to prove their good will in such small matters, for instance, as allowing the refugees to move through the customs controls without the excessive interference and indeed robbery from which they have hitherto suffered. Much will turn on the effectiveness of the central ministers, appointed to each of the two Bengali provincial governments, in restraining and influencing local opinion. And it will be a great step forward if the new arrangements for the minority communities to be represented on the two provincial governments work effectively. Only on the execution of these and similar provisions during the next six weeks will it be possible to say whether this agreement really marks a turning point, or merely one more in a series of previous agreements between India and Pakistan which have been broken in practice by one side or the other. It is quite certain that if the present agreement does not work there will be a new upsurge of communal hatred which neither Mr Nehru nor anyone else will this time be able to hold in check.

The obstacles to a real settlement in this matter are greater in Pakistan than in India, not because Moslems are more aggressive than Hindus in communal disturbances—in these outbreaks it is often impossible to say who "started it"—but because Pakistan is by intention a state for Moslems, whereas India is not, at any rate in theory, a state for Hindus. India has adopted a constitution which accepts the principle of a secular, democratic state with all citizens equal before the law and no religious discrimination. It would be going too far to say that there has been no discrimination in practice against Moslems in independent India, and it was the unpleasant experience of Hindu ascendancy in certain provinces before the war which caused the Moslem League to come out finally with its demand for a separate state. But there has been evidence of a real will in the highest quarters in India to ensure a fair deal for the Moslem minority, and the constitution at any rate affords a legal ground for appeal against infringements of its principles. In Pakistan, on the other hand, as the state was formed for the specific purpose of protecting Moslems and their faith, there is a natural tendency to establish Islam as the national religion and to exclude non-Moslems more or less from the full rights of citizenship. Pakistan, unlike India, has not yet adopted a constitution and much will depend on what legal guarantees the constitution which is now being drafted will provide for Hindus—especially in East Pakistan (East Bengal), where almost the whole of the Hindu minority left in Pakistan is now to be found.

The fundamental question is whether it is going to be possible in future for Hindus in Pakistan and Moslems in India to lead a secure and tolerable life. No frontier could be drawn to separate in unmixed masses the two great religious communities of the old India, and though in the Punjab an exchange of populations by migration was brought about after appalling bloodshed, elsewhere substantial minorities were left on both sides of the frontier, and it is unlikely that there could be further expulsions of the same kind on a large scale without armed conflict. The Bengal rioting has already produced a dangerous swarming of refugees, but the numbers who have left their homes under pressure of fear is still small compared with the total who would be involved in a general exchange of minority populations. Neither country wants a general exchange, and the people threatened with being uprooted from the places they, and often their ancestors, have inhabited want it least of all, except as an alternative to persecution or massacre. It is essential, therefore, to find some way of assuring to the members of each minority safeguards which will enable them to live and work in peace in the localities where they reside.

For Pakistan the danger in a renewal of communal conflict is greater than it is for India for two reasons. First, there is the military superiority of India, which applies particularly to East Bengal; Pakistan has hardly any troops in this detached portion of its territory and, as a military operation, it could probably be overrun by Indian troops in a very short time. Secondly, even if there were no armed invasion and an exchange of population could be made without war, Pakistan would be the loser economically, for the Moslem minority in India is four times as big as the Hindu minority in Pakistan, and it is unlikely that Pakistan could cope with such a great increase of population within its borders—which would be additional to the economic strain and dislocation caused even by migrations of equal numbers each way.

It is for the Pakistan leaders to exert themselves both to resist attempts to write religious discrimination into their new constitution and to restrain their local officials from such collusion in anti-Hindu violence as there appears to have been recently in East Bengal. In India, on the other hand, it is important that a consciousness of holding the stronger cards in the conflict should not lead the Government to overplay its hand. Pakistan, if pressed too hard, may be recalcitrant even against heavy odds, and without a settlement by conciliation India would be in danger of winning a Pyrrhic victory. India might win a military triumph over Pakistan or ruin it economically by a forced exchange of minorities, but what would India gain in such circumstances by the collapse of Pakistan as a state? As long as nearly a quarter of the total population of the "sub-continent" are Moslems, a stable and cohesive national unity can never be constituted over the whole area by force, but only by the willing consent of the Moslem section. A period of genuine reconciliation and co-operation between the two states might lay the foundation for some

ALLIANCE

form of federal union in the future, but conquest, with its inevitable accessories of military rule, carpet-baggers and the revival of militant Mahasabha Hinduism within India, could bring no lasting peace, even if the issue of the struggle could be decided without interference from outside—as it certainly could not be, with Moscow watching for every opportunity to cause disruption and chaos in the non-Communist world.

What is now required is to maintain the momentum of good will started by the Delhi conference and use it for tackling, in turn, not only the question of the minorities, but the other problems which have been bedevilling India-Pakistan relations. A limited trade agreement has now been concluded and ratified, and this is a step towards ending the economic deadlock between the two nations ; there is now a hope that, with Pakistan adhering to the International Monetary Fund and due to make a declaration of parity in the near future, an adjustment of currency rates may be made as a matter of multi-national arrangement, so that it will no longer be for Pakistan merely a question of accepting or rejecting Indian demands. On Kashmir there is now some ground for believing that India would be willing to agree to a plebiscite for the Valley, provided that Jammu and Ladakh were reserved to India, and this would be a reasonable solution.

The British attitude towards all these questions is determined by one basic wish: to see a reconciliation between India and Pakistan and their effective leadership in Asian affairs. British opinion may criticise either of the two states on what it believes to be the merits of a particular question at issue, but this is done in no prejudiced or interfering spirit ; to be silent about the events taking place in southern Asia would signify a lack of interest in the affairs of one-fifth of mankind. On the eve of the Commonwealth Conference at Sydney, it is an especial British interest that the economic strength of the two partners should be restored by a rapid revival of trade and by the ending of armed preparations which undermine economic stability in both Dominions.

Death on the Roads

TO the individual member of the community the words " road safety " conjure up a vision of official exhortation, of " jimps " and mournful widows. But to the community as a whole the toll of road deaths and injuries presents a problem of great complexity, and the yearly statistics are the indices of success or failure in a many-sided attempt to prevent a pointless drain upon its strength and resources.

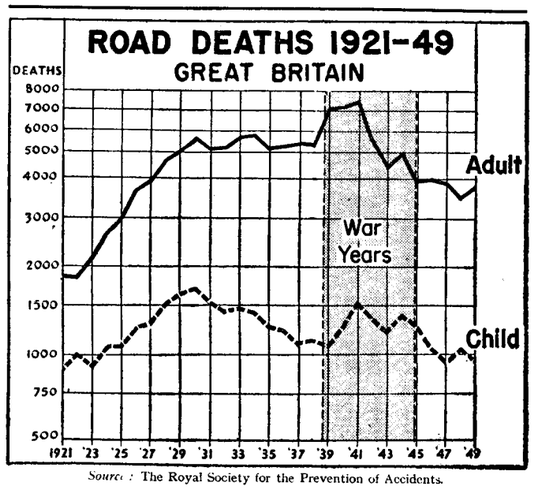
As can be seen from the accompanying graph, there have been two periods, in the early thirties and during the war, when road deaths mounted alarmingly. The underlying explanation is fairly straightforward: in the early thirties the community had hardly begun to adjust itself to its changing environment, the lethal capacity of the motor car was increasing faster than the citizen's awareness of its dangers, and the death roll began to fall as measures of precaution and education were introduced. During the war, the blackout and the number of unskilled drivers in charge of service vehicles provided only too simple an explanation. Since the war, the campaign for greater road safety has been renewed on a far larger scale than during the prewar decade, and it has been accompanied by a marked decline in road deaths and injuries. The figures for 1949 show an increase over 1948 in the total of both deaths and injuries —as a result of the increased numbers of cars on the road—but there has been a steady reduction from the high casualty rate of the war years, and even from the prewar years. Road deaths in 1949 totalled 4,773 as against 6,648 for 1938. Serious injuries amounted to 43,410 as against 50,975, and those slightly injured totalled 128,596 as against the much higher figure of 175,878 in 1938.

But it is still too early to assert with confidence that the accident rate will continue to fall or that the improvement of the postwar over the prewar years is solely the result of road safety campaigns and other official measures. In the first place although the number of licensed vehicles is now over four million, compared with 3,157,000 in 1939, approximately half of these are private cars, most of which are restricted in their mileage by petrol rationing. It is perhaps not unreasonable to assume that there has been a fall in total vehicle mileage, combined—in the absence of pleasure motoring —with a greater concentration of traffic in the commercial and industrial centres. Experience seems to show that areas with a concentrated—or congested—flow of traffic do not produce such a high accident rate as areas where the flow is faster or more spasmodic.

In the second place, the present composition of the population means an increase in the most vulnerable age groups, the very young—especially children between five and seven years old—and the elderly. It remains to be seen whether the permanent increase in the number of the elderly and the temporary increase in the very young will tend to dispute the general proposition that the community has come to adapt itself over the past twenty years to the growth of fast motor traffic. Thirdly, there is a much higher proportion of old vehicles on the roads than in the prewar years, and road surfaces are not, on the whole, up to their prewar standards. The real test will come when new cars are once more freely obtainable and petrol rationing has ended.

It is sometimes asserted that there are " three E's " responsible for road safety—education, enforcement and engineering. The first, road education, is largely in the hands of the Royal Society for the Prevention of Accidents, a voluntary body with a government subsidy. The society acts as the Government's agent in carrying out a publicity campaign on a very large scale, largely through the medium of local authorities. One of its most interesting innovations is the new training centre in London equipped at a cost of £25,000. Here elaborate models of rural and urban road layouts are furnished with miniature moving vehicles which, at the turn of a switch, can be made to demonstrate good or bad road behaviour ; here, also, are timed reaction tests for seasoned motorists and training " quizzes " for all ages. However, since exhortation by means of advertisement is the cheapest weapon for fighting road accidents (it cost just under half a million pounds in 1948-49) it is still the method most widely used.

Enforcement is largely a matter for the police and the courts, and the strictness of supervision has unavoidably slackened with the depletion of the police force. Demands are frequently heard for more stringent penalties for traffic offences, and particularly for greater uniformity in the sentences imposed, but there are many difficulties to be considered. If fines were reduced to an " automatic tariff," it would mean the end of any attempt to relate the penalty to the offender's means, and any all-round stiffening up of the penalties runs the risk that juries and magistrates may become more reluctant to convict. Considerations of expediency affect both the question of " how to enforce " and of " what to enforce." Should pedestrians be as strictly controlled as vehicles ? Should bicycles be licensed ? Panaceas for road accidents are offered repeatedly in the correspondence columns of the press, where one class of road-user tends to attribute all the blame to another. But the difficulty is that the more complicated the traffic laws become, the more difficult it is to respect them. A simple thoroughly-known code of behaviour that is universally respected is too valuable an asset to road safety to be lightly abandoned.



The third aspect of road safety, highway engineering, is largely a question of cost. Many good arguments are advanced for resuming the interrupted ten-year plan, first announced by the Ministry of Transport in 1946, for reconstruction and new construction of roads. But since local authorities are responsible for most roads, and all their approved plans earn grants of between 50 and 70 per cent from the Ministry of Transport, this is a form of capital investment over which the government has direct control. Town planning legislation should go a long way to help the local authorities to buy land and property for road widening and straightening, and to influence the types of new buildings on main thoroughfares, but it will be a very long time before shopping centres, schools, old people's houses and factories are gradually banished from the suburban arterial roads that are at present the greatest natural death traps. Ideal road systems, with different classes of traffic segregated into separate lanes, and " fly-over " viaducts and by-passes to canalise fast through traffic near busy centres, will take many years to introduce into the congested industrial areas of Britain. Even the comparatively small effort between the two wars cost over £1,000 million.

A good deal of research is at present being done in the less obvious aspects of road safety. Is it safer for illumination to exploit the reflective surfaces of roads at night, so that moving objects are silhouetted, or to cast the lamp-light in the same direction as the traffic so that it illuminates the objects themselves ? How should the dazzle from the headlights of passing cars be dealt with ? What are the possibilities of standardising the ground-clearance of vehicles, as well as automatic stop-lights, and front-hinged car doors ? These, and many more inquiries, will soon be assisted by a new system of accident analysis by causes. Its development is a matter of years, and like all social statistics it may tell a false tale if wrongly used, but it should prove the basis of a much more scientific approach to road accidents than has been possible hitherto.

Comparison with other countries is not so helpful as might be supposed. Measures for preventing road accidents are at least as far advanced in Britain as elsewhere. Accident statistics, on the other hand, are compiled on such a variety of bases that comparison is difficult. France, for example, appears to have a very low death-rate on the roads, but the " fatalities " only include deaths on the spot, whereas in the United States they usually include casualties dying within six months, and in Britain deaths after any interval of which the accident was the " primary cause." It has been pointed out that annual road deaths in the two states of New York and Pennsylvania (an area comparable with Great Britain and dominated by two major cities not unlike London and Glasgow) are only three thousand to Britain's five thousand. If, however, road deaths per 100,000 population are compared, these two states have 16 against Great Britain's 10 per year ; while if deaths per 100,000 vehicles are compared, the American states lead with 71 to Great Britain's 163 per year. Probably the only valid measurement of road safety anywhere is deaths per vehicle-mile —which there is at present no means of assessing.

It would be fruitless to pass a dogmatic judgment on which is the most successful line of attack on the accident rate for the government and local authorities to pursue. Public opinion, however, is decisive everywhere. It is this which in the last resort determines the penalties that can be exacted for offences against road safety. It is the public's attitude towards learning to drive, as exemplified in the forty per cent rate of failure for driving tests, which makes it difficult to raise the standard of the test as it so obviously needs to be raised ; the public outcry against a test that failed more than half the candidates is not difficult to imagine. It is public opinion that governs—however myopically—the political decisions on how much of Great Britain's scarce resources should be spent on road improvement.

But if there is to be an enlightened attitude towards road safety the public must have more information. If motorists and pedestrians are to stop blaming each other they must be told much more about the causes of accidents, not merely about their weekly totals. If public opinion is to reach an intelligent decision on whether to spend money on improved roads or better houses, urban parking spaces or better schools, the expense will have to be publicly justified by more accessible and intelligible information.

Numbers of deaths are plotted on a " ratio scale " so that equal percentage changes are represented by the same vertical distance anywhere on the diagram.

NOTES OF THE WEEK

Trial of Strength

After three days of nightmare calculations during which the Government Whips counted and recounted their supporters as an insomniac counts sheep, the Government survived two divisions on the Budget resolutions, dealing with the increased tax on petrol and the higher taxation of commercial vehicles, by the narrow margin of five votes. It can now enjoy a short breathing space until the ending of the second reading of the Finance Bill, after which there will presumably be another series of close divisions during its committee stage. The Liberals voted solidly against the Government on Wednesday. Mr Clement Davies had made it clear last week that they disapproved of the two new taxation measures on economic grounds, and there is no reason to believe that their action was dictated by any arrangement with the Conservatives. The Liberal leaders are still determined to fight the next election as an independent party, however closely their actions in the House of Commons may correspond to the Conservatives.

The strain which the events of this week have imposed upon the Government gives added force to the view expressed by Mr Churchill on Monday that the present situation cannot continue. For his part he hinted that such a thing as a coalition had happened in the past, presumably with the idea that if the dreaded word can be exposed to the air of Westminster for some time, it may lose some of its horrid connotations and become less abhorrent to the Labour party, however scornfully the idea may be rejected now. At present, the policy of the Government is that they will attempt to govern as long as they can command a majority, but that if they are defeated on an issue of confidence they will go to the country as soon as the business of supply can be accomplished. They appear to be in no doubt that in the present situation, in which no other party can form a stable government, the correct constitutional course for them to take after a defeat would be to advise a dissolution of Parliament and to hold a fresh election.

This is a reasonable attitude to take. Moreover, the result of the West Dumbartonshire by-election, where the swing towards the Conservatives was only 0.4 per cent, indicates that another General Election at this moment would not produce a more stable government. The onus of stabilising the political situation, therefore, really rests with Mr Churchill. The Opposition was quite entitled to divide the House on the two Budget resolutions which, if they were not major issues, at least raised questions of real public importance. But there are dangers in this course. If every minor attack on the Government is to be pressed home, Parliament will be kept in perpetual uproar, and a fruitless general election may be precipitated on some trivial issue, long before the march of external circumstances has provided the data upon which the parties can build fresh and realistic political programmes. But it is, after all, the business of the Opposition to oppose, and now that it feels capable of forming an alternative Government—which it never did in the last Parliament—it cannot be blamed for doing so. An agreed policy on national Government has been much in the air this week, but it could only come down to earth if the Government were disposed in its favour. This is plainly not so.

* * *

The Dock Strike

The London dock strike, which by the middle of the week involved nearly 14,000 strikers and 84 ships, provides a sad revelation of the impotence of authority in the face of determined agitators. The strike, which began because three men were expelled from the Transport and General Workers' Union for their activities in the dock strike last summer, is essentially an internal dispute within the union. But this fact does not justify Mr Isaacs's remark that "the public are not concerned." The public are clearly deeply concerned in any dispute, whatever its causes, which hampers shipping and commerce, involves the use of troops and threatens to spread to other ports and industries. Moreover, a dock strike is fast becoming an annual event in the London calendar, and the public needs some assurance that measures can and will be taken to eradicate the cause of trouble. It would indeed be a poor advertisement for next year's Festival of Britain to invite overseas visitors to "come to London—to see the South Bank, the trooping of the colour and the dock strike."

The difficulty in this instance is that none of the normal negotiating or conciliation machinery can be brought into operation, because the strike is aimed not at the employers, but at the leadership of the Transport and General Workers' Union. Mr Deakin is quite right to refuse to parley with the strikers or accede to their request for a referendum of the union membership on the expulsions. But it is the shortcomings of leadership and organisation within the union that have precipitated the strike and the public reasonably demands that Mr Deakin should make every effort to settle it since his own officials on the spot seem to be quite powerless to handle the situation. The Dock Labour Board has rattled the sabre, saying that continued breach of contract might lead to dismissals, but threats, which could not possibly be carried out against 14,000 strikers, tend to do more harm than good. In the meantime the Government's decision to use troops in order to maintain essential supplies has temporarily had the effect of exacerbating the men's resentment.

At present the unofficial Port Workers' Committee which got the men out on strike is the only body able to get them back. The committee has shown that merely by lifting a little finger it can paralyse the entire Port of London, and since the committee thrives on publicity this may only be a prelude to much graver trouble. The authorities have not the slightest ground for believing that the committee will respond to appeals to reason, to patriotism, or to loyalty, and the sooner official policy is based upon strength rather than nervous optimism the better the chance of removing the cause of the trouble.

* * *

Bungling in Bonn

The public altercations that have been going on in western Germany during the last weeks should not be taken too seriously. The transition of the Federal Government under the Allied High Commission was bound to have difficult feverish moments; and it is only these that get reported. It is a pity that leadership in western Germany should not be in the hands of wiser and more patient men, but that is a fact the occupying powers have to get used to. It is a pity—and in bad taste—that Dr Adenauer should lead the singing of *Deutschland Uber Alles* in Berlin; but it is the obvious song for a west German Chancellor to sing in the heart of the Soviet Zone. German democrats have little tradition to look back to save the sentiments of 1848.

More serious is the predicament into which Allied policy is getting itself by trying to exercise powers and functions that properly belong to the Federal government, if it is to be independent and democratic. Last week the High Commission sent Dr Adenauer a letter explaining why it could not approve a law which would reduce income tax with striking benefits to the better-off. It objected not so much to the measure as to the fact that no alternative source of revenue was provided, for instance by taxing luxuries. It noted that the proportion of the national income deducted for taxes and state insurance is about 26 per cent compared with 40 per cent in Britain.

Behind this, of course, is the growing irritation of the Americans as they see the "liberal" economic policy in which they encouraged Dr Adenauer's government offering no prospect of an end to German dependence on dollar aid. The Germans are paying for only one-tenth of their food and raw material purchases from the Americans. Under the Economic Co-operation Administration agreement between the Federal Republic and the United States, the Germans undertook to achieve a balanced budget and internal financial stability as quickly as possible. Of these, too, there is little sign. Indeed, the proposed income tax reduction appears to ignore the large deficit revealed in the first drafts of this year's budget—a deficit which will be used to support demands for a reduction in occupation costs. The spree goes on.

The Allied High Commission certainly had the right to remonstrate, and the ECA has good grounds for alarm about Dr Erhard's policies. (The British did not wish to interfere; it was the Americans who insisted on doing so.) But why did the matter have to be handled in this way? Was nothing known of the income tax proposal before it became law by vote of parliament? Could not the project have been nipped in the bud by informal American intervention? Was there no way of avoiding a direct challenge by the Allies to the working of the system they set up? Dr Adenauer declares—not without reason—that the whole basis of parliamentary government has been challenged on a point over which economists might well disagree. The danger of exposing the Chancellor to the charge of being a puppet is surely obvious.

* * *

The German Contribution

There is clearly a risk of serious deterioration in relations with western Germany at a time when they are of critical importance. "Dismantling" in Hamburg and Salzgitter is still talked about passionately. Much bitterness has been caused not only by French behaviour over the Saar but also by Mr Bevin's remark that Hitler's revolution did not change the German character but expressed it. As *Die Zeit* has remarked, this is not the way in which statesmen further European understanding.

On the other hand, there has been a deplorable tendency among the Germans to force the pace, to demand to be wooed. Dr Adenauer seems to take it for granted that the meeting of American, British and French Foreign Ministers in London next month will be considering the next steps to be taken towards granting further powers to his government, so anticipating the review—or rather interpretation—of the Occupation Statute which is due between next September and March. He is probably wrong. His persistent girding at the western governments and haggling about the terms on which Bonn will send delegates to the Council of Europe have soured the optimism with which western statesmen made the concessions represented by the Petersberg agreement of last autumn. Public opinion, too, has been dismayed by the reappearance of anti-semitism, by the permitted revival of the *Stahlhelm*, and by the minor place given in government investment plans to repairing damaged towns and providing houses for homeless millions.

Allied policy in Germany can be liberal and conciliatory, or it can be strict and suspicious. It cannot successfully combine both attitudes, as do the Russians, who have a German party at their ruthless beck and call. Dr Adenauer should realise that a bold and firm decision to press on with the former policy depends largely on the behaviour of his government. He is not strong enough to get something for nothing all the time. The result is that the official policy of integrating Germany into a European framework is little nearer achievement than it was when it was formulated.

New Approach in Malaya

One of the first events to follow the arrival in Malaya of Lieutenant-General Sir Harold Briggs as co-ordinator in chief has been the formation of a "War Cabinet" which can represent Malayan views. So far as it goes this is excellent news; there will certainly be no lack of problems to test the effectiveness of the new team in the months to come. The emergency in Malaya cannot yet be said to be rounding the corner. Indeed, it is only logical to suppose that, if existing trends in the development and continuation of bandit activity are not reversed, Malaya will eventually be lost. This is a very serious situation. And it is one of which many people in Malaya dearly wish both their own and the United Kingdom government seemed more actively and apparently aware. It also raises acutely the question of what more either of these governments can and should do. In Malaya itself, business as usual is rapidly becoming an untenable attitude, a grim façade whose very maintenance creates the serious risk of prejudicing a fresh and wholehearted approach to the entire problem.

It is in Britain, however, that the most downright change of attitude is needed. Perhaps because the Colonial Secretary does not carry enough weight in the cabinet, the Malayan emergency has not yet been seriously treated as the prime threat to the Commonwealth which it certainly represents. More troops, for instance, are required in Malaya. It may not be possible to recruit and send them without a change in public opinion; but what has been done to keep an issue such as this in the public eye here at home? Further, the scarcity of administrators of the district officer type, to follow up behind successful military operations, is a grave problem: why at least has not the rest of the colonial empire been combed to find reinforcements? Again, far stronger and more frequent statements are needed from London that Britain means to stay in Malaya and see the emergency through; in spite of the presence of British forces many Asiatics there—and Europeans too—doubt it. Morale is the essence of the Malayan war, and it is folly not to do all that is possible to sustain it. Even on the financial issue Britain could do more. The total cost is now £45,000 a day, of which £30,000 is paid by Malaya—although half refunded by Britain—and £15,000 is paid directly by the United Kingdom for its own forces. But the refund to Malaya has never been made on more than a yearly basis; and even if the amount is not increased, a promise on the part of the British Government to meet a fixed percentage of Malaya's special expenses indefinitely would not only help hard-pressed Kuala Lumpur to budget ahead but, again, could be used as valuable publicity for Britain's earnest intentions.

The Scottish Covenant

Last weekend the so-called Scottish National Assembly held its fourth meeting in Edinburgh and decided that its executive body, the National Covenant Committee, should approach the leaders of the Government and the Opposition to discuss the establishment of a Scottish Parliament, and, failing this line of approach, that a petition to the King should be prepared. In its four years of life the Scottish Covenant (which grew from a schism with the more extreme Scottish nationalists during the war) has had considerable success. Its demands are limited to Scottish home rule within the United Kingdom by means of a Parliament in Edinburgh (in addition to the present Scottish representation at Westminster) with powers over domestic policy and taxation, while leaving

foreign policy, defence policy, control of customs and excise, and the more important aspects of external trade relations in the hands of Westminster. There are respectable arguments for and against the feasability of this proposal, but adherence to the convention has grown steadily, and last weekend it was announced that signatures in its support have reached just short of a million and a quarter names (or just under half the voting turn out of Scotland at the recent general election).

It was clear from the tenor of the speeches at last weekend's assembly that the organisers of the Covenant are aware that their next moves will be much more difficult than the mere organisation of signatures. They will have to convince opinion in London that their supporting signatures have been obtained in a *bona fide* manner, that they speak for a determined section (if not a majority) of Scottish opinion, and that their proposals are more solid than the romantic ideas of Celtic particularists or Edinburgh lawyers anxious to arrest the dying prestige of their capital city.

The Covenant does not have the backing of any political party except the Liberals, and it stood aloof from the general election campaign. The Conservatives are prepared to set up a Royal Commission on Scottish devolution but they have not given their blessing to the Covenant. In particular the business community in Glasgow and elsewhere dislikes the thought of dealing with Edinburgh instead of London. The Labour party has not been sympathetic of late to demands for devolution. In particular it dislikes what it believes to be the anti-Socialist bias of the covenant movement. However, the Government has belatedly been made aware that a large measure of the desire for self government has been inspired by resentment at the high-handed methods of Whitehall—especially in the matter of housing, transport and civil aviation—and the low calibre of its two successive Secretaries of State for Scotland. The appointment of Mr Hector McNeil, who could ill be spared from the Foreign Office, to that post is a measure of the Government's anxiety that with any further blunders the support in Scotland for either the Conservatives or the Covenant might grow very fast. It will be interesting to see what conciliatory gestures Mr McNeil will be able to make, or what special advantages for Scotland he will be able to wring out of his colleagues.

* * *

Higher Assistance Scales

Details of the new scales of national assistance have now been published. The scales will come into force on June 12th and in a full year they will add about £8,500,000 to the cost of assisting the present number of cases. But since some people, who do not qualify for assistance at present because their resources amount to more than the old rates, will become eligible under the new rates, the eventual additional cost is estimated at £10 million a year.

The effect of this increase in assistance payments, which broadly amounts to 2s. a week for a single person and 3s. 6d. for a married couple, on insurance benefits was discussed in *The Economist* of April 8th. But it is also worth pointing out that the Government, while obviously motivated by a desire to soften the impact of rises in the cost of living, has made itself particularly vulnerable in its fight over wages. The changes in assistance rates will mean that a married couple with three children aged, say, 12, 8 and 3, and paying 12s. a week for rent, will have their income made up to 85s. 6d. a week (compared with 79s. at present). This, however, is a minimum. The Assistance Board can itself make small discretionary allowances to meet special needs. In addition, the person receiving assistance may have other forms of income, and capital, which are either wholly or partly disregarded by the Board when it is assessing his needs and the resources he has to meet them. Thus an unemployed person may keep 10s. 6d. of his casual earnings in a week without having his assistance payments reduced and his wife (like other recipients of assistance) can keep 20s. of hers. It is quite possible, therefore, for the 85s. 6d. to be increased to £5 a week or more, at which level it approaches, and may even exceed, the income of the lowest paid wage-earners in similar family circumstances. The Government's recognition that the rise in the cost of living requires a rise in the rates of assistance is consequently bound to make the pressure for raising the lowest wage rates even stronger. And how can it resist the pressure without giving the impression that it considers that the unemployable deserve better treatment than those who gain their own livelihoods?

* * *

Food Rationing Changes

Hopes that a new Minister of Food would produce some bold changes in food policy have not been fulfilled. An ounce more butter and an ounce less bacon and now the removal of more foods from the points system is as far as Mr Webb seems able to go—or at least as far as he is allowed to go. His difficulty is that policy over food rationing is inextricably mixed up with policy over food subsidies, and until the subsidies are drastically overhauled there can be no great changes in rationing. Obviously, it would be a popular move to increase rations and take some foods completely off the ration. But the limit on subsidies means that higher rations—unless there is a fall in purchase prices—will have to come from the consumers' pockets, and an additional increase in the cost of living would not only be unpopular but would add to the Government's difficulties over wage increases.

There is no doubt that the great majority of wage-earners could absorb an increase in the cost of food without hardship—that is unless it is a hardship to smoke a few less cigarettes a week and fill in a few less football pool forms. But ten years of artificially low food prices have encouraged people to regard any increase in food prices as a hardship since it restricts expenditure on entertainment and other outlets.

Yet Mr Webb ought surely to have allowed himself to do more, even within the limits imposed by the subsidies. Margarine rationing has long since ceased to mean anything, and with the higher butter ration could easily have been abandoned. And instead of reducing the number of points available to consumers—which will cause discontent in very small households—along with the freeing of some previously pointed goods, he might well have scrapped the points system altogether. Syrup, which is in much demand as a substitute for sugar, could have been transferred to the sugar ration, and the other articles that are retained on points—notably biscuits, rice and tinned fruit—could be left for fair distribution by the grocers themselves. The truth is that, among most of these sorts of foods, rationing by the purse has already replaced rationing by points. The rigid pattern of consumption fostered by the subsidies would here have come to the Minister's aid if he had taken the bold course of abandoning the points system, for people's reluctance to spend more on food, if it has to be at the expense of their "necessities" such as tobacco and bets, would prevent the scramble for the freed goods that he evidently fears.

* * *

Realism in Jordan

At last, a responsible group of Arabs has come out with a decision that amounts to facing the facts in Palestine. The new Jordanian Parliament has voted for the annexation of Arab Palestine—that is, for a provisional dividing line which accepts the results of the Palestine war. The many Arabs who prefer to live in the pretence that this result does not exist are bound to argue that the Jordanian Parliament is no more than a bunch of yes-men pandering to King Abdullah's ambitions. But this is not so. It contains, besides its 30 senators and deputies from old Jordan, a like number from Arab Palestine, among them several men of wide public experience who are established leaders of local thought. Plainly, these have reflected that even though Amman may by their standards be unsophisticated, incorporation in Jordan offers them more peace, more security and more homogeneous company than does any other of the choices before them. No person who has reasonably assessed the alternatives can question this view. For the only alternatives would appear to be independence under Egypt's puppet Gaza government, which has no administrative experience and little support, or else gradual absorption by Israel.

The annexation was unexpected only on account of the speed at which it took place. Within minutes of the opening of the new Parliament King Abdullah had announced it in his speech from the throne. He then left, calling on both houses to vote for it. They paused only for a heated dispute whether to vote together or separately (which has been misreported as a debate on the merits of the annexation proposal). No one opposed the motion. All proceeded to the palace to get the royal ratification. At home, the event makes no difference to the mechanics of government; Arab Palestine has been defended, policed and administered from Amman for considerably more than a year.

*

But abroad, the decision involves several foreign states, notably the Arab League to which Jordan belongs, Great Britain to which it is allied by a treaty of 1948 covering a "collective defence system" and—naturally—Israel. It has thrown the Arab League into consternation. It undermines the League stand for the outdated UN partition line, by accepting a different and less advantageous division of Palestine. It also vexes the monarchs who for personal or dynastic reasons hate any aggrandisement of King Abdullah's kingdom. The League members must now decide whether to banish Jordan from their number or whether to save their faces by some resolution giving it "temporary" custody of its new domain. The British prefer to recognise outright an act which though it simply accepts a *fait accompli* is a step towards Middle Eastern recognition that Israel exists and must be lived with. At the same time, they have sweetened the pill for Israel by announcing *de jure* recognition of the State of Israel. The Israelis, as is natural in the circumstances of eternal armistice in which they are living, have emphasised that they cannot view this unilateral annexation as a final political settlement. No one—not even King Abdullah—asks that it should be final. It is merely a start towards dispelling the make-believe in which, unless given a jolt, the Arab League would live for ever.

* * *

Bleak Future for Arab Refugees

Quite unjustifiably, the Arab refugees seem to have slipped in the last few months out of the world's news and off its conscience. Three-quarters of a million people, destitute, disillusioned, underfed, ill-housed and idle, have still to be helped and resettled if they are not to die. On Monday next, May 1st, responsibility for them ceases to lie with the United Nations Relief for Palestine Refugees Organisation (UNRPR) which has been keeping them alive for upwards of eighteen months. The charge now passes to a new body—the United Nations Relief and Works Agency—which is due between now and June 30, 1951, to shift them off a basis of mere relief and on to a basis of relief plus work, organised in co-operation with the local governments.

This is a formidable assignment. Immediately ahead lies the task of taking over the actual distribution of food and medicine from the bodies—Red Cross, Quaker and others—who have been doing it on UNRPR's behalf. Some field staff members are volunteering to stay on a month to month basis, others must go. The local governments are in no position to take over the job at the standard the refugees have come to expect. A hiatus threatens. Just around the corner lurks the threat of exhausted funds. The $31 million that was subscribed to UNRPR by a few charitable governments is spent. The further $54.9 million that has been asked, in voluntary contributions, for the works-relief operation, has not begun to materialise. The United States Congress is being asked for half this total, but the actual money (which forms a fraction of the $3,102,450,000 Foreign Aid Bill now being debated in both Houses of Congress) will clearly not be available for some time. The British contribution (which the Americans faintly hope will be half the remainder) is still in debate. No one else will subscribe till these two gifts are made. Lastly, the co-operation of some of the Arab governments is doubtful. Jordan, which has 500,000 refugees on its hands, is eager to begin work. But the Syrians, more nationalist and less realist, are averse to accepting offers that imply tacit admission of the situation in Palestine.

*

The brightest spot in a bleak outlook is the composition of the new organisation. Its director, who is appointed and paid by the United Nations, is a Canadian of wide experience and impressive qualifications. Major General Howard Kennedy, a civil engineer by training, was during the war Quartermaster General of the Canadian army. At his elbow sits an advisory board which is appointed and paid by the principal contributors of funds—the United States, Britain, France and Turkey. The team has this week taken up its quarters in Beirut.

Their job is two-fold: to keep the refugees alive and well and to inaugurate the so-called pilot projects for irrigating new land that will point the way to more work and better living standards. It is to be hoped that the second half of the assignment will not be swamped by the first. For though works are said to be going to absorb $34 million and relief $19 million, direct relief is to stop on December 30th next. Work for all breadwinners cannot be inaugurated before then. It is impossible to see how General Kennedy's team, however competent and willing, can keep all the refugees alive on the means available.

* * *

Temporary Housing

The first chapter in the story of the temporary housing programme is now complete. The 156,623 houses it produced have been occupied for some time, and last week the final bill of account, amounting to £201 million, was published. This works out at an average cost of nearly £1,300 a house, which is a high price to pay for a box intended to last ten years and which failed dismally in its intended purpose of bridging the gap between the end of the

Air Subscription Rates

Increases in air freight charges make it necessary to raise certain air subscription rates:

	Old Rate	New Rate
New Zealand	£7 15s.	£8
Australia	£6	£6 5s.
Hong Kong and Malaya	£5 15s.	£6

These increases will become effective for air subscriptions started or renewed on and after this issue.

war and the gearing up of the permanent housing programme. The "pre-fabs" will go down to history as an example of a programme which was too late, too slow and too expensive. In its original conception the proposal to erect temporary houses was a good one. But the decision, taken in 1945, to scrap the steel house, for which orders and prototypes had been planned in 1944, in favour of the aluminium house, destroyed most of the impetus of the scheme. As a result of this revision of plans, only 9,300 temporary houses were completed in 1945, and it was not until the middle of 1946 that the rate of completions really accelerated. Even so there remained 46,000 to be erected in 1947 and 17,000 in 1948. From the middle of 1946 the temporary programme competed directly with the permanent housing programme for site, labour and many types of fittings and materials other than bricks. It must therefore be reckoned that the nation is saddled with tens of thousands of temporary houses which might just as well have been of permanent construction. Of these the 54,000 aluminium houses have proved much the most expensive at an average cost of more than £1,600 each.

The second chapter of the story will open in some fifteen to twenty years' time, when agitation will start for the removal of the boxes. The internal planning of the houses is good, their construction is much better than is necessary for a ten-year life, and their initial costs were far too high to justify removal at the end of ten years. Aesthetically they are usually an eyesore, and it is difficult to believe that time and gardening competitions will do much to remedy this. Yet it remains probable that in the circumstances of the day, in, say, 1970, many local authorities will feel it better to continue to demolish the slums of 1870 than to rebuild the misbegotten "pre-fabs" of the nineteen-forties. To judge from the life of some 1918 army huts, the temporary houses may still be an issue in local politics at the opening of the twenty-first century.

Fishing Lessons

The recent antics of the fish market have provided an entertaining object lesson in elementary economics, with a few sidelights on psychology thrown in. Economically the sequel of decontrol neatly demonstrated what economists have been at such fruitless pains to expound and planners so loth to believe—the ultimate sovereignty of the consumer and the subordination of the middleman. In a free market, merchants, wholesalers and retailers are only the final buyer's agents, profiting according to the accuracy with which they gauge and transmit his demands. Let them misjudge these—as after ten years in the dark they had every excuse for doing—and their error at once becomes expensively plain. Those who have indiscretly paid the earth for hake or halibut cannot, like the equally indiscreet official purchasers of snoek, make the taxpayer finance both its storage (were this physically possible) and the advertising campaign designed to move it off the shelves; nor can they recoup their losses from the same source. Consequently they guess again, quickly and better; and the morning after the spree is a good time to go shopping.

This jolt, however, has not left the ultimate datum to be ascertained, the public's appetite for fish, just where it was before. The fact is that the British housewife and her family are sick, tired and fed up with fish. From a coveted prize during the war years it has become the reliable but all too frequent last resort of the meatless, eggless and cheeseless cook, and as habitually served—wet-blotting-paper cod smothered in flour paste, dead umbrella-like flatfish, weary herring, the agglomerated bones and skin of whiting—a last resort embodying all the least attractive features of austerity. Resignation and inertia have hitherto supplemented necessity; but it looks as though the market's error has shocked the housewife out of both, and as for necessity, there are, at the moment, eggs. Without going so far as to say that the outlook for the fishing industry and its allied distributive trades has seriously darkened (for hens will not lay overtime all the year round and the weekend joint shows no sign of expanding) one may well hold, on last week's evidence, that skill, caution and salesmanship will be needed to renew public enthusiasm for their wares.

Fitting Theatres to Towns

Statistics now invade every aspect of the national life. After a long period of nursing new repertory companies in provincial towns and cities the Arts Council has now produced facts and figures by which to judge the financial practicability of launching what used to be the most excitingly unpredictable of enterprises. In the April Bulletin of the Arts Council, its Associate Drama Director, Mr Charles Landstone, boldly sets out a table showing, on the basis of population, what size of civic theatre a town could reasonably be expected to support without subsidy, and states that no town without a population of over 70,000 can hope to maintain a repertory theatre without a heavy annual subsidy. Between a town of 70,000 with a civic theatre seating 350-450 and a weekly repertory, and a town of 300,000 with a theatre seating 600-700 and a three weekly repertory, there is surprisingly little difference in the size of theatre but a great deal of difference in the financial prospects of the enterprise. Mr Landstone's advice is timely since the

Papers for the People

Why this volume is named "Papers for the People,"* except as an alliterative, catching title, is hard to say. It consists of a History of the Bonaparte Family; an essay on the Sepulchres of Etruria; a tale entitled Valeria Duclose, some Leaves from the Journal of a French Physician, illustrating some scenes of the first French revolution; an essay on the Education of the Citizen; a paper expounding and illustrating the doctrine of the Mythus, with a view to explain how the words myth and mythus, have latterly come into general use; a tale of the Mediterranean, a naval story; an article on the Popular Cultivation of Music; and a Biographical Sketch of Ebenezer Elliott, with a notice of his writings. These very miscellaneous productions, like the contents of a magazine or a quarterly review, seem in no way peculiarly adapted to the people. . . . Though the title be deceptive, the volume is a good one. Each article is good of its kind. The history of the Bonapartes is at once complete and concise, though not over favourable; the tales are good; the instruction for the popular cultivation of music is well conveyed; the nature of the myth is clearly explained; and the serious paper on the education of the citizen is well written, but by no means profound. . . . The works of Messrs. Chambers when they touch political or social subjects, are not distinguished in general for sound views. We cannot look for profound researches in popular and light essays; but the Messrs. Chambers are practically good free traders, and yet they put forth an essay that would countenance every interference with private business, which any government has yet undertaken, or may at any time undertake. . . . The Messrs. Chambers must reform their own opinions to make their teaching really useful to mankind. The good qualities of the book are, that it is plainly and forcibly written, and it will be acceptable to many readers who may not be sensible of its errors, or may even cherish them. It is got up very neatly, and the ornamented paper used for the covers, is likely to be extensively and even more tastefully imitated.

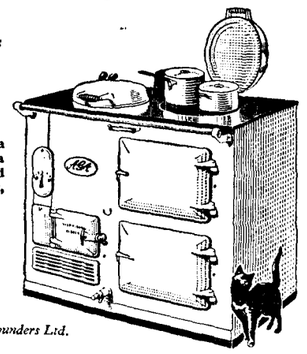
"SHE WAS EVER SO OBLIGING . . .

She even obliged me to follow her example and have an AGA"



A TRUE AND ENCHANTING STORY

"Mrs. B——, who is my very obliging domestic help, saved her earnings for years and bought an Aga," relates a new Aga owner in Surrey. "I didn't have one *at first!* And every day I'd hear, 'Now ma'm if you had an Aga' . . . there'd be plenty of hot water *any* time . . . or no fuss about lighting up and waiting . . . or no dirty cooker to clean, no black pots and pans, a spotless kitchen . . . or food cooked better and almost without watching, a cosy kitchen always. At last my husband and I investigated. We discovered that the Aga does all the cooking and heats lashings of water, enough for 3 baths and all household uses, yet burns only a shillingsworth or less of fuel a day. When we discovered what a lot of money the Aga saves, we changed to the Aga. We are so very glad we did!"

CHANGE TO THE WORK-SAVING, time-saving, money-saving Aga — and happiness! The Aga Cooker and Water Heater has a *guaranteed* maximum fuel consumption of 3½ tons a year burning COKE (in plentiful supply). There are also 2-oven and 4-oven models available without water-heating. Prices from £85 to £115.

Hire purchase terms from **£2** *a month*

SEND TODAY for full details of all Aga models: write to Aga Heat Ltd., 34/1 Orchard House, Orchard Street, London, W.1.

Proprietors: Allied Ironfounders Ltd.

COOKERS AND WATER HEATERS

Stand in your local grocery store any Friday or Saturday and watch the housewives buying the week's provisions. See how often they insist on advertised products. It's the same in all shops. People ask for branded products automatically — because the names are always on the tips of their tongues. The Daily Mirror with the largest daily net sale in the world—over 4,547,000—tells your product story to millions of people whose purchasing power has increased the most. And its space rate—it works out at only ·78d. per inch per thousand—is lower than that of any other National daily. Help your retailers to sell your goods by advertising to the maximum number of people at the minimum cost.

Via the Mississippi

Along the waterway where once the showboat brought entertainment to Mississippi townships modern newsprint is now transported speedily and economically. It is a three thousand miles long story, beginning in the Canadian Province of Newfoundland and finishing at Nashville, Tennessee. It starts at Bowaters Corner Brook mills, where newsprint is loaded on to ships and transported up the St. Lawrence river, through the Great Lakes, to Chicago. Here the newsprint is discharged into great barge trains—one being 225 feet longer than the "Queen Mary". From here to Nashville, Tennessee the barges follow the traditional river highway to the deep south. Down the Illinois, the Mississippi, the Ohio and the Cumberland rivers newsprint journeys in the wake of the long-gone showboat—along fifteen hundred miles of water that by-passes railroads and high freight charges. An important advantage of this overland waterway transport is the lessened risk of damage to the newsprint rolls—another instance of the customer service which has become so closely associated with the Bowater Organisation.

GREAT BRITAIN CANADA AUSTRALIA SOUTH AFRICA
U.S.A NORWAY SWEDEN

1948 Local Government Act for the first time empowered local authorties to provide entertainment on any serious scale, subject to the limitation of a sixpenny rate, and city development plans are now beginning to include plans for civic theatres. The Arts Council's statistics show that except in prosperous residential towns only 3 per cent of a town's population can be relied upon to support a good class repertory theatre. In a small town the minimum running costs necessitate weekly attendance and therefore weekly repertory. In a large town the theatre-going population is large enough to permit of a change of play at three weekly intervals and therefore of a higher standard of performance.

The article assumes that the theatre should be self-supporting, and this should clearly be the aim after the first few years in which the theatre is establishing its reputation. However, Mr Landstone asserts "definitely that a civic theatre with a seating capacity of less than 800 will permanently need some sort of subsidy if its work is to make a contribution to theatrical art." Last year the Arts Council gave grants of just under £100,000 to some 22 dramatic companies. If local authorities become alive to the possibilities of the 1948 Act their subventions could relieve the Arts Council of a large proportion of this expenditure. The limitation of a sixpenny rate leaves a local authority with ample space for manœuvre provided that it runs most of its entertainment activities on an economic basis. An article in *Civic Entertainment* by a "Borough Treasurer" illustrates this. Assuming that a sixpenny rate in a medium sized town amounts to £42,000 the article gives the following illustration:

Expenditure in various civic entertainments	£250,000
Deduct income from admission charges, refreshments, etc.	£208,000
Net cost to fall on rates	£42,000

These figures illustrate how large a town's gross expenditure on entertainment (which must embrace more forms than the serious drama if it is to be justified to the generality of ratepayers) can be if the business administration is effectively managed.

Offensive Against Europe's Docks

It is too soon to judge whether the Communists are to score an important victory on the docksides of Europe. Certainly they have done everything in their power to paint a picture of invincible working-class resistance to the shipment of American arms to Europe. In France and Italy, Communist leaders have openly promised to proceed to political strikes, violence and general illegality. Moscow radio already declares gleefully that "vessels with their holds filled with arms are steaming helplessly from port to port."

The first reactions have not, however, been altogether to the Communists' taste. At the beginning of this month American aircraft were unloaded without trouble from the French carrier *Dixmude* at Bizerta, and the first arms shipments have reached Cherbourg, Naples and Oslo without incident. Moreover, the anti-Communist trade unions have not allowed the case for the shipment of arms to go by default. "Vigilance Committees" were formed in many European ports earlier in the year by the International Transport Workers' Federation, and they have worked hard to counter Communist propaganda.

Yet there may well be serious trouble ahead. However blatantly political the reason for the dock strikes, there are generally a sufficient number of other grievances for strike action to receive strong support from the men—only in Cherbourg is the French Government certain that arms will be unloaded by the men themselves. Elsewhere, low wages, bad conditions and general discontent leave the workers under Communist influence. In Antwerp—not noted hitherto for industrial disturbance—a dock strike has broken out, ostensibly to prevent the arrival of arms but almost certainly inspired by distrust of King Leopold and irritation at the long drawn out political crisis. In the docks, as elsewhere, the Communists are able to profit from any form of local disturbance—political tension, poor conditions, faulty trade union organisation. Moreover, once the arms are landed and distributed, they may still be liable to sabotage in the shunting yards and depots by groups of Communist *militants*. All in all, there is enough uncertainty to make any forecast that the Communist offensive will be decisively broken a hazardous matter.

Re-education in China

A journalist writing about Soviet Russia, and with reference also to Fascist regimes, once remarked that "the citizen of a modern totalitarian state is condemned to a lifetime of perpetual enthusiasm." It is not enough for him—at least if he aspires to an administrative or professional career—to be docile and obedient to the state authority and refrain from political criticism or opposition; he must actively support and glorify the government, testify to the official faith and give thanks with spontaneous ardour for the inestimable benefits conferred upon him. One of his first duties, when the totalitarian revolution has gained power, will be to attend courses in political indoctrination, so that he may be changed in his mental outlook, and then duly register conversion.

In Communist China, where since the time of Confucius great importance has been attached to right thinking among civil servants, this business of conversion is being taken very seriously. According to the New China News Agency revolutionary colleges have been set up to "help intellectuals of the old regime to fit into the new democratic society"; over 200,000 persons are said to have graduated from these institutions for adult re-education during 1949. Most of them were formerly officials or students under the Kuomintang, with "a sprinkling of gendarmes, policemen, business men and even a few former secret agents." The students at a People's Revolutionary University near Peking are put through a course of study of the theory of historical materialism and of the development of human society "through slavery, feudalism and capitalism to socialism"; lectures are followed by discussions in which the students "help to expose to each other their anti-social tendencies." The Agency report admits that many of the pupils had not been in a very receptive mood at the outset, but it claims that gradually "a dwindling minority of unco-operative students came under the pressure of their fellows." It is alleged also that the students had great difficulty in developing "the power of independent thought and self-examination." This is at first sight rather puzzling, for independent thought would seem to be the last thing the system is designed to encourage. But the experienced reader will have guessed rightly that the words are used, as in other Communist countries, in a special sense.

It is natural to ask how far such teaching produces real conversions and also how far the authorities themselves believe in the reality of the professed changes of heart. All these students are aware that those who learn to recite the Marxist-Leninist patter most glibly will do best for themselves under the new dispensation and that those who talk back too vigorously are likely to be denounced to the political police. On the other hand, a prolonged course of uncontradicted dogmatic teaching supplemented by the techniques of the revivalist meeting can certainly have a powerful effect on minds which have previously had neither strong convictions nor a highly developed critical faculty. No doubt by the methods described above the Communists get a large number of conversions which go beyond a mere outward conformity. But the Vicar of Bray probably has followers still more numerous among the re-educated.

Letters to the Editor

Partition and Peace

SIR,—Mr Berman's proposal to hand over Berlin to the Russians in return for part of their zone west of the Elbe, and to accept the partition of Germany as permanent, is based on erroneous assumptions. Exclusive control of Berlin as capital of all Germany would undoubtedly greatly attract Russia; she fought for it through the blockade. But after the return to the west of the two Saxonys and of Thuringia (about 10 million people), Berlin would become the capital of a Russian Germany with but 5,000,000 in Brandenburg and Mecklenburg. Most of the 3,000,000 Berliners would rapidly disappear. The least the western Allies could do would be to organise their transfer to the west with all their moveable wealth, their skill and their rights. The flight of these people would turn Berlin into an unimportant provincial town—or rather an exposed frontier fortress. It would only be about fifty miles from the nearest crossing of the Elbe. The east German military shelter belt, which protects Russia from the west—at one or two points it is not much more than a hundred miles distant from the Rhine—would be reduced at some places by about two hundred miles. This can hardly be attractive to military minded Russia.

All this is however not the essential issue. The main question is whether or not Russia is prepared to call off the cold war on all fronts in return for the permanent exclusive control of Berlin and of a very much reduced slice of her present zone of occupation. There is not the slightest reason to asume that she is reconciled to the incorporation of the Ruhr industrial potential into a Western European Union, and prepared to strengthen this union by retroceding to it a large part of her zone. She would of course not mind selling the Eastern German Republican Government she has set up if she could get anything by it. But retrocession would greatly weaken her position. Putting a large slice of Germany, now partly hidden behind the iron curtain, into the full limelight of the west would not be good propaganda. While the Soviets are convinced that the west is their irreconcilable enemy, they must go on fighting it.

Their attitude has been made very clear by their turning down the neutrality plan evolved by Professor Ulrich Noack and the so-called Nauheim Circle. It proposed the withdrawal of all armies of occupation a year after the peace treaty. Germany was to remain completely disarmed, but neutral. Her neutrality would be guaranteed internationally—not only by the occupation powers. She would accept control and supervision of her industries by international organs; neutrality would be made part of her constitution; no German would be allowed to serve in any army. The plan should have been very attractive to the Soviets. They could withdraw their armies to Poland and Czechoslovakia, where they could stay by invitation of their friends. The British and the American armies would have to leave the continent. For some time the Soviets through their German stooges had encouraged the movement. It became highly suspect in western Germany, and some of its meetings were foolishly forbidden. Notwithstanding this recommendation, the East German Government suddenly turned it down, for communism in the eastern zone is evidently not yet strong enough to face the west without direct assistance.

The slightest inclination of the western Allied authorities to discuss this peace plan would however create a violent revulsion of public sentiment against them in western Germany, and especially in Berlin.

Giving up Berlin after its heroic defence and recognising partition would be looked upon as an act of betrayal all over Germany—the Communists, who are posing as the only genuine advocates of national unity, would greatly benefit from it. The Russians would rightly come to the conclusion that nations who wish to buy peace on dishonourable terms are frightened, and can, because they are frightened, be successfully intimidated and blackmailed.—Yours faithfully, M. J. BONN

27 *Eton Court, Eton Avenue, N.W.*3

Foreign Policy

SIR,—As an observer who has watched at close quarters with both sympathy and dismay the twistings and turnings of British foreign policy in Europe, may I suggest to your English readers four points or objectives which seem to me indispensable to the creation of a European government.

1. The idea of a European government is a vital factor in the cold war. To the French and Italian people who are not imbued with ardent loyalty to their own particular governments—the idea of a united Europe is ideologically indispensable for carrying out their share of the international schemes of economic recovery and defence. It is therefore necessary that the governments of the European countries should immediately take a decision of principle to the effect that within, say, ten years they will create a European government. This solemn undertaking would speedily change the political climate of Europe for the better.

2. The Council of Europe should, however, during the next few years, dissociate itself explicity from the tasks of European recovery and defence and confine its energies (*a*) to discovering what functions a European government should fulfil in the future and (*b*) to agreeing without delay upon certain practical, if minor, measures which member governments may execute in concert in the meantime. In these tasks there should be no disharmony between the Committee of Ministers (which is not a government but a conference) and the Consultative Assembly (which is not a legislature but a body advising the Ministers).

3. All European politicians should proceed with their campaign of education in the European idea, in which the United Europe Movement will have a preponderant role. For it is only when European populations are familiar with the *raison d'être* of a European Government and the sacrifices that its establishment would entail that they will be in a position to elect to power (or authorise by referendum) national parties with a mandate to surrender a part of national sovereignty.

4. Meanwhile the twin objectives of western European defence and European recovery should at present be pursued by conference (the only available method of getting anything done). The aim of the OEEC and of the organisations arising from the Brussels and Atlantic Pacts is, and should be, to establish joint streamlined administrative machinery by which governments may give adequate effect to their military and economic alliance. The misconception that the OEEC is a European economic executive *manqué* still lingers, much to the disservice of its component members who seek faithfully to fulfil its actual function, that of a standing conference of economic ambassadors.—Yours faithfully, EUROPEAN OBSERVER

The Opposition and the Budget

SIR,—Probably the most telling criticism of the Conservative Manifesto was the simple question asked, in February last, by one of our dailies: "Tell us," it asked, in heavy capitals, "HOW, HOW, HOW?" The only sort of answer it provoked was the familiar "Wait till we have seen the firm's books, and then we will tell you how to run the business."

I doubt if this was an honest answer. We now have the Chancellor's latest budget under fire, and it is a budget illuminated against the vast financial background disclosed by official figures from the Inland Revenue, the Board of Trade, the Banks, etc. Is it not true to say that any intelligent student at the London School of Economics has, at any time during the past few years, had virtually all the data he required to produce a "budget" as an exercise, provided only that he was given a directive as to policy?

Historically, we have reached what is probably the most decisive—as it is the most exciting—point in our history. The surge of the vote to the Left has been halted, and the country is split on what we conveniently call fundamentals. Very soon we shall again have to face the polls, the voters as well as those voted for. Are we so backward a people, or so untrustworthy, that we must be left to vote on the issue of a "penny off a pint"? Now, surely, is the time for the people to be treated as adults, and honestly, and the Opposition's true answer to Cripps's budget is an Opposition budget. Let the Conservative shadow cabinet produce a shadow budget, so that those who vote may see, not only how well, but how they will live if the Opposition returns to office.—Yours faithfully, FRANK HELLINGS

3 *Holly Mount, N.W.*3

The Royal Prerogative and Dissolution

SIR,—In your note on "Budget and Politics" you refer to the action of Lord Byng in 1926 as a thoroughly bad precedent for the exercise of the Royal Prerogative in refusing a dissolution to a Prime Minister. This precedent is, however, only unfortunate because of the way in which Lord Byng handled the further complication of receiving a second request for a dissolution a few days later from Mr Meighen, who, at the head of the alternative Government, had met with no more success in commanding a majority. This time the dissolution was granted, and therein alone the Governor-General appears to have made his mistake. Mr Mackenzie King himself never criticised Lord Byng for refusing him a dissolution in the first place. His argument was solely that, when it had to come, he himself should have been asked to form another Ministry beforehand, so that it could be granted to him as Prime Minister, as he had first requested it.

I think, in fact, it is safe to say that although the King must act on the advice of his Ministers it need not necessarily be on that of his present Ministers; and if the King today were to know that Mr Churchill could form a majority in the House of Commons to support his action (or even could do so after a General Election) he would have every right to refuse Mr Attlee a dissolution.

Surely a much happier, and more recent, precedent would be the action of Sir Patrick Duncan, who, as Governor-General of South Africa in 1939, refused to dissolve Parliament at the request of General Hertzog, calling instead upon General Smuts to form an alternative Government, which stayed in office, without an election, for several years.—Yours faithfully,

Pembroke College, Oxford KEITH H. JEFFERY

Newfoundland and Canada

SIR,—The otherwise excellent article, "Newfoundland into Canada," in *The Economist* of April 1st, contains one statement which is open to question: Newfoundland iron ore "cannot compete with high grade Canadian ores," and this is what has "caused a closing down of part of the mines on Bell Island." The fact surely is that Confederation has changed nothing in this respect. Newfoundland ore never came into central Canada. It went to Nova Scotia and Europe, and sometimes to the United States. Ore from the two Ontario mines which are the only producers in old Canada never went to Nova Scotia or to Europe. There was, and is, no competition whatsoever. It is the loss of European markets which has shut down part of Bell Island. This has nothing to do with Confederation, since Newfoundland has been part of the Canadian monetary area since 1895.—Yours faithfully,

Ottawa EUGENE FORSEY
Canadian Congress of Labour

The Norwegian Economy

SIR,—Your correspondent's report on Norway makes depressing reading, ignoring, as it does, all positive achievements. In fact, production, investment, employment, and productivity are all greater now than before the war. The production index, which was 100 in 1938 and 81 in 1945, was 129 in 1949. The national income in 1949 was 13,830 million kroner (20 kroner = £1). No less than 4,675 million kroner of this amount was invested in reconstruction and development schemes, representing an investment rate of 37.1 per cent. Of the amount invested, 3,673 million kroner came from private sources and 1,002 million kroner from the State and local authorities.

Reconstruction has been more than achieved in the rebuilding of the merchant fleet and the fishing and whaling fleets. The Spitsbergen coal mines are producing more than ever before, and output of the chemical industry is now 50 per cent greater than before the war.

A guide to the state of the Norwegian economy is the fact that 15 billion units of electricity were produced in 1949 compared with 9,638 million in 1938 and new generating capacity has been installed at the average rate of 143,000 kW. a year against 57,500 kW. a year between 1937 and 1940. The working population has increased by only 20,500 in the period 1946-49, but the number of people in employment has risen in the same period by 95,000. In fact, never before have so many people had employment, and never before has unemployment been so little.

The restoration and expansion of Norway's productive capacity has naturally meant a concentration on investment at the expense of consumption. An indication of this is that in 1949 Norway imported capital goods and raw materials to a value of 3,873 million kroner and consumption goods to a value of only 345 million kroner. This concentration on investment appears the only right course in view of the need to "stand on our own feet" when Marshall Aid ends.—Yours faithfully,

Books and Publications

A Major Event

"Chambers's Encyclopædia." New Edition, XV volumes. Managing Editor, M. D. Law. George Newnes. £42 10s.

THE appearance of a new major encyclopædia is an event offering to the reviewer an almost unanswerable challenge. To review it in the usual sense is impossible, to generalise on its methods, its *raison d'être* and history, is perhaps interesting but certainly inadequate. The would-be critic may, however, apply certain tests. Some articles will impinge on his particular expertise; how do they show up? How well qualified are their writers? How up-to-date, in fact and scholarship, their matter? On most his ignorance will be black and total; how much wiser does he find himself for reading them, how effectively set on the path of further study? How easy is it, starting from ignorance or vagueness, to find one's way about among the headings in search of a particular piece of knowledge? What about the distribution of space, the balance between subjects and, when the question arises, between the ephemeral and the lasting? And finally, how satisfactory are illustrations, format, print and binding?

The new "Chambers's Encyclopædia" stands up triumphantly to interrogation on these points—with some reservations concerning the last; the quality of the binding runs far behind that of the contents. Its system of cross reference allows an experimental reader to pursue an unfamiliar subject through its logical ramifications, to key it into previous knowledge, and to pinpoint any particular item of information sought with remarkable smoothness. The balance of subjects is a matter on which judgments must differ. One may feel that Crime might well have been given more, instead of less, space than Cricket, and Lenin than Lace; or that John L. Lewis deserves more attention than "Monk" Lewis or for that matter Cecil Day Lewis. But no editor can please everyone all the time; and it is an awkward fact that importance in any absolute sense and suitability for full-scale treatment in an encyclopædic entry are far from being the same. An encyclopædia, concerned as it is with facts rather than opinions, is better fitted to answer queries on scientific, historical and technical matters than on art, literature, and music, which may accordingly appear hard done by—Shelley or shellfish, Raphael or refrigeration, being cases in point. This is, however, a shortcoming of encyclopædias in general, from which the new "Chambers" (the review of its forerunner, published exactly one hundred years ago, is reprinted on page 932) redeems itself with particularly full references for further reading.

Those articles which deal with economic and related topics score very high indeed. A formidable company of top flight contributors has been assembled: Professor Hayek, for instance, writes on Economics, Professor J. R. Hicks on Value on the Theory of Wages, Professor G. D. H. Cole on Economic Planning, Economic Systems and a number of other topics, Dr N. Kaldor on Distribution, Dr T. Balogh on Exchange Control—to name but a few. One can hardly imagine the work better done. Possibly the standards demanded of the reader might have been more thoroughly assimilated. Professor Erich Schneider's authoritative article on the Theory of Production, for instance, shows an austere unwillingness to compromise with the layman's limitations, while Mr G. L. S. Shackle, dealing with the no less intrinsically sticky Theory of Capital, keeps these in mind throughout. The institutional and descriptive articles in this field steer a careful but not invariably successful course between that excessively general treatment which frustrates the seeker after hard facts and the particularity which may bring over-rapid obsolescence. Thus Professor V. Morgan's article on Central Banks, chiefly devoted to the Bank of England, continues a historical survey with an admirable exposition of essential functions, but does not touch actual procedure. Were the information readily available elsewhere and a signpost provided, this lack would hardly matter; as it is, one cannot but feel that the desire to avoid the ephemeral has led to the missing of a chance.

Particular mention is due to the articles on Prices, on the National Income, and on the National Debt, which are models of what such things should be; and to the efficiency, throughout this group of subjects, of the system of cross reference. In the economic field at all events it can be said without qualification that a new standard of excellence has been set up.

An Observant Ambassador

"Moscow Mission, 1946-49." By Lieutenant-General Bedell Smith. Heinemann. 337 pages. 15s.

THIS judicious and comprehensive appreciation of the Soviet Union and its policy by the former Chief-of-Staff of SHAEF is in striking contrast to the type of ambassadorial memoir in which significant anecdote and insignificant people, superior manners and inferior verses jostle for space. This is much more serious and solid fare, and it is a revealing guide to the kind of experiences and despatches that have shaped State Department policy during the period of America's postwar awakening to its new responsibilities. One feels in it the influence of that powerful planner, Mr. George Kennan, who has been much in and out of the Soviet Union since 1933, and of the rather Teutonic academic tradition which makes American intelligence sometimes ponderous and inhuman in its judgments. General Bedell Smith does not just reminisce, he writes for the record: and a very important record it is—of the crucial Four-Power Moscow conference of 1947, of the period of the Berlin blockade, of Stalin's breach with Tito, and of the prospects of peace.

On the long and difficult negotiations about the Berlin climax to the cold war the narrative is less revealing than the British White Paper on the subject; but it does illuminate the subtle play of Molotov's mind as he tried to make every bit of mischief he could within the limits set by Stalin. It confirms, too—what was always argued in *The Economist* at the time—that the Soviet purpose was not to get the western allies out of Berlin but to stop the creation of a federal government in western Germany. Yet it was only indirectly that this purpose was revealed by the Russians, and ostensibly they were interested only in the settlement of the Berlin currency question.

It is surprising and disappointing that a distinguished American soldier should give no more than three pages to some quite commonplace views on Soviet military strength. Much of what he writes on other subjects—the "war of words," culture, religion and industry—has been said before and better, and there is a disturbing tendency to judge Russian motives and behaviour far too much by Anglo-Saxon standards. From "the businessmen's standpoint," the author thinks that:

> Soviet industry is at present so inefficient and so wasteful of both manpower and labour that it could never compete on a cost basis with the efficient mass production methods of the United States.

The best chapters are those on Stalin, on his colleagues of the Politburo and on the treatment of the diplomatic corps in Moscow. Stalin seems generally to have been friendly, although he told the General on his arrival—this was as early as 1946—that he believed the Americans and British to be "united in an alliance to thwart Russia." And when the Ambassador said to Stalin that the question uppermost in American minds was "How far is Russia going to go?" Stalin replied "We're not going much further." Perhaps he was thinking of China.

Politics and the Documents

"The British Political Tradition." Volume I. "The Debate on the American Revolution, 1761-83." Edited by Max Beloff. Nicholas Kaye. 303 pages. 12s. 6d. Volume II. "The Debate on the French Revolution, 1789-99." Edited by Alfred Cobban. Nicholas Kaye. 495 pages. 12s. 6d.

THESE books are the first two volumes of a new series which is being produced under the general editorship of two distinguished Oxford political scientists, Mr Alan Bullock and Mr F. W. Deakin. The purpose of the series—which later will include volumes on the various separate strands in the British political tradition, Whig, Radical, Conservative, Liberal and Socialist, together with several more specialised studies—is to illustrate the growth of a political idea or argument through a selection of the relevant contemporary documents. When introduced, as these two volumes are, by scholars with an expert knowledge of their period, there is undoubtedly a great deal to be said for this method, since a study of the documents can illumine the quality of a period of history—of post-mediæval history that is—far more brightly than any commentary. This series should not only prove a godsend to the undergraduate, but a source of great pleasure to the historically or politically minded layman. As the general editors emphasise:

> It is to meet the need of the reader who is interested in English political ideas but has neither the time, nor the patience, nor perhaps the opportunity, to read through a library of books to find the material he is looking for that this present series of books is designed.

It was undoubtedly right to include the debates on both the American and the French revolutions, and both Mr Beloff and Dr. Cobban have performed their task with competence and skill. It is, however, no disparagement of Mr Beloff's work to say that *The Debate on the French Revolution* is the more important of the two books. In the first place, there already exists in Professor S. E. Morison's *Sources and Documents Illustrating the American Revolution* a comprehensive collection of the relevant documents relating to that epoch, whereas there is no readily available counterpart, published in England, for the French Revolution. It is perhaps for this reason that Mr Beloff's book is shorter by two hundred pages than Dr Cobban's, and contains only the more well known documents from the American side of the fence. In the second place, the quarrel between England and the thirteen colonies elicited no arguments comparable in quality or significance to those which the French Revolution precipitated within the British political conscience. It is true that after decades of reflection upon the experience of the quarrel with the American colonies, two ideas, which would have effectively stifled the nineteenth century development of Britain and the Commonwealth—the indivisability of sovereignity, and the economic advantages of a closed mercantilist economic system—were abandoned. But there is little in the American Revolution debate which gives to the period of the French Revolution that sense of wrestling with profound ideas, and which elevates the debate between Burke and Paine, between Pitt and Fox, to the highest plane of political controversy.

The Vichy Story

"Mémoires: Rappelé Au Service." By Maxime Weygand. Flammarion, Paris. 597 + xxvii pages. 650 frs.

"Le Drame de Vichy I: Face a l'Ennemi: Face a l'Allié." By Yves Bouthillier. Librarie Plon. 320 pages. 420 frs.

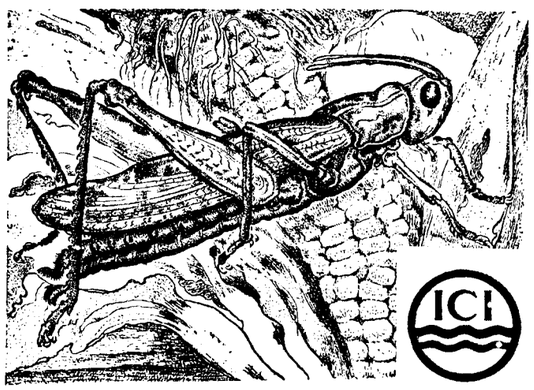
THE Vichy regime is becoming the best documented of all the political aspects of the second world war; and the documents are tending to make one revise one's original judgments on men and events. It has been the main purpose of Vichy's more respectable defenders to argue that the ultimate depths and infamies of collaboration as practised by Laval were neither inherent in the acceptance of the armistice, nor intended by Marshal Pétain and his original team. These defenders do not all speak with the same voice; indeed they could not do so and be honest, since "Vichy" was never of one mind. Indeed it is this legend of Vichy as a single phenomenon—the triumph of French fascism is the hour of national humiliation that most requires revision. Only the Communists, with their own treasons to conceal, require it to be maintained integrally. Vichy had links with the future as well as with the past; General Weygand's subordinates in North Africa provide the dominant figures in France's army of today. For men like Weygand and Bouthillier, the most urgent thing was to maintain the continuity of the French state—their animosity to de Gaulle rests upon his having broken it.

General Weygand's narrative makes the weightier but the less interesting book of the two. It divides into four clearly marked sections: a brief account of his command in the Levant; the story of the battle of France from his taking over the command until the armistice; the political and administrative problems which he faced as minister of defence in the first Pétain cabinet; and his mission to North Africa, where he continued the work begun as a minister of building up the nucleus of a future French army of *revanche*. General Weygand's attitude is clear and limited; the armistice was a military necessity; the notions of the Breton "redoubt" or of retreating to North Africa were wholly impracticable; the armistice and the preservation of some kind of French government were essential if the struggle against the permanent enemy was to be renewed. His ideas on internal politics consisted of the naive clichés of the French extreme right and are without significance.

M. Bouthillier, who was Pétain's finance minister until he fell foul of the Germans in 1943 and was arrested and deported, is as much the subtle intellectual civil servant as Weygand is the blunt soldier. In this, the first of two promised volumes, he has produced the most revealing book on Vichy to be published since M. de Moulin de Labarthète's incomparable *Le Temps des Illusions*. He is much less inclined to see Vichy as a cover for conscious anti-German activity, much more pronouncedly anti-British (especially over Mers el Kébir), and except on military matters much more worth reading. In particular he does finally explain what happened over the dismissal of Laval in December, 1940.

Where the two narratives meet and confirm each other, as well as filling out the picture already given by Mr Churchill and M. Baudouin, is in their account of the Anglo-French discussions before the June armistice. More and more it looks as though the deep cleavage and bitterness between the allies could have been avoided if M. Reynaud had been better able to face realities. Had there been an arrangement of the kind suggested in the British telegrams which were withdrawn to facilitate the "Union" proposal, there might have been no Mers el Kébir, and no de Gaulle.

Reconstruction in Mongolia



"Outer Mongolia and Its International Position." By Gerard M. Friters. John Hopkins University Press. (London: Geoffrey Cumberlege.) 358 pages. $5.00 or 45s.

DESPITE the fact that the independence of the Mongol People's Republic (Outer Mongolia) was reaffirmed in the Russo-Chinese agreements of February 14th last, it remains true, as Mr Friters himself remarked in a recent broadcast, that "the Mongolian question is one which may well one day be put back on the agenda of Russo-Chinese relations." The available information ought, therefore, to be readily to hand, and it is fitting that Mr Friters' work on the subject which has long been known to specialists in the field in a partial and not readily accessible form, should now become available in this handsome if expensive volume.

Mr Owen Lattimore, who is currently wrestling in the clutches of Senator McCarthy, contributes a long interpretive introduction. Whether or not one agrees with it all, it is a

'Gammexane'

'Gammexane' is a proprietary name given to a range of remarkable new insecticides developed as a result of wartime discoveries by I.C.I. research chemists. They are based on benzene hexachloride (BHC), a compound first prepared by Michael Faraday as far back as 1825, which can exist in four forms — known as the alpha, beta, gamma and delta "isomers" — each having the same molecular formula but different properties. The achievement of the I.C.I. chemists was their discovery that one of these isomers possessed remarkable insecticidal properties. By isolating and testing the different isomers, they established in 1943 that BHC's insecticidal powers lay almost entirely in its gamma isomer, and that in pure gamma BHC they had an insecticide which was, in some respects, the most effective ever discovered. 'Gammexane' insecticides, based on gamma BHC, mark a significant advance because, though their effect on insects is both deadly and persistent, they are almost entirely harmless to men and animals. At home, in farms and factories, they have eradicated pests ranging from cattle ticks and wireworms to cockroaches, bed-bugs and the house fly. Overseas they have proved the most powerful of all weapons against the locust.

useful attempt to combine a sociological appreciation of the changes in Mongol society with an analysis of the impact upon them of the Russians (seen here in the light of protectors against the Chinese) and does at least afford a clue through the close-packed material presented by Mr Friters. For his part, the author has clearly endeavoured to present his factual material with the minimum of interpretation. Even this is no small task as his polylingual bibliography makes plain. For the reconstruction of the history of Outer Mongolia over the past few decades resembles nothing so much as the attempt to reconstruct a prehistoric monster from a handful of separate bones. Few westerners have been there in recent years—and few Mongol accounts are available. One is thus, as the story goes on, more and more dependent on Russian sources. One's suspicion of these, and especially of the more recent ones, is likely to be heightened by the fact that (since Mr Friters sent his work to the press) the author of one of the standard Russian books on the subject, Mr Ivan Maisky, well known to English readers in another capacity, has been forced to avow publicly before the Pacific Institute of the Moscow Academy of Sciences, the racialist-colonialist errors of the first edition of 1921, and to promise a second edition, written in a manner more in conformity with the dictates of the spirit of Soviet oriental studies.

Nevertheless, much can be gleaned by a student as diligent as Mr Friters, particularly since, after a preliminary chapter on "Geography and Society," he is concerned almost wholly with diplomatic history where the limitations of his sources are less apparent. It does not make for easy reading that Mr Friters has divided his subject topographically, so that we get separate chapters on relations with Russia (Tsarist and Soviet), relations with China, relations with Japan, and relations with other powers—the latter never important and latterly negligible. However, the outline of the story is clear. Under both types of Russian regime, Outer Mongolia has been regarded mainly as a buffer, although, as Mr Friters wisely insists, one should not jump to easy conclusions about the fundamental continuity of Russian policy.

On the subject of the transformation of the Mongolian economy and society to a state more suited for the supply of animal products in quantity to the Russians, and more in conformity with Marxist principles, the evidence is scantier. The constitution of 1940, printed here by Mr Friters, represents a sort of intermediate stage between the two constitutions of the USSR—a fact from which some conclusions can perhaps be derived. Apart from one unfortunate incursion into eastern European politics in which Mr Friters does not seem at home, this is a very useful and praiseworthy piece of work.

Shorter Notice

"India, Pakistan in World Politics." Jossleyn Hennessy. National Newsletter. 90 pages. 3s. 6d.

This handy little booklet provides a quick survey of some of the events and problems that have arisen in the Indian sub-continent during the past three years. Beginning with the place of India and Pakistan in the world balance of power, it gives, amongst other things, a summary of the Kashmir dispute, the Indian food problem, Pakistan's fundamental difficulties, the Hindu-Moslem issue, devaluation troubles and the question of the capitalism or socialism in India. Much of it written from the economic angle, the booklet constitutes an excellent and authoritative introduction for the serious general reader.

Mr. Hennessy, however, is dealing with a subject in which even absolute truth looks different when seen from different directions. And some of his readers will doubtless cavil at some of his facts as well as his conclusions. It would, for instance, be an unusual Pakistani who accepted his account of India's case over Hyderabad; and many Indians would probably join issue with him in his presentation of the events leading up to the situation in which Indian and Pakistani regular troops come to face one another in Kashmir. But it may well be argued that in doing so they are both showing a characteristic encouraged by if not actually acquired from, their long contact with the British. For, like the British, both Indians and Pakistanis have come to believe that if you really think something very strongly you must be right.

AMERICAN SURVEY

Loyalty Dilemma

(From Our American Staff)

THE confusion surrounding Senator McCarthy's Communist charges against the State Department was worse confounded last week when the committee of inquiry heard, under subpœna and under oath, the Senator's ace witness, Mr Louis Budenz. Senator McCarthy has announced that he will "stand or fall" on the guilt of Mr Owen Lattimore, an unofficial consultant of the Department on Far Eastern policy. Mr Budenz, a former editor of the *Daily Worker*, who has now returned to his original Catholic faith, could not, from personal knowledge, substantiate Senator McCarthy's accusation that Mr Lattimore had been a member of the Communist Party. But Mr Budenz testified that, while he was a Communist, he had been informed that Mr Lattimore was one of the faithful by Communists on whose accuracy he relied.

On certain key issues, such as the Marshall plan and the Finnish-Russian war, Mr Lattimore's position has been at variance with the party line; Mr Budenz suggested that an official dispensation to disagree in public might have been granted by the party, as is done from time to time to provide cover for valuable agents. Mr Budenz explained his own reluctance to name many individuals whom he regards as Communists by pointing out that the party is instructing persons charged with being Communists to bring libel suits against their accusers and thus "bleed them white." (Mr Budenz' forthcoming book has been given careful legal review with this in mind.)

The logical conclusion seems to be that a person who does not fight a charge is a self-admitted Communist, while one who seeks redress through the courts is toeing the party line. Similarly, anyone who agrees with Communist views on national issues is a Communist, while anyone who disagrees with them is a sufficiently important agent to have been given an official dispensation. A card-carrier is a party member; a non-card carrier is an under-cover man. As the *Washington Post* notes, this is a new doctrine—of guilt by dissociation.

Meanwhile, Washington columnists are trying to identify the sources of Senator McCarthy's inspiration. There is a suspicion that the private papers of Nationalist China's representatives could illuminate much that is dark. Political analysts concede that Mr McCarthy's present purpose may be to unmask Communists in the State Department, but they do not overlook the need of the Republicans for a campaign issue to set against the theme of Congressional repudiation of the Fair Deal that the Democrats are assiduously developing. There are a number of Republican Senators, some of whom must seek re-election this summer, whose voting records on domestic issues are unattractive campaign material; they need to direct the voters' attention elsewhere. Senator Hickenlooper's interest in the affairs of the Atomic Energy Commission quickened last spring at the time when it became clear he would face formidable opposition in this autumn's elections. It will help key Republican contenders if they can boast that they have saved the country from Communism, and the fact that the chief saviour is a man named McCarthy might have particular merit in certain Irish-Catholic districts.

★

More and more Americans are becoming concerned about the procedures followed in Congressional loyalty investigations. The Supreme Court has just upheld the right of Congressional committees to a reply from witnesses asked if they have been members of the Communist Party. The committee involved was the House Un-American Activities Committee; the witnesses two of the ten refractory Hollywood writers. But Congressional privileges imply Congressional responsibility. When Mr Lattimore testified, he challenged Senator McCarthy to repeat, outside the privileged halls of Congress, the statements he had made under cover of the immunity they confer; the Senator's subsequent statement in the open bore only a superficial resemblance to what he had said *in camera*. How much immunity of this kind is necessary to protect the national security, and how much can be granted without seriously infringing the liberties of the citizen as set forth in the Bill of Rights?

★

The question is by no means confined to the activities of Congress. The procedures followed by the President's own loyalty programme are being subjected to a series of constitutional challenges in the courts, the third arm of government. The present system of loyalty checks was established by executive order under a section of the Hatch Act that prohibits the Federal employment of any person who is a member of any party or organisation advocating the overthrow of constitutional government. Under this order, each agency set up a loyalty board to hear cases concerning its own employees, while the Civil Service Commission created an Investigation Division and named a Loyalty Review Board to hear appeals and see that the procedures of the lower boards are adequate and fair. A check was made of all serving employees when the programme was started and since then applicants for jobs have been investigated before appointment. At the same time that the loyalty check was inaugurated, the President asked the Attorney General to draw up lists of subversive organisations, affiliation with which might contribute to a verdict of disloyalty.

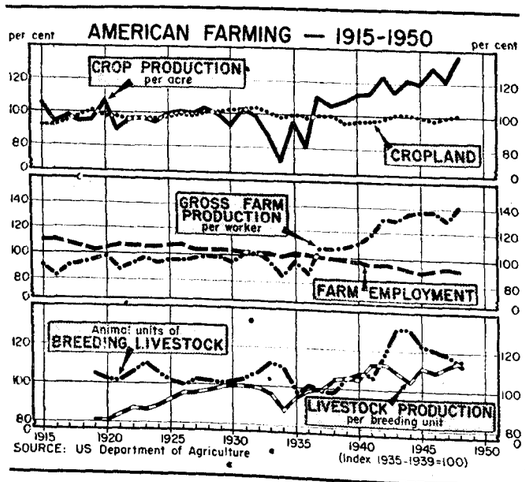
Both these aspects of the programme are being challenged in the courts, on the one hand by organisations contending that the Attorney General was in error in listing them as subversive, and on the other by individuals dismissed as

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

bad security risks who argue that the dismissal procedure violated the Bill of Rights. The two cases that are likely to determine the constitutionality of the loyalty check are those brought by the Joint Anti-Fascist Refugee Committee against the Attorney General, and that brought by Miss Dorothy Bailey against Mr Richardson, the chairman of the Loyalty Review Board. In both instances appeals were lodged and denied by a court that divided two to one. The dissenting judge, Justice Edgerton, urged that Miss Bailey had been denied the fundamental right of confrontation and cross-examination of witnesses, and that the listing of an organisation as subversive without a hearing denied due process and freedom of speech and assembly. In both cases the majority emphasised the difference between an administrative procedure and a trial in the strict legal sense, and stressed that federal employment is a privilege, not a right. The conditions of such employment are therefore subject to the discretion of the President. The Supreme Court has been asked to review the two cases.

Meanwhile various bills to extend the scope of the loyalty programme are competing for places on the Congressional calendar. One that has attracted much attention is the revised version of the Mundt-Nixon Bill, that failed to pass in the last session; it would tighten the regulations against the employment of Communists, would require the registration of Communist organisations and their members, and the marking of propaganda they send through the mails, and establish a Subversive Activities Control Board. Another Bill, that to establish a National Science Foundation, would assure the investigation of all participating scientists by classing them as civil servants.

These legislative, executive, and judicial decisions on the vexed subject of loyalty present a fundamental dilemma. To attract the recruits it so badly needs, the government must assure the maximum observance of individual liberties. Yet it must keep down the harassment of the innocent without permitting the genuine Communist networks—whose existence the witch-hunters, wittingly or witlessly, help to conceal—from strangling democracy from within.



Two Blades for One

[FROM OUR AMERICAN STAFF]

THE hopes of certain Congressmen that foreign aid programmes can be made to serve increasingly as disposal programmes for America's agricultural surpluses, illustrate the different rates of progress of the physical and social sciences. Over the last generation, and particularly over the last decade, chemistry, biochemistry, genetics and other physical sciences have made substantial contributions to the production of more food and fibre on less land and with less work. The discoveries and improved techniques have been given practical application under government auspices in federal laboratories and experimental stations, in state agricultural colleges, and in "pilot projects" established by the co-operative extension service (maintained by federal, state and county authorities); much has also been done by private companies producing fertiliser, farm machinery and hybrid seed. And these practical applications have been brought rapidly into general use by the considerable proportion of commercial farmers who keep a keen eye on scientific advances.

The resulting abundance is a just cause for pride, but it also gives modern relevance to the Kansas farmer of folklore, whose first row of vegetable marrows grew so fast that they caught up with him and strangled him before he finished planting the last row. Americans like to read that disease-free potato seed from the United States has doubled the yield of that vegetable in hungry China, that their new hybrid onions are making themselves at home in Egypt, that artificial insemination, with germ-plasm flown from America, is improving the livestock bred in foreign lands. But they do not like to read of potatoes dyed blue (to prevent them being eaten by humans), or rotting where they grew, because techniques of distribution have not kept pace with techniques of production. And, as taxpayers, they do not like the cost of that time-lag when it amounts to half a billion dollars in three years.

The rapid progress of production is shown by the fact that, while a quarter of the food produced during the war years went to military consumption, and the number of workers on farms declined by 8 per cent, the American civilian population was 12 to 14 per cent better fed than before. Over the last two decades there has been an average increase in productivity of 50 per cent an acre in all the major crops, and a similar if less spectacular rise in animal increase. Delegates to a United Nations conference on natural resources last summer were told that, if all American

farmers were using all the technological improvements now available, "they could have produced last year's maize crop (the largest on record) on a third fewer acres, and at the same time have had more income and improved their soil."

Many of the factors which made this agricultural revolution possible were known before 1930, but then their effect was reduced by widespread drought and depression. There were several of these factors—changes in managerial techniques, improvements in machines and processes, scientific developments, wider use of power, and so on. Not until the drive of war needs brought them to simultaneous fruition did the extent of the revolution become apparent, in a form which was then as welcome as it is now embarrassing.

Mechanisation has not only made it possible to plough by tractor and transport by lorry; it has freed for productive use the 55 million acres previously used for feed and pasture for the horses and mules that have been superseded by the motors. And the introduction of electricity on the farm, from the washing-machine and the churn to the maize-husker and the milking machine, has notably increased the productivity of each worker employed. On the land itself,

the use of commercial fertilisers has doubled in the past decade, and the need for such trace minerals as zinc, cobalt, iron, molybdenum, manganese, has recently been recognised. The spreading use of contour ploughing, cover crops, dams and artificial ponds is holding topsoil in place and restoring eroded acres. New chemicals for spraying, generalised innoculation, and the development of resistant breeds of plants and animals are providing means of disease and insect control.

At the same time, sustained high levels of national income are making it a paying proposition for farmers to shift to livestock, poultry and dairy products, which benefit both the land that produces and the consumers that eat them. And research in the use of farm products not as food but as basic raw materials for a variety of new industries is opening up new outlets. But production is increasing faster than are the new opportunities. In 1950, two hens lay as many eggs as three hens laid in 1925, and spread their output over a larger part of the marketing year. Selected acres on which normal production of maize used to be 45 bushels have been brought to yield as much as 193 bushels. And hay, which formerly lost as much as 90 per cent of its vitamin A content through poor curing practices, is now put before the animals in its prime.

*

The team approach to research in agriculture and animal husbandry seems to have paid dividends. The four-fold increase in the maize crop in one specific area was brought about not only by using the best hybrid seeds available, but also by using the soil scientists' knowledge of soil types and fertilisers, the agronomists' knowledge of timing in planting, and the agricultural engineers' knowledge of improved methods of weed control and fertiliser application. Recent experiments in agricultural improvement have moved from laboratory to field conditions, by setting up "pilot" farms in various parts of the country, or in foreign countries, and have come far closer to the average farmer's struggles than did the old-fashioned attempts to solve a single problem under ideal conditions.

Agricultural research paid for out of tax money has been responsible for a variety of recent marvels: wheat that ripens a week before hot weather strikes the Great Plains, sugar beets remodelled so they can be lifted out of the ground by machines, hogs tailored to produce less lard and more bacon, grape juice and grapefruit juice marketable as frozen concentrates, trace minerals that can be fed to citrus trees by spraying, frozen salmon waste used to feed prime mink and fine blue fox, cures for Dutch elm disease, and studies of what makes maple sugar taste like maple sugar.

Yet the need for new research multiplies with its products. Nature never takes a holiday from producing new diseases; flies are now breeding without benefit of laboratory encouragement that can thumb their wings at DDT. And Americans who prided themselves on making deserts bloom and cattle shed their ticks in odd corners of the world have been told by Orientals at international conferences that they are neglecting prime sources of food supply in pond and river culture at home. The foreword of the 1949 report of the Administrator of Agricultural Research suggests that lessons are being learned on all sides: "A point often overlooked in the exporting of scientific information is that although fundamental principles apply everywhere, applied research has definite limits when transferred from country to country."

Deeper into Deficit

With Federal expenditures running further behind the January estimates than are tax receipts, the Bureau of the Budget was able to announce last week that it hopes that when the 1950 fiscal year ends in July, the deficit will be only $5.4 billion, $100 million less than the President forecast last January. But it raised the figure for the 1951 deficit by the same amount, to $5.2 billion. The staff of the Congressional joint committee on taxation are probably more realistic than the Budget Bureau. They assess the deficit for the current fiscal year at $6.7 billion, and for 1951 at $7.3 billion. They expect the national income, and therefore tax receipts, to fall sharply in 1951. Other forecasters are not so sure as they were earlier in the year that this will be so, but almost everyone agrees that the Bureau shows little appreciation of the political facts of life when, in calculating the total of next year's expenditure, it allows for the full cut of $1 billion which the House Appropriations Committee has recommended.

The theoretical enthusiasm of Republicans, and others, for a further cut of another $1 billion has, of course, been fanned by these predictions that the country is sinking even deeper into the mud of the deficit. But when it comes to pulling it out at the expense of their constituents, it seems much safer to leave the thankless task to the other fellow. After the Easter holiday, most members of the House of Representatives were more interested in restoring the Appropriations Committee's cuts than in making new ones, although they got off to a good start by reducing Federal payments to the voteless District of Columbia by ten per cent. The Senate will probably be willing to repair this damage; it has just added about $450 million to the $1.1 billion Rivers and Harbours Bill, which authorises funds for the elimination of water chestnuts in the Potomac and other public works, more important but often easily postponable. Senator Douglas insists that $840 million could be saved on this Bill alone if the national economy was given precedence over local interests.

The House Ways and Means Committee does not seem to be any readier to use the Tax Bill as a rope to haul the country out of the deficit. It also began voting on this four-months' old Bill after the holidays, but constituents had been pressing for reductions in excise taxes, not for increases in corporation taxes and the closing of loopholes. The President considers that these are essential to make up the loss in revenue resulting from lower excise taxes, but the Committee shows every sign of reducing the excises by about twice the $655 million that Mr Truman proposed and leaving most of the deficit to look after itself.

* * *

Trade Tests for Bipartisans

The resolution to approve the International Trade Organisation Charter has made a long-delayed and not altogether auspicious Committee debut in the House of Representatives. The Senate Republicans, who were not consulted, see in this move a scuttling of the bipartisan policy almost before it is floated clear of the rocks—an interpretation that seems to give the minority a veto of every enterprise, without imposing any responsibility on them. Even Senator Vandenberg, in his great days, found it difficult to bridge the party gap on foreign economic policy; without his trusted leadership, the Administration, whatever machinery is elaborated, will have to treat with half a dozen factions in the opposition.

The truth about the ITO hearings opened by the House Foreign Affairs Committee seems to be that they are designed to prove the Administration's good faith abroad, rather than as a serious attempt to secure ratification this year. This will require action by both the House and the Senate and, while it may be easier to secure than a two-thirds majority in the Senate, the time-table in the upper House is so crowded at this point in the session that the chances of approval are slight. Mr Acheson and Mr Thorp made out rather a perfunctory case for ITO: that it embodies in its code of trading practices the American ideal of multilateralism (even though its ratification would entail a number of changes in American laws to put them in tune with the great theme) and that the additional 18 signatures needed to bring ITO into existence will hardly be secured unless the United States takes the lead. There is a suspicion in the United States, however, that foreign enthusiasm for ITO is based on the hope that the United States will take the high road of multilateral perfection, while other signatories would profit from the increased respectability given to diversions from it.

But even in the United States, the Bill to simplify customs administration, promised last September, is only now about to be presented to Congress, probably too late for action this year. Plainly both the Charter, the customs Bill and the Torquay tariff negotiations would have a warmer welcome if exports had not declined, and imports risen. In February exports, though somewhat up from January's dip, were 26 per cent lower than a year ago, and imports, though they declined from the January figure, were still 6 per cent higher than in February, 1949. Any effort to stimulate imports, even indirectly, as through the Charter, arouses alarm lest the dollar gap be closed at the expense of American jobs. Senator Millikin has announced that the Republicans will try to revive the "peril point" amendment to safeguard Americans against the State Department's misguided generosity, while the news that the new tariff negotiations will cover 2,500 items, many of them of importance not only to America's chief suppliers, but also to American business, has brought a flock of protestants to Washington. While the ITO hearings are dragging on, another House committee will publicise the objections of the National Labour-Management Council on Trade Policy. This body is an alliance of certain protectionist-minded American Federation of Labour unions with business interests in such industries as pottery, china, glassware and fisheries. The Administration's reluctance to press for House action on ITO may be due to unwillingness to provide a second sounding-board for such complaints in an election year, when its own studies on the import problem are in an early stage, and there is so little flesh on bipartisan bones.

* * *

Campaign for Truth

For a country in which advertising has reached such a high peak of perfection and acceptance, the United States has always been singularly shy about blowing its own trumpet. Mr Truman's speech last week to the American Society of Newspaper Editors showed a new realisation in the Administration that to do good by stealth is not enough: the billions for foreign aid, defence and the Atlantic pact will be spent in vain if the battle for men's minds is lost. The amount to be spent on information activities in the next fiscal year is only $34 million—less than half of one per cent of the expenditures on domestic defence alone. This is only $7,000,000 more than the amount spent by Britain, and proportionately less than the amount allotted to information abroad by any other major country.

The effectiveness of even this modest programme can be judged by the resources the Russians have devoted—with very considerable success—to jamming the Voice of America, and by the closing, just last week, of the two American libraries in Czechoslovakia, an action that sealed up one of the few gaps in the iron curtain. The Voice of America, reaching, with more or less success, across national boundaries

to the isolated minds of eastern Europe, needs more money, for new transmitters, anti-jamming activities, and to translate its broadcasts into the eight minority tongues of Russia. The battle of the air waves has loosened Congressional purse-strings before. But there is an even greater need for expansion in the less glamorous work of carrying news, documentary films, and library facilities to more accessible minds, particularly in Asia, where long-standing suspicion and ignorance of the United States offers a fertile field in which Russian propaganda can sow distrust of American "Imperialism," "War-Mongering," and instability. The Advisory Committee on Information has urged, in all its reports, that the money allotted for all branches of the "campaign for truth" is far less than is required.

President Truman told the assembled editors that he had instructed Mr Acheson to plan a "strengthened and more effective effort to use the great power of truth in working for peace." Government efforts in the field of information have always been suspect in American publishing circles. and it was tactful as well as truthful of Mr Truman to remind these listeners that the new drive must depend, in large part, upon the free agencies of fact and opinion in the United States, and that more influence was exercised by the "baggy pants of the managing editor than the striped trousers in the State Department." Collaboration with other nations, however, is required if the free world is effectively to repel the present stream of vilification and distortion. In this, and in his enthusiasm for the project of bringing more students and trade groups to the United States to see for themselves how American democracy works—something already being done, in a small way, by the Economic Co-operation Administration—the President clearly had taken note of the maiden speech of Senator Benton, who formerly directed information activities in the State Department. Senator Benton, supported by six other Democrats and four Republicans, has introduced a resolution asking for a "Marshall plan of ideas." This would embrace not only expansion of the Government programme, of information exchange and re-education, but would also create a non-governmental agency to guide private efforts, and an expansion of the educational work of UNESCO.

* * *

Houses Galore

Mr Hoover held out a promise—sadly unfulfilled in his day—of a chicken in every pot. A more fortunate President may soon be able to boast of a house for every family. Last year more houses were built than ever before, though admittedly the population has grown since the previous peak in 1925. But the first quarter of this year suggests that the boom, instead of levelling off, is just getting into its stride. Over 270,000 non-farm dwellings were put in hand, 59 per cent more than the first quarter's total last year. The Federal Reserve Board reports that a million families plan to buy new houses this year, and a similar number expect to do so next year.

Unless there is a serious economic slump, there seems to be no reason why they should not; the new housing Bill signed by President Truman makes it easier to pay the first instalment on a moderate-priced house than on a car. Lending is done by private institutions, with the government's role merely that of an insurer of mortgages, but under the new regulations a house costing $7,000 can be obtained for a mere $350 down and $30 a month, for 30 years; a Ford car requires $400 down and $77 a month for a year and a half. Ex-servicemen—of whom there are 15 million or more—need provide no ready cash at all, and if private lenders cannot be found to accommodate them the Veterans' Administration is provided with funds for direct loans. Congress refused to take the Fair Deal step of encouraging housing co-operatives to build homes for the forgotten middle-class, but, by authorising nearly $4 billion in new federal credit, it has insured the life of a housing boom that Mr Truman's economic advisers believe is the best medicine against recession.

In an election year, even though the government deficit is increasing, hardly a voice, Republican or Democratic, was raised against money for houses. It now appears that Congressmen who last year anticipated the early end of rent control may be given another opportunity to pose as the tenants' friend without compromising their principles. The extension of federal rent controls in 1949 gave States and cities the privilege of discarding them if they so desired, and controls have been lifted from approximately a quarter of the nation's 100 million residents of cities. Opinions—and statistics—differ as to whether rent increases in decontrolled areas have been exorbitant; the National Association of Real Estate Boards reports a median increase of 22 per cent in the rents that were raised in 100 cities; Mr Truman's message to Congress puts the average increase in 14 cities—a very different thing—at 25 per cent and cites increases of 46 per cent in Houston, Texas, and 56 per cent in Dallas. The compromise now being discussed would extend rent control until June, 1951, but after January would restrict it to cities that voted for its continuance.

Shorter Notes

The rain makers in New York are having a hard time. The first attempt was held up by rain; and the second because the ice chopper failed to work. By the time the plane was loaded, a fog had crept up from the sea and had reduced visibility to zero. A few days later when conditions again seemed perfect, the expedition had to be cancelled because the continuing mild weather had caused so much snow to melt that one small reservoir was in danger of flooding. When the clouds were at last sprinkled with dry ice, and assailed with silver iodide smoke from the ground, New York had a heavy snow storm for the first time in April for nearly 60 years; the rain maker was not so sure as the angry citizens that the responsibility was his. The general situation is much more hopeful, with the reservoirs at last filled to 80.5 per cent of capacity compared with 55.4 per cent about a month ago. But last year at this time they were filled to 98.7 per cent of capacity.

*

The CIO's new International Electrical Workers' union has won its first battle with the recently expelled, fellow travelling United Electrical Workers. The 27,000 employees in the electrical manufacturing plants run by the General Motors Corporation have chosen, by a majority of nearly 19,000 votes, to be represented by IEW. The much more numerous employees of the General Electric Company and the Westinghouse Corporation must make their choice before long. This defeat in its first skirmish is unlikely to deter the UE from carrying on a bitter, even if a losing, war.

*

In an effort to keep the streets of New York clean and tidy, the Sanitation Department has distributed 4,800 large wire baskets in mid-Manhattan and is waging a campaign against people who dump their refuse on the pavements or who break bottles and drop cigarette packages in the streets. So far several hundred dollars have been collected in fines, but this has to be balanced against the mysterious disappearance of over 300 of the wire baskets, worth $10 each. Whether these disappearances are the result of organised sabotage or whether they are simple cases of theft, no one appears to know. It has been suggested that they are being used as lobster traps and the police are working out a "confidential plan of action." Up to date only two baskets have been found, one of them in Connecticut.

THE WORLD OVERSEAS

Economic Commission for Europe

(From Our Geneva Correspondent)

THE Economic Commission for Europe here has reached a crossroads in its career, and its Executive Secretary, Dr Gunnar Myrdal, has produced a report that shows clearly why the future of its work causes considerable bewilderment. He sees Europe split between two groups of nations. Growing political suspicion divides them, yet their economic interests are to some extent interdependent. Co-operation, research and the exchange of information show, he claims, that even greater possibilities lie ahead if governments want them. He proposes, among other things, a special commodity agreement for European steel, the co-ordinating of national policies for timber production and transport organisation and—above all—a multilateral European agreement on exports and imports. This would include

> relatively long-term purchase commitments by the western countries for cereals (and possibly other supplies) from the eastern countries, framed somewhat on the model of the International Wheat Agreement with upper and lower price limits, and minimum quantity commitments; a commitment on the western side that the proceeds of the sale of these products could be used for the purchase of goods on lists to be agreed upon; and if it were desired, arrangements for increased flexibility in the payments provision for goods contracted for within the general framework of this agreement. It could, for instance, be agreed that currencies earned through an export surplus in one country could be used for purchases in another.

These are some of the questions that the ECE will face when it meets at the end of May. This is, perhaps, a good moment to recall its functions and past record. It was set up in Geneva in May, 1947. Its parent body is the Economic and Social Council of the United Nations, and its home is among the peacocks and magnolias of the Palace of the Nations. Its terms of reference show that it was designed to serve both the short-term purpose of assisting reconstruction and recovery in Europe and the long-term one of promoting a habit of co-operation among European governments wherever this would promote the economic welfare of Europe, and to serve as a centre of economic and statistical research. Its powers, however, were limited in that it could take no action in respect of any country without the consent of the government of that country, and it was set up only for an experimental period. The Economic and Social Council must review its work not later than 1951, and decide whether it shall continue under its present or other terms of reference, or be wound up.

Strong and Independent Secretariat

The members of ECE are the European members of Uno and the United States. The Commission itself only meets once a year for about a fortnight. The real work is carried out by a number of technical committees, served by a strong and independent secretariat under the Swedish economist, Dr Myrdal. Its committees meet fairly frequently and provide a convenient, neutral forum for the discussion of technical problems of common interest to a number of countries. Governments usually send well-qualified and well-briefed delegates.

The original committees of ECE were coal, electric power, inland transport and industry and materials, and an independent panel on housing problems. These were taken over, ready-made, from three emergency bodies which it absorbed. The trade committee was set up provisionally in 1948, on the initiative of the Soviet delegation, to study the expansion of trade between European countries and problems of agricultural and industrial development which would be of importance to European trade. Last summer it was established as a full committee. An *ad hoc* committee on agricultural problems of common interest to ECE and FAO was set up in 1948, mainly with Soviet backing, and turned into a full committee last summer. These have become the focus of discussion on trading across a divided Europe.

Success and Frustration

The achievements of the committees have varied enormously, from notable success to complete frustration. The coal committee carried out the function of allocating the available supplies of coal in Europe with as much success as its predecessor, and on the technical side has done much good work. The inland transport committee has also met a real need in Europe and has become the main European centre for the co-ordination of policy on inland transport problems. The timber and steel committees did useful work during the period of postwar shortages. The timber agreement of 1948 on sawn softwood, by which importing countries observed buying limits and exporting countries made available agreed quantities of timber, certainly had a stabilising effect on the market and helped to ensure a fair distribution at a time of acute shortage. The steel committee worked closely with the coal committee in developing a coal allocation policy which released large quantities of coke for steelmaking, and it also had a part in the negotiation of the scrap agreement.

The electric power committee has provided a useful forum for discussing such complicated international schemes as the utilisation of Polish brown coal and Czech lignite for the production of power for western Germany, and some useful technical work has been done by the secretariat. Nevertheless, it is a committee which never really got going. European power problems are huge in their capital requirements and intractable in their political implications—no country dares to rely to a large extent upon imported power.

The story of greatest frustration comes from the trade committee which ought to be one of the mainstays of the whole of ECE. Last year, the western countries said that its first task should be to organise an exchange of information upon commodities available in the east and the goods required for them in the west. In reply, the east asserted that the export licensing system of the United States and of some western countries implied a major discrimination against them, and that, as long as it was maintained, all efforts to develop east-west trade would be futile. Consequently they saw no purpose in exchanging information. In an effort to break the deadlock, Dr Myrdal circulated to all governments concerned an *aide memoire* containing suggestions for the multilateral European trade agreement already mentioned. This produced the series of tepidly positive replies from the west and the hotly negative one from the Poles, published in Appendix IV of the Executive Secretary's Report. As publication of the governments' replies became imminent, the Russians at last produced a verbal answer that an exchange of views on questions contained in the *aide memoire* could take place when the Executive Secretary visited Moscow early in May.

The failure to set up an effective trade committee has blighted both the agriculture committee and, to a lesser extent, the industry and materials committee. From the beginning, the east has treated the agriculture committee as a rostrum for propaganda speeches, and any serious attempt to get to work has been blocked by suggestions for more "essay subjects" for the secretariat on such tendentious themes as "the effect of devaluation upon small and medium farmers in the west." The last meeting of the committee at the end of March finished most dismally, the only moment of hope being the announcement by the Soviet delegate that large quantities of agricultural products would be available from the East "on fair and favourable terms." But questions from the west elicited the answer that such things could only be discussed by the trade committee.

The industry and materials committee has had a slightly more fruitful career, but has also been badly affected by the east-west tension. Now that the postwar shortages are more or less over, it is concentrating its resources on housing problems and upon engineering. On housing there has been useful exchange of information on new developments in building methods and materials. On engineering it seems possible that both committee and secretariat may become stuck in the rather unrewarding complexities of a very ambitious study of the whole industry.

The secretariat serves all the committees, and in addition includes a large and expert research division whose main function is the production of the annual "Economic Survey of Europe," and the quarterly "Economic Bulletin for Europe."

The Future of ECE

At its fifth session, due to begin next month, the Commission must make recommendations for the future of the committees. All have some points in common. They all provide a forum for experts from different countries, and the opportunity for an independent survey of the problems of a particular industry. They all suffer from the difficulty of obtaining information from the east. Most have come to the end of their original terms of reference.

Indeed, the whole future of the Commission itself will have to be considered. Is it worth keeping alive, and will it be possible to do so? Its greatest strength lies in its unique, independent position. It also has the advantage of a strong and internationally minded secretariat, built up under a chief who has a crusading zeal for bridging the gap between east and west, and the importance of this is the underlying theme of the whole of his report. The situation is now such that if ECE were wound up there would be no corner of Europe left where east and west could meet on neutral ground to discuss topics of common economic interest.

Against all this must be set the disadvantages and cost of continuing ECE. It is quite expensive in money and in manpower. Its cost comes out of the contributions of the member countries of the United Nations. For 1950 the authorised budget, excluding taxation, is $945,510, a reduction of just over 4 per cent on the 1949 budget. To this must be added $800,000 which the European Office of Uno reckons that it could save if ECE were to shut up shop in Geneva. In all, the total annual cost to member governments is about $1,746,000. The cost in manpower is 171 established ECE posts (of which just over half correspond roughly to the administrative and executive grades of the British civil service); six "administratives" provided by FAO to serve the agriculture and timber committees; 21 interpreters and translators; and 72 clerks, stenographers, etc., provided by the European Office. Out of a total of 89 "administrative" and "executive" posts for the whole of ECE, the Research Division accounts for 32, and for 63 of all grades out of the total of 171 established ECE posts.

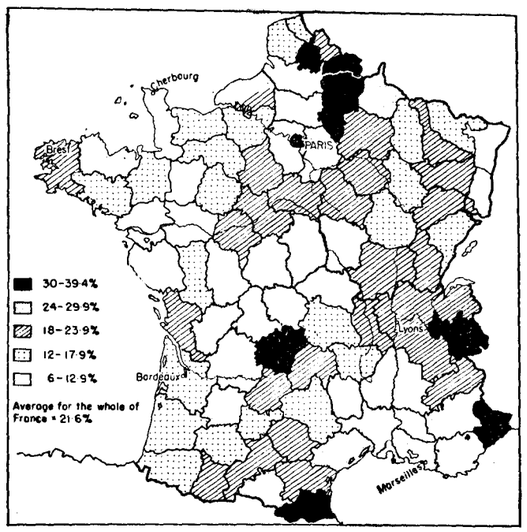
Inevitably there is a good deal of duplication of work between ECE and OEEC, which is the more regrettable in view of the world-wide shortage of trained manpower to do this kind of work. Against this argument, it must be remembered that all OEEC work is conducted from a government angle and that it cannot present an independent viewpoint. The decisive fact is that, however desirable ECE may be, it cannot function without the co-operation of governments. If the east European governments continue to withhold information it will be scarcely possible to persuade the western governments that OEEC is not a better centre for consultation and research.

French Communism—II

The Communist Electorate

[FROM OUR PARIS CORRESPONDENT]

EMPHASIS was laid in the first article on France's Communist cadre; on the body of men and women for whom the combined teaching of Marx, Lenin and Stalin serve as a touchstone in thought and action. (Stalin's "Short History of the Bolshevik Party" is the bible of the French Communist cell.) These "initiates," who are to be counted in tens of thousands rather than in millions, regard the political development of France merely as one phase in the world-wide transformation of property-relations. Together they form something like a church militant, hierarchic, indestructible and transcending the lives of its members. This Communist cadre certainly differs from any other group in contemporary France; as a social phenomenon, it presents problems of religion, sociology and individual psychology that cannot be discussed in terms of everyday politics. The question why in November, 1946, 5,489,000 citizens of metropolitan France voted Communist can, however, be answered to a great extent in terms of economic conditions and local party history. For of the 20 to 25 per cent of the electorate that has voted Communist in the various elections, national and provincial, since the liberation, only a very small percentage could be described as Marxist revolutionaries. For out-and-out Asiatic Communism, the creed of *le camarade Joseph*, implies a far greater tribalism than exists in France where, even though political and national feeling is sporadically strong, the social horizon is usually narrow. French individualism is, indeed, a by-word and, whatever its shortcomings, the main glory of the post-revolutionary period.



Communist Voters

It may perhaps be argued that the present disunity and, in particular, the lack of exchange between different social groups which a sincere belief in equality has not prevented, are working strongly in favour of a modern, centralising dictatorship that would give, as Nazism at first gave, a greater range and equality of opportunity. It is doubtless true, for instance, that the youth of the factories is attracted to Communism as a way out of the rut, as a chance of getting on in the world. And, if ordinary opportunities grow fewer through economic depression, the totalitarian movement will gain in strength. At present, however, the Communist electorate is scarcely totalitarian. By no means homogeneous in class, it is still, in so far as it is ideological, rather a movement of protest—of youth against age, of modernism against administrative obsolescence. For despite the stock "get-together" collectivism of French Communist propa-

ganda, the Communist voter, especially of the older generation, is still often an anarchist at heart ; a man, that is, who disbelieves in central government and elects *his* deputy to prevent the tyranny of his enemies. This anti-state feeling is strongest in the country, but it is also rooted in the anarcho-syndicalist tradition of the factories.

The nation-wide appeal of the *Parti Communiste Français* is unquestionable. M. Francois Goguel in his study of the last general election* points out that the Communist party was the only party which nowhere got less than 6 per cent of the votes and also the party which exceeded 24 per cent in the greatest number of constituencies (42 against 28 for the MRP). Nor, as might be supposed, is the Communist party purely a working-class party. As a matter of fact, in one of the four main industrial areas it is very weak, and in another only middling strong. On the other hand, the electoral map shows many country districts far removed from the climate of modern production which are thoroughly Communist. M. Goguel explains that, in these regions, the Communist party has replaced the old ultra-radical parties of the nineteenth century, the *Montagnards* and *Républicains Constitutionnels*.

The electoral strength of the modern Communist party derives, therefore, from elements which, economically, have

little or nothing in common with one another, and which come from different worlds, if not from different centuries. For, granted that the miners in the Pas-de-Calais vote Communist in order to obtain the nationalisation of industry, it can scarcely be the collectivisation of agriculture that is demanded by the farmers of Corrèze—the reddest department in France, but one in which over 70 per cent of farmers own their own land. The Communists have, with a sublime opportunism and aided by the lack of contact between the two worlds, managed fairly well to combine their urban and rural propaganda: cheap food to buy and expensive food to sell. The magnanimous sweep of Lenin's "Peace, Bread, Land" is, of course, denied to them in France where so many solidly entrenched small-holders have done so well selling food to the towns during war. M. Waldeck Rochet, the versatile editor of *La Terre,* has, however, kept his head above water chiefly by stirring up the feeling of the small and medium peasants against those who have rather more land.

* *Géographie du Référendum du 13 octobre et des élections du 10 novembre, 1946.* By F. Goguel, *Esprit,* February, 1947.

In a country where there is such a potentially large peasant vote, the Communists must, as good party men, seek to isolate as much of the countryside as they can from political alliance with the bourgeois parties. But in France, as has been mentioned, the accident of republican tradition has more or less played into their hands, a good many farmers voting of their own accord with the urban proletariat instead of, kulak-wise, with the possessing classes of the towns. This alignment is certainly not general. In a department such as La Vendée where religious tradition is strong there are on Communist deputies. Nevertheless, from the point of view of Marxism-Leninism the very large *montagnard* vote is something of a windfall.

> It does not matter much that the vine-growers of Roussillon or the farmers of the Limousin do not belong to the working class. It is enough that they find themselves in a party which is animated by a consciousness of class.†

The descendants of the original *montagnards* who, in the Second Republic, voted for Ledru-Rollin against the monarchists may no longer in effect be voting French Republican when they put their cross on the Communist Party list, but the difference between Jacobin and Bolshevik does not seem to lose them much sleep.

Hard Task of Socialists

Communists make short work of their erstwhile partners. The Socialist party which from about 1924 to 1939 enjoyed the position of the foremost Left parliamentary party, has now definitely been ousted by the Communists, who have taken over the role—as in their day the Socialists took it over from the Radicals—of "defenders of the Republic." The Socialists—who, in the opinion of most, are scarcely a working-class party any more—are left, therefore, with the hard task of persuading the Left electorate that French Communism is un-French. Such, for the Socialists, are the bitter fruits of the Marxist alliance in the Popular Front of 1936 and during the period between the liberation and the emergence of the Third Force coalition. As late as the autumn of 1946, it must be remembered, there was still in France a decisive cleavage between the Marxist and non-Marxist parties. In the referendum on the "September Constitution" (now that of the Fourth Republic) the non-Marxist parties were so averse to co-operating with the Communists and Socialists that the leaders of the newly formed MRP (a party both Catholic and Left of centre) were unable to persuade their followers to vote "yes," with the result that the MRP rank and file either abstained or voted against their directives. Thus the present constitution of France was finally voted in by only 36 per cent of the electorate with 31 per cent against and 31 per cent abstentions. (It is incidents such as this which suggest that the MRP, if economically to the Left of the Radicals, are in social sentiment to the Right of them. In the event this dual orientation has split the MRP into Socialist Left and a Conservative Right wing.)

To the Socialists there now seems to be reserved the role of caretaker of such measures of state-planning as their party, or their party's influence, has succeeded in introducing —social security and the nationalised industries. But the support of civil servants for civil servants' sake is never a popular platform ; especially at a time when government workers, always insisting on their proper proletarian status, are doing considerably better that their opposite numbers in the private sector of industry. Moreover, the Communist party, both in parliament and through the trade unions, has a habit of outbidding its rivals' proposals and outclassing their performance in day-to-day organised agitation. When all is said and done, *pas d'ennemi à gauche* is something like an iron law of industrial strife, which no French union can afford to disobey.

(To be continued)

New Zealand's Financial Problems

[FROM OUR NEW ZEALAND CORRESPONDENT]

On February 1st, only seven weeks after the change of Government in New Zealand, which ended Labour's 14-year rule, the new Prime Minister and leader of the National Party, Mr Holland, gave a review of national finances for nine months of the current year. He drew three conclusions: that New Zealand is spending much more overseas than it is earning, that the Government is spending very much more than it is raising by taxation and borrowing combined, and that if New Zealand continues to inflate its currency and credit in the next three years to anything like the extent it has inflated it during the last three years, the country will be in serious difficulties.

It must be admitted that Mr Holland's disclosures then did not seem greatly to disturb the country's complacency. National interest was focused on the Empire Games, about to open in Auckland, whither, indeed, Mr Holland repaired immediately after issuing his statement. The Dominion was in a holiday mood. A little later the Labour leader and ex-Premier, Mr Fraser, suggested to Mr Holland that, if the financial picture was as black as it had been painted, Parliament should be called together at once to discuss it. But Mr Holland does not propose to convene Parliament until the usual time late in June.

War-time Controls Eased

In the two months that have since passed, the new Government has been putting into effect such of its election promises as need no legislation, notably the easing of a number of war-time controls. But other Ministers have also been firing a number of salvoes in support of Mr Holland's February broadside. The general effect has been to indicate that action must be taken to overhaul state spending, to stop losses which are occurring even in a department like the Post Office which had been a notable profit-earner in the past. Supplementary statements by Ministerial heads of departments have included:—

Railways.—Loss on workings to the year ended March 31st, £1,500,000. Nothing has been paid towards interest, thus making a further deficit of £3,000,000 and putting the department £4,500,000 "in the red." Increase in fares, particularly suburban, is forecast.

Airways.—Loss in year just ended, £350,000. Increase in fares is also forecast; at present taxpayers are providing more in support of national airways than passengers do in fares.

Post Office.—This department, which usually makes a profit of £1,000,000 or more, lost £350,000 last year.

Broadcasting.—This service, which in the past had earned substantial profits, is struggling hard simply to balance its revenue and expenditure.

State Housing.—In 1949-50 the loss was £195,000 and in the financial year just beginning a loss of £236,000 was estimated. But a decision to increase the rent for new tenancies will reduce the loss to about £174,000. (Supporters of the Government, such as the *Christchurch Press*, are critical of the party's election promise not to increase the rent for current tenancies, arguing that, while that may have been good politics, it is not good business.)

Labour's reaction to the new Government's disclosures and remedies have been mainly of the "I told you" category with a reminder that one of the National Party's main campaign slogans was "This is a cost of living election." The ex-Minister for Finance, Mr Nash, for instance, in a brief comment on the decision to increase some state house rentals, said the new Government was "running true to form."

The reply to this, of course, is that the user should pay —that it is inequitable that state house tenants should be subsidised by the general taxpayer. Nevertheless, the new Government would seem to have some awkward housing problems to solve. For instance, it has decided that in future state houses will not be available for rental by those with incomes beyond £10 a week. An immediate repercussion has been a complaint by civil servants that the effect of that policy will make it difficult for them to accept transfers on promotion, for many will have the choice of quitting a state house in one town and being ineligible for a similar house in another. They are likely in those circumstances to refuse promotion.

No Early Tax Relief

In many ways Mr Holland and his Ministers made a good businesslike start. There is general appreciation, too, that they have inherited many "sticky" financial problems. Already there seems no prospects of giving the early taxation relief, to the investigation of which the National Party is committed by another election promise. Mr Holland is believed to cherish the hope that he can make substantial headway in "squaring the yards" financially in two years and, presumably, be able then to cut taxes a little. But another election will be upon him by that time and it is difficult to judge what the temper of the country will be by then.

It cannot be said that there has been any notable shift in political sentiment since the election four months ago. But there is no longer the day-after-the-poll confidence that a change of government will bring prompt cuts in taxes and the cost of living. Safeguarding of social security benefits, the keystone of the welfare state edifice, was pledged by both parties. But the new Government is already moving to eliminate wasteful expenditure in medical benefits, and, as a general policy, is overhauling projects which cannot be justified on economic grounds.

SCHWEPPIGRAM No. 16

If you're waking, call me early.
call me early, mother dear!
This is another critical day
in Britain's critical year;
Wages are frozen and prices are high
and there's lots of tax to pay;
And I'm to be Queen of the May, mother;
I'm to be Queen of the May.

schweppervescence lasts the whole drink through

HENRY GARDNER & CO. LTD.

(CAPITAL AND RESERVES, £1,800,000)

is associated with

The Cyprus Co. Ltd., Drew, Brown Ltd. (Canada), Sandilands Buttery & Co. Ltd. (Malaya) and C. Tennant, Sons & Co., of New York and with the organisation of The British Metal Corporation Ltd., London, Australia, Canada, India and South Africa.

The Group provides manufacturers and producers of finished articles and raw commodities with an economical method of marketing their products throughout the world. Expert knowledge in distribution and salesmanship is available through the various units of the Group.

New Zealand traditionally moves sedately in the preparation of its Budget. Although the close of the financial year coincides with Britain's (March 31st) the Budget is seldom presented until August. But sufficient of its contents have already been foreshadowed to indicate that a lively Parliamentary session is in prospect. Labour's past administration will then be as much on trial as the National Party's remedial programme. Mr Holland certainly has the numbers and seems also to have the personality to weather any immediate political storms. Labour is holding its fire, apparently, until Parliament meets. Mr Holland's bearing under Labour criticism in his first session as Prime Minister could vitally influence his prospects of holding public support. In that test his good-tempered aggressiveness may be his best asset.

Indians in South Africa

[FROM A CORRESPONDENT IN NATAL]

THERE was much rejoicing among the 300,000 Indians in South Africa earlier in the year when the representatives of India, Pakistan, and the Union met and recommended the holding of a round-table conference to examine Indian disabilities. They recalled the round-table conference of 1926 and Dr Malan's part (he was then Minister of the Interior) in the Cape Town Agreement which followed it, and they had high hopes that a similar conference would have like results in promise and even better results in performance.

Some of these hopes have receded. It was reasonable to assume that the period of waiting for the conference to be arranged would be free of further restrictive legislation. Instead, the Nationalist Government has just introduced with confidence in the support of influential British interests in Natal, a Group Areas Bill, one of the purposes of which is to ensure that Indian-owned-and-occupied properties in European and allegedly-European areas shall, at some fixed date, possibly on the death of the owner, pass into European hands and occupation.

This Group Areas legislation is the main trunk road to the Nationalists' stronghold of *apartheid*. All four races—Europeans, Natives, Indians, and Coloureds—are to be taken along it. The Bill is not, therefore, pointed exclusively at Indians, an argument which the Nationalists can advance against any protest Delhi or Karachi may raise. The psychological effect on Indians, however, is greater in the knowledge that they are the special object of political and economic attack. Natives have at least the consolation of being told, though they find it difficult to believe, that the Government has their welfare at heart. A political party that claimed so much for Indians would commit suicide, so intense is the antipathy. Most general laws in South Africa have selective administration, and no one is in any doubt that these new proposals will have a ruinous effect on the Indian community, especially on Indian merchants.

"Great Historical Mistake"

In fairness to the Nationalists it is necessary to emphasise that the Indian problem is one of extreme difficulty. "South Africa," said General Smuts, "is the victim of a great historical mistake." He was referring to the introduction of Indians in the middle of the 19th century and the subsequent immigrations until 1911 when the Government of India stopped the movement. The original mistake was the failure to repeat for Indians what was done for the Chinese labourers on the gold mines—to provide for their return home. As a result, the country is now saddled with a fast-increasing population of unwanted Asiatics.

They are subjected to all manner of restrictions. The votes they had have been taken away ; the parliamentary vote in 1896, the municipal vote in 1924. Professional opportunities are few. There are no Indian engineers, accountants or chemists. Provincial barriers confine them to their original settlement. Durban, for example, possesses the largest Indian population of any city outside India. Natal contains 200,000 Indians, the Orange Free State no more than thirty. A series of gold laws, land tenure acts, "pegging" acts, and licensing regulations control their residence, ownership, and economic activities. Initially, these took the character of necessary protective devices to save European trade against Asiatic competition. Today, they are more like punitive measures adopted to squeeze Indians out of the country.

There is one feature of Indian life, however, which is not so easily regulated from without, and which, at bottom, is the cause of all the trouble. It is the Indian birth-rate. The Indian population is uniquely youthful. There are, in Durban, thrice as many Indians of 15 years of age as Europeans. Last December a hundred more children were born to Indians than to Europeans and Natives combined. It may be said that this does not constitute a problem in a country as big as South Africa, where there are only 300,000 Indians against 2,000,000 Europeans. The retort is that it is not so much a problem as a threat. The only answer to numbers is numbers, and it is doubtful whether any immigration scheme commensurate with economic capacity could correct the balance in a city like Durban. The Union is heavy with fears for the future as a result.

In addition, there are strategic considerations which do nothing to allay European disquiet. The eastern fringe of Africa is becoming increasingly "Indianised." Republican India looks jealously upon these settlements, and not a few of the more strident Indian Nationalists—the island of Mauritius is full of them—talk of this fringe almost in terms of Indian imperialism, and certainly in terms of the championship of Africa's millions. Mr Nehru has added his voice to theirs and to those in South Africa who, as avowed Communists, have projected the local Indian problem into the larger problem of all-Africa.

Possibility of Compromise?

These are but some of the features of a dispute which the United Nations, after due intervention, returned to the country of its origin with the hope that the disputants might come together and discover, if not a solution, a compromise acceptable to all concerned. More than this cannot be hoped for in the present mood of the Nationalists. And did some magic produce in them the change of heart of which Indian leaders speak, it would quickly be neutralised by the British in Natal, who, in this respect, are more Nationalist than the Nationalists.

Fundamentally there is no great difference between the treatment of Indians by General Smuts and by Dr Malan. If anything, General Smuts has been forced to do what he did not want to do. This certainly was the case in the 1946 Act which led to the Government of India's appeal to the United Nations. Dr Malan, on the other hand, is doing what he always said should be done. Both, however, are now convinced that Indians are in South Africa to stay. Repatriation (expatriation is more correct) is dead. This disagreeable fact serves but to irritate Afrikaners and British alike into further extravagances. The question now arises whether Mr Nehru will agree to enter a round-table conference, in view of the Group Areas Bill. Some Indian leaders in South Africa are half inclined to advise him against such a course, on the grounds that there is little hope of obtaining relief from statutory disabilities from a Government which persists in adding to them. Mr Nehru, who is known to listen to the avowedly leftist Congress Party in South Africa in preference to the moderate Indian Organisation, has never been enthusiastic about a round-table conference. There is, then, a very real possibility of another stalemate between the main disputants, with the only recourse a further appeal to the United Nations, a body which, in this instance, has shown a very unrealistic knowledge of the situation.

Inflation in Brazil

[FROM OUR RIO DE JANEIRO CORRESPONDENT]

IN Brazil, the year 1950, like its predecessor, opened on an inflationary note. The civil and armed services, whose pay is said to maintain a quarter of Rio's population, and whose 30 per cent increases a year ago cost the country £21 million, were voted a Christmas bonus of £10 million. This parting shot by Congress, in defiance of President Dutra's appeals for economy, is a reminder that 1950 is an election year; it does nothing to brighten hopes of reducing what may be an all-time record in Brazilian budget deficits. Since 1907 there have been only two precedents for modest budget surpluses, in 1947 and 1948. These owed much to the President's restraining hand, but a Congressional Report expects a deficit of about £70 million on the 1950 budget, since Congress has already raised to 21,858,000,000 cruzeiros the Executive's estimated expenditure of 20,183,000,000.

The widely ventilated and altogether reasonable assumption that Brazil's domestic inflation would have been aggravated had the cruzeiro followed the pound is only a sidelong admission that inflationary pressure is increasing. Symptoms other than the new budget are clear enough. After vanishing from the shops because of real or alleged scarcity, several foodstuffs have returned at much higher prices, with the grudging blessing of the price control authorities. These familiar moves have brought the usual reaction. Claims before the Labour Courts recently included a 100 per cent increase for textile operatives, one of 80 per cent for barbers and another of 60 per cent for 110,000 of Rio's white-collar workers. For the wage-earner it is an uneven struggle, sustained in the spirit caught by a newspaper cartoon when the wages-prices spiral last spurted over a year ago. In this the butcher asks a dismayed housewife: "Why do they give your husband more money if not to pay his bills?"

Cost of Living Rises

The most competent statistics available agree that living costs in both Sao Paulo and Rio are at least four times more than in 1939 and twice those in 1945. Soft currency devaluations and the Brazilian coffee boom recently accounted together for the matching of a 21 per cent rise in wholesale prices of domestic products by an equivalent contemporary drop in wholesale prices of imports. Retail prices are another matter. Domestic linen, for example, commonly shows a spread of about 300 per cent between wholesale and retail quotations. For the man in the street prices continue to climb, and it is no comfort to find that home-grown foods are now virtually as dear as those imported. Potatoes bought from disgusted farmers at three-farthings a pound fetch in Rio 10d. a pound—even more than the much better Dutch varieties, whose landed cost multiplies by ten or twelve between the quayside and the shops. This speculative mentality, which gags all but the newspaper critics, has long been a chronic influence on Brazilian inflation.

Far surpassing the real rise of the country's production, this inflationary growth has meant a long decline in the exchange value of its money, bringing with it rising prices—and more new issues. After the first war, when the exchange value of the milreis was four times that of the present cruzeiro, a new Ford car was dear at 5,000 milreis; today the black market price fluctuates between 100,000 and 150,000 cruzeiros (or up to £3,000). British exporters may find a more startling example of actual conditions in the fact that BSA motorcycles were being advertised by a local dealer several months after devaluation at the equivalent of £400. For necessities "consumer resistance" can be temporarily broken by bigger pay packets; signs of greater productivity are discouragingly few. When the cruzeiro's exchange rate will drop to something nearer its internal value is thus an open question.

Business Activities "Normal"

Meanwhile, rising manufacturing costs are not allowed to interfere with business profits. Indeed, which is cause and which effect is a moot point in a country where high units profits are the marrow of business. The Budget Report's description of business activities as "normal" is doubtless justified by Brazilian standards; nevertheless, the textile industry is seeking from the Government the right to sell abroad "in any currency" 300,000,000 metres of "surplus" production which it claims are "exhausting the industry's financial resistance." Textile prices might well discourage home shoppers, but Brazil's domestic market is far from exhausted, as local mills would doubtless find if foreign competitors were given their head here. The ability of the high-cost textile industry to save foreign exchange under the protection of existing import restrictions is evident; as a currency-earner it now ranks virtually nowhere. As for agriculture, the only "surplus" stocks are those that rot for want of transport or storage, or because discouraged farmers reject the low prices offered by middlemen.

The impact on Brazilian foreign trade of these domestic conditions—lagging production and an insistent expansion of cash and credit—has been modified by the dollar-earning strength of coffee and by import cuts (now affecting American goods more severely than ever). Both factors together promise an end to Brazil's dollar backlog in the very near future. Yet, as the Budget Report remarks, coffee alone cannot meet all Brazil's foreign exchange needs. Shipments are declining ; if Brazilian forecasts are correct, there may be little or no coffee for export in June, July and August. And the undoubted dollar-earning possibilities of Brazil's iron and manganese ores are still at the discussion stage.

Sterling Shortage Alleviated

As for sterling, the acute shortage noticeable early this year has already been alleviated by, first, British forward purchases from a promising cotton crop due in May ; secondly, heavy British buying of about 25,000 tons of Brazilian cocoa ; and thirdly, the growth of purchases from Brazil for sterling by several European and South American countries. In the longer run, the fulfilment of Sir Stafford Cripps's earlier hope that the shortage would prove temporary essentially depends on an expanding output of export staples. Only this can enhance Brazil's customarily favourable balance with the rest of the sterling area.

The arrival in Rio this week of a West German trade mission may foreshadow another bilateral trade agreement. The Chairman of a German-Brazilian Chamber of Commerce, formed here with American encouragement, has recalled that before the war Brazil was Germany's best customer, and Germany, Brazil's second best. Those were Schachtian days, but British exporters certainly face the prospect of sharper competition here with increasing European interest in Brazilian staple exports. How soon a jigsaw bilateralism can increase the exports themselves remains to be seen. It is at least clear that Brazilian production must set the pace for Brazilian development.

THE BUSINESS WORLD

Films and the State—I

Where Angels Fear to Tread

IN deciding to lend a further £1,000,000 to the National Film Finance Corporation the Government has postponed for a little while longer the moment when the sources of finance for British film production will once more run dry. The decision can only have been an unpalatable one to make, and it can hardly be presented to Parliament with any great confidence. Beyond the usual objections to the use of public money to support a shaky industry (objections which the President of the Board of Trade was himself expounding with some force only two years ago) it arouses misgivings because it offers no assurance of continuity and no firm prospect for the future; it settles nothing. It is not likely to fill the gap for much longer than another year, and then the question of who is to finance film production, and why, may well have to be faced in earnest.

But the lending of this £1,000,000 is only one of a series of unpleasant decisions which confront the Government this year in its dealings with the film trade. One of these was taken in March, when the quota of British first-feature films for the coming year was reduced from 40 per cent to 25 per cent. This sensible decision, which put the quota roughly where it should have been two years earlier, would have been more impressive without the brave words that had preceded it and the damage that the high-quota policy had first been allowed to do. Among its other ill effects, the high quota prejudiced hopelessly the working of the Anglo-American Films Agreement, which has been in force since June, 1948, and which has failed to fulfil the hopes either side placed in it. The agreement was intended to run for four years, but provision was made for review at the end of two; new talks are, therefore, to begin on May 15th in London, and these are unlikely to be easy.

*

Added to these matters is the need, which grows in urgency, for some action on the recommendations of the Plant committee on the distribution and exhibition of films. The Plant report, published in November, made proposals designed to increase the industry's total earnings, break down restraints of trade, and augment the share of the total earnings which goes to the producers of the films. Most of its proposals, being designed to bring about keener and freer competition in the film business, have been received by the trade itself with some distaste. But it also recommended that the Entertainments Duty should be reduced, and this the trade naturally welcomed. The Budget has turned down the last idea firmly for the moment; reductions of tax are not in the fashion. But what is to be done about the committee's suggestions as a whole? And what, if anything, is to be done about the proposals for reducing costs of production which were made in the Gater report?

*

If it were found possible to decide all these outstanding questions in a homogeneous manner, the result would amount to a policy for the British film industry. The Government has shown its awareness on more than one occasion of the need for such a policy. Mr Harold Wilson appeared to recognise it last week when he announced (not to Parliament but to the annual meeting of the Association of Cinematograph Technicians) the intention to extend the financial powers of the Film Finance Corporation:

> Pending the more fundamental attack which will have to be made on the problems of the industry, it is proposed to limit the additional finance available to the corporation to £1,000,000.

But where is the base from which such a "fundamental attack" can be launched? The Government has been closely entangled in the film business for some years now—at least since the autumn of 1947, when Mr Dalton imposed his "ingenious" import duty on American films. The train of crises which that piece of ingenuity set off in the trade has gone on ever since. Deeper Government intervention has been followed by more obstinate decline, and to describe what has happened to the industry (in Mr Wilson's words) as "one of its periodic financial crises" is not quite right; a glance at its history will show that over thirty years the film producing industry has been commonly in a state of disorganisation and failure, interrupted by an occasional boom which has invariably proved to be unsound. If there is to be a policy for the film industry it is necessary that this fact should first be perceived and digested; taken over a period, film production in Britain has never paid its way. The attack will therefore need to be radical. Or is the industry to be kept going whether it pays its way or not? The necessity of a film industry, solvent or bankrupt, is accepted often enough without much question. Mr Wilson, when he spoke to the Association of Cinematograph Technicians, mentioned the industry's "contribution both in the field of culture and in the expression of our way of life on the screens of the world," its "importance as a source of entertainment for our people," and further its importance "to our economic situation"—meaning, no doubt, that a supply of British films saves dollars.

These are reasons extraneous to the economics of the film producing industry itself, but because the industry is always expected somehow to become solvent at almost any moment they are rarely considered apart. Perhaps it is in consequence of this that the various forms of

state protection and help which have been extended to the British film producers have always rested to some extent on false assumptions and have never fully achieved their object.

If film production is to be kept going as a national cultural service, it seems clear that the existing structure of the industry is unsuitable for the purpose. Yet the existing structure seems equally to be incapable of survival on a purely trading basis. The experience of the National Finance Corporation, which published its first report this month, illustrates both these facts. The corporation's experiences are worth examining.

Its history began effectively in July, 1948, when the President of the Board of Trade set up an organising committee to prepare the way for a national corporation to finance the production of films. The Special Loans Bill did not become law until the following March, and the corporation was not formally established until the following April; but in the meantime the programme of lending had begun and the corporation had been committed to certain lines of action. In particular, its predecessor company had engaged itself to make a very large loan to the British Lion Film Corporation.

It is doubtful whether many people appreciated at the time how large a part the British Lion group played in the Government's plans. The fact seems to have been that the group's production programme was in danger of coming to a standstill for lack of new money, and if this had happened little production outside the Rank organisation would have remained. The Government therefore asked the organising committee to consider the terms on which a substantial loan could be made "as a matter of urgency" to the British Lion group. The group had put its requirement at £2,000,000, and the committee promised £1,600,000; but an investigation by accountants showed this to be "quite inadequate" for its purpose, and it was finally agreed to lend £3,000,000.

*

Thus the corporation at the outset had to commit three-fifths of its total resources to one group, for a period not publicly defined but certainly longer than two years. The loan to British Lion has had certain good results. It has been used partly for direct production by the group, and partly to finance the work of "independent" producers. From this source have come most of the good British films (again, outside the Rank organisation) that have been made in the last 18 months. The loan did not, however, leave much over to finance other production, and it is hard not to conclude that the dimensions of the gap to be filled were underestimated at the start. By the end of its first year the corporation had committed some £4,400,000 of its funds, and for the remaining £600,000 applicants were already lined up, including a "workers' co-operative" enterprise (discussed in a note on page 959) started by the film technicians themselves to relieve their unemployment. A new Act of Parliament will now be needed to enable the corporation to go on financing new production.

The state finance of film production was an improvisation, devised to fill a need that was thought to be temporary. It was, as the corporation's report says, to "carry the independent producers until the confidence of private investors was restored." In fact, however, the state of film finance declined in 1949 more sharply than ever, and the Rank organisation (the one major British group that did not rely on the corporation's loans) disclosed losses and announced the cutting down of its production. Film production had normally been financed up to about 75 per cent of the budget of each film by bank lending supported by distributors' guarantees. The corporation's role was intended to be the lending of the remaining 25 per cent. But when films are losing money distributors' guarantees become harder to obtain, or are limited to cover a smaller part of the cost of the film, and this has happened in the past year; so that the corporation has had to put up a larger proportion of the cost of some films than it intended, or the films would not have been made.

*

It is no doubt fair to say, as Mr Harold Wilson said last week, that state finance has in these eighteen months "saved the industry from almost total collapse." But it is not yet clear at what cost this has been done. The corporation has provisionally written off £750,000 out of the £3,700,000 which has been lent so far; its report concedes freely that this provision "may prove to have been too large or too small." But this may help to explain why private finance for film production is still no easier to find. If the corporation cannot get its money back, commercial confidence will not return.

In doing its urgent first-aid work the corporation has also done its best to induce the industry to manage its own affairs better; there is a great deal to be done along these lines. It has tried with some success to get a consistent method of budgeting and costing into general use. Its position as universal lender has enabled it to test one budget against another and to squeeze out some wasteful or luxurious notions. The report speaks guardedly of getting "perhaps in general a higher code of commercial practice," and these words, applied to the film industry, are not idle.

But when the financial difficulties have been acknowledged and the inadequacy of the corporation's resources has been conceded, there remains a persistent doubt whether the film-producing industry possesses the talents and the ideas needed to give the performance which has lately come to be expected of it. The task (or is it merely a dream?) is to make itself a self-reliant industry, producing enough to fill a large proportion of screen time in the British cinemas, maintaining itself by the entertainment value of its product, and carrying to the screens of the world an expression of British ideas and culture. It is easy enough to paint such a picture and blame lack of money for spoiling it. But on this front, too, the experiences of the National Film Finance Corporation have obliged it to apply some cold water. The list of films made with its support contains some good films, but some that were never impressive even on paper. As the report observes: "It has not received sufficient propositions of merit." In fact there are many shortages in the film industry. There are shortages of front money, of end money, of distributors' guarantees. But the shortage of ideas is not less marked than these. It may not deter a poor-quality producer, but it will deter a good producer, and not a few are idle at present for lack of a good subject around which to construct a film.

Capital and Savings

AN article in *The Economist* last week described and commented on the main conclusions of the White Paper on the National Income.* It left over for separate discussion two important questions—the condition of the savings-investment account, and the character of official estimates about profits. Both are highly technical questions, and the former, because of its intimate connection with budgetary policy, must be examined first. It was claimed in last week's article that "the national income approach is the soundest way of studying economic factors and the changes which occur in them." The basic ideas behind this method of study are simple. They rest on the fact that the value of the community's output in any period corresponds to the total of the money incomes paid to the factors which enter into production. The goods produced will satisfy the total money demand of those who produce them. To this simple identity, however, there are two important qualifications. If gifts or loans are received from abroad, the nation can spend more than its current income, and if gifts or loans are made it will have so much the less to spend out of its current income. In other words, an overseas deficit tends to reduce, and an overseas surplus to increase, any pressure towards inflation that may already exist. Secondly, if the community gives the Government authority to spend part of its income and if it wants to increase its capital equipment, it must abstain from spending on its own consumption enough of its money income to finance the Government's outlays and the cost of the investment programme. It must submit to taxation and also save; and if the community does not save enough, the Government must do the job instead by taxing more than is necessary to meet its own current expenditure.

This, in the simplest terms, is the underlying reality of the need, under present conditions, for a budget surplus to avoid inflation and excessive spending. A single step beyond these simple terms, however, plunges the student into considerable difficulty. An economy that is on an even keel, neither inflating nor deflating, must set aside enough of its current income to meet the Government's spending and to finance the investment programme. But when it comes to measuring the size of the investment programme and the savings (from various sources) that are available to meet it, real complications begin. Some of the expenditures and savings are known with fair accuracy, but many have to be guessed at and some are no more than residuals which depend on a series of guesses. The idea of arranging fiscal and economic policy in such a way as to secure an identity between investment and savings is sound, and the use of the lever of the budget to bring these two sides of the capital account into equilibrium (by budgeting for a surplus if savings are likely to be inadequate to cover the capital expenditure to which the nation is committed) is legitimate. But this cannot be done to a nicety, for a variety of good reasons. The statistics of savings and investment are conjectural; they are subject to wide revision; they are based on calendar (and not fiscal) years; and they embrace not only the central government's contribution of savings and its share of capital expenditure but also those of the local authorities and of the extra-budgetary funds.

These facts make it impossible to condemn out of hand last week's budget as being too soft and not sufficiently disinflationary. The Chancellor's budget is designed to produce a surplus (together with the contributions of the local authorities and the national insurance funds) of £440 million this year, compared with £492 million last year. The question is whether this surplus will be sufficient to cover the deficiency of savings compared with the prospective expenditure on new capital formation. The surplus will be sufficient only if the estimates of private saving—which *prima facie* look optimistic—are actually realised. By this test—that is, the financing of the whole capital programme without risking the generation of any further inflationary pressure—the Chancellor's budget may have done barely what was needed. Certainly his own test—to secure an "overall balance," in which incidentally he has not quite succeeded—is not the relevant one.

The "Economic Survey" did not set out in full detail the investment expenditure which is in prospect this year. The projected total of gross capital formation is £2,435 million, which shows a slight reduction compared with last year's estimate of £2,465 million. But there are too many guesses in what is "known" in the total, and large areas where nothing is known at all. In what are now described as the "controlled" sectors —in particular the nationalised industries, and in other major industries, such as steel and oil, that can measure their investment programmes with fair precision, the estimates for this year's investment in fixed capital ought not to be too wide of the mark. The co-ordination of all their various claims on the national resources is the responsibility of the Capital Investment Committee, but little is known about the criteria that the committee adopt in settling competing claims. Nor is it clear, on occasions, whether the estimates for fixed investment in particular sectors are annual totals, or annual rates of expenditure measured at particular dates. The distinction is important, in view of the length of

ESTIMATED GROSS FIXED INVESTMENT 1948–50 (PRINCIPAL SECTORS)

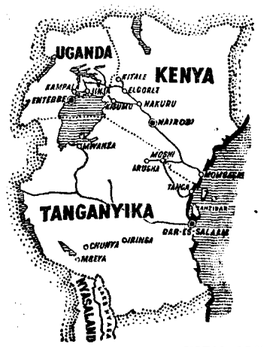
	2,062 ? a	*2,160*	*2,196 ?*

Source: Economic Survey; estimates for miscellaneous investment are subject to a "wide margin of error." A figure of £400 million is suggested in the Survey, for 1948 only.
(a) National Income White Paper gives £2,015 million.

* Cmd. 7933. HMSO 1s. 6d.



time that is needed to carry out investment decisions. Thus the projected fall in investment on housing from £475 million to £451 million this year rested on the assumption that sometime later this year the building programme would begin to reflect the cuts ordered last September. Since these cuts are now not to be made, it is impossible to tell whether the estimate of £451 million still stands; all that can be said is that there has been no attempt since the budget to alter the figures published in the "Economic Survey."

The principal investment programmes for 1950 set out in that document were summarised in the table now reproduced on page 954. The total of the specified components in the investment programme is put at £1,786 million, but even within this specified total there is plenty of approximation. For instance, the total of £400 million for manufacturing industry rests mainly on building work; "estimates for the rest of investment in this sector are necessarily very approximate." But apart from defects in the more or less specified estimates, there is a volume of miscellaneous investment which the "Economic Survey" does not attempt to estimate, apart from a guess of £400 million in 1948. Presumably, this miscellaneous investment has not fallen, and if a very tentative figure of £400 million is assumed for 1950, the total for fixed investment might approach £2,200 million. These figures are based on end-1949 prices; if prices were to rise by 2 per cent this year the total would rise to about £2,250 million. There is, therefore, a margin of about £235 million (£2,435 million total investment, less, say, £2,200 million for fixed investment) which must be represented by investment in stocks and working capital; this margin seems to be about £70 million less than last year.

Of this possible total of £235 million for new investment in stocks, some £100 million may be required, according to the Survey's estimates, to finance the higher prices of stocks, compared with £75 million estimated for 1949. But—again if the Survey is right—"expenditure on stock building should not be large" this year; last year, the value of the real increase in stocks was put at £150 million, and this year's figure presumably might be of the order of £75 million. Thus, of the £235 million to be invested in stocks, only £175 million can be more or less identified. It is, therefore, difficult to reconcile the projected total of £2,435 million for total investment with what is known of fixed investment and what the "Economic Survey" discloses about the building of stocks. Somewhere, £60 million or so seems to be missing from the account. These figures are summarised in the above table. There is one evident

CONSTITUENTS OF TOTAL INVESTMENT
(£ Million)

	1948	1949	1950
Fixed investment	2,015	2,160	*2,200*
Investment abroad by oil companies and increase in foreign trade credit	100	80	?
Real increase in stocks (net)	75	150	*75 ?*
Extra cost of replacing stocks at higher prices	400	75	*100*
Total investment	2,590	2,465	*2,435*
NOTES:—			
(1) Unaccounted difference	...	...	*60*
(2) Sales of surplus stores, to be added to net increase in stocks above to show gross increase	99	48	*80 ?*
(3) Gross increase in stocks	*174*	*198*	*105 ?*

The table below shows some of the goods that British East Africa bought from Britain in 1948. There is a market, too, for many other British products. *Write for our new booklet 'Overseas Markets.'* It contains detailed trade tables for British East Africa and other territories where the Bank has branches.

TOTAL 1948 U.K. EXPORTS TO THE TERRITORY WERE £31,358,000. THESE INCLUDED:

AGRICULTURAL & HORTICULTURAL TOOLS	£331,000	PAPER & CARDBOARD	£750,000
CEMENT	£424,000	PERFUMERY & TOILET PREPARATIONS	£100,000
CHEMICALS, DRUGS, DYES, COLOURS ...	£1,353,000	COTTON MANUFACTURES ...	£4,553,000

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)
HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

inference from the figures suggested for 1950 ; they must be regarded as *pro forma,* but there seems to be a little leeway in the total of projected expenditure, measured by end-1949 prices, which could take account of any moderate rise in prices.

*

If the dissection of the total investment programme is difficult, the assembly of the various sources of savings to meet it is no less complicated. Since the figures for the financing of capital formation were published in Table 13 of the "Economic Survey," revised figures taking account of the tax changes in the Budget have been announced. These are given below:—

FINANCING OF GROSS CAPITAL FORMATION
(£ Million)

	1949	1950
Current surplus of public authorities	492	440
Transfers by public authorities to private capital accounts (*a*)	216	135
Less: Taxes on capital	−253	−200
Depreciation provided by public authorities	110	110
Additions to tax reserves	8	20
Total set aside by action of public authorities	573	505
Depreciation allowances	865	900
Undistributed profits	530	600
Personal savings (*b*)	427	480
Total set aside from domestic receipts	2,395	2,485
External deficit (+) or external surplus (−)	+ 70	− 50
Total domestic capital formation	2,465	2,435

(*a*) War damage payments, etc. (*b*) "It should be noted that the figure for gross personal saving is not a forecast, but simply the sum which it is estimated will be required if a resurgence of inflationary pressure is to be avoided." (*Hansard,* April 20, 1950, Cols. *35* and *36.*)

These estimates are differently arranged from those in the "Economic Survey" but they show only minor changes—as was inevitable since Sir Stafford Cripps followed the principle of "bilateral balance" in his Budget. The main question to be asked about them is whether they promise to be sufficient to balance the nation's investment outlays in 1950. The surplus of savings by the public authorities can be regarded as a firm estimate only on the assumption—which will almost certainly be belied—that the Chancellor's estimates of the Government's current expenditure are not inflated later in the year by supplementaries for the social services. Secondly, the figure for gross personal saving is put forward quite frankly as a balancing item—not a forecast of what is expected to happen but a statement of what must happen (if all the other figures are valid) if further pressure of inflation is to be avoided. On this assumption, gross personal savings are supposed to rise from £427 million last year (candidly described as "amongst the most precarious" of the estimates in the National Income White Paper) to £480 million in 1950 —or, after allowing for taxes on capital, from a net figure of £174 million to £280 million. There are at least no outward signs of such a possible reinforcement of personal savings in 1950.

The National Finances

This week's issue of the *Records and Statistics* Supplement to *The Economist* contains a special section, dealing with the National Income, Public Finance and the Budget.

The *Records and Statistics* Supplement is obtainable by subscription only, at £2 10s. a year ; a combined subscription to *The Economist* and *Records and Statistics* costs £5 a year.

Scarcely less puzzling are the estimates put forward for saving by companies. It is assumed that the depreciation provisions that they are allowed to deduct for income tax purposes will rise from £865 million to £900 million, which is more or less plausible. But apart from this, the amounts set aside to free reserves from this year's current income are supposed to rise from £508 million to £620 million. During last year there were distinct signs of a check to the rise in company profits. Indeed, the Chancellor in his Budget speech declared that

> the progressive increase in profits which had gone on for nine years came to an end in 1948.

This fall was duly marked in the national income estimates for 1949, but there have been signs of some recovery of profits in the latest available returns. On the estimates as published, gross company savings would have to rise from £1,373 million to £1,520 million to fulfil these expectations:—

ESTIMATE OF COMPANY SAVINGS
(£ Million)

	1949	1950
Depreciation provisions	865	900
Tax reserves	22	+ 20 ?
Inventory "profits"	25	100
Free reserves	455 } 530	500 } 600
	1,358	1,520

These figures may turn out to be more or less right, but at present they must be regarded as optimistic. There is conceivably a margin of doubt about perhaps £100 million of the estimates for private savings.

Finally, this year's capital estimates assume that £50 million will have to be provided to finance the surplus in Britain's external payments. This is a figure which, the "Economic Survey" said, had been "assumed for the purpose of the national income estimates." But there are some judges who would concede the possibility of a much higher figure for this year's surplus. Certainly the movement of visible trade in the first quarter of this year lends some support to the guess that the external surplus might even be double that "assumed" in the Survey. If so, the surplus would absorb a correspondingly increased amount of savings from capital investment at home.

It was stated at the outset that the capital account is a field rich in possibilities for statistical error and guesswork. Since the estimates are officially stated without any indication of potential margins of error, their reliability can be put to only the most general tests. This examination suggests that the projected domestic investment programme represents the most that is likely to be done this year (unless prices rise very rapidly). But if savings turn out to be smaller than has been assumed and the external surplus larger, the estimates might fall short of what is needed by £150 million. At least it is very difficult to concede that the investment-savings account will be balanced this year without some decisive change in savings habits and without a resumed rise in company profits. The best provisional conclusion—despite what the Chancellor has budgeted for—is that some increase in inflationary pressure may well be generated this year through a failure of savings to reach the amounts which the official statistics suggest are necessary.

Business Notes

US and Sterling Balances

The problem of the sterling balances has suddenly burst into prominence again as a result of an unfortunate "leak" from the US State Department suggesting that Britain had put to the US Government definite proposals that the United States should share part of this burden. The facts are not quite what the Washington reports make of them, and do not justify the explosive reactions to them which have come from certain quarters in Congress. The sterling balances were one of the subjects left for further study by the continuing American-British-Canadian committee set up after the tripartite financial discussions of last September. Since then a great deal of exploratory and educational work has been done, information has been asked for and given, and now and again members of the committee have put certain ideas on paper. The latest "British proposals" were nothing more than another exercise of this kind, an attempt to relate the problem of the sterling balances to the gradual tapering off of Marshall aid and to President Truman's Point IV programme. The broad outlines of this essay were familiar: direct dollar aid, it assumed, might be given to India, Pakistan and South-East Asia, and the recipient countries might be induced as a condition of receiving that aid to write down their sterling claims on Britain. Thus three objectives would be served: the economic counter-attack against Communism would be reinforced ; the Point IV programme for aid to undeveloped countries would be set in motion ; and progress towards convertibility of sterling might follow the reduction of Britain's sterling liabilities. Such was the essay, in the form of a highly tentative memorandum. To elevate this into a set of hard proposals was to mistake its character and intent.

It is evident from the course of discussions within the ABC continuing committee that a very long time will pass before any results emerge from the consideration of this subject. Obviously, too, the other interested parties within the sterling area will have to be consulted before any hard proposals are made. In this context, it is significant that Indian reactions to the Washington "leak" showed particular sensitiveness and alarm. The coming Sydney conference of Commonwealth countries, though primarily concerned with the economic problems of South East Asia can hardly fail to debate the subject of sterling balances, though it is not one of the specific items on the agenda.

Bank Sells "Tanks"

The Chancellor of the Exchequer this week announced the details of the deal by which 1,667,961 shares of Tanganyika Concessions held by the Bank of England on Treasury account are being sold to an Anglo-Belgian group of mining companies. These shares are the unsold balance of a larger block acquired from the French Government under the agreement of April, 1946. They previously belonged to French shareholders and had been requisitioned, together with many other sterling securities, by the French Government. The purchasing Anglo-Belgian group consists of the Anglo-American Corporation, the Rhokana Corporation, the Rio Tinto Company, the Zambesia Exploring Company, and the Société Générale de Belgique. This group is paying 20s. a share for 1,500,000 shares and 24s. a share for the remainder —considerably more than the prices at which the Treasury bought these securities, but appreciably less than the price of 26s. 6d. to which they rose on Wednesday (by the close on Thursday they had reacted to 25s.). The sale to the Anglo-Belgian group has been made on the understanding that it will resell 750,000 of the shares to an American group headed by Messrs Ladenburg Thalmann & Company of New York.

The sale has been authorised by the Treasury on certain conditions. The first is that the Anglo-Belgian and American purchasers hold the shares for two years. The second is that they will vote against any sale by the Tanganyika Concessions of its interests in the Union Minière du Haut Katanga and the Benguela Railway (except any sale of the railway to the Portuguese Government). Tanganyika Concessions holds a 20 per cent voting interest in the Union Minière and a 90 per cent interest in the Benguela Railway. A further condition of the sale is that the purchasers will use their best endeavours to secure that Tanganyika Concessions does not dispose of its Union Minière and Benguela Railway assets for ten years, and that if any subsequent sale is contemplated a first offer must be given to the British Treasury. Given acceptance of all these conditions by the purchasers, the Treasury will consent to the transfer by Tanganyika Concessions of its registered office from Great Britain to Southern Rhodesia. Consent has been given to this sale and to the partial resale to American interests in the belief that this is one more step in the mobilisation of American capital in the development of mining resources of Africa. A wholly spurious "cloak and dagger" atmosphere was given to the operation at first by the fact that it was revealed in almost all essential details in last Wednesday's *Daily Worker.* The story was there adorned with headlines of purest Marxian dialectic which told the world that the Treasury had "signed away uranium mines to America." In fact, the indirect interest in Union Minière acquired by the American group through this deal will be around 2 per cent. An intriguing and as yet unexplained part of the story is how a full, though slightly outdated, copy of the contract reached the offices of the *Daily Worker.*

* * *

Trouble with the Power Programme

Lord Citrine, of all people, must have startled the Government last week when he expressed the hope that the electricity supply industry was not "going to be planned out of existence." Coming from the chairman of the British Electricity Authority, these were hard words. Do they indicate foreknowledge of a Government attempt to review the electric power investment programme ? Lord Citrine seemed to suggest as much:

> From time to time I hear rumours—and I put them at no more than rumours—of the possibilities of cuts in our programme. I say if that is even considered as a practical proposal it will come not merely as disappointing to the people in this industry who all these years have struggled so hard to improve its capacity, but it will be disastrous for British industry as a whole.

The occasion of these remarks was a luncheon of the Electrical Development Association. It is true, therefore, that they were made to a special audience. The association is the promotional body of the electricity supply industry. It was financed and supported by the old electricity undertakings to promote expansion, and is now financed and supported by the authority and the area boards in the same way for the same purpose. The salesmen of the industry have always been strong in it, and expansionist talk is what they expect to hear at meetings. But members of the Government, including the Minister of Fuel and Power, were present, and some of Lord Citrine's words were plainly addressed to them.

Lord Citrine seemed to speak more as the head of a harassed business warding off bureaucratic interference than as a senior planner himself. The authority had "already

been limited to a total (new) capacity of 1,500 megawatts a year by government decision," and "if we are confined to that limitation it will be many years before we really can overtake the full demand for electricity in this country." The public was "getting sick of delays," and "there is going to be the usual indiscriminate blame." Efforts to get boilers from the United States seemed no nearer success, and only those who had tried it could see "how protracted it all is, and how many agencies have got to be consulted, and how much information has to be given to some quarters where one would rather wonder about its necessity."

It is hard to recognise in these aggrieved overtones the voice of electricity supply, the favourite child of the capital investment programme. True, the authority is "restricted" to 1,500 megawatts of new plant a year. But what does such a restriction mean when the rate of installation that proves physically possible is 566 megawatts (1948), 703 megawatts (1949), or even 850 megawatts, which Lord Citrine indicated as possible for this year? He conceded that the demand "appears to be beyond the physical capacity of the manufacturing industry." He described how the authority is going to Italy for valves and Germany for tubes (which he declared to be "measures which are not pleasant and not broadly acceptable to British people") and doing its best to go to the United States for boilers. He described how it has lately been trying to arrange with British firms outside the boiler industry to make boilers for power stations; these efforts have had some success, but in some quarters "it has been felt impossible to transfer, as it were, their activities to the sphere we so much require." If the authority is already taxing the power plant industry to its limits and seeking to draw engineering capacity away from other uses, what good would be done by assigning to it a still larger share in the investment programme? It might, perhaps, impede other forms of investment. But would it produce more power?

Industry

Road Transport and the New Taxes

While the Road Haulage Executive is still considering the impact of the new taxes on petrol and oil and on commercial vehicles, the Road Haulage Association has advised its members to raise their rates by 10 per cent to meet the increase in operating costs. The association's members own 75 per cent of the privately owned haulage fleets, 120,000 vehicles of all types and sizes, compared with the Transport Commission's 37,000 long-distance lorries. The individual firms will have to revise their contracts with each customer. Until their state-owned competitor defines its attitude there is bound to be uncertainty, but the association reports that those customers already approached seem to accept the increase as inevitable. The 10 per cent rise will permit hauliers to pass on the full increase in costs to their customers; profit margins, the hauliers contend, are already too narrow to allow for further reductions. But one of the largest users, the Milk Marketing Board, is showing no disposition to accept 10 per cent as a reasonable figure. It holds that the effects of the purchase tax will make themselves felt only gradually. Even the petrol tax, in its view, can only partly offset the saving in cost of haulage which has come from the steady increase in milk production. The rate per gallon of milk carried has more than once been reduced as these economies have made themselves felt; the Board contends that further reductions were in prospect and is unwilling to concede a net increase.

It will be surprising if the new purchase tax on commercial vehicles has the effect intended: that is, to bring about a reduction in the numbers sold on the home market from more than 100,000 a year to less than 73,000. Roughly 400,000 vans and lorries are on order, and the delays in delivery range from two years or more for light vans to 1½-2 years for medium lorries and one year for the heavy 5-ton lorries. Some of these orders are doubtless from buyers who have put their name down with several manufacturers in the hope of early delivery from one, but this practice of over-ordering commercial vehicles is not so common as with passenger cars. No doubt, too, there are small firms which will find the 33⅓ per cent tax a deterrent, though others will accept it as an offset to the initial allowance of 40 per cent for tax purposes which is allowed in the first year. Buyers in general will pay the increase and be grateful for delivery. Recourse to the second-hand market can still involve paying 50 to 100 per cent above the list price for light vans and up to 70 per cent of the list price for lorries.

* * *

The British Motor Show in New York

British motor manufacturers picked an auspicious time for their first exhibition in New York. The seasonal winter lull in car sales in the United States has been followed by a rise in demand so sharp that even the expanding output of the American industry cannot satisfy it. Some 1,350,000 cars, 17 per cent more than in the same period of 1949, were produced in the United States in the first three months of this year, but demand is so great that there is a delay of three months in the delivery of the popular makes, and prices of second-hand cars are rising. Against such a background, the £1,100,000 worth of orders taken by British manufacturers at the show is a hopeful portent for the future of British cars in the United States. But how far is it a reliable portent?

There is a real market for the two types of car, the small car and the sports car, which British manufacturers produce on a fairly large scale and which are not made in the United States. This explains the interest in the Jowett and Jaguar types with speeds exceeding 100 m.p.h., and in the less expensive Sunbeam-Talbots, Rileys, and MGs. The Nuffield organisation says that two-thirds of the overseas orders for MG cars come from the United States. The same absence of similar American production accounts for the popularity of small Austins, Hillmans and Morrises. The larger British cars are hard to sell.

The uncertain element is the size of this market. The British motor industry has set itself to win one per cent of the United States market, i.e., about 40,000 to 50,000 cars a year. Its attainment will probably depend on the British industry establishing itself as the main supplier of these two comparatively specialised types of car. The prices are now generally described as "reasonable," although some comments suggest that they are still too high. Continental competition, which could be a threat, does not seem to be developing. More serious is the prospect of American competition in the small car field. Several American models are planned. The Nash 5-seat Rambler, with an 82 b.h.p. engine, costing $1,808, is the first to come into production. A second version is expected to cost $1,100. The cheapest British car shown, the Ford Anglia, costs $1,003. The Austin A40 costs $1,480, the Morris Minor $1,250 and the Hillman Minx $1,495.

But for the present some British manufacturers find themselves in a position in which they cannot augment their deliveries of cars to the United States for at least two months. One difficulty is in the specifications demanded by the United States authorities; these prevent manufacturers from switching production destined for other markets to the United States to meet a sudden demand. Another difficulty is that the bulk of the industry's output is already sold for months ahead in other markets. Output in the first quarter of this year was larger than had been anticipated and allowed [illegible] latitude to meet new orders, but a further expansion [illegible] is impeded by the limitation of supplies of [illegible] demand from North America should rise greatly, the British manufacturers might quickly find themselves faced with the decision whether to cut their supplies to overseas markets in the sterling area; and this they might find painful.

* * *

Price Controls for Wool Cloth

Utility wool cloth prices are not tied (as utility cotton prices are) to precise specifications of the content and structure of the cloth. It has therefore been possible for the utility scheme for wool textiles to survive the last few years of rising costs with less strain than the cotton scheme, and the Government—at the moment when it has chosen to quarrel openly with the cotton industry for its alleged deficiencies in utility production—has been able to grant wide relaxations of the price controls for woollen and worsted cloth. This does not mean that the wool textile industry is immune from any damage in the conflict between the trend of raw material prices and the Government's efforts to keep the official price index down. An examination of the new price control arrangements for the wool textile industry soon shows where the immunity ends.

Maximum permitted prices for woollen cloths have been based on a "cost plus" calculation: the cost of the raw material, the cost of manufacture, and a profit margin. For worsted the arrangements were substantially the same, with modifications to meet the fact that the successive stages of worsted manufacture (combing, spinning, and weaving) are carried on by different firms. The changes announced by the Board of Trade last week remove all price control for non-utility wool cloth and yarns; with prices inflated by purchase tax, these cloths are now thought to be meeting enough market resistance to keep their prices down—and if they were to rise, the interim index of retail prices would not be affected.

For utility cloths the new arrangements are not so simple. Each category of cloth has a ceiling price, for each description of cloth there are several categories to give a price range, and the "cost-plus" calculation tells the manufacturer into which category he puts his product. Substantially, this system remains. But instead of selling at his "cost-plus" price, the manufacturer may sell at any price up to the maximum for the category into which the product falls. He will thus enjoy a new room for manœuvre in his price policy, and this is thought to be practicable because the seller's market for many cloths of this type no longer exists. At the same time the Board of Trade has included some new descriptions of cloth in the utility schedules, notably worsted-rayon blends which have not previously been allowed to carry the utility mark. The changes take effect on May 1st.

* * *

Utility Prices and Costs

It will readily be seen where these arrangements differ from those in force for the cotton trade. If a cotton manufacturer makes a utility cloth he makes it to a specification; he can modify its content only within narrow limits, and has no influence over the maximum price at which he can sell it. But the wool cloth manufacturer plans a cloth for sale at a particular price, and with that price in mind decides what to put into the cloth. If materials or manufacturing costs go up he can economise by reducing its quality. Alternatively, he can leave the formula unchanged and sell the product at a higher price simply by marking it with a higher utility category, and indeed the method of arriving at utility marks for wool cloth makes this procedure automatic.

But there are limits to this flexibility, imposed by the framework of the utility scheme and by the manufacturer's own reluctance to debase indefinitely the quality of his products. If costs rise beyond a certain point and the system of categories with their ceiling prices remains unchanged, it can cease to be possible to promote a cloth into a higher category. The result must be that quality will decline greatly and some cloths will cease to be made at all within the utility range.

Such a situation is not entirely out of the question. The last general increase in the permitted prices for utility wool cloths to meet the higher cost of materials was made in March, 1948. A small increase was permitted in the following November to meet wage concessions in the industry, but the utility scheme for wool cloth as it exists today is substantially based on raw material costs as they existed at the beginning of 1948.

Wool prices have risen by more than 50 per cent since then. Since the devaluation of sterling the rise has passed the point at which it could any longer be absorbed by tolerable dilutions of quality, and, as manufacturers use up their stocks, a revision of the utility schedules in their entirety is becoming urgent. If it is not done soon, utility production in the wool trade can hardly escape serious distortion. But such a revision (unlike the relaxations described in the preceding note) would raise the prices of specific categories of utility clothing—and would therefore affect the interim index of retail prices. And when this threatens, the Government tends not to be accommodating.

* * *

Film Technicians' Co-operative

A movement to form a "co-operative workers' unit" for film production (the term means a unit controlled by the technicians' trade union) has been active in the Association of Cinematograph Technicians since the beginning of 1948; it seems now to be nearing fruition. A company, ACT Films Limited, has been formed with a board of directors nominated by the association "for their experience in their particular creative and administrative sphere and for their experience in the ACT." It is precluded from paying dividends, though the articles provide for profit-sharing arrangements with the employees. These will be an essential part of the scheme. The higher-grade technicians will accept the appropriate union minimum rate, and each will "participate in the costs of production to the extent of the difference between the minimum rate and his normal rate." In fact the minimum rates for these skilled technicians are fairly high; the Gater report last year gave £22 10s. for an editor, £20 for a camera operator, £22 10s. for a sound recordist, and £20 for a literary editor. It is of interest that the difference between rates of this kind and what is "normally" paid will provide for participation to the extent of between 10 and 15 per cent of the total budget of the film. The association hopes that actors and actresses will participate on the same basis, and is discussing this possibility with British Actors' Equity.

Apart from the notional funds represented by participation on the lines described, the company will not at first put up any money towards the cost of its productions. It has applied for finance to the National Film Finance Corporation, which has been in touch with the project for some time, and which not long ago received fresh instructions from the Board of Trade to enable it to finance this project if it thought fit. The first film is to be based on Mr Howard Clewes's book *Green Grow the Rushes*. Mr John W. Gossage is to produce and Mr Derek Twist to direct the film. There seems no reason now to doubt that the Film Finance Corporation will lend the money; the promoters are still working on the budget for their first film, and this seems likely to be in the region of £100,000—a fairly modest budget as these go nowadays, but still a substantial sum which no British producer can be certain of getting back.

When the association's members first put up the idea, the executive observed that two issues were raised: the principle of co-operative production on its merits, and the use of co-operative production as a temporary palliative for unem-

ployment. The two issues remain. Clearly it is unemployment which has forced the project through to its present stage. In future, however, the scheme will have to justify itself by the merits—and the economy—of its work.

* * *

Fewer Ships under Construction

The shipbuilding returns issued by Lloyd's Register of Shipping for the first quarter of 1950 give an indication of the extent to which shipbuilding activity in foreign yards is expanding. The tonnage of merchant ships under construction abroad at the end of March was 2,789,455 tons gross—388,878 tons more than at the end of 1949. In Great Britain and Northern Ireland the total under construction declined in the same period by 98,972 tons gross; it was 1,895,219 tons gross at the end of March. This is nearly 350,000 tons less than in June, 1948. The diverging trends of British and foreign shipbuilding activity would be more marked if returns from Germany were available. Apart from Great Britain, the only countries which showed a decline during the quarter were the United States (441,640 tons under construction compared with 512,787 tons) and Denmark (128,239 compared with 132,129). France and Italy have each increased their shipyard work by about 50,000 tons, presumably with the assistance of ECA counterpart funds, since their building costs are among the highest in Europe; but by far the largest increase is in the returns for Japan, which now show 84 ships of 390,036 tons gross under construction, compared with 41 ships of 120,416 tons gross three months earlier. This is evidence of the large domestic shipbuilding programme which the US authorities in Japan have approved; this, again, is assisted by counterpart funds. In Japan no fewer than 62 vessels (290,608 tons gross) were laid down during the quarter, compared with 66 vessels (268,392 tons gross) in Great Britain and Northern Ireland. Completions in the United Kingdom totalled 86 ships (360,969 tons gross), while 65 ships of 204,440 tons were launched.

The total building in British yards is likely to decline more markedly in number of ships than in tonnage in the coming months, since the new orders are largely for tankers and bulk ore carriers of large capacity. Since devaluation there has been a spurt of new orders for ships of this type from dollar sources, but the yards which are not equipped for such large construction are having great difficulty in attracting orders for the more handy type of cargo vessel. Some yards are without follow-up orders to replace work which is now well on the way to completion. It is significant that the tanker tonnage now building amounts to half the total figure for the United Kingdom. Now that the flow of supplies is satisfactory and the delivery time greatly improved, it is apparent that the continuing high cost of shipbuilding is the greatest obstacle in the way of obtaining further orders for tramp vessels and cargo liners, which are the bread and butter of the shipbuilding industry as well as of many sub-contracting firms.

Finance and Investment

Second Thoughts from Brazil

The authorities in Brazil have excelled themselves in the erratic series of announcements on the redemption of their bonds in the past week or so. Twice in a matter of days Brazil bondholders have been informed that the Brazilian Government intended to redeem certain sterling loans—only to find that the authorities in Brazil, once within 24 hours and again ten days later, had revised their intentions.

A note in *The Economist* last week explained that the Brazilian Government had announced through its London agents, Messrs N. M. Rothschild and Sons, its intention to redeem six issues—the 5 per cent funding loan, 1898, the 5 per cent 1914 loan, the 5 per cent 20-year and 40-year funding bonds of 1931, the 4 per cent 1911 loan and the Lloyd Brasileiro 4 per cent sterling bonds. Later, a seventh issue, the 6½ per cent sterling loan of 1927 was added to the list, only to be removed the following day. The decision to replace the 1927 loan with two other loans, the United States of Brazil Railway Guarantees Recission 4 per cent bonds and the 4 per cent Ceara Railway loan, of which (under "Plan A" and "Plan B" together) £4,000,000 and £1,000,000 respectively is outstanding, was known too late for inclusion in *The Economist* last week. But unabashed by the unfavourable reception to its first change of plan, the Brazilian Government decided on Monday of this week—ten days after the original announcement—not to redeem the 20-year funding bonds. Instead it would repay the £480,000 outstanding in "Plan A" and £176,000 in the "Plan B" bonds of the 4½ per cent 1883 loan.

It may not be possible to endow these changes of mind, in the continued absence of an official statement, with a rational explanation. But the answer may be that the Brazilian authorities had only belatedly realised that in repaying the 1927 loan and the 20-year funding bonds, they were also assuming an immediate dollar liability which they were in no position to do. The 20-year funding bonds alone had nearly $40 million dollar tranche outstanding in 1948. And if Brazil is at the moment flush of sterling, it is still short of dollars. It could hardly have paid off its sterling creditor without at the same time repaying others. Moreover, under the original terms of the 1927 loan the Brazilian Government is precluded from redeeming this issue other than by sinking fund purchases. If such are the reasons that prompted the Brazilian Government to stage a double *volte-face*, they still do not excuse the lack of forethought which occasioned highly undesirable market movements. The role of the London agents in this whole episode has been limited to making available promptly and properly each new announcement.

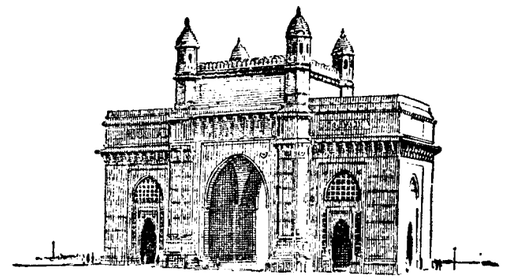
Standardised Treasury Bills



The technical change announced by the Chancellor a week ago in the arrangements for issuing tender Treasury bills and Treasury deposit receipts should make a real contribution to the smoother working of the banking system and the money market. As recorded in a "shorter" note in these columns last week, tender bills and TDRs issued after May 1st will have lives representing an even number of weeks instead of calendar months. Treasury bills, traditionally having a three-months life which therefore varied, according to the vagaries of the calendar, from 88 to 92 days, will in future be standardised at 91 days, or thirteen weeks. TDRs, which in recent years have been issued at the option of the authorities with lives of five, six or seven months (and therefore were subject to similar variations in their lives expressed in terms of days) will be standardised at 154 days (22 weeks), 182 days (26 weeks) and 210 days (30 weeks) respectively. In the past, the practice of working in calendar months has had the effect of depriving the banks and money market of maturities of these instruments on many days scattered hazardly through the year: for example, no bills will mature next Friday, because February 5th was a Sunday, and none will mature during the last three days of May because February had only 28 days. Such gaps in the even flow of maturities, and the corresponding concentrations of maturities on other days, cause much quite needless distortion in the money market, putting the authorities, the banks and the discount houses to a great deal of effort to restore the system on each occasion to an even keel.

The remedy, long advocated in these columns, is the simple one now adopted. It will ensure that both bills and TDRs

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office.

A comprehensive banking service is available at the Bank's branches in

INDIA PAKISTAN CEYLON BURMA KENYA ZANZIBAR UGANDA TANGANYIKA and ADEN

NATIONAL BANK OF INDIA LIMITED

Head Office: 26 Bishopsgate, London, E.C.2.

"I hear

Henry's lost his partner.

Died suddenly last week."

"Bad luck.

Will the business

be able to carry on?"

Yes of course—the partnership was covered by a Scottish Temperance Life Policy, which safeguards capital should one of the partners die prematurely. Write for further details to The Scottish Temperance & General Assurance Company, Dept. N, 109 St. Vincent Street, Glasgow.

will normally mature on the same day of the week as that on which they are first taken up and paid for. The only exceptions will be those caused by the incidence of public holidays, so that the occasions on which the old difficulties recur will be few. It is astonishing that the authorities have taken so long to bring themselves to this minor departure from tradition. Since they persuaded the banks, over three years ago, to drop the practice of window-dressing and to work instead to a more or less steady cash ratio from day to day, it has been more than ever apparent that the smooth functioning of the banking mechanism demands a continuous flow of floating debt maturities. Yet in 1948, when the matter was raised in Parliament, the Chancellor saw no reason for change. His belated second thoughts are very welcome. The convenience of the new arrangement is undoubted—and should soon console even those few discount brokers who have been observing that the standardisation of bills deprives them of the chance to make a tiny extra " turn " on the Treasury bill rate on those certain occasions when the life of the bills has differed from what is now to become the standard life.

Erleigh and Milne Judgment

The hand of Nemesis has fallen heavily on Messrs N. S. Erleigh and Joseph Milne, the former joint managing directors of the ill-starred New Union Goldfields group which crashed nearly three years ago. According to Judge F. W. Lucas, delivering judgment on these two men in the trial concluded last week in Johannesburg, " New Union Goldfields was really a gambling house, saved from earlier collapse by the miracles of the discovery of gold-bearing land in the Orange Free State." The company was placed under judicial management in 1947, following inquiries by a London accountant in connection with a proposed application for a quotation of New Union shares on the London Stock Exchange and a subsequent auditors' qualification to the balance sheet.

After hearings lasting fully two years Erleigh has been found guilty on forty-four out of sixty-three charges and Milne on eighteen charges generally described as " fraud theft and contravention of the Companies Act." As well as their prison sentences of ten years each, Milne has been fined £88,810 and Erleigh £95,115. In default of payment of these sums an additional thirty-four years' imprisonment will be imposed. Leave has been given for the accused to appeal and both are to be allowed bail.

The full text of the judgment is not yet available in London, but excerpts from it make astounding reading. By implication, if not directly, Judge Lucas calls in question the technique of South African gold-mining finance with its emphasis on vendors' consideration and the opportunities afforded to the unscrupulous to seek personal advantage. As for the " other financiers and stockbrokers who helped the accused in manipulation of the share market to further their ends " some may yet be brought to court for their part. It has been said in mitigation of the crimes that what Erleigh did was common practice in Johannesburg. The judge did no more than his public duty in directing the attention of the South African authorities to this menace to the gold-mining industry and the moral standards of the country.

Free Sterling Rates

Free sterling has been appreciating during recent weeks. The pound note in Switzerland at one time reached Sw. Fr. 11.05—the highest price since devaluation. Dutch account sterling is currently quoted at $2.62, fully 20 cents above the post-devaluation low. The most marked rise in " free " sterling in the past fortnight—the rise in the rate for industrial switch sterling in New York—was caused not by the improvement in the sterling area's gold reserves but by the boom in television shares on Wall Street which spilled over into American buying of Electric and Musical Industries shares in the London market. Within a matter of days the price of " Emmies " jumped from 20s. 6d. to 29s. 6d. The rate in New York for industrial switch sterling rose accordingly. At one point last week it was $2.20, almost 50 cents higher than at the beginning of the month.

Unfortunately, the buying of 300,000 " Emmies " by American speculators has little to do with the intrinsic dollar worth of British securities. American distaste for sterling securities remains, despite the improvement in Britain's balance of payments. The yield obtainable on British Government stocks in New York is still 7 per cent. In the words of a New York brokers' firm, British Government securities have recently become " practically unsaleable at a time when secure yields at attractive levels are being actively sought " by the American public. It is true that the sterling switch rate for Government securities has risen recently from $1.53 to $1.65. But even this rate represents a discount of 42 per cent whereas the discount on French securities in New York has narrowed to 5 per cent. French securities have risen almost to parity, primarily because the authorities in France have made foreign-domiciled French securities more readily negotiable, and this is more important to the investors than any figures about larger dollar exports.

The recent activity on Wall Street is reflected in the London market by the firmness of the dollar premium, which has risen by a further two points to 17 per cent. Although the return on dollar stocks remains attractive to British investors in comparison to the return obtainable on many British securities, this premium is higher than that on dollar stocks in other European centres. In Holland, for instance, where switching by residents in dollar securities was recently reintroduced, the dollar premium is only 7 per cent. Although the discrepancy between yields in America and in Holland is larger than that between America and Britain, the Dutch take the view that the risk of requistioning of dollar stocks by the authorities in Holland remains, and that the Netherlands Bank would take over requisitioned securities on the terms quoted in New York, and not on those quoted in Amsterdam.

* * *

Intra-European Payments in March

The latest monthly settlement of operations under the intra-European Payments Agreement—the settlement for the month of March—has further indicated the hardening of sterling as a European currency. Once again, no gold and dollar settlements were made by Britain in connection with payments agreements with OEEC countries. Nor did Britain need to use any of the drawing rights accorded to it by Belgium. No such drawings have in fact been made since September of last year. Between July and September, 1949, however, the equivalent of $45,063,000 was used by Britain in drawing rights on Belgium and a further $6,563,000 was drawn on the Belgian credit opened in connection with the second version of the Intra-European Payments Scheme. During March OEEC countries used drawing rights granted by the United Kingdom to the equivalent of $5,664,283. These went to four countries—Austria, Greece, Turkey and Western Germany. Austria has now used up the $15 million worth of sterling drawing rights granted as " bilateral " rights by Britain and has begun to use its " multilateral " drawing rights to meet sterling requirements. Greece, similarly, had exhausted its bilateral drawing rights by the end of February and has now begun to use multilateral rights in order to meet its deficit with the sterling area. Western Germany had, by the end of March, exhausted its bilateral drawing rights. These various operations confirm other indications that the sterling area is now running a considerable surplus in its trade with OEEC Europe

Egyptian Pounds and Swiss Francs

Last September the Egyptian pound followed sterling, but Egyptian exports, despite this stimulus, are still encountering price resistance in some markets—to such an extent that the Egyptian authorities are now taking further steps to lower the effective exchange rate of the Egyptian pound. Thus the recent trade and payments agreement between Egypt and Switzerland opens the way to a further lowering of the Egyptian pound in terms of Swiss francs. The agreement officially establishes a free rate in Egyptian pounds. With the approval of the Egyptian authorities, Swiss exporters to Egypt and several categories of Swiss financial creditors will in future be able to sell their pounds in the open market, primarily for the benefit of Swiss importers of Egyptian goods. As the free rate is more than likely to move to a discount, Swiss financial creditors will suffer some financial loss, but they may be well satisfied to make some sacrifice in return for greater freedom for transfers.

Not all types of Egyptian exports, however, will be purchasable for the new " cheap " Egyptian pounds. Karnak cotton bought from government stocks has still to be paid for in full at the official rate, but Karnak bought in the open market can be purchased as to 70 per cent with free pounds. All ancillary expenses connected with exports may be met from free funds.

The British exchange control has, of course, no voice in the arrangements for dealings in Egyptian pounds, as distinct from transactions in Egyptian account sterling ; but the authorities here are hardly likely to view these new multiple-rate practices favourably. The move towards freer rates is not, however, unexpected. In his recent speech at the annual meeting of the National Bank of Egypt, the bank's president, when discussing last year's devaluation, implied that he, at any rate, would have preferred a floating pound to a new fixed parity. The first alternative, he suggested, " would have allowed the pound freely to find its real parity on the markets, without prejudice to its stabilisation at a fixed rate later on."

Trade

Achievement in Exports

The export industries have made good use of the advantage given to them by devaluation. In March the value of exports reached its highest recorded level, £184 million. Their volume was provisionally estimated at nearly one-fifth above the average for 1949, and apparently constitutes a further record. Perhaps the most encouraging feature has been the expansion in the export of goods other than vehicles and machinery. Both of these two latter groups were larger than in February, but smaller than in January, the previous postwar peak. On the other hand, wool textiles, iron and steel manufactures, chemicals, electrical goods, cutlery, pottery and even coal were quite significantly larger than in January. The export drive is thus developing a broader and more varied base.

Although the figures for the first quarter of the year are reassuring, a comparison with the same period of 1949 reveals certain weaknesses. Total exports at £516 million were some 10 per cent larger than a year ago. The vehicle group, which accounted for nearly one-fifth of the total, exported £100 million worth of goods, an increase of 20 per cent on the year, while machinery exports at £80 million rose by only 10 per cent. Iron and steel manufactures increased by 20 per cent to £37 million and had almost overtaken cotton textiles as Britain's third largest export. Wool textiles increased by 15 per cent and coal by nearly 50 per cent. Chemicals also increased slightly, and so did one or two of the minor exports. On the debit side, however, cotton textiles were nearly 15 per cent less than in the first quarter of 1949—a disturbing exception to the general rising trend. Exports of silk and rayon and apparel were also smaller, and so too were electrical goods and pottery.

If this present rate of export can be maintained throughout the year, Britain may well attain an overall trade surplus larger than the £50 million suggested in the " Economic Survey." The dollar deficit may also be appreciably reduced. Dollar earnings from exports to Canada and the United States are not yet back to the level of a year ago, but they have been increasing over the past few months. Exports to such countries as Switzerland and Belgium have been on a much larger scale this year than in the first quarter of 1949.

* * *

Agreement between India and Pakistan

The deadlock in Indo-Pakistan trade has at last been broken. After seven months of embargo on commercial intercourse between the two dominions, statesmanship has prevailed, and an agreement was signed last week which will once more permit trade to flow from one country to the other. The period of deadlock was not only unnecessary, it was also harmful to both sides. The economic unit is the Indian subcontinent and self-sufficiency of either country could be achieved only at considerable economic cost.

The new trade agreement is in two parts. The first deals with the governmental transactions. Pakistan is to sell raw jute—which is discussed in a subsequent note—and 150,000 tons of wheat at a price to be agreed later. India in return will sell mainly manufactured goods: 20,000 tons of jute manufactures (largely gunny bags), 45,000 bales of cotton textiles and 5,000 bales of yarn, 7,000 tons of mustard oil, 500,000 lb. of tobacco, 5,000 tons of steel sheets, 1,000 tons of rolling stock, 12,000 tons of timber, 50,000 tons cement and a quantity of woollen manufactures. Both parties have agreed to see that adequate foreign exchange is available to permit this programme to be fulfilled.

Part two of the agreement covers a list of miscellaneous goods over which there will be no governmental control and no obligation to provide the necessary foreign exchange. Such trade will be free from quota restrictions. Among the goods which India will sell to Pakistan under this heading are leather, spices, paints, drugs and cigarettes, while those on the Pakistan list include cottonseed, soda ash and hides and skins.

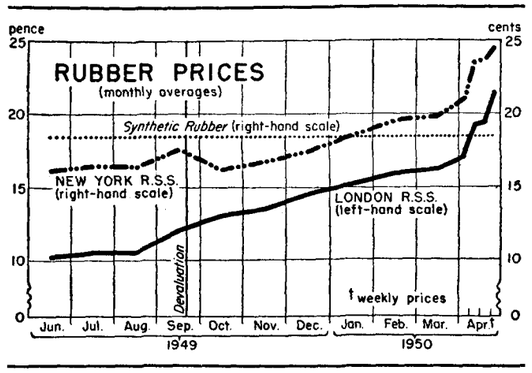
* * *

Deal in Jute

Although the agreement covered many commodities, jute was clearly the focal point of the negotiations. When Pakistan decided not to devalue its currency last September, India refused to pay the higher sterling price for raw jute and all shipments from Eastern Pakistan to India were stopped. The Calcutta mills continued to operate by using up stocks of raw jute which they had accumulated. In the nine months from July, 1949, to March, 1950, their total output reached 635,800 tons, compared with 774,100 tons twelve months earlier, and the consumption of raw jute was estimated at 3,713,000 bales against 4,521,000 bales in 1948-49. But it was clear that unless additional supplies of raw material were forthcoming it would have been necessary to cut output drastically. Under the present deal, Calcutta will receive 800,000 bales, said to be mostly " cuttings " and low grade qualities. India is to pay for it in its own currency—an interim measure—and the total quantity is expected to cost Rs. 12½ crores.

One effect of the interruption of trade between the jute growing areas and their main port—Calcutta—was to push on the development of Chittagong. From last August to October the average monthly export from Chittagong was 48,244 bales, but in the following four months the average was raised to

207,407 bales. The capacity of the port is expected to be increased further when additional berthing and warehousing facilities are available and when river transport to Chittagong has been fully developed. It seems, therefore, that on present showing Chittagong can handle an export of 2½ million bales a year—and probably more later on. An alternative outlet to Calcutta has thus been developed. The importance of the trade agreement to Pakistan, therefore, lies in the fact that, firstly, the raw jute sold to India could not be disposed of easily in other markets owing to its quality, and, secondly, the Pakistan jute growers were being well paid for their produce they had few opportunities to spend their income since supplies of consumer goods were short.



Now that trade between the two dominions has been resumed it is likely to develop. The initial agreement is for only three months, though the shipment of raw jute can be completed at a later date. But it would be very surprising to see another standstill imposed after July.

* * *

Boom in Rubber

On Tuesday the price of rubber in the London market reached 1s. 10d. a lb., its highest level for nearly twenty-five years. The rubber market has been firm for the past six months ; it received a fillip first from devaluation and then from increased American consumption. But the boom of the last three weeks must be related to other causes. At its present price, natural rubber in New York is some 6 cents above the price for general-purpose synthetic rubber (GR-S) selling at 18½ cents a lb., and this margin is wide enough to encourage switching from natural to synthetic in the manufacture of "non-transportation" goods. So far there is no evidence of any switching in the manufacture of tyres or inner tubes. Admittedly, the consumption of synthetic rubber jumped in March from 31,700 tons to 38,000 tons. But the consumption of natural rubber also increased—though not so sharply—from 56,600 tons to 61,000 tons.

The high level of industrial activity in the United States and more particularly the high rate of production of motor

vehicles is clearly boosting the demand for natural rubber. But it is not this increased demand alone which has forced the price to 1s. 10d. a lb. Consumption in Britain and in Europe has also tended to increase during the past six months, though imports into Russia have been much smaller than twelve months ago. The latest figures for world production and consumption of natural rubber relate to February. They show that during the first two months of this year production totalled 237,500 tons (7,500 tons more than in the corresponding period of 1949) and consumption was 252,500 tons, an increase of 10,000 tons. If the present boom in rubber has any real foundation in supply and demand, the March figures must be expected to show a sharp drop in output and a further increase in consumption. If Malaya and the United States are indicative of these respective trends that is apparently what has happened. Production in Malaya tended to decline further in March, while consumption in the United States rose.

But the present acute shortage of supplies has probably been due to increased hoarding by Indonesian smallholders. If this proves to be so, it will be only a temporary phenomenon—it will cease when Indonesian producers are willing to hold cash rather than rubber. That may take some months. But these supplies, even when they are marketed, are unlikely to disturb the firm undertone which has been created in the rubber market by the latest burst of prosperity in the United States.

Shorter Notes

Coal output last week was 4,420,700 tons, 1,288,400 tons more than in the preceding week when output was reduced by the Easter holidays. Total output for the first 16 weeks of the year was 67,772,200 tons compared with 66,882,700 tons in the same period of 1949. Lord Hyndley, chairman of the National Coal Board, last week called this slight increase "frankly disappointing." At a time when home consumption was rising it meant that traditional export markets cannot be supplied now and may, therefore, be lost to other suppliers or other fuels. It had been hoped that increased mechanisation would more than offset the steady loss of manpower. Statistics show that in the week ended April 15th there were 290,100 face workers on colliery books and the total of all workers on the books was 702,100. In April, 1949, the total was 725,800 and 298,200 of these were face workers.

*

A group of technical experts belonging to the International Telecommunications Union are meeting in London this week to discuss technical difficulties in the way of international standardisation of television transmission. The high costs make it desirable to share television programmes wherever possible but slight differences between stations using the same basic Marconi method of transmission can prevent this. The BBC is known to be reluctant to make any change until colour television can be brought in ; the European countries now planning to start transmission themselves do not want to standardise on the British system because they feel it does not incorporate enough of the technical progress made since 1936 when transmission was first started.

*

Despite the reports emanating from Cuban and American sources that a group of financial interests in the two countries is about to purchase the United Railways of Havana, the company's chairman in London has warned "it would be as well to regard this information with a certain amount of caution." The reports suggested a purchase price of $20 million. Meanwhile, the Cuban government has appointed a commission to determine the amounts owed to the railway company by the state and sums needed to provide adequate revenue in future.

*

Cable and Wireless (Holding) has been granted Stock Exchange quotations, starting May 2nd, in its 3 per cent 3½ year unsecured loan stock, the 4 per cent 10-year unsecured loan stock and the new ordinary stock. The quotations are subject to a proviso that on May 1st the company announces applications for the new ordinary stock under the reconstruction scheme to have exceeded the minimum of £4,955,834 for the scheme to be effective. Since the new stocks cannot be issued until court sanction has been obtained for the scheme, any dealings before then will be subject to cancellation if approval is not forthcoming. But dealings, prior to this sanction, in the Savings Bonds due to be distributed under the scheme cannot be cancelled, so that stockholders who sell these bonds take a risk of the scheme not becoming operative.

COMPANY MEETINGS

CAMMELL LAIRD AND COMPANY, LIMITED

SATISFACTORY RESULTS
HIGHER OUTPUT FIGURES
SHIPBUILDING COSTS REMAIN TOO HIGH
SIR ROBERT S. JOHNSON'S REVIEW

The eighty-sixth annual general meeting of Cammell Laird and Company, Limited, was held on April 25th at the registered office of the Company, New Chester Road, Birkenhead, Sir Robert S. Johnson, chairman and managing director, presiding.

The chairman, in moving the adoption of the report and accounts, said:—

Ladies and gentlemen, this is our eighty-sixth annual meeting of the company, but before dealing with the business of the meeting, I wish to say how sincerely sorry we all are to miss the genial presence of our colleague Mr A N. Winder, who, owing to ill-health, is unable to be with us today.

Sir Stanley Goodall has decided not to seek re-election and Mr P. B. Hunter has been appointed to the board since the last annual meeting, and therefore comes before you for re-election ; being a member of the firm of our legal advisers he will be of the utmost help to us in our deliberations.

We have again had a very busy and profitable year in our shipyard, and I would once more congratulate the management, staff and workmen on the very fine effort they have made and convey my thanks to them for the success of their achievements.

I will now comment on the accounts of the company for the past year, and as all of you will have received, and no doubt examined, a copy of them, I hope you will be able to follow me with interest.

BALANCE SHEET
CAPITAL

During 1949, the new scrip bonus issue was made, thereby doubling the £1,775,000 ordinary stock, the present issued stock as shown in the balance sheet being £3,550,000 and under the heading of revenue reserves, you will see that the general reserve has been reduced by £1,775,000 to provide the amount capitalised, thereby reducing the reserve to £1,125,000. To this it is proposed to add £250,000 from 1949 profits, making the resultant figure at December 31, 1949, £1,370,000. Other revenue reserves have been increased by roughly £61,000 practically all of which is for possible depreciation in value of trading stocks.

TAXATION

You will notice that we have shown separately in the balance sheet the amount set aside for income tax on the profits for the year, £286,000. As payment is not actually due to the Treasury until January 1, 1951, we think it better to show this as a separate item.

FIXED ASSETS

The additions to properties during 1949 amounted to £110,000 (1948 £66,000) and the depreciation for the year was nearly £98,000 (1948 £76,000) consequently, although we have kept the works up to date with new plant and machinery, the total book value at the end of 1949 was only £10,000 higher than it was at the beginning of the year. Our buildings, plant and machinery have been maintained in the best condition and the whole of this cost has, as usual, been charged to revenue.

CURRENT ASSETS

SUNDRY DEBTORS at £647,000 show a reduction of £339,000 as compared with 1948 which is largely due to balances owing on completion of new ships (i.e., the difference between the ultimate ascertained cost and the provisional price) being very much smaller than in the earlier post-war years. This means that we are achieving greater control of our costs, and is a tribute to our management.

QUOTED SECURITIES (Government Stocks) show an increase of £514,000.

BILLS RECEIVABLE are £500,000 more than a year ago and in holding these bills we are enabled to employ cash not immediately required, upon more remunerative terms than the bank deposit rate of interest, and at the same time oblige our customers.

Our CURRENT ASSETS at £6,079,000 are over £4,200,000 in excess of CURRENT LIABILITIES and I think we can congratulate ourselves on this very good feature of our balance sheet. With the ever growing stringency of business conditions, these liquid reserves are of the greatest importance.

PROFIT AND LOSS ACCOUNT

Turning to the profit and loss account, it will be noticed that the trading profit for 1949 at £898,000 is £86,000 higher than that for 1948, but I would like to point out that this has only been achieved by higher output and that our rate of profit on turnover is appreciably lower than in 1948. On the other hand, the average wage of our employees was appreciably higher in 1949 than in 1948.

INCOME FROM INVESTMENTS rose by £40,000 to £358,000 the increase being chiefly owing to a special non-recurring dividend from one of the smaller companies in which we are interested. Dividends from our associated companies—English Steel Corporation Limited, and Metropolitan-Cammell Carriage and Wagon Company, Limited—are the same as last year.

The net balance carried to the APPROPRIATION ACCOUNT is £436,976, an increase of £27,000 on 1948 and when to this is added the £192,673 brought forward from 1948 and the interim dividend of £58,575 is deducted, a net balance of £571,074 is available for disposal, which your board propose should be dealt with as follows:—

	£
In payment of a final dividend of 6½ per cent. less tax on £3,550,000 ordinary stock ...	126,912
Transfer to general reserve ...	250,000
Carry forward to 1950	194,162
	£571,074

DIVIDEND POLICY

In my speech last year, in referring to the capital bonus issue, I stated that under present national conditions, it might not be possible to give to our stockholders a return much greater than they were at present receiving, and before deciding upon the slight aggregate increase in our dividend distribution for 1949, your board have given the most serious consideration to this matter. They would have liked to have done more, but were restrained from doing so by the urgent appeals from the Chancellor, although having regard to the severe cut in our ordinary share capital some years ago which amounted almost to annihilation, they might have been excused if they had gone a little further. We can, however, feel that we have in every way complied with the Chancellor's urgent appeal for restraint and I hope that the shareholders will at least feel that the board has done what it could.

ENGLISH STEEL CORPORATION LIMITED

As usual, we have included in our report, the accounts of both our associated companies —The English Steel Corporation Limited, Sheffield and the Metropolitan-Cammell Carriage and Wagon Company, Limited, Birmingham—and I am sure you will agree with me that the figures of both companies make excellent reading.

Unfortunately, the English Steel Corporation are still threatened with nationalisation and I am afraid that we can only possess ourselves in patience and await the issue. Of one thing, however, I can assure you, and that is that the threat of being taken over has in no way retarded their efforts to keep in the forefront of their industry, and they have, and are, spending considerable sums of money in the most modern equipment and facilities, so that if they are allowed to continue under free enterprise, they should unquestionably be in an excellent position to meet the keenest competition. One of the most gratifying features is that during the year all the departments have shown improvement, and all have contributed their share to the success of the business.

During the year the stainless steel business made great advances, and when the new capital that is being spent comes into production it will be a very big thing.

The wheel and axle business of Taylor Bros., Trafford Park, has also made great improvements, and they are now in a position to give very much greater delivery of wheels and axles and such like for rolling stock. They also had a very good year financially.

Darlington Forge have had their new machine shop in action, and they are doing very well and have greatly improved their deliveries.

METROPOLITAN-CAMMELL CARRIAGE AND WAGON COMPANY, LIMITED

Regarding the Metropolitan-Cammell Carriage and Wagon Company, Limited, they have had a busy year and attained a new high record in the value of deliveries. Exports amounted to 60 per cent. of the total, and there was also an increase in production for the Home market which included delivery of 184 motor and trailer coaches for the new Liverpool Street-Shenfield electrified service.

The company's railway rolling-stock factories still have a large order book and will again be actively engaged during the present year in fulfilling contracts for passenger coaches for India, South Africa, Rhodesia and Egypt, and goods wagons for Argentina, Australia, New Zealand, Crown Colonies and other overseas countries. In addition to this work, substantial numbers of passenger coaches and mineral wagons will be completed for British Railways.

Although there is still a considerable overseas demand for new railway vehicles, severe competition is now being encountered from European builders.

Representatives of the company have made extended visits to overseas markets.

The production of metal omnibus bodies has increased during the past year and a still greater output is programmed for the current year, including large numbers for London Transport Executive and a number of municipal transport undertakings. Successful trials have been carried out under operating conditions in this country with the Olympic integral 'bus and an important export order is in progress for vehicles of this new type which will be the joint production of the Metropolitan-Cammell Company and Leyland Motors Limited.

PATENT SHAFT AND AXLETREE COMPANY, LIMITED

The Patent Shaft and Axletree Company, Limited, achieved the highest output of steel plates and sections since 1937 in spite of a shortage of man-power. Some falling off in demand, particularly for light sections, is now however evident. The improvements and extensions made to the Monway Light Mills were completed during the year and great benefits therefrom are already evident.

Here again, The Patent Shaft and Axletree Company,—are threatened with nationalisation, and as I mentioned in my speech last year, if this comes about, it will very detrimentally affect the parent company as they obtain a very considerable part of their material, including very special steel, from this unit. We must, however, just patiently await events.

DELIVERIES OF SHIPS

At our shipyard at Birkenhead, we have again experienced a very busy year and we actually delivered one more ship than we anticipated at the beginning of the year. In all, we delivered eleven ships, including two for Alfred Holt and Company, two for the Athel Line, one for Shaw Savill and Albion Company, one for Ellerman Lines, one for the British Tanker Company, two for the British and Continental Steamship Company, and two for the Argentine Flota Mercante del Estado, from whom I am pleased to say we have received a most appreciative letter, congratulating us on completing our contract to their entire satisfaction both in regard to cost and delivery.

I believe that the output per man at our works is improving and I am pleased to say that supplies of material on the whole are better than in previous years.

ORDER BOOK FOR NEW SHIPS

Our present order book for new ships will give us work for possibly another two years, but the problem at the moment is to obtain new orders to take the place of the ships we are completing. In the repair department 1949 was again a very busy year, but the last of the big reconditioning jobs was completed about the middle of the year, and in consequence it is becoming more difficult to obtain orders to the fullest capacity of our facilities, but I am very glad to say that so far we have done very well.

ENGINEERS' CLAIM FOR £1 A WEEK RISE

Regarding the Engineers' claim for £1 a week rise, to be paid out of profits, this presumably is pre-supposing that large profits have been, and are being earned, but this is not so, so far as the shipbuilding industry in general, and my own company in particular, are concerned, as anybody who cares to study our accounts can find out for himself. Moreover, for several years past, my company has ploughed back into the business more than half of the net profits after taxation, and indeed, we would have been deserving of censure had we not built up our reserve resources after our sad experiences during the slump following the first World War. It is most important under present conditions to conserve our resources as far as possible to enable us to face whatever difficult times may lie ahead.

The cost of ships is much too high, and any savings that we can make as shipbuilders by reducing our cost to our customers in order to obtain work and to induce ship owners to embark on rebuilding their fleets is the proper thing for us to do, rather than to increase the cost of the ships by increasing wages.

Before closing I would like to repeat what I said last year that our staff and workmen are to be heartily congratulated on a good year's work. They have shown a very fine spirit of loyalty and co-operation with the firm, and by so doing they are I believe helping us to ensure employment for the future.

The report and accounts were unanimously adopted.

I. GRIEW & COMPANY, LIMITED

RECORD SALES

The fourteenth annual general meeting of I. Griew & Co., Limited, was held on April 26th in London, Mr Louis Samuels (chairman) presiding.

The following is an extract from the circulated statement:—

I am pleased to report another successful year's trading and that sales were a record in the history of the company. During the year new plant and equipment has been installed and extensions to the factory are now nearing completion. These improvements are not only necessary to increase output, but also to ensure the carrying out of the board's policy of constantly improving the quality of the furniture we produce.

The net profits of our subsidiary, Davey & Armitage, Limited, amounted to £14,255, and this result is not unsatisfactory. We are following the same policy as in the parent company of constantly improving the plant, equipment and premises, so that we shall be able to take full advantage of any increase in the supplies of timber from abroad.

The combined trading profits amount to £87,034, compared with £78,471 for 1948, which included £6,543 from previous years. The net profits, after all charges, including £39,195 for taxation, amount to £31,364, and after transferring £17,000 to general reserve there is a carry forward of £18,257. The net surplus of current assets over liabilities has risen by over £11,000 to £125,410. Your directors have decided to recommend that the final ordinary dividend be maintained at the rate of 17½ per cent, actual on the increased capital. This represents a modest increase of just over 4 per cent.

Sales for the first three months of the current year have been well maintained. The present position as regards the parent company is difficult, not only because supplies of hardwoods are difficult to obtain, but also because costs have risen considerably since the beginning of the year. In regard to the subsidiary company, we must still be largely dependent on our strictly controlled quota of softwoods, although we are always seeking ways of increasing its turnover by use of other timbers.

The immediate future is therefore somewhat uncertain, but we are confident that, with our efficient organisation, backed up by a keen and capable staff, we shall be able to overcome any difficulties which lie ahead and give a good account of ourselves.

The report was adopted.

INTERNATIONAL NICKEL

MR ROBERT C. STANLEY ON PROGRESS

The annual meeting of the International Nickel Company of Canada Limited was held at Toronto on April 26th.

Mr Robert C. Stanley, the chairman, in the course of his address, said: Mining is the third largest industry of Canada, being exceeded only by agriculture and forestry. More than 90 per cent. of the nickel produced in Canada is sold to other countries. Since the greater portion of this goes to the United States or is sold elsewhere for United States dollars, nickel causes a constant flow of these dollars to Canada. Thus the Canadian nickel industry is one of the chief sources of United States dollars so essential for the maintenance of Canada's foreign trade. During the past three years our exports of metal have returned $168,000,000 to Canada.

The total income for 1949 was $184,052,188, as compared with $198,329,310 for 1948. Total dividends paid on the common shares in 1949 amounted to $29,156,338, or $2.00 per share, the same as in the two preceding years. Four quarterly dividends of 40 cents per share, the same as in the two preceding with an extra dividend of 40 cents per share in December. Dividend payments on the preferred shares totalled $1,933,899.

Capital expenditures in 1949 were $18,553,851, comparable with $14,080,479 in 1948. By countries expenditures were: $15,014,072 in Canada, $2,272,881 in the United States and $1,266,898 in Great Britain and in other countries. It is estimated that capital expenditures in 1950 will approximate $22,000,000.

BRITISH PLANTS

Nickel production at our Clydach, Wales, refinery for the year 1949 was 49,400,000 pounds, an increase of 9,600,000 pounds over 1948. At the beginning of the year Clydach brought a further unit into operation, and the additional output, together with the general improvements being introduced, enabled costs to be reduced. Output at the Wiggin rolling-mill plant in Birmingham, England, showed a reduction of about 12½ per cent. The reduction was spread over all products except the Nimonic alloys, the demand for which is increasing with the further development and production of jet engines for aircraft.

Operations at our precious metals refinery at Acton, England, continued at capacity throughout 1949. Costs were up somewhat owing to increases in the prices of acids and other raw materials. Production of palladium and silver showed a reduction from 1948, with platinum and rhodium higher.

Nickel finds its way into a very great number of industrial applications. In the United States, Canada and Great Britain the steel mills take approximately a third of the total, including substantial amounts for stainless steels.

Total sales of nickel in all forms for the entire year were 209,292,257 pounds as compared to 240,098,274 pounds for the year 1948. While the volume of nickel sales in 1949 in the United States and Canada was down from the preceding year, it exceeded the average of the prewar years 1936 through 1939 by about 70 per cent. Outstanding were the increases in platers' supplies and in the proportion of the steel industry's requirements represented by the stainless steels. Volume in these classes was 160 per cent. higher than in the prewar years mentioned.

The report was adopted.

UNITED KINGDOM PROVIDENT INSTITUTION

INCREASED INTERIM BONUS

MR JOHN BENN'S SPEECH

The annual general meeting of the United Kingdom Provident Institution was held on April 19th in London.

Mr John Benn, the chairman, who presided, said:—I have the honour to move the adoption of the report and accounts for the year ending December 31, 1949, the 109th year in the history of the United Kingdom Provident Institution. Quite early in the year my father, who had occupied this chair since 1934, intimated to the board that he wished to be relieved of his duties on his 74th birthday. To my surprise, and satisfaction, his colleagues invited me to succeed him. Having served on the board for some years I was fully aware of the responsibility attaching to this office; I accepted only after most careful consideration, and shall do my utmost to justify the trust which has been placed in me.

Turning now to the balance sheet and accounts, you will observe that the new sums assured of £5,901,208 exceed the previous year's figure by £393,208. The average policy was for a sum assured of £800. Expenses in relation both to premium and total income show a slight reduction. The greater part of the income is, of course, devoted to the settlement of claims; the next largest item is the provision for the bonus, with the result that, taking the average of the past three years and before deduction of tax, 18s. 2d. out of every £1 received by the institution was applied for the benefit of members.

You will observe that the very satisfactory rate of £5 4s. 5d. gross interest has been earned on the fund, compared with £5 2s. 7d. a year ago. I must emphasise that the rate is calculated on a very conservative valuation of your fund and reflects the great strength of the reserves.

FIRE AND ACCIDENT BUSINESS

As last year, the accounts of the United Kingdom Fire and Accident Insurance Company, Limited, are included in the report, and they record further progress. The gross premium income of £285,234 shows an increase of nearly £200,000 over the figure at the end of the war, and a net underwriting profit of 4.7 per cent. has been devoted to strengthening the reserves.

During my early months at Gracechurch Street I have been greatly impressed by the sense of public responsibility which prevails in the City of London. Financiers are now out of favour, but the country's debt to those who transact its money business cannot be measured only by balance sheets. The silk hat is not the badge of plutocracy it is often represented to be, nor are the silver buttons of our messengers a sign of subservience. The silk hat was, I believe, worn originally as being the hat most easily raised to the customer, but it is also, like the buttons, symbolic of the strict and exact standards which happily still mark the business of the City. This is perhaps most clearly recognised abroad, especially in the United States, where our reputation for reliability, built up over 150 years, is still our most valuable asset.

THREAT OF NATIONALISATION

In common with several industries, insurance has been impelled to find its voice by the threat of nationalisation, which, directed first against the industrial branch, was applied to all forms of insurance conducted by the companies concerned. The institution played its part in the life offices' campaign to defeat this reckless proposal. The right and proper concern of the electors with economic affairs clearly demands that the fullest information about all forms of business enterprise should be available, if sound judgment is to be formed and reflected in Parliament.

In his Budget broadcast, Sir Stafford Cripps suggested that the man in the street is not much interested in the methods of public finance. If that is so, it is a state of irresponsibility which must somehow or other be remedied. After all, he is vitally affected.

The nation has learned that its life assurance savings now amount to at least £2,000 million, an average of some £40 per head of the population. Moreover, as these savings are being maintained and increased at a time when most other forms of thrift have halted or gone back it is to be hoped that the new Tucker Committee will recommend the Chancellor of the Exchequer to improve the amount of tax relief on life assurance premiums.

INCREASED INTERIM BONUS

We have just completed two-thirds of our present triennium, and all with-profit policies written this year will share in the bonus to be declared early in 1951. Meanwhile, I am happy to announce that the directors have decided to declare an increased compound interim bonus of 33s. per cent. to be paid on all with-profit policies which mature this year, with 2s. extra for long-term policies in the temperance section which will receive 35s. per cent. In 1949, the percentage of actual to expected deaths was 69 in the temperance section and 74.2 in the general section, a comparison which indicates that the advantages we offer to abstainers are well grounded. As a pioneer institution in the temperance field, we note with satisfaction, from a new survey by the Hulton Press, that there are now 3,000,000 total abstainers in this country.

I referred earlier to the regard in which British assurance is held in the United States. We, in turn, can learn something from the Americans, who are constantly aware that service is implicit in business and this gives an impetus to the whole economy. It is significant that a New York life assurance company, when recruiting staff, invites young men to enter on "a pleasant and profitable career," not in selling policies, but in "providing family security."

That, of course, is the primary aim of the United Kingdom Provident Institution. So when we write your policies and collect your premiums, we sometimes pause to think what all this means to members in protection for their families, in providing for education, buying homes, financing business, and for retirement and old age. While the sums assured with us now exceed £60 million, these big figures are only a measure of the support which our mutual Institution enjoys from its many thousands of members. All these individuals and families have hopes and plans for the future which they have confidently placed in our hands, and with more than a century of successful endeavour behind us we will not fail them in the years ahead.

The report and accounts were adopted.

BLAW KNOX, LIMITED

PROGRESS IN A DIFFICULT YEAR

The annual general meeting of Blaw Knox, Limited, was held on April 27th at the Russell Hotel, Russell Square, London, W.C., Mr J. Theodore Goddard, the chairman, presiding.

The secretary, Mr Donovan Farnworth, read the notice convening the meeting and the report of the auditors.

The following is an extract from his statement circulated with the report and accounts for the year to December 31, 1949:—

It is again my great privilege to present to you the directors' report and statement of accounts for the year ended December 31, 1949.

It will be noted from the balance sheet that the net profits for the year, after providing for taxation and liabilities of every kind, are £109,982, an increase of £25,418 over the previous year.

The period under review has certainly been one of difficulty and keen competition, with the volume of business handled somewhat reduced in comparison with the previous year. Unfilled orders on hand amount to £3,146,000, as against the record figure of £3,600,000 at the end of 1948. Your board has the situation constantly under review and in recent months their efforts have been concentrated on the introduction of new products of heavy earth-moving equipment.

NEW PRODUCTS

In this connection I am pleased to be able to report the production of new important products which your directors consider will favourably influence the company's trading opportunities in the more difficult times which lie ahead. I refer in particular to the "Goliath" motorised scraper and the "BK-12" self-propelled blade grader. This new equipment is now in production and an appreciable volume of orders has already been secured by the company.

Hitherto plant of this class has only been available from the United States. It is of the utmost importance in civil engineering construction, and more particularly in Colonial development, and it is considered that not only will this equipment largely influence the company's future turnover, but production in this country will contribute appreciably to saving the country's dollar resources. Our ability to deliver these machines now is well timed and, in my view, justifies very completely the decision previously made to undertake their production.

The company's transmission and radio tower business continues to maintain a high and satisfactory level of activity both in the home and export markets. The steelworks department has secured further notable contracts for open-hearth equipment and dolomite machines, and maintains a satisfactory position.

GOOD LABOUR RELATIONS

Our engineering works at Watford and Rochester maintain good labour relations and a high standard of efficiency producing equipment of outstanding quality. It is a great pleasure to me to be able to report once again the excellent relationship which exists within our organisation. Without the closest co-operation and understanding between management, staff and workpeople, which I am glad to say exists in the fullest measure, the results now put before you could not have been achieved.

I see no reason why the business of your company should not continue to go further ahead.

The report and accounts were unanimously adopted.

PLATERS AND STAMPERS, LIMITED

SATISFACTORY TRADING RESULTS

RECORD SALES AT HOME AND ABROAD

MR ARTHUR KEATING ON THE OUTLOOK

The annual general meeting of Platers and Stampers, Limited, was held on April 26th at 41, Threadneedle Street, London, E.C.2, Mr Lloyd W. Sichel presiding in the absence of the chairman, Mr Arthur Keating, in America.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1949:—

Ladies and gentlemen,—For the second time since Platers and Stampers became a public company, I have the pleasure of addressing you with regard to your company's general business welfare. Your directors have already placed their accounts for 1949 before you, and have submitted for your approval today the final dividend which they recommend. I shall keep my own remarks brief, since the business news from Platers and Stampers for 1949 is good, and good news requires considerably less explaining than bad. I think you will all agree that your company's trading results to date have been most satisfactory, and have thus far more than justified the faith and confidence expressed by the directors some two years ago, when our shares were first publicly offered.

OPERATIONS IN 1949

1949 was a good year for your company. Sales both at home and abroad set new records and placed before our productive departments the not always easy task of keeping the output of our factories flowing in quantities that would meet a continuously increasing demand. These record sales have resulted in record profits—£306,863 in 1949, as compared to £215,654 the year previous. The onerous requirements of taxation have taken a correspondingly greater amount—£167,528, as against £108,806—but there still remains a net profit after taxation of £139,335. This compares with a figure of £106,848 in 1948.

After deducting dividends paid and recommended for the year, plus the sum of £16,698 in goodwill written off, your company carries forward into 1950 undistributed profits of £372,689, contrasted with the sum of £300,102 brought forward from 1948. The goodwill referred to arose out of the acquisition of its wholly-owned subsidiary in 1946, and represented the premium paid on those shares. Your directors have considered it prudent to remove this item from the consolidated balance sheet.

DIVIDENDS

In accordance with the limitations on dividends requested by the Treasury, your directors have again recommended a final dividend of 22½ per cent., which, together with an interim dividend of 12½ per cent. paid in August, 1949, makes a total of 35 per cent. for the year. This is the same amount as was paid in 1948, and is at the rate indicated in our prospectus two years ago. The 1949 dividends require £50,050, which you will note is little more than a third of the consolidated net earnings after taxation.

CONSOLIDATED BALANCE SHEET

The consolidated balance sheet at December 31, 1949, reflects the very strong financial position of your company. Current assets rose to £943,917, nearly half of which is represented by cash balances The working capital, increased by £86,184, now stands at £548,339 and is certainly ample for immediate needs of the business. The decrease in the amount of stock in trade from the previous year is attributable to the unprecedented demand for our products, particularly in the final quarter of the year. The management has already taken steps to make good this depletion of our stocks, and to increase them to a level in keeping with the increased sales expected in 1950.

The fixed assets, stated at cost, less accumulated depreciation, amounted to £372,613 at the year end Additions during 1949 came to £36,795, the bulk of which is in respect of new productive machinery acquired to increase manufacturing capacity in product lines which have proven particularly popular. It has always been your company's policy to maintain its physical properties at the highest possible level of efficiency, and substantial sums were again expended in this connection. Also during the year a comprehensive plan of internal reorganisation was carried out, with the result that a good amount of space which was previously not utilised productively has now been made available.

In viewing the liabilities and income tax reserves of the company, it should be noted that the sum of £13,010 has been added to future tax reserves to offset the immediate tax savings afforded under the initial allowances provisions of the Income Tax Act. Of this sum £9,178 has been provided from 1949 net earnings.

The issued share capital of your company remains at £260,000, represented by 1,040,000 shares of 5s. each. Total capital and reserves now amount to £1,056,656, as compared with £931,015 at December 31, 1948. This overall increase is entirely accounted for in the increased amount of undistributed profits carried forward, together with an increase of £53,123 in future tax reserve.

DEMAND FOR PRESSURE COOKERS

I am sure that most of you are generally familiar with the company's range of products. These consist of houseware items, for the most part directed towards kitchen applications. They include pressure cookers, hollow-ground and taper-ground cutlery, the Prestrig kettle, bathroom fittings, baking tinware, egg beaters, tin openers and a very wide variety of small kitchen tools and specialities. These products are generally sold under the company's trade names, "Prestige," "Ekcomatic," "Skyline" and "Ovenex," the first and second of which I hope have become familiar to you as the result of our extensive advertising programme. Within a few weeks each of you will be sent a copy of your company's new general catalogue so that you can more fully appreciate the range of quality merchandise which we now manufacture. In manufacturing and selling these articles your company continues to enjoy the benefits of its relationship with the parent company, The Ekco Products Company of Chicago. The latter company, which is perhaps the largest and one of the most successful manufacturers of housewares in America, constantly places at our disposal its vast technical and merchandising "know-how" acquired during the past sixty years in a highly competitive market. Ekco also makes available to us a great many patents and secret processes, which have proved of the greatest help.

Last year your attention was directed to the outstanding success which had met our introduction of pressure cookers into the U.K. and overseas markets. The enthusiasm of the public for pressure cooking has no abated, but continues to grow steadily. During 1949 we greatly increased our range of pressure cookers by introducing larger models and a number of improvements in design This is in accordance with your management's determination to maintain its position as the leading manufacturer of pressure cookers in the Empire To achieve this position we have expended a great deal of money on national advertising and merchandising campaigns. You may be interested to know that during 1949 we completed several motion picture advertising films, which have been exhibited in cinemas throughout the United Kingdom and in some parts of the Commonwealth. These and other vigorous merchandising plans will be maintained or accelerated in 1950, as your directors firmly believe that the potential demand for our pressure cookers will increase still further as the many advantages of pressure cooking become better known to the housewife.

OTHER LINES

Although pressure cookers have been the most significant single factor in your company's sales growth, there have, nevertheless, been strong upsurges for other lines. This is particularly true with respect to our lines of hollow-ground cutlery. The demand for these lines today far exceeds our present productive capacity, and we are now installing additional plant and equipment, sufficient nearly to double present facilities.

The company's products have also enjoyed an increasing popularity in export markets. Export sales accounted for a substantial percentage of our total sales during 1949 and, since devaluation of the pound, there has been a marked increase in shipments to hard currency countries. Canada particularly has become a fruitful market, and we have shipped a very large quantity of our goods into that Dominion during the past six months. We can feel a certain satisfaction in the help which we are thus affording our Government towards closing the "Dollar Gap."

Early in 1949 the company moved its general offices from Burnley to their present headquarters in London. This has greatly facilitated administration and control by the management. The company now employs in its factories at Burnley and Derby and in its London office approximately 1,000 persons. In common with many other companies, we have not always found ourselves able to obtain increased personnel necessary to keep pace with our expansion. This is particularly true at Burnley, which is in the centre of the cotton trade, and where the labour situation is still very tight.

PROSPECTS

Your directors have every reason to feel confident in your company's future. In 1950 we expect again to surpass the records established in 1949 and shipments for the first few months of this year confirm that view. Our manufacturing and merchandising plans have been made accordingly. In the export field many new and important markets have now opened for us, while the exploration and development of existing markets during the past two years should bring increased business to us from these areas.

Your company is continuously on the alert for new lines, and many of these are now off the drawing boards and in the hands of our production engineers. These additions will not only help to diversify our product lines, but should make substantial future contributions to our turnover and profits. To keep pace with this anticipated growth, your directors are aware of the necessity of expanding our productive facilities. You have my assurance that our plans in this direction are already well advanced.

You will have gathered that I am pleased, not only with the results achieved to date, but with the prospects in store for your company. I now look forward to a year from this time, when I trust I shall have the pleasure of confirming these anticipations. Meanwhile, I know you will join me in thanking all ranks of the company's personnel, whose loyalty and teamwork have made all this possible.

The report and accounts were unanimously adopted; the retiring directors, Mr W. W. Gibson, Mr B. A. Ragir and Mr G. V. Wellesley, were re-elected and the proceedings then terminated.

THOMPSON AND NORRIS MANUFACTURING

SUBSTANTIAL PROGRESS

POSITION FURTHER STRENGTHENED

MR H. MINCH'S STATEMENT

The sixty-ninth ordinary general meeting of The Thompson and Norris Manufacturing Company, Limited, was held on April 25th on the company's premises at Great West Road, Brentford, Middlesex, Mr H. Minch (chairman of the company) presiding.

The secretary (Mr K. N. Henley, A.S.A.A., A.C.W.A.) read the notice convening the meeting and the report of the auditors

The following is the chairman's statement which had been circulated with the report and accounts for the year ended December 31, 1949, and was taken as read:

Your directors submit the sixty-ninth annual report of The Thompson and Norris Manufacturing Company, Limited, and its subsidiaries, believing it should meet with your approval, as further strengthening of the position of the company is evident.

SATISFACTORY PROFIT EXPANSION

Without going into too much detail, you will notice the net profit has again increased from £158,147 to £170,662, a most satisfactory result taking into account the downward trends in price levels which have developed during the year. In the course of the year we capitalised £266,800 of our reserves and the resulting shares were distributed to our shareholders in the proportion of two for each one held. On the increased capital we have already declared an interim dividend of 10 per cent. and we now propose to pay a final dividend of 25 per cent., making a total of 35 per cent. for the year, being equivalent to an increase of 5 per cent. on last year's basis.

Your directors have also decided to transfer £21,800 to general reserve making this figure £205,000 after the transfer of the bonus issue as shown in the schedule, and £18,500 to dividend equalisation account, making this £90,000, and have written off the capital and bonus issue expenses of £3,857 and, after providing for the proposed final dividend, the group carry forward is increased from £158,855 to £208,074. You will notice that trade investments have increased to £19,178; this represents investments in related companies and gives us the benefits of certain technical information. The difficulty in obtaining raw material has resulted in a stock reduction and cash in bank increased from £87,574 to £224,846, reflecting the volume of stock and altered prices.

PRODUCTION TRENDS

In the past year all factories have made substantial progress. In particular, our Irish factory is now running to full quota and, considering it is only two years since it started production, we think this is most satisfactory; steps will be taken to increase substantially its capacity. Our South African investment continues to make progress and should help to augment our profits in the future.

The past year has seen a consolidation of the factory expansion referred to in my last year's speech. Trading conditions are as difficult as ever, but we continue to make improvements in methods of production and subject to adequate supplies of raw material, we anticipate a successful year.

CHANGES IN DIRECTORATE

It is with great regret that I have to advise you that our works director, Mr T. Whittaker, who has been with us nearly 30 years, has had to resign his position on account of ill health, but his services will still be available to us when required in a consultative capacity.

We have appointed to the board Mr G. E. Prideaux, who has been our sales manager for many years, and Mr E. C. Winn, who has also had long experience with us in accountancy and costing matters, and shall be glad to have your approval of their appointment.

In conclusion, I am happy to thank all factory and administrative personnel for their loyal and enthusiastic co-operation during the past year, and to express my complete confidence in the continuance of the existing happy relationship.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, Mr W. R. Tomlinson, Mr J. H. D. Samuel, A.C.A., F.C.C.S., Mr G. E. Prideaux and Mr E. C. Winn, were re-elected, and the remuneration of the auditors, Messrs Hart Bros., Drake and Company, having been fixed, the proceedings terminated.

EXPERT TOOL AND CASE HARDENING COMPANY, LIMITED

GRATIFYING RESULTS

The twenty-ninth ordinary general meeting of this Company was held on April 27th in London, Mr A. H. Redfern, the chairman, presiding.

The following is an extract from his circulated statement:—

The net profit before taxation amounts to £140,991, as compared with £119,495 for the previous year These results are most gratifying. The proposed final dividend of 20 per cent., which makes a total of 30 per cent. for the year, is equivalent to 45 per cent. on the capital before the bonus issue and compares with 40 per cent. last year. Out of total net profits of £140,991, shareholders receive approximately only one-seventh of the total profits by way of dividends.

A new subsidiary company, Expert Tool Heat Treatments, Limited, formed to take over the specialised heat treatment business formerly carried on by your company, was put into operation as from January 1, 1949.

In December, 1949, a wholly owned subsidiary company, E.T.I.C. South Africa (Proprietary) Limited, was incorporated in the Union of South Africa, to invest in and to establish operating companies which can be closely associated with the activities of the parent company.

None of us can predict the trend of events and it is early in the year to prophesy, but I am confident that shareholders will not be dissatisfied with the results for 1950.

The report was unanimously adopted.

A special resolution was passed approving the amendment to the memorandum of association of the company.

RHEOSTATIC COMPANY, LIMITED

INCREASED DEMAND

The thirteenth annual general meeting of the Rheostatic Company, Limited, was held on April 27th at Slough.

Mr M. J. Gartside (the chairman) said: Although it is disappointing that I cannot report a repetition of the record profit of the previous year, your board considers that the result is satisfactory having regard to the difficulties which faced the industry just over twelve months ago.

You will have seen from the directors' report already circulated that the net profit amounted to £25,609 after providing £34,240 for taxation. The directors have transferred a sum of £11,500 to general reserve, so retaining profits in the business to provide some of the capital required for the purchase of new equipment necessary for the continual improvement of manufacturing methods.

Recently the members of the company approved the board's recommendation of a bonus distribution of shares whereby the issued ordinary capital was increased from £98,000 to £147,000. The final dividend of 10 per cent. recommended to you to-day on this new capital is equivalent to the 14 per cent. distribution of the previous year.

SUBSIDIARY COMPANIES' RESULTS

The consolidated accounts presented to you include satisfactory profits earned by your two subsidiaries, La Thermostatique S.A. in France and Contactor (Pty.), Limited, in South Africa. The accounts of the latter company are included for the first time and cover a period of nine months prior to the balance sheet date, majority interest having been acquired from January 1, 1949. The item of goodwill in these consolidated accounts represents shares of Contactor (Pty.), Limited, allotted to the parent company as consideration for the grant of exclusive selling rights in Africa, this allotment being prior to Contactor becoming a subsidiary.

The new developments of "Satchwell" Controls mentioned a year ago have enabled your company to strengthen its position in the central heating field both at home and abroad, and gradually increasing demand since that time has resulted in a substantial addition to the company's output during the current year.

Export markets continue to receive very active attention from your board, and I am pleased to report a record figure of orders from overseas during the period. Devaluation has considerably assisted your company in entering new markets and consolidating its position in existing ones in face of American competition, and the value of export orders received continues at a similar high level during the current year. Such export business is, however, still extremely competitive in character, and the stability of price called for in respect of long-term contracts necessitates continual modernisation of plant and methods to combat rising costs.

NEW DESIGNS

Further new designs of "Satchwell" Controls for the domestic electric heating field will shortly reach the production stage and will extend the potential market for your company's products. The increased demand referred to earlier, coupled with the greater diversity of the company's range of temperature control devices, has resulted in our works being once more in full production; further increase of demand would require extensions of buildings and plant, and your board has plans ready for execution as and when the need arises. It must, however, be borne in mind that owing to steadily rising costs a greater turnover does not necessarily mean a proportional increase of profits.

The report was adopted.

GENERAL REFRACTORIES, LIMITED

RECORD TURNOVER

The fiftieth annual general meeting of General Refractories, Limited, was held on April 25th at Sheffield, Sir Ronald W. Matthews, D.L., J.P. (chairman of the company), presiding.

The following is an extract from his circulated statement:

In recent years I have given prominence to the policy your board was pursuing in modernising and developing the works, quarries, etc., of the group, and you will notice that during the year under review we incurred capital expenditure of no less a sum than £216,408 and that at the end of the year had outstanding further commitments on capital account amounting to £178,000, which we hope will be completed during 1950.

The turnover for 1949, both for the home and export markets, has established new records in the history of the company. Despite the fact, however, that we had a record turnover, the trading surplus of the group amounting to £465,251, is slightly lower than that for the preceding year. So far as the U.K. group was concerned we had a very substantial increase in turnover as compared with the previous year but the benefits which should have accrued from this increase in production were offset by the effect of devaluation on the cost of raw materials purchased from abroad, the further rise in fuel prices and the heavy increase in cost of repairs and replacements of a revenue nature.

With regard to your foreign subsidiary in Belgium, trading conditions in that country unfortunately became very difficult during the last six months of the year under review. Many factors were responsible for the change in the economic conditions in Belgium. The most serious in so far as your subsidiary's immediate prospects are concerned is German competition. This is a development which must give everyone connected with industry in this country serious food for thought

WORKING CONDITIONS

Your board have always considered as a first priority the improvement of the working conditions and social amenities of the employees, realising that better conditions improve the earning capacity of the employee and the quality of his work. There is unhappily even now, with the end of Marshall aid in sight, and with Germany and Japan rapidly improving their industrial effectiveness, a tragic unawareness in many quarters of the dangers which threaten our economic stability. Today the grim truth must be faced that everyone must work to the utmost of his skill and strength if he is to keep even such advantages as he enjoys today.

The group surplus for the year, after providing for interest, depreciation and taxation, amounts to £159,964. The balance of £117,728 represents the group surplus dealt with in the accounts of the parent company. There has to be added to this sum the amount brought forward, £81,175, aggregating £198,903. From this has to be deducted the transfer to general reserve £70,000, leaving available £128,903, out of which your directors recommend the payment of a dividend of 12½ per cent., leaving a balance to be carried forward of £84,216 as compared with £81,175 brought in. You will, I am sure, agree that the financial position of the company is very sound, the liquid surplus being £386,128. So far as the future is concerned, I can only say that at the present time the order position of the U.K. group on home and export account is favourable.

The report was adopted.

THE EMPLOYERS' ASSURANCE

RECORD UNDERWRITING PROFIT

The sixty-ninth ordinary general meeting of The Employers' Liability Assurance Corporation, Limited, will be held on May 17th in London.

The following is an extract from the statement by the chairman, The Right Hon. Lord Courtauld-Thomson, K.B.E., C.B., circulated with the report and accounts for the year to December 31, 1949:—

Before dealing specifically with the results of 1949 I wish to refer to our treatment of business in foreign currencies. As you know, the revaluation of sterling took place on September 19th but we considered it best to continue to use throughout the year 1949 the exchange rates ruling prior to that revaluation for the conversion of all foreign currency items. All foreign currency items, other than our fixed assets, have been revalued in the balance sheet at the rates of exchange ruling at that date.

To summarise the results of the year, the combined premiums of our group were £15,099,883, a decrease of £336,714 from those of 1948. The Corporation's results for 1949 are notable in that the underwriting profit of £1,014,956, representing 7.8 per cent. of the premiums, is the largest in its history. It is particularly satisfactory that not only does this underwriting profit constitute a record but that all the main fields in which we operate throughout the world have contributed to this result.

Our total trading profit was £1,212,769. We have provided for United Kingdom taxation no less than £754,604. The net profit was, therefore, £458,165. We have appropriated £250,000 to general reserve raising it to £3,000,000 The carry forward will be raised by £60,028 on the year to £564,549.

DEPARTMENTAL FIGURES

Our fire premiums again expanded by nearly 12 per cent. and we realised a profit ratio of 7.1 per cent. The premiums in our accident and general account were £11,847,360. In the United States, where we wrote just over £3,000,000 of workmen's compensation business, the results were again profitable. Our motor premiums throughout the world in 1949 were £4,791,035 compared with £4,549,825 in 1948. The results at home were unsatisfactory, for conditions remained difficult and unprofitable. In the United States our motor premiums increased slightly. Last year I anticipated better results in 1949, and this turned out to be the case.

The total of our premiums in other classes of casualty business—liability, accident, burglary, plate glass, fidelity and surety—was £3,725,515 compared with £3,771,921 in 1948. These classes continued to provide a good proportion of our total profit.

The Clerical, Medical and General Life Assurance Society has again had a good year, its new business, at £4,456,658, being only a little short of the record figures of 1948.

The results of our marine subsidiary, The Merchants' Marine Insurance Company, Limited, continued to be satisfactory. The net marine premiums amounted to £558,581 and the marine fund, at the end of the year, amounted to £824,588 or 147.6 per cent. of the premium income.

Our total investments at £24,035,444 taken at market values show appreciation over book values.

Here at home the economic picture is already well known to you, but the problems of business are of other kinds. We must hope that all branches of British insurance may be enabled to progress without disturbing influences from outside.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY LIMITED

LIFE ASSURANCE AND SAVINGS

Income - - £14,700,000
Total Assets - £87,600,000

The eighty-ninth annual general meeting of this Society was held on April 25th in London.

Mr J. K. Wiseman, F.C.I.I., chairman and joint managing director, who presided, in the course of his speech, said:

Life assurance offices continue to play a most important part in the country's struggle for economic stability, and have proved to be a very powerful medium for the sustaining of saving by the mass of the people.

In my speech at this time last year I referred to the plan for nationalisation which had then been suggested. This plan met with such opposition from policyholders, employees and other interested parties, that the planners thought it expedient to make changes in the form of their proposals which it was hoped would make them more palatable.

The results of these second thoughts were embodied in a pamphlet published by the Labour Party in January, 1950, under the title of "The Future of Industrial Assurance."

The fundamental idea of the proposals is that there would be a state board whose functions would cover the whole of the business conducted by the industrial assurance companies, whether mutual or proprietary, and the collecting friendly societies.

In their essentials, these proposals do not differ from nationalisation.

The British insurance industry as a whole has been united in the desire to see this important factor in the economic life of the country removed from the realm of political interference and exploitation.

The directors have thought it prudent to strengthen the financial position of the Society by making further transfers to the investment reserves.

EXPANSION OF INCOME

Turning now to our accounts, the total income for the year amounted to £14,717,000, an increase of £578,000 over the previous year.

In the industrial branch the premuim income for the year amounted to £8,214,000, an increase of £216,000 over the previous year.

The amount added to the industrial branch funds during the year was £3,544,000, which includes £2,177,000 interest on investments. This addition is money put aside as a provision for future payments to policyholders. Adding this item to the actual disbursements to policyholders during the year the total is £7,512,000.

ENDOWMENT ASSURANCES

I am happy to be able to say that the endowment assurance business in the society's industrial branch has been well maintained, and I would like to draw attention once again to the advantages attaching to a monthly endowment assurance policy in the industrial branch. The benefits allowed under the Society's industrial branch monthly policies are most generous, and, in addition, these policies participate in the Society's periodical bonus distributions in this branch.

In this branch the sum of £583,245 has been transferred to the investment reserve, bringing it up to a total of £2,500,000.

The premiums received on the fire and accident and general insurance business amounted to £441,000, an increase of £34,000 over the previous year.

The balance sheet shows that the assets total £87,653,000, an increase of £5,063,000 over the previous year.

The report and accounts were unanimously adopted.

DERBYSHIRE STONE, LIMITED

HEAVY CAPITAL EXPENDITURE PROGRAMME

The fourteenth ordinary general meeting of Derbyshire Stone, Limited, was held on April 26th at 58, Victoria Street, London.

Mr John Hadfield, M.Sc., A.R.I.C. (the chairman and managing director), presided, and in the course of his speech, circulated with the report and accounts, stated:—

The trading profit and other income of Derbyshire Stone, Limited, and its subsidiaries was £252,250. After all charges there remains a net profit of £107,071, the comparable figure for 1948 being £69,675.

Your directors are not unmindful of the fact that the profits of the year, after all prior charges, would justify a substantially higher dividend on the ordinary stock than that recommended. The decision to recommend a payment of 12½ per cent. only has not been arrived at lightly and the determining factor is that your directors consider it to be in the national interest to follow this policy at this juncture.

I told the members last year that the directors had budgeted for capital expenditure of £240,000 in 1949. Due to difficulties and delays in securing plant, only £166,525 was spent. Your directors propose to pursue vigorously in 1950 their policy of plant reconstruction and additions and it is anticipated that over £200,000 will be spent during the current year

POLICY OF MODERNISATION AND EXPANSION

The works of Cotswold Lime and Limestone, Limited, Gloucestershire, which company we acquired in 1948, are being considerably enlarged and new units will come into operation during the latter half of 1950. The Louth unit, which is not yet in production, will be producing ground chalk and whiting this year. The large new works at our Caldon Low limestone quarry in Staffordshire will be in operation in 1951. Your directors are confident that the policy of modernisation and expansion which has cost and is costing so much money will be fully justified.

A balanced series of products is now being manufactured with the various minerals which we quarry or mine at the centre and on the periphery secondary and tertiary products entering into numerous phases of the life of the nation. Vertical expansion has marched steadily with horizontal expansion. Nevertheless, the facilities for the production of what was once the principal output of the company, tarmacadam and bituminised macadam and special road construction materials, are being steadily increased, and it is hoped that we shall get a large share of the business available during the next few years.

One interesting development of the year 1949 is related to the possibility of your company becoming interested in the large-scale working of lead deposits in Derbyshire. Recently the area available to the company has been extended to a degree which will make it worthwhile to carry out extensive investigations as to the quantities of lead ore which may lie within this area. Johannesburg Consolidated Investment Company, Limited, in association with Derbyshire Stone, Limited, proposes to carry out immediately an examination probably aided by geo-physical methods and boring. If the evidence is such as to indicate that lead ore in satisfactory quantities lies within the area, a company will be formed in which both parties will be substantially interested.

Prospects for the year 1950 appear to be reasonably good. The department which does cause your directors some concern is that which deals with the production of materials for road construction, for it is probable that the cuts in Government road grants may have some effect and possibly the demand for coated macadam in 1950 may be affected. In spite of this, however, your directors consider that the general balance of our range of products should ensure a profit which will not compare unfavourably with that of 1949.

The report was adopted.

ENGLISH ASSOCIATION OF AMERICAN BOND AND SHARE HOLDERS, LIMITED

MR J. F. A. SWANSTON'S SPEECH

The sixty-fifth annual general meeting of the English Association of American Bond and Share Holders, Limited, was held on April 20th at 5, Great Winchester Street, London, E.C., Mr J. F. A. Swanston, the chairman, presiding.

The secretary (Mr G. Cooper) having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen, unless any shareholder signifies to the contrary, I will assume it to be the wish of the meeting that the annual report be taken as read.

You will have gathered from a perusal of the figures in our annual report that the Association has more than maintained its sphere of usefulness in the service of holders of dollar investments, and in this connection may I, once again, draw your attention to the certificates we issue against dollar share certificates, which are designated "Special" Certificates? They are countersigned by the Westminster Bank Limited as custodians of the original dollar certificates and are issued in any name desired. Holders of "Special" Certificates are relieved of any anxiety in regard to dividends or rights and are entitled to any information derivable from our records, which are constantly revised, without charge. The secretary will gladly forward an explanatory leaflet to any applicant.

Although there has been some slight relaxation in the restrictions governing British investment in dollar stocks, the opportunities of making such investments are still very limited, and it does not appear that any amelioration of this situation is to be looked for in the immediate future.

This being the position, it would be a mere waste of your time for me to enter into a detailed review of dollar investment possibilities. Our association is, however, playing a useful part in serving the interests of holders of dollar stocks, and in this connection we have paid our tribute, in the annual report, to the valuable contribution made by our officers and staff. It only remains for me to proceed to the formal business.

I now beg to move: "That the report and statement of accounts for the year ended December 31, 1949, be received and adopted, and that a final dividend of 8 per cent., namely 16s. per share, be distributed, making, with the interim dividend of 8s. per share already distributed, 12 per cent., less income tax, on the paid-up capital of the company."

Mr Hubert Smithers, O.B.E., seconded the resolution, and it was carried unanimously.

Mr Leslie W. Farrow, C.B.E., proposed the re-election of Mr J. F. A. Swanston, the director retiring by rotation, and in doing so said that Mr Swanston had been chairman of the company for a very considerable period and it had prospered under his leadership.

Mr Charles D. Brassey (managing director) seconded the resolution, and it was carried unanimously.

On the proposition of the chairman, seconded by Mr Smithers, the Rt. Hon. Lord Ritchie of Dundee, who had been appointed to the board during the year, was also re-elected.

A cordial vote of thanks was passed to the chairman, which he suitably acknowledged.

The proceedings then terminated.

RAPHAEL TUCK AND SONS, LIMITED

INCREASED TURNOVER

The forty-eighth annual ordinary general meeting of Raphael Tuck and Sons, Limited, was held on April 24th in London, Mr Desmond Tuck (chairman and managing director) presiding.

The following is an extract from his circulated statement:

You have only to refer back, so far as our company is concerned, to remarks I have made at previous meetings to find that I pointed to the existence then of conditions which were impeding the freer flow of business and of further profit earning. In a country in which the individual finds himself or herself carrying the continued burden of a degree of taxation far in excess of any other country in the world some of those conditions which still exist are inclined to react to the detriment of business with an increased potency and effectiveness.

100 PER CENT. PURCHASE TAX

With a few minor exceptions the rate of purchase tax on our chief items of production, i.e., greeting cards, has been 100 per cent. This rate applies equally to calendars, picture postcards, and many other pictorial reproductions other than books.

We, of course, do not pay this tax—we only advance it in respect of merchandise we deliver to the retail distributor. The charge is passed on to him and he in turn passes it on to the public, the ultimate consumer. But the distributor assumes liability for payment of the tax the moment the merchandise is invoiced and delivered to him, before he sells it. Can you wonder that with the knowledge that his customers are mostly in the same boat, he has shown an increased hesitancy in ordering supplies beyond his more immediate estimated requirements?

Normally, increases in wages both in manufacturing, warehouse handling, etc., and increased costs of overheads, should find themselves reflected in the prices to the trade and the ultimate consumer of the finished articles. But unfortunately it does not stop at this. The imposition of 100 per cent. purchase tax automatically has the result of doubling these increased costs, with their subsequent effect on the selling price of the finished articles.

THE ALTERNATIVES

We were faced with two alternatives. Should we pass everything on, thereby taking a chance by exceeding what we considered were the ceiling prices the public would be willing to pay, or should we carry part of the burden ourselves? We chose the latter alternative, thereby suffering a reduction in our gross profit. But for the 100 per cent. purchase tax such a situation would never have arisen.

It is perhaps fortunate in a way that this delay in publishing our 1949 accounts has occurred, because I am now in a position to inform you that things should be better. Our turnover is up, thanks partly to merchandise not subject to the heavy incubus of purchase tax which has occupied so much of my remarks.

As to the future, beyond that I am encouraged to think that considerable benefit should accrue to us as a result of favourable business arrangements I was able to conclude in the United States, thanks to the renown and high esteem in which the name of Raphael Tuck and Sons, Limited, continues to be held, I have returned from across the Atlantic more than satisfied at the prospects that lie before us.

The report was adopted.

G. HOPKINS AND SONS, LIMITED

(Brewing, Dairy, Electrical and General Engineers)

WORKS IN FULL PRODUCTION

Mr A. H. JOHNSON'S STATEMENT

The fourteenth annual general meeting of this company was held on April 21st in London, Mr A. H. Johnson, O.B.E., the chairman, presiding.

The following is an extract from the chairman's circulated statement:—

We have been able to speed up the completion of work in hand by constant attention to the best utilisation of the greater floor space at our disposal and by bringing our subsidiary companies into fuller employment on assembly work for your company; this has made it possible to reduce the outstanding balances of work in progress, stock and debtors by more than £100,000, which enabled the company to close the financial year with a credit balance at the bank.

At the last annual general meeting I referred to proposals to raise further capital. Since that time a certain amount of capital expenditure has been planned and some plant has already been ordered. The whole question of new developments, new equipment and modernisation of existing plant and premises is under discussion by your directors at the present time. The company's capital requirements will be reviewed by the board when decisions as to the measure of the expenditures involved have been settled.

It has been found possible, and indeed, helpful to our own production to provide work for our subsidiary companies, which made profits in 1949. These profits have been carried forward in the subsidiary companies' accounts to reduce the debit balances of past losses, which now stand at £10,814. It is hoped to place the subsidiaries on to a profitable basis of activity as a permanent feature of the group position, and your directors have this matter very much in mind.

DIVIDEND 17½ PER CENT

Turning now to the accounts and directors' report, as against £49,806 in 1948, we have a net trading profit in the parent company of £51,646, the balance of £34,377 brought forward from 1948 has been increased by £6,766 excess taxation provision no longer required, and from this a deduction of £1,375 has been made to write back to cost the balance-sheet value of our investment in subsidiary company. After deducting £28,843 to provide fully for all taxation on the profits of the year, and £6,576 for the Preference and interim Ordinary dividend, there remains a balance of £55,995. Your Board recommends the payment of a final dividend of 11½ per cent. on the Ordinary share capital, making a total distribution for the year of 17½ per cent. The balance to be carried forward on profit and loss account, after providing for all charges, and for the sum of £10,000 which your directors propose to place to a reserve for employees' retirement payments, is the amount of £39,083.

I can say that the work already on the company's order book, together with that which may reasonably be expected to mature during the months ahead, should be sufficient to keep our works in full production for the present financial year.

In conclusion, I should like to express on your behalf and that of my co-directors and myself, appreciation and thanks to the employees of the company and its subsidiaries for their co-operation and effort during the year. I have every reason to believe that the present year will mark another successful trading year for this company.

HADFIELDS LIMITED

OUTPUT MAINTAINED

LORD DUDLEY GORDON'S SPEECH

The sixty-second annual general meeting of Hadfields Limited was held at Sheffield on April 27th.

Lord Dudley G. Gordon, D.S.O., M.I.Mech.E., the chairman, in the course of his speech, said: The accounts cover the first 12 months' period since September 30th was adopted as the closing date. The group profit for the year includes that for ordnance work carried out in previous years. Ordnance work in future will show a sharp decline.

The total of capital and revenue reserves added to the credit figure in the consolidated profit and loss account, gives a total of £5,250,000. The research department has made important advances during the year. The scheme for its reorganising and rehousing is nearly completed.

In commercial work, output was maintained and there is no falling off in inquiries for both home and export work A satisfactory number of orders were executed for the company's main specialities such as dredger buckets, fully hardened forged steel rolls and crushing machinery, as well as the supply of special steels in the form of castings and forgings.

The important subsidiary, Millspaugh Limited, has made excellent progress and now has on hand several orders for complete paper-making machines, in addition to all the other equipment required for the paper-making industry.

RECONSTRUCTION PROGRESS

The large scale plans for reconstruction and reorganisation of the whole of the works progressed satisfactorily. The new light forge is now at work. Preparation for the new heavy forge is proceeding according to programme and in the foundry the first portions of the new melting plant are already in position. Two-thirds of the programme for deferred repairs was completed at the end of January, 1950, and has absorbed a large amount of material, including more than eight acres of glass and over three miles of guttering.

In spite of the fact that the Iron and Steel Act now has full legal force though its operation is postponed, this has not resulted in any slackening either in production or reorganisation. The application to remove from the Third Schedule of the Act the greater part of the group leaving only Hadfields Steels, was rejected. A new application to exclude Millspaugh Limited and other subsidiaries has been agreed to in principle. A detailed scheme will be submitted for approval in the near future.

There is every reason to continue opposition to the proposal to nationalise certain firms in the steel industry. No possible benefit could result and there is every indication from the experience of industries already nationalised that great harm would be done.

MANAGING DIRECTOR'S REMARKS

Mr J. B. Thomas, F.C.A. (deputy chairman and managing director), said:—

Despite the disturbance created by the reorganisation of the works, production increased appreciably during the year, the total value showing an increase of 15 per cent. over the previous twelve months, the main reasons being due to (a) increased costs and (b) an average of 151 additional manual employees.

A claim has been made that wages shall be increased by £1 a week, and that such cost should come out of profits. *Such a claim, if successful, would cost this company at least £300,000 per annum.* On last year's trading this would more than absorb the gross profit before taxation from all our companies and the country would suffer a loss of £115,000 in taxation income. The stockholder (without whose money there would have been no buildings and plant to enable the worker to earn an average of £358 per year) would receive no return on his capital.

If we are to emerge successfully from our present situation and be able to exist without the generous charity of the U.S.A., our outlook on life and what we are entitled to must undergo a complete revision. Nearly all democratic countries seem to be expecting the U.S.A. to carry them through their troubles. It is time all started to help themselves instead of depending upon others. Soon it will be too late.

The report and accounts were adopted.

CONWAY STEWART AND COMPANY, LIMITED

FURTHER SUBSTANTIAL PROGRESS

MR S. W. JARVIS'S SPEECH

The fifteenth annual general meeting of Conway Stewart and Company, Limited, was held on April 27th at the registered office, 75, Shoe Lane, London, E.C.

Mr S. W. Jarvis, chairman and managing director, said: Gentlemen,—The accounts and directors' report for the year ended December 31, 1949, have been in your possession for some little time, and with your permission I will take them as read (Agreed.)

Your directors are pleased to announce further substantial progress for the past year. The net profit for the year, after making full reservation for taxation, was £25,471, which compared with £21,886 for 1948.

SATISFACTORY RESULTS

Considering the mounting difficulties we have had to face in the way of increased competition and further import restrictions in many countries, and the stifling taxation which must have a severe dampening effect on the expansion of any industry, I think you will agree that the results for the year's trading are very satisfactory.

During the past year our sales again beat all records, both at home and abroad, and there are now signs of freer trading conditions in some countries where business has been closed to us for some time past, which I feel augurs well for this year. 1950 has opened out quite well, and there is every indication that we are more than holding our own in this very competitive period. With signs of restriction in buying, the excellent quality and value we offer the public are fully appreciated.

TRIBUTE TO STAFF

Our staff have continued to give us excellent and loyal support, and on your behalf I should like to thank them for their service to the company.

Before closing, I regret to say that in last October we lost one of our younger directors, Mr K. C. Jarvis, who was killed in a motor accident, and whose loss we all feel very deeply.

The report and accounts were unanimously adopted and a final dividend of 20 per cent. (making 30 per cent. for the year) was approved.

The retiring director, Mr R. H. Garner, was re-elected, and the remuneration of the auditors, Messrs Chalmers Wade and Co., having been fixed, the proceedings terminated.

WANKIE COLLIERY COMPANY, LIMITED

INCREASE OF CAPITAL APPROVED

An extraordinary general meeting of the Wankie Colliery Company, Limited, was held on April 26th in London.

Sir John R. Chancellor, G.C.M.G., G.C.V.O., G.B.E., D.S.O. (chairman and joint managing director), in the course of his speech, said: This meeting has been called to consider the following resolutions:—(1) For the conversion of the stock of the company into shares of 10s. each, (2) for increasing the capital of the company from £1,700,000 to £3,400,000 by the creation of 3,400,000 new shares of 10s. each, and (3) for altering the articles of association to provide that the maximum number of directors shall be nine.

It is the intention of your board, if this resolution is approved, to dispense with distinctive numbers on shares and to make an application to the Stock Exchange for permission to deal in unnumbered shares.

The capital expenditure envisaged in connection with the extensions required to put the collieries in a position to meet the expected increased demands for coal over the next few years is estimated at approximately £2,000,000.

TERMS OF ISSUE

In order to finance those extensions it is proposed to increase the capital of the company from £1,700,000 to £3,400,000 by the creation of 3,400,000 new shares of 10s. each. If the resolutions are passed, your board propose to proceed immediately with the issue of 3,293,750 new shares.

Of these 3,293,750 new shares, 800,000 shares will be issued to Powell Duffryn, Limited, at the price of 12s. 6d. per share, payable in full on application, and the balance of 2,493,750 will be offered at the price of 12s. 6d. per share, payable in full on application, to the holders of stock on the register at the close of business on April 4, 1950, on the basis of three new shares of 10s. each for every four 10s. stock units held on that date, fractions of a new share being disregarded. Members will also be given the opportunity of applying for any of the 2,493,750 shares not taken up under the letter of rights.

Letters of rights and forms of application for excess shares will be posted on April 27, 1950. The issue of the 2,493,750 shares has been underwritten by Erlangers, Limited.

The outputs of coal and coke from September 1, 1949, to March 31st last amount to 1,091,414 tons and 60,228 tons respectively, showing increases of 104,975 tons of coal and 11,334 tons of coke when compared with the outputs for the same period of the previous financial year.

Your board has declared an interim dividend of 3¾ per cent. in respect of the operations of the first six months of the current financial year.

AGREEMENT WITH POWELL DUFFRYN

Your board are pleased to report that an agreement has been entered into with Powell Duffryn, Limited, under which they have been appointed managers to the company for a minimum period of ten years from May 1, 1950.

In view of the considerable investment which Powell Duffryn, Limited, are making in the company, it is proposed, subject to the resolution before you being passed, to invite two nominees of that company to join the board. The special resolution increasing the maximum number of directors from six to nine provides for this.

The resolutions were carried.

THE MERCHANTS' MARINE INSURANCE COMPANY, LIMITED

SATISFACTORY RESULTS

The seventy-ninth ordinary general meeting of The Merchants' Marine Insurance Company, Limited, will be held in London on May 17.

The following is an extract from the statement by the chairman, The Rt. Hon. Lord Courtauld-Thomson, K.B.E., C.B., circulated with the report and accounts for the year 1949:—

Our marine premium in 1949 amounted to £558,581 and the marine fund now stands at £824,588 or 147.6 per cent. of the premium income. The fire and accident and general accounts again yield excellent results, with an increase of £15,673 to £123,700 in the combined premium income, and the profit of £18,610 is transferred to the profit and loss account. These underwriting profits, added to the interest on our investments, make our profit for the year £46,077. After providing £16,430 for United Kingdom taxation we have a net profit of £29,647.

A new factor which must seriously affect future hull settlements is that resulting from the devaluation of the pound sterli Concerning cargo business, whereas for ma years we have secured a reasonable mar of profit on this section of our underwriti it seems doubtful whether future operatic will prove equally satisfactory. I am glad report continued progress in the developme of our overseas business.

BIRMINGHAM RAILWAY CARRIAGE AND WAGON COMPANY, LIMITED

SATISFACTORY RESULTS

The ninety-sixth annual ordinary gene meeting of the Birmingham Railway Carria and Wagon Company, Limited, was he on April 25th at Birmingham, Sir Berna D. F. Docker, K.B.E., J.P. (the chairmar presiding.

The following is an extract from the chai man's circulated statement:—

The results for the year 1949 show an in provement over any post-war year, but would remind you that in our industry, whe the length of time from the booking of a order until the completion of the work ma be considerable the profits of the year usuall reflect the result of work commenced one even two years earlier. I consider that onl in 1949 have we returned to what can b regarded as normal results from the employ ment of our works at their full capacity.

The improvement in output was a ver satisfactory one but, contrary to the indica tions in my report of last year, the proportio for export was not increased. This was du to the unexpected cancellation of substantia orders for wagons by the Argentine Govern ment and was occasioned by that country' shortage of sterling necessitating a drasti curtailment of the programme of expenditur upon capital goods.

As provision had been made for thes wagons in our 1949 production plans, th cancellation necessitated an adjustment in ou programme, and I consider the increased out put all the more creditable.

Keen foreign competition is being ex perienced and is likely to continue from th Continent, Canada, the U.S.A. and fron Japan, and I have drawn the Board of Trade's attention to Japanese competition in particular, as it is evident that the low standard of living in that country makes it impossible to compete in price, and unless the Government handles firmly the question of America's direction of Japanese industry, many markets which are traditionally British will be closed to this country solely on the question of price.

The report and accounts were adopted.

NOTICES

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with Limited Liability.)—CANADIAN PACIFIC RAILWAY PERPETUAL 4 PER CENT CONSOLIDATED DEBENTURE STOCK. —NEW BRUNSWICK RAILWAY 4 PER CENT DEBENTURE STOCK.—CALGARY AND EDMONTON RAILWAY 4 PER CENT DEBENTURE STOCK.—ATLANTIC AND NORTH-WEST RAILWAY 4 PER CENT FIRST MORTGAGE REDEEMABLE DEBENTURE STOCK.—In preparation for the payment of the half-yearly interest due July 1, 1950, on the above Stocks, the Transfer Books will be closed on May 19th and will be reopened on July 3, 1950.—R. F. TREMAYNE, Deputy Secretary, 8 Waterloo Place, Pall Mall, London, S.W.1. April 21, 1950.

APPOINTMENT as Export Executive required by Honours Graduate, aged 34, now in charge of the Continental subsidiary of a major British manufacturing company. The advertiser has specialised in the organisation of efficient selling arrangements in overseas markets, including Latin America, U.S.A., Europe and others, where he has acquired an extensive experience of modern sales promotion methods and their application to the export trade. PRIVATE SECRETARY (male) required for General Manager of important mining interests in Bolivia. Applicants should be of first-class character, possessing sound general knowledge, and expert in Shorthand and Typing in both English and Spanish. Age between 30 and 45 years. Salary £100 per month with free housing, etc.—Applications in writing, giving fullest particulars, to Box 3434, c/o Charles Barker and Sons Limited, 31, Budge Row, London, E.C.2.

Investment Statistics

Company Notes

Vickers.—Consolidated net profit amounted to £3,290,724 in 1949 compared with £3,373,948 (of which £600,000 less tax was of an exceptional nature) in 1948. These figures are struck after the provision of £4,548,602 against £3,090,092 for taxation and after deducting £589,257 (£428,154) for minority interests. Some £578,531 of net profit in 1949 represents part of undistributed profit of English Steel Corporation which may not be available for distribution if the Steel Act is implemented. The dividend of 6¼ per cent for the year absorbs £287,874 net (same as the 12½ per cent paid on capital before bonus issue for 1948).

Vulcan Foundry.—Consolidated trading profit increased from £294,669 to £399,398 in 1949; net profit rose from £89,117 to £138,550. The dividend of 5 per cent plus 1½ per cent bonus is repeated. Work in progress at the year-end less provisions and payments on account amounted to £1,623,864 (£1,688,392).

Anchor Line.—Net profit for the 15 months to December 31, 1949, was £298,664 (£319,324 for 9 months to September 30, 1948); no dividend is recommended on the ordinary stock (12½ per cent); £250,000 (£100,000) is placed to general reserve.

Austin Reed.—Net profit for the year to February 20, 1950, amounted to £242,423 (£183,767) after taxation of £138,550 (£104,182). The dividend for the year is 7½ per cent on the enlarged capital.

Stewarts and Lloyds.—Consolidated profit in 1949 rose from £5,315,738 to £7,803,994 and net profit from £3,017,071 to £4,377,844 after £3,426,150 (£2,298,667) U.K. taxation. The dividend of 12½ per cent for the year on the deferred stock is repeated.

Spillers.—Group net profit struck after UK taxation £804,000 (£766,000) and depreciation and obsolescence £515,000 (£452,000) increased from £565,000 to £599,000 in the year to January 31, 1950.

Guest Keen Baldwins.—The balance transferred from consolidated profit and loss for 1949 amounted to £801,811 against £627,703 after charging £223,700 (£193,650) profits tax and £659,586 (£644,932) income tax. A surplus provision of £300,000 for taxation arises mainly from the sale of assets to the Steel Company of Wales. The dividend for the year is 10 per cent (same).

United Molasses.—Consolidated profit rose from £1,861,830 to £2,238,633 in 1949. Net profit of the group was £786,426 (£831,725) and sum attributable to holding company £714,366 (£748,448). Depreciation took £799,975 (£422,383) and taxation £652,232 (£607,722). The year's dividend is 27½ per cent plus 2½ per cent tax-free capital distribution (same).

De Havilland Aircraft.—Group trading profit in the year to September 30, 1949, amounted to £1,274,631 (£1,135,382); net profit including £23,080 provisions written back was £346,367 (£290,983). The dividend of 10 per cent is repeated. Net current assets increased from £3,568,743 to £3,861,051; stocks rose from £7,597,659 to £8,663,253; the bank overdraft at the year-end was £234,337 (£489,029) against which cash totalling £525,309 (£119,278) was held.

Elder Dempster Lines Holdings.—Group trading profit rose from £3,071,152 to £3,141,197 and net profit was reduced from £1,674,818 to £1,470,900 in 1949. The dividend of 12½ per cent is unchanged. Net current assets at the year-end were £6,325,021 (£4,668,357). Consolidated book value of the fleet at December 31, 1949, is given at £6,452,440 (£6,438,318); liquid funds amounted to £8,844,278.

United Newspapers.—Consolidated profit rose from £547,189 to £614,417 and net profit from £154,164 to £185,086 in 1949. The dividend for the year is 20 per cent (15 per cent).

Fremlins.—Balance of trading account for year to January 31, 1950, was £364,040 (£377,761 for varying periods in 1948-49). The ordinary dividend for the year is 11 per cent.

Goodyear Tyre and Rubber.—Total profit for 1949 amounted to £1,773,904 (£1,832,154) and net profit £770,858 (£858,640). The dividend for the year is 46¼ per cent tax free paid as an interim. Stocks declined from £2,283,730 to £1,976,340 on the year.

Capital Issues

Morphy-Richards.—Application has been made to the C.I.C. to raise additional funds by way of issuing loan capital and 150,000 4s. ordinary shares.

Thornton-Varley.—A placing has been arranged of £300,000 4½ per cent redeemable debenture stock, 1961-71, and £187,800 of the £200,000 5½ per cent cumulative redeemable £1 preference shares. Application has been made for permission to deal in both classes of capital.

Wankie Colliery.—Stockholders registered on April 4th are to be offered 2,493,750 10s. ordinary shares at 12s. 6d. per share in the proportion of three new shares for every four 10s. stock units held. A further 800,000 shares are to be subscribed for by Powell Duffryn at the same price.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 't'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (n) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 14 years 1 month.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (h) Assumed dividend 18½% after capital bonus. (l) To latest redemption date. † Free of tax. (m) Final dividend on increased capital. Yield basis 35%. (n) Yield basis 26⅛% after capital bonus.

Statistical Summary

EXCHEQUER RETURNS

For the week ended April 22, 1950, total ordinary revenue was £48,596,000 against ordinary expenditure of £69,000,000 and issues to sinking funds £230,000. Thus, including sinking fund allocations of £464,000 the deficit accrued since April 1st is £46,000,000 compared with a surplus of £2,509,000 for the corresponding period a year ago.

CALLING ALL PHILATELISTS

Don't forget to visit the International Stamp Exhibition at Grosvenor House, London, which will be open from May 6th to 13th. A cordial invitation is extended to all serious philatelists to visit Stand No. 38, where H. R. HARMER, the International Stamp Auctioneers, will be glad to help all prospective buyers or vendors of fine and rare stamps at auction. A fine range of Collections and Properties will be available for sale by Private Treaty.
H. R. HARMER LTD., 39/42 New Bond Street, London, W.1.
Tel.: MAY. 0218. Cables: "Phistamsel, London."

THE Civil Service Commissioners invite applications for appointments as *Senior Scientific Officer* and *Scientific Officer* to be filled by competitive interview during 1950. Interviews began in January and will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1950, may eventually be announced. Successful candidates may be appointed immediately The posts are in various Government Departments and cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a university degree in a scientific subject (including engineering) or in Mathematics with first or second class honours, or an equivalent qualification, or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer posts taking their degrees in 1950 may be admitted to compete before the result of their degree examination is known.

Age Limits: For Senior Scientific Officers, at least 26 and under 31 on August 1, 1950; for Scientific Officers, at least 21 and under 28 (or under 31 for established civil servants of the Experimental Officer class) on August 1, 1950. *Salary Scales* for men in London: Senior Scientific Officers, £700 x £25—£900; Scientific Officers, £400 x £25—£650. Rates for women are somewhat lower.

Further particulars from the Secretary, Civil Service Commission (Scientific Branch), 7th Floor, Trinidad House, Old Burlington Street, London, W.1, quoting No. 2887.

WANTED to purchase Manufacturing Wholesale and Retail Grocery, Provision and Fruit and Vegetable Businesses. Must be good established running concerns. Price in accordance with Assets per Accounts. State turnover, and location, etc. Completely confidential.—Box 668, Robertson & Scott, Edinburgh, 2.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. (Econ.) Degree is a valuable qualification for [illegible] research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894) at moderate fees payable by instalments, if desired

Prospectus from Dept. P17, WOLSEY HALL, OXFORD

TRADING OR ESTABLISHING in CANADA or the WEST INDIES?

If you are trading with or contemplating establishing a plant in Canada or in the West Indies, we can be of help to you.

Through 330 branches across Canada and 23 in the West Indies, we can provide information on business conditions, exchange regulations, exports and the establishing of branch plants.

Your enquiries will receive prompt and courteous attention.

THE BANK OF NOVA SCOTIA
108 Old Broad Street, London, E.C.2.
Established in Canada in 1832 with limited liability.

OXFORD UNIVERSITY—NUFFIELD COLLEGE

NUFFIELD COLLEGE proposes to elect an Official Fellow, who will be required to devote himself to research in the Social Sciences, and invites applications, to be received not later than May 22nd. Applicants (men or women) should be under 35 years of age. Further particulars may be obtained from the College Secretary, Nuffield College, 19, Banbury Road, Oxford.

UNIVERSITY OF BIRMINGHAM
(Faculty of Commerce and Social Science)
LECTURESHIPS IN GOVERNMENT

The University of Birmingham proposes shortly to appoint Lecturers and Assistant Lecturers in Government. The duties of the posts will include : (a) the teaching of government (a qualification in economics and economic history is desirable since the successful candidates will be expected to help with the general scheme of tutorial supervision now instituted in the Faculty); and (b) the promotion of original work in the general field of government. Some experience in the direction of research by others and in the editing of manuscripts will be an advantage. The appointments will be in Grade II (£550-£1,100) or Grade III (£400-£500), according to the qualifications and experience of the candidates. The successful candidates will be required to enter upon their duties on October 1 1950.

Four copies of applications, together with testimonials and the names of three referees, should be sent by May 19th to the undersigned, from whom further particulars may be obtained.
The University, Birmingham, 3.
April, 1950.
C. G. BURTON,
Secretary.

UNIVERSITY OF NOTTINGHAM
SCHOOL OF AGRICULTURE

The Council invites applications for the following appointments in the Department of Agricultural Economics:—
(a) *Agricultural Economist*
Salary scale: Men £470 to £710, Women £400 to £620, plus cost of living bonus, Men £90, Women £72, per annum. Candidates must be graduates in Economics and/or Agriculture.
(b) *Assistant Agricultural Economist*
Salary scale for candidates with 1st or 2nd Class Honours and at least two years' postgraduate experience: Men £295 to £470, Women £230 to £400—plus cost of living bonus, Men £90, Women £72, per annum. Candidates should be graduates in Economics and/or Agriculture.
Form of application and conditions of appointment may be obtained from the undersigned.

H. PICKBOURNE, Registrar.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH
WILSON CHAIR OF INTERNATIONAL POLITICS

The College invites applications for the Wilson Chair of International Politics. The salary is in accordance with the professorial scale of the University of Wales and in addition a travelling allowance will be paid.
Further particulars can be obtained from the undersigned, to whom eight copies of applications should be sent by May 31, 1950.
T. MAELGWYN DAVIES, Registrar.

SURREY COUNTY COUNCIL—EDUCATION COMMITTEE
COUNTY TECHNICAL COLLEGE, WEYBRIDGE
DEPARTMENT OF COMMERCE

Applications are invited for the following post:—
(1) *Graduate in Economics and/or Commerce.*
The Lecturer appointed will be required to prepare students for London University and Professional Examinations. Ability to assist with subjects of Management Examinations will be a recommendation. Applicants should give full information regarding the subjects in which they are qualified.
Salary for this post will be in accordance with the Burnham Technical Report.
Application forms and further particulars may be obtained from the Registrar, to whom applications should be returned not later than 14 days after the appearance of this advertisement.

CAPITAL, £1,000 to £100,000 sought by Wholesale and Retail Food Distributors for Expansion Purposes and for additional Working Capital by old-established and thoroughly sound linked Scottish Concerns; Merchants, Banks, Trusts, and Individuals are particularly invited to apply. Terms commensurate with investment. Other Banks considered.—Box 667 Robertson & Scott, Edinburgh, 2.

LADY (25), B.Sc.(Econ.), fluent French, Spanish, German, seeks post in U.K. or abroad.—Box 405.

Spiders and the Fly

THE defenders of the British electoral system have always claimed as its great virtue that it produces strong governments—not always wise but at least capable of firmness. The truly alarming lesson of the general election of 1950 is its failure to repeat this pattern of the past; instead of producing a result which might chart the course of British politics for years to come, it merely showed that the two major parties have divided the nation into almost equal halves. The forebodings that greeted this result are now shown to be fully justified. The new Parliament has no intrinsic life of its own; it is proving to be merely a battle ground on which the parties manoeuvre for the best position for a fierce and prolonged struggle some time in the future.

This would be acceptable to the country if the mock war at Westminster seemed to bear some resemblance to the fight for economic and social progress on which Britain is supposedly engaged. But these issues are not yet very prominent in the party war cries. The Conservatives seem determined to harry the Government on every possible occasion, whether the issue be vital or merely contentious. The Labour party, for their part, are pressing on with plans for a new election programme. The vitality of the political scene is more apparent than real. It is a matter of arithmetic in the divisions, not new political ideas. Neither side is genuinely anxious to precipitate a fresh appeal to the electorate until it sees signs that the balance of public opinion has begun to swing in one direction or another. The Conservatives are able to display vigour in their attack because they know that on a major division in which all the reserves are mobilised the Government can just save itself from defeat. So far they have been able to command the credit for opposing the Government without the risk of reaping the consequences by having to form a Ministry themselves or of bearing the blame for another general election before Supply has been voted and before electors' minds have changed.

This situation cannot continue indefinitely. Sooner or later, the Government, impelled by exhaustion and exasperation or encouraged by some calculation of electoral advantage, will decide on a dissolution and a general election. The real danger is that an election might have to be held before there had been a shift in public opinion sufficiently large to produce a strong majority for either party. If this happened, either there would be a mere extension of the present political stalemate or—more likely—a coalition, with dire consequences upon the cohesion of the Labour party. The fear that haunts the party managers is that the present division of the electorate between Labour and Conservatives is unlikely to change in the foreseeable future. The strategists of the Labour party are aware that the allegiance of a high proportion of the middle class and agricultural votes, given to Labour in 1945 and withdrawn in 1950, is unlikely to return to them—the more so since Labour now finds it

politically essential to placate their most cherished supporters, the industrial wage earners. The Conservatives are uneasily conscious that the twelve and a half million votes, from 43.4 per cent. of the electorate, which they received in February, may represent the upper limit of their natural following. Unless they can find a way to broaden the basis of their support, they may never be able to score a decisive victory over Labour.

It is not, therefore, surprising that Lord Woolton and Mr Morrison should be wooing the Liberals at the same time. The two and a half million electors who voted Liberal in February represent a very tempting prize for either of the major parties. A net shift of 30 per cent of the Liberal vote to the Conservatives last February would have given them 17 extra seats or a small majority over Labour; an equivalent shift to Labour would have given Labour 31 extra seats or a substantial majority over the Conservatives. If Lord Woolton could detach even a third of the Liberal vote, he would have progressed a long way towards a rather insecure Tory majority; if Mr. Morrison could do so, the result would be a strong Labour Government.

*

The form of the two approaches, however, is somewhat different. The Conservatives use two different —and conflicting—methods of attack. On the one hand, they have been at pains to show that the Tory party has shaken off its authoritarian and protectionist past and is imbued with the spirit of modern liberalism. The other method is directed not at the Liberal voter, but at the leaders of the Liberal party. It takes the form of tempting offers of an electoral compact, whereby Liberal and Conservative candidates would not oppose each other in the constituencies. It cannot fail to raise in the minds of Liberal politicians images of an effective Liberal party in Parliament, thirty or fifty strong, and even the possibilities of office in a coalition government. Both these methods were used together in a speech made by Lord Woolton to the National Union of Conservative Associations last weekend. In it he suggested that since there was no longer any important point of principle which divided Conservatives and Liberals, they should form a common anti-Socialist front, leaving their points of difference, particularly on electoral reform, to be settled at leisure.

It is probable that the deficiencies of the Liberal Party, and the liberal tone in which much of the Conservative case is now presented, will continue to make many people of liberal persuasion vote Conservative. But it is much more doubtful if the guile of even Lord Woolton and Mr Churchill in combination will succeed in drawing the Liberal party into an electoral compact with the Conservatives. The Liberal party faces, it is true, a gloomy future as a political party, but it would be very unwise to sacrifice even these uncertain prospects unless the Conservatives were prepared to offer and guarantee the one concession—electoral reform—which would alone be adequate compensation for losing its independence. Without a binding promise that the Conservatives would take effective action—and not merely institute an inquiry—to reform the electoral system, the Liberal party would become the mere prisoners of the Tories, and would win no commensurate advantage. It is, presumably, because such a promise is not likely to be forthcoming that the Liberal Party has, this week, assured "Liberals in the country that it has no intention of compromising the independence of the Liberal Party."

The Labour party fights for the souls of Liberal voters with fewer weapons at its disposal, but its pertinacity is no less strong. It cannot offer to make an electoral compact with the Liberal Party since, as a majority party, it is less prepared than the Conservatives to consider electoral reform. It could not make any concessions to Liberals without rousing the deepest distrust and resentment among its own followers. All that Mr Morrison can do is to mute the voices of the party's more illiberal spokesmen, and patiently to make unprovocative speeches, as he did last week at High Wycombe, asserting that the Labour Party is the real heir to the Radical tradition and that it is a party which has the interests of all classes at heart.

*

It is impossible to predict the outcome of this contest for the Liberal vote. Undoubtedly the instinctive desire of the voter to produce a decisive result will lead many Liberals to vote Labour or Conservative at the next general election, even if the Liberal Party decides to risk putting up four or five hundred candidates. It is also possible that there may be an increasing number of alliances between Conservative and Liberal associations in the constituencies, despite the official disapproval of the Liberal Party. But if either Mr Morrison or Lord Woolton wish to win over a decisive number of Liberal voters, they should first reflect upon the kind of person they are trying to attract and the kind of policy which will attract him.

It is, of course, impossible to depict with any accuracy the classes or sections of the community that provide the majority of the Liberal votes. With a few exceptions in the industrial north, the majority of wage earners and their families do not vote Liberal; they either have a solid allegiance to Labour or they float between Labour and Tory. Broadly speaking, that section of the middle class which feels most bitterly about the redistribution of income since the war or has been most offended by the class-conscious remarks and tactics of Labour politicians votes Tory, not Liberal. The Liberal vote is largely garnered from those people—skilled wage earners, professional men and women of all kinds, and young graduates from the universities—who hope for bold and imaginative policies to meet Britain's economic and social problems. In this, they may flatter some parts of the Liberal programme, but their thinking finds no comfort in the stereotyped catch-phrases of "free enterprise" or "planning." The Liberal vote is drawn from those who are not convinced that the Conservative party is really the modern standard bearer of Liberalism, or that the Labour Party is an effective guardian of the Radical tradition; it sees in both of them the same failure to face the realities of today.

This may be a negative attitude, and it may be that many votes are cast for Liberal candidates more as a gesture of protest than in positive support for the policies of the Liberal party. But neither Mr Morrison nor Lord Woolton is likely to gain the support of the Liberal voter by speeches which are so concerned to be "moderate" that all meaning and content is drained out of them. It is not possible for them to appease their own supporters and to attract Liberals at the same time. In default of a great renascence of vitality and leadership within the Liberal party, the Liberal vote is likely to go to that major party which first shows itself genuinely prepared to tackle the major problems of the time—the excessive claims of the Government on the nation's income, the restraints exercised by industry, labour and government upon competition and incentive, the encroachments upon civil liberty and the threats to the liberal tradition of the British community. A party which recognised these tasks would do more than attract 2½ million Liberals; it would change the whole conformation of British politics.

Agenda for Sydney

IT is a truism that economic development can hardly succeed without a measure of military security and political peace. It is also true that in Asia today the prospects of pacification do not seem particularly bright. Yet there are two good reasons for removing the question of defence from the Sydney agenda. The first is that the strategy of the cold war will be thoroughly discussed when the three Foreign Ministers meet in London. Since the successful defence of Asia cannot be considered without the active participation of the United States, it is wiser to leave it to a conference at which the Americans are represented. In the second place, the wholehearted co-operation of the Asian Dominions will be difficult to secure if all the discussions at Sydney are pitched in terms of defending South-East Asia against Communism. Better results are likely if the emphasis is primarily economic.

A general outline of the conference's tasks already exists in the Spender Plan. The aim is to assess the broad economic needs of the area—with agricultural development as the first need—then to examine the resources of capital and in trained manpower to meet the needs, and then to match needs against means, calling upon local resources, upon the Commonwealth and finally upon the United States. But the conference should not devote its entire time to drawing up a "comprehensive plan." The analogy of the Marshall Plan is appealing, but in many ways misleading. The countries of western Europe presented a reasonably homogeneous problem; their difficulty in 1947 was primarily a shortage of foreign exchange, and the assessment of their dollar deficits was an effective method of completing an already comprehensive picture. In Asia, not merely dollars but almost everything is scarce, and different things are missing in different countries. There can hardly be a complete picture; the problem is to choose, from a great variety of desirable plans, the jobs that can be done quickly and effectively.

To make these choices involves an examination of existing plans and possibilities. But the field is not entirely uncharted. The statistics prepared by the United Nations' Economic Commission for Asia and the Far East (ECAFE) and by the Food and Agriculture Organisation are likely to be as reliable as any other estimates produced on the spot. The delegates at Sydney will have full statistics of output and trade for all the vital South-East Asian commodities, estimates of comparative productivity, particulars of shortages of all forms of capital equipment, drafts of possible investment programmes and development schemes and estimates of the resources which cannot be obtained locally. Plans already published show that the countries of South-East Asia—including India and Pakistan—seek to invest some $750 million in agricultural development in the next three years, most of it from local capital. Over a year ago, an ECAFE Working Party on industrial development produced a detailed report of the industrial plans already drawn up by the participating governments; these amounted to no less than $13 billion to be spread over the next five years.

Such figures may or may not be reliable but there are good reasons for not reduplicating the effort necessary to collect them. One is that many of the figures can only be notional in the circumstances prevailing in Asia. Another is that the intense nationalism of all Asian governments may be mollified by using the work done by international bodies upon which they are represented. To pass over the international agencies would be to pass over some of the most acceptable instruments for common planning.

*

The success of the Sydney Conference will not, in fact, depend upon the scrupulous exactness of its output of statistics but on the sense of momentum that it manages to create. For this reason, if for no other, the

vital task is to make a start—to select a limited number of key projects, to establish the machinery of co-operation and administration, to secure the financial assistance and get to work with all speed. There is no secret about the most serious economic obstacle to Asian recovery. It is lack of food. Before the war, Asia was a net exporter of food; now it is an importer on a massive scale. India's grain imports grew from 2,600,000 tons in 1947 to nearly 4,000,000 tons in 1949. In that year, it had to spend over £100 million of its foreign exchange reserves on food, £33 million in the dollar area. Japan has the same problem. Before the war, Japan imported over 4 billion lb. of milled rice. Since the end of the war, the United States, whose exports of rice have more than trebled, has largely financed and provided Japan's rice supplies. American subsidies are coming to an end and Japan is now turning to South-East Asia, where it will compete with India, Malaya, Hongkong and Indonesia for such small surpluses of rice that may be on offer. Only a very rapid expansion of grain production in South-East Asia can meet this demand in the absence of dollar grants.

Here is an immediate field for action. Little, unfortunately, can be done in Burma. Its exports of rice are at a third of the prewar level and their restoration would all but solve the difficulties of India and Japan. Yet political unrest in Burma makes it almost certain that rice exports will fall even lower this year. Similarly, Indo-China, which exported over 3 billion lb. of rice before the war, is not likely to exceed the figure of 433 million lb. reached in 1948. The emphasis should, it seems, be placed upon the expansion of rice growing in Siam and the improvement of productivity in India.

There are considerable opportunities in both countries. In Siam, for instance, the World Bank is considering the possibility of a loan to improve the transport and shipment of rice. The immediate need is to dredge the river Menam Chao Bhraya below Bangkok so that 10,000-ton ships can use the river fully laden, to extend wharves and dock equipment and to improve the Siamese railways. The acreage under rice could also be increased and better types of rice grown. In India, the very backwardness of agriculture offers considerable scope for advance. ECAFE has estimated that Japan devotes 108.6 kilograms of fertiliser to each hectare; in India the figure is 0.52 kilograms. This is only one instance in which a vigorous agricultural programme could bring about increased productivity.

A considered policy for raising Asian rice production in the next two years would in itself demand a complete strategy of economic aid. A Commonwealth administrative agency could be set up at once, its officials and experts engaged, its original financing undertaken; from the experience of a first venture of this kind far more would be gained than from scrupulous exercises in paper work. Further agricultural development, new industrial projects, investment in transport and shipping facilities could be undertaken later. From one task accomplished effectively, such an agency could judge far better than from doubtful statistics what are the real obstacles to economic and social progress in Asia.

Experience would probably show that two barriers, above all, stand in the way of rapid advance. The first is the lack of trained men, not only in the high administrative grades of government, but also in the field—the NCOs of industry and technology who can demonstrate on the farm and at the bench the advantages of new methods and machinery. The United States is better equipped than the Commonwealth to deal with this shortage—although there are problems of salary and status to be overcome—but a British initiative could accomplish a great deal. Has a Commonwealth census of available skilled manpower been considered? Has any thought been given to establishing a new type of Commonwealth technical service in which men could make their career, without risking, as British advisers lent to other governments may now risk, unemployment in their middle forties?

The chief obstacle, however, must remain finance. The countries of South-East Asia have no surpluses to invest in major capital improvements. The amount of assistance coming from other members of the Commonwealth is also likely to be limited. Britain has made it plain that the £750 million which has found its way in one manner or another into Asia since the war cannot be repeated. On the contrary, the flow is now to be reduced. Australia is embarking on large capital developments of its own. Canada is no more than an interested observer. Outside the Commonwealth, Germany and Japan can hardly supply new capital since they are in great need of it themselves. The conclusion can only be that, if development on any rapid and ambitious scale is to be achieved, the United States is the only source of new finance.

This fact does not, unhappily, make it any more certain that the capital will be forthcoming. In the short run, there are various provisions amounting to nearly $200 million, first destined for China, which Congress might be persuaded to release for use elsewhere. The Import-Export Bank might be ready to follow up its $100 million loan to Indonesia by advances to other Asian territories. The World Bank will probably finance one or two sound projects. But all this is small compared with, say, the finance made available by Britain in the last four years. American commercial loans will certainly not appear until political conditions are more stable and, even then, the attractiveness of investment will have to be proved. For the time being, any American aid to Asia will represent a political decision to extend economic assistance in the hope of earning the dividends of political stability and economic security rather than a quick financial return.

If the need for aid is accepted, the form it may take should be less important. The President's Point Four is one method, and, in spite of all the political commotion it has aroused, the suggestion that dollar loans should be substituted for further releases from the sterling balances is in reality only another. It must be admitted, however, that the hopes of such a "political" decision by Congress do not seem very high at present. The Point Four programme has been reduced by half and the issue of the sterling balances has been grossly confused. There is none of the understanding and unity of purpose that went to the framing of the Marshall plan. The one hope is that the work accomplished at Sydney may, by its practical effectiveness, open a new phase in American thinking; then genuine economic assistance might be forthcoming later on. Here is the most cogent argument for a policy of action. Plans and figures will not ignite the American spark. That can be done only by an effective job of work.

Too Willingly to School

THE Worcestershire Education Committee recently dismissed a teacher for refusing to give up spare-time coaching of children for the entrance examination to the grammar schools. By their decision, the Committee let loose a controversy on a particular aspect of the selection of children for free places in grammar schools. Was it part of the intention of the 1944 Education Act to provide such places for children of merit, but to deny that parents and teachers had any right to give their children every advantage in competing for them? Or has competition for these places developed into most undesirable forms, including coaching in taking "intelligence" tests, likely to have serious effects on children of tender years? This is not the main issue in what has come to be known as the "eleven plus" examination, but it is a good illustration of the strains and resentment that are widespread.

In theory, the objects of the Act are admirable. It makes all secondary education free, and it substitutes selection by merit on the child's part (measured by his performance in the "eleven plus" examination) for mere ability on the parents' part to pay grammar school fees. But the measurement of merit is difficult and much resentment arises in middle class breasts when their swans fail in the examination while their neighbours' geese succeed. A grammar school education is now within reach of the working class family if the child succeeds in the examination. If he does not, his failure often creates a strong sense of disappointment and injustice. Most complaints, however, come from middle class families—those who, before the new Education Act, expected to, and were fully prepared to, pay for a grammar school education for their child, irrespective of his ability. Now they can be certain of one only if, at the age of eleven, the child is among the most intelligent of his age group; owing to the uneven distribution of grammar schools, this may mean in some areas that the child has to be among the top ten per cent. Thus, many middle class parents complain that their children are squeezed out of the grammar schools and many working class parents suspect that their children are not admitted because of prejudice on the part of the selectors.

It is easy to state the grammar school problem on paper, and to solve it by the reflection that in time it will recede. The standards and reputations of the secondary modern schools will no doubt rise; there are a few good ones now and more will be built; experience should lead to improvements in the entrance examination giving it wider and readier acceptance. But such improvements alone will not dispose of all the difficulties which confront middle class parents. Their background and their ambitions for their children rest upon the kind of training and prospects that are offered by the grammar school. In the past, the key to entering most professions has been the School Certificate or Matriculation; these examinations are not normally part of the curriculum of the secondary modern school, or of the rare secondary technical school. Since very few middle class parents are prepared to run the risk of their children being automatically excluded from the professions by failing to pass the grammar school entrance examination, there has been a sharp increase in the demand for places in private schools, entry to which is not governed by the "eleven plus" examination. This in turn increases the financial burden upon that section of the middle class which in the past could not afford to send its children to a public school, but could afford to send them to an endowed grammar school where the fees amounted perhaps to only a quarter of the cost of their education. The grammar school, which often has a long tradition, high educational standards, and a roll of distinguished students, is still the goal of the moderately well off and of aspiring working class parents.

For that reason, the "eleven plus" examination is a period of crisis for thousands of parents and their young. Each education authority conducts the examination by its own method, but there is a good deal of common practice. Most authorities set papers in English and arithmetic and hold an intelligence test; the more rigid education authorities stop at that point and draw a line corresponding with the number of grammar school places to be filled, rejecting those below it. The more enlightened among them take into account the child's record at his primary school and give some weight to the teachers' reports; others interview as many as 50 per cent of the candidates.

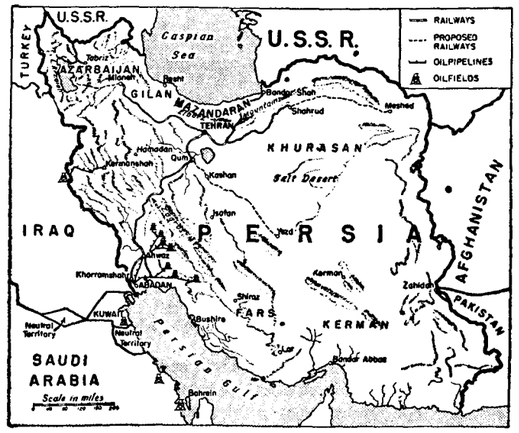
For a true test of merit, a child's record over 3 or 4 years at his primary school may give a better indication than his performance in a series of written and oral tests on two or three days. But the difficulty of laying down objective standards—to say nothing of the danger of favouritism by head teachers—is too great to encourage education authorities to abolish altogether the standardised written tests. Parents will insist that objective tests are used and their complaints are not against tests as such but against their alleged unfairness. But it is not unfairness so much as inadequacy which is mostly to blame. If 500 children present themselves for 100 places, the selection of the first 50 presents little or no difficulty. But below the thin layer of brilliant children there is a much thicker one of promising candidates among whom there may be little to choose. It is the need to squeeze out a large proportion of these more or less equally talented children that gives many parents the impression that the "eleven plus" examination is a gamble at most unpromising odds. Many children are not ready in time for it; too many are herded into it, and given a dose, at far too young an age, of the kind of preparation that their older brothers endure five years later for School Certificate. Some authorities try to recognise these points by giving later opportunities for the reconsideration of children whose development may have been tardy. But by the time these children have reached 13 most grammar schools are so full, and the practice of turning unsuitable children out of the grammar schools so rare, that places for new 13-year-olds are hard to find.

There is no agreement about the ideal proportion of grammar school places to total pupils, though the Ministry of Education has given its blessing to a figure of 15 per cent. Restrictions on school building prevent local education authorities (except in areas where the need for grammar school places is really desperate) from

building new grammar schools. Nor is it likely, unless the Ministry of Education assumes much more dictatorial powers than it has ever been prepared to exercise, that the lack of balance between the under-provided and over-provided areas will be completely corrected. Education authorities take pride in their local grammar schools, and they would not readily sacrifice places that they can fill only too easily in order to secure some national average of grammar school places to total students. Moreover, even if school building were free it would not necessarily be right so to expand the number of grammar school places in the underprovided areas that the total provision in those areas was increased from 15 to, say, 30 per cent of the eleven-year-old age group. A grammar school education presupposes two things—first, that the child is capable of profiting by an academic course, and, secondly, that adequate openings in the salaried occupations and in the professions are available. On the first point, many heads of grammar schools complain that 10 to 15 per cent of the children who now enter are not really suited for the intellectual discipline of the grammar school and would be much happier in a secondary technical or secondary modern school. On the second point, there is no evidence that the professions are likely to be short of recruits from the schools (except perhaps for girls to go into nursing and teaching); the need is rather for improved technical ability in industry rather than a larger number of applicants for the swollen salaried professions.

There are no immediate or easy solutions to these problems of entry to the grammar schools. In time, a sprinkling of new grammar schools in the under-provided areas should provide some relief; in the meantime, those middle class parents who can still afford to pay will rely on the private or independent school for their children's education. But, in the long run, the only solution is to put meaning into "parity of esteem" for all types of secondary education which it was the aim of the 1944 Act to create. An equal degree of confidence and respect for all forms of secondary education, whether taken in modern, technical or grammar schools, will take many years to achieve; and it would be tragic if "parity" were achieved by lowering the standards and the prestige of the grammar schools. The aim of all local authorities should be to reduce the pressure on the grammar schools not by diluting their standards but by providing an alternative in the other secondary schools, differing in the nature of the training they provide but not in its quality. Only when parents see from experience that the products of the secondary schools are at no disadvantage compared with the products of the grammar schools, will they readily send their children there. The growth of a genuine parity of esteem, however, calls for changes of parental attitudes which still equate a black collar job with social respectability. It will come only when parents, whether middle class or working class, accept the fact that only a small proportion of children will be better equipped for life by a grammar school education and will be happy in the kind of occupations or professions which it opens to them. For the rest, whether they be 70 or 85 per cent of the school population, the alternative provided by a good general education combined with a sound introduction to a career in industry, agriculture or domestic science should have strong attractions. It is an alternative which is suited to the needs of most children seeking employment in a complicated technological society and to the needs of that society itself.

Can Persia Plan?



MOST Persians wish that foreigners—British, American, Russian—were not so interested in their internal affairs. They would like to be left to go their own way, at their own pace, in the vast spaces of their pleasant country. But two facts reduce their chances of being left alone. One is their position on the map, which keeps them within the orbit of the cold war. The other is the course of recent events in China, which suggests that they must now choose between two patterns of social change—either the ruthless, methodical process now being imposed upon China; or the more hesitant, unspectacular transformation that takes place when eastern feudalism accepts western aid for "social development." Persia's landlord-politicians pay lip service to reform, but most of them have complacently refused, hitherto, to see that a ruling class of the present pattern must inevitably choose the western way. In practice, they have done so, for two years ago they accepted a modicum of American military assistance, and recently the Shah made an official visit to the United States. So far, however, by no means all Persian politicians have faced the implications.

Last month a new cabinet started the Persian new year with a substantial vote of confidence from a brand new senate—the first under new constitutional arrangements—and a newly elected Majlis. Such an array of new brooms should put new impetus behind the policy, known as the Seven Year Plan, that is designed to produce change on a western model. On paper, this plan has been ready for some considerable time; it was accepted by the Majlis more than a year ago. The team of American advisers that was hired to pronounce upon it—Overseas Consultants Inc.—has tendered its recommendations in five volumes. Nothing is now lacking save the means of executing the plan. The main task facing the new prime minister is to get the several parties whose concurrence is required—Shah, cabinet, planners, senators, deputies—to move in step. First he has to secure the funds that are needed before the plan can be seriously started, and secondly he has to get some agreement about the order in which its component parts are to be carried out.

When the question of funds for development is put to any Persian, from the Shah downwards, he at once argues that Persia is owed the money as compensation for material damage done by the allies' war time occupation. But this contention is hardly valid. During the war, the Persians suffered a psychological affront and some great physical inconveniences; but they also gained greatly from local expenditure and from local employment by foreigners as well as from rising oil royalties. Last year, the British Government repaid the Persians most adequately for the main wear and tear which it had caused—£8,200,000 in gold and transferable sterling for the wartime carriage of British military traffic on Persian railways. If the Soviet government

were similarly to transfer the 12 tons of gold which it owes for goods and services during the war years, the Persians could start to acquire fresh funds on a basis of today's needs and forget about yesterday's grievances.

Any thoughtful Persian looking at the parlous economic state of the country would accept this view. The government's finances show a deficit owing mainly to increased military expenditure. Reserves are low. Export trade (excluding the trade of the oil company) has fallen steadily since 1946-47. Industrialists, merchants, and peasants, are all in a disgruntled mood. The manufacturer, during the war and since, has been selling all he could produce without thought of costs; now he is finding that his prices are far above those of competing imports, and is closing plants and leaving workers unpaid. The merchants are irritated with the Bank Melli, which has been restricting credits to the bazaars in order to have more to lend for the seven year development projects. The peasants, particularly in the north, are still feeling the effects of the bad winter in Azerbaijan in 1948-49 and the long succession of droughts in Kholasan. Poor administration and distribution have also contributed to their misery.

The situation is one in which Soviet propaganda is revelling. There is a noticeable increase in the quantity and distribution of leaflets and newspapers by the Russian-sponsored Tudeh ("Mass") party. Its membership is at present not impressive either in quantity or quality, for it lost most of its influential adherents when the Russians pressed their intrusions too far, firstly over the question of federal autonomy for Azerbaijan, and secondly, over the question of an oil concession in north Persia. But it has recovered from the low levels to which it subsequently fell, largely thanks to delays in sterling on the seven year plan.

It behoves the new government, therefore, rapidly to seek the funds for the plan if it is to arrest this development. The Bank Melli is ready to lend but can supply only a fraction of the total on the scale envisaged—21,000 million rials ($650 million) over the next seven years. The obvious source to which to turn is the Anglo-Iranian Oil Company. Last summer, the company, having the seven year plan as well as its increased profits in view, offered the Persian government a new agreement. It proposed increased royalties, payment of an increased tax per ton of oil produced, and an annual payment, as opposed to a bulk payment at the termination of its concession, of Persia's share of each year's allocation to general reserve. This offer was turned down by the late Majlis, partly because it disliked any tacit admission that a foreign concession can be an asset, but largely because no one had made it his business to give the new offer any publicity among Persians. The offer that was turned down, but is still open to the new Majlis, was an increase of royalties from 4s. to 6s. per ton, a small increase of tax, and payment of a guaranteed minimum annual sum to Persia in respect of its share of dividends and reserves. The guaranteed minimum was £4,000,000 per annum. On the basis of the outputs for 1948 and 1949, therefore, a calculation reveals that the old rate—already paid—and the new rate—which is still on offer—compare somewhat as follows, allowance being made for the devaluation of sterling:—

	1948	1949
Output.....	23·4 mn. metric tons	25·4 mn. metric tons
Old rate....	£9·1 million	£13·4 million
New rate...	£18·6 million	£22·0 million

It should be added that the figure for 1949 at the new rate would probably be exceeded, since it is calculated on the known figure (£18 million from royalty and tax), plus the minimum figure (£4,000,000) for share of dividends and reserve. The final figure for the latter, judging by the experience of 1948, is likely again to exceed the minimum.

It is obvious from these figures that the Persian exchequer stands to gain from the supplemental agreement arrears amounting to some £20 million for 1948 and 1949, to say nothing of higher income for future years. Once the money is available, from this or international sources, development and reform can be started. Under the original plan, as approved by the government's American consultants, 28 per cent of the total was to be allocated to health, 25 per cent to agriculture (including irrigation), 23 per cent to roads and railways, 14 per cent to mines and industry, leaving 10 per cent for smaller projects. But the events of recent months suggest that there have been second thoughts about these propositions. In particular there has been disagreement whether the plan should take over the liability of Persia's Industrial and Mining Bank. In the teeth of considerable criticism the planners have accepted this liability, with the result that the first credits give agriculture only 5 per cent; the bulk of the money goes to more immediately spectacular undertakings. These are the completion of the railways to Tabriz and Meshed, and the financing of the Industrial and Mining Bank in order to rescue Persian industry from the plight of high wage bills and low productivity.

These quarrels may be resolved, but it will require an immense concerted effort by planners and cabinet. They will have to show great firmness towards their industrialist friends, whose mismanagement is a perpetual liability to the financing of the seven year plan. They will need sufficient strength of character to cut down expenditure on urban or inter-urban projects, of the kind that politicians prefer because they produce results quickly visible to voters, and direct attention back to the slow but basic processes of restoring health and agriculture. Unless they do so, a country that is 90 per cent agricultural may stave off discontent for a decade, but it cannot hope to become prosperous or to maintain real independence.

NOTES OF THE WEEK

Missions to Moscow

It is presumably not altogether an accident that two high officials of the United Nations should be making for Moscow on the eve of the conferences between western ministers that are to take place in London. It would certainly suit Mr Stalin and make things more difficult for Mr Bevin and Mr Acheson if press agencies—or other media favoured by the Kremlin—started spreading reports of possible bases for east-west negotiation at the precise moment when major plans have to be made on the assumption that no such possibility exists. The French appear already to be going through one of their periodical fits of nervousness about the "provocative" nature of the Atlantic Pact policy, and opinion in the west is still quite vulnerable to the shrill clamour of the Soviet peace campaign.

Mr Trygve Lie and Dr Gunnar Myrdal would be less than human if they did not cherish some hope of going down to history as men who helped to stop the cold war; but they would be less than wise if they did not realise that false moves would prolong it. If general proposals are discussed, however informally, and then bruited abroad, only to be rejected in London as too imprecise, then the peacemongers score a trick and pessimism gets deeper. On the other hand, if the two visitors can help to get the Russians back to the United Nations or persuade them to talk frankly about east-west trade, then positive good would be done. But the work must be precise and confidential, not merely propaganda material for a Tass message late on a Saturday night. As officials they have, of course, to remain impartial and judicial; but in dealing with the Russians in the past they have gone so far in this effort as to do some injustice to the point of view of the western governments. Cordial wishes for the success of these Moscow missions must not, therefore, conceal slight uneasiness about their timing and consequences.

* * *

May Day Contrasts

May Day has become a barometer of the cold war. From capital after capital the readings have come in, registering everything from storm to the flattest calm. In most English speaking countries the day went by with no more than routine celebrations. At the other end of the scale, the Russians demonstrated their passion for peace with an immense mechanised military march past and an air display of the latest jet fighters and bombers. The principal speaker on this great day of peaceful labour and constructive work was, appropriately enough, the Soviet Chief of Staff.

In the debatable lands between east and west, the day passed in commendable calm. In Berlin, the Communist demonstrations and western counter-demonstrations, which had been a source of much previous anxiety, were completed almost without incident. In the Soviet sector the "spontaneous" demonstrators were herded into groups and formations and fronts—uncannily reminiscent of the city's recent and ill-omened past—and the Moscow note was struck by the marching of the armed *Bereitschaften*, or militarised police units. In the western sector an even larger crowd collected to picnic with its lunch baskets and showed that democracy is, in its old untidy, unpredictable way, prepared to see out the cold war.

In the other chief areas of tension in free Europe—France and Italy—there were noticeable signs of declining Communist ardour. In Paris General de Gaulle collected a bigger crowd than the Communists demonstrating for M Joliot-Curie and against the atom bomb. In Italy the free trade unions stole much of the Communists' thunder and their sympathisers had to listen to Guiseppe di Vittorio's warning that Communists cannot expect to win all the time.

Yet Europe is not the only arena of the struggle. There the balance of advantage may lie with the west. Elsewhere it is still uncertain. Thousands paraded with Communist flags in Indonesia. Thousands more applauded Communist demonstrations in Tokyo, demanding an end to the American occupation. And—a tragic and visible demonstration of western failure—eighteen Africans were shot dead and others wounded in May Day disturbances on the Witwatersrand.

* * *

Dominions and Communists

The Australian and South African governments are embarking on an experiment in the handling of Communist activity which may offer useful lessons to other governments contemplating similar action. Both have tabled Bills which seek to disband the Communist party and to make it an offence for any individual to be a Communist, or to be associated with Communists. The Bills may be amended on their passage through the two parliaments, but there seems little hope that a more liberal spirit will be infused into them. Mr Menzies, for one, has stated categorically that he intends to see his Bill through in its entirety.

In each Dominion the Communists, it is true, are stronger and a greater potential threat to the state than they are in Britain. But the banning of a political party in a democratic state, however subversive its doctrines may be, is wrong in principle and seldom achieves the object of checking the activities of party members. Indeed, in Australia especially, it is more likely to spread around Communism an atmosphere of clandestine adventure, conspiracy and martyrdom which might attract better—if not more—people than the present humdrum propaganda and committee activity offered by the party leaders. For every six fellow travellers scared by such legislation one militant is created. Moreover, a party working underground is difficult to control especially if it concentrates on industrial unrest and sabotage.

There is a further point which applies particularly to the Australian Bill. In order to be able to enforce the outlawing of the Communists and also, presumably, as an attempt to prevent them from forming secret societies, Mr Menzies has laid it down that the onus is placed on an individual described as a Communist to prove that he is not a Communist, that information which leads to the declaration of a person being a Communist need not be divulged, and that private houses in which Communists are suspected to be hiding may be raided. These provisions may be essential for carrying out the intention of the Bill; but they constitute a deep encroachment on the rights of individuals and an invitation to abuse of power by the police. The democratic and liberal way to fight the Communists is by personal action in committee, in conference, and in writing; the law should be used only to protect the individual and the community from violence and unconstitutional methods.

* * *

Red, White and Blue in Docks

An uneasy truce has been declared between the two unions in the London docks. The men of the Stevedores' union (the blue ticket holders) and the small minority of the dockers in the Transport and General Workers' Union (the white ticket holders) who had followed the lead of the stevedores, returned to work on Monday. As in the previous dock strikes in London, the unofficial strike committe has been able

to keep up the pretence of retaining the initiative by ordering a resumption of work when it was clear that most of the strikers intended to resume work in any case. In week-end meetings, the unofficial committee stated the terms on which the strikers were going back to work with a blithe disregard of the fact that the terms had neither been discussed with nor accepted by anyone except themselves. By tactics which are typical of the Communists they have, therefore, succeeded in creating the impression that they dictated the course of events throughout the strike. They have also prepared the ground for future trouble.

There are two points worth noting about the recent strike. First, the reports of widespread dissatisfaction among the "white ticket holders" with the Transport and General Workers' Union do not stand close examination. Less than ten per cent of the London dockers who are members of this union joined the strikers. And most of this small minority, at the original meeting which declared the strike, voted against striking; they joined the strikers because of the traditional acceptance of majority decisions—at this meeting, the stevedores outnumbered them by four to one—and possibly because of some sympathy with the Communists. There may be many defects in the organisation of the Transport and General Workers' Union; but there was no doubt that the dockers' representatives in that union were right to insist on the principle that dockers who refused to abide by the dock labour scheme and by the agreements, which had been negotiated with their consent, should be expelled from the union. Had there been no rival union inspired by militant tactics, that would have been the end of the matter.

The second point is that the political nature of the strike bears a remarkable similarity to other dock strikes which have broken out throughout Europe. In spite of all disclaimers to the contrary, the coincidence of Cominform propaganda calling on dockers to disrupt the Marshall plan and to prevent shipments of arms to the Far East, of the strikes in Europe and now of the strike in London, makes it as certain as it can be that the London strike was started and kept going by Communists. The rivalry between the two unions was the opportunity for causing a strike rather than the cause itself.

* * *

Danger and Dissent

On Tuesday the House of Lords debated a motion criticising Lord Vansittart for not having used "due care in the exercise of the Privilege of Parliament" during a debate which he had initiated on March 29th on the infiltration of Communists into the public service. In the original debate Lord Vansittart had named a number of individuals—with certain extremely tasteless embellishments of language—whom he considered were Communists or fellow-travellers. Lord Stansgate re-opened the matter this week to try to get his fellow peers to decide whether Lord Vansittart had abused the privileges of his position. In the event the debate was a painful affair, despite the fact that Lord Exeter made their lordships listen before the debate began to a Standing Order of 1626 warning members that "personal, sharp or taxing speeches be forborn." The leader of the House, Lord Addison, unceremoniously brought the debate to a full stop after Lord Vansittart's defence of himself, but only after a sharp and taxing exchange with his supporter and political colleague, Lord Stansgate.

Although it is possible to dismiss the whole affair as a quarrel between overwrought elderly statesmen, the debate did underline a point of great importance. The principle of Parliamentary Privilege is vital to the maintenance of democratic institutions, but it also puts into the hands of the member of a legislature the power to damage the reputation of a private individual without any possibility of redress. It would be unnecessary to underline this point, were it not for the fact that it is just such an abuse of privilege by Senator McCarthy in the United States Senate that has led to a recrudescence of "witch hunting" in Washington. It is one thing for the Government to adopt special measures to counter the infiltration of Communists into positions of trust in the public service. It is quite another for legislators to make charges which they cannot be called to substantiate under the due process of law.

Lord Vansittart was undoubtedly right to call attention—however unwise his choice of words or of the individuals whom he singled out for attack—to the threat of Communists being given positions of influence within the public service. Since their defeat at the general election, there are grounds for believing that the Communist party in Britain, as in other European countries, will for the time being work more below than above the surface. Lord Stansgate was equally right to draw attention to the damage which Lord Vansittart's actions and attitude could inflict upon individual citizens. In the two men and in the two points of view are expressed the dualism that runs through the whole of English political history. Lord Vansittart stressed the importance of preserving the body politic, Lord Stansgate, speaking with the authentic accents of the Dissenters, stressed the importance of protecting the individual. It is the undying debate that was argued by Strafford and Prynne, by Pitt and Fox.

* * *

Local Government Tangles

The rejection by the House of Commons, on a free vote, of two private bills for confirming county borough status on Ilford and Luton is of more than local importance. The local government pattern of England has been largely frozen since 1926, and has remained completely unaltered since 1939, in a form which everyone agrees is illogical and unsatisfactory. There is a group of towns, of which Ilford (population 185,000) and Luton (110,000) are members, which on their own intrinsic merits has a sound claim to the independent status of a county borough. Unfortunately, to give these towns their rights, within the present framework of local government, might do more harm than good. To concede Ilford's claim, for instance, would be to justify a spate of similar applications from other populous districts in Greater London, while to yield Luton's claim would bring about the dismemberment of the county of Bedford.

Nevertheless, there is bound to be sympathy with Ilford, Luton, and all the other local authorities whose claims have been fobbed off since 1945 with the argument, repeated again by Mr Bevan, that they must wait for a comprehensive reconstruction of local government—an ironical excuse from the head of a Ministry which bears the main responsibility for the long delay in getting local government reorganised. After a wait of several years Mr Bevan snubbed the Local Government Boundary Commission, turned down its comprehensive plan, and assumed the responsibility for making fresh proposals. He is now able to argue that in view of the Parliamentary situation a further indefinite postponement is inevitable. Meanwhile the lack of any machinery for making urgent adjustments, such as the Boundary Commission provided, is being keenly felt.

In point of fact, there is no real reason why the present Parliament should not justify its existence by making a determined attack on the local government problem. The whole question, as debates on the Ilford and Luton bills showed, cuts right across party loyalties. There is widespread agreement that it would be useless to refer the problem to another commission, and that Parliament must take responsibility for finding a solution. Mr Bevan's contention that the local authorities will not agree amongst themselves is irrelevant because they will never agree. Given a determination by both parties to consult the needs of local government and to ignore the lobbying of particular interests, a solution would not be impossible.

Tito Takes Stock

Marshal Tito said remarkable things in the speech that he delivered to the Jugoslav National Assembly on April 27th. There were some frank admissions of shortcomings in the economic performance of the regime, some recognisable figures of production instead of mysterious percentages, a subversive message to Balkan neighbours about federation between "equal" socialist states, and some strikingly polite references to western trade partners and former enemies in Austria, Greece and Italy. In short, the Marshal is as staunch a Communist as ever, but now finds it convenient to talk sense in a candid way and in reasonably simple language.

The most significant thing in the speech is its call for increased production and exports. The future of the Marshal may depend on his ability to convince his people and the outside world that he can buy or borrow from the west what is needed both to raise standards of living and to carry out the programme of industrialisation—indeed, on his ability to snap his fingers indefinitely at the blockade imposed by the Russians and their satellites. He insisted that more timber must be cut and sold, more food grown to produce genuine surpluses, otherwise "next year we shall run into considerable difficulties concerning our international trade." Some 500,000 tons of maize and 250,000 tons of wheat are needed for export this year.

There will certainly have to be a stout performance by the Jugoslav economy to justify—on purely economic grounds—the help that has come from the west. Belgrade has received since last summer some $75 million worth of aid from the Export-Import Bank, the World Bank, the International Monetary Fund and this country. Further aid from the World Bank is expected soon and German and Dutch firms have obliged with credits. Yet trade with the west in 1949 did not equal that with eastern Europe in 1948, in spite of the fact that exports to America are more than keeping pace with imports from the same source. Moreover, until capital equipment and machinery ordered from the west begins to arrive it will be difficult to be sure whether the trained manpower exists to make full use of it, especially in the key industries of mining, timber and oil.

The Marshal made it clear that he will persist both in his five year plan and in his determination to have a strong armaments industry, the claims of which on the economy look excessive but are difficult to assess. The Jugoslav people are in for no easy time, but their performance up to date suggests that the prospects of success are very fair.

* * *

Belgian Elections Again

After all, a compromise on the royal question in Belgium has proved impossible. When, three weeks ago, the King offered to surrender his prerogatives to his eldest son, the way seemed clear for a solution agreed between the three parties. The procedure governing the transfer of power was drawn up and there seemed to be no more than points of detail to settle. Distrust of the King's real intentions, however, prevented a solution. The Socialists asked that he should undertake to remain in exile once his prerogatives had been abandoned. The King replied haughtily that he had nothing to add to his previous offer; the Socialists withdrew their concurrence with the compromise plan; and the Liberals, after much heart searching, decided that they could not join the Christian Socialists in a coalition to carry through the proposed compromise without Socialist support.

The Regent has therefore dissolved Parliament and new elections will take place on June 4th. If the Royalist vote in the referendum is any guide, the Christian Socialists should now secure a majority in both Chambers, but it is too early to say whether they would then revert to their original demand that the King should be permitted to return unconditionally. This is the declared policy of the extreme wing. It is probably not the ideal solution in the eyes of the ex-Premier, M. Eyskens, and other moderates. Perhaps the best hope now for pacification in Belgium is that the Christian Socialists should secure their majority and use it to introduce the compromise which so nearly succeeded before.

* * *

French Trade Achievement

Widespread industrial unrest during the early months of this year has not prevented the French trade deficit with the rest of the world from steadily shrinking. During the first quarter of this year French exports were valued at 147,773 million francs, compared with 100,731 million during the first quarter of 1949; the corresponding figures for imports were 212,222 million and 167,645 million. France was thus able to cover 69 per cent of its imports by its exports during the first quarter of 1950, as against 59 per cent during the same period last year. It was able, moreover, to achieve this in spite of a considerable increase in the value of total imports. For the month of February, when exports reached a record postwar value of 53,353 million francs, exports covered as much as 73 per cent of imports. These figures exclude France's trade with its overseas territories, with which it has an increasing surplus; and if these colonial figures are also included the picture looks even brighter. While in 1948 the average monthly deficit of the whole of French external trade was nearly 20 billion francs, in February this year it was down to about 11 billion francs.

Owing to last year's excellent harvests, grain, which used to be one of France's largest imports, has become an export. France has not only repaid 300,000 tons of wheat lent to it last year, but has also exported more than 120,000 tons during the first three months of this year. It has also stepped up its exports of textiles, metals and animal and vegetable products. Imports of refined oil products, coal and foodstuffs have been heavily reduced. (The cut in food imports is of particular importance because they came mainly from America.) It is true that France has increased its imports of a number of consumer goods and raw materials; but any increase in textile exports would not have been possible without greatly increased imports of raw materials, many of which were paid for out of Marshall aid. Raw textiles constituted a quarter of the value of all imports during the first quarter of this year, and half of the cotton imports came from the United States.

It is, of course, the trade deficit with the dollar area which still presents the French with their greatest and most intractable problem. Yet even here some progress has been made, largely through cutting down dollar imports. These amounted to 17.5 per cent of total imports during the first quarter of this year, compared with 25 per cent during the corresponding quarter of last year. Unfortunately French exporters, who have made such successful onslaughts on the sterling area markets, have achieved only small successes in the dollar markets.

* * *

Mr Webb on the Cabbage Patch

It has alwaye been fairly obvious that Mr Maurice Webb's many excellent qualities do not include a capacity for ruthlessly clear thinking. His expressed opinions on the vegetable shortage, however, constitute an unmistakable record in what the *New Yorker* would call the Department of Utter Confusion. In the course of a single speech at Reading he asserted that vegetables were scarce because of last year's drought (a fact hardly open to question); that their high price, nevertheless, was due to the fact that they were handled by private enterprise without benefit of controls; that the maximum price regulations would merely result in their disappearance from the market (it is something to see this realised) but that, with socialised distribution, high prices could be avoided even in a drought-bedevilled season; that housewives could break down vegetable prices by boycotting vegetables (this after years of educational campaigning on the need for vitamins); and that any complaints should be addressed (after five years of Labour government) to the Opposition parties.

Pages could be devoted to the logic of these statements; but one would particularly like some explanation of the miracle by which genuinely scarce vegetables, impossible to include in any rationing scheme, are to be kept by a socialised distributive system at the price appropriate to times of plenty. Few people would deny that the system of distribution of vegetables in this country falls a very long way short of perfection, adding inordinately to the price of the produce sold and detracting inordinately from its quality. Over-centralisation and marketing bottlenecks join with poor grading and bad packing against the interests of both producer and consumer; and municipal or co-operative enterprise may well have a place in any movement of reform. Any network of quick-freezing or canning plants, such as would provide a real answer to the problem of alternate glut and scarcity, might also need, or at least benefit from, Government assistance. Neither possibility, however, could really be described as "socialisation." So far as immediate help to the housewife goes, Mr Webb might be better occupied in relaxing the restrictions on imports of vegetables from the Continent. But then what would happen to the rural vote?

* * *

Equality in Misery Again

It might have been thought that supplies of food were now varied enough and ample enough for the dog-in-the-manger (what I can't buy thou shalt not have) attitude that has characterised the last few years to have disappeared. But no. Three recent items of news show that it persists as strongly as ever. First comes Mr Webb's announcement, in a written parliamentary answer, of the removal of the 5s. limit on meals in restaurants—together with the agglomeration of house charge, dancing and cabaret charges, service charge and oyster charge. The limit is not, however, being removed because it is nonsensical and aggravating, having long since served the purpose for which it was imposed in June, 1942. It is being removed because "the balance of public advantage" lies that way, because the Government, after duly assessing the limit's merits as an "instrument of equity in the consumption of food supplies" and the psychological consequences of allowing a restaurant to charge an honest price for a worthwhile meal, has decided that the importance of the tourist trade just, but only just, overrides these considerations. Along with this grudging acceptance of the inevitable must be put the Government's attitude to cream. The housewife would only be irritated, said Mr Webb recently, if he had accepted Mr Dillon's offer to fly Irish cream to this country. Now it is quite true that only a small minority of housewives would buy cream at the price that would have been asked. But if they choose to spend their money in this way why should other housewives, who perhaps prefer to see their housekeeping money going on football pools, cinemas and the dogs, be irritated?

Unfortunately there is some evidence that in this dog-in-the-manger attitude the Government is merely reflecting the attitude of the majority of the public. The *News Chronicle* discloses this week that a recent Gallup Poll asked people whether they would consider it fair to have a two-tiered rationing system, that is, a system under which rationed foods would be on sale at considerably higher prices provided that the present rations of the same foods were available at fixed prices. Only 27 per cent thought it would be fair, while 65 per cent thought it would be unfair—though 16 per cent of these were honest enough to admit that they would buy more butter if the system were in force. This preference for equality in misery is an ugly side effect of the principle of fair shares, and after ten years of imposed uniformity it will be hard to get rid of it.

* * *

The Status of Nurses

The fourth and final report of the Nursing Reconstruction Committee of the Royal College of Nursing was published this week under the title "The Social and Economic Conditions of the Nurse." Since nursing is probably the most reported on profession in the world, many of the committee's comments and recommendations are inevitably familiar. What is interesting is not so much that the committee should recommend so strongly the status of students for nurses in training, better conditions of work and so on, but that it should still have to recommend these things even after the undoubted improvement that has taken place in recent years.

The fact is that most hospitals still regard the student nurse as an indispensable "pair of hands" for carrying out the work of the hospital. This is hardly surprising, for the increasing demands made on the hospitals are such that hospital authorities are afraid lest too much emphasis on the student status of nurses in training will be to the detriment of their patients' welfare. This is admittedly a short-sighted view, but it is difficult to blame the hospitals for putting the interests of their patients first.

On a longer view, however, the committee, like others before it, is right to emphasise the importance of student status as a means of reducing the deplorable wastage of nursing manpower during training. Last year's Nurses Act, it points out, should go some way towards making this shift of emphasis universal among hospitals, by separating

The Defeat of Socialism

SOCIALISM seems making progress in England as well as abroad. It is patronised by some of the clergy, and by some of the literati. It is looked on as auxiliary to one party in the Church—it is claimed as the ally of Christianity, or perhaps its completion. It is said to be the fulfilment of science to reconcile the past with the future, political economy with progress; and so it makes way in the land. . . . It is smiled on by philanthropists and ladies—it promises distinction and influence to schemers whose main creed is to promote their own advancement, and who are ready to adopt any opinion, as a secondary creed, that serves that object. . . . About the desirableness of bettering the condition of the people there cannot be a doubt. Religion and philosophy alike forbid us to believe that the present condition of the masses is to be their permanent condition. As there have been changes in past time, there must be changes in future; but as the past changes were not brought about designedly by schemers, neither will future changes. . . . Unfounded as we regard their plans, we have no fear that they will extensively seduce the people. What they might have done had restrictions on trade been continued, we will not say. But most of the evils which have of late been pressed so much on public attention, are the lingering results of a system which has received its death blow, and we can rely on the coming prosperity of the community to release us from all fears of socialism.

The Economist

May 4, 1850

the finance of training nurses from the general finances of hospitals. But the committee also points out, very rightly, that the emphasis on student status implies that the nurses concerned should be worthy of that status. At present, many are called for training but few are chosen as trained nurses. The committee would have far fewer called, a large part of the tasks at present being performed in the wards by nurses being allotted to other and less skilled workers.

Thus the committee lends the weight of its authority in support of the proposal for a three-tiered system of work in the wards. First there would be those doing non-nursing duties, such as domestic and clerical work. Then there would be those doing simple nursing tasks not requiring much skill, such as is now done by "assistant nurses" with a short training. Thirdly, there would be the highly skilled nurses trained from specially selected students. All this is logical and sensible—regarded from the nursing viewpoint. But although the committee shows itself thoroughly aware of the need to regard nursing against a wider background, its proposals will not reduce in total the hospitals' increasing demands on the nation's shrinking woman power.

* * *

The Relief of M. Joliot-Curie

M. Joliot-Curie can blame nobody but himself for his dismissal from the post of French high commissioner for atomic energy. So fanatical was the tone and so rigid the doctrine of the Communist congress recently held at Gennevilliers that further tenure of a key post in his country's military and industrial organisation by a professing party member was clearly not possible. Elementary political loyalty is the least a government is entitled to demand of a public servant, but it is precisely that loyalty which Communists consider themselves free to cast aside when and how they think fit. Indeed—in France at any rate—their claim goes further, to the point where allegiance to the Soviet Union is held to be the first duty and obedience to Stalin the ultimate test of political reliability. The idea that the Soviet Union should be the *patrie* and France merely the *pays* still seems to some fantastic, but it is so often proclaimed by the party itself that it must be accepted at its face value.

As if to make the matter clear beyond doubt, Stalin himself sent on April 28th the following telegram to the party's leader, M. Thorez:

> Highly esteemed Comrade Thorez! Allow me to greet you and congratulate you on your 50th birthday.
>
> All the peoples of the world and the workers of all countries know and esteem you as a proven leader of the Communists of France, a leader of the French workers and working peasants, and as a valiant fighter for peace and for the victory of democracy and socialism throughout the world.
>
> The people of the Soviet Union, moreover, know and love you as their friend and as a staunch fighter for friendship and alliance between the peoples of France and of the Soviet Union. I wish you further success in your work for the good of the French people and the working people of the whole world. I grasp your hand firmly.

M. Joliot-Curie has more than once declared that, as a man of honour, he would not even think of passing on to a foreign government any secret of national defence; his conscience as a Frenchman and a scientist would forbid him doing any such thing. But his protestations provoked most bitter criticism from his party comrades and, as *Le Monde* has pointed out, M. Joliot-Curie has probably escaped expulsion only by a hair's breadth. The party could not allow one of its leading intellectuals to deviate into bourgeois nationalism and perhaps stray into Titoism.

Even though M. Bidault's decision to dismiss this distinguished scientist last week-end was taken "with regret" and courteously announced, it marks his government's new and stern determination to assert the authority of the state. It will make many French fellow-travellers think again about the nature of their loyalties. What is more—perhaps the best thing of all—M. Joliot-Curie's own conflict of loyalties is resolved for him; he has been protected—as a man of honour—from the consequences of breaking party discipline by behaving as a loyal Frenchman. The strength of the ties that bound him to his comrades has been analysed in a series of articles from our Paris Correspondent of which the last appears in this issue on page 1004.

* * *

Munnings-Moscow Axis?

The exhibition of contemporary French painting now being held in London under the title of "In Paris Now" may call attention to the present delicate relation of pictorial art to international politics. As is well known, Picasso is one of the star converts of the French Communist Party and was chosen to design the emblematic dove of peace for the Communist-promoted World Peace Congress. When he joined the party at the end of 1944, he was received with royal honours, Marcel Cachin and Jacques Duclos being personally present to give him his membership card. What is less well known is that Picasso and his school have repeatedly been attacked with great vehemence in the Soviet press; their art is denounced as "bourgeois formalist decadence" (the Nazis called it *Kulturbolschewismus*) and as a "demoralising influence" for the Soviet people. The official Russian attitude to the darling of the French Communists was aptly expressed by a Red Army general who went to see an exhibition of Picasso's works in Vienna. "If that man lived in Russia," he said, "we would take away his food and textile ration cards." Sir Alfred Munnings himself could not have put it more strongly.

In France there has been since the time of Courbet a traditional association between innovation in art and revolutionary politics, and for many a French intellectual Picasso's conversion has been the strongest support for the claim of Communism to be in the vanguard of culture. But in the Soviet Union, where the Communists have been thirty years in power, the artist is kept firmly in his place and is not allowed to indulge in those goings-on which have been characteristic of artists in the west over the last two generations. There the highest function of the artist is to glorify the people's leaders, but for this purpose it is important that his art should not be so abstract that a representation of Stalin might be mistaken for one of Molotov. When a Marshal of the Soviet Union has his portrait painted, he naturally wants to have his medals and decorations accurately reproduced, but for such a task no reliance could be placed on a pupil of Matisse. Again, the artist should help in socialist construction, but if Braque were to be commissioned to design a poster for increased tractor production, a Kazakh peasant might be misled into thinking it was an exhortation to breed more camels.

So far the men of the Kremlin have very successfully got away with the inconsistency which allows one part of the Cominform to treat Picasso as a glorious genius while another part puts him under the ban of official censorship. But the western planners of the cold war should certainly take steps to expose the contradiction and drive a wedge into this crack in Communist solidarity. A suitable means to the end would the holding of a World Congress of Lowbrows, which would rally all anti-Picasso forces in the west and send fraternal greetings to the haters of formalist decadence in Moscow. The Russians would then be forced into the open, and would have either to repudiate Picasso without compromise, thus causing alarm and despondency among the French comrades, or else to champion his cause, at the risk of infecting the jealously protected Soviet public with the aesthetic corruption of Paris.

east and western divisions, but the Germany that betrayed western civilisation and the Germany that is to be accepted into the councils of the Atlantic community. In Frankfurt a German court has been trying the head of a firm of pest exterminators who knowingly sold poison gas for Auschwitz, sufficient to kill over 450,000 human beings. Almost every newspaper in the country has suppressed reports of the trial. In London Herr Blankenhorn, who has been entrusted by Dr Adenauer with the organisation of a new German Foreign Office, has completed a study of the Foreign Service, to which he was invited by the British Government. Herr Blankenhorn has also paved the way for Herr Schlange-Schoeningen, who will be the Federal Republic's first diplomatic representative in Great Britain since 1939.

There is hardly a German who would admit that these two events could be mentioned in the same breath. Indeed, the memory of the past is felt as no hindrance by Dr Adenauer and his colleagues when they strike the attitude of model Europeans whom the British would do well to emulate. Germany's neighbours still find it impossible, however great their desire for reconciliation, to forget the past so thoroughly.

An example of what deters them is the composition of those departments in Bonn that deal with Germany's foreign relations. It is a reminder that only a few officials of high principle and courage withstood the enormous pressure to join the Nazi Party to which they were subjected, and that no efficient German diplomatic service can be re-established without recruiting party members. The list of 22 members of Dr Adenauer's foreign service contains the names of no fewer than 15 former party members. The highest percentage, curiously enough, is in the office which maintains liaison with the High Commission, where eight out of 11 personalities were Nazis, including the head of the office, Herr Blankenhorn himself.

Herr Schlange-Schoeningen, however, comes to London free from this reproach. He is a former East Elbian landowner who, as Minister in charge of administering the so-called *Osthilfe* under Brüning, distinguished himself by looking after the interests of small farmers. He held no post under Hitler and won British respect as an efficient, if dictatorial, head of the Department of Agriculture in the days of Bizonia.

To rake up past utterances of his, as has been done recently in the British press, serves no useful purpose. The decision to make a partner of Federal Germany has been virtually taken, with eyes open to the risks and for reasons which are not inconsistent with the original purposes of the occupation. If the policy is to succeed the best must be made of the presence in London of a German Consul-General who is as good a representative of his country as can be found.

Rent Policy Suggestions

Two weeks ago the suggestions put forward by Professor Paish for an alternative system to replace the present Rent Restriction Acts were discussed in these columns. A new broadsheet by PEP (Political and Economic Planning) contributes to the discussion by propounding the possibility of a system of rent rebates. Their suggestions apply only to a limited field since they have confined themselves to the rent problems of local authority housing and have assumed that the majority of new houses will continue to be built by local authorities. This assumption is a very questionable one, since there is a growing body of opinion which holds that the time is now drawing near when local authorities should begin to concentrate on slum clearance and permit the economics of supply and demand to reassert themselves over the field of house building in general.

The proposals put forward by PEP for council houses envisage the universal adoption of rent rebate schemes. Housing authorities already possess such powers, but few exercise them for two reasons. The first difficulty is that in districts where the level of wages is low, comparatively few tenants would be able to pay the economic rents without subsidy. The broadsheet suggests that the subsidies should be withdrawn from all houses to be built from now on and that the relief to the Exchequer should be shared out between housing authorities in relation to the total deficits on their housing accounts. The effect of this would be to give larger subsidies to poor areas and smaller subsidies to more prosperous areas. The second difficulty in the way of a system of rent rebates is the odium which attaches to a detailed family means test. PEP sets out for consideration the scheme in operation in Australia. This system gives rent rebates in accordance with local wage levels and assumes that, at this wage level, one fifth of the family income can be afforded on rent. A family pays more or less rent according to whether its income is above or below this average on certain fixed principles which are applied nationally and are easily understood. There are certain advantages in both these suggestions, but if they were introduced they would certainly—and perhaps rightly—be strongly resisted by the local authorities as a further encroachment by the central government.

Plan for Cambridge

The planning consultants, Professor Holford and Mr Myles Wright, who have put forward proposals for the future of Cambridge*, are naturally and rightly anxious to preserve its distinctive character as an ancient University city and as one of the most beautiful towns in northern Europe. This character is threatened by a growth of industry and population which is as persistent, if less spectacular, as the development which has taken place in Oxford (and which long ago earned it the name of the "*Quartier Latin* of Cowley"). The population of urban Cambridge has increased by some 15 per cent over the last ten years and now exceeds 100,000. Moreover, it may continue this rapid growth. Cambridge is an attractive site for industry which is debarred or removed from Greater London. The University connection provides an added reason for the influx of modern scientific industries. The attractions of Cambridge as a residential town will increase when the rail service is improved. Finally the choice of Cambridge as a regional centre by Government departments has already produced an influx of 3,000 civil servants, who now outnumber the staff of the University.

Cambridge no longer revolves around the University; yet the University has claims which cannot be ignored. Much of its work has to be carried on in cramped conditions and, whilst it would be a mistake to increase the number of students, the need for new buildings cannot be gainsaid. Traffic congestion in the central area is both a serious problem in itself, and a menace to the quiet pursuit of University studies. The consultants' road proposals are modest, and are designed to reduce traffic in the University area without going to the expense of elaborate by-passes; but like the rest of the proposals, these improvements will only be effective if the population is kept strictly within the suggested limit of 120,000. As the consultants observe, "it is impossible to make a good expanding plan for Cambridge."

The Government, which is itself largely responsible for the growth of Cambridge, has adequate powers to call a halt. It will be very shortsighted if it fails to use them. There is no reason why firms, which value the University connection, should not be diverted to other towns in the neighbourhood, while the choice of Cambridge as a regional centre should be reconsidered. Town and planning control will mean very little if it permits the tragedy of Oxford to be repeated at Cambridge.

Letters to the Editor.

Where Angels Fear to Tread

SIR,—May I offer an explanation of why your article on the film problem under the above heading finally gives the situation up as a no-thoroughfare after exploring every normal commercial avenue. There is in fact no way out in that direction. Theatrical business, whether on stage or screen, is a gamble in which the hazards and gains are immense and cannot be foreseen by the wisest speculator. The most experienced and prudent man of business engaging in it drops all his financial habits after a month or two in it, finding them quite useless.

Let me illustrate. A contemporary playwright of mine, the late Henry Arthur Jones, began life as a commercial traveller. When he first got behind the scenes in a theatre as playwright-in-chief to Wilson Barrett he was amazed and horrified by the scandalous waste and business mismanagement that prevailed there. He urged its reform on Barrett, who, actor like, at once "saw himself" in the part of a great business organiser, and followed Jones's directions for a week. At the end of that brief experience he found that he had saved £9, and, telling his adviser that he would not spend such another week to save £900, relapsed into his old happy carelessness and refused utterly ever to be businesslike again. Why should a man who is either making £300 a night or losing £100 bother about economy? I asked Henry Irving's manager, Bram Stoker, why he did not put a hydraulic lift into the Lyceum Theatre and save the labour of 80 stage carpenters. He said he preferred the carpenters, as he was used to them, and the lift might go wrong. Fancy a factory saying this! To a commercial firm with, say, two thousand employees, a change in wages of a ha'penny an hour may make all the difference between bankruptcy and a satisfactory dividend. To a theatre manager the wages of his stage hands and booking office clerks means nothing, even if they are wasting his petty cash and robbing him all the time. When I was a beginner the cost of sending up the curtain in a west end London theatre was from eighty to a hundred pounds. One night at the old Avenue Theatre, with the most popular couple of players in the cast (the Kendalls) the takings were sixteen shillings; and the pair had to take to the provinces, as all famous actors have to at last. My first commercially produced play, *Arms and the Man,* drew £17 a night at the same theatre, and had to go to America to found my reputation as a playwright. These failures were produced on the chance of their drawing £300. They cost perhaps a few hundred to produce. Fifty years later a play of mine cost £600,000 to produce on the screen, and yet made a huge profit, my share of which was promptly confiscated and redistributed by the Labour Government, leaving me only a commission of sixpence in the £ for collecting it.

Clearly it is a mistake to consider such conditions from the point of view of Angel Court or Threadneedle Street. They constitute a sport and a very hazardous one. What is needed is a Board of experienced turf bookmakers, betting against all the plays as they now bet against all the horses and dogs in the races. The bookmaker does not back his fancy and bet against outsiders: he bets against all racers and budgets for 10 per cent (say) at the odds, checked by the Tote, and is not driven out of business if an outsider wins or a favourite loses, as our film speculators are. A public spirited and naturally honest speculator like Arthur Rank, will not then have to take his chance of ending in poverty or in the peerage he deserves.—Yours faithfully, G. BERNARD SHAW

Ayot Saint Lawrence, Welwyn, Herts.

Economic Realities

SIR,—Your article last week refers to the statement of the Financial Secretary to the Treasury, during the budget debate, that "a simultaneous reduction in purchase tax and food subsidies would raise the cost of living index very steeply indeed." This argument is described as "technically quite accurate."

Why only "technically"? And why should you be led to doubt whether the index is a representative measure of the cost of living? The "cost of living," in its ordinary English sense, is surely not difficult to interpret—and no one would seriously doubt whether the budget of the vast majority of private individuals is more affected by the cost of jam than the cost of jewellery or by the price of woollen underwear than that of wireless sets.

Those who advocate a substantial reduction in the food subsidies often argue that this would be offset by a reduction in Purchase Tax of an equivalent sum. In making it clear that the result of this would be that the average worker's wage would not go as far as it did before, Mr Jay has greatly helped us to distinguish between substance and shadow.—Yours faithfully, JOHN DIAMOND

House of Commons

[Why our doubts? Mr. Diamond's examples in fact supply the answer. If Mr. Diamond eats strawberry or plum jam, it is included in the "interim index of retail prices"; if he eats raspberry jam it counts in his cost of living, but not in the official index. The only article of woollen underwear in the index is "boy's vest, wool, short sleeves"—too small to enter into our cost of living or presumably his. And if Mr Diamond suggests that the cost of a wireless set is not part of the cost of living he is being more austere than the official statisticians, who are realistic enough to include radio sets and many other household goods in their index. The "cost of living" seems a simple idea until one comes to measure it. This is difficult even with the aid of good statistics; it is impossible by using the kind of folklore that holds that £300 million can move the cost of living down one point but will push it up six or seven points.—EDITOR.]

Royal Prerogative and Dissolution

SIR,—Mr Jeffery quotes the example of the refusal of a dissolution to General Hertzog in 1939, and of General Smuts' formation of an alternative Government which remained in power for several years without an election. Presumably General Smuts was able to form such a Government because he commanded a majority in Parliament, and Sir Patrick Duncan appears therefore to have acted in accordance with well established constitutional practice.

On the other hand, what are we to make of your correspondent's suggestion that the King would be equally entitled to refuse a dissolution to the Prime Minister and call on an alternative Prime Minister to form an administration if he knew that the latter could command a majority after an election? How is the King to have such foreknowledge of the outcome of an election?

Surely, either general indications make the defeat of the Government party at the polls a foregone conclusion, or else the issue remains doubtful until the votes have been counted. In the former case, the result will not be greatly affected by a dissolution being granted to the leader of the party which is, in any case, about to be heavily defeated at the polls.

Alternatively, if the outcome of the election seems doubtful, then the refusal of a dissolution to the Prime Minister and the granting of it to another parliamentary leader would be widely interpreted as a sign of Royal favour to one party at the expense of another, as your correspondent recognises in condemning Lord Byng's action in 1926. Naturally, if the alternative Prime Minister does in fact command a majority in Parliament then there is no doubt of his title to the office, and he may or may not then ask for a dissolution, as he sees fit.—Yours faithfully, R. BLUM

15 Crawford Street, London, W.1

The Budget and Tax Avoidance

SIR,—A fortnight ago you referred, in a note headed as above, to tax relief which an employee may receive on his contributions under a retirement scheme approved under Sections 19-23 of the 1947 Finance Act. You stated that they "can secure income tax relief to the full extent of their contributions under these schemes."

Unfortunately this statement is not correct. The 1947 Finance Act does not deal with the relief on the employee's contributions but merely lays down that if a scheme is approved under these Sections the employer's contribution will not be assessed as part of the employee's remuneration.

The 1947 Act provides neither for relief to the employer nor for the employee. To secure such relief it is necessary for the employer, so far as his own contributions are concerned, to establish with the Inland Revenue that his contributions can be treated as a legitimate business expense in accordance with the rules of Cases I and II of Schedule D of the 1918 Income Tax Act. The employee obtains relief in accordance with Section 32 of the same Act. This relief can only be granted if a life assurance or deferred annuity policy is taken out and he only receives relief at the ordinary rate for life assurance policies subject to the conditions of that Section.

If the employee's contributions are to be treated as an expense approval must be sought under Section 32, of the 1921 Finance Act.

The statement made in your article is an example of the confusion which frequently arises owing to the piecemeal nature of income tax legislation with regard to retirement benefit schemes. Sections 19-23 of the 1947 Finance Act are a particularly glaring example of this. Indeed, it would not have been possible in my view, to have applied these Sections in practice were it not for the very reasonable manner in which the officials concerned deal with the cases which come before them.—Yours faithfully, H. W. M. TELLAN

3 Abchurch Yard, Cannon Street, E.C.4

Polish Minority in France

SIR,—A recent article outlined the factors leading to the establishment of emigrant Polish communities in France. Although the prewar developments were dealt with accurately enough, I must question the analysis given of the postwar situation.

Your correspondent quoted a prewar figure of "over 500,000 Poles" in France. To be a little more accurate, the figure was about 800,000, which included the 100,000 Westphalian Poles and their descendants who left Germany for France after 1918. Of the working Polish population in France only about one third were in the mining industries.

If your correspondent's figures are accepted then it would seem that, up to the beginning of 1947, over 100,000 Poles left France. Yet, according to official Polish statistics, between July, 1946—when the repatriation to Poland of former emigrants began in earnest—and June, 1949, only 69,000 returned home from France, this total including DPs as well as re-emigrants. Where, then, did the others go?

Your correspondent referred to the French Government as taking precautions "to prevent the further spread of activities on the part of the agents of the Polish Government," which led to much resentment in Poland and a Polish Note of protest early in 1947 . . . "a second note followed a year later, and the two countries began to refuse permission to enter their country to each other's citizens." But, as far as I am aware, the only exchanges between the two countries during the period were the Cultural Agreement of February, 1947, and the Agreement on the provision of social welfare services for each other's citizens, signed in June, 1948. Indeed, in November, 1947, Wiktor Grosz, the Polish official spokesman, said: "Our nation regards France as a natural ally. It aims at closer Polish-French relations."—Yours truly,

JOHN CLEWS

The Union, The University, Birmingham 15

[1. We agree that the figure was about 800,000 before the economic crisis of 1929. Thereafter it dropped. M. Jules Moch, speaking lately on racial minorities in France to the Foreign Press Association in Paris spoke of "500,000 *en* 1937 *pour redescendre aujourd'hui à* 389,000." These figures can be confirmed from other sources. 2. A comparison between French exit figures and Polish entry figures must make allowance for the people who sojourn intermediately in a third country, and are registered by Poland as coming from that country. 3. The date of the Polish note of protest given by us as "early in 1947" should have been February 13th, 1948. The second note followed on March 9th—only a month later.—EDITOR.]

International Law

SIR,—Mr Cole's letter in your issue of April 15th contains an error of fact, which gives a misleading picture of Soviet foreign policy. The Russian postwar alliances are not "solely and explicitly aimed at an attack by Germany or any of her late associates." They are, as reference to the texts will show, aimed at Germany or any state directly or indirectly allied to her. This phrase not only can include the western powers, but is intended to. The Declaration of the Soviet Foreign Office on the North Atlantic Pact charges Britain and the United States with a policy of aggression which goes "to the extent of utilising for this purpose yesterday's aggressor who since the end of the war has come under their sway."—Yours faithfully, L. B. SCHAPIRO

Explaining Pakistan

"The Making of Pakistan." By Richard Symonds. Faber and Faber. 227 pages. 12s. 6d.

THIS book attempts a broader survey than the title might suggest. Though history is by no means neglected its main purpose is to describe the territorial composition, the economy and the predominant political outlook of Pakistan today. Here Mr Symonds has the great advantage of being the first in the field and within the narrow compass of some two hundred pages he has assembled a great deal of useful information not readily accessible elsewhere. At times Mr Symonds's commentary is overweighted with facts, but they are at least facts that deserve to be more widely known.

In terms of population Pakistan is the fifth largest nation in the world and it is situated geographically in a position of vital strategic importance. Yet despite its obvious significance in an age of global politics, the sense of neglect from which Pakistan suffers, and which has done so much to dampen earlier enthusiasm for the Commonwealth, is not wholly unfounded. Large and populous though it is, its southern neighbour is larger, yet more populous and more firmly established on the world stage. Mr Symonds's interim study has been written with all this very much in mind. His book is expressly intended to disseminate more widely a knowledge of the affairs of Pakistan, and if his approach, while always fair minded, shows partiality towards the country and people he describes, that in one sense enhances its value. It is to be read, therefore, less as a critical analysis of national problems and policies and more as an illuminating reflection of how they appear when viewed from Karachi. After reading Mr Symonds one can understand better why Pakistanis feel so deeply about the future of Kashmir, and can estimate more exactly what, in terms of practical economics, they mean by "Islamic socialism."

Five years ago only a small minority of outside observers believed that Pakistan could be created, or if it were, that it could survive. Perhaps this lack of foresight was due to overmuch concentration on what the politicians were saying or doing. Pakistan was not their creation. It was not even the creation of Mr Jinnah. He was the chosen leader but, as Mr Symonds observes, even if there had been no Jinnah it seems probable that there would have been a Pakistan. The urge towards a separate Muslim state came from below because the ordinary Muslim was rightly or wrongly convinced that he would not get a fair deal in a predominantly Hindu India. The state, therefore, from the outset was founded on religious, not racial, feeling. The popular will that, in face of immense difficulties, created Pakistan continues to sustain it. If at any time any doubts about the wisdom of Partition, or any wish for ultimate reunion with India, entered the minds of Pakistanis "it was buried for ever with the Punjab dead" in August, 1947. Yet while the almost messianic fervour of the people has accomplished much that would not otherwise have been possible, the hard facts of economics and strategic position cannot be disregarded. They are by no means uniformly unfavourable. On the contrary Mr Symonds is able to show that given reasonable conditions Pakistan's economic position is one of considerable strength. The great handicap in this, as in every field, is the division by a thousand miles of Indian territory of western from eastern Pakistan, the one traditionally linked to the Arab states of the Middle East, the other, more backward and isolated, an indissoluble part of South East Asia. Weré pressure from without to be relaxed centrifugal forces would almost certainly exert a dangerously disruptive power.

Mr Symonds has comparatively little to say of the external policies of Pakistan except in relation to India. He endorses the widespread view that in the event of war with India, now happily much less likely than when he wrote, emotional fears of Hindu domination would outweigh apprehensions of the consequences of Russian aid: he notes also that Mr Liaquat Ali Khan's now abandoned visit to Moscow was welcomed even by those classes who would have most to lose from association with Communism. In respect of the Commonwealth Mr Symonds is not a very discriminating guide. He records recent Pakistan criticisms of Commonwealth indifference and inaction in her dispute with India without examining how far they could be substantiated. The Commonwealth has done less than it might, but some Pakistani comments betray no very clear understanding of what it was possible for it to do.

Studies from the IMF

"Staff Papers." Vol. I. No. I. International Monetary Fund. 173 pages. Annual subscription $3.50 or equivalent. 3 Issues yearly. Obtainable from IMF, 1818 H. St., Washington.

ACCORDING to its Articles of Agreement, the IMF's duties include that of acting "as a centre for the collection and exchange of information on monetary and financial problems." These papers, the work of members of its staff, represent one item in the discharge of that duty. They constitute, in widely different ways, a most valuable contribution to the contemporary literature of international financial relations and the forces underlying these. They range from the quasi-legal (Mr Ervin Hexner's account of the relations between the International Trade Organisation and the IMF) through the statistical and factual (Messrs H. K. Carton and W. J. R. Woodley's invaluable analysis of the effect of the ECA programme on the imports of participating countries and on American exports) to the analytical and speculative.

In this last category, Mr E. M. Bernstein's paper on "Latent Inflation: Problems and Policies" deserves particular attention. Prior to the recent war little if any attention had been paid by economists to the logical, as opposed to the temporal, sequences of the process generally and too loosely labelled "inflation." Between the generating of the inflationary movement by those decisions, private or public—nowadays overwhelmingly the latter—which imply an expansion in the liquid means of payment, and the final economic and social adjustments to a jacked-up price level, there are a succession of distinguishable stages at any one of which the process may, by appropriate action, be brought to a temporary standstill. Thus price ceilings (reducing, with rising costs, the amount of goods coming on the market) and rationing, which both have the effect of freezing new money in the consumers' hands, generate unintentional savings and give a largely illusory impression that no inflation is taking place. Investment expenditure is similarly held in check, with a similar accumulation of unwanted liquidity, by raw material and manpower controls. Even in the next stage, when active accumulation of liquid assets has ceased and consumers and business men are trying to restore the normal proportion of wealth to income and the normal distribution of wealth between real and money assets, controls may prevent their doing so, and by thus inhibiting an actual price rise create the illusion that inflation has been avoided. That this "latent" or "suppressed" inflation is only less distorting and crippling to the economy than the old-style runaway collapse of the currency is one of the hard lessons of the postwar years. Mr Bernstein's luminous account of its nature, development, and possible (though difficult) cure is much the best which has yet appeared. It is well balanced by Mr J. Keith Horsefield's essay in the measurement of inflation—in the same sense—and further supplemented by a highly practical analysis, by Messrs J. J. Polah and T. C. Chang, of the effect of exchange depreciation on export price levels. If the "Staff Papers" keep up this standard in subsequent numbers they will rank as an indispensable part of the economist's equipment.

From Captain Cook's Journal May 26th. 1769

"Some flying showers again. This morning we hauled the pinnace a Shore to examine her bottom, and had the Satisfaction to find that not one worm hath touched it, notwithstanding she hath been in the water nearly as long as the Long Boat. This must be owing to the White Lead with which her bottom is painted . . . . for no other reason can be assigned why the one should be preserved and the other destroyed, when they are both built of the Same sort of Wood and have been in equal use. From this Circumstance alone the bottom of all boats sent into Countrys where these worms are ought to be painted with White Lead . . . "

TWO CAPTAINS ON WHITE LEAD

From a letter to ASSOCIATED LEAD MANUFACTURERS September 3rd, 1949

"For many years I was Deputy Conservator of the Port of Rangoon and had under my charge four unattended light-ships. They were anchored off the mouth of the Rangoon River and were subject to rigorous climatic changes and sea conditions . . .

In March 1942 the Port fell to the Japs. At the time all our light-ships were on station, with the exception of one relief. In May 1945 I returned to Rangoon and it was evident that none of these craft had received any paint attention during the Jap occupation but I found the *lead-painted* decks as intact and in as good order as the day we left them and some had not been painted for four years."

Yours faithfully,
H. C. Granger-Brown,
Captain M.N.

WALL STREET JOURNAL NOW AIR-DELIVERED TO BRITAIN

TO BRING YOU FAST ECONOMIC NEWS DAILY FROM AMERICA

SUBSCRIBERS in the London postal area receive The Wall Street Journal by air from New York, two days after publication date—a day later in the provinces. Service was inaugurated March 1, 1948; has been in successful daily operation more than two years. Subscribers include leading industrial and financial firms.

* * *

You are invited to subscribe. You will have the advantage each day of this fastest possible complete news which The Wall Street Journal brings you—covering U. S. industrial, financial and political developments. You will be kept speedily and intimately informed, as never before, of U. S. changes and trends affecting England's export potentials and your own future business and income. You will receive no modified or abridged edition, but the exact, full-content Wall Street Journal circulated in the U. S.

Subscription price is $72 a year—payable in sterling (£25.14.4 at current rate of exchange) at our London office by permission of the Foreign Exchange Control of the Bank of England.

Achievement in the Gold Coast

"The Gold Coast. A Survey of the Gold Coast and British Togoland, 1919-46." By F. M. Bourret. Oxford University Press for Stanford University Press. 231 pages. 18s.

DR FLORENCE BOURRET of the San Francisco College for Women has produced, with the encouragement and help of the Hoover Institute and Library in America, what must be assessed as the best study of a British colonial dependency that has been published in this country for many years. There is a hint in the opening paragraphs of the author's preface that similar books about other territories are to follow, to fill a need for the "scientific study of those factors which are determining the present progress, not only of Africa as a whole, but of each separate division" as the continent is drawn "into the full current of world activity." If that prospect is indeed fulfilled, the team of workers under Miss Margery Perham, which has done so much good work at Oxford during the last few years, will need to keep in strict training in order to maintain such lead as they may have established.

The book is admirably efficient, particularly in its choice of documentation; admirably objective; and admirably produced. It would be invaluable both to the student and to the practising administrator for the bibliography alone, which happily includes a list of the more important articles on Gold Coast affairs which have appeared in this country and the United States in recent years.

The aims and achievements of the European colonial powers in general and of Great Britain in particular have been subjected to so much apparently deliberate misrepresentation since the end of the war that it is a pleasure and a relief to find that, when the eye of the beholder is not distracted or prejudiced, the British definition of the difficulties standing in the way of a rapid fulfilment of Britain's expressed intentions in the field of colonial policy receives not only corroboration, but corroboration in terms which make British efforts to describe them seem entirely inadequate. Indeed, the terms in which Dr Bourret writes of administration on the Gold Coast will seem to some readers—and particularly to those who have been responsible for forming and carrying out policy in that difficult country—to be so impartial as to produce a picture altogether too favourable. Many such readers would argue that the Gold Coast, despite the far-reaching experiments in constitutional reform of which it has been the scene in recent years, has been the least well-governed of British African territories—and to judge from the deterioration in Anglo-African relations there, on which many travellers comment, their judgment is not necessarily wrong.

"The Royals"

"The Marines Were There." By Sir Robert Bruce Lockhart. Putnams. 229 pages. 12s. 6d.

SINCE the days of Charles II the Royal Marines have taken part in many and varied actions all over the world but probably their versatility was never displayed more fully than in the last war. Marines fought in craft ranging from battleships to kayak canoes; they provided crews for assault landing craft and Irrawaddy river boats; they were naval airmen; they were swimmers (popularly "frogmen"); they were coast defence gunners, anti-aircraft gunners, and merchant-ship gunners; they even manned and fought tanks on the Normandy beaches and in the subsequent street fighting in the coastal villages. Most important of all, they were Commandos. Throughout their history the Marines have specialised in assaults from the sea and by 1944 nine Royal Marine Commandos had been formed whose operations included the Dieppe, Sicily, Salerno, Anzio, Normandy and Arakan landings; the storming of Walcheren; and the Rhine and Elbe crossings.

Sir Robert Bruce Lockhart disclaims any intention to write a history of the Royal Marine Corps in the last war and describes his book as a "narrative." But to achieve success a narrative must have form; and descriptions of events must be logically arranged, either by time, or place, or function. "The Marines Were There," unfortunately, is written in a disjointed and rather anecdotal style that is unsuitable to a book of this character. The actions in which the Marines fought are as stirring as any that occurred in the last war: for example, the liberation of the Scheldt by the capture of Walcheren island gave them the opportunity to display the same courage and dash as their fathers had shown at Zeebrugge. Unfortunately the author's description of this superb, though relatively straightforward, operation is not easy to follow. He is more successful in his accounts of smaller operations, such as the feat in which canoes manned by Marines limpet-mined shipping alongside the quays of Bordeaux, after making the 70-mile passage up the Gironde from the Bay of Biscay.

There is a need for a proper history of the Royal Marines in the second world war, and for a critical examination of the policy or policies that governed their employment. There is a need, too, for a serious consideration of the place of Marines in modern military organisation. But Sir Robert Bruce Lockhart does not concern himself with these matters and the field is still clear for a satisfactory book on the subject.

Shorter Notices

"The British Journal of Sociology," Vol. I, No. I. Edited by M. Ginsberg, D. V. Glass and T. H. Marshall. Routledge and Kegan Paul. 10s. Annual subscription 30s.

THE first issue of this new quarterly journal contains five articles by distinguished workers in sociology and related fields. Although these articles are on different subjects and written from different angles, there is an underlying common theme—the need for more social research on a sufficiently large and thorough scale for it to assume scientific importance. This is scarcely a novel idea, but it is doubtful whether the really practical issues that may result are fully appreciated. These were stressed by Professor Glass in an inaugural lecture in the Chair of Sociology at the London School of Economics last year, and the address is reprinted in this journal. Since the government is having more say and the individual less say in shaping social policy, he urged the necessity for such action to be guided by the findings of social research and considered, as an example, its probable usefulness in town and house planning.

The main interest to the research worker in this publication will undoubtedly be that it contains the first report on the five-year programme of research into the sociology of the middle classes which is being carried out by the London School of Economics from a grant made by the Nuffield Foundation. Admittedly, the report made by Mr T. Hall and Mr Caradog Jones touches merely on the fringe of this vast scheme, but it gives a taste of the things to come. It is concerned with the social grading of occupations to see if social class when related to occupation has any generally accepted meaning. After obtaining opinions from about a thousand people on the grading of 30 occupations, the authors found that these opinions differed very much less than they had anticipated. Their report contains in some detail an analysis of the results. If the findings of such social research are made readily available in future issues of the journal, it will serve a useful purpose.

AMERICAN SURVEY

Mr Acheson's Send-Off

(From Our American Staff)

AMERICAN Secretaries of State normally face stranger occupational hazards than the Foreign Ministers of other civilised countries and those who decide to serve the United States in its foreign service have grown used to expecting no reward except to be described as "striped-pants cookie-pushers." But the ordeal through which Mr Acheson and his unfortunate staff have been dragged in the last few weeks is without precedent. The *New Yorker* remarked recently that the moral and intellectual squalor of this period had not been matched in living memory. The State Department long ago learned to ignore the derisive legend of its indolence and the belief that it would inevitably be defeated at the hands of more cunning European diplomats. But to have its loyalty and its morals attacked—without warning or evidence—by members of the Senate is something new and shocking.

It is against this background that Mr Acheson will meet Mr Bevin, M. Schuman and the other Foreign Ministers of the Atlantic Pact countries in London. It would not be surprising if he and his advisers were to arrive with nothing in their heads except lists of organisations to which they had never belonged, subversive characters they had never met and secret Communist meetings they had never attended. It is certainly unlikely that they can bring much in the way of new thought and sparkling policies; they may even prove unaccountably stubborn in their refusal to accept other people's ideas. If that should happen, the fault will not be in them but in their scars. Mr Walter Lippmann pointed out three weeks ago that "Mr Acheson and his colleagues are like a man who is trying to put together a complicated jigsaw puzzle with one hand while with the other he has to keep at arm's length a crowd yelling in his ears, beating him over the head, pulling his hair and untying his shoes."

Mr Acheson has been unfortunate, since Congress returned in January, in having no great issues with which to arouse either the Congress or the country. The Marshall plan is no longer news. In contrast to the scene two years ago when the first hearings before the committees brought headlines and full houses, the arguments for the third year's authorisation were heard without benefit of publicity. When the Secretary of State gave evidence there were only two or three Senators present and the questioning was perfunctory. The two programmes for which the State Department is mainly responsible this spring are neither of them Congressional favourites. Point Four, even at $45 million a year, was cut in half in the House of Representatives and hours were wasted in the Senate on discussing whether it was safe to embark on such a programme while one of Senator McCarthy's victims was employed in administering it. The wisdom of even suggesting, at this session, the ratification of the charter of the International Trade Organisation, the second of the department's programmes, was always questionable. Nothing is likely to be done about it and the secretary's presentation of his case, even if it had been as convincing as the fanatical supporters of the ITO hoped it would be, could never have generated the kind of enthusiasm which drives ex-Communists off the front page.

The ex-Communists are, indeed, becoming a formidable aristocracy in this socially egalitarian United States. If, as some think, titles are a better goal to set for the ambitious than some which have been erected in their absence, now is the time to consider using them. Whittaker Chambers, 1st Baron of Westminster (in the State of Maryland), and Louis Francis Budenz, Viscount Fordham, might be content to retire in dignity on their laurels and leave the front pages to the young and eager; the government of the United States might then be able to get on with the job of fighting the cold war against Communism, instead of answering the charges of those who have left the ranks of the faithful or have been expelled from Eden, as has been Mr Earl Browder, who, despite his parents' attempt to pick his title at birth, rates no more than a knighthood. The point has now been reached when, in the view of many Republicans, the fitness of officials for their jobs depends on an evaluation of the conflicting evidence of the ex-Communists.

*

Without spectacular policies to divert attention from Senator McCarthy's commando raids, Mr Acheson has been compelled to come down into the arena himself. Two weeks ago he spent nearly an hour defending, before the American Society of Newspaper Editors—and it must have been deeply humiliating to him that such a defence was necessary—his team of Assistant Secretaries, seven of the ten being, as he pointed out, "old-fashioned Southern Communists" from the Carolinas, Texas, Alabama, Georgia, Louisiana and Tennessee. Two days earlier these same editors had vigorously applauded a vituperative and factually inaccurate speech from Senator McCarthy in which he referred to General Marshall as a "pathetic" Secretary of State. To counter its effects, Mr Acheson had to cut short a speech on foreign policy and point out that his department "is manned today by able, by honourable, by loyal, by clean-living American men and women."

Though there is no disposition to agree with the Senator over General Marshall's qualities, there is considerable disappointment that the General has remained so long outside this controversy, except for one letter in support of Dr Jessup and one denying knowledge of Dr Lattimore, which also contained some sentences of general disapproval for Republican tactics. The State Department which his successor inherited was searched for Communists while he was Secretary and the staff he handed on was cleared of suspicion during his term of office. The Chinese policy for which Mr Acheson is now being abused is, whether it is right or wrong, General Marshall's. Had he accepted the responsibility which was his, he could, with his immense national prestige, have scattered the State Department's traducers with a few words. It is surprising that such a disinterested public servant did not at once understand the urgent need for him to go to the help of his successor and his old colleagues.

But for two months Mr Acheson has had to shoulder the whole burden, while contemplating the decay of the American position in the Far East and preparing for the London conference at which a number of vital decisions should be made. Few in Washington, who have lived through these months of degradation, believe the conference can now be productive. The precarious position of the French and British governments, originally thought to be the limiting factor, are now less important inhibitions than the American domestic situation. The appointment of the two Republican ex-Senators, Messrs Cooper and Dulles, will help, though they are more likely to become a rallying point for the saner members of their party in the Senate than the symbols of a true bipartisanship. There is now no Senator Vandenberg to bring the barbarians to their senses and it is inconceivable that considerations of national interest could move Senator McCarthy from the course he has set in quest of his consuming ambition—to be the first Catholic President of the United States. There are those who think that, young as he is (he will be 41 this year), he was still born some twenty years too soon for its fulfilment. He would be the ideal Presidential candidate, it is believed, in 1984.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Negroes in Uniform

[FROM A SPECIAL CORRESPONDENT]

THE compromise civil rights Bill designed to safeguard minorities against discrimination in employment, that the House recently passed, substitutes moral exhortation for the legal sanctions of the Administration's draft; but even this tepid measure is unlikely to survive a Senate filibuster. Many Republican legislators, well aware that for campaign purposes a bird in the bush is often worth two in the hand, suspect that Mr Truman is resigning himself with equanimity to this defeat. Some of them, in their chagrin, have cast doubt on the President's sincerity and ask why, if he is really concerned about the plight of the Negro, he has not ended racial discrimination in the armed services, where it could be abolished without legislation. Mr Truman probably welcomes this attack, for he knows what the opposition and the country have not yet discovered: that the only real progress which has been made in extending civil rights has taken place in the services because there the President can act without waiting for Congress.

Immediately after the Democratic convention in 1948, Mr Truman issued an executive order, declaring there should be equal treatment and opportunity for all persons in the armed services and appointing a committee to make recommendations to put this policy into practice. At that time, both the policy statement and the committee were regarded as desperate rearguard actions in support of a lost cause, the total effect of which would be to secure a few Negro votes and produce some moral generalities by the committee that the services could safely ignore.

Instead, during the past 15 months the President's Committee on Equality of Treatment and Opportunity in the Armed Services has minutely scrutinised the racial practices of the services. Not content with making recommendations, it has succeeded in persuading the services to adopt all of its proposals to eliminate discrimination. The result has been a quiet social revolution in the forces—a revolution that may, through example, prove far more effective than legislation in achieving the ends of the President's civil rights programme.

*

The services have always defended their denial of equal opportunity to the Negro on two grounds. First, the Negro population could not match the white in intelligence and technical skill; therefore military efficiency required that Negroes be confined to a few jobs that required little skill. Second, social custom dictated segregation of Negro recruits in certain units. "To get ahead of the country" would provoke trouble and imperil efficiency.

Strictly on the ground of military efficiency and quite apart from the desirability of equal treatment, the committee pointed out that to base job assignments on an estimate of general racial intelligence was to ignore individual differences with consequent waste of manpower. Furthermore, it claimed that segregation was doubly inefficient because it not only condemned the highly skilled Negro to a unit unable to use his ability, but it concentrated the unskilled in one group, thus multiplying their ineffectiveness.

The experience of the Navy supports the Committee's conclusions. Before the war, the Navy used Negroes only in the messman's branch. During the war it reluctantly,

WORLD-WIDE COMMERCIAL BANKING

IRVING TRUST Company

ONE WALL STREET NEW YORK 15, N.Y.

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

and after much protest, opened general service opportunities to Negroes, but refused to use them in the seagoing fleet. It soon discovered that the range of individual Negro skills was wider than it had supposed. The Navy could not utilise these skills in shore installations and harbour craft; but, because segregation on shipboard is impossible, it felt it could not risk lowering morale by putting Negroes in the crews of combat ships.

As an experiment, the Navy, toward the end of the war, assigned Negroes in general service ratings to fleet auxiliary ships. The expected trouble did not develop, and early in 1946 the Navy announced that henceforth Negroes would be eligible for all ratings in all ships of the service. Furthermore, there would be no segregation in berthing, messing, or other facilities. As a result Negroes are now found throughout the fleet in all types of ships.

*

Some Army officers contended that the experience of the Navy proved nothing because Negroes formed only two per cent of naval general service, as against nine per cent of Army enlisted, personnel. This argument has been effectively demolished by the Air Force. With the exception of two all-Negro fighter outfits, which saw service in Italy, and one bombardment squadron, which was completing training at the end of the war, Negro airmen in the recent war were used principally in engineering, quartermaster and ordnance battalions. By the end of the war the Air Force was convinced it had needlessly wasted the abilities of a large number of Negroes. After Mr Truman's executive order was issued, the Air Force prepared a new racial policy and laid it before the President's Committee.

This programme has been in effect for nine months. In that time the Air Force has disbanded the all-Negro 332nd Fighter Wing and transferred its men to white organisations. Some of the pilots are now in jet aircraft; others are serving in Germany and Japan. In addition, individual commanders have screened their Negro personnel. Those eligible for technical training have been sent to school and the rest have been returned to the same jobs, but in units formerly all white. As a result, 74 per cent of the 25,000 Negroes in the Air Force have been fully integrated, and the programme is continuing. All Air Force jobs and schools are open to Negroes, and the percentage of Negroes in technical schools teaching radio and radar closely approximates the percentage of Negroes in the Air Force as a whole, thus indicating the calibre of Negroes the Air Force is attracting. As in the Navy, they are messed and housed with whites.

The Army offered the only serious resistance to reform, partly because it has had segregated units since 1866 and partly because of the large number of officers from the South. In conferences lasting several months, the Committee has pointed out insistently that it is impossible to extend equal opportunity to the skilled Negro, or use his abilities to the full, in a segregated unit. A Negro army one-ninth the size of the white cannot possibly duplicate the latter's variety of functions and opportunities. Because the jobs were simply not available in Negro units, the Committee found that 198 out of 450 Army occupations were closed to Negroes, and that 81 per cent of Army school courses were likewise beyond their reach

The traditional 10 per cent quota allotted to Negroes, because this is roughly the Negro proportion of the population, was an obstacle both to Negro opportunity and to Army efficiency. When the quota was full, the Army shut off new Negro enlistments, but continued to re-enlist its unskilled Negroes. As a result, the door was closed to highly qualified Negroes who would be of use in training others, and left open to the professional Negro private.

After nine months of negotiation, during which the Committee hammered these facts home, the Army finally agreed to accept all four of the Committee's recommendations, and announced it would make all jobs available without regard to race, put school attendance on a strict basis of merit, abolish the 10 per cent racial quota, and begin the assignment of Negroes to white units. This revolution has been effected without any public agitation and with a minimum of publicity. But the President would now probably welcome some questions from Republicans about racial discrimination within the armed services.

American Notes

Democrats Go Right

Last Tuesday saw the formal opening of the election campaign which will end in six months' time, when the voters will choose 435 Representatives, 36 Senators, 33 State Governors and holders for numerous local offices. The Administration hopes to make Mr Truman's nominal Democratic majority into a genuine Fair Deal one, the Republicans to repeat their habitual success in off (non-presidential) years. Until this week the Democrats seemed to have much more solid reason to hope than the Republicans: then came the Florida primary, in which voters in that State picked their party candidates for next November. The fight was for the Democratic nomination, which in the South means election, but the victory went to the Republicans. For Senator Pepper, labour's favourite son and a Fair Dealer who sometimes goes too far left even for the Administration, was defeated, after fourteen years, and by a large majority, by Representative Smathers, the darling of the Republicans, who has been as conservative as even they could wish during his two terms in the House of Representatives.

Mr Smathers is younger and handsomer than Senator Pepper, and an ex-Marine. Both candidates fought a vigorous down-to-earth campaign, but Mr Smathers made capital out of the illiteracy of Florida voters. He announced with bated breath that Senator Pepper was "a shameless extrovert" and had practised "celibacy" until his marriage. These damning characteristics were unearthed by the Federal Bureau of Investigation, according to Mr Smathers; he also made much of the Senator's past connections with Mr Henry Wallace in an apparently successful effort to suggest that there is more than his name to link Mr Pepper with the adjective "red." Other Democrats will decide, perhaps too hastily, from the evidence of the Florida primary, as the Republicans have already done, that demagogic anti-Communism of the McCarthy type pays electoral dividends and that voters this year, unlike 1948, seem to think highly of those who oppose the welfare state.

*

In Alabama Senator Lister Hill was never in danger of losing the Democratic nomination; interest there centred on whether "regular" Democrats would regain control of the party's state machine from the rebels who gave Alabama's electoral votes to the States Rights' candidate for President in 1948. The regulars seem to have triumphed on Tuesday, but their official reason for wanting to win was that it would be easier to work against civil rights for Negroes from within the party than from outside it. Many liberal Democrats believe that their party can never be healthy until it cuts out its conservative deadwood and to them the victory in Alabama will be little comfort for the defeat in Florida.

In Ohio, also, this week's primary was largely a Democratic affair, for no Republican aspired to supplant Senator Taft. There were seven Democrats seeking the honour of opposing him, none of them as strong as the party might have wished. Mr Joseph Ferguson, who won the nomination, is an experienced, if not outstanding, candidate and with labour's help may do better against Mr Taft than now seems likely. But there are Democrats who believe that Mr Taft is the Republicans' worst enemy and that it would be a pity to defeat him this year and put him out of the presidential running for 1952.

* * *

Up-to-Date Defence

It looks as if the Administration's revaluation of the country's military needs, which has led the Secretary of Defence to ask Congress for increased appropriations, was inspired more by the warming-up of criticism at home than of the cold war abroad. Of the recent developments which Mr Johnson cited as having forced the Joint Chiefs of Staff to make this reappraisal, one was certainly recent—the Russian attack on the American Privateer over the Baltic, which will do much to make Congress appreciate the need for more and better American aircraft. But several of the other developments, notably the Russian atomic explosion, were old enough to have been appraised before the President presented his 1951 budget to Congress. However, it was only a few weeks ago that General Eisenhower, expressing his concern lest America's defences become dangerously old-fashioned, blew into flame the ever-smouldering criticism of Mr Johnson's attempts to cut these defences out of what was thought to be too small a piece of the taxpayer's cloth.

While the Air Force and the Navy are probably better dressed than they make out, Mr Johnson evidently now agrees that their aircraft will be seriously out-of-style within a few years unless present replacement rates are stepped up. This will be possible if Congress follows the example of the House Appropriations Committee, as it seems ready to do in spite of the economy drive, and gives Mr Johnson the additional $350 million which he has now requested for the coming fiscal year. Apart from $50 million for anti-submarine vessels, the new money would be spent entirely on aircraft; the Navy would have $750 million altogether for aeroplanes next year and the Air Force $1,550 million. This would help it to achieve 48 up-to-date groups, and this, for the moment, seems to be the height of its ambition. Even its new Secretary, Mr Thomas Finletter, one of the original advocates of the 70 groups that would supposedly give the United States supremacy in the air, is understood to have accepted 48 groups as the only practical possibility at present.

The immediate difficulty is that rising costs and new inventions such as jet engines have upset long-term calculations. The Air Force's controversial B36s, to which the Defence Department's weapons evaluation group has now given its approval, cost about $4 million each, twice as much as the obsolescent B29s which they are replacing. The Navy estimates that its aircraft will cost, on an average, 15 per cent more next year than this, and it is proposing to bring itself up-to-date with an atomic submarine and other new weapons. The Army will not be far behind. Mr Johnson warned Congress that it was entirely possible that even bigger defence appropriations would be needed in future years, not only for America's own military forces but also for the military aid programme. The Air Force in particular is likely to be asked to increase its contribution to European defence under the "national specialisation" scheme, which General Bradley forecast on his return from the Atlantic Pact conference at The Hague.

* * *

Foreign Aid in the Doldrums

After two weeks of desultory debate—an average of one speech a day to a handful of uninterested listeners—the Senate will vote on the third year's authorisation for the European Recovery Programme as Mr Acheson packs his bag for Paris. The Economic Co-operation Administration has asked for $2,950 million and the Bill also includes funds for Korea, the "general area of China," Arab refugees and $45 million for Point Four, technical aid to underdeveloped areas. The annual attempt to force Spain upon the democratic European club was defeated as usual, but by a disappointingly small majority, after the Administration pointed out that a loan to Spain under the Marshall Plan would be taken as an affront by many European countries; furthermore, Spain had never made an official request for a loan through the Export-Import Bank channels open to any country that offers a reasonable prospect of repayment.

Senator Kem's proposals, that aid should be denied to any country that nationalises further industries or sells goods with war potentialities to Russia, are merely regular move in this Missouri Republican's private war with Britain. But this year he has been joined by Senator Taft, a fighter much more to be feared, who is attacking on a less easily defended flank. Since Britain has restored its gold and dollar reserves by devaluation and since the sterling area has balanced its international budget, Mr Taft sees no reason "why we should advance anything to Great Britain in the year ahead." There is no doubt that he would have seen even less reason if Britain under party-type condemned ECA as problems and that he would have cut Commission as he now severely for overspending last year's appropriation near to the does for underspending it. The fact that ECA saved $150 million last year proves to Mr Taft that its estimates are "padded" and that it certainly can do with less than it is asking for this year.

He has not yet decided which of the various amendments for reductions of from $600 million to $1 billion has the best chance of passage and is therefore worthy of his support. But, unlike Senator Fulbright who is disappointed that his goal of European federation is no nearer, Mr Taft insists that the goal of the Marshall Plan has been achieved and that money spent on it in future will have no connection with the security of the United States. This would, in his opinion, be better served by an attempt to balance the budget by reducing expenditure. Senators Milliken and Saltonstall have found one way of doing this, temporarily at least; instead of authorising $45 million for Point Four, they suggest that a bipartisan commission be set up to report on the scheme some time before the Marshall Plan ends in 1952. They maintain that Point Four is too important to be buried in an omnibus authorisation and that it deserves separate consideration on its own merits.

Crime and Politics

The shots that killed Charles Binaggio, a Kansas City gambler allegedly involved in a nation-wide crime syndicate, did not, as might have been expected, act as a starting gun for Senator Kefauver's proposed investigation of interstate crime. Instead, they warned the Democrats of the political dangers of an inquiry which had until then seemed non-partisan. Binaggio was murdered in the Democratic Club which he ran on Truman Road, and at his funeral local Democratic leaders shared the duties of pall-bearers with local gangsters. His death is believed to be the penalty for failing to "open up" Kansas City to criminal elements, as he had supposedly promised to do in return for substantial contributions to Democratic funds in the 1948 election campaign. It may also have been retribution for testifying against his criminal associates to a federal grand jury, which has now reported its shock at finding that criminals in Kansas City have a regular system of violating State laws against gambling, "without the slightest risk of prosecution."

This grand jury, and those which are enquiring into crime in other cities, were set up on President Truman's

For an all-in charge they get not only "flash" information on races, but police protection and guarantees of immediate *habeas corpus* proceedings and bail if arrested. But no laws can stop the gambling which is inherent in human nature, in the opinion of the famous leaders of the underworld, who have been giving the committee the benefit of their experience, and there is much agreement with this view.

Postmen only Ring Once

The Postmaster General held a pistol to the head of a surprised and indignant Congress when he announced that he would allow the postman to ring only once a day at doors in residential areas, instead of twice, and only once on Saturdays in commercial districts. Mr Donaldson is anxious to reduce his office's present yearly deficit of over $500 million, but he does not hope to abolish it entirely. The Post Office in the United States, in contrast to the British postal service's steady profits, has had a deficit in 83 out of the last 100 years. Congress has been content to regard the loss as an educational subsidy, but the Postmaster General claims that the present disparity between income and outgo is too great, and the House Appropriations Committee has shown how unwilling it is to add to the taxpayer's burden, by cutting down the department's proposed income for the next fiscal year by $25 million.

Mr Donaldson says the volume of mail has increased more than three and a half times since 1938 but that operating costs have mounted even more swiftly. Rents and leases are more expensive and wages have risen steadily ; only last year Congress nullified the effects of a rate rise in fourth class mail by giving the numerous Post Office employees an additional $150 million a year. The costs of air and rail transport are fixed by two other government agencies, the Civil Aeronautics Board, and the Interstate Commerce Commission. The air mail contracts cover hidden subsidies to the air lines which the Hoover Commission believed should not be borne by the Post Office, while the ICC is considering petitions filed by the railways asking for a 60 per cent increase in payments for carrying the mail. Meanwhile mail charges have hardly changed and only the first class service is run without loss.

Reorganisation of the rigid and unwieldy structure of the Post Office is long overdue ; so are economic charges for services that are not of benefit to the whole community. The Hoover Commission estimated that the Post Office could save about $200 million annually by inaugurating a modern accounting system and by setting up regional headquarters to centralise the direction of the service in big cities and elsewhere. But these measures, as well as the Bill to end the time-honoured system by which Congressmen virtually appoint 22,000 out of the total of 470,000 persons employed by the department, have been shelved for nearly a year. In addition Congress is reluctant to prescribe the obvious, but politically unpopular, remedy of higher mail rates. A Bill recently approved by the House will only add $131 million a year to the revenue, compared with the $375 million requested by Mr Truman in his budget speech this spring.

Even this small advance has been very strongly opposed by the publishers and newspaper proprietors who will be affected by increases in charges for second-class mail, although many privileges they enjoy, such as free delivery in the county where a paper is published, are retained in the Bill. Their pressure has also resulted in the approval of a number of exemptions from the increase, for newspapers with small circulations, for example. However, Mr Donaldson's decision to cut the postman's rounds—and the number of postmen—to fit the Post Office's income may rouse other interests and make Congress think again.

Shorter Notes

President Truman, in the interests of newspaper correspondents as well as of himself, has transferred the weekly Presidential press conference from the overcrowded private office in which it has been held for thirty-seven years to a conference room across the street. There every reporter has a chair and all can see the President, a new experience for some of the shorter ones. But some are finding it difficult to adapt themselves to the new formality, comfortable though it is, especially to the apparently embarrassing requirement that they must identify themselves before asking a question.

*

It was only over the week-end that the strike of apartment house workers forced New Yorkers to walk upstairs and do without central heating and hot water, but it was a cold weekend and the fifteenth floor is not a very desirable residence when there is no lift. The union of Building Service Employees, formed in the depression years, has won regular wage increases, until its members now earn $45 to $50 for a 48-hour week ; but this year the new state law continuing rent controls drove the real estate interests to make a stand against further increases. The men have now gone back to work until a fact-finding commission makes its recommendations.

THE WORLD OVERSEAS

The Canadian Opposition

(From Our Ottawa Correspondent)

CANADA, like the United States, is at present in the midst of a prolonged period of rule by one party. In the United States the Republicans' search for a policy has an air of desperation because of the approaching elections of 1950 and 1952. In Canada the Conservatives are engaged on a similar search, less spectacular but more leisurely. After their crushing defeat last year they have another three or four years before they need fear another election. Only 40 Conservatives came back to Parliament after the election of last June. Thirteen Socialists (members of the Co-operative Commonwealth Federation) and 10 Social Creditors (all from Alberta) made up the rest of the House with a few independents. With a majority of this size the Liberals should have nothing to fear from the Opposition, and so far the only parliamentary trouble has resulted from their own blunders. But on anything beyond a very short-term view it is a matter of considerable concern that an effective opposition should be developed.

The peculiarity of Canadian politics is that the cycles of party power are extremely long. It is easier to describe political history in eras than in ministries. From Confederation in 1867 until his death in 1891 was the era of Sir John A. Macdonald, who was not only the Father of Confederation but also of the Conservative Party. His era was interrupted, on account of the "Pacific Scandal," by one term of Reform Government. On his death there followed five confused years with four Prime Ministers until Sir Wilfrid Laurier took power in 1896. His was the first great Liberal era, which lasted until 1911, when he was defeated mainly over the issue of a reciprocal trade agreement which he had signed with the United States. The Conservatives, who under Sir Robert Borden had used the slogan "No truck nor trade with the Yankees," had plenty of chance for all the imperialism they could muster. Their era lasted until 1921, although in the last four years they had the support of pro-conscription Liberals. From 1921 until today it has been a Liberal era. Mr Mackenzie King's long rule was broken by a few months of Conservative government under Mr Arthur Meighen in 1926 and by one full Conservative term under the late Viscount Bennett from 1930-1935. But these were mere interruptions in the long run of Liberal successes.

This phenomenal spell of Liberal rule shows how difficult it is to develop an alternative government ; it also shows how badly an alternative is needed. But there is a fundamental problem involved in trying to reconcile the two races and all the numerous divergent economic interests of Canada. To develop a policy which will win support from all parts of the country is like walking a tight-rope, and the peculiarity of tight-ropes is that there is room for only one person on them at a time. It is relatively easy for an opposition party to find a policy which will appeal to one section of the country better than the Government can. It is very difficult for it to push a government off the tight-rope and climb on to it itself. Any party in power is likely to be more pragmatic than dogmatic, and this is certainly true of the Canadian Liberals. They can adjust their balance to meet changing circumstances much more easily than the Opposition can demonstrate what it could do.

Moreover, the field of controversy is very restricted. In foreign policy there is no fundamental divergence between the parties. In matters of social security and national defence they all profess to be aiming at the same thing. They can only compete by outbidding each other. Apart from the inevitable and proper running fight about economy in government and details of administration, the one major field which offers promising ground for public contr…ersy is that of trade and economic policy.

With memories of Sir John A. M… …nald's "National Policy" (which covered his protecti… …), of Borden's "No truck nor trade with the Yankees" a… of Bennett's Imperial Preference, the Conservatives are naturally regarded as a high-tariff party, an imperialist party, a party of the eastern industrialists. On this basis present Conservative policy might be expected to be to move Canada as near to the sterling area as a dollar country can get. One might expect to hear talk about the British connection and a good deal of anti-Americanism. It seemed natural that one of the first Conservative contributions to the continuing debate on trade policy would be a proposal for a Commonwealth conference. But the party spokesmen were careful not to say what the conference should do ; and indeed the proposal seemed little more than an attempt to embarrass the Government by suggesting that it should do something instead of nothing. It conspicuously failed. The imperial note will be sounded once in a while, but it is unlikely to be a major theme in the Conservative policy. The party shows no more signs of anti-Americanism than anybody else.

Self-Confidence of Industry

Protection in the era of Conservative rule meant primarily protection against American industry. Its prime beneficiary was the young industry of Canada. It was aimed chiefly at manufactured goods. But now the Canadian manufacturers' view has changed profoundly. Mainly as a result of two world wars, Canadian industry has a confidence it has never had before. In a great many fields Canadians now feel sure that they can build machines or turn out manufactured goods more cheaply and just as well as their American competitors. In the field of agricultural implements—as one outstanding example—one firm at least has proved the claim to be true. But this assurance depends on a number of conditions, and the chief of them is that it should be possible to produce in sufficient volume to permit the most economical mass-production. So the manufacturer as well as the farmer is now more concerned with outside markets than with protection against outside competition.

Where does this leave all the Opposition parties? It leaves the Socialists (the CCF) with a clear policy line of very limited appeal. The Co-operative Commonwealth Federation is a curious party. In its origin in the early 1930's it was an attempt to amalgamate three elements which have never been easy to harness together in any country—the radical farmers, the left-wing intellectuals, and some scattered workers' organisations. Although in very recent years the Canadian Congress of Labour has formally supported the CCF, the 1949 election showed an almost complete failure of the much-heralded Labour support in the industrial East. The baker's dozen of CCF in the present House are mainly Western and predominantly from Saskatchewan.

Naturally the CCF talks about the importance of the British market, accepting sterling, and setting up import and export boards. The wheat farmers, more than any other group of Canadians, depend on overseas markets, and particularly on Britain. If things go really wrong for other sections of the community, if an American recession should reduce the market there for Canadian goods the CCF might rally much wider support. A depression would do for the CCF what nothing else seems able to do.

The Conservatives are trying to get away from any local appeals of this kind—though they too have not been above making them—and to discover a national appeal. The search seems to be leading them towards a policy which is not so much a contradiction of the Liberals' policy as an extension of it. They will not attack the idea of looking to the United States (as at one time it seemed they might): they will say that Canada ought to produce more for that market. They will not deny the importance of getting tariff concessions from the Americans; they will insist that Canada must persuade or bully the United States into taking its manufactures rather than the raw materials Americans generally look for. They will demand exploitation of Canadian resources for "Canada First." It remains to be seen whether the present leaders of the party can make a coherent policy out of this. But on the surface it looks as though it might be made into the modern version of the "National Policy." In this 1950 world the old cries of protection or imperial preference no longer have much pull. The industrialist who used to demand protection now demands fresh markets. The farmer who used to demand low tariffs is now more concerned that Canada should import from the countries that will buy his produce. Both might be satisfied by the dream of a great mineral and industrial expansion based on sales to the United States and greatly increased domestic consumption. Something of the kind seems at the moment to be what the Conservatives are aiming at.

The Liberals can adjust their policy to meet all these circumstances as they arise. The CCF must stick to its socialist doctrines and look after its farm supporters. The Conservatives have the unenviable task of putting together a consistent and positive policy to deal with these new pressures better than the government can. As yet they find it difficult to explain what this policy will consist of, but they hope that before 1953 and 1954—that is before the next election—that they will have found the answer.

French Communism—III

Communism and Gaullism

[FROM OUR PARIS CORRESPONDENT]

THE Communist Party has, it is generally agreed, no chance at all in the foreseeable future of coming to power in France either by vote or by a *coup d'état*. As is well known, during and after the war the Communists used their pre-eminence in the Resistance for two main purposes: to eliminate from French public life as many as possible of the political and administrative personnel of the Third Republic, and to train their own cadres for the eventual seizure of power. So well did they succeed in the first task that, at the height of their influence (during the period between the resignation of General de Gaulle in the spring of 1946 and their own dismissal from the government by M. Ramadier a year later), they had managed to place their representatives or nominees in most of the key positions of state. In particular the army and the police were, although not in party hands, at least under paralysing supervision. The chaotic purge of collaborators from 1944 to 1946, in which fuel was added to the Communist fire by other *arrivistes* anxious to get ahead while the going was good, completed the demoralisation of the bourgeoisie and official classes, to the lasting detriment of France's political unity.

In the opinion of certain experts in Bolshevik tactics it was never the Kremlin's intention that the French Communists should attempt to seize power after the liberation. Various factors, notably the presence in France and Germany of allied troops in strength, made this course inadvisable even at the peak of Communist Resistance prestige. The method of advancement then chosen was rather that of the systematic penetration of the "bourgeois state" with a view to later absorption of all non-Communist elements—as was to happen, for instance, in Czechoslovakia. The reappearance as veteran parliamentarians of MM. Thorez, Duclos, Cachin and other deputies of prewar days coincided, as had been planned, with the banishment from parliament of a considerable number of trained politicians who had been made ineligible by law. When, in the autumn of 1946, the Communist Party was returned with the largest number of deputies and M. Thorez became vice-president of the French Republic, it seemed that Communist participation in the government had come to stay.

Failure of Past Strikes

Things turned out differently. Events in Indochina, the initiation of the Marshall Plan, and, above all, the deterioration of diplomatic relations between the Soviet Union and the western powers reduced Communist influence on French policy. The general strike of 1947 and the miners' strike of a year later, both of which were disastrous failures, reduced Communist popularity to its present rather low level. This recoil, a normal enough episode in the Communist "dynamic process," in no way diminishes the potential force of French Communism. For, if the Right has made a corresponding recovery of political power, it cannot be said that any of France's major social problems have been settled during the early childhood of the Fourth Republic. The political temperature is still low, but should the French workers feel like picking a quarrel, they have a good deal to quarrel about, and professionals to help them conduct it.

It is possible that the present Communist campaign against the receipt of American arms will be "symbolic" rather than "objective"; that, instead of risking serious losses, mass arrests, pitched battles in the field and the enacting of an adverse electoral law in the National Assembly, if not the outlawing of the party itself, the Communists will confine themselves to propaganda for "peace." Time will show. Meanwhile, a more solid ground of agitation is undoubtedly the question of industrial workers' wages, which are both low and inequitably distributed. The reintroduction of collective bargaining has immediately instigated a wave of strikes. The Government, hamstrung by the insolvency of the state railways and other public utilities, cannot afford more than about a 5 per cent increase in its payroll. The private employers, who would greatly embarrass the Government by themselves going far beyond this figure, have so far offered no more than a 5 or 6 per cent raise, although it is generally considered that they are willing to go to 8 or 10 per cent. The CGT's demand of an overall 3,000 francs bonus is believed to entail a 20 per cent increase, account being taken of the employers' increased contribution to the Social Security *caisse*. These figures are hotly debated. Nothing at any rate is settled and the situation does not promise well. On May 8th the collective bargaining Council will meet to try to agree upon a minimum wage. With the Communists holding out for a minimum of 20,000 fr. per month hope of agreement seems slight. The recent riot at Brest, in which an employer in the building trade was set upon by demonstrators, was caused by agitators exploiting wage-grievances.

The demonstration, it is interesting to note, did in fact secure a wage-raise, although not *hiérarchisé* as the jargon has it, that is, with larger increases for the unskilled than for the skilled workers. It is at this moment in the economic tussle that General de Gaulle is making something of a come-back.

The *Rassemblement du Peuple Français*, which the General founded in 1947, has shown itself powerful enough to act as a counter-force to Communism in appealing to the people's imagination. The RPF's handicap, apart from the General's alarming, if in other aspects reassuring, personality has been a fundamental vagueness as to its nature, its method and its programme. At his last press conference, however, General de Gaulle said exactly what he meant by *un rassemblement au-dessus des partis*, a conception that had previously smacked of Bonapartism. The *Rassemblement* is in fact to be a new and very large party, unlike all the others: unlike them because it would be much larger and therefore independent; unlike them because, as a majority party, the *Rassemblement* could, the General claims, so change the constitution of the Fourth Republic as to ensure the proper separation of the powers and the emergence of a capable executive. The RPF's programme would derive from two main conceptions: in foreign affairs, the integration and defence of Europe through Franco-German co-operation; at home, the harmony of the nation through the association of interests which at present are at war. These are large ideas and require precision.

The *Rassemblement*, which has hitherto stuck to generalities, has now published a preliminary draft law regulating contracts of association of capital and labour. This law is envisaged as optional for an initial period; but, to encourage the formation of contracts between the different parties engaged in industry, those enterprises which accepted the principle of association would immediately be granted certain forms of tax-relief by the state. The main objectives of the law are to ensure an equitable sharing of profits between owners and employees and to strengthen the authority of the *chef d'entreprise*. For, once his employees had entered into a contract with him, they could not legally break its conditions while the contract endured. The declared aim of the association of capital and labour is to destroy the power of both the trusts and the trade-unions. Its moral principle is the human association of those engaged together in a particular enterprise, a principle which, in the opinion of the RPF, is threatened alike by capitalism and Communism.

Most observers believe that Gaullism is, as a mass ideology, no more capable than Communism of penetrating the prevailing political apathy of Frenchmen. Short of the occurrence of a national catastrophe it is clearly not the intention of the General to try to establish a dictatorship. (In any event such a coup would be impossible, for the RPF has no cadre of militants comparable with the Communists.) There will, however, be elections next year in which the RPF will have an excellent chance, if the present social conflict continues and if its propaganda is shrewd. It is, indeed, possible to conceive of an alliance of all elements right of a line drawn through the centre of the MRP, with a reduced Communist Party, a reduced Socialist Party, some Catholic Socialists (now in the MRP) and a few Radicals in opposition. This solution is now desired also by certain independent thinkers of the Left, who would prefer a government of the Right with a stable majority to no government at all.

The Communists, it must be remembered, would almost certainly welcome the advent to power of pure Gaullism in order that, face to face with it, having first destroyed all other democratic elements of the opposition, they might more plausibly smash "Fascism" in the name of the people. De Gaulle appears ready to accept alone the direct challenge of the revolutionary Left. The country as a whole, however, while it will perhaps be willing to be ruled by a right coalition with a preponderance of RPF, does not relish the *tête-à-tête*, de Gaulle-Moscow, that the destruction of the existing political centre would bring about. The General has categorically refused any and every coalition between the RPF and "*les partis*." There are, nevertheless, perhaps some parties whose co-operation he could stomach at a pinch.

Doctrine of the Split Society

Politically France is very much back in the Third Republic, with the sole difference that its politicians, if more scrupulous, are certainly less able than they were then. Psychologically, however, the nation has changed decisively, and in a direction from which new political forms must eventually emerge. In all the countries of Christendom, presumably, a deterioration of the inherited balance between the individual and the community is, under the pressure of industrialism, already in progress. France itself is no exception. For, although splendidly free from the maniacal tendencies and the *fumisterie* of Central Europe, it is now suffering from a kind of social schizophrenia which is characterised primarily by a massive apathy. By the same token it may be said that France's personality has not re-emerged from the divisions of the 'thirties and 'forties. Revolutionary Communism, a phenomenon familiar in semi-industrialised Latin countries since the first World War, is the doctrine of the split society.

In this sense Communism is ineradicable so long as human beings live dissociated from each other amid the debris of a vanished order. The optimistic liberalism of American economics has, in spite of the immeasurable value of the Marshall Aid already received, proved as inacceptable to France as its own native *planification*. Nor is anything solved by talk of National Communism or any other -ism. During a period of social engineering—a phrase doubtless repellent to the individualist Frenchman—it is not dogmatic inspiration that is needed from the government nor starry-eyed elation from the people, but a government of maximum width of outlook in its ensemble and of true creativeness in its individual members. In other words, France needs a coalition not of *les partis* as they are but of the best of the men in them.

"What are you doing for Whitsun?"
"Going to Burgh Island, old boy, down in Devon, you know. It's a grand spot for relaxing in luxury, which always does one good, and I hear it's even more comfortable since they made the extensions to the hotel last winter. Prices are moderate and inclusive, too."

"Is the food good?" "Excellent—so is the wine-list, *and* the service. And you'd enjoy the smugglers' inn, the 'Pilchard'. There's tennis on the Island, too, and golf courses on the mainland nearby. Oh, and a first-class resident band for dancing. Yes, Burgh Island Hotel has everything, and the scenery, of course, is superb."

"Sounds just the thing—I'll phone them this evening for reservations."

Chile's Economic and Political Difficulties—I

[FROM A CORRESPONDENT]

CHILE is now experiencing once again the dangers which plague a country whose economy is to a large degree dependent on the export of one or a small number of primary commodities. As a result of the decline in the price of copper during 1949 the consumers, workers, businessmen and government of Chile are fearing a grave crisis.

In recent years the export of copper has accounted for from two-thirds to three-fourths of the country's foreign exchange. Although, in recent years, copper's part in the total has been declining slowly it is still so important that anything which influences the copper industry is of vital importance to the whole Chilean economy. For although the country is 90 per cent self-sufficient in agricultural products, it depends on exports to pay for a large proportion of the country's consumption of manufacturing products.

Since the early 1930s copper has been the nation's principal export product. For half a century previous to that period Chile had to a large degree depended on the export of nitrates. With the development of synthetic nitrates during the First World War, however, Chile's nitrate industry nosedived into a depression from which it never fully recovered. Copper production—which is almost completely controlled by three American-owned companies, grew steadily, and reached a peak during the Second World War.

('000 Tons)

	Production	Exports		Production	Exports
1937	394·4	383·2	1945	462·1	431·2
1941	456·0	439·9	1946	358·6	373·0
1942	476·9	454·4	1947	408·4	387·3
1943	488·5	449·3	1948	424·9	414·8
1944	489·9	482·1			

Although copper production decreased after the end of the war, the country's income from the metal increased. During the war the United States Government put a ceiling on the price of Chilean copper, pegging it at 11½ cents a pound, in spite of the fact that it was paying up to 14 cents a pound premium for copper taken from relatively unproductive US mines. However, in 1946, government controls on imported copper were withdrawn, and during the following months the price went as high as 23½ cents a pound. This resulted in an increase of copper-earned dollar income for Chile from $73,546,752 in 1946 to $120,115,178 in 1947.

But, while this copper-inspired prosperity lasted, Chile took advantage of the situation to increase its imports. Petroleum imports increased from 200 million to 300 million litres, and sugar imports went up from 150,000 to 180,000 tons. On the other hand, the financial position of the government was greatly improved. For the first time in many years Chile was able to balance its budget. During 1947, the government budget showed a surplus of some 368 million pesos, which was increased to 1,352,536,038 pesos in 1948. These surpluses paid off the deficits incurred during the years 1944-46, amounting to 1,103,659,741 pesos, and paid increases in salaries of teachers amounting to 45 million pesos. After these disbursements there still remained a net surplus of 571,876,296 pesos at the end of 1948.

Effect of Falling Copper Prices

The decline in the price of copper, however, started in the second quarter of 1949. In May the price fell from 23½ cents to 20 cents a pound. In the succeeding months it fell to 17⅝ cents. So far the effects of the change in the price of copper have been felt mainly by the small, marginal producers of the metal, and by the Chilean Government itself. The 1949 budget, however, showed an actual deficit in the government's operations for the year of 259 million pesos. This was covered by part of the 1948 budget surplus. This same surplus had been allocated to cover certain expenditures entailed in laws passed during 1949 or in proposed legislation still pending before Congress. So it was expected that the government would have on hand a balance of about 1,000,000 pesos at the end of December, 1949.

The budget for 1950 reflects the expected decrease in government revenues from the copper industry. It provides for a balanced budget at 14,264 million pesos, amounting to an increase of 312 million pesos (2 per cent) in income. The budget also represents an increase of 1,329 million pesos in proposed expenditures—compared with the original budget of the previous year. These figures did not include expenditures for the Chilean Development Corporation, the National Railroads and one or two other semi-autonomous organisations, the cost of which amounts to some 1,513 million pesos. These bring the total expenditures to 15,777 million pesos, without taking into account announced wage and salary increases.

Estimated government income for 1950 from the copper industry was expected to drop by 1,765 million pesos from 1949 estimates, of which 1,265 million would represent reduced tax collections, while exchange transactions would render the government 500 million less.

The 1950 foreign exchange budget also indicated this same trend. It foresees receipts and expenditures totalling $232.2 million (US), or $74.7 million less than the 1949 budget. The 1950 estimate provides for reductions in various imports: $28.2 million decrease in expenditures on agricultural, mining and industrial equipment, while $8.7 million is to be slashed from imports of transport equipment. Imports of foodstuffs will drop $10.2 million.

The current situation has been somewhat complicated by a continuing inflation, and by a severe overvaluation of the Chilean peso. The inflation, which has been more or less continuous during the last two decades, but has been particularly noticeable since the last years of the Second World War, has caused much political discontent during the last few years. The cost of living index in August, 1949, on the basis of 1937 as 100, stood at 541.6 as compared with 459.8 a year earlier and 391.7 in August, 1947. The increase was 17.8 per cent over 1948 and the increase from 1947-48 was 17.4 per cent, while between 1946-47 the index had moved up 35.5 per cent.

Some idea of the rise in the cost of commonly used articles can be seen from the following unofficial estimates: In early 1947 a working man's midday meal cost approximately 25 pesos, but now costs some 60 pesos. A pair of shoes has risen from 250 pesos early in 1947 to 400; a working man's suit of clothes from about 1,800 pesos to 2,800. Sugar has increased from about 6 pesos per kilo to 9, while bread has gone from 3.60 pesos to about 7, and milk from 3.2 to 5.40 pesos.

(To be continued)

Holland's Foreign Trade

[FROM OUR SPECIAL CORRESPONDENT]

IN the past two months Holland has come face to face with an acute shortage of sterling. Dutch reserves in London—£35 million at the end of 1949—have disappeared. In the place of sterling the Netherlands Bank now holds something like DM 400 million. Dutch authorities themselves are at a loss to explain how the whole of this reserve should have disappeared within a matter of a few months. Most of the withdrawals would seem to be explained by Dutch transit trade with Germany. Dutch merchants have in recent months made heavy purchases of commodities and manufactures, paid for these in sterling and re-exported them—at substantially higher prices—against payment of Deutsche Marks.

For the individual trader this has been highly profitable business. But it remains to be proved whether these transactions are in the best interests of the Dutch economy. The Netherlands Bank would appear to favour this exchange of its sterling reserves for Deutsche Mark holdings. Holland, the bank argues, normally has an adverse payments balance with Germany and a favourable balance with the sterling area. In the present opportunities for trade, the Bank sees a possibly non-recurring opportunity for building up a Deutsche Mark reserve. This opening is based on the recent Dutch-German trade pact, which permits payments by Germany for its Dutch imports in marks at a time when most other countries still insist upon being paid in their own currencies or in dollars. The agreement further places few quantitative restrictions upon trade between the two countries—provided the goods imported are of Dutch origin. But even on this point the authorities in Holland and in Germany are not too particular, for in fact not many of the goods Germany buys from Holland originate there.

The sterling-mark swop is criticised in some quarters on the grounds that it has denuded Holland of sterling at a particularly inopportune moment. True Holland normally earns sufficient sterling. But this year it is faced with an unexpectedly high bill for its sterling area raw materials. At the same time Britain is showing growing unwillingness to pay the higher prices Holland is demanding for its food exports to this country. For three months now, Anglo-Dutch trade negotiations have dragged on without being able to agree on new prices. Undoubtedly the Dutch bargaining position has been weakened, since the British negotiators are well aware that Holland needs an agreement, faced as it is with a sudden sterling shortage. If in the next few months Holland should have to curtail its sterling imports for lack of exchange, the new emphasis on German transit trade may turn out a costly venture.

Entrepôt trade with Germany by no means occupies the whole energies of the Dutch trading community. They have re-established themselves as intermediaries between Scandinavia, France, Belgium, Italy and Switzerland. For Holland these activities have gained in importance now that trade financed with "cheap" sterling has almost come to an end.

Dollar Exports Remain Small

For all the improvement in Dutch payments with most European countries, the Dutch dollar balance continues to be almost hopelessly negative. Dollar earnings cover barely one seventh of dollar expenditure. Devaluation has helped little. Dutch exports to North America have always been small and remain small. There cannot be much scope for expanding sales of flower bulbs—in which Holland has always had a monopoly—beer, gin, or the few other Dutch consumer goods for which there is a market in the United States. There is much noise and flag waving about the need to increase dollar sales, and there is to be a series of trade fairs in the United States—one began at Philadelphia on May 5th. Regional Trade Consuls have been appointed. The Queen has received the chief buyer of a leading New York department store. But most of these endeavours meet with slightly scornful cynicism in business circles, and it is difficult not to sympathise with such reservations.

Nor has the Dutch dollar incentive scheme proved very successful. Dutch exporters to the North American market are permitted to retain 10 per cent from the proceeds of their exports to buy goods for which import licences would not otherwise be granted. In this way they obtain luxury articles —nylon stockings and American motor cars are two examples —and sell these at a greater guilder profit than if the whole of the dollar proceeds were handed into the Central Bank at the official rate of exchange. Thus, at the moment, the "nylon" rate is Fls. 6.75 compared with the official rate of Fls. 3.80 to the dollar.

Although Holland's export trade is still less than its import trade, the position has improved greatly in the past two years. Visible exports covered only 39 per cent of the imports in 1947; in 1948, the proportion rose to 55 per cent, and last year it was 72 per cent. In the last quarter of 1949 it had even reached 84 per cent. The negative balance with the United States accounted in 1949 for as much as half the entire Dutch deficit. Unless it proves possible to channel at least some of Indonesian trade through Holland again, the improvement has probably gone as far as it can. The Dutch programme of industrialisation has not saved as much foreign exchange as had been hoped. The plans were conceived under the impression that Germany would remain industrially impotent for years to come, but the temptation to import again from Germany many of the goods for which new enterprises had been established is proving too great. And, as in other countries, the programme has proved more expensive than anticipated. Industry is running short of working capital. Bank indebtedness is rising. Stock market

will make your holiday clothes and sports wear immaculate. Retex will make good the oils and dressings lost in wear.

atmosphere is unpropitious for new issues. For the present the banks are willing to be accommodating, but difficulties may arise when industry has to meet its past tax liabilities. At the moment the Dutch authorities are up to two years behind in collecting taxes, and a good many enterprises are said to have used up liquid funds originally earmarked for taxation.

Collectivisation in Poland

[BY A CORRESPONDENT]

DURING the postwar years of revolutionary change in Poland right up until the beginning of 1949, the Communist regime succeeded in establishing no more than 40 collective farms covering a mere 23,000 acres. In the past twelve months, however, under the remorseless drive for sovietisation in every phase of Polish life, the number has risen steeply to 700 covering some 400,000 acres with an ultimate target of 2,000 by the end of 1950. According to a statement in the last issue of the Polish Politburo organ, *Nowe Drogy*, mass collectivisation of Polish agriculture is not only intended but is regarded as a vital objective of the Six Year Plan.

Since the all-out campaign for collectivisation initiated by the Polish Politburo in Warsaw last autumn, every form of inducement and pressure is being applied to Poland's 15 million peasants to submit. The inevitable preliminary was a purge in the Polish Peasants' Union of all known opposition and unreliable members and particularly of leaders. It has been officially admitted that 6,000 committee members of the Peasant Co-operatives and 8,000 from the various local executives of the Peasants' Union have been expelled.

The 1950 budget of the Ministry of Agriculture is to be increased by 33 per cent—the new funds, according to Cabinet decision, "to be spent on general assistance of the newly created collective farms." They will have priority in the allocation of machinery, fertilisers and schemes for development. Peasants joining collectives will have their taxes cut by one-third. A new regulation makes it imperative on the banks to deal with their applications for state loans for houses and farm buildings with the utmost despatch and they are to be given priority over non-collective farmers.

Although therefore, the phase of compromise in Polish land policy is ended, the approach to the peasant himself is still tentative and placatory and there is nothing at this stage to suggest the strong-arm methods employed by Stalin against the Kulaks in the late twenties. The Bierut regime, not unmindful that it is the instrument of a hateful policy imposed by an alien arbitrary power, is still sensitive, of course, about applying force against its own people; also some grace and time has been gained within the programme of the Six Year Plan in which to try "persuasion" before resorting to the brutality of expulsion and deportation.

At this stage also three different categories of collectives are being created. The first and least "collective" are rather loosely organised groups of farmers and farms for the purpose of what is termed "joint cultivation." They make communal arrangements to share machinery and their own labour for the ploughing season alone. There is no obligation on them to co-operate for the sowing and reaping but naturally they are encouraged to do so.

The second category comes nearer to the collective ideal in that land and livestock are actually pooled, but the contract is not permanent and withdrawal by any individual farmer is permitted. In the third category, the collective principle is rigidly applied all through and although withdrawal of a member is legally provided for, in practice it is rendered almost impossible.

One feature peculiar to Polish collectivisation is that nominally peasants still retain ownership of their individual holdings and are entitled to rent payment for such from the collectives. But just what this "right" is worth can be judged from the fact that, according to the statute, in the event of a peasant in the last two categories deciding to withdraw from his collective, he is prohibited from reclaiming his original holding. He must accept as a substitute land "on the fringe of the collective" which, of course, might be miles from his home.

As in the Soviet system, every farmer retains from one to two and a half acres for his own cultivation, also two cows and other such livestock as he can support together with the farm buildings necessary to house them. It is also laid down in the statute that every member must work for the collective for a minimum of 100 days a year at any job required. Special wage rates are paid for work over the daily norm and premiums are to be given for achieving higher output. Income in kind and in wages depends on the type of collective to which the peasant belongs.

In the type of collective where there is no common sharing of land, what a peasant reaps from his own holding decides his reward. In the second and third types of collective income is apportioned in accordance with the amount of land, livestock and labour contributed after certain overall deductions for capital investment and cultural and social amenities such as provision for the aged and so on.

Official Polish reports show that 70 per cent of the collectives now in being are situated in the western territories—that is, in Silesia, Pomerania and East Prussia. This is to be explained by the fact that the peasant here has, as a new settler, been dependent on state aid and organisation from the beginning and is, therefore, more susceptible to official propaganda. Also in view of the ever present threat of German irridentism, he feels less secure and more in need of the Government at his back.

Opposition of Farmers' Wives

It would be logical to suppose that peasants who are members of the Communist Party would be among the first to join the new collectives. A break-down of the figures in the *Nowe Drogy* shows that this is not the case. While in the newly settled Stettin area, it is true that 95 per cent of peasant members of the Communist Party have joined collectives, only 40 per cent have done so in the Kielce area (Central Poland).

Despite triumphant propaganda about last year's acceleration of the collective movement, even Polish Government spokesmen and Party leaders admit certain major obstacles from the human standpoint must be overcome. Foremost among these are apparently the Polish farmers' wives and daughters. In a recent speech, Roman Zambrowski, Politburo member, lamented that "the collective movement, despite the Politburo resolution to that effect, has not yet succeeded in inducing Polish women to join or to serve on committees." Another admitted obstacle is the opposition of the Catholic clergy, specifically the hierarchy. Communist organs relate alleged incidents of peasant sabotage against collectives inspired by priests.

In view of the fact that Poland's high population in ratio to cultivable land area must always make collectivisation a dubious proposition, a fact realised by the Polish Communists, it is clear that only extreme political pressure from Moscow has compelled them to impose it.

Certainly the past years have repeatedly demonstrated the regime's reluctance to collectivise and it is no secret that even Marxist last ditchers like Gomulka and Minc advocated all other measures short of it. Fundamentally, it was on this issue that Gomulka fell. Minc on the other hand was summoned to Moscow and came back a "converted" man, although it is noticeable that for orators on the collectivist ideal, the Party prefers to put on the platform today men with a more blameless past.

"Glad you like this sherry —it's South African

It's extremely good. I got some South African wine the other day . . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

THE BUSINESS WORLD

Films and the State—II.

Industry or Sport?

NOBODY nowadays would expect, say, the University of Cambridge to pay for itself. But the film industry, though vaguely conscious of a cultural role, has neither attained nor aspired to a status in which Government subsidies can be taken for granted. It is still a trade, run in the hope of earning profits on entertainment, a commodity for which the British people will cheerfully pay very large sums. That it should persistently fail to earn profits, and make losses instead, is repugnant to common sense. If its failure proves irretrievable, then the state will have to decide whether to support the industry permanently as an institution of cultural or "national" value, or to treat it as just another unsuccessful business and let it go to the wall. The first of these two courses opens up a fascinating field for speculation, in which the dangers of a state-controlled propaganda machine have to be set against the odd fact that much of the really first-class British film work has been done in the documentary field by sponsored or subsidised directors.

But before such a possibility is faced, common sense requires that the working of the industry should be analysed and dissected to see whether it cannot be induced or enabled to make a success of itself. Two painstaking official inquiries to this end were made last year. A working party representing the film producers and the studio employees, with Sir George Gater as chairman, considered ways and means of reducing the costs of film production. It was hampered by incomplete evidence on the costs of specific films; the President of the Board of Trade has lately said that better evidence is now coming in, and that this will help him in deciding what to do next. Even so, the Gater working party found that "towards the end of the war and in the years immediately following it extravagance in the British film industry was allowed to go beyond all reasonable bounds," and that not enough had since been done to put things right. Constituted as it was, the working party was hardly able to allot blame with any unanimity; but its report spoke of excessive management expenses, the high salaries of some actors, the salaries of highly skilled technicians forced up by scarcity value; and even lower down in the scale "the wages of film workers compare favourably with the wages of workers in other industries."

High performance might justify high salaries and wages, but performance in the film studios is low. As the Gater report said, the big increase in studio manpower after the war "was not matched by a corresponding increase in output." Output of finished film (measured in minutes of screen time) for each camera-day expended in the studios is a useful rough measure of production efficiency, though it leaves quality out of account. The working party found that in the production of 22 first-feature films in 1947-48, one camera-day produced only 1.29 minutes of film. The average cost of these 22 films was £2,946 a camera-day, and 88 camera-days were needed to produce a film of the average length of 103 minutes. The figures indicate an average cost of nearly £260,000 for each of these films. It may be assumed that the films were not fully representative. Perhaps the costings were not above question. But costs of this order could be justified only for an industry with a world-wide market at its feet.

The studio workers, who were represented on the committee, blamed the employers for poor planning of production, wasteful buying of materials, too many retakes, and "exaggerated standards of perfection." The employers complained of restrictive attitudes and too rigid demarcations among the crafts and trades represented in the studios—"hold-ups in shooting while the appropriate man is fetched to knock in a nail or change the position of a potted plant." Neither set of complaints is baseless. The film industry in Britain has never for long escaped from the traditional notion that it must be expensive and luxurious as a condition of survival.

★

Why is this? Some explanations are familiar: the paramountcy of personal prestige in any entertainment business, the competition among producers—even in a state of depression, since hope will always spring—for a small number of outstanding actors and technicians. Hollywood, it is further pointed out, lies in wait to offer still more lavish rewards to exceptional talent. But, though they have a basis of truth, these explanations have to be stretched painfully to cover the lavish wardrobe-buying, the charm schools, the expensive sets and redundant properties, and the long waits for the man with the potted plant. They are, in fact, rationalisations of a long-entrenched habit. Mr Bernard Shaw offers a simpler but more acute explanation in his entertaining letter on page 992. Film-making, he suggests, is not a business at all in the accepted sense; it is "a sport, and a very hazardous one." The trouble here is that sportsmen on the scale of Mr J. Arthur Rank are few, and diminishing in number; and that the hazards have come to be all one way.

"To examine the costs of production of an industry without considering its earning capacity," observed the Gater report, "is far from satisfactory." The producers maintained that no reductions in costs would put film production on a paying basis unless their earnings were increased as well. The Plant committee on film distribution and exhibition conceded this point—"in the national interest the industry urgently needs more revenue." It therefore examined the possibilities of stimulating the cinema trade as a whole to earn more, and of enabling the producers to get a bigger share of the gross earnings. In doing so it unearthed some curious facts.

Certain of these indicate that the state, in spite of its concern to foster and protect the industry, is itself a powerful agency holding it back. Government insistence on thrift in the use of film stock is still, it seems, to blame for the fact that 35 or 40 copies are made of a film where 100 used to be made before the war. This is one reason why the general release in London is spread over three weeks; the delays pile up as the copies are spread thinly over the provinces, and many films arrive in small towns long after the interest in them has died. Exhibiting arrangements have become "stereotyped."

To render costly productions unprofitable for the sake of a relatively small saving of film stock is misguided, particularly in a Government which is at the same time investing money in the productions on slight security. The official attitude towards the prices of cinema seats is no less misguided; time and again the state has insisted that prices must not be put up. Is this from concern for the cinema-goer's pocket? But "for every £100 worth of entertainment provided by the cinemas the public have to pay £156 at the box-office, the Government taking the balance." The Entertainments Duty is not only unreasonably heavy, it is also graded in an unreasonable manner which has destroyed the exhibitor's freedom to charge what he judges his entertainment to be worth. Further, the high quota has made doubly sure that receipts will be too low to make British film production pay. As the Plant report said:

> The higher the British quota, the more certain it is, having regard to the amount of producing and playing talent and productive equipment available, that the value of the films produced in this country will not be more than average and that their share of the net receipts from British cinemas will not suffice to recoup their production costs.

But the Plant inquiry did not put all the blame on the Government, or exonerate the trade. Although the trade is not very old, it has taken on the settled and inflexible habits that are associated with age. Perhaps it would be embarrassed by the gift of freedom to print as many copies of a film as swift, widespread distribution would require. Even the liberty to form its own price policy might be full of perils. The Plant committee wanted to unsettle the habits:

> We should like to see a radical change in the whole system of film distribution which induced the adoption of freely competitive trading at each stage and in every situation.

This idea has not been welcomed. It would upset the routine. It would mean, for example, free competitive bidding for first releases, and an interloper might outbid the circuit cinema or the established first-release house of a district. The idea underlying the proposal is to make the payments for a film "more closely commensurate with its full potential value to the public." But this, while it increased the rewards of successful production, would be liable to add to the penalties of failure as well. Nobody (one trade association observed indignantly) would bid for the bad films at all. The proposal that a new body independent of trade interests —and therefore quite different from such existing "joint" bodies as the Films Council—should be set up to supervise the transition to free competition was taken by the trade as the unkindest of all blows, a monstrous attack on its independence. But if the state is to make itself responsible for keeping the film-producing industry alive, how can "independence" in this sense be possible?

From these cross-currents some plain facts emerge. The exhibiting end of the film trade has not succeeded in so organising itself that it can get the fullest value out of good films when these come its way. The distributing trade, which supplies films to the cinemas, is largely tied to fixed routines of distribution, devised either to serve specific cinema circuits, or to market the films of certain producers, or for both purposes. Those arrangements may tend to protect bad films, but they do not give full value to good films. The distributing trade holds a key position; the film renters not only supply the cinemas, they also play a large part in financing production. But they have never been organised to finance and serve more than a modest volume of British film production, and particularly of "independent" British production. If British production is to be established and maintained on an ambitious scale, either more renting firms will be needed, or some new arrangement for finance to take the place of the distributor's guarantee.

The renters, in their turn, can argue that British film production is not big enough, good enough, or sufficiently sound financially to make any great change in their trading arrangements worth while. More than half the renting firms trade primarily in American films; are they to change their habits? The existing picture of British film production does not inspire confidence, and —this is in one way the root of the matter—the bigger it has grown the more thinly its talents have been spread and the less confidence it has inspired.

On one point only can the exhibitors, the renters, and the producers all agree: film takings are too heavily taxed. This is true. It may even be true that, if the conditions of competitive exhibition, rational distribution, and economic production could miraculously be brought about, there would still be a deficiency between expenditure and earnings, concentrated at the producing end. The argument has only one flaw: most other industries in Britain are too heavily taxed as well. What consideration ought to induce the Government to spare the film industry in particular?

*

It is clear that any Government attempt to make film production viable will have to be far-reaching. It will require to alter the structure of the film trade at all stages in important ways, and almost certainly it will also exact some sacrifice of Government revenue—either in reduced taxation or in subsidies dressed up as loans. The difficulty of directing subsidies through the right channels to the desired ends is very great. But what of the difficulty of directing the benefits of reduced taxation? Any simple increase in net film earnings, brought about in this way, would yield more money to the American producers than to the British, because the Americans have the larger share of the trade and the stronger competitive situation. Thus it would add to the dollar cost of films—unless taxation discriminating against the foreigner is to be tried once more. But one of the Government's main purposes in seeking to stimulate British film production is to save dollars. The merits of domestic film production as a dollar-saver will be considered in the concluding article. It is apparent, however, that without more clarity about the purpose, a workable policy is remote.

Boom in Rubber

TWELVE months ago, when the Rubber Study Group finished its London meeting, rubber stood a little under 11d. a lb. This week, the Group has been meeting in Brussels, with very different conditions to study. Natural rubber is selling for twice as much as it realised twelve months ago. After devaluation, the price was 1s. 0⅞d., and only a month ago it was 1s. 4d. In the space of a few weeks a squeeze has occurred which has increased the price of rubber by more than one-third to 1s. 10d.—the highest level for 25 years. Such events make the arguments for "one and sixpenny rubber" look modest. They have also robbed the work of the Study Group of much of its interest; its agenda this week seems to have been largely formal, and it has taken no major decisions within its restricted field of policy. The Study Group represents both sides interested in rubber —producers and consumers. The former have no reason for complaint about the trend of prices in recent months (though they have other worries about production). As for consumers, they would like to see a lower price, but they also know that the Study Group has no power to compel a fall.

The market, then, is sovereign. Demand has been better than was expected a year ago (when the American recession was already casting a dark shadow), and supplies have been smaller—indeed, the present rate of production of natural rubber seems quite inadequate to meet the current level of demand. It is not easy to measure supplies with close accuracy. Political and economic unrest in Malaya and Indonesia has so far prevented a rapid response in supplies; in more normal circumstances, this would certainly have been evoked by a rise in prices on the recent scale. The figures show that this is not happening. Output in Malaya for the first three months of the year totalled 161,300 tons, against 174,000 tons in the first quarter of 1949. Output in Indonesia for the same periods totalled 88,000 tons in 1950 against 91,000 tons in 1949. Estate production is measurable more or less accurately, but these figures (as Table I shows) include estimates of output from smallholders, which are far from precise. The figures shown for smallholders' output in Indonesia are in fact worked out from exports; actual smallholders' output was almost certainly higher than these figures suggest in the first months of this year. Indeed, estimates suggest that smallholders in Indonesia last year hoarded as much as 60,000 tons of rubber, preferring the substance of their harvest to the shifts and uncertainties of local currency. The estimates of smallholder output in Malaya are derived from dealers' reports of purchases of smallholders' rubber and they, too, reflect available supplies rather than actual output. The figures for world production of natural rubber for the first two months of this year—the latest available—totalled 237,500 tons, showing a rise of 7,500 tons on the first two months of 1949. But the "squeeze" in the market did not develop till late March and early April, and when the figures for these months are available they will no doubt show a sharp fall on last year. Even the totals for the first two months would, of course, be larger if smallholders' output was fully accounted for in the statistics, but the difference would not be enormous; in any case, what matters to the rubber market and to rubber prices is the level of current deliveries. There is no doubt at all that these are well below current consumption.

Pressure of demand, rather than any speculative hold-up in supplies, has pushed the price to this week's new peak of 1s. 10¼d. And it is the level of demand, particularly in the United States, that will determine whether the present price will be maintained or even pushed higher. In New York, natural rubber is now selling at 25 cents a lb., compared with 18½ cents for general purpose synthetic. Neither side in the financial talks in Washington last September could have expected that result.

Both the United States and Canada then agreed to increase their purchases of rubber and tin, and the former announced in the communiqué that it was prepared

> to open to natural rubber a substantial additional area of competition, including a modification of the Government order relating to the consumption of synthetic rubber.

This modification, made a week after sterling was devalued, enabled American manufacturers to reduce their consumption of general purpose synthetic rubber by 35,000 tons a year, and of special synthetic by 15,000 tons a year. These cuts left the way open for commercial consumption of natural rubber to expand by 50,000 tons a year; at that time it was selling in New York at

17½ cents a lb. compared with 18½ cents a lb. for general purpose synthetic. From October onwards, American consumption of natural rubber began to increase. By the last quarter of the year, the total was 154,000 tons —more than 5,000 tons above the previous postwar peak, reached in the first quarter of 1949—and it rose even more steeply in the first three months of 1950, to 177,800 tons. The shares of total consumption represented by natural, synthetic and reclaimed rubber in the United States are shown in Table II. The amount of reclaimed rubber used has fluctuated from month to month, but the general level has shown little change throughout the past fifteen months. Consumption of synthetic, too, has been fairly steady since last August, until it increased sharply in March. In fact, virtually the whole of the increase in total rubber consumption in the United States since then has been in natural rubber—the reverse of the situation earlier in 1949 when the slight recession in American industry affected natural rubber much more than synthetic. The modification of the American Government order regulating the consumption of synthetic rubber has undoubtedly helped natural rubber, but its main support has come from the sharp revival in American industrial activity. Analysis of American consumption of the different types of rubber in "transportation items" (tyres and inner tubes) shows that some substitution of natural rubber for synthetic took place in the last quarter of 1949, perhaps accounting for 10,000 tons. During the same period synthetic tended to be substituted for natural rubber in "non-transportation items," but this switch amounted to no more than 2,000 tons.

The demand for natural rubber in the United States, then, is still determined mainly by the level of industrial activity and at the moment this is expanding. The official index of American industrial production (1935-39=100) stood at 184 in March—a marked recovery from its low point of 161 last July, though still below the peak of 195 reached in the last quarter of 1948. In particular, the output of motor vehicles in the United States has increased sharply in recent months, and this has undoubtedly increased the demand for rubber. But since the area of competition between natural and synthetic rubber has widened, price must now play a greater part in determining relative usage. The American motorist apparently prefers tyres made of natural rubber so that natural might be appreciably higher than synthetic rubber before tyre manufacturers switch to the latter. In recent weeks, natural rubber has cost 6 cents a lb. more than synthetic, but so far there has been little evidence of any such switch in the production of tyres and inner tubes. In "non-transportation" items, however, which account for roughly one-third of America's consumption of natural rubber, some switching towards synthetic rubber is taking place. In such conditions, it needs some boldness to make even a rough estimate of American demand for natural rubber during the current year. Legally, consumption of natural rubber can now expand by 50,000 tons during the year, without any rise in total rubber consumption, and unless the price of natural rubber continues to rise sharply, any increase in total rubber consumption is likely to favour natural rubber. If the first quarter of this year is any guide, consumption of natural rubber in the United States in 1950 may reach 650,000 tons, an increase of 80,000 tons over last year's figure.

The future of the American synthetic industry is still undecided. The American Government intended to sell its synthetic rubber plants to private manufacturers but wanted to retain its control over the consumption of the general purpose synthetic. The rubber industry was not prepared to take over the plants unless controls were abolished. As neither party is apparently willing to compromise, the present system of Government ownership and control is likely to continue for the next three

years. Manufacturers, therefore, will enjoy greater freedom to buy natural rubber—if they want to—than they did twelve months ago. But a certain minimum consumption of synthetic in "transportation" items will be enforced. In these circumstances, natural rubber is likely to continue to be more affected by changes in the level of industrial activity than general purpose synthetic rubber.

Commercial consumption, however, represents only part of the American demand. Stockpile purchases are equally important. Unfortunately, no official indication

A showroom for the world

At the British Industries Fair the achievements of Britain's industrial skill will be viewed by business men from all parts of the world. To assist them the Westminster Bank has established offices at each of the three Sections. All normal banking transactions can be carried out at these offices and experts in all aspects of the Exchange Regulations will be in daily attendance. Arrangements are also in operation to supply status information and to place manufacturers and buyers in touch with each other. These facilities, available to all who visit the Fair, form part of the comprehensive service which the Westminster Bank provides for financing foreign trade.

Supply—and Demand

From April through to January the shearers, wool pressers and classers are busy, for the Australian wool clip is a major factor in world supplies. Production in Australia is on a grand scale. Equally great are the requirements of the Australian consumer—and in this magnitude of supply and demand lie opportunities for British business houses . . . A wise preliminary to any Australian venture is consultation with the Commonwealth Bank. For the Commonwealth Bank *knows* Australia. Its activities touch upon every aspect of Australian life and industry and its branch system covers Australia, and New Guinea. It has, therefore, unrivalled sources of information, and this information it gladly places at the disposal of business houses in Britain.

is given of their size but they were estimated last year at 100,000 tons and in 1950 they were expected to rise to 125,000 tons. The object of these purchases, it is believed, is rather to support the dollar-earning capacity of the sterling area than to supply the Government with a given quantity of rubber, since existing official stocks are believed to be large. If this view is correct, it can be assumed that further stockpile purchases will not be made until market conditions change. Purchases so timed could have a powerful stabilising influence. If it were to happen that the 125,000 tons of natural rubber had to be acquired this year and these purchases were superimposed on an expanding commercial demand, the price of rubber would rise further—and sharply. But so far this year, there has been little evidence of any large-scale buying for the stockpile.

★

Consumption of natural rubber in countries other than the United States has also increased during the past six months. British consumption jumped to 55,000 tons in the last quarter of 1949, compared with the relatively high figure of 48,000 tons in the first. This high rate has been maintained during the first three months of 1950. In Europe, too, consumption of natural rubber during the first quarter of this year has been substantially larger than last year. But Russia is an exception. Data on actual consumption are not available, and the estimates in Table III are based on net imports. Between January and March of this year net imports totalled only 7,250 tons compared with 32,500 tons in the first quarter of 1949. The reason for this sudden reduction is not known. It may have been due to the rising price—though high prices have seldom deterred Russian buyers of other commodities—or it may have been due to a change in official policy, but such a low level of purchases could hardly be maintained throughout the year. Data for world consumption are available only for January and February. In these two months it totalled 252,500 tons, or 10,000 tons more than a year ago; the increase over 1949 for the full twelve months might well be between 75,000 and 100,000 tons. Such an increase in commercial demand, however, could be offset by a reduction in American stockpile purchases.

The rubber market, then, has a firm foundation based mainly on a rising industrial activity in the United States and supported by an expanding consumption in Europe. If these trends continue, the chance of any surplus of supplies this year is likely to be remote, even if supplies hoarded in Indonesia are marketed. But political conditions in south-east Asia show no sign of improvement; and, until stability and order are restored, there is not likely to be any marked rise in rubber output in response to the high price, to enable world production to expand to meet the rising requirements of a high level of industrial production in the United States, Britain and Europe. In the past six months, the rubber industry has benefited from a more enlightened administration of the control of synthetic rubber consumption in America. But if the present "squeeze" in rubber persists for any length of time, not only American manufacturers, but even, perhaps, the American Government might switch towards synthetic.

Business Notes

Landmark in Gilt-edged

The long-awaited Electricity loan, the terms of which were announced late on Tuesday, and the lists for which were to open and close yesterday, sets up a new landmark in the gilt-edged market. For the first time since the 'thirties a full gilt-edged stock has been launched with a "coupon" rate above 3 per cent. This 1976-79 stock of the British Electricity Authority, carrying a Treasury guarantee that makes its investment status indistinguishable from that of direct obligations of the British Government, has an interest rate of 3½ per cent; and although offered at a full point discount has a maximum life sixteen years shorter than that of the 3 per cent Gas stock placed just twelve months ago. The decision of the authorities to borrow at this stage and on these terms is therefore not only an acknowledgement of the steep rise that has occurred in interest rates but also an indication that they have abandoned any lingering hopes of a reversal of this trend.

The terms of this offer, though so markedly in contrast with those of other postwar issues—the last BEA issue, made in October, 1948, consisted of 3 per cent stock, 1974-77, offered at 99½—were in close alignment with the existing pattern of yields. There is, of course, no directly comparable security, but the gross yield of £3 11s. 1d. per cent offered by the new stock to latest redemption compares with £3 9s. 1d. per cent from the previous BEA issue with its slightly shorter maximum life and with £3 11s. 10d. per cent from Transport Stock with a nine year longer life. The slight turn by comparison with the 1948 BEA issue and the high flat yield (£3 10s. 8d. per cent) may give the stock a particular appeal to certain types of private investor—especially trustees—but it is too long for the banks and is not well suited to the insurance companies. Its net redemption yield, if calculated with tax at the rate of 7s. 6d. which is applicable for life assurance funds, is appreciably less than can be obtained from several stocks with shorter lives.

★ ★ ★

Borrowing without Tears

In fixing the terms the authorities evidently made very little allowance for the abnormal size of the issue—it is for £150 million, payable in easy instalments ranging to mid-

November. They presumably felt that any further shading —which would have pitched the stock definitely below the current level—would have "banged" the market without inducing any proportionate increase in the public response. As it is, the first stage of the flotation has been accomplished with virtually no disturbance of the market, but it is taken for granted that a very large slice of the loan will be taken up by the authorities themselves and will overhang the market for many months.

Whether such obvious expedients to defend the existing level of the market are justifiable is very much open to question, even when the issue is so large. The BEA is far from being the only large absorber of capital. Nor is this issue a definitive funding operation. The BEA continues to spend at the rate of £100 million a year; £65 million of the new money was bespoken even by the end of March for repayments due to the banks, and the Authority is likely to be borrowing from them again by the turn of the year. In the meantime, part of the "repayments" to the banks will merely take the form of switches from bank advances to bank portfolios of floating debt—unless the "departments" are such aggressive sellers of the scrip as to be able to finance thereby the calls on what they retain. This, for the present, is financing without tears; but there may yet be a time for weeping.

* * *

Rail Freight Increase

Six months after the Transport Commission sought an increase of one-sixth in rail freight rates "as a matter of urgency" and three months after the Transport Tribunal had advised the Minister that the application should be granted, the Government has at length made up its mind. The new increases are to come into operation on May 15th. So ends a prolonged period of hesitation during which, in the Minister of Transport's words, "I have considered with my colleagues, not only the Committee's advice but also wider aspects which could not be covered in a public inquiry." Mr Barnes did not say what these wider aspects were, and it is surprising that the Tribunal's hearing, which itself ranged over a great number of aspects of the application, should have left further work for the Government to carry out on the case.

A good deal of Parliamentary heat was generated after the announcement over the question whether the Government would find time for a debate on it. The last of the argument has yet to be heard, for the regulations that the Minister will have to issue before the increases can take effect can be "prayed against"; some time during the next nine days, therefore, the issue is likely to be raised again. It must be hoped that the debate will be more distinguished than the lamentable exchanges between Mr Morrison and Mr Churchill ten days ago. The important issue is not the decision to increase charges now, but whether those increases are the lowest that the transport user should be called upon to pay and whether the efficiency of the Railway Executive and the Transport Commission is the highest that traders can reasonably expect.

The last is a very dubious proposition. All that the Commission can say on efficiency is that they are doing as well as they can; that integration of transport is a new and difficult job; and that the public will have to wait for economies, the size of which cannot be guessed, to be realised. This is deferred hope, which goes no distance at all in countering the effects on industrial and living costs of the new increases in freight rates. Together with the budget increase in petrol duty and the imposition of purchase tax on lorries, the new railway charges will involve a marked increase in the cost of transport and industry will not be able to absorb it.

Finance Bill Changes

The Finance Bill, following a drab budget, contains little that is dramatic. The detailed procedures for increasing the tax on hydrocarbon oils by 9d. and levying 33⅓ per cent on lorries are prescribed. The Navy will watch for changes in its privileges, which are now to be regulated from the land-locked fortress of the Treasury. Justice is at last to be done to married men, by providing for the collection from married women of tax attributable to their income but assessed on their husband's. There are the promised alterations in estate duty to upset the decision in the Fitzwilliam case.

But the main matter of new substance is the clause on "surtax to be charged on consideration for certain restrictive covenants"—in particular the retrospective taxing of the sums received by Sir John Black and Mr Lord in return for their undertakings not to engage in motor manufacture for other employers. The clause is drafted in quite unequivocal language; any undertaking ("whether legally valid or not," to admit the uncertainties of the old Common Law doctrines on restraint of trade) the tenor or effect of which is to restrict a person as to his conduct or activities, and in respect of which any sum is paid "to him or to any other person" comes under the clause. The sum will be treated as the net amount of an annual payment in his hands which had borne the deduction of tax at the standard rate. So a sum of £100,000 would be imputed to have a gross value of £181,818, which is then assessed to surtax; at the full rate the beneficiary will have to pay 10s. 6d. in surtax for every £1 of gross value, or £95,454. Out of his original £100,000, therefore, he will be left with £4,546 after paying surtax.

Much has been made of the objections to the retrospective effect of the clause to the surtax year 1949-50. Such legislation is indeed objectionable. But history shows that neither party when in power is blameless in resorting to retrospective revenue enactments. The Lord-Black cases have not made a good impression, and the Government gave fair warning about upsetting the legal devices that were exploited by them. Both gentlemen now remain bound (unless they can persuade their companies to release them from their covenants) for the net advantage of a few thousand pounds. The exercise was not worth the fuss and resentment which it has caused. But the fact that it was thought reasonable to pursue it underlines the extreme difficulty in a regime of penal taxation of providing acceptable rewards for exceptional skill.

Banking and Finance

Sharp Rise in Bank Deposits

The curve of bank deposits normally turns upwards in the first month of the government's financial year, as the Treasury swings from the phase of revenue surpluses into one of revenue deficits. This year's movement, however, has been a good deal more violent than usual. The clearing banks' statement for April shows an increase in net deposits since mid-March by no less than £76 million, or over £30 million more than the corresponding increase in 1949 and fully £10 million more than that for 1948. For some two years now, the level of deposits has been almost stable, apart from purely seasonal fluctuations; and, despite the rise during April, the total at £5,663 million is still £2,000,000 below that for April, 1949. While it would be unwise to try to draw any firm conclusions from the experience of a single month—and especially one that spans the end of the fiscal year—the sharpness of this latest movement does raise the question whether the recent stability can be maintained. As was to be expected, the more rapid rate of credit expansion arises partly from heavy demands for bank advances. Ever since the devaluation, these have been running well beyond the levels of the previous year; the increase last month amounted to £36.7 million in contrast with £15 million in

167

In recent years one hundred and sixty seven firms have entrusted their development schemes to John Laing & Son Limited.

Such schemes include factories for light industries, complete works reconstruction and vast projects for heavy engineering

April, 1949, and only £7,000,000 in April, 1948. It seems probable that a considerable part of this increased demand reflects the needs of the BEA, so that the rise in the aggregate of advances will slacken—and may even give place to a fall—when repayments are made out of the proceeds of the issue announced this week.

The trend of advances, however, accounts for only about half the additional rise in deposits by comparison with April, 1949. In other words, the Government in this past month has been making bigger demands upon the banking system than it was doing in the similar period of last year. It is possible that this change arises mainly from technical influences which may prove to be only transitory. In particular, it is noteworthy that in the five weeks covered by the latest clearing banks' statement, the seasonal rise in the active note circulation was nearly £17 million less than the similar rise last year, a difference which has the effect of reducing the amount of finance that the Treasury secures, directly or indirectly, through the central banking system and of increasing correspondingly its demands on the commercial banks. This factor, in conjunction with the increased need for advances, is perhaps sufficient to explain why deposits have turned so sharply upwards. But, after this rather disturbing movement, the figures for May and June will deserve to be scrutinised with more than usual care. On general grounds, it might be expected that the sharp improvement that has occurred in the external balance of payments since the devaluation will be reflected in a new tendency towards credit expansion.

* * *

I.C.I.'s Profit Setback

Among leading industrial companies whose results have recently been announced, Imperial Chemical Industries (whose figures are summarised in the Investment Statistics section on page 1038) is almost the only one to show a sharp reduction in profit in 1949. After allocating £4,500,000, compared with £3,500,000 in 1948, to the central obsolescence and depreciation fund, consolidated trading profit of ICI declined by no less than £5,632,070 to £17,323,509. Lord McGowan gave a hint in his statement last May that the experience in 1948 might not be repeated. The chairman then admitted that although there were no grounds for pessimism "the sellers' market had gone for nearly all products and we shall have to fight hard to keep our overseas markets . . . we are alive to the fierce competition which we are now facing." The impact of these external forces seems to have been heavier than was generally expected. Devaluation uncertainties created difficult trading conditions, particularly in hard currency markets, for a large part of the year. Perhaps this earlier damage was only partially repaired by a rise in exports to hard currency countries after devaluation. Though it is to be noted that total exports of British chemicals actually increased from £85.3 million to £86.1 million in 1949. In the home market, ICI claims to have kept prices as low as possible, since its final products are the raw material of many industries producing for export. Last year's further rise in costs must have meant that this policy could be maintained only at the expense of profits.

Though the decline in profits is serious, it has been mitigated to some extent by a reduction in the year's provision for taxation. After crediting £497,769, compared with £197,788 in 1948, from taxation provisions made in earlier years, the taxation charge for 1949 was £6,496,828, some £4,561,695 down on the year. Earnings retained by subsidiaries are somewhat lower at £554,977, against £644,770, and earnings brought to credit in the accounts of the parent company amounted to £9,791,503, compared with £10,850,414 in 1948. Calculated on the ordinary capital of £60,558,139 after the issue last year, group earnings for 1949 are equivalent to 28.3 per cent, compared with 31.8 per cent computed on the same basis for the previous year. Hence the earnings cover for the maintained dividend of 10 per cent for the year has not been greatly impaired by the decline in profit.

* * *

Dealings in New Cable Stocks

The minimum of £4,995,834 new ordinary stock required to be taken up by stockholders in Cable and Wireless (Holding) for the modified scheme of reconstruction to be implemented was gained by the narrowest of margins. The ordinary capital of the new company is to be precisely £5,000,000. In addition, the capital will comprise £8,250,189 3 per cent 3½-year unsecured loan stock and £4,000,000 4 per cent 10-year unsecured loan stock. The authorised capital will be £47 million. The directors state in their circular that they regard the result as highly satisfactory. True, a win by a short head is as good as by a mile. Yet with the big holding of Globe Telegraph at his disposal, it was always odds-on that Sir Edward Wilshaw would get the modified scheme past this penultimate hurdle; it now awaits High Court approval. The pay-out will amount to £35,693,372 compared with £32,195,000 received in compensation for the company's cables undertaking.

It is indeed surprising, in view of the holding of Globe Telegraph, that as much as £8,250,189 of the 3 per cent 3½-year unsecured loan stock has been applied for. Certainly the majority of outside ordinary stockholders—roughly two-thirds of the total—appear to have decided to sever their connection with the company. If applications for the 3 per cent loan stock are deducted from the £12,389,586 old ordinary capital after the 80 per cent bonus issue, £4,139,397 remains as the amount of new ordinary capital opted for by ordinary stockholders. The round £5,000,000 of ordinary stock has been made up by applications for £860,603 by preference stockholders. Stockholders who have opted to take up the new ordinary stock saw it open at around 96½ per cent on Tuesday and subsequently fall to 92½. It is clear that some holders are not taking Sir Edward Wilshaw's estimates of likely earnings at their face value. The market was rather surprised at the amount of stock that came out in early dealings.

Holders of the new ordinary stock may well feel piqued at the hardy performance this week of the 3 per cent 3½-year unsecured loan stock. The scheme offered them the option of this stock. It opened at par and has so far not been more than 5s. per cent under 100. The short redemption date and the intention of the company to hold the price of the stock by purchases in the market have attracted investment funds in search of both income and liquidity. One snag lies in the arrangement for early drawings—five-eighteenths of the stock will be drawn or purchased in the market at the end of the provisional period of renunciation of allotment letters. There can surely be little doubt now as to the wiser choice for ordinary stockholders under the scheme.

The firmness of the 4 per cent 10-year unsecured loan stock has been, if anything, even more impressive. Applications by preference stockholders for this stock (issued at 96 per cent) amounted to £6,730,893 nominal compared with the maximum of £4,000,000 to be issued, so that a fairly drastic scaling down was necessary in allotment. The success of this issue was vital to the scheme, since the provision of the marginal amount of cash payable to ordinary stockholders depended on it. Sir Edward made it an attractive morsel in consequence. The stock, which like the 3 per cent issue is free of stamp at present, opened at just under par but later exceeded it. The latest price is 101.

Kaffir Slide Halted?

Weakness in the Kaffir market was renewed early this week. On Tuesday the gold share index of the *Financial Times* dropped to a new post-devaluation low of 126.7, compared with the peak of 138.49 earlier this year. In the new account which opened on Wednesday news of the provision of further finance for the Orange Free State by the Kennecott Corporation of America had a steadying effect, but no more than that. The corporation has agreed to guarantee the provision of £2,562,000 working capital for Merriespruit (OFS) Gold Mining, which is in the southernmost area of the OFS field adjacent to Virginia (OFS) Gold Mining. Both mines are under the aegis of Middlewits, whose shares were marked up 1s. 3d. to 32s. 4½d. after the announcement. The response of other shares to this further instalment of American help towards solving South Africa's problem of raising new capital for the OFS was disappointing. For the Kaffir market, the account just ended was its worst since devaluation, but the irregular trend in prices since Wednesday suggests that confidence has not yet fully returned.

Forced selling by weak holders both here and in Johannesburg, together with a reported bear squeeze, has been largely responsible for the market's discomfiture in recent weeks. The earlier trumpeting of the prospects, particularly of OFS

*Ex-rights.

shares, by some of the leading firms in the Kaffir market had left speculative positions in its train which could not stand the heavy weather of falling prices. The high hopes for the Orange Free State still demand a long view; and the relative firmness of the producing mines during the past difficult month shows that buyers of gold shares are at present not disposed to focus on the horizon.

Mines which have capital requirements to meet in coming months have been particularly disconcerted to find that every attempted market rally succumbs under new bouts of selling pressure. This points to the depleted state of the resources of "the shops," which have been unable to step in and stop the rot. The provision of even the modest amount of capital so far demanded by their satellites in the OFS has evidently seriously weakened the power of these mining finance houses to call the tune. In some cases the new capital needed for one mine has been found only by selling the shares of others. The great need of the Kaffir market at the moment and in the future is to attract new capital. Yet if poor development news, such as came from Welkom this week, can produce all round weakness of Tuesday's dimensions in development shares, it seems that the prospect of arousing new public interest, and even of retaining much of the support already enlisted, is not bright.

* * *

More Treasury Bills

Despite the very large changes which have taken place in the composition of the floating debt in the past nine months, it appears that the switching process from Treasury deposit receipts to Treasury bills is not, even now, complete. It was announced last week that the offering of Treasury bills for yesterday's tender was to be raised to £250 million, a new high level. This increase in the size of the tender, to no less than £80 million above the basic figure that obtained until July of last year, has given rise to a new discussion in City circles about the possibility of eventual supersession of the Treasury deposit receipt altogether. During the past nine months the total of outstanding tender Treasury bills has been raised from £2,210 million to £2,960 million, while the issue of TDRs has been reduced simultaneously from £1,224 million to about £430 million.

The speed with which this switching has been achieved is not, however, any indication of the scope for further repayment of TDRs now. If the weekly offering of bills were to be maintained for 13 weeks at the increased level of £250 million, the aggregate issue of tender bills would rise to £3,250 million, or £290 million more than the present issue. This increased borrowing on bills would represent, however, only a moderate proportion of the Treasury's additional need for finance during the lean revenue season. In 1949 the combined total of outstanding tender bills and TDRs reached its lowest point in mid-March, at £3,214 million, and rose to a peak of £3,868 million by end-December, an expansion of over £650 million. Obviously, the demands for 1950 cannot be forecast accurately at this stage. But, in the absence of funding issues, they are unlikely to be less than those of 1949 and will probably be appreciably larger—because of the hope of a surplus on the external balance of payments (so that the Treasury will be securing less finance from overseas) and because the budget surplus will be smaller. But even last year's rate of borrowing would raise the total of tender bills and TDRs to well over £4,000 million by end-December next.

This means that if the TDR issue were to be kept from rising above its present level during the course of this year, the weekly bill issue would have to be raised to £275 million or more by the early autumn and held at that level at least until the year-end. If this were done, it is just possible that the whole TDR issued could be redeemed in the course of the ensuing "revenue" quarter. But if the objective were to redeem the TDRs now outstanding and to avoid recourse to TDR borrowing even during the lean season for revenue, the "basic" level of the weekly bill offering would have to be raised to well over £300 million. And that seems most unlikely to happen.

* * *

The Rupees and their Backing

The conclusion of an interim trade agreement between India and Pakistan (recorded in *The Economist* last week) and the visit of the Pakistan Finance Minister to London have been interpreted in some quarters as adding fuel to the flames of rumour on devaluation of the Pakistan rupee; it has been suggested that Pakistan might be contemplating devaluation either to the old sterling rate of 1s. 6d. or to a new rate of 1s. 9d. (to which the Indian rupee might be upvalued in turn). In an interview in London this week, however, Mr Ghulam Mohammad went out of his way to deny these rumours; his denial, moreover, appeared to go beyond the bounds of that uncomfortable perfunctoriness which Finance Ministers are apt to assume when asked awkward questions just before a forced change of front. Mr Mohammad put up a spirited defence of the present rate, arguing that Pakistan's trading experience with countries other than India since September was convincing proof of the correctness of the decision to maintain the Pakistan rupee at its old parity. He added that the rate would be confirmed to the International Monetary Fund within a few weeks (as soon as the necessary legislation was passed in Karachi); under the rules of the International Monetary Fund, Pakistan could have delayed making such confirmation until August if it wished.

Mr Mohammad also commented on the report that Britain has suggested that the United States should take over some

of Britain's sterling liabilities to south-east Asia. His understanding was that the request related only to that portion of the releases from these balances which was customarily allotted in dollars. Pakistan, he intimated, would have no objection to that, but would require to be consulted before any more extensive transfer of sterling debts took place. The Indian viewpoint on this question, according to reports from Delhi this week, is that India would not object to a mere transfer of these debts from Britain to the United States, provided it was not accompanied by any scaling down of present or future releases from the balances. Since dollar releases would be utilisable for purchases in either the dollar or the sterling area whereas sterling releases are not, this statement may seem to be little more than a reiteration of the obvious. The interesting feature of these reactions, however, is that neither India nor Pakistan would now apparently be willing to accept any agreement which offered less than $2.80 for every pound, blocked or unblocked, they now hold; a year ago the demand for dollars was so great that India, at any rate, might have been willing to pounce upon any such chance.

* * *

Distributing Foreign Compensation

The Government has decided to set up a Foreign Compensation Commission to arrange the distribution among individual claimants of any lump sum payments made to this country by foreign governments as compensation for losses suffered by British interests through foreign nationalisations and other causes. Under the terms of the Foreign Compensation Bill, published this week, the Commission, which will remain indefinitely in being, will also have the task of reporting to the British Government on losses suffered by British nationals in countries with which no compensation agreements are yet in force.

The first two payments to be handled by the Commission will be those due under the Anglo-Jugoslav agreement of last December, and the Anglo-Czechoslovak agreement of last September; under these agreements the Jugoslavs are to pay out some £4,000,000 of compensation in seven equal annual instalments, and the Czechs are to pay some £36 million over an unspecified period (although £15 million is promised before the end of 1954). But for the establishment of the Commission these sums would presumably have been distributed by the Foreign Office (acting, perhaps, on the advice of some *ad hoc* committee set up under an independent chairman with legal experience). Since the Government itself is almost always among the claimants to any sum paid over in compensation, the establishment of the Commission will relieve it of the invidious task of acting as judge and jury in cases which affect its own interests.

* * *

Paying for Sterling's Fall

In an answer to a Parliamentary question this week Mr Gaitskell revealed the composition of the £61.1 million of payments made to foreign creditors under revaluation guarantees which became operative after the devaluation of the pound. The main beneficiaries were Portugal, Iran, Brazil, Belgium and Uruguay. Portugal received £27.4 million, a payment which must have lifted its total sterling holdings to between £85 and £90 million, at which level it is second only to Egypt among sterling creditors outside the sterling area. Some £82 million of this holding, however, is lent on long-term to the British Government; this holding appears, in fact, as "other debt—internal" in the British National Debt return. Of the other countries believed to have enjoyed revaluation guaranteees entitling them to a 43.9 per cent write up of their holdings in accordance with the rise in the sterling price of gold, Iran received £10.9 million and Brazil £10.5 million (after allowing for the £600,000 *ex gratia* payment voted to it by the House in March). After this write-up, the guaranteed holdings of both these countries must have amounted to about £35 million. In addition, however, Brazil is believed to have held some £5,000,000 of unguaranteed holdings and to have added to these quite substantially since. The revaluation payment to Belgium and the Belgian Congo, at £5,100,000, proves to have been rather bigger than was expected and must evidently have lifted Belgium's holdings above the £15 million gold point when it first became effective.

The only other payments made in accordance with revaluation guarantees on ordinary sterling holdings were those to Uruguay (£4,900,000), to Peru (£1,100,000) and Paraguay (£200,000). Additional small payments, totalling £1,500,000 in all, were made to Switzerland, France and British Honduras in connection with special small debts outstanding. Argentina, however, which was believed to hold a gold guarantee for sterling in its "A" account, got nothing at all, presumably because it had no sterling left there.

A Sensible Policy for Process Steam—9

Resistant Films v. Process Economy

BY SPIRAX

It is important for every user of process steam to recognise the existence of obstructions to the transfer of heat from the steam to the process. There is the metal wall of the equipment, with possibly a layer of scale; but there are also insulating films of air and water.

The most serious obstructions, putting up a prodigious resistance to the flow of heat, are the stagnant films of air and water on the internal surfaces of the steam spaces of the process plant. *The thicker the films the slower the transfer of heat and the poorer the performance of the plant.*

When steps are taken to minimise the thickness of these resistant films, heating efficiency and plant output economy immediately respond in a most gratifying way.

That is made possible by so improving the steam trapping and air venting arrangements that condensate is discharged at the rate at which it is forming and air is expelled continually during the whole of the processing period.

BREAKDOWN ON THE TUBE

Emergency calls for replacement of burnt-out boiler tubes are not uncommon, and one of the causes can be scale deposited in the boiler from the water. The modern way of avoiding scale formation in industrial boilers is by conditioning the boiler water with Calgon (sodium metaphosphate) one of Albright & Wilson's phosphates. Calgon not only prevents the formation of scale in boilers but will keep feed pipes and valves clear as well. It will in fact all be clear to you if you care to consult Albright & Wilson's Technical Service Department.

CALGON

a very little Calgon prevents a lot of scale

Industry

Building Efficiency

The working party report on building which was published this week (HMSO, 2s. 6d.) is a remarkably mild document in all the circumstances. "We have not yet recovered the rhythm of peace-time industry, nor could it well be expected that we should do so." Why not? Some other industries have regained and passed their prewar standard of productive efficiency. But, as the report concedes, productive efficiency in the building industry as a whole had recovered to only about a quarter of its prewar level by the end of 1948. Since then there appears to have been a further improvement of "a few points." Building costs in general at the end of 1948 appear to have been some 2½ times as high as before the war. But the cost of materials was only 2.2 times, while labour costs were 2.8 times the prewar costs. Thus a disproportionate share of the increase in the cost of new buildings has taken place in the building operations themselves.

How does the working party propose that this state of affairs should be corrected? It offers some common-sense advice to builders. It advises the pre-planning of large operations in detail, and the more careful management of work:

> Before starting work on a site the builder, with full knowledge of the operation he is going to undertake, should draw up a programme of work.

This can hardly be a novel idea. Adequate costing arrangements are urged, and a report on costing ordered from a firm of chartered accountants says that "costing records should be kept by personnel having sufficient technical knowledge to enable them to do so intelligently." The working party (having been plainly told by the British Standards Institution that "the building industry offers an immense scope," accepts the necessity of giving more attention to the standardisation of materials and components, a process which should be "aimed at securing the most efficient use of machines, plant, material and labour." It favours the greater use of mechanical aids in general and of power-driven tools on the site in particular, though the suggestion is qualified by the need for tools which are "sufficiently robust" to stand up to the exacting conditions of a building site and the need to insist that "reasonable care" is taken of them.

Many of these suggestions are incontrovertibly sound, but most of them are of the kind that any sensible builder could work out for himself in an hour or two. The exception is the incentive system of payment, which the working party supports; this is still a controversial matter in the trade. Even an incentive system of payment, however, will only work if the managements and the workers are sufficiently concerned with efficiency to set reasonably high task standards.

* * *

The Nature of Incentives

On almost every count, therefore, the essential question raised by the working party report on building is: what inducement exists for builders and building workers to work hard and make themselves efficient? The report points out that efficiency has been diminished by "the conditions of inflation present in the economy as a whole." There has been enough work for all the employers: "They should beware of complacency in the face of continually rising costs." But the employers have been hampered by controls, by shortages of materials, and by the complete absence of a reserve of labour to draw upon. They have been "inclined to offer additions to current wages in order to attract workers from other sites." Labour has become geographically immobile, though very ready to move from one firm to another and finding it easy to do so. The less competent workers, like the less efficient employers, have never had much difficulty in getting work.

The working party holds that these causes of low output per man are likely to be temporary, and that there are already signs of improvement; and one of its members, Professor C. G. Allen, points out in an appended note that "full employment" does not properly mean this inflationary state of things at all. The thesis that matters will get better of themselves is, however, at best unproven. At this point it is worth while to look at the report of the building productivity team which visited the United States last summer* The team concluded that output per man-hour on similar site operations was about 50 per cent greater in the United States than in Britain—and this without taking into account other American savings through simplified design or better organisation. And yet the American building industry does not in general use payment by results, which is being urged as the remedy in Britain. What, then, accounts for the difference?

Some of it is explained by the different social conditions in America. A worker who has driven to work by car may start the shift fresher than a man who has come by bus or train. High-quality food is amply available for the mid-day packed meal; commercial enterprise brings mobile canteens to the building site. Men do not suffer from lack of energy, and "unauthorised breaks for refreshment are unknown." But, says, the productivity report, a large part of the difference can still be explained only by "the individual attitude towards work." The American building worker "has never acquired the habit of doing less than he is capable of doing." His job offers him a high standard of living, and in the background of this positive inducement lie the threat of unemployment and "the considerably greater difference between average earnings and unemployment benefit." A system of payment by results in the British building industry would not create these conditions; it would seek to replace them by a different incentive.

Productivity in Drop Forging

The strength of incentives in the United States, and their weakness in Britain, is discussed in another valuable report from a productivity team; the subject in this case is the drop forging industry.† Here again, technical as well as social and psychological factors are at work. This industry is concerned with the forging of relatively simple parts with the assistance

† Productivity Report: Drop Forging. 2s. 3d.

of dies—the type of forge work which lends itself to repetition. The economies of standardised products, large orders, and long runs are therefore very great, and these advantages are more readily open to the American industry than to the British. Still, the report points out, the British motor industry is big enough to place large-scale orders, and the forgemasters could encourage it to do this. American forgemasters are ready to pass on economies to their customers, and to quote low prices for large quantities; further, they seek to persuade their customers to make price reductions possible by modifying designs.

This is one reason why production per hour is so much the greater in the American forges; the team, after examining the job sheets for 20 forgings, concluded that the American output was four times as great. The fullest possible machine utilisation is "the greatest single contribution towards higher productivity with existing plant." It implies that hammermen should be asked to do no work that can possibly be done for them, but also that they should keep their machines incessantly at work through the shift. American hammermen earn between £20 and £30 in a week of 40 hours. One operator said that he earned up to £45 regularly in a 45-hour week, and his price per piece was about half of that received by a British operator producing a similar part.

The report contains many useful technical observations on a trade on which the existing literature is slight; it reveals many points at which the British industry might improve its methods. But, like the preceding productivity reports, it has general observations to make as well. The American worker is "encouraged by the knowledge that if he increases production he will benefit accordingly," and he has also in mind "the fear of replacement if he fails to achieve the accepted standard." But the key to his attitude is the purchasing power of the money he earns:

> In Britain at the present time the purchasing power of money is limited by the scarcity of goods in the shops, the high prices, the purchase tax, and the incidence of high income tax.

The team expresses reluctance to touch on national policy, but it "considers this state of affairs to be detrimental to high productivity."

Mr Wilson and the Cotton Industry

When the President of the Board of Trade made his attack on the cotton industry in the budget debate he did not mention that the state of the utility scheme had been under discussion with the cotton industry for some weeks previously. The trade representatives had told the board in what ways it considered the Government's picture of shortcomings in utility output to be exaggerated, and had given its reasons. It had pointed out that some other shortcomings, for which Lancashire was being blamed, were in fact the Government's own fault. It had made proposals to put things right. Certain of its proposals had been accepted by Mr Wilson—for example, the more prompt adjustment of cloth prices to take account of changes in raw cotton prices—but others had been turned down. For Mr Wilson to choose this moment to attack the cotton trade in Parliament was a little bewildering, and the resentment he caused has not died down yet.

Now, however, the Government and the Cotton Board have agreed to undertake a joint review of the utility cotton scheme—a review from which, it seems, fairly important changes are not to be excluded. This should do a great deal to restore a better atmosphere. Sir Raymond Streat, the chairman of the Cotton Board, made the proposal known on Monday, just before he left for Japan, by publishing a letter to Mr Wilson. He put the matter with some astuteness when he said that the review might take many weeks or months, but if the trade knew that it was going on the difficulties of getting over the interim period would be greatly eased. His proposal was that the Board of Trade and the Cotton Board should "set to work to formulate revisions and reforms to cope with radically changed circumstances." At the same time he used words which implied some doubt, at least, whether the utility scheme even in a reformed state could last indefinitely:

> It has worked well because of the original momentum of wartime good will and effort rather than because of its merits as a scheme. It is not technically sound enough to merit continuance in all its present complexity for any appreciable period.

Mr Wilson accepted the proposal for a re-examination, in terms which suggested that he was thinking of doing the same for other utility schemes as well. He did not, however, fully take the Cotton Board's point, and it is important that this should be understood now if more disappointment and bitterness are to be avoided later. That Mr Wilson should refuse to accept Sir Raymond Streat's description of the scheme as "a complicated jumble of compromise decisions piled one on top of the other" was natural enough in view of what he had just said in Parliament. But he pointedly reaffirmed the view that "the advantages to the public—and I might have added to the trade—of the utility scheme should continue as a permanent feature of our economy."

Utility for Ever?

No way has yet been suggested of preserving the advantages of the utility cotton scheme without preserving its disadvantages also, and if utility is to be part of the national heritage, the drawbacks will need to be appreciated. The capital drawback arises from the very *tour de force* by which, at a dark period of the war, the trade and the Government succeeded in laying down precise specifications for a range of cloths in common use, sufficient to keep the population clothed in wartime at modest cost. Ever since that time

the cotton textiles produced for tax-free consumption on the home market have followed worthy but stereotyped lines. These lines are laid down, and manufacturers who would like to seek change and innovation—those, in fact, who have enabled Lancashire cotton goods to survive in world trade—have had to conform. It is easy for British shoppers to forget what variety was like; but even to them some things are conspicuous. Lately there has been (to take one example) a better supply of poplin utility shirts. But pyjamas of poplin or similar fine cloths do not appear with the utility mark; there is no utility mark for them. To take another example, the utility range of Jacquard-woven furnishing cloths was an excellent idea in wartime, when the Jacquard weavers were threatened with almost complete unemployment. But now, many years later, the same range of cloths is the hallmark of utility furnishings. Some manufacturers would have liked to introduce new cloths, but these would not have fitted into the utility scheme, and would have had to pay purchase tax; therefore they have not been made. They would not have taken more cotton or more labour, or in any way have cost more to make; they would merely have been new. Storekeepers and clerks who would like light working overalls have to buy, instead, heavy overalls designed for industrial work, and containing much more cotton.

In these circumstances, there is a danger that many standard lines of cotton manufactures will become embalmed and perpetuated, while other lines will grow extinct; and it is hardly possible to conceive of the utility scheme so rejuvenated that this would not happen. Perhaps the British market could be induced to accept it contentedly. But how, in that case, will the export trade survive? Many good export lines have no place in the utility schedules. Already manufacturers who put such lines into production a year ago, when they were being urged to produce for export, are being upbraided for having sold a residue of this production on the home market—for these are non-utility cloths, and their sale on the home market spoils the proportions between utility and non-utility sales.

Seafarers Oppose Nationalisation

The seafaring unions—the National Union of Seamen, the Navigators' and Engineer Officers' Union, and the Radio Officers' Union, have rejected a suggestion from the Confederation of Shipbuilding and Engineering Unions that they should join in considering proposals for the "adequate public control of shipping." The recovery of British shipping since the end of the war, and no doubt the marked improvement in social and economic conditions for seafarers which has followed the National Maritime Board agreement of 1947, have influenced the seafarers to urge the Confederation to leave the shipping industry alone. They emphasise that shipping is international in character, and therefore unsuitable for nationalisation. Moreover, "there are certain tendencies evident which can conceivably be detrimental to British shipping services and could possibly be aggravated by the processes of nationalisation. Flexibility in management to meet speedy and unpredictable changes in trade and commerce is essential if British shipping is to maintain its pre-eminence as a world carrier." The Confederation is pressing for the ultimate nationalisation of shipbuilding, ship repairing, and marine engineering as well as shipping. But shipbuilding and repairing are almost equally international in character and equally need to be flexible.

Mining Manpower

Neither the Government nor the Coal Board seems to share the alarm of some of the miners' leaders at the continuing decline in manpower. The Board is believed to hold the view that if the industry ends the year with about 700,000 mineworkers there will be no cause for concern; and the 1950 Economic Survey indicated that the right distribution of the labour force was more important than its numbers. Mr Isaacs's statement in the House of Commons that the removal of the Control of Engagement Order had had no significant effect was probably true. Mining manpower has, however, declined steadily since this was done, and there is no sign that the decline is under control.

Since the beginning of the year, the net loss of manpower has been about 500 a week; the latest figure is 701,800, compared with 708,367 in January. Mr Arthur Horner has given a warning in a speech in Edinburgh that if the present trend continues there will only be 696,000 men in the industry in a few months; and he recalled that when manpower last stood at this level there was a serious coal crisis. This is rather a *non sequitur*, for conditions have changed. Much mechanisation and improvement have been done in the collieries, and there is no great reason why increases in productivity, if they could be accompanied by reductions in absenteeism, should not more than compensate for the fall in manpower. The Communist group among the miners' leaders—Mr Moffat of Scotland and Mr Davies of South
