The Great Alliance

IN one respect, at least, the fifties will not differ from the forties. Now, as then, the survival of the free world will depend upon the closest possible partnership between the United States and the British Commonwealth. This proposition commands such wide assent on both sides of the Atlantic that it may sound platitudinous, yet it is important to remember how relatively recent its general acceptance really is. Ten years ago, the symbols of American policy were still the Neutrality Act and Cash and Carry. Even five years ago, a considerable measure of isolationism hid behind such declared policies as "unequivocal support for the United Nations," and the dogma of "One World" served, in many cases, as a convenient excuse for taking no particular interest in any part of it. Five years ago also, there were many people in Great Britain who found much more pleasure in looking east than in looking west. Steadily, however, in the last four years, the realities of Communism have driven such views back, in both countries, into the last ditches of entrenched wish fulfilment—in Chicago or Shoe Lane. The need of free society to unite in its own defence and the central role in that defence of Anglo-American co-operation have become the commonplaces of the Atlantic world.

It is as well, as the new decade opens, to recall these facts. Although the recognition of the need for Anglo-American partnership has steadily increased, it has not done so at a uniform pace. On the contrary, the line of advance shows recurring and ferocious wobbles, during which, far from advancing in understanding and co-operation, the English-speaking peoples have appeared to take time off to misunderstand and irritate each other with all the ease their common tongue permits. Such squalls blew up intermittently throughout the Palestine dispute. Another hovered over Anglo-American relations last summer before devaluation, only to extinguish itself in the immense psychological success of the Washington Conference in September. The reason why, at this particular time, it is especially necessary to remember the extent and growing intimacy of Anglo-American understanding is that another period of storm is clearly beginning.

Two issues are already boldly chalked on 1950's calendar of troublesome events. The first is an old and tried source of Anglo-American malaise—the passage through Congress of the appropriations for dollar aid to Europe. These sessions have involved a certain amount of plain speaking about the doings and omissions of the European countries, with Britain, as the largest participant, attracting the lion's share. This year there is some reason to expect even plainer speech than usual. On the one hand, there is growing sentiment in America in favour of a balanced budget and a limit to Government spending. On the other hand, a critical Congress will find in Britain's recent conduct of economic policy a certain amount to justify a drastic cut in the appropriations. The Marshall plan's great achievement in assisting Europe to restore prewar levels of

162517

duction has shifted the emphasis from problems of output to the much more baffling problems of exchange and trade. The British record in restoring production is second to none, but the record of sterling as an international currency is less satisfactory. The belief that inflated government expenditure at home and overgenerous releases of the sterling balances overseas are frustrating the stabilising effect of devaluation has gained ground. As a result, it is argued, sterling is weaker than it need be and the attempts to safeguard it by tight exchange control and a managed currency are preventing the unification of the commercial and monetary systems of western Europe—a development which, of all things, the Americans most hope to see as a result of the Marshall plan. Britain's Continental neighbours, some of whom tend to have more aptitude for general ideas than for their concrete application, are not unwilling that Britain should appear the dog in the manger. Even the efforts that Britain has made to escape from dependence on dollar aid—for instance, by reducing its purchases of American oil—have given rise to criticism, since the American exporters who suffer immediately as a result of the British move are not likely to share the State Department's understanding for the stern necessity dictating Britain's action. All in all, British trade and financial policy seems certain to come in for searching, critical and often unfavourable comment in the coming months.

*

Difficulty and misunderstanding are no less likely to cloud the discussion of a second issue which will thrust itself on to the Anglo-American agenda in the coming months. The New Year opens under the sign of tragic upheaval in Asia. The Communist conquest of China will have its repercussions throughout the Far East and South East Asia where Britain and the United States are deeply and almost equally involved. But if Communism threatens the interests of both partners in the area, they have not yet considered its implications. A common strategy for containing it has been talked of as a desirable objective, but never seriously worked out. On the contrary, in one area at least—Japan—the local application of American policy has even shown a certain hostility to British interests. Attempts to restore trade between Japan and the sterling area have hardly been encouraged by the occupation authorities, and that the attitude persists to this day has been illustrated by recent American attempts to reduce Japanese purchases of oil from sterling sources.

To this old source of friction may now be added a new one—this time of Britain's making. The British decision to go forward and recognise the Communist regime in China, which, it appears, will be announced shortly, is bound to hamper very considerably the efforts to concert Anglo-American policy in Asia. Its likely consequences—an Anglo-American clash over the raising of the Nationalist blockade of Shanghai and an Anglo-American dispute in the United Nations over the issue of China's representation on the Security Council—are discussed in greater detail in a Note on page 10. The supposed gain from the move, which is presumably increased Communist respect for British trading interests, is derisory compared with the solid harm it will do to Anglo-American understanding. From the point of view of relations with Washington, it is clearly a blunder.

Anyone who confined his attention to the visible manifestations of policy as they bear day by day in the newspapers might well ask how is that two nations, who have accepted the need for partnership as one of the first assumptions of their conduct of international affairs, nevertheless continue to misunderstand and irritate each other with such unfortunate regularity. The answer is undoubtedly in part historical. Only four years ago, the structure of naval stability in South East Asia and the Indian Ocean provided by the British Commonwealth was still in American eyes a manifestation of outdated colonialism. Similarly, the sterling area was still looked on as an enemy to American conceptions of free world trade. It is only gradually, largely by the spread of Communism, that such systems have come to resemble Voltaire's deity, in that if they did not exist, it would be necessary to invent them. Naturally, the earlier criticism and the later recognition of their usefulness still war together in the American consciousness. From the general premise that Anglo-American co-operation is necessary, the logical deduction is not always drawn that the British partner, even though it is a junior partner, has an independent contribution to make and a vital part to play.

If inhibitions of this kind cloud America's understanding of Britain's role, the fog seems to be thicker still on this side of the Atlantic. Loss of power never easy to accept gracefully. After a century *domination*, the British are no longer the powerful centre of world order. However, no imperial power has ever been so fortunate in its successor and there is little evidence for the streak of sullen isolationism that has appeared in so much of British foreign policy in recent years: the determination to make no sacrifices of sovereignty in any direction, the impression conveyed—for instance in most negotiations concerned with American investment in British colonies—that America is an intrusive outsider; the resentment, reinforced by ideological prejudice, of any suggestion touching Britain's internal economic policy even from those who are underpinning it to the tune of a billion dollars a year. If the Americans have yet to learn to treat Britain consistently as a respected partner, the British have yet to learn consistently to behave like one. And since, for some time to come, it is the implications of Britain's trade policy that are most likely to hold the centre of attention, nothing would so quickly restore respect and confidence as the achievement of national solvency.

It may well be that 1950 will not prove a very favourable year for the closer knitting together of the British-American alliance. Quite apart from the squalls on the immediate horizon, the great gales of national [illegible] will blow through the land in both countries [illegible] not necessarily during elector[illegible] contests [illegible] and sanest voices are heard [illegible] the citizen of good will may console himself that [illegible] standings and upsets of [illegible] tions of understanding [illegible] stronger. Housing Policy—I

After the Millionth House

Last, Mr Aneurin Bevan announced that the number of new and reconstructed dwellings made available since the war had passed the million mark. The passing of this landmark and the imminence of a general election open a new phase in postwar housing. There are many objections that can be, and have been, brought against Mr Bevan's housing policy. It has been erratic, expensive and, in some respects, unjust. But judged by the paramount test, that of numbers of dwellings completed, it has succeeded.

The million mark is not merely a convenient round figure; it represents, very roughly, the war-created deficiency of housing as it was estimated five years ago. With the million houses completed, the housing position ought to be back to 1939. It is doubtful whether a popular vote would so describe it. Statistically, nevertheless, it can be demonstrated that—if not by the end of 1949, then by the end of 1950—the deficiency of the war years will have been made good. Some 470,000 houses were destroyed or made uninhabitable during the war. In addition, about a million new families, rather more or less, sub-divided from their family trees between 1939 and the end of 1948 and became potential claimants for new houses. This makes a total possible demand for new houses (throughout this article and its successor, "house" must be read as meaning "dwelling") of 1,400,000 to 1,500,000. This figure stands on the debit side of the housing account. On the credit side stands the effort made since the end of the war to meet the demand. By the end of September 556,000 new permanent houses and 171000 temporary houses had been built and 262,000 dwelling units made available by repair, conversion and adaptation, a total of 989,000. At current building rates, which are not likely to be much affected by the capital cuts until the end of 1950, it seems probable that some 250,000 new houses will be finished between September, 1949, and January, 1951, and that other building operations and conversions will, by that time, bring the total to something between 1,300,000 and 1,400,000 over and above those in existence when the war ended. As it is probable that, for economic and other reasons, a number of the new families will not wish to separate from the old, it seems fairly clear that the relation of dwellings to families will be very much the same in a year's time as it was in 1939.

*

Why then is the housing shortage to all appearance nearly as bad as ever? The explanation lies in the wholly distorted nature of the relationships between people's incomes and the costs of the things they spend them on. There is plenty of evidence from the past that the demand for housing is very elastic. When incomes rise relatively to the cost of housing, or the cost of housing falls relative to incomes, the demand for houses goes up quite substantially. What has happened in the war years is that the sum total of personal incomes has risen (comparing 1938 with 1948) by 80 per cent, even after direct taxation is allowed for. The price level of housing (the total of rent, rates and water charges), on the other hand, was in 1948 only 12 per cent higher than in 1938. No wonder that the demand for housing is almost insatiable.

The 12 per cent increase, of course, is wholly artificial. It is the product of rent control on the one hand and of housing subsidies on the other. Rents have, in fact, become an almost prime example of the chaos that can result from a number of well-intentioned but unrelated interventions of state policy. Families living side by side in identical houses may be paying wholly different rents, simply because of the different dates at which the tenancies changed. Local authorities may put up the rents they charge; private landlords may not. Real incomes, swollen by food subsidies, increase the demand for housing and lead to higher building subsidies. The state pays large sums to subsidise big new houses for some families and smaller sums, or no subsidy at all, in respect of smaller older houses inhabited by no less meritorious families. The very poorest often get less help than those who are better off than themselves. The whole subject is one of bottomless confusion. If a new phase in the history of housing is starting, the most obvious prescription is that there should be a deliberate and consistent attempt to restore, over the years, some reality to the housing position, so that either the occupants of houses are asked to pay the

true economic cost of them, or if they are not, at least the assistance they are given is arranged on some logical basis that treats all like cases alike.

Even if, in the course of 1950, the prewar position is restored, that does not, of course, mean that the housing problem will be solved. It does not imply that there was anything satisfactory about the situation immediately before the war. There were at that time many families living in overcrowded conditions, and millions living in houses of a deplorable structural standard and lacking the amenities which any family has a right to hope for. No one could say that the hundreds of families living in tenements in Stepney or the Gorbals were living in anything but the most wretched conditions, which it was a reproach to society to permit. There was far too much overcrowding and far too many slums in 1939, and the slums at least are now eleven years worse.

The real question is not whether the state-subsidised housing effort should stop, but whether it should now be diverted specifically to the relief of overcrowding and to the clearance of slums, leaving any other more general provision of houses to be carried out, whether by local authorities or by private enterprise, without benefit of subsidy. This was the point that was reached by housing policy at the beginning of the 1930s. The dominant motive in the repeal of the general subsidies given under the Chamberlain and Wheatley Acts was financial economy in the crisis of 1931-32. But it did so happen that, at exactly that time, the costs of building fell (the fall was probably not unconnected with the withdrawal of the subsidies) to such an extent that it was possible to build unsubsidised houses to rent at a figure that the ordinary wage-earner could afford. There is, of course, no scientific definition of that figure, though ten shillings a week was generally quoted and accepted If so, the equivalent figure would be about £1 a week today. Withdrawal of the general subsidy might well have a sharp effect on building costs, but it is difficult to believe that the fall would be so sharp as to make it possible to build houses of the present standard to rent for £1 per week. Some retreat from the present lavishness is doubtless in order, now that the million mark has been passed. But it would be very rash to argue that the policy that worked in 1931 (in the sense of producing an unsubsidised housing boom) would work again today.

The first essential in any attempt to formulate a housing policy for the new phase is to form some idea of the continuing need for new houses. Once every family who requires it has been provided with a separate dwelling—a position which will have been substantially regained within a short time—the continuing need for houses will arise from migration from place to place (a small factor on an annual basis) and from the replacement of old houses by new. How much should be allowed for rebuilding those old and condemned houses so picturesquely referred to by town planners as "blight"? Ideas about housing standards have risen so much in the last ten years that many houses that were above the sanitary inspector's level of condemnation in 1939 are below it now. On a method of assessment adopted by Dr Elsas in his book "Housing Needs Before the War and After," it can be calculated that at the end of 1948 there were 4,000,000 obsolete houses over 60 years old in Great Britain. If it be supposed that three-quarters of these houses should be replaced in the first twenty years after the war, and that in the same period another million houses will be needed for new families, for migrants and for special needs such as agricultural labourers, then a total of some 4,000,000 required houses in twenty years can be built up—that is, the continuation until 1965 of the present rate of building. The twenty years after the second war would then produce roughly the same number of houses as the twenty years between the wars.

But estimates cannot be constructed in this way in an economic vacuum by reference only to social and aesthetic requirements and without calculation of cost. The resemblance between the attained 4,000,000 of 1919-39 and the assumed 4,000,000 of 1945-65 conceals one major and possibly decisive difference: virtually all the first 4,000,000 were additions to the total stock of houses (relatively very few houses were destroyed in those years), but three-quarters of the second 4,000,000 would have to be replacements.

Nobody in this country has had any opportunity for two centuries at least of gaining any experience of how the economics of house-building works in a country where the supply of houses has caught up, at least numerically, with the demand. But one thing is obvious, and that is that the demand for new houses in replacement of old must depend in very high degree on the cost of the new houses. It may be true that there are 4,000,000 houses in this country—that is, one in three of the total—that it would be nice to replace by new houses. But there are certainly not 4,000,000 houses so insanitary or offensive that people should be forbidden to live in them. Above the slum level, however it is defined, it becomes a matter of relative cost. New house A is more desirable in every way than old house B. But if B can be had for 10s. a week while the economic cost of A is 35s. a week, very many families will plump for B and the effective demand for replacements will be nothing like 3,000,000 in twenty years. And if the Government decides that it knows better and goes in for subsidising the new houses until they are cheap enough to create a demand for them, it will find the process most expensive. Not only will it have to pay a fat subsidy on the new house, it will have to buy the old house and tear it down—for otherwise the old house will steadily undercut the new. If a buyer's market in houses is combined with a level of costs that makes the full economic rent for new houses much higher than the public's conventional notions of what is fair, then a programme of replacement must either be very small or else immensely costly.

The passing of the million mark is an achievement for Mr Bevan. But it should also be a danger signal for the building trade. It means that the demand for houses—other than for the replacement of existing houses—will very soon be within sight of running out. Just how soon it will run out depends on a complex variety of factors. For example, when at last it is decided that the British people should again pay prices for their food that correspond to the real cost of producing or importing it, a large part of the present apparent demand for houses will disappear overnight. But even without this, the present demand will be met before very long. When that time comes, the maintenance of a building industry of anything like the present dimensions will depend on the replacement demand. And the replacement demand will depend absolutely on the level of costs. A further article will examine the present level of costs and will include some figures that have not previously been published.

Electoral Facts

(By a Correspondent)

[This article is contributed by a correspondent who has made a special study of election statistics. The figures and diagram attributed to the British Institute of Public Opinion are printed by courtesy of that institution and of the News Chronicle.*]*

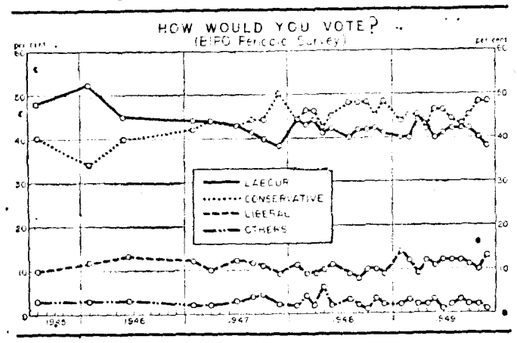
SOONER or later—and probably sooner—the date of the election will be announced and then those who have a taste for political speculation will be able to devote all their energies to spotting the winner and guessing the majority. Election prediction is perhaps a rash and unproductive occupation, but few resist its lure. Often forecasts are based on mere intuitions of popular feeling or on one-man straw polls (of acquaintances). This article endeavours to set out the facts requisite for more serious attempts to anticipate the outcome. It leaves prediction to the reader, who is free to discount the current evidence in the light of the developments he thinks likely in the time that will elapse before polling day.

At the present, plausible arguments can be elaborated in favour of the chances of both the major parties. Members of the Labour Party are apt to cheer themselves by quoting their by-election record. They have been challenged in 34 seats since their victory in 1945, yet not one has been lost. But they have been very lucky. In every seat they have had to defend since February, 1946, they had in 1945 a majority of at least 12 per cent. In any case a disproportionate significance tends to be attached to victory or defeat in by-elections. A much more exact guide to the change in opinion is given by the turnover in votes. Admittedly it is not always easy to calculate what the turnover has been. By-elections have occurred in 52 constituencies since 1945, but in only 17 of them were there the same number of candidates both in the 1945 general election and in the subsequent by-elections.

Probably the simplest way to make a reasonable comparison between the results of the general election and of the by-elections is to exclude from consideration those constituencies where a party, absent on one occasion, won sufficient votes on the other to save its deposit, and for the rest, to assume that parties which fought only once and which did not even poll one-eighth of the votes did not appreciably affect the turnover between the major parties. The following table has been compiled on that basis.

Year	Number of By-Elections Included	Percentage of Total Major Party Vote				Conservative By-Election Gain over 1945 General Election
		By-Elections		1945 General Election in the same Constituencies		
		Cons.	Labour	Cons.	Labour	
1945	7 (out of 9)	47·2	52·8	48·8	51·2	−1·6
1946	8 (out of 17)	42·8	57·2	41·8	58·2	1·0
1947	7 (out of 9)	49·8	50·2	42·2	57·8	7·6
1948	8 (out of 11)	48·1	51·9	40·3	59·7	7·8
1949	5 (out of 6)	44·6	55·4	38·5	61·5	6·1

It is impossible to say, of course, how far the constituencies where the by-elections occurred were representative of the country as a whole, or how far the figures for each year were affected by the chance of when in the year the by-elections were concentrated. It happens that the great majority of the by-elections have been in three areas (Greater London, the West Riding and Scotland) and that two of the three included in the calculations for 1949 took place at a period probably rather favourable to Labour. In a general election, if the Conservatives were to succeed in winning 6 per cent of the 1945 vote away from Labour they would have a 4 per cent lead in the total vote—which would be quite enough to ensure them a comfortable Parliamentary majority. But, apart from the chances which surround by-elections, there is an important limitation on their value as pointers to the future. People may not vote in the same way in by-elections as they would in a general election. In five by-elections at the beginning of 1929 the Conservative government of the day won 3.9 per cent less of the vote than in the same constituencies in the general election the following May. A similar study of the results in six seats contested early in 1935 shows that the government of the day (also predominantly Conservative) fared 5.8 per cent worse than in the general election of the following November.



★

The Conservatives, if they are seeking comfort, quote the results of Antipodean and local elections and the findings of public opinion polls. The first two give little clear justification for optimism. The connection between events in Australia and New Zealand and the decisions of the British electorate can hardly be close. Local elections, though they have shown plainly the improvement in Conservative organisation, can offer little precise information about the movement of opinion; there is no evidence to show how far the views of the 40 per cent or 50 per cent of the electorate who bother about local contests are the same as those of the 70 or 80 per cent who will be brought out by a general election campaign.

Public opinion polls probably offer the most precise information available about the movement of political opinion. Over a period of thirteen years Dr. Gallup and his affiliate organisations—and some of his imitators—have had a remarkable record of accuracy in election prediction. Despite his spectacular failure to select the winner in last year's Presidential election in the United States, his error was only 4.5 per cent; in retrospect it can be seen that carelessness and the over-confidence engendered by past successes were in large measure responsible. The British Institute of Public Opinion (his affiliate in Britain) was less than 2 per cent out in its predictions of the result in 1945 and it has been very accurate in some unpublished studies of recent by-elections. A margin of error of perhaps 3 per cent should be allowed for ineradicable biases and sampling fluctuations, but there is no reason to suppose that the BIPO does not offer a substantially accurate guide to the outward movements of public opinion on politics.

Since 1945 the BIPO has periodically asked the ques-

tion: "If there were a general election tomorrow, how would you vote?" The results have shown a fairly steady trend, not dissimilar from that generally manifest in the voting at by-elections.

Since last September the slump in Labour support has been very marked, although there are reasons for thinking that quite recently it has become less sharp. Despite South Bradford (there is strong evidence that it was not a typical constituency) there seems no doubt that Labour's position is decidedly unfavourable at the moment. But it should be noted that Labour recovered from a similar slump in the autumn of 1947. And it is at least possible—although not necessarily certain—that some people will change their minds under the stress of an election campaign.

The BIPO findings reveal clearly the relative unimportance of the minor parties. The Liberals have shown no appreciable recovery since 1945 and appear unable to muster even one-seventh of the votes. They have certainly fared disastrously in those by-elections which they have ventured to fight. In 1945 they won only 12 seats, more than half of them through the absence of a candidate of one of the major parties. They plan to put well over 400 champions in the field this year, but it is hard to see how they can increase—or even perhaps maintain—their present Parliamentary representation. The Conservatives, by their strenuous efforts to woo them, appear conscious that their intervention will draw more votes from the right than the left. Undoubtedly polls seem to indicate that, in the absence of their own candidate, appreciably more Liberals would vote Conservative than Labour (except in Wales). However, if there are indeed to be 400 Liberal candidates, most of the 10 to 14 per cent of the population found by the BIPO to be Liberal supporters are likely to have a chance to express their preference—and that means, in all probability, that their influence on the outcome of the election will be very small. The Communists will make a certain amount of noise over their 100 candidates, but the 850 votes which the Communist candidate won in the North St. Pancras by-election this year may be typical. In a very few constituencies they may draw enough votes from Labour to let the Conservatives in, but it is not likely to affect the total result.

The BIPO findings also show some interesting facts about the social division of political opinion. Women, for instance, have swung more violently against the Government than men. The November survey showed the Conservatives with a 14 per cent lead among women, but only 4 per cent among men. The Conservatives appear to have the broadest lead among the 50-64 age-group and the narrowest among the over-65s and the under-30s. As far as social class goes, the Conservatives are in a majority of more than 3 to 1 among the upper strata of the BIPO cross-section (representing 31 per cent of the population) while Labour has a 4 to 3 advantage among the remainder.

In the last Presidential election in the United States, barely 50 per cent of the adult population voted. One of Dr Gallup's main problems was to decide which of the people he interviewed would take the trouble to record their preference on polling day. This presents less of a problem in Britain since in the last seven British general elections the number of electors who have recorded their votes has varied between 71 and 77 per cent. A large proportion of non-voting is, of course, due to illness, to removal and to inaccuracy or obsolescence of the register. There is little evidence to suggest that those who either from indifference or conviction abstain from voting are drawn particularly from the habitual supporters of one side or the other, or indeed that they are very numerous. The BIPO has found that 3 or 4 per cent of those interviewed say that they will not vote. On the whole it appears that the better-off are more conscientious about their electoral duties and perhaps selective apathy may hurt Labour more. But it is not likely to be a very important factor.

*

There is every indication that the turnout in the coming election will be of record size. The register is probably the most efficient yet compiled. The party organisations are larger and more alert than ever, and popular interest in politics seems unusually high. In the 1930s by-election turnout was usually 10 to 20 per cent lower than in the 1935 general election. But in recent contests the vote has sometimes exceeded that in 1945 and has seldom been far below it; 87.3 per cent of the electorate apparently voted in South Bradford—more than in any constituency in 1945.

Of course, neither the electorate nor the constituencies are the same as in 1945. Then there were 33,200,000 on the register; now there are 34,400,000. On a very rough estimate 2,500,000 of the 1945 electors have died and 3,500,000 new electors have come of age. And a much larger number must have moved; but there is no evidence that migration has concentrated voters of one side or the other in marginal areas or that these changes are likely to have a marked effect on the result. There is no doubt, however, that the redistribution of seats under the Act of 1948 has helped the Conservatives, or rather that it has removed a bias in favour of Labour which undoubtedly existed in 1945. Then the size of constituencies varied very considerably and Labour, being strong in the depopulated areas, benefited. The average constituency returning a Labour member at that time contained 6,000 fewer electors than that returning a Conservative. It has been estimated that, had the present redistribution taken place before the 1945 election, Labour would have won 30 fewer seats. That unfairness eliminated, there is at present no reason to believe that the electoral system will appreciably favour either party.

It is commonly said that, whoever wins the next election, the margin will be narrow. Such a dictum fails to appreciate how the British electoral system exaggerates narrow majorities in votes into sizeable majorities in seats. This may be illustrated by a very simple rule of thumb formula which, propounded in 1909 before the Royal

Commission on Electoral Systems, fits recent election results in Great Britain and New Zealand with extraordinary accuracy. The Rt. Hon. J. P. Smith then suggested that, in a reasonably homogeneous country with a two-party system and single-member constituencies, the ratio of the seats won by the parties should be at least the cube of the ratio between the votes cast for them. In other words, if the ratio between votes is A:B the ratio between seats should be at least $A^3:B^3$. When that formula is applied to the last five New Zealand elections the composition of the House of Representatives can be calculated from the division of the votes with an average error of only one seat (in a House of 80 members). When it is applied to the three general elections which have occurred in Britain since the return of a predominantly two-party system in 1931 the average error in calculating the division of the contested seats won by the major parties is—fantastic though it may seem—two seats. There is nothing magical about this formula. There is no reason why it should fit with such uncanny accuracy the results of the next election. Nevertheless its results coincide generally with more empirical calculations which have been published about the relation between seats and votes. If the formula is generalised it may readily be seen how a narrow lead in votes is likely to be magnified into a comfortable Parliamentary majority. If 620 seats are divided between the major parties the formula gives the following table.

Per cent. Division of Major Party Vote	Seats	Majority (Ignoring Lesser Parties)
65—35	520—80	440
60—40	404—136	328
55—45	348—212	176
52—48	336—284	72
51—49	318—232	36
50—50	300—300	...

Even if there is a bias in the electoral system which means that one side wins more seats than the other for a given percentage of the vote, there is no doubt that on the average in recent elections between 15 and 20 seats have changed hands for every one per cent turnover in votes; a turnover of 15 to 20 seats means of course a change of 30 to 40 in the size of the Parliamentary majority. Those who profess belief in a Parliamentary majority of under 40 presumably have an intuitive perception of what the division of public sentiment will be to within one per cent.

Germany's New Year

WITH wise words such as the Germans have for decades been unaccustomed to hear from their rulers, Dr Adenauer enjoins the Federal Republic of Germany to conduct itself in 1950 with patience, tact and circumspection. Germany has no Talleyrand in Dr Adenauer, but it has at least a politician. For a short space, perhaps, the Germans are not cursed by the presence of a "great man" at their head; instead they have a Chancellor who, despite a tendency to take decisions without reference to his Cabinet or Parliament, believes in the golden mean. For a while, too, the two-thirds of Germany which is ruled from Bonn is free to turn its face to the west; the chances of its maintaining that freedom increase with every day that it remains cut off from the east Elbian area which traditionally links Germany to Poland and Russia.

In the eastern Germany that is ruled from Berlin—and Moscow—the process of perfecting a "people's republic" is gathering speed. Developments there continue to leave the advantage with the west. As the purges reach ever deeper into the ranks of the bourgeois parties and business men, in accordance with the instructions of the Cominform, the gulf between life in the two German states becomes wider and plainer. For a while yet, American aid will continue to provide western Germans with a standard of living not far below the prewar levels, save in the matter of housing. The eastern Germans will continue to receive Russian flattery in exchange for economic extortion. Even the hopes of that shadow sovereignty which they expected to gain from the establishment last autumn of the People's Republic have faded. The puppet politicians in Berlin are bound by the punitive conditions imposed at Potsdam, and are strictly on probation. The task demanded of them is to liquidate all critics of Russia, to organise the overthrow of the Bonn Government, and to force the western occupation forces to withdraw. Until that day, they have the cold comfort of knowing, in President Pieck's words, that they are guarded by "the unshakeable Stalin Watch on the Elbe."

For a short while, therefore, the three western powers and the western German moderates have still a chance to achieve some consolidation of strength. What use are they likely to make of it in 1950? The targets at which the Germans will aim this year are already clear. Dr Adenauer means to gain by his patience, tact and circumspection complete sovereignty for his government, and every possible economic advantage for his country. Indeed, no freely elected German Government could aim at less. Specifically, the Federal Government, which leans heavily on the support of the industrial and business circles, will seek to end the restriction of steel production to 11.1 million tons, the restrictions on shipbuilding, the bans on civil aviation and on the manufacture of synthetic oil and rubber, and the unilateral subordination of German heavy industry to the Ruhr Authority. It will ask to take over the reorganisation of the Ruhr steel trusts, which German experts are at present being required to carry out under Military Government Law 75; in this way it will make certain that no drastic structural changes in the Ruhr combines are made, and that the old shareholders are enabled to become owners of the reorganised trusts. The German trustees, now working under the Tripartite Combined Steel Group, will then no longer run the risk of being branded by their countrymen as traitors who "decartelised" the Ruhr at the orders of the Military Government.

As for relations with the world outside, the Bonn Government will aim at establishing this year a Foreign Ministry, with diplomatic as well as consular missions abroad. It will also seek to secure a guarantee of armed protection. It will object to restrictions on its exports to Russian-dominated countries, to conditions being attached to the use of ERP counterpart funds for investment, to demands for anti-cartel legislation, or for

an end to so-called discriminatory trade practices—in short, to all the strings attached by the ECA to American aid. At the same time, it will offer American private capital every possible inducement, in the teeth of Socialist opposition, for investment in German industry. At every turn, unless they deliver the goods, the western Powers will be threatened with a Russo-German *rapprochement*. Sooner or later, Germany's representative on the Ruhr Authority will demand that the scope of its work shall be extended to cover the heavy industries of Germany's western neighbours. The Ruhr Statute, framed for a thoroughly controlled Germany producing in a world short of coal and steel, now belongs—as one German newspaper recently declared—"to the scrapheap." In the dominant German view the future of the Ruhr Authority in a world of surplus supplies lies in its becoming a new form of international cartel.

As matters stand, it appears that the Ruhr Authority will have to expand its realm or dissolve. During 1950, the alternative will be plainly put before the occupation Powers: either control Germany as an equal part of a western European economic unit, or not at all. For Germans the main question is whether the form that the wider integration will take is to be that of a Socialist super-state, or of an association of private industries, with interlocking capital structures, operating marketing agreements. The Adenauer Government is working for the latter solution; so are the managers—the technocrats who have taken the places of the prewar "Ruhr barons."

*

To deal with these clear-cut purposes the Allied High Commission still shows no sign of agreeing on a coherent, realistic policy for the coming critical period. The tag ends of the battered Potsdam agreement still entangle the few straggling threads of Western Union. With every week that passes, bringing its hundred or so dismissals of redundant members of the Control Commission, it becomes plainer that British and French "control" of Germany will soon degenerate into a farce. Innumerable regulations issued by Military Government on every aspect of German life are still extant, but in practice disregarded. By the end of 1950, there will be 3,200 members of the British element, of which a preposterous number will consist of petty officials administering such matters as transport and rations before the eyes of unrationed Germans. That all the best will have resigned long before goes without saying. A great number of supervisory functions have to be exercised under the Occupation Statute by the High Commission, and by the Military Security Board established under the Ruhr Statute. But few delude themselves with the belief that this supervision can be effective. The Occupation Statute looks like being a dead letter long before it falls due for re-examination in September, 1950.

A matter of immediate urgency is the future of the tripartite coal and steel control boards. Both should now be dissolved. The coal board has been the one outstanding success of the British in Germany, but now its real work has finished. True, it is supposed to supervise the German draft plan—if it ever emerges—for reshuffling the steel and coal trusts under Law 75; this task, however, belongs to the future, and might well be transferred to the appropriate officials of the High Commission. Similarly, the Combined Steel Group has to face the fact that the supervision of a Law 75 which may never be carried out is no justification for its continued existence. As for the Military Security Board, which is supposed not only to see that Germany's steel capacity is kept within the prescribed limits, but also to prevent remilitarisation, it is impossible to be both optimistic and realistic about its future. It is not equipped for effective work; it will most certainly meet with German resistance to inspection; and—above all—the will to impose sanctions is weakening, and the power to impose them has never existed.

*

The fact has to be faced that the whole basis of Allied policy towards the enemy Germany has been dissolved by the rivalry with the Russians and by the resulting tactics of the military chiefs of America, Britain and France. No amount of vague talk about preparing Germany for integration in the framework of western Europe can conceal the fact that a landslide has begun beneath the feet of the Allied High Commissioners. What might have been two or three years ago a policy of wise concession and economic sense threatens to become a policy of strategic expediency shaped by fear of the Russians, by the delays imposed by French obstinacy, and by the lack of a clear-sighted and consistent policy in London and Washington.

A characteristic example of the way in which events overtake policy has been the excited discussion about German rearmament. The sudden revelation of the end to which the present trend of policy logically leads brought strong protests from the Foreign Offices and from the leading German politicians against the very idea, either of a German army or of a German contribution to a western European force. Yet it is as clear now that the problem of defending western Germany will be solved by the Germans on their own (if the Allies do not tackle it for them) as it was three years ago that the Germans would soon have to be left to run their own economic life. The public argument on this matter has been allowed to get ahead of official thinking in the Allied capitals. Meanwhile the Russian-sponsored campaign for the neutralisation of Germany and the withdrawal of occupation troops—an idea full of dangers for the west—has been given renewed impetus.

*

The year opens with Allied policy on Germany—never unanimous despite the frequent compromises in which logic and realism were blended—as divided as ever. Some division there is bound to be between British, American and French ideas, and therefore some inconsistency. The threat from Russia has made it impossible to follow consistently a policy for Germany that will be satisfactory in all respects. A clearly charted, firmly agreed course is what is needed. On the one hand every unnecessary and unworkable restriction on the Germans should be removed without delay, even if it means dismantling the High Commission; on the other hand the western governments should stand firmly by their intention to keep occupation troops in the country and enforce a few basic precautions against rearmament and Nazi revival.

The Allies doubtless hoped that the Petersberg agreement of last November would give them breathing space to think what their next move should be towards granting sovereignty to the Federal Republic; but the Germans are unlikely to concede that breathing space and there will have to be some radical and fresh thinking during 1950. The fact has to be kept firmly in mind that effective control rests with the American element, because of Mr McCloy's dual role as head of the Economic Co-operation Mission and American High Commissioner, and that the threat of cutting off Marshall aid remains the sole sanction that can be applied to a recalcitrant German Government. It is symptomatic that practically the only orders to be issued to Bonn for many months past have both been on behalf of the ECA, but in the name of the High Commission. The end of American aid—whether it comes in 1952 or earlier—will mark the end of Allied power to force a German Government to do those things that ought to be done and to leave undone those things that ought not to be done. The best possible use must be made of that year or two to see that it becomes a permanent political and economic interest of the Bonn Government to work with western Europe and to forge links with it which can be broken only with serious risk to the Germans. And that means beginning work now on building the military and political framework of Europe into which the Germans are to be fitted.

NOTES OF THE WEEK

Bluff and Double Bluff

The British political scene, on which the curtain is traditionally rung down around Christmas and the New Year, has been galvanised into a rude vitality by the increasing likelihood of a general election towards the end of February. A weekly journal of comment would be foolish to take part in the elaborate guessing game which the politicians delight in playing with the newspapers over such matters. But one fact at least makes an early election extremely probable—the elevation to the peerage of five members of the House of Commons with safe Labour seats. It is possible to argue that it is the Government's intention to hold a little election of six seats (there is one other vacant), with the near certainty of winning them all, as a heartening aperitif to an election in June. But to deplete central and local party funds for such a totally irrelevant performance seems hardly sensible; yet if the general election is not to come within the next three months no government would dare to withhold the writs for these by-elections.

The evidence from the honours list has been reinforced by other indications of preparation, which if they are not the prelude to an early election, must be part of one of the most elaborate games of double bluff conceived since the launching of "Operation Overlord." It is perhaps a shrewd calculation on the part of Transport House that, by filling the wind with straws, they may stir their opponents to premature efforts. Certainly the Conservative Party machine, which has been brought to its present pitch of activity largely by voluntary effort, could much more easily have its spring broken by overwinding than the Labour Party. Of this the managers at Abbey House are well aware, and it probably accounts for the unnatural sangfroid with which they discount all rumours of an early election.

If there is to be an election in February—and the 23rd appears to be the most reasonable date—the probability is that Parliament will be dissolved *in absentia* before the scheduled end of the recess on January 24th. This would give ample time for the writs to be issued, for the campaign to be conducted in full scale and for the Labour Party to use to its full the advantages of its Jubilee rally at the beginning of February. One thing has become very apparent, that the Prime Minister must not only make up his mind at once whether there is to be an election in February—it is probably already made up—but he must, if he has decided to wait until late May or early June, immediately proclaim the fact. The country is in the grip of election nerves, and it should not be left in a state of suspense throughout the next few weeks.

There is no doubt that the national interest demands an election in February, however little the idea may appeal to those Labour candidates and organisers responsible for retaining Labour's foothold among the agricultural constituencies. If the Prime Minister has decided on a February election it is probably on the basis of better the devil one knows, in the shape of February filldyke, than the devil one does not, the stormy economic weather ahead. The British electorate would endorse this as a very reasonable calculation.

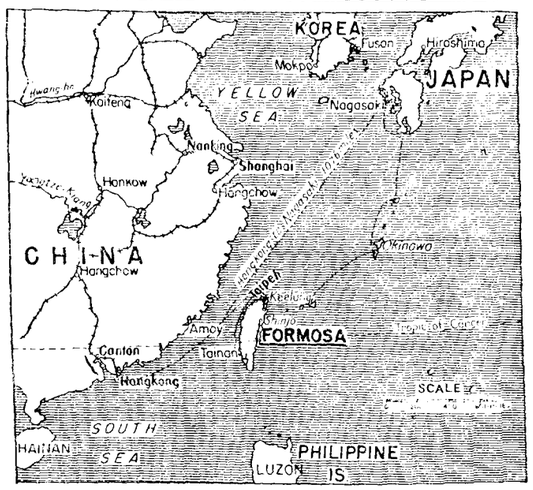
The TUC's Difficulties

It seems probable that the wages policy recommended by the General Council of the TUC will be endorsed at next week's special conference of union executives. However much individual unions may dislike the prospect of refraining from wage claims for a year, the imminence of the election and the desire not to jeopardise the chances of a Labour victory are bound to have a powerful influence on their decisions. But, even so, the outcome is by no means certain. Much depends on the results of the ballot now being taken among the miners in the individual coalfields. Although the delegate conference of the National Union of Mineworkers decided last week to support the TUC's policy, the margin was not very big, and the rank and file may well turn against their leaders. The Yorkshire delegates, for example, voted with the majority, but there is very strong feeling in the county about the position of the lower-paid workers.

In the meantime, two important groups are going ahead with their claims without waiting for the conference. The Confederation of Shipbuilding and Engineering Trade Unions has already presented the employers with a demand for £1 a week increase. The National Union of Railwaymen, in spite of its failure to secure the support of the other two railway unions, has now tabled its claim for a £5 minimum wage. Its action is understandable enough. The NUR, after a troubled summer, decided last autumn to abandon the idea of a flat rate increase for all their members and to concentrate on improving the position of the lower-paid men. This decision alone averted the threat of a national go-slow movement, and it would be expecting altogether too much of human nature that the railwaymen now should drop their claim together.

The General Council is also meeting with difficulties in its efforts to persuade unions to abandon their cost-of-living and sliding-scale agreements. The offer of the Iron and Steel Trades Confederation to give up its agreement was conditional on others doing likewise. None of the others has agreed, and the National Federation of Building Trade Operatives has this week told the TUC's Economic Committee that it cannot do so, because of its special circumstances. The builders' sliding-scale arrangement is on an annual, not a monthly, basis, and next month they would be entitled to an increase of ½d. an hour, which they attribute to price rises before and not since the devaluation of the pound. Like the railwaymen, the builders undoubtedly have a good case, especially as they have already agreed to drop their claim for an increase in basic rates. It is nevertheless



unfortunate, to say the least, that the courageous attempts of the TUC's General Council to give a lead to the unions should meet with such a doubtful response.

* * *

Chinese Complications

The British official view about China is that Chiang Kai-shek is finished, and if the wishes of British firms trading to Shanghai could have terminated his resistance to the Chinese Communists, it would have been over long ago. The trouble is that he refuses to lie down and, as long as he stands on his feet facing the enemy, he will have friends in America to argue that resistance to Communism in Asia should begin with help for Chiang to hold Formosa—a help which would, of course, be incompatible with American diplomatic recognition of the Chinese Communist Government.

Chiang's stock, after having sunk to an all time low, has recently recovered somewhat because, unlike other Chinese Nationalist leaders, he has shown an undaunted spirit in adversity and his armed forces in Formosa have not so far

gone over to the foe. They may still do so, but the longer they go on failing to desert, the less certain it becomes that Chiang must be written off finally, at any rate as a thorn in the side of the new regime. Provided that Chiang's air force and fleet, which have so far remained loyal to him, do not desert, the strategic prospect for the defence of the island should be very good, for an invasion across 100 miles of open sea without naval superiority is not an easy proposition for even the most powerful army. It is essentially a question, not of strategy, but of morale, and is for that reason extremely hard to assess; for in Chinese affairs even the most experienced observers can seldom be sure who is going to betray whom.

For the British Government, which has apparently made an irrevocable decision to recognise the Chinese Communist Government in the immediate future, this situation threatens very undesirable complications. The British policy is understood to have the good will of the State Department, which would like to take similar action. But, as long as America's Far Eastern policy remains indeterminate, Britain will have to move with extreme caution. Much of the pressure for recognition of Communist China has been due to the hope of gaining a stronger juridical position for breaking the blockade of Shanghai, but, while there is any possibility of further American aid being given to the Formosa Nationalists, any British naval action to restrain their warships would involve a serious provocation to a section of American opinion which, to judge from President Truman's veering and tacking on the China question, is too powerful to be ignored. It is not enough for certain quarters in this country to condemn American policy as "nervous, impulsive and ill-directed" or to talk about "a squalid and useless struggle in the China seas." Britain must take account of American popular reactions about which the only cause for surprise, in view of past history, is that they have not been stronger than they have.

*

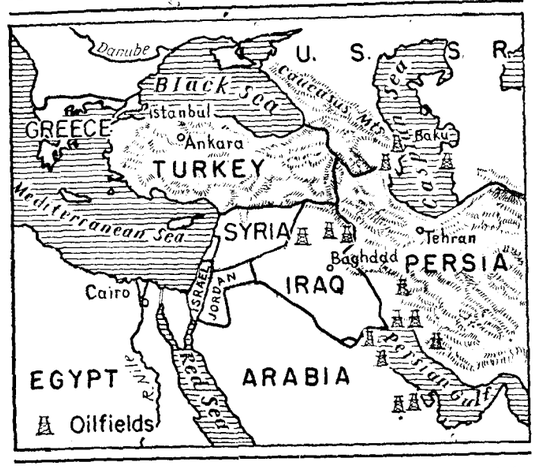
A most delicate problem will also have to be faced in connection with the credentials for Chinese representation on the Uno Security Council, the Far Eastern Commission and the Allied Council in Tokyo. How can Britain recognise Communist China without supporting the Soviet thesis against the United States on these issues? Is America, despite Marshal Aid and the Atlantic Pact, to be voted down internationally by a British-Soviet bloc? One would like to think that the British Government had given full thought to these questions, but, with a general election so near, there is always a danger that such minor matters may be overlooked.

* * *

M. Bidault's Budget

All through the Christmas season, M. Bidault has been bludgeoning his budget through the Assembly with persistent use of the vote of confidence on every major disputed clause. In all the Assembly has been compelled to vote on six of these and at times the government's majority has fallen as low as four. Even so, the budget remains unbalanced, since the Assembly will not vote more than 2,245 billion francs in place of the 2,275 billions originally requested by the government and the *projet*, in its unbalanced state, has still to face the known disapprobation of the Council of the Republic. If the second chamber should reject it, M. Bidault must secure an absolute majority for its repassage in the Chamber. This he is most unlikely to do, for, although the Socialists, Radicals, Centre groups and Popular Republicans who nominally support the Coalition have a firm majority, it is rare for any government issue to be sufficiently acceptable to all groups for their voting strength to be mobilised in full.

This difficulty impedes the passage through the Assembly of any major project; and, even if M. Bidault at last brings his budget into harbour, his administration must immediately face a new storm in the shape of a bill to restore collective bargaining and define the conditions under which compulsory arbitration will be enforced. The Socialists—who command over a hundred seats—insist that the Bill shall include a provision ensuring a minimum wage. The Radicals, committed to almost complete non-intervention by the state, may refuse to accept the clause. Yet if the Government cannot pass the wage bill speedily, it will be under strong Socialist pressure to take action to grant bonuses to the lower paid workers. The present likelihood is therefore a repetition of the stormy debates of recent weeks and of a new resort to the vote of confidence.



It is difficult to see how else the coalition could proceed. Nothing holds it together beyond an instinct that it is probably as well for France to have some sort of government, but this is not a sentiment that can be mobilised every time a detail of legislation needs to be passed. United by no common policies and by few bonds of friendship, the Coalition's best hope is not to legislate at all. Unhappily, the country must have its annual budget, and from time to time—as now—the trade unions raise again the problem of wage rates. It is, therefore, by no means certain that M. Bidault's crew will be able to navigate the present rapids into the calmer waters of legislative inertia beyond. Meanwhile, it is surprising how well France has come through the last year with the minimum of real government.

"Containment" on the Caspian

Before the Shah left the United States on December 30, President Truman joined with him in issuing a statement on the "common problems" which face their two countries, and on the possibilities of American aid for Persia. This, said the statement, would take the form of American government support for Persia's requests for loans from the World Bank and for assistance through United Nations agencies. It also pledged "certain military assistance" to be given in the interests of Persian security.

This last phrase may have a quite satisfactory ring to British minds, which know that in no circumstances, short of a flagrant aggression by another power, does Congress agree to go to war; but the Russians do not know or will not

understand this fact. To judge the impression created by the statement in Moscow it is necessary to imagine what the effect would be in western capitals if the assurance had been given to the Shah not by Mr Truman but by Mr Stalin. There would be consternation everywhere and the act would be considered highly provocative.

Yet this kind of American policy is not new. Ever since, in March, 1947, President Truman gave his first personal dramatic undertaking to provide aid and protection to Greece and Turkey, the United States has been committed to sharing in the defence of the eastern Mediterranean and of the Middle East with its oilfields. The line it decided to reinforce was the mountain frontier of north Greece and the Caucasus—the line known, in Middle Eastern forces slang, as "the roof." Until now there has been a serious gap in that line. It ran from the Albanian frontier through Thrace to the Black Sea, and then from Trebizond to the north-east corner of Turkey; but beyond this lay an open door to the south—the long flat road down the Caspian coast and into Persia. To extend military aid to the forces across this road is beyond doubt logical. The question for America's Atlantic Pact partners is whether such a move is not more dangerous than useful unless the aid given is of real military significance. The answer presumably is that the Americans want to produce not a defence line but a deterrent. Nothing the Persians could do would stop a modern army on the move; but some measure of strength might delay that army's decision to start.

President Truman seems to have overlooked the psychological differences between Turks and Persians. In Turkey, US aid is going to people who are fiercely anti-Russian anyway, and among whom Communist propaganda can therefore make no headway. In Persia it is going to a people that has, hitherto and for generations, sat upon the fence. There are plenty of Persians who feel, with some reason, that Russia is near and who fear the gifts brought from far away America. What are they going to think of their Shah for making such a decisive gesture in Washington? Its reception will be mixed unless it is quickly followed by material proof of support in the shape of money, or spectacular machinery for Persia's army or for its seven year economic plan.

Corporations in the Colonies

The Colonial Development Corporation has not so far received so much attention as its twin, the Overseas Food Corporation, which is responsible for the East African groundnut scheme. But it was given its fair share of publicity this week with the announcement that negotiations with the International Bank for Reconstruction and Development for a loan of $5,000,000 have fallen through. The breakdown of the negotiations is discussed in detail in a Business Note on page 39. Here it is enough to point out that the loan was needed to buy specialised engineering equipment which it was intended would be available for all the projects on which the corporation is at work. This was obviously an efficient way of buying and using dollar machinery. If each colonial government had to buy it on its own, there would not be nearly enough of it to go round even if the dollars could be made available.

The setting up of a central pool of equipment, as of a central pool of technicians, is so very much a *raison d'être* of the Colonial Development Corporation that one wonders more than ever why Lord Trefgarne allowed the negotiations for the loan to fall through. It is true that alternative equipment is said to be available, but the corporation's own report pointed out that, by reason of its efficiency and of shorter delivery dates, American equipment was in most cases the best.

The breakdown of the negotiations ought, therefore, to be an occasion for some hard thinking about the future of these big corporations that are carrying out development overseas. It is not only the mishaps of the groundnut scheme that arouse doubts whether they are fulfilling the functions intended for them. When they were first mooted they were regarded as a means of bridging the gap between what the colonial governments could do for colonial development under the Development and Welfare Acts and what private enterprise could do. The corporations would have the backing of the Treasury but would not be subject to detailed control by either the Treasury or the Colonial Office. Yet this independence ought never to have been intended to give either corporation freedom from public criticism of activities which are, after all, being carried out with public money. Both corporations, however, give the impression that they think they should be immune to scrutiny in press and Parliament, an impression which is strengthened by Lord Trefgarne's statement on the proposed dollar loan. He said that the International Bank's conditions were "not reconcilable with the principles and methods by which the corporation operates." The British public would like to know a bit more about what those principles and methods amount to. The two corporations are an experiment in colonial development, and they must expect to be tested, as all experiments are tested, for an assessment of their success.

* * *

New Job for the British Council

As from this week, the British Council takes over the welfare of all colonial students in this country. At first sight, the news that it is to spend an additional £515,000

between now and 1954 contrasts oddly with the severe cut in expenditure on information and publicity services to which the Government is committed. How does its new commitment tally, ask the council's perennial critics, with the ruling that it is to cut its expenditure by £325,000—roughly one-tenth of last year's estimates—as well as to "absorb the effect of devaluation"? Or with the notices of dismissal on grounds of economy that are now being served upon long-standing members of the staff?

The anomaly is in fact only apparent. The council has always drawn its funds from three departments: the Foreign Office, the Colonial Office, and, to a lesser extent, the Commonwealth Relations Office. Each of these makes its own bargain with the Treasury. Each is liable to the new 10 per cent cut upon its publicity services. But each can apportion that cut as it likes. The Foreign Office is going to pare the council's share of its funds; the Colonial Office is not going to do so—it may even increase it. In addition, it has decided to hand over to the council's experienced staff, which handles overseas students within the United Kingdom, the whole task of looking after the young men and women from the colonies who are now working here.

The job will include the housing of 200 students in a new London hostel—the former Hans Crescent Hotel—as well as the assumption of responsibility for Colonial Office hostels in the provinces. The funds will come, as to £425,000 out of £515,000, from the Colonial Development and Welfare Fund, and will be managed by the council in a separate account. Thus the council is simply to take on and expand a very necessary piece of work that was being done less well elsewhere.

In a word, at least one Government department has sensibly marked its appreciation of the council's work in this country. Quite apart from questions of colour, a big metropolis is a lonely place, and the scholastic advantages to be found in England can only too easily be outweighed in the mind of the colonial student by boredom, loneliness or a sense of social bitterness. Several private organisations do their best, but it is right that public funds should be applied to it, since in the long run more goodwill can be earned, more trade encouraged, and more done to check infiltration of Communism into the colonies if the future public figures in the colonies—the present colonial students—are enabled to enjoy their sojourn in Britain.

The Commonwealth Relations Office would do well to follow this good example and offer similar amenities to students from India, Pakistan and Ceylon.

* * *

Classes Without Workers

That great national institution, the Workers' Educational Association, faces a grave dilemma which has been more candidly discussed in the press than in the annual report which has just appeared. A movement which once played a pioneer part in equipping ambitious and talented workers for the political struggle of the early twentieth century has become less and less militant and more and more middle-class. The students' homework has dwindled, the teachers have turned increasingly into lecturers, and the toilsome search for knowledge and ideas has given place—at least in some classes—to more dilettante interests. Like all generous-minded organisations the WEA has dispersed its effort and widened its range in order to gain prestige—and ultimately to increase its income. And it is clear that a body which, in the course of the year, receives a grant of £3,000 from the Ministry of Education and £500 from the National Union of General and Municipal Workers has to steer a tricky course between propaganda and pure instruction.

On the surface the report has much to say that is cheering. Three-year tutorial classes (this is the real stuff) numbered 889 during last year: this was nearly equal to the prewar figure, but was below that of 1930. The number of courses (6,380) and of students (111,351) rose sharply above the figures for 1947-48. There was obviously much useful organisation and a great deal of that zealous co-ordination with all and sundry, at home and abroad, which is the bane of such voluntary organisations. But when one looks at other figures in the report the picture is less reassuring. Only a fifth of the students can be classified as manual workers, or as people whose education stopped at 14 or earlier. Out of roughly 93,000 students, 27,000 are classified as occupied in "home duties and nursing," over 11,000 as teachers, and 4,500 as professional and social workers. This mingling of persons of different status produces excellent political but poor educational results, and leads to the formation of classes which can become happy hunting grounds for bright young people who confuse teaching with self-expression. Well over half the students attend classes of less than twenty meetings, and 31 per cent are studying literature and arts against 56 per cent engaged in such "social studies" as economics and history.

The tradition fostered by such men as Professor Tawney is not one to be lightly sacrificed, but those who run the WEA should face the fact that the conditions and demands which brought it into existence are rapidly disappearing or changing. The title has become a misnomer, the ideals are lofty but confused, and the student has been given too many soft options. The WEA needs to undergo a period of soul searching and self analysis to discover how it may effectively fit into the schemes of after-school education which are now evolving.

Victory for the Wafdists

The victory of the Wafdist party in the Egyptian general elections last Wednesday was altogether unexpected. It was thought likely that they would win more seats than any one of the other parties, but it was believed to be most improbable that they would gain, as they have done, an absolute majority. At the time of going to press they are sure of at least 160 seats out of 319 in the Chamber of Deputies. Their success is evidence of the fairness of the elections and of the integrity of the present Prime Minister, Hussein Sirry Pasha.

The leader of the Wafdists, Nahas Pasha, is one of the outstanding political figures in Egypt; he is, unfortunately, *persona non grata* at the Palace, and a constitutional issue of some importance might now arise as the result of his victory. His absolute majority entitles him to refuse to form a coalition government of the type that the King has always favoured before; yet it seems unlikely that King Farouk will ask him personally to lead the new government. There is a precedent, however, for a way out of the dilemma; in 1926 Zaghlul, who, like Nahas, was at loggerheads with the monarchy, took the post of President of the Chamber, not of Prime Minister, and was content to rule from behind the scenes. Nahas Pasha has in Sirrag el Dine Pasha an exceptionally able lieutenant, and it might well be politic for him at this critical stage in Egyptian affairs to follow Zaghlul's example and to put Sirrag el Dine forward as Prime Minister while he himself rests content with the Presidency of the Chamber.

From the point of view of Britain, the result of the elections, though welcome, is not likely to mean very much at the moment. It would be a mistake to renew negotiations immediately for a treaty; British prestige has suffered enough already from being the butt of party quarrels. So long as events do not make a new treaty an absolute necessity Whitehall should be content to jog along without one in comparative peace as it has done for the past few years.

Wreckers Win at the Thyssen Works

When Dr Adenauer put his signature to the Petersberg Agreement in November, the tale of dismantling in Germany's heavy industry was supposed to be closed. The rejoicings over the news, in which workers shared with managers and owners, were indeed heartfelt and reflected a great improvement in relations between the British and Germans. But a struggle immediately developed once more over the Thyssen works, once the largest iron and steel plant in Europe. The race to dismantle this plant before the Petersberg Agreement came into force was won by the wreckers. A plant which could produce 2,300,000 tons of crude steel a year has had its capacity reduced to 117,000 tons. Pig iron capacity, on the other hand, has been left at 600,000 tons a year. With so much iron, and so little steel capacity, the Thyssen works have been left in a state which makes economic nonsense.

Moreover, allegedly at the insistence of the French, a new type of limit has been imposed on the Germans. Hitherto they have been restricted to an overall steel output of 11.1 million tons a year; now they are informed that the Thyssen works itself must not increase its steel capacity beyond the present 117,000 tons. Small wonder, therefore, that the *Vereinigte Stahlwerke*, which owns the plant, and the Economics Minister of the *Land* North Rhine-Westphalia, seized upon a loophole in the Petersberg Agreement, which permitted parts "of trifling value" to be retained even if they had already been dismantled. By a stretch of the term, the Germans now ask for the retention at the Thyssen works of at least one blooming mill, now dismantled and crated for delivery to Britain. As this mill could handle many times the quantity of steel which the works can at present produce, the German object is clearly to restore the plant to a capacity of about 800,000 tons a year—a task which they could achieve given the blooming mill and fourteen months for repairs.

But the British and French are adamant, standing on the letter of Petersberg as they did for four years on Potsdam. Confused conceptions still lead them to suppose that the destruction of a great steel plant is sound politics, even if poor economics. As far as German competition is concerned, steel men in Britain and France are fully aware that Germany will have secured a great advantage if, after removal of old plant, American or Swedish capital is found to re-equip the Ruhr. American finance may well discover, when restrictions are forgotten in a few years' time, that the Thyssen works stand on the best natural site for an integrated steel mill and continuous strip mill in Europe. The Ruhr possessed at Dinslaken the only broad continuous strip mill on the Continent before the war; it has been dismantled and sent to Russia. While the British industry is going ahead with its erection of more of these $200 million mass-production units the French celebrated on December 23rd the start of work by the *Société Lorraine de Laminage Continu* (SOLLAC), the largest of such projects on the Continent. After a long tussle over an enterprise of doubtful profit, ECA dollars have finally been secured for this new departure in French mass-production. A French dream seems to be coming true—as the Thyssen works and Dinslaken stand wrecked, a vast heavy industrial project takes shape on French soil. Yet western Europe is already faced with a surplus of steel and cries out for more French wheat and meat. So much for integrated planning and the French desire for it.

jugation of Bulgaria by the Soviet Union. It is made clear that, as the economic dictator of Bulgaria, Kostov bargained very hard with the Russians, and refused to sell them exclusively produce, such as tobacco, which he could and did sell for better prices in western Europe; he also gave orders to his subordinates in the economic ministries to treat all Soviet trade negotiators and representatives as foreigners, and to refuse to reveal to them the contracts or negotaitions which Bulgaria had with other countries.

Furthermore, Kostov is revealed as expressing the opinion, both in the cabinet and at the meetings of the central committee of the party, that "without the help of the capitalist west, Bulgaria cannot restore its national economy or guarantee its peaceful development." Even worse, he toyed with the idea of accepting Marshall aid, until strict orders came from Moscow for its rejection. The Finance Minister, Stefanov, was also in favour of accepting Marshall aid, and spoke with envy of Tito's Jugoslavia, which had "a sober and realistic policy." The other economic ministers complained several times that "the shortage of certain goods in Bulgaria" was due to the fact that "these goods were exported to Soviet Russia"—an obviously true and justified complaint.

These "treasonable" activities of Kostov and the other Bulgarian cabinet ministers would have been considered normal and highly patriotic in any non-Communist state. But Moscow's control over the Cominform countries is now being tightened up to such an extent that not even the slightest complaint against any aspect of Soviet policy is allowed and no independence, from the instructions even of minor Soviet officials, is tolerated. The Kostov case shows how the Soviet policy which led to the breach with Tito is resented and opposed even by the most loyal and most fanatical Communist leaders outside the Soviet Union. Kostov's hanging is a grim warning to all satellite statesmen; but one wonders for how long Moscow will be able to kee up this naked terror against Communist leaders of lon standing and great experience in conspiratorial work.

Civil Servants Sabbatical Year

A small and (perhaps unjustly) envied group of senic civil servants swoops about the world like swallows fron London to Washington, Buenos Aires or Colombo with a week-end now and then in Stockholm or Paris, touchin down now and again for a breathless consultation with th Treasury, the Board of Trade or the Ministry of Food. Bu the great majority of the senior civil service polishes it trousers for forty years without prospect of more than a fortnight's annual leave in Brittany or Switzerland and without any expectation of working outside the walls of Whitehall or Harrogate. It is for these involuntary stay-at-homes that the Nuffield Foundation has just offered three travelling fellowships a year to be awarded to outstanding men and women in the Home Civil Service between the ages of 30 and 45. The avowed object is to give them the opportunity of becoming better acquainted with the administration, problems and experience of other parts of the Commonwealth, or if necessary, of foreign countries. The unavowed object is to provide a chance for them to lift themselves out of the day-to-day routine.

There is a certain irony about the way in which the Treasury allows itself to be pushed by private benefactions down a road that it has been reluctant to tread. In 1944 the Assheton Committee in its report, "The Training of Civil Servants," recommended that promising young civil servants should be given a sabbatical year. (The Commonwealth Fund of New York has, in fact, offered three fellowships for travel in the United States to civil servants since 1937). The Treasury, which has argued that pressure of business makes such a scheme impracticable at present, has accepted the idea with grace once the Nuffield Foundation has offered to put up the cash.

There can be no doubt that both the Nuffield and the Commonwealth Fund schemes are valuable. The war mixed up the outside world with the civil service, by importing scientists, economists and business men into it. The fellowship schemes, on a very modest scale, will propel civil servants into the outside world. It is to be hoped that the Treasury will soon be able to extend the idea of a sabbatical year to others—on its own initiative.

No Priority for Schoolchildren

Once again, a medical officer of health has called attention to the breakdown of the priority dental service for mothers and children since the national health service was introduced. As long ago as last July the subject was raised in a debate on the adjournment, and the official answer was, in effect, that the Government hoped that Whitley council machinery would soon be set up which would enable new salary scales for dentists in the service of local authorities to be negotiated.

That was six months ago, and Whitley machinery has still not been set up. Local authorities are bidding against each other for the services of dentists, and dentists are continuing to leave their clinics for general dental practice. It was recently stated that the school dental service has only the equivalent of 500 to 600 whole time dentists, compared with 921 at the end of 1947—which was itself not enough to provide adequate attention for each schoolchild. Nor is it only children's teeth that have suffered through the introduction of the health service. There have been constant complaints about the time, sometimes amounting to many months, during which children have to wait before they

Binding Cases

Binding cases for THE ECONOMIST *and* RECORDS & STATISTICS *can now be supplied. These new cases, made by Messrs.* EASIBIND LTD., *are in stiff, dark blue cloth covers, and are gilt-lettered on the spine. The cases are of a new design and provide an extremely effective and firm binding.*

The case for THE ECONOMIST *will hold 26 issues and the half-yearly Index; that for* RECORDS & STATISTICS *will hold 52 issues. The year can be stamped on the spine.*

The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, **not** *to* THE ECONOMIST, *but to—*

FOR BUYER

If you've not yet completed arrangements for your exhibit at the Canadian International Trade Fair, it would be advisable to do so now; without delay. You can show what you sell — and sell what you show — to world businessmen from Canada, the United States, and many other countries. It is a most economical and effective way to establish new business connections.

Business visitors from every country find that the Trade Fair offers a double opportunity — (a) to the businessman or industrialist who is looking for new ideas and equipment for his office or plant — (b) to wholesalers, retailers, importers and jobbers who wish to purchase goods for profitable re-sale.

For all information concerning the Canadian International Trade Fair — please consult:

MIDLAND BANK LIMITED

receive the spectacles they have been prescribed. It is true that if the case is considered urgent the optician and manufacturer can shorten the delay by giving that particular child priority. But it is no one's business to see that they do so, and in any case ought not every child to be given priority over the general run of the adult population? Treatment, whether of eyes or teeth, has double the value when given early.

The Minister of Health must bear a great deal of responsibility for this breakdown in the priority services for children. It is he who, by providing a free and unnecessarily elaborate ophthalmic service for the general population, has caused the delay in the provision of spectacles for schoolchildren. It is he who, by providing an extravagant system of financial incentives for dentists in general practice, has caused dentists to leave the service of local authorities. It is now up to him to see that the priority formerly given to children is restored. At the very least he should see that the obstacle to setting up a dental Whitley council is removed. A new salary scale which the local authorities, having regard to the salaries of their other employees, can agree to may not be sufficient to attract dentists to their service so long as conditions in general practice remain so favourable. But not even a start can be made in restoring the priority dental services until one has been drawn up.

How Many Scientists?

The Ministry of Labour has at last produced five pamphlets (with a promise of seven more to follow) dealing with supply and demand "for persons with professional qualifications" in Physics, Geology, Chemistry, Architecture and Electrical Engineering.* These small pamphlets are of importance, for they turn the vague and global estimates of the Barlow Committee on the demand for scientific manpower into specific calculations for individual professions. Where the Barlow Report in 1946 recommended in general terms that the output of scientists should be doubled, each of these pamphlets calculates the demand and supply for qualified men and women in its own field. The result should be valuable to parents and intending students in order to guide them in the choice of their careers; to businessmen to help them to know which of their vacancies will become easier to fill, and to the universities to guide them in planning the expansion of their various scientific departments.

In the three and a half years which have elapsed since the Barlow Report was published great changes have taken place. There are now two to three times as many physicists in training as before the war, six times as many geologists and nearly three times as many architects: the figures for chemists and electrical engineers are not given, but the increase in the last three years has been great. As a result supply has in three out of the five professions caught up, or all but caught up, with demand. Only in the case of the chemists does supply continue to lag; industry is apparently insatiable in this field—a 40 per cent increase in the demand for chemists was estimated by a group of 16 firms over the next five years. The demand for electrical engineers also exceeds the supply, but there are already plans for meeting this deficiency. In the other three professions a rough balance has been achieved, and after 1951 the demand for physicists is expected to fall sharply. Similar results are likely to be found for the seven other professions, which are to be the subject of future reports.

* * *

Finns Under Pressure

This year the Russians have lost no time in putting Ministry [illegible] on Finland; the baiting season usually begins about March. Indeed, the first item of news to greet Finns in the New Year was that Mr Gromyko, now Soviet Deputy Foreign Minister, had received the Finnish Ambassador in Moscow and demanded an explanation of why Finland had not yet handed over more than 300 persons wanted by the Russians as "war criminals." This demand was backed up by a list, of which no details have been published, except that it includes the names of 56 people "already known to the Finnish Government." It was stiffened by the accusation that the Finnish authorities are helping the "criminals" by giving them forged identity papers and permitting them to use false names.

From this last point it appears that many of the people on the list will turn out to be refugees from the Baltic States whom Moscow claims as Soviet citizens. A small number of these unfortunates were returned to Russia under strong pressure a couple of years ago. But the real purpose of this move is not likely to be a sudden desire to usher in the New Year with an assertion of Soviet sovereignty; it is almost certainly an attempt to influence the forthcoming elections of the next President of Finland.

On January 15th and 16th all qualified voters will choose, on a basis of proportional representation, the 300 members of the electoral college whose duty it is to elect a President by secret ballot. This body will meet in Helsinki on February 15th under the chairmanship of the Prime Minister and, without discussion, make its choice by a majority vote. The next President will enter on his six-year term of office on March 1st.

There is little doubt that President Paasikivi will be re-elected. This prospect annoys the Finnish Communists and does not please the Russians. Their propaganda organs have for several months past been indicating intermittent disapproval of the tone of discussions on the election, the choice of candidates and the probable results. But, even when reinforced by Mr Gromyko's recent demand, propaganda is not likely to affect the results in favour of the Communists. The Finns have learnt thoroughly the art of being independent without being provocative and neighbourly without being subservient.

* * *

Statesmen of Good Will

If Mr Rajagopalachari, Governor-general of India, adheres to his intention of retiring shortly, a second of the small band of great names associated with the struggle for independence will disappear from India's public life, this time fortunately by voluntary retirement and not by an assassin's shot. Most of Mr Rajagopalachari's seventy-one years have been spent in the service of "the cause." Almost inevitably, a leader in such a struggle is apt to become embittered and to brand all who are not with him as against him. Yet, while he yields to none in patriotic ardour and determination, the clarity of Mr Rajagopalachari's thought has never been clouded by his feelings, and no crisis has ever stung him out of the gentle persistence characteristic of his speeches and writings. "Raja-ji" (as he is affectionately called) was at Gandhi's side in all his political campaigns and took his turn in prison with the rest; but he has always been a shrewdly independent thinker, a realist and a moderate—attributes all too rare in revolutionary ranks.

Prior to the Cripps offer, the British Government could always refuse to grant independence on the ground that there was no agreement between Hindu and Moslem. The outstanding difference between the Cripps offer and all previous ones was that it removed doubts of British sincerity by stating clearly for the first time that their failure to agree need not impede Indian independence. When the Congress party rejected this offer in 1942, "Raja-ji" did not hesitate to point out, with his usual logic and his usual gentleness, that by insisting that independence was acceptable only to a united

India, the Congress party was ensuring the continuance of British rule. He urged that it was better to be partitioned and free than to be united and unfree. This deviation from the party line caused his "soundness" to be distrusted and for some time he walked in the wilderness. By 1947 political realities had brought the party round to accept partition as inevitable, and so "Raja-ji" found his own unchanged views once more in accord with the party line.

As from January 26, when India formally becomes a republic, the head of the state will be president. It is widely expected in India that Dr Rajendra Prasad, another life-long party stalwart, who has been presiding over the labours of the Constituent Assembly, will be elected first President of the Republic without a contest.

Dr Rajendra Prasad who, like Mr Rajagopalachari, has won for himself a nickname of affection—"Rajen babu"—is noted for his wise good humour, his tolerance and his chairman's skill in eliciting agreement; while another greatly respected moderate of broad views and conciliatory disposition, Khawaja Nazimuddin, is Governor-general across the border in Pakistan. In view of the present deplorable relations that exist between the two Dominions—which currently have broken off virtually all trade relations with each other—the outside observer is tempted to suppose that India and Pakistan relegate to safe constitutional offices, where their influence on the course of events can be strictly limited, those outstanding men who are by temperament most fitted to compose their differences. The Kremlin must be delighted.

* * *

Copper or Bobbie?

Local branches of the police have recently been voting on the question whether the traditional helmet is to be retained or replaced by a flat cap. Opinion within the Force appears to be divided. There are no doubt technical arguments for and against on grounds of comfort, of convenience in moving through doorways, or of resistance to glass bottles and coshes. But the question is one ultimately to be decided by the Home Secretary on grounds of national policy, having regard for psychological considerations which transcend mere calculations of efficiency. There is something about a British policeman's helmet which is in the fullest sense of the word disarming. The helmet increases a man's natural stature and thus provides the guardian of the law with that more than human size which the ancients thought to be a mark of divinity. In a crowd the approach of the forces of order can be seen from a distance, and awe is often thereby struck into unruly hearts without any need for use of the truncheon; whereas insignificant flat caps have to hack their way violently through presses of human beings in order to make their presence known. The helmet is conducive to a stately dignity incompatible with the hasty actions and the frantic hurry, which, if we are to judge from films, are characteristic of the police of some other countries and lead to many errors and miscarriages of justice.

Above all, the helmet inspires affection as well as awe, and for this reason is a most important factor in support of our national constitution. It inspires affection fundamentally because it looks unmilitary—at least by modern standards—and is somehow even a subject for humour. Some policemen resent this, and it is true that young men under the influence of intoxicating liquor are occasionally overwhelmed by the desire to knock a policeman's helmet off his head. But this is a small price to pay for a symbol which creates between police and public a bond of friendly feeling such as is rare in human societies.

The policeman, after all, is a man whom human beings have invested with power over themselves in order to restrain their wicked devices; but being himself also a man, he is always in danger of being corrupted by power. He is Leviathan, potentially totalitarian. In many countries the ordinary man regards him as an enemy, and even in the most orderly and democratic lands the sense of fear in his presence is never entirely eliminated. To counteract this underlying psychological tension, it is essential that he should not take himself too seriously as the incarnation of the state, but strive to be, and look like, the citizen's friend. Herein lies the significance of the helmet; it gives just that touch of avuncular benevolence which is missing in a flat cap. May it long remain among the most cherished of our national institutions!

Shorter Note

The Treasury has issued information about the increased demand for British books in the United States and Canada since devaluation. Two Oxford booksellers, Messrs Blackwells and Messrs Parkers, report a sharp increase in the American demand for secondhand and rare books from Britain; and the Oxford University Press are now exporting 50 per cent of their total output, of which 17 per cent goes to hard currency areas. It is to be hoped that the publicity given to Oxford will elicit similar figures from other booksellers and publishers.

A Warning for 1850

At the commencement of the new year there are few questions which involve so many important consequences, with regard to the future, as the state of the "money market." The bullion in the Bank, which little more than two years ago was under *nine millions*, is now upwards of *seventeen millions*; the minimum Bank rate of discount *then* was *eight* per cent, *now* it is *two and a half* per cent. . . . But these cases rest upon their own special and peculiar grounds. Neither with respect to the stock and share market can it be said that any speculation has manifested itself; for the rise in consols may be attributed solely to legitimate investments of spare capital. But all past experience has proved that such an abundance of capital will sooner or later lead to strenuous attempts to find a profitable employment for it, and in all probability will be productive of undue excitement and speculation in those channels especially which are productive of the greatest profits in the first instance. But while this is the certain result of "cheap money," and while the knowledge that it is so should enforce upon all the necessity of great circumspection in their acts during such periods of excitement, yet we do not mean to infer, as is so commonly done, that any blame attaches to those who manage the Bank of England, or who exercise the greatest influence in the "money market," in connection with these periodical fluctuations. They, like other traders, are the creatures of circumstances, over which they have little or no control; and all that we can expect them to do is to exercise their trade with as much circumspection for their own benefit as possible—for in so doing they will best consult the true interests of the public. These fluctuations, which occur from time to time, are the effects of great disturbances either in the political affairs of a country or, more generally, in the production and distribution of commodities. . . . It is not by any regulations of the currency or the banking of the country that we look for a cure for these great and inconvenient fluctuations. We believe they can only be ameliorated by the ultimate effects of a perfectly free trade, by greater facilities of communication, and by the possession of more knowledge, all of which will materially aid in preventing those violent derangements in the production and distribution of commodities which most usually are their immediate cause.

The Economist
January 5, 1850

★ FOR AIR-MINDED CHAIRMEN AND DIRECTORS

Why not see for yourself— in South America

You *can* spare the time to go there

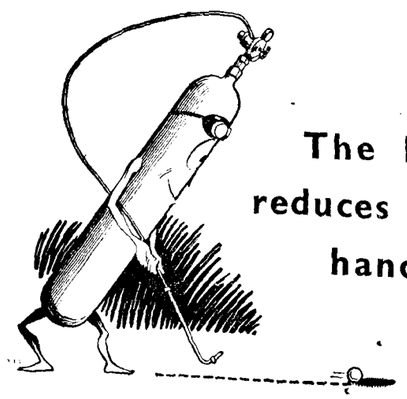
NOBODY knows better than you do how much your trade with South America—which is also the nation's trade—would benefit if you could find the time for a personal inspection of your markets there.

And you *can* find the time if you fly there by B.O.A.C. The high frequency of B.O.A.C. services means that you can fit a visit to almost any South American city—or a complete round-trip of your South American markets—into the shortest possible period.

B.O.A.C. aircrews have inherited the centuries-old British tradition of courtesy, reliability and navigating skill. Excellent hot or cold meals are served, there is a well-stocked bar, and passengers are waited on by a steward and stewardess.

FAST, FREQUENT SERVICES
From London to

Rio de Janeiro	- 4 flights weekly
São Paulo	- - 2 „ „
Montevideo	- - 3 „ „
Buenos Aires	- 3 „ „



It's often *cheaper* to ship by air

Lower insurance, packing and warehousing costs—and also, if shipping to countries that assess Customs Duties by gross weight, the lighter packaging—means that air freight to South America is often actually *cheaper* than sea freight.

B.O.A.C. TAKES GOOD CARE OF YOU

FLY BY B·O·A·C

Reservations and information at no extra charge from Travel Agents, or from British Overseas Airways Corporation, Airways Terminal, Buckingham Palace Road, S.W.1. (Victoria 2323)

The BOC reduces your handicap

The 38-ton cast-iron driving pulley of an old fashioned steam engine was due to be scrapped. The pully measured 16 ft. across and the hole through which it had to go to the scrap heap was less than 5 ft. wide. A tricky problem—solved by a B.O.C. process. Oxygen cutting did in four days, a job which had been estimated at six weeks by other methods. Throughout industry today processes such as this are in everyday use—playing a vital part in Britain's recovery.

The British Oxygen Co Ltd
London and Branches

Fear in the forest

Fire is the most feared of all forest disasters—and the costliest. It takes some seventy years for spruce to mature for paper-making. Unchecked, fire in a few hours could lay waste a whole season's logging area—and leave it unworkable for the next half century. To combat this ever-present menace the Government and mill-operators of the Province of Newfoundland formed the Forest Protection Association, to which the Bowater Organisation is the largest individual financial contributor. In assisting to make this association the most successful fire prevention division in the whole of Canada, Bowaters have themselves installed 12 fire protection depots and erected many look-out towers throughout the Province. Bowater fire wardens watch over thousands of square miles of timber. On foot, by rail, by car and from the air endless vigilance is the only insurance there can be against forest fires. By the preservation of standing timber and in scientific cutting and reafforestation the Bowater Organisation serves the pulp, paper and allied industries throughout the world.

Letters to the Editor

The Risk of Isolation

SIR,—In your leader on the "Risk of Isolation" you call attention to the "frustrated chaos of intra-European trade" much of which is blamed on the British Government. In actual fact trade within western Europe in 1948 recovered to 90 per cent of its prewar volume and was running at some 105 per cent in the first half of 1949. Trade with eastern Europe is regulated on the basis of strategic considerations which you have at various times energetically defended against the wishdreams of fellow-travellers.

Indeed, it is questionable whether the recent liberalisation of intra-western European trade undertaken almost unilaterally by Britain has not gone beyond the limits set by the need to close the dollar gap. By making sales of western European luxuries and semi-luxuries easier within Europe the pressure on *entrepreneurs* to increase sales to the United States has been decreased. At the same time sterling is made the vehicle of the growing European capital flight to the United States and its new parity is imperilled.

We must strive for integration in Europe. But it is foolish to imagine that the price-mechanism unaided by long term planning will be able to perform the larger scale adjustments required quickly, smoothly and without unnecessary hardship. If the British Treasury and Board of Trade are to be blamed it is not for their adherence to *dirigisme* but, on the contrary, for their failure to put forward constructive plans which embody a monetary mechanism to achieve a balancing of trade by a planned expansion of investment in those countries which have a surplus in their balance of payments and suffer from unemployment. By decontrolling imports and at the same time refusing to explore a closer integration of the productive system of western Europe we succeed in having the worst of both "freedom" and "planning."—Yours faithfully,

T. BALOGH

Balliol College, Oxford

Pakistan and India

SIR,—Few people in this country realise that 60 per cent of Pakistan's trade was with India and 30 per cent of India's trade was with Pakistan. This has come to a dead stop since India devalued her currency unilaterally without previous consultation with Pakistan, which she was obliged to do under an existing agreement.

I have seen complaints in the British Press that Pakistan has refused to deliver 300,000 bales of jute to India, under contracts made before devaluation. Those contracts were between private parties of both Dominions and were for payment in Pakistan rupees. I know of several cases in which Indian merchants, having purchased goods from the United States before devaluation, refused to take delivery unless the devalued rupee was accepted in payment. Now that the Calcutta mills have exhausted their jute reserve, the Indian Government is trying to throw mud at the Pakistan Government, who have no responsibility for these private contracts.

At the time of the partition of the Punjab, the Hindus removed from the West Punjab all their banks, including their cash deposits, books, etc. Practically all shopkeepers and money lenders, who provided agricultural finance, were Hindus who were ordered by the Congress high command to withdraw from the West Punjab immediately. Several of my Hindu friends told me at that time that the West Punjab economy would break down and that we would be obliged to request them to return and would re-unite with India. Today, the whole trade of West Pakistan is in Muslim hands and all the shops are full of goods and prospering. Where India failed on a provincial basis, she is now trying to break our economy on the higher Dominion level; but they must not forget that when you put up a wall against water it finds other channels and may not flow back into its original bed.

India has refused to purchase our cotton, but fortunately for us, England, Russia, France, Italy, Belgium and some other countries can consume all of our surplus cotton, which is only about 1,000,000 bales a year. Our prices of cotton are the same as those of last year in spite of India's boycott. India purchased 175 tons of wheat from us. Our Government purchased 500,000 tons from the farmers to help the starving in India. This wheat is lying at their door, and the Indian Government, for political reasons, would rather have their people die of hunger than honour a contract with Pakistan. In America, from where I have just returned after attending a meeting of the Food and Agricultural Organisation of the United Nations, I learnt of the failure of India's effort to purchase 4 million tons of wheat from the United States.—Yours faithfully,

Trade Agreement with Jugoslavia

SIR,—Your comments on the recent trade agreement with Jugoslavia in your issue of December 31, 1949, omitted, I think, one rather important consideration. The agreement is admittedly more a political than a business deal and you did not inquire who is paying the cost. I feel that this question deserves some examination.

The nationalisation of British interests in Jugoslavia deprived British investors of property worth many times the figure of £4,500,000 which was agreed as compensation to be paid by Jugoslavia over a period of eight years. If the British negotiators could not do better than that, then the British claimants should not have been deprived of the possibility to express their disagreement and given a chance to wait a little longer to see whether Jugoslavia could do without trade with the west.

Article 2 of the Agreement on Compensation [Cmd. 7600] provides that the Government of the United Kingdom accept the payment of £4,500,000 in full satisfaction and discharge of all claims of British nationals whether they are made or presented before or after the date of the signature of the agreement. That means that the British Government compromised very substantial British claims without even knowing the amounts involved. This agreement was signed on December 23, 1948. Had one waited a little longer the British bargaining position would have been much stronger. Tito's quarrel with the Cominform has given the British negotiators a second opportunity to protect British interests more effectively. But instead of an improvement of the British position we see that Tito has now been given by the British Government a credit of about double the amount he is supposed to repay to British investors within eight years.

It may well be that the deals with Tito are justified by reasons of foreign policy. But why should the costs be borne by the unfortunate British investor? Why should the British government, to the debit of its dispossessd subjects, finance the dispossessors? Treaties for compensation for nationalised British interests abroad need not go before Parliament and it seems, therefore, advisable that attention should be drawn to this practice of conducting foreign policy not at the risk of the public at large, but on the shoulders of one fraction of the business community.—Yours faithfully,

A. DRUCKER

The Fellowship for Freedom in Medicine

SIR,—In your issue of December 17th, you suggest that if some system of contracting out of the National Health Service were devised, it would help the Government in a difficulty which they have created for themselves by undertaking to provide services which they cannot achieve in full. If any such system were adopted, it would have wider advantages than you suggest, for it would provide the best possible security whereby private medical practice could continue. That this is a desirable object few will deny outside the ranks of those who approve of complete state monopoly in medical service.

The Fellowship for Freedom in Medicine is frequently represented as being opposed to National Health Service in principle. This is not so, but it sees in the present Act an easy road to monopoly, of which it does not approve. It is bent on securing amendments to the Act that will ensure the continuance of private practice as an alternative for those of the public who wish to use this (either as a whole or in case they need an independent medical opinion), and as a competitive stimulus to the service provided by the State. Contracting out of the service, by any member of the public who wishes, is one of the amendments that we have under consideration. We realise that for most people, when they are ill, freedom of choice between the National Health Service and private practice is at present illusory, because they cannot afford to pay for both. With the alternative of a fair refund of money from the State in exchange for the surrender of the right to any part of its medical service, this freedom of choice would again become a reality to many of these people.—Yours faithfully,

R. HALE-WHITE, Vice-Chairman

The Fellowship for Freedom in Medicine,
45 Nottingham Place, W.1

Books and Publications

The King with Two Faces

"Benito Mussolini: Memoirs 1942-43." Edited by Raymond Klibansky. Weidenfeld and Nicolson. 284 pages. 18s.

THE writing of the different pieces of this book was finished three years ago, and it is inexplicable and unfortunate that its publication should have been delayed so long. In the meantime it has been superseded in various ways. Admiral Maugeri's articles on Mussolini in captivity in the summer of 1943 are particularly interesting, but he has already published a fuller account in his own book "From the Ashes of Disgrace" (which, incidentally, has made him *persona ingrata* with the Italian naval authorities of today).

Nonetheless the collection of Mussolini documents now published under the collective title of memoirs is of historical value; there can be no doubt about their authenticity and on the whole the editing is admirably done. One is provided with the Duce's apologia together with notes which scientifically expose his tricks. The character that emerges is the one with which all the authoritative postwar accounts have made us familiar, the Mussolini who is even more vacillating than he is theatrical. Indeed at times his indecision seems almost pathological; it is again Admiral Maugeri whose description best illustrates the Duce's incredibly ambivalent attitude towards Hitler and Germany.

Mr Sprigge's introduction to these memoirs emphasises Mussolini's inveterate journalism—in the worst sense. It was here that the Duce's vacillation and his vanity met. It amused one's public and perhaps furthered one's own popularity to change one's poses, but everything Mussolini wrote was some kind of limelight thrown upon his own face.

In the last brief period of Mussolini's life with which this book is concerned, whether in the memoirs he himself wrote in the *Storia di un anno*, or in the accounts of those who dealt with him, the selfless martyr pose is strained to the uttermost—"Is this funicular safe?—not for my sake, because my life is over, but for those who accompany me." But even at this stage Mussolini lost himself in contradiction; he began to waver between the aping of Napoleon and a new-found desire to appear as a betrayed Christ. It is one of the mysteries of twentieth-century history that this man should have imposed his own conception of his greatness upon so much of the world and for so long. In the days before the last war only the Italian anti-Fascist exiles warned us that Mussolini was a weakling. Now Professor Klibansky has pinned the poor fluttering creature to the pages of this book; even so, he expresses in his foreword a well-justified fear of the new legends which are quickly springing up.

Qualified Optimism

"Controlling Factors in Economic Development." By Harold G. Moulton. The Brookings Institution. Faber and Faber. 359 pages. 29s.

AFTER the depressing spate of Malthusians lamenting the rape of the earth and of Keynesians *plus royalists que le roi* proclaiming the stagnation of the mature economy, there is at first sight something decidedly refreshing about a real sunburst of economic optimism. Dr Moulton's book is an attempt to discover, by inductive rather than deductive methods, the laws of the dynamic economy; to assess the extent to which the historical trends of the last hundred and fifty years can be extrapolated into the future, the forces which have shaped them and must continue to do so, the limiting and the stimulating factors. Of the former, that which most exercised the minds of the classical economists—the law of diminishing returns—worries Dr Moulton not at all. Erosion? Well under control. Exhaustion of minerals? The surface is hardly scratched as yet—and anyway, there are the synthetics. Sheer inadequacy of cultivable surfaces? It is not the surfaces that matter, but what one does with them; irrigation, pest and waste elimination, improved plant and stock breeding, and so on.

More serious than any such technological consideration is the economic instability arising—here the Brookings Institution momentarily joins hands with Keynes—from the divergence between the will to save and the will to invest. Dr Moulton specifically disclaims any intention of attributing all depressions, at all times and all places, to this discrepancy; he does, however, see in it an incessant drag on progress. Individual depressions can themselves, of course, constitute a more or less serious interruption of progress, and one which he sees no hope, in the free economy, of entirely abolishing. They can, however, be mitigated, and will prove mere minor nuisances provided that the economy in which they occur is basically healthy and not, like America in the 1920s, unduly vulnerable by reason of increasing income inequality.

Concerning the positive elements, the stimulating forces of the dynamically advancing economy, Dr Moulton has surprisingly little to say—to say, that is, in economic terms. Individual and collective ambition for self-betterment is taken for granted; given that ambition, given consciousness of scientific possibilities and willingness to explore and exploit them, progress follows automatically, providing that certain underlying requirements are maintained: conservation of natural resources, clear-sightedness in labour-management relations, sound money, and (one year with another) balanced budgets. Above all—here Dr Moulton returns to the preoccupations of the 'thirties—mass purchasing power must keep

pace with production, whether by constantly rising wages or constantly falling prices.

Considered as a serious work of economics this book is decidedly sketchy. Technological forecasts—which, one must suppose, Dr Moulton is no better qualified to make than the next man—mix awkwardly with the economic analysis in which his expertise is undoubted. Considered as a contemporary picture, one intelligent man's estimate of trends and potentialities, it shows in a much more favourable light. At the very least it should serve to set the Malthusians in perspective.

Filling a Gap

"Indian Economics and Pakistani Economics." By B. B. Ghosh. A. Mukherjee and Company, Limited, Calcutta. 612 pages. 10 Rupees.

MR GHOSH has his faults. His style is repetitious and his writing slipshod; his proof reading is abominably careless and his occasional excursions into economic theory totally inadequate. But in this particular book these are unimportant blemishes. Nearly a generation has passed since the last full scale study of the economy of the Indian sub-continent and in between there has been war, inflation and partition. Mr Ghosh, therefore, fills a gaping gap; and he fills it well. Apart from the misprints, the standard of accuracy is high. Nothing is left out which should have been included; and the blending of present facts with enough history to put them in perspective is judiciously done. One could have wished for a clearer description of the development of the currency and some of the recent trade figures given are misleading because they do not include food imports on Government account: otherwise the narrative is clear and the facts reliable.

The great changes which have come over the sub-continent's economy since 1939 stand out in bold relief. The repatriation of the sterling debt, the buying out of the pensions and the purchase of a certain number of British interests, have improved the invisible account by some £20 million a year. Releases from the sterling balances, which still stand at some £750 million, permit a further excess of imports. Yet the result has not been the great development that one might have expected. Exports have dropped to two thirds of their former volume. Indian exports of oilseeds and cotton have nearly disappeared and the jute trade which is responsible for one third of the sub-continent's exports is itself threatened by substitutes abroad and disputes between India and Pakistan at home. Meanwhile the food position has worsened. Pakistan's surplus has temporarily almost disappeared and India has to import 4,000,000 tons a year against 1,500,000 tons prewar, in order to meet the exiguous ration.

There is, however, hope for the future. Seven million desert acres are due to come under irrigation in the next half dozen years in Pakistan, and 20 million acres are to be irrigated in the next 15 years or so in India. And present yields in both countries are so low that there are a hundred quite cheap ways of improving them: from better seeds to better insecticides, from more manure to more warehouses. Industrialisation is necessary, and is indeed proceeding; but it is clear from this survey that, in the immediate future at least, the raising of the standard of living of the sub-continent depends upon the improvement of its agriculture.

Timber Mining

"History of the White Pine Industry in Minnesota." By Agnes M. Larson. Minnesota Press, Minneapolis. London: Geoffrey Cumberlege. 432 pages. $7.50.

THIS book does not actually smell of the pines themselves, as does one American magazine, but there is nevertheless an aroma of the trees all through its pages. It is a history of the lumber trade in Minnesota, the northern, mid-western State that lies around the headwaters of the Mississippi. The book begins in the eighteen-thirties, when 70 per cent of the State was forested and the once lucrative trade in furs was slowly dying out, and it ends in about 1916, when the State's great natural resources had been exhausted by "timber mining" and nearly all the big sawmills had closed. By then Minnesota and the white pine had yielded pride of place to the Douglas fir and to comparatively undespoiled western states like Washington. The whole business of the lumber trade during these years, the felling of the trees, the life of the lumberjack, the river drive, the various methods used in sawmills, the general basis of ownership and finance of individual firms, and their operations, are described in detail, fascinating but perhaps too minute for one who is not a native of the State. Nevertheless, through the records of personal endeavour general history emerges; the timber trade, even though it left many counties devastated and unsuitable even for farming, contributed the capital to develop the State and provided a market and raw materials to build homes for the early wheat farmers inside and beyond Minnesota's borders.

Shorter Notice

"The Mechanism of Exchange." 6th Edition. By John A. Todd. Geoffrey Cumberlege. Oxford University Press. 290 pages. 10s. 6d.

THE first edition of this book appeared as long ago as 1917. Until about 1933 (when the fourth edition appeared) it was one of the best standard text books for students of monetary mechanisms and management—and, to a lesser degree, for students of monetary theory. The heady new wine of monetary history since 1933—on which extra chapters have been added—sits less easily in the still trusted old bottle of pre-Keynesian analysis and the book's main value is now as a work of historical reference. It serves this purpose admirably; the charts and statistical appendix are mines of information and the text achieves conciseness without the appearance of cramming.

AMERICAN SURVEY

Time for Politics

(From Our American Staff)

IT seems unlikely that 1950 will be a productive year west of the Iron Curtain. By the time a new British Government is installed and ready to offer new policies, the campaign season will have started in the United States. Although there are elections of some importance every year, it is only every two years that they are sufficiently widespread to inhibit, for some months, any action by the Administration that is not directly concerned with collecting votes. Next November elections will be held for the whole of the House of Representatives, 34 of the 96 Senate seats and the Governorships of 33 of the 48 States. In 21 of the States, Governors must be elected every two years, in 26 every four, and in New Hampshire every three. Seven of the eight key States must elect a new Governor this year, and the eighth, Illinois, will have a crucial Senate battle to sustain the public's interest. Ohio, Massachusetts, Michigan and Connecticut are four States which have Democratic Governors, elected with Mr Truman in 1948, who must run again and who can expect to win only if 1950 is another Democratic year. In the other three, New York, California and Pennsylvania, the Republicans will be trying to hold States won in the Republican tide of 1946.

As the New Year begins, this seems likely to be a somewhat unusual election. It is not surprising that Mr Truman should be determined to win every possible seat in both Houses, but it is strange that the Republicans should be making such efforts to help him. General opinion in Washington is that the Democrats could sleep the year away and still win without difficulty. But, perhaps because he remembers how wrong general opinion in Washington proved to be fifteen months ago, Mr Truman is taking no chances. What is more, the last session of Congress has taught him that a comfortable party victory does not, of itself, clear the way for a Democratic President with a Fair Deal programme. To be happy after the results are announced, he must have a majority of supporters of his policies over the combined forces of the Republicans and the Southern Democrats. He has not had that during the last year—far from it—and even the redoubtable Mr Roosevelt rarely enjoyed it.

To get it next year, Mr Truman will concentrate, during the second session of the Eighty-first Congress—one that must necessarily be short to allow the incumbents time for their campaigning—on a few simple domestic issues. Civil rights, the repeal of the Taft-Hartley Labour Act, and the Brannan Farm Plan will be pressed on Congress—not, it must be admitted, with any expectation that they will be passed, but in order that Democratic candidates may point an accusing finger at their opponents and demand a Congressional majority large enough to ensure their passage in 1951. Foreign policy, on the whole, will have to wait. Certainly that is true of the development of existing policies in Europe, although, if anyone has a good Asiatic policy (Mr Truman has lately demanded that a "positive" one be produced out of the hat), it will be accepted. The Democrats are vulnerable in the Far East and it would be useful to be able to take the wind out of the sails of those who have adopted General Chiang Kai-shek as their mascot.

The Republicans, on the other hand, have as yet shown no sign of recovering consciousness after being run over by Mr Truman last year. The first few months after the election were spent in blaming the unfortunate Mr Dewey for the defeat, in addition to his own, of the disreputable characters running for re-election to Senate and House at the same time. Using Mr John Foster Dulles as a guinea-pig in New York's recent by-election, Mr Dewey then experimented with the tactics of opposing the welfare state on every issue and waging the kind of undignified campaign that the right wing of the party thought he should have waged himself. The results were even less satisfactory, but the party is in no position to learn from this experience. The national committee's funds are running out and the "Fat Cats" (the rich on whose contributions the party must live) are able to dictate the kind of programme they are willing to finance.

On Boxing Day the Republican National Committee presented the Democrats with a delayed, but none the less welcome, Christmas present in the announcement of the appointment of a policy committee, the members of which were gleefully recognised as certain to produce a policy which would ensure a Democratic victory, not only in 1950 but in 1952 as well. But no policies save those of such inflexible Republicans as Messrs Harrison Spangler, Clarence Buddington Kelland and Walter Hallanan will open the pockets of Colonel McCormick and the other midwestern millionaires on whom the party largely depends.

Senator Vandenberg, although not by any means recovered from his serious operation in October, came back to Washington in a desperate attempt to save the Republicans from themselves, and issued a number of statements by which he hoped to bring his colleagues to their senses. But it was clear that the isolationists were less inclined to listen to him, and less afraid of him, in sickness than they had been in health. Senator Wherry called a press conference a few days later and pecked at Senator Vandenberg's statements with reference to "bipartisan big-wigs." Those who had such high hopes, only two years ago, of rebuilding the Republican party began to despair, as Senator Morse showed when he called Mr Wherry's pronouncement a "cloak for the weapons of isolationism."

With the Republicans falling apart, the Fair Deal Democrats have been preparing to defeat the worst of the Republican Senators coming up for re-election this year. There are not many Republicans in this year's batch, which was last elected in 1944, in Mr Roosevelt's last campaign, and is therefore, heavily Democratic. Indeed the Democrats can indulge in the luxury of attacking some of the men in their own party of whom they are not particularly proud, such as Senator Elmer Thomas of Oklahoma and Senator McCarran of Nevada. The chief Republican targets will be Senators Millikin (Colorado), Donnell (Missouri), Hickenlooper (Iowa) and Capehart (Indiana). The first two of these now seem in danger and the last two are so shaky that the party organisations in their States are thinking of replacing them with less shopworn characters—much to the annoyance of the Democrats, who were licking their lips in anticipation of easy victims. Three of the other Republicans, Senators Morse (Oregon), Tobey (New Hampshire) and Aiken (Vermont), are men whose defeat would give little pleasure to anybody and another is Senator Taft (Ohio), who is a special case. If he is to be the Republican presidential candidate in 1952—and it is the prayer of every good Democrat that he should be—he must not be beaten this year. He is not likely to be.

But since it is necessary not only to win, but to win by a crushing majority, the President is making his programme for this session one steeped in electoral appeal. The Administration has not, as has been said, turned isolationist, but it certainly seems to have decided that this year's election will be won on domestic issues, not foreign ones. The cold war must wait until 1951. It is to be hoped that it will. Mr Truman is apparently satisfied that he has time to finish his game of politics and beat the Russians, too.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

American Notes

Approaching Mid-Century

"The state of the Union," President Truman told Congress last Wednesday, "continues to be good," as it nears "the midpoint of the twentieth century." Later, when he spoke of moving forward into the second half of the century, he threw a sop to those who contend that the half-way mark has already been passed. Mr Truman was equally careful throughout his message to tread on as few toes as possible, but his conciliatory mood did not go as far as a compromise on his basic programme.

An important part of Mr Truman's message was his expression of faith in the United Nations and his emphasis on America's obligations to them. This was accompanied by a warning against the false economy of "crippling" the European Recovery Programme, and requests for prompt adherence to the International Trade Organisation and for the provision of assistance to under-developed parts of the world, particularly urgent in connection with the Far East. The theme of the Presidential message was that, at mid-century, "the human race has reached a turning-point" and the direction it takes depends upon whether the United States can provide an answer to the challenge of Communism.

This can only be done by giving full expression to the ideals of liberty and equal opportunity within the Union's own borders and by demonstrating how the great developments during the first half of the century can be made to provide an infinitely better life for everyone. And here, in Mr Truman's opinion, the government has a special responsibility: it must create and maintain conditions favourable to "the growth we know is possible." Most of the President's recommendations to Congress are directed to this end. The

prescription is much the same as before: strengthening of the anti-monopoly laws, assistance for small businesses, more houses for middle-income families, extension of rent controls, development of natural resources, better insurance against the hazards of old age, unemployment and idleness, improvements in medical care and in education. Also, of course, there are the three most controversial recipes of all—civil rights legislation, a new law to govern labour relations and a system of production payments to support farm incomes.

President Truman recognises that this programme will require large expenditures which are not at present covered by government revenue. To meet this situation, he proposes to recommend, in his fiscal message next Monday, "the quickest and safest way of achieving a balanced budget." These recommendations will, almost undoubtedly, prove to be as quick and safe a way of stirring up Congressional controversy and are little more likely to prove acceptable than are most of his other major recommendations. The chief omission in this year's message is last year's request for legislation to meet the dangers of "boom and bust," which 1949 showed to be less urgent than had been thought. With the help of existing government programmes, the country "met and reversed the first significant downturn in economic activity since the war," and it is this, more than anything else, which accounts for the optimism of the President about the state of the Union.

* * *

Storm in the China Sea

The Communist threat to Formosa—which is, with Hainan, General Chiang Kai-shek's last outpost and an island of some admitted strategic importance to American Pacific defences—has coincided with the gleeful throwing off of bi-partisan restraints by many Republicans. But as the dust settles in Washingon, it appears that Mr Acheson, by standing firm, has been able to prevent any substantial capitulation to those who are urging military aid to the Nationalists, whether they are to be found inside the Administration, or among the augmented chorus of Republican critics.

The National Security Council, according to reliable reports, has decided not to recognise the Chinese Communists, but it has also ruled out the occupation of Formosa advocated by, among others, Senator Smith, or the use of the Navy in its defence, proposed by Mr Hoover and Senator Taft. A study, however, will be made to determine whether the Generalissimo really needs, and will use to advantage, limited technical and financial help. Mr Truman has a private purse of $75 million for the Far East voted by the last session of Congress, and there are also some $94 million of frozen ECA funds.

The announcements that lent some local colour to rumours of an about-face on Chinese policy have lost much of their initial significance. The strengthening of the fleet, and of Okinawa's defences, had been approved two weeks before the domestic storm blew up, while the dispatch of the Joint Chiefs of Staff to Japan in February, coupled with Mr Jessup's leisurely progress to Bangkok, have more the appearance of buying time—at the risk of their persuasion to General MacArthur's views—than of decisive steps toward a new stand.

*

Far Eastern policy has never come under the shelter of the bi-partisan umbrella, and therefore has regularly been subject to harassment by Republican irregulars. But with the revolt against Senator Vandenberg's leadership, there is a risk that the critics, unless appeased in some fashion, may take their revenge by refusing to support appropriations for the Marshall plan and European defence. Senator Knowland has already demanded that aid should be withheld from countries that recognise the Chinese Communists. Mr Acheson is determined, however, that the hopes of driving a wedge between the Chinese and Moscow, and of forming an anti-Communist front in Asia, shall not be jeopardised by an adventure in Formosa that would revive imperialist nightmares throughout the Orient and once more fasten the stars and stripes to the discredited and shabby wagon of General Chiang. General Bradley, chairman of the Joint Chiefs of Staff, is equally unwilling to immobilise any of his ten divisions in a risky attempt to hold Formosa.

Conciliation is, however, in the air; it might profitably have begun earlier with a more generous attitude toward Mr John Foster Dulles after his defeat in New York, but at least Mr Truman went out of his way this week to express his appreciation of the bipartisan co-operation he has received. Both Senator Vandenberg and Senator Connally, the two Congressional pillars of that co-operation, have offered very similar tit-bits to Republicans hungry for a foreign policy that reflects Congressional demands and prejudices as well as Administration aims. They agree that funds for the Marshall plan must be cut this year, perhaps by as much as $1 billion; that the Chinese Communists must not be recognised without prior consultation with the Foreign Relations Committee. Both urged, on the other hand, that General Franco should be recognised by the return of the American Ambassador to Madrid. All these concessions are perhaps more attractive than substantial; even the State Department is now willing to include Spain in the technical organisations of the United Nations, and conscious of embarrassment in having an Ambassador in Moscow, but none in Madrid.

* * *

Coal's Cold War

All the persuasions of the coal owners have failed to convince President Truman that a national emergency calling for his intervention has yet arisen from the "40 per cent" coal strike, although it is now six months since the miners worked more than three days a week, apart from one short interval in November, and coal stocks have fallen very substantially. This week's unexpectedly large cut of one-third in passenger trains may perhaps convince Mr Truman that it is time to abandon his neutrality. He is even more likely to feel differently should the weather, so far persistently and unseasonably warm in the east, co-operate with the mine-owners by forcing householders to stoke their furnaces. Nor has Mr John Lewis, the miners' leader, come to the aid of the operators by goading the government into action: he has not ordered a full resumption of the coal strike after the New Year holidays, as it was thought he might.

Rumours that the coal-owners would close down the mines have proved equally unfounded but, driven to defend themselves since no one else will do it, they have sought refuge behind the Taft-Hartley Act and have filed charges of unfair labour practices with the National Labour Relations Board against Mr Lewis. They have also asked for an injunction requiring the miners to work full time. If they obtain it, it will apply not for the eighty days which is the maximum under the national emergency provisions of the Act, but for as many months as the NLRB may take to examine the charges. The case against Mr Lewis is that the three-day week is an attempt to coerce the employers and that he has refused to bargain in good faith.

Until recently Mr Lewis declined to state his requirements, but he has now signed contracts with a few small producers who, however, mine only about 18 million of America's annual 600 million tons of soft coal. These new contracts provide for an increase of 95 cents a day in wages, bringing them up to $15, and an extra 15 cents, to 35 cents a ton, on the contribution to the miners' welfare fund. This fund is to be controlled by Mr Lewis, who has already brought it near bankruptcy, and the stipulation remains that the miners will only work when "willing and able." It is this insistence on the freedom to strike which has so far cemented the unusually united front of the owners; but the five-day working week, the reward for signing the new contract, is very tempting to high-cost operators who find it difficult to meet fixed charges on the three-day basis.

Whatever the outcome of the present phase of the cold war in the coalfields, it is unlikely to bring the campaign to an end. Mr Lewis is well aware that, at present prices (for which he is largely responsible), the demand for coal is not sufficient to require five-day operations all the year round. His answer to this is that, if all the miners cannot work all the time, they must all work some of the time. For the last six months he has imposed this share-the-work system on the coal owners and for its sake he has already sacrificed two of his basic principles: miners are working without a contract and all mines are not paying the same wages.

Slaves of the Decibel

On New Year's Day the authorities in charge of New York's Grand Central Station decided, of their own volition, to stop broadcasting recorded "music" over their public address system. These broadcasts, interrupted by advertising slogans every five minutes, have, for the past three months and for 17 hours out of every 24, been beating on the eardrums and drowning not only the words but also the thoughts, of the half million persons who use the huge station each day. This generous gesture followed a calculation that the much-needed profit—$1,800 a week—paid by advertisers for the use of the station's loudspeakers was being cancelled out by the loss of passengers' goodwill.

That this loss was serious had become apparent during an inquiry held by the State Public Services Commission, at which psychiatrists testified that the broadcasts amounted to forced feeding of advertising, liable to cause the stomach ulcers which come from suppressed hostility. Very little of that hostility continued to be suppressed after it was discovered that, to the advertising profession, those passing through the station were a "captive audience." Their slavery to the decibel was revealed to them by "the editor of an adult comic book, published in the area, who commutes back and forth through the terminal"—Mr Harold Ross, editor of the *New Yorker* magazine, who instigated the hilarious inquiry. Those protesting to the Commission (which has not heeded to announce its decision) were certainly more representative of his readers than of the railroad's captives. The majority of the latter, already well-conditioned by their radios at home, were probably quite unaware of their servitude.

Nevertheless, this fight of a minority for privacy, for the right to be left alone with its thoughts, for one of the freedoms denied by the Nazi and Soviet systems, has aroused sympathy all across the country, especially in those cities which suffer under a similar scourge in their trams and 'buses. These are more difficult to escape from than is the Grand Central Station; one of Mr Ross's bogies was that audible advertising in the vehicles themselves might spread to New York as it has recently done to Washington.

Arguments that unavoidable listening threatens the constitutional right of free thought failed to convince the Washington Public Utilities Commission, perhaps because threats to the constitution are an old story in the nation's capital. The PUC concluded that radio reception in public vehicles is no obstacle to safety of operation and that it actually improves the conditions under which the public rides. But the indignant citizens of Washington, enrolled in a Committee against Forced Reading and Forced Listening and encouraged by the New York triumph, are seeking legal release from their captivity to the decibels. The choice may be between two freedoms—of enterprise or of thought.

THE WORLD OVERSEAS

Ceylon—Junction of Asia

(By a Correspondent)

IN 1831 the Colebrook Commission, after two years of close investigation into British rule in Ceylon, which had flourished since 1798, reported:

> The peculiar circumstances of Ceylon, both physical and moral, seem to point it out to the British Government as the fittest spot in our Dominions in which to plant the germ of European civilisation, whence we may not unreasonably hope that it will spread to the whole of these vast territories.

Monday's meeting of Commonwealth Foreign Ministers is at once a vindication of the Ceylonese and a tribute to the prescience of the Colebrook Report. In the strategic sense, no doubt, every prospect pleases; but that would avail the Commonwealth little if the people of this young Dominion had not achieved a society stable economically and politically. The position Ceylon is expected to hold today as a defensive bastion of the Commonwealth is, *mutatis mutandis*, no great distance away from the 1831 ideal of a Ceylon whence the "germ of European civilisation" might spread over all the vast East.

Military writers may be left to expatiate on the strategic importance of the island. The ordinary man with an atlas notes that it is in a position to cover both the Indian Ocean and the Bay of Bengal, the roads from Suez and the Cape and the narrower ways, south and east, to the Pacific and the China Seas. He notes that it controls or could control the great land masses to north and east. In this island, not too densely inhabited to prohibit the entrance of strangers in substantial numbers, much of the climate is suited to European habitation.

Trincomalee is one of the world's great natural harbours, great alike in capacity and in possibility of protection; Colombo is one of the world's great man-made ports, a city of 300,000 inhabitants, whose peacetime prosperity is based on the swift and sure handling of ships and cargoes. In Ceylon, finally, are facilities for air bases—and for air action from those bases.

150 Years of British Rule

It has not been all a matter of luck that during the 150 years of British rule relations between Government and people have been increasingly cordial and that racial and religious minorities, with one or two lapses, have lived in amity. British colonial administration has been criticised and not without reason; but the Colonial Office, in its dealings with Ceylon, has been less open to attack than anywhere else. Britain took over a reasonably fertile island, not too densely populated: there were 1,167,000 inhabitants when the British went there and at the last census there were about 6,694,000. As population has increased, agriculture has been encouraged to expand. True, Ceylon suffers, as all western-dominated Asia suffers, from too energetic a cultivation of "cash" crops and from a grave neglect of "consumption" crops; but Britain had the will and the resources to "cushion" Ceylon in the bad years—not infrequent—when the cash crops were inadequately remunerative. Even with a big floating population of Tamils on the rubber and tea estates, the right food was usually there and in the right amount.

Moreover, despite the qualms of some planters, the Administration has always looked after the working and living conditions of the labourer. Social services, when Ceylon became a Dominion, were at a higher level than anywhere inside the Colonial Empire: tremendous advance had been made in public health; if education was not all that could be desired, education facilities were remarkable.

On the political side, the struggle for responsible and representative government has been long, extending over more than eighty years. But it has always been waged in a good temper on both sides; and the Island has been happy in a succession of able Ceylonese politicians on the one side; and, on the other, a succession of able administrators—Sir William Manning, Sir Hugh Clifford and Sir Andrew Caldecott may be cited—were quick to feel the pulse of public opinion but cautious in giving way to political desires running too far ahead of probable political performance.

Experiment and Achievement

Though the Colebrook Report resulted in the creation of Legislative and Executive Councils, both were "official"; not till 1889 were eight "non-official" members allowed to the former and not till 1910, when Japan had beaten Russia and China was modernising its method of government, did Ceylon get ten non-official members. This Council, by the way, the Governor of the day described as a "harmonious and efficient instrument for giving effect to measures for the good government and progress of the Island."

The tempo of change was swifter just before and during the Great War. Ceylonese reformers, united in the Ceylon National Congress, pressed for more than mere representation, for an actual majority on the Council. They got it in 1919—with two effects. First, communal animosities became active and the Tamil League was formed; secondly, it became clear that power divorced from responsibility would not work here any more than elsewhere. On Sir Hugh Clifford's advice, the Donoughmore Commission was sent out and that curious experiment, the Donoughmore Constitution, followed. It was a tremendous advance in the direction Ceylon desired. It produced for the first time in the East a trial of adult franchise. It put government in the hands of seven dissociated Executive Committees. On the other hand, it intensified communal rivalry, till in 1936 all the Ministers were Sinhalese; it produced no party system based on live political issues; it still failed to couple real responsibility with power.

Ceylonese and British agreed that, even as an interim measure, this Constitution would not work, and the Soulbury Commission was sent out. Officially ignored by Ministers but actually assisted by enlightened and politically adult Sinhalese, notably Mr D. S. Senanayake, the Commission came, saw and—more or less—conquered. It recommended a bicameral legislature and a Cabinet responsible to that legislature; the First Chamber to consist of 95 members elected on a territorial basis and six nominated by the Governor to represent minorities. In arranging electoral districts, too, concessions were made to the minorities.

From this Constitution, in full working order by 1947 and with Mr Senanayake leading a strong United Nation party, backed by the Independents, it was no long step to the Dominion status granted in the Independence Act of 1947 and implemented in February, 1948, when the first session of Parliament was opened by the Duke of Gloucester. Ceylon had become a Dominion not much less quickly and with infinitely less disturbance than India and Pakistan.

No Threat to Stability

What does it all amount to? First, the Ceylon Constitution is, by the will of its people, on the British model; and there seems good reason to believe that, though so many Ceylonese are politically uneducated, it will work. Second, racial and religious minorities are not at present aggressive or afraid. Of the population, 4,621,000 are Sinhalese; 800,000 Indian Tamils; 409,600 Moors; 41,500 Burghers (people of part European blood); 5,400 Europeans. The Sinhalese, mainly Buddhists, are by no means as dominant as their numbers might suggest. The Tamils, many of them labourers, are not yet politically active. The Muslims are giving the Government support. The Burghers have found their niche. Europeans are content that Ceylon will need them as experts for some time to come.

There is no serious threat here to political stability; if danger is to come it will be on the economic side. Ceylon does not produce enough food—only half what it eats. It has, partly because of its high expenditure on public service, no real margin if its "cash" crops—tea, coconuts, rubber—produce less than they are producing today. With a population 85 per cent agricultural, it must produce more "consumption" crops. That Mr Senanayake has in hand; substantial sums are earmarked for clearing land that has been out of cultivation for centuries, restoring and improving irrigation, works which have been derelict and broken for as long. With that goes the development of hydro-electric resources.

In a word, one can hope that Mr Senanayake and his advisers, even though they will have to cut public expenditure, are on the way to achieve that general measure of prosperity which is the surest bulwark against Communism. One condition is essential—a period of peace. That is why Ceylon, clearly unable to protect itself, is likely to co-operate in any system of Commonwealth defence the conference can evolve.

Prospects for Venezuela

[BY A CORRESPONDENT RECENTLY IN CARACAS]

VENEZUELA is not only a dollar account country, with one of the hardest currencies in the world, but it also has a population which spends as fast as it earns. There is an enormous and still largely unsatisfied demand both for consumer and capital goods which British merchants could do more to exploit. Exporters have either been unwilling to embark on the initial market research, or they have been put off by the predominance of American interests. The result is that Britain's main exports to Venezuela consist of equipment for the oil companies, which is not a net dollar earner, and Scotch whisky, which is. Yet there is scope for cars and cycles, tweeds and textiles, prefabricated houses, building materials, pottery, furnishings and household goods, and above all machinery for developing agriculture and industry.

As in all Latin-American republics, there is growing pressure for industrialisation in Venezuela. Indeed the country's most urgent need is to achieve a more balanced economy and to exploit its considerable natural resources.

At the moment Venezuela lives on oil. Coffee and cocoa, once substantial exports, have been neglected. The central plains, the *Llanos*, are highly suitable for cattle-raising, but little is done to encourage it. About two-thirds of the food and a large proportion of consumer goods are imported. This leads to an abnormally high price level, which benefits nobody but the middlemen who make a handsome profit. Ninety per cent of the national revenue is derived, directly and indirectly, from oil; petroleum accounted for 95 per cent of foreign exchange earnings in 1948.

The present Government—a military Junta which has ruled without Parliament since the overthrow of the left-wing *Accion Democratica* last November—is alive to the dangers of an unbalanced economy. Like every Venezuelan Government since Gomez, it has adopted the slogan *Sembrar el Petroleo*—"sow the oil," or invest revenue in capital development.

But the oil-sowing policy is painfully slow in bearing fruit. A few light factories have been built on the outskirts of Caracas, the capital city, and the United States and Bethlehem Steel Corporations are now exploiting the rich iron ore deposits in the Guayana Highlands. A "basic economy" plan, financed partly out of Rockefeller and oil companies' funds, is being started. But, broadly speaking, only the fringe of the nation's economic resources has been touched.

Any plans for economic development depend on increased immigration and a better use of the available manpower. The present population is only 4,500,000—half that of London in an area the size of western Europe. So far, 8,000 displaced persons have been brought in under an international scheme and there are plans for Government-sponsored immigration (at first suspended by the Junta but now revived) which provide for the entry of 400 families a month.

From the Donkey to the Dakota

If Venezuela is to support an increased population, however, urgent measures must be taken to raise the general standard of living, to improve housing, health and sanitation, and to introduce better transport facilities and communications. Apart from the roads round Caracas and those built by the oil companies, there are no good long distance roads, and there are few railways. Air transport, on the other hand, is excellent. Venezuela in effect by-passed the railway age and went straight from the donkey to the Dakota.

The Government has ambitious educational plans and is building a new university city to train doctors, teachers and engineers. There is evidence everywhere—even on book matches—of its campaign against *Analfebetismo*. But even so, about 60 per cent of the population is illiterate, and the health and mortality figures are alarming. According to a recent survey more than half the population is suffering from malnutrition, and the Ministry of Health records 8,000 deaths a year from tuberculosis, 400,000 diagnosed cases of syphilis, and 5,300 cases of typhus, with 10 per cent of live births dying before the age of one.

Some progress is being made with housing, through the *Banco Obrero*, (Workers Bank) which leases or sells houses and flats at reasonable rents. But living conditions are still primitive. Along the roads into the main towns, in the oil "overspill" towns and on the hillside above Caracas, whole families are living in one-roomed shacks, made of cardboard cases, mud and dried palm leaves. The fact that there may be a gleaming new American car outside and a radio and a refrigerator inside—because the owners are making good money in the oilfields or elsewhere—in no way relieves the authorities of their responsibilities. Though it is carrying out plans for developing water supplies and power, the Government tends to prefer spending money on new public buildings than on workers' houses. In the oil districts, much of the new construction of houses, schools, and hospitals has been undertaken by the companies themselves. Indeed, the paternalism of concerns such as the Shell Group is contributing in no small way to modernisation and the improvement of social standards.

High earnings in the oilfields, together with the special

privileges wrested from the foreign companies by the unions, have inevitably encouraged the drift from the land. The companies deny that they are enticing labour, but, even if the proportion directly employed in oil is small, the industry exercises a magnetic pull over the whole population. Venezuela as a nation is suffering from the effects of a too rapid expansion of its oil resources—effective exploitation dates back less than 30 years. This has created a lop-sided economy and imposed an artificial semi-Hollywood "civilisation" on a largely primitive community. It is trying to do in three decades what it has taken Britain more than a century to accomplish.

Belgian Coal Reorganisation

[FROM OUR BRUSSELS CORRESPONDENT]

In the reorganisation plan for the Belgian collieries the Government has emphasised its belief in private enterprise. The coal mining industry has a history, not only in Belgium, of difficulty in adjusting its operations so as to meet, on the one hand the pressure of modern standards for its workers and on the other the public pressure against undue increases in price. One way out of this dilemma is nationalisation, but in Belgium nationalisation was rejected as a remedy soon after the war, and the rejection was not opposed—indeed it was even advocated—by many Socialists.

Nevertheless, the history of the industry since the war has not been happy. Increased wages had to be introduced under an arrangement whereby they effectually fell on the taxpayer. Labour was short and had to be imported, and a compensation scheme was introduced whereby the profit-earning collieries paid for the losses of the less fortunate. The financial structure of these expedients became very complicated, and bore all the marks of an emergency arrangement which, for lack of anything better, sufficed so long as coal was in seriously short supply. It was only this year that coal became plentiful once more, and some change in the method of financial working became a necessity.

The method adopted by the Government is to leave it to private enterprise and to let the weakest go to the wall. An increase in the prices of domestic coal, especially anthracite, was authorised and the price of coking fines was materially reduced. The inter-colliery compensation scheme was abolished; the subsidy, which had lately been some frs. 2,000 million a year, was now to be paid only to those mines which showed a loss, and then only to the extent to which their loss exceeded ten francs a ton. Moreover, and this is the key to the whole process, the rate of subsidy was to be reduced by five per cent each month, with a view to its complete abolition at the end of twenty months. In no case was the subsidy paid to any colliery company to exceed frs. 165 a ton and the collieries were to take responsibility for the rise in wages which the subsidy was originally intended to finance.

Low Output Per Man-Shift

This leaves the industry with twenty months, starting from the beginning of last October, to put itself on a profitable and self-financing basis. The authorised rise in prices will provide only about frs. 400 million, so that something of the order of frs. 1,600 million a year will have to be found by reductions in the cost of production. To achieve this would require a saving of the order of frs. 60 a ton on coal which may only be sold at a mean pithead price of frs. 685 a ton. The effort required, however, is not evenly spread, since only about 43 per cent of the coal raised is sold at a profit. It is calculated that, within the 20 months' period the collieries working at a loss at the outset will, if they are to break even at the end of the period, have to raise their output a man-shift by 23 per cent. The magnitude of such an effort may be judged by the fact that it has taken four and a half years to raise the output a man-shift, for Belgium as a whole, by 25 per cent from the abnormally low figure of 500 kg. registered in 1944.

The output a man-shift in the Belgian collieries is customarily on the low side. The prewar average is put at 753 kg., though in the first four months of 1940 an average of 825 kg. was recorded. Since the war there have been a number of vicissitudes, largely because of a shortage of suitable underground labour. After the repatriation of the German prisoners of war, labour was recruited from Italy under a treaty which gave Italy the right to buy a given tonnage of Belgian coal, and from displaced persons of Baltic, especially of Polish, origin. As things stand, though the labour force of about 165,000 includes over a hundred thousand Belgians, almost two-thirds of the face workers and half the other underground workers are foreigners. The difficulty of teaching the job to new recruits has slowed down the process of output increase.

Since the introduction of the new plan, there has been a very noticeable increase in the rate of output a man-shift. The figure, which had risen to 638 kg. in the spring but fallen to about 623 kg. in the late summer, is now 707 kg. a man-shift. This may be partly due to the closure of the uneconomic workings at Bray and Hornu Wasmes in the Borinage and at Bois d'Avroy in the Liège basin. A more potent influence, however, may have been the added incentive given to the more economic mines by the abolition of the compensation scheme. Now that the profitable mines no longer support the laggards, their rate of production has increased, notably in the Campine basin in the Limbourg.

Equipment Through Marshall Aid

It is not, as yet, possible to say whether this rapid improvement can be increased or even maintained. The balance of probabilities suggests that the main improvement will have to come either from the re-equipment of the mines, or from the more slowly maturing economies resulting from fusions, especially of adjacent workings. The scheme, in its present form, does not, however, set a premium on the fusion of workings, since it presupposes that effort will be concentrated on the rapid improvement of output and thus puts at a discount the devotion of labour resources to the drilling of the necessary connecting galleries. The *Conseil National des Charbonnages* has recommended fusions in several cases, but hitherto little has come of them.

As for re-equipment, credits are available to the extent of frs. 720 million in the form of 2½ per cent advances for the purchase of equipment made avalibale through Marshall Aid. Up to the present, although a great proportion of the coal is mechanically cut, a very great deal remains to be done in supplementing the pithead equipment and improving the underground haulage. Constructive work in this connection may go some way to solve the problem, though it is doubtful whether this can operate quickly enough to have a crucial effect on the twenty-month plan.

While the closure of uneconomic workings inevitably raises social problems, especially in a country in which the unemployment problem is acute, the position is rendered somewhat worse by the incidence of the recent increase in prices. Thus the increased price of anthracite favours the Liège basin, which contains a number of the older workings, but works seriously against coking fines and the "fat" coals, of which a large proportion comes from the Borinage. It is in the latter area, around Mons, that many of the less economic pits are located, and there thus seems to be some substance in the allegation that the plan is working against this district. Current reports suggest that the lowering of the basic price of coking fines, from frs. 720 to frs. 640 per ton at pithead, is not enough to affect the competitive position

STEEL AT THE CROSSROADS

Time to reconsider...

Everybody knows that the present proved policy of the steel industry has raised output to an all-time record, kept prices down and maintained good labour relations through every post-war crisis.

Would state-owned steel give as good results?

Thoughtful people of all parties are growing more and more uneasy. There is still time to reconsider the alternatives of state-owned steel and the present proved policy.

The present proved policy

1. Retains healthy competition.
2. Stimulates progress through co-operation in research, etc.
3. Protects the public interest by Government supervision.

STEEL

is serving you well

BRITISH IRON AND STEEL FEDERATION

for Belgian coke except over a comparatively small part of the market area in France. Most of the agitation against the Government's coal policy is concentrated, therefore, on the problem of the Borinage. It is eased by the fact that there is a shortage of surface workers, and Belgian workers are not unaccustomed to travelling long distances to their jobs. On the other hand, closures are bound to result in a number of surface workers becoming redundant and, since 90 per cent of these are Belgians—lacking the protection of treaties or of contracts with the International Refugee Organisation—the potential social problems are obvious. M. Duvieusart, the Minister of Economic Affairs, has said that he is considering special measures for the least economic pits ; and it seems likely that the Borinage problem will call for Government aid in such forms as extra family allowances and public works.

It may be that experiments now in progress in the Borinage will increase the profitability of individual collieries. These experiments are centred round the attempt at La Bouverie to commercialise the supply of mine gas, drawn off from the mine and piped, at present, to a chemical works twenty miles distant. The gas, which has hitherto been regarded as nothing but a danger, is apparently proving excellent in thermal qualities and may become a valuable mining by-product. It is not yet known, however, whether its use can be generally extended. There are other experiments, at a still earlier stage of development, in the production of gas by underground combustion. These are being carried out at Batterie, near Liège.

Meanwhile, as a measure of protection for the Belgian collieries during their reorganisation, M. Duvieusart has promised that, in principle, imports shall be restricted to the 25,000 tons monthly of German coking fines. The Welsh anthracite supplies to Antwerp and the Durham bunker coal sent to Zeebrugge, however, have apparently not yet been stopped. Belgium's international trade in coal has never been on a large scale, exports being conditioned by proximity to north-eastern France, Switzerland and, to some extent, the Lombard plain ; and imports by the German supplies which go mainly to Luxemburg and the conditions of supply of English and Welsh seaborne coal. At present, however, price conditions are wholly against Belgium, mainly as a result of the large increase in wages since the war together with the big charge for social security contributions, which adds no less than 38 per cent to the employers' wage bill. These charges plus the low output per worker resulted, according to calculations made earlier this year, in a wage-cost of frs. 456 a ton, which compared with frs. 142 in the well-equipped Dutch mines, frs. 177 in Germany and frs. 219 in Great Britain. Devaluation will have increased this disparity, and it is clear the Belgian industry has a long way to go before it is on a par with that of neighbouring nations.

Dr Malan and Mr Havenga

[FROM A SOUTH AFRICAN CORRESPONDENT]

DR MALAN and Mr Havenga have come to terms, at any rate for a year, on the coloured question. The former has agreed to postpone for twelve months the intended legislation to abolish the existing system by which the coloured community (there are about a million of them) enjoys the parliamentary franchise on the same roll as Europeans, and it is claimed for the latter that he has saved, for the time being, the constitution and the monarchy. To that extent Mr Havenga deserves and has received the felicitations of the English press, which, by and large, is a supporter of General Smuts and the United Party.

There are aspects of this matter, however, which deserve closer scrutiny. One of the immediate results of the new agreement is the shattering of the hope of many in the United Party that Mr Havenga might be drawn away from the Nationalists into a coalition with General Smuts—a hope that flourished in spite of the fact that General Smuts personally made no direct overtures to Mr Havenga who has not shown any inclination to break his pact with Dr Malan. There has been a reluctance on the part of both Mahomet and the Mountain to move or be moved.

Mr Havenga is a peculiarly silent man. He eschews publicity, dislikes the newspapers, and frowns upon the guesswork and anticipation which forms part of the political correspondent's day. What can be said of him without assuming more than is known is that he is more a Nationalist than a United Party man. He is an avowed republican and a supporter of the principle of race separation. His only difference with Dr Malan is on the means by which Nationalist aims are to be achieved. He refuses to concede the wisdom of seeking a republic through a simple parliamentary majority, though, contrary to General Smuts, he accepts the legality of the simple majority. In addition he rejects any tampering with the entrenched clauses of the South Africa Act, which define the political status of the coloured community. He insists with commendable firmness upon a recognition of the broad will of the people.

Conflict Confined to Afrikaners

Mr Havenga's presence as leader of a third party dictating the political course, illustrates a neglected feature of South African politics. Outside the country, and to a large extent inside it, the belief persists that the conflict is one between the British and the Afrikaners. Fifty years ago it could be so described. The conflict today, however, is almost exclusively confined to the warring elements of Afrikanerdom. English-speaking South Africans take part in it as spectators or as skirmishers and can be discounted in the bid for votes. The English-speaking vote has already been cast ; it will always go to General Smuts and the United Party.

Only by recognising the nature of the conflict as an Afrikaner disturbance can the actions of the Nationalist Government be understood. It explains the absence of any positive effort by Dr Malan and his colleagues to attract English-speaking citizens to their side. The Nationalists have done little, possibly because there are so few opportunities of doing anything, to counter the party propaganda in the English press. They have done much—in the Citizenship Act, in the proposed abolition of the BBC news service, in republican propaganda, and in unilingual education—to offend the English-speaking electorate. Theirs is a bid for the support of Afrikaners.

In any consideration of party fortunes the most important significance attaches to Mr Havenga's Afrikaner party. Despite the respect in which Mr Havenga is held by the British section, his party is as exclusively Afrikaner as the Nationalist Party. Its members are Nationalists rather than United Party men, divided from the Nationalists in personal loyalties, in their homage to General Hertzog, and in a regard for the place of the English-speaking people in the nation's design.

As if to emphasise the one-sided character of the party struggle the absence of any English-speaking voice or leadership is impressive. There is no Englishman, present or in prospect, who can hope to attract the Afrikaner vote. The English-speaking cause, and for that matter the British cause in the wider sense, depends upon the saving abilities of the great Afrikaners, in the person of General Smuts, before him in the urbanity of General Botha, and, between the wars, in the latter-day conversion of General Hertzog. With the death of Mr J. H. Hofmeyr there is no Afrikaner successor to this particular tradition, a fact which does not stir, as it should, the English-speaking section to a realisation of its political poverty.

To the British, Dr Malan often appears tactless and gauche. He seems to move clumsily. It is in the Afrikaner context, however, that his party tactics must be studied, and there he will be found capable of handling a situation with ease and advantage. He would like to have the support of English-speaking people. As that comes to him but slowly, he devotes his energies to the cultivation of Afrikaner votes. And in this he is not too much disturbed by the presence of Mr Havenga, for Mr Havenga is no vote catcher and no publicist. It would take no great pressure to persuade Mr Havenga to go back to his farm.

The agreement reached between them is to be reviewed at the end of 1950. By that time Dr Malan's proposals for the future of the coloured community will have been made public. Already there are indications that they will include provision for a separate portfolio of Coloured Affairs, representation in the House of Assembly, and direct representation on Provincial Councils. The scheme may appeal to those for whom it is intended as the constructive side of *apartheid* and, if translated into social improvements, be the means of attracting this section to the Government's side. In that event Mr Havenga might find it very difficult to refuse his support.

It can be assumed that Dr Malan will go to the country on an issue of this size with confidence in the response of the Afrikaner electorate.

Where, it may be asked, does General Smuts stand in these probabilities. There are grave doubts whether he will ever again be Prime Minister of South Africa. If such be his fortune, it will come about as the result of world events rather than of purely domestic disturbances. His party's chances depend on a movement of Afrikaner votes to his side. This movement may occur, but it will do so not because of the positive merits of the United Party but because of failure on the Nationalists' part to grapple with the economic difficulties that lie ahead. It is useful to remember that on each occasion General Smuts has been raised to the premiership, South Africa was faced with war or economic crisis, never with racial problems. He remains the war minister called in at critical moments. Afrikaners in the mass have no confidence in him in native and non-European policy, and not very much in his ability to find men to sustain the nation in financial difficulties.

New Zealand's New Government

[FROM OUR NEW ZEALAND CORRESPONDENT]

A MONTH after the election which ended Labour's 14-year rule in New Zealand, it is clear that what the country can expect is not so much a new legislative programme as a new and brisker approach to the business of administration. To many New Zealanders the comment of observers overseas which had been cabled to the Dominion newspapers has exaggerated the significance of the change of government, especially in its implication that New Zealand has rejected Socialism. It is true that the National Party, now in office, did state in its election manifesto that it "stands wholeheartedly for an economic system owned, directed and controlled by private enterprise," but the National Party also gave assurances that it would not tamper with social security benefits.

In truth, Socialism was not "routed." But in a consistent pattern in nearly every one of the 80 electorates a "shift" of about four per cent in national sentiment cut Labour's Parliamentary representation from 42 seats to 34 and correspondingly increased National Party representation from 38 seats to 46. The most potent factor in the change was that the Labour Government had grown old and tired in office. It had had four terms and the first two were much more productive than the last two. This was logical enough ; there were in the later years fresh legislative worlds to conquer. Declining majorities in 1943 and 1946 had reflected public judgment on Labour's legislative slowing-up and its loss of drive and imagination. Last year the public decided, in effect, that the good things Labour had produced would not be lost by a change of government, and that there were likely to be gains in a more business-like administration which would loosen controls, give quicker decisions, cut waste, and perhaps reduce taxation slightly.

The new Prime Minister, Mr Holland, has taken a direct line with the public which has so far given wide satisfaction. In choosing his Cabinet he re-grouped portfolios in a business-like way. There was a little surprise, perhaps, that he added unofficially to the size of Cabinet, which is fixed by law at 13, by appointing three more ministers without portfolios as well as two Parliamentary under-secretaries. But so far there has been no suggestion that a larger ministry will mean a more expensive one.

Less State Interference

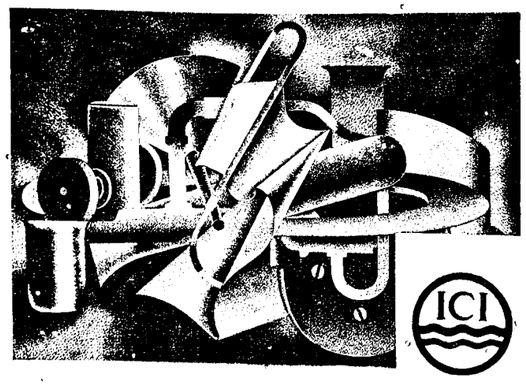
Mr Holland has made no attempt to set up in business as a suave politician. There has been a note of determination to most of his public statements as Prime Minister. For instance, he told an audience in Auckland (the city and province which played the decisive part in the election) that the state could not be expected to act as a fairy godmother ; it was not able to distribute things to the people without first of all taking those things from the people. He emphasised his view that the people, having chosen to free themselves of government control, should "do the maximum for themselves." As far as the Government was concerned, it was prepared to do its job. But it also intended to get out of the way of private enterprise so that private enterprise could do its job, too.

The New Zealand Parliament customarily meets in June to begin a four or five months' session, but a short session is expected about February or March to enable the new Government to get legislative sanction for some of its election policy.

As far as empire and foreign policy is concerned it is clear that no material changes are contemplated. Indeed, Mr Holland has paid generous tribute to the work of his predecessor, Mr Fraser, as an imperial statesman and he backed his compliments with an invitation to Mr Fraser to be one of the New Zealand delegates to the Commonwealth conference in Ceylon. Mr Fraser declined the invitation but promised to make his counsel available on questions of external policy whenever that should be desired.

Peak of Prosperity

This incident was entirely in keeping with the spirit in which the change of government has been made. The final stages of the election campaign had shown some signs of bitterness, which flowed largely from Mr Fraser's decision to monopolise the election eve broadcast time instead of sharing it with Mr Holland. As it happened Mr Fraser, tired and a little irascible, made a very poor broadcast which must have done his cause no good. But on the following night he came back to the microphone to submit gracefully to the decision of the people and to congratulate Mr Holland who in turn spoke modestly of his own success and complimented Mr Fraser on his achievements as Prime Minister for nine years.



Perhaps the appropriate summing-up has been made by a non-political observer in an article called "Election Autopsy" in the Presbyterians' national journal.

> All except narrow partisans will wish Mr Holland and his team the very best luck. They are unfortunate in that they are entering office at the peak of prosperity so that they may be blamed if overseas conditions bring about a depression in this country. But they are also lucky in that they have a good working majority in the House and an excited, expectant electorate throughout the country. Their victory has livened up New Zealand politics and brought in a breath of fresh air.

Achievements of an Industry

Genius for invention is inherent in the British people. In a previous series of announcements — "Ancestors of an Industry" — I.C.I. told the story of Britain's scientific pioneers from A.D.1144. The present series is designed to describe some recent British chemical achievements, many of which have been the genesis of new products and processes which have given fresh vigour to the nation's industry.

Such achievements have been sometimes the brilliant discoveries of inspired individuals, but are more often the work of teams of research chemists co-operating on a given task and working to a set plan. The announcements in this series are proof — if proof were needed — that the British spirit of initiative and enterprise is still alive.

First Fruits of Devaluation

THE figures of the sterling area dollar deficit for the final quarter of 1949 and of the gold and dollar reserves held at the end of the year make welcome reading—though any reassurance they convey must be subject to reservations. Certainly, the true underlying trend, if discernible at all at this early stage after the devaluation, cannot be gauged merely from the bald facts that in these three months the dollar deficit of the sterling area dropped to $31 million and that the gold and dollar reserve rose by $263 million, heartening though these movements are. To appraise these figures and set them in perspective, the first step is to examine how the deficit was financed. This is done in Table I, which carries the quarterly table back to the beginning of 1949, while a more extended comparison of the gold and dollar reserves is given in Table II.

Before scrutinising these figures it is well to recall that much of Britain's dollar expenditure eligible for Marshall Aid is nevertheless financed in the first instance by dollars put up by the Exchange Equalisation Account, so that at any given moment there are dollars due to Britain from ECA in reimbursement of past expenditure. The published figures of the gold and dollar reserve naturally exclude these accruing dollar claims, so that since the beginning of the Marshall period there has, in effect, been a further hidden reserve representing cash payments already made for ECA goods against subsequent reimbursements. This item has fluctuated considerably and has in the past vitiated strict comparison of the quarterly figures of the dollar reserve. It can, however, be claimed on the authority of the Chancellor of the Exchequer that no such reservation need qualify a comparison of the last two published figures—those covering the fourth quarter of 1949. Amounts due on ECA reimbursements at the end of the year were, in fact, slightly larger than at the end of September. Hence the increase in the gold and dollar reserve by $263 million over the last quarter of 1949 was a genuine improvement—even though some of the factors responsible for it were of decidedly non-recurring character.

In a survey of these figures this week, the Chancellor of the Exchequer gave three broad categories of reasons for the reduction in the sterling area's dollar deficit from $632 million in the second quarter of 1949 and $539 million in the third quarter to a mere $31 million in the fourth quarter. The first was the reversal of all the operations which had occurred in anticipation of the devaluation of sterling: the much-publicised postponement of purchases of sterling goods and the delays in payments for purchases actually made. These influences had helped to inflate the deficits in the six months preceding devaluation and, conversely, their reversal diminished the deficit for the post-devaluation quarter. His second explanation was the increase in business activity in the United States in the last part of the year, an increase which led to a rebuilding of American stocks of all kinds, including those of sterling area goods. These two sets of influences on the reserve are, of course, non-recurring, and the Chancellor ventured the guess—it cannot be elevated higher than this—that about half the reduction in the dollar deficit as between the third and last quarter of 1949 was due to these "once for all" items.

The third reason given by the Chancellor for the diminution in the deficit was the fall in the sterling area's dollar imports and the expansion of its exports to the dollar markets following devaluation. The cuts in dollar imports decided upon by the United Kingdom last July and recommended to other members of the sterling area are beginning to bear fruit. Sir Stafford Cripps suggested this week that as from the beginning of 1950 total sterling imports from dollar countries will be running some 25 per cent below the corresponding 1949 figures. If so, the exhortations to economy of last July, reinforced by the much more formidable effect of higher dollar prices caused by devaluation, are beginning to achieve what was expected of them.

In presenting and commenting on these figures, the Chancellor pleaded for objectivity in their reception. "I hope that no one will shout that we have already reached our goal or grumble that we have failed." Those who take the trouble to analyse the figures in the light of the information given by the Chancellor are unlikely to do the former. If the assumption can be made that half the improvement in the dollar deficit, from $539 million in the third to $31 million in the fourth quarter, was due to non-recurring influences, it follows that the normal dollar deficit of the sterling area in the fourth quarter amounted to $250 million and was, therefore, running at an annual rate of $1,000 million. This "normal" deficit was almost exactly filled by Marshall Aid last quarter, but it greatly exceeds the prospective receipts from Marshall Aid, particularly after June 30th next. Since the Canadian credit is beginning to run dry and Britain will very soon have to think seriously of re-selling to the IMF the dollars which it acquired from that institution for sterling up to the permissible quota in 1947 and 1948, the need to look at the dollar problem without the rosy spectacles of exceptional external assistance through which it has lately been viewed, should be self-evident. Seen in the cold light of reality, the dollar deficit of the sterling area in the first post-devaluation quarter still gives little cause for reassurance. As the Chancellor said

FINANCING THE STERLING AREA'S GOLD AND DOLLAR DEFICIT
million U.S. Dollars

Total Net Gold and Dollar Deficit (Quarters)	Decrease in Gold & Dollar Reserve	Drawings on Canadian Credit	Drawings on I.M.F.		Receipts under ERP	Total Reserves
			India	Australia		
I. 330	− 56	30	32	...	324	1,912
II. 632	+ 261	30	...	...	341	1,651
III. 539	+ 226	29	...	...	284	1,425
IV. 31	− 263	27	...	20	247	1,688
TOTAL 1949: 1,532	+ 168	116	32	20	1,196	...

this week, "a great deal remains to be done if we are to eliminate the real deficit."

Even more will have to be done if the gold and dollar reserve is to be reconstituted to a safe minimum. The Chancellor said this week that he still regarded the level of the gold reserve as at the eve of Marshall aid as the minimum safety level if sterling was to perform its functions as an international currency. This means that the gold and dollar reserve should be built up again to $2,240 million—or, at the present rate of exchange, to about £800 million. That is more than $500 million in excess of the reserve held at the end of 1949. The recovery in the reserve in the last quarter was due wholly to exceptional assistance—to Marshall aid, drawings on the Canadian credit and to Australian purchases of dollars from the International Monetary Fund. If the reserve has to be built up by a further $500 million in a phase of rapidly diminishing external assistance, the task which faces this country is one which leaves no room for complacency in looking back on the results of the last quarter.

* Immediately before the beginning of E.R.P.
† Immediately before devaluation of sterling.

Nonetheless, the achievement of the first post-devaluation quarter must not be discounted. The powerful stimulants and sedatives injected into various national economies by the exchange readjustments of last September are beginning to show results. Already losses of gold by Britain to the two hard currency countries of Europe—Belgium and Switzerland—have stopped, and this movement can be directly attributed to the more permanent effects of devaluation. This cessation in the gold drain to countries other than the Western Hemisphere is one of the most welcome features of the last quarter's returns. Another reassuring aspect of the improvement is that, according to the Chancellor, it was fairly evenly spread over the whole of the past quarter and that the recovery in the reserves was still proceeding at the end of the year. This suggests that the non-recurring influences in the situation are still operating. But as those influences must be losing potency, it also suggests that more permanent influences making for an improvement in the balance of payments are slowly gathering strength. They will need to do so, and much more rapidly, if the tasks ahead—the rebuilding of the gold and dollar reserves to a safe minimum and the establishment of dollar solvency by the sterling area by 1952—are to be successfully accomplished.

Too Much Steel?

WHEN, last spring, the Organisation for European Economic Co-operation embraced the principle that projects of investment and modernisation in European industry "should be developed rationally and in concert," steel was one of the first industries to which the principle was held to apply. Since this decision was followed closely by the announcement of international approval for a series of iron and steel development projects, there was a natural inclination in the public mind to assume that a European steel plan, or something of the kind, had been evolved; but this was mistaken.

It had to be pointed out at the time that no method of international planning, or even of co-ordination, of investment existed. The Steel Committee of OEEC was confronted from time to time in 1949, usually in a hurry, with the duty of scrutinising particular projects, and in the given circumstances it had little choice but to approve them. It also made a conscientious study of the possibilities of co-ordinating investment in the future, and in the autumn produced an extremely tentative report, which has not been published. The fact was that neither its political structure nor its extremely modest organisation would allow it to go very far in treating a subject at once technically complex and politically difficult.

It is all the more to the credit of the Economic Commission for Europe that the secretariat of the steel division at Geneva, in a report published this week*, has plunged firmly and publicly into the forbidding subject. The distinction between the secretariat and the Steel Committee of ECE (which is made up of delegates from the member countries) is in this case real. Many members of the committee were prepared broadly to support the estimates of probable output and consumption—and therefore the forecast of a surplus in the near future—at which the secretariat had arrived; but other members, perhaps because the expansion plans of their countries are by implication criticised, objected to the secretariat's conclusions. The constitution of the United Nations, however, permits the secretariat to publish its own studies of affairs without seeking the specific approval of the member countries, and the decision to publish this report was taken on that principle. This is fortunate, because there is little doubt that before unanimous agreement could have been obtained, the argument would have had to be watered down.

As the report stands, the argument is plain and forthright. Substantially, it is that the existing known programmes of the European steel industries, added together, will give a total annual production of more than 70 million tons of crude steel in 1953. This forecast is based on the national production programmes and not on calculations of capacity, though naturally it assumes that certain new plants will have come into operation by then. But the secretariat does not expect European demand for steel in 1953 to be more than 58 million tons—if 1953 is a year of full employment. Further, it does not expect that Europe will be able to export more than 4,100,000 tons of crude steel (or 3,000,000 tons of finished steel) in that year to the rest of the world—again, assuming high levels of trade and employment all round, and making a number of other assumptions which the authors of the report clearly believe to be optimistic. This means that Europe will be able to sell, at home and abroad, only about 62 million tons of basic steel products expressed in crude steel equivalents, and that some 8,000,000 tons of output will not find a market. The suggestion is made, therefore, that investment and production plans for the national steel industries ought to be co-ordinated in earnest, and this ought to be done jointly by the producers and consumers of steel as well as by the governments. Some of the projects which are to lead to the high level of output which is forecast have not yet been begun, and might (it is hinted, be reconsidered. At the same time a co-ordinated effort ought to be made to influence the consumption of steel, when the need arises, to absorb the rising output.

The report sets the European programmes against an elaborately documented world background; indeed, the statistical apparatus brought to bear is somewhat intimidating until it is realised that the same broad conclusions can be reached by simple empirical methods. In order to estimate the maximum likely level of steel exports from Europe in 1953, a survey is made of the probable course of production and consumption in the major regions of the world. The possibility of exporting to the United States and the Soviet Union is not entirely dismissed, but the prospects for both these regions are described as "marginal and erratic." In the United States, the recent shortage has come to an end, and American output has been cut. The Soviet Union is planning a huge increase in steel output—"a production of 25 million tons is planned for 1950 and there has been authoritative mention of 60 million tons as the steel target for 1960"—but, though these figures suggest a rapid increase in requirements, Soviet policy has never aimed at importing steel in large quantities, except when prices were abnormally low in depression years. Canada, in spite of its expanding production, will probably continue to be a substantial importer, but "American steel will almost certainly continue to hold the bulk of the Canadian import market."

The traditional importers of steel from Europe are the under-developed areas—Latin America, Africa, the Middle East and the Far East. It is clear that, as these regions develop their industries, their requirements of steel will increase; but an examination shows that they are, at the same time, developing steel production of their own. The Middle East, which is an exception in this respect, is expected to import something less than 1,000,000 tons in 1953. Japan was a net exporter of steel before the war, and the Japanese steel industry, though depleted by the war, is beginning to recover. Australia and India have become important producers—Australia is the lowest-cost steel producer in the world—and have soundly-based expansion plans which are expected to take effect by 1953. On balance, the Far Eastern countries are expected to need net imports of only 700,000 tons in 1953 to make up their total requirement of 11,550,000 tons. In Latin America, annual steel consumption rose from 2,140,000 tons in 1935-39 to 3,560,000 tons in 1948; it is expected to rise further, as industrialisation progresses, to 4,550,000 tons in 1953. But Brazil has been developing its steel industry, and the Argentinian plans for domestic steel production have been revived; output in Latin America is expected to rise from 969,000 tons in 1948 to 2,550,000 in 1953, and net imports are therefore expected to decline slightly to 2,000,000 tons.

The report arrives at the conclusion that the world outside Europe, but including the Soviet Union, will require net imports of only 3,750,000 tons of finished steel (5,000,000 tons of ingot equivalent) in 1953. Before the war, Europe could have been expected to supply the bulk of this requirement; the European share in world steel exports was 88 per cent in 1935. But the European share was already declining in the immediate prewar years; it fell to 76 per cent in 1938 and 69 per cent in 1939. Immediately after the war the United States was the principal supplier, and even in 1948 the European share had recovered only to 53 per cent. The European exporters of steel who had maintained their position, and even improved it, during the depression of the early thirties, now find themselves at a decisive disadvantage in the trade in flat products and pipes, which has fallen substantially into American hands. The authors of the report emphasise that price and quality will henceforth again be the decisive factors. They believe that they are being "very optimistic indeed" when they accept the possibility that Europe may regain a share of 80 per cent, or slightly more, in this trade. "The postwar export policy of American steel producers," they add, "would seem to justify doubts in this respect."

In the United States, where production of crude steel rose from 51.4 million metric tons in 1937 to 80.3 million

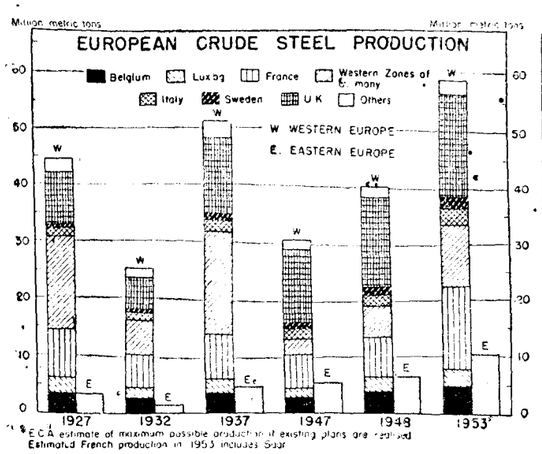
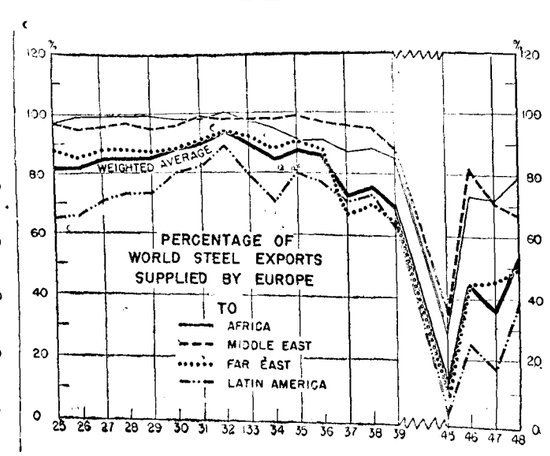
* European Steel Trends in the Setting of the World Market. Geneva: Steel Division, Economic Commission for Europe.

in 1948, apparent consumption in the same period rose from 47.9 to 75.2 million tons. These figures express the decisive industrial and political factor in the world today. What are the prospects that a similar revolution will take place in Europe between now and 1953? European consumption in 1948 was 44.9 million tons—more than in 1935, though less than in the years 1936-39. The annual consumption per head which this represents, 110.5 kilograms, compares with 518 kilograms per head per year in the United States. It is clear, however, that the rate of increase of consumption per head which can be achieved will depend on the ability of the main using industries to absorb the steel. The report makes a series of estimates of steel consumption for these industries (coal mining, electricity, transport, engineering, and so on) based largely on the published national plans for their expansion and activity; these estimates are brought down from an otherwise ambitious level by the modest expectation of railway development, and the increase arrived at is no more than 34 per cent. Separate and parallel inquiries were also pursued by other methods, and none of the answers give a probable consumption in Europe of more than 60 million tons of steel in 1953. The estimate of "practical" maximum demand in that year at which the report arrives, 58 million tons, represents a *per capita* consumption of some 136 kilogrammes; and this European average—the report comments—



> would be equal to the prewar average level of consumption in countries like France or the Netherlands. For a continent which has been so impoverished by war and by subsequent political instability to reach such an average level of consumption would no doubt be considered a most remarkable achievement.



To meet these relatively modest requirements, the European countries have launched out into expansion projects which appear quite disproportionate to the need. The most remarkable proportionate increases are in countries which had only small steel industries before the war. Thus, while the British expansion programme is massive, the proportionate increase which it represents becomes insignificant by the side of mushroom developments in Greece, Turkey, the Netherlands, Denmark and Norway. Only for Germany is a steel output envisaged which is less than before the war, and here it is necessary to remember that German capacity is still in excess of permitted German production; if the conditions were to arise which would make such a step profitable, more German capacity might be brought into play.

★

A modest excess of steel capacity, as many advocates of expansion have pointed out, need not be alarming. Indeed, in the finishing end of the industry some excess of capacity over output can be said to be necessary in order to provide the flexibility of output of finished products which the consuming industries need. In the sections producing crude steel, it may be possible to some extent, and even useful, to correct over-rapid investment by accelerating the rate of scrapping of new plant. But the argument of efficiency cannot be used to support those investments which are based on autarkic considerations purely and simply. Some of these can fairly be guaranteed to do no more than replace steel imported from an efficient neighbour by dear steel produced on a small scale, for a small national market, from expensive imported coal and ore. The report expresses the opinion that "the general tendency towards autarky which is noticeable in many fields other than steel is probably the most important single factor responsible for many of the present expansion plans." Some of the projects arise from a conception of strategic interest which the report shows to be half-baked; more than a few spring less from commercial than from national and political conceptions of industrial development. When the pinch comes, it may be the economic and intelligently-sited industries which are forced to contract, while national plants serving a local market, and perhaps not serving it efficiently, will receive protection for the political reasons that caused them to be erected.

What Europe needs (it is suggested) is not a conglomerate of national policies of self-sufficiency, but "the guiding policy of economy in the use of resources." Thus, if money were not wasted on unnecessary steel plants, more would be available to invest in other industries which would in turn make possible an increased use of steel. By these means the European steel industries would be enabled in the long run to develop in a healthier way, and on a more stable economic basis, than now seems likely; and the general standards of living would be enabled to rise. False investment policies, by contrast, can only aggravate the restrictive tendencies in European trade; and the consumer has to pay.

Business Notes

From Surplus to Deficit

At first glance, the Exchequer returns for the nine months to end-December suggest that there has been a less drastic inroad into the Chancellor's projected "above-line" surplus than might have been expected. Made up on the eve of the year's main tax-gathering season, the accounts

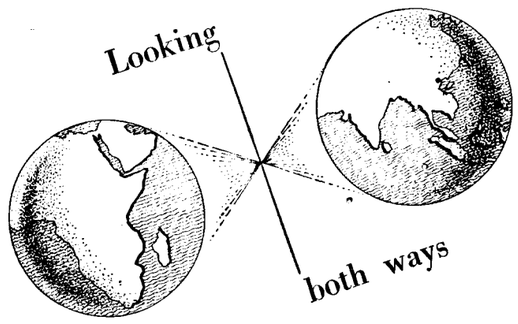
† Actual. ‡ Budget estimate.

show a cumulative "ordinary" deficit of just over £22 million (or £34 million after provisions for statutory sinking funds are included). In the similar period of 1948-49 there was a surplus of £272 million (or £260 million after allowing for sinking funds). This deterioration on the nine-month period is a good deal less than the decline originally envisaged for the full year—the Chancellor budgeted last April for an above-line surplus of £470 million (after sinking fund) compared with one of £831 million in 1948-49.



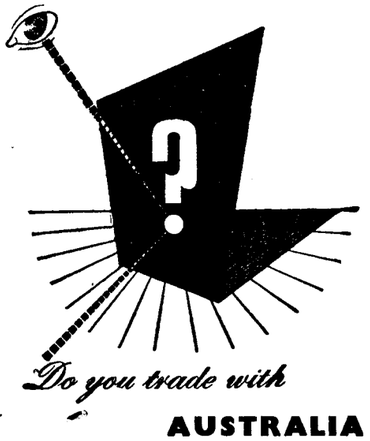
Closer examination of the accounts shows, however, that the position is a good deal less favourable than these figures suggest. Ordinary expenditure, which for the full year was expected to rise by £136 million, has already risen by no less than £254 million and actually exceeds by fully £100 million the increase envisaged after allowing for supplementary estimates already presented. The fact that only a relatively small deficit is shown for the nine months is thus wholly due to the buoyancy of revenue, which the Chancellor expected to decline in the full year by £229 million but which has so far fallen by only £41 million.

★ ★ ★ ★

Large Non-recurring Receipts

Unfortunately, this buoyancy has been mainly due to those special categories of revenue the receipts from which are non-recurring. For the fiscal year as a whole, the Chancellor expected receipts from surplus stores and miscellaneous receipts to decline by £186 million, whereas they have so far fallen by only £74 million. Again, receipts from trading services were expected to fall by nearly £11 million, whereas in the nine months they have actually risen by fully £38 million, most of this gain having occurred in the past three months.

Among more normal sources of revenue, the principal



Traders and industrialists looking for opportunities in the undernoted Territories should get in contact with the National Bank of India. Topical information on business matters and a comprehensive banking service are ensured by a network of branches in these areas. Your enquiry is welcomed at Head Office.

NATIONAL BANK OF INDIA
LIMITED

Branches in: INDIA, PAKISTAN, CEYLON, BURMA, KENYA, UGANDA, TANGANYIKA, ZANZIBAR and ADEN.

Bankers to the Government in Aden, Kenya Colony, Zanzibar and Uganda.

gain has been in EPT and profits tax, which in the full year were expected to provide £39 million less but have so far provided nearly £23 million more than in the previous year. Receipts from excise have fallen much less steeply than was expected, but those from customs, expected to expand slightly, have contracted. Death duties and surtax have both been buoyant, but income tax, from which an additional £122 million was expected for the full year, has so far contributed only an extra £4 million. As, however, appreciably less than half the yield of income tax is collected in the first three-quarters of the year, it is much too soon to assume that the shortfall on this particular estimate will not be made good in the next three months. But even if it is made good, the year-end pattern of above-line revenue is likely to be a good deal less satisfactory than that shown by the end-December return. In the last quarter of the fiscal year 1948-49, the Exchequer collected £47 million from the "once-for-all" Special Contribution and it also brought in a special credit of £55 million (under the head of miscellaneous receipts) arising from the financial settlement with India.

The position "below-line" has also been much less satisfactory than had been expected. Aggregate expenditure, after deducting the relevant credits, was expected to fall during the full year by £23 million to £456 million, whereas in the nine months it has already risen by £57 million to £423 million. This is only £33 million less than the estimate for the full year, whereas in the final quarter of 1948-49 no less than £113 million was expended. To date, therefore, there is an "overall" deficit of £457 million compared with £106 million in the similar period of 1948-49. This deterioration of £351 million compares with a budgeted deterioration of £338 million for the full year (i.e., from an "overall" surplus of £352 million to £14 million).

* * *

"British Discrimination" in Tokyo

American resentment of the restrictions of trade which arise from the dollar shortage (and, particularly, restrictions of trade in oil) is in general understandable. It tends, however, on occasion to flare up over some unexpected issues; the outcry about "British discrimination" against American companies in Japan is the most astonishing example yet recorded.

Until Japan became a closed economy in the middle thirties, rather more than a third of the oil trade in Japan was in the hands of what are now "sterling" companies. After the war, the American command in Tokyo (SCAP) permitted the sterling companies to re-establish themselves in the market—though only as distributors, since the Japanese requirements were met with products imported ready refined from the United States, and paid for in Washington out of US Government funds for relief in occupied areas. The Anglo-Japanese trade agreement for 1948-49 provided for some Japanese purchases of oil from the sterling area, but nothing came of the provision; except for a small amount of indigenous oil, which was refined locally, Japan's requirements continued to be met from American sources, through tenders to the Government in Washington.

Last summer, however, General MacArthur decided to permit the Japanese commercial refineries to operate once more on imported crude oil. At about the same time, a new Anglo-Japanese trade agreement provided for Japanese purchases of sterling oil (crude oil and/or petroleum products) to the value of £5,000,000 in 1949-50. Accordingly, tenders were invited in Tokyo in October for more than 4,000,000 barrels of crude oil to be paid for in sterling. The British groups (Shell and Anglo-Iranian) offered oil from Kuwait, but their tenders were refused; instead, 960,000 barrels were bought as a stop-gap from California, with American Government funds, and in November a new tender was invited for 2,000,000 barrels. On this occasion a condition was made that the oil should not contain more than 1.6 per cent sulphur—a stipulation which admits Arabian oil (exploited by American companies) but excludes Kuwait oil. It was explained to the British companies that their previous tenders had been rejected because of the high sulphur content (some 2½ per cent) of Kuwait oil; this (it was implied) would be liable to have corrosive effects in the refineries. The second tender, which again was specifically for payment in sterling, was awarded to the Overseas Commercial Corporation, which offered Arabian crude.

The question then arose how this American undertaking came to be in a position to take sterling in payment for oil which it would itself have to buy for dollars. The corporation explained that it proposed to spend the sterling in Japan, on Japanese textiles, and would pay for the oil with dollars obtained by selling these textiles, presumably in the United States. The British exchange control found this procedure unacceptable, and refused to agree to the use of sterling; the corporation was therefore unable to get its successful tender confirmed by SCAP, and the transaction fell through.

* * *

Dollars or Sulphur?

This unhappy story requires two footnotes. The first is that the exchange control regulations were not—as seems to be supposed—altered or manipulated to "discriminate" against the American company; the regulations as they stand do not permit the American companies to sell their oil for sterling outside the sterling area, because it would leave a residue of sterling in American hands, and this would ultimately constitute a dollar claim. Obviously, there were special features in the proposed transaction which the British Government, interested in the balancing of trade between the sterling area and Japan, could not be expected to like; but, shorn of these features, the transaction is analogous to many which American oil companies would like to undertake, and cannot, in many parts of the world. The regulations sometimes have absurd and unfortunate effects, but it would be hard to show that the present case is one of those.

The second point is that it is hard to know how seriously the objection to the high sulphur content of the Kuwait crude is intended. The British companies are sceptical, partly because they made an alternative offer of virtually sulphur-free crude from Borneo and this was disregarded. They are, however, sending a refinery technician to Japan to convince the Japanese that the sulphur in Kuwait crude is no more difficult to handle in refining than the sulphur in Arabian crude; it presents no insuperable problem of corrosion in the refinery; and, in the finished products, the sulphur remains in the heavy fractions in the form of stable (and innocuous) compounds, while the lighter distillates are virtually sulphur-free.

It is by now clear that these explanations will have a considerable barrage of propaganda to penetrate. The present position is that the authorities in Tokyo have left it to the Japanese refiners individually to buy crude oil, if they wish, with the available sterling. In view of the amount of prejudice that has been created, and of the fact that no sterling oil has yet penetrated into Japan since the war, the prospects for this branch of Anglo-Japanese trade do not look brilliant. The fantastic feature of the whole affair is the storm of indignation which it has produced in some American business circles against "British discrimination."

* * *

From IEPS to EMA

A special payments committee of the Organisation for European Economic Co-operation has been hard at work during the past week putting the finishing touches to an amended Intra-European Payments Scheme which, all being well, will be submitted for approval to the full meeting of the Council of OEEC later this month. The new scheme which is beginning to emerge from these discussions is in the main the product of a marriage between British and American proposals. These showed strong resemblances from the start, the similarity being not altogether surprising since each had its inspiration in Lord Keynes's plan for a Clearing Union. The latest reports from Paris suggest that the IEPS will become a European Monetary Association which will discharge the twin roles of a central clearing institution and a monetary fund granting credits to member countries. It will, in other words, combine the jobs now performed by the Bank for International Settlements and by the system of contributions and drawing rights established under the IEPS. It would be reasonable to assume that the BIS would take over the task of the European Monetary Association, though this might involve some reform, and even a geographical shift, of the Basle bank.

The members of the EMA would contribute quotas to the Association, paying the bulk of them in their own currencies and only a small part in gold and dollars. The Association would, in addition, receive ECA dollars, the amount for the current year being limited to the $130 million still available out of the pool put at the disposal of ECA to finance schemes helping to free European trade and payments. In subsequent years, a larger proportion of the ECA dollars appropriation would be made available to the European Monetary Association, this being the main channel through which Marshall dollars for the remainder of the European Recovery Programme would be distributed according to merit and not according to deficits. The European Monetary Association would make periodic clearings of intra-European debits and credits.

As under the BIS compensation, the member countries would meet their ultimate balances first from existing resources; thereafter, they would be helped by recourse to the facilities of the Association. They would buy the currencies of which they were in need from the EMA, making payments in their own currencies. It has been suggested that the Association should keep its books in a special unit of account based on gold—an echo of Keynes's "Bancor" device. The creditors under the scheme would thus have a claim on the Association as a whole, and this claim would be expressed in terms of the new unit of account. Provision would, however, be made for immediate convertibility of part of these credits into gold or dollars, thus giving the member countries an incentive to build up surpluses in their intra-European trade. The deficit countries, for their part, would be subject to pressure intended to restore equilibrium in their balances of payments. This would take several forms, including alterations in the exchange values of their currencies.

*

Such a scheme would do away with most of the defects involved in the rigidity and bilateralism of the existing IEPS. Its limitations in achieving effective interconvertibility of European currencies should, however, be recognised. It would avail little to restore free payments within Europe if quotas on intra-European trade continue. The setting up of this new European Monetary Association thus needs to be accompanied by vigorous action for the liberalisation of intra-European trade. Again, no mechanism of this kind, however ingenious, will operate if there is substantial disequilibrium in European balances of payments. The success of the scheme would therefore depend on the effectiveness of the measures taken to keep payments in approximate balance. Even with all these reservations, however, it is evident that the arrangement would represent an immense advance on the present IEPS. It would, above all, have the elasticity which the present scheme lacks. It would allow intra-European trade to evolve and adjust itself gradually to the tapering off of Marshall aid and to anticipate the state of affairs that will soon obtain when Europe's trade will have to be conducted without any injection of dollar grants.

* * *

No Dollars for Lord Trefgarne

The negotiations for a dollar loan from the International Bank for Reconstruction and Development to the Colonial Development Corporation have broken down. The amount of the initial loan was to be $5,000,000, but more was to be made available as and when required. The finance was needed by a subsidiary of the corporation, the Colonial Development Corporation Engineering Ltd., and would have been used to purchase tractors, bulldozers and other mobile equipment to serve the corporation's whole field of activities. It had been contemplated that the British Treasury would guarantee the loans, as would in any case have been required by the bank's constitution. The main obstacle to agreement was the unwillingness of the corporation to accept the standard form of loan contract applied by the bank to all its borrowers.

In the view of the corporation, the terms of this contract would have placed an undue administrative burden on the corporation's staff, given the detailed information that would have had to be supplied to the bank not only about the corporation's activities but about all its ancillary interests. A second, and probably more fundamental, reason for the deadlock was the unwillingness of the corporation to submit to such inquisition, which it regarded as "unacceptable intervention in its operation in the Colonies." It should be pointed out that the conditions which have proved unacceptable to the corporation appear to have been accepted without undue difficulty by such borrowers from the bank as France, Belgium, the Netherlands, Luxemburg and many others. Some of these borrowers may have been induced, in their thirst for dollars, to swallow their pride, but that is hardly an accusation which can be levelled against all of them. At the same time it must be said that if the International Bank is to become one of the main channels for the export of capital to under-developed countries it will need in its technique and operations somewhat greater elasticity than is allowed by rigid adherence to a seemingly immutable form of contract.

Finance and Investment

Exchange Control Relaxations

A number of minor relaxations in sterling exchange control came into effect on the first day of 1950. The most important relates to the freedom with which fresh capital brought into the United Kingdom for approved projects may thereafter be withdrawn. Previously such capital was blocked for a minimum period of ten years. Now any new capital coming in can be taken out again at any time, up to the amount of the original investment. This relaxation has been made in the hope of facilitating an influx of American capital. A number of projects for such investment have taken shape recently and have received the transfer guarantee granted by ECA as part of the Marshall plan. The previous restrictions on the freedom with which such capital could be withdrawn had become highly anachronistic and their removal was overdue.

For the rest, the relaxations apply to transactions with other OEEC countries—except the hard currency countries in the group, which include Belgium, Switzerland and, for some purposes, western Germany. The measures fall into four categories. First, persons from these countries who are working in Britain and who are "non-residents" for the purposes of the British exchange control, will be allowed to remit home as much as they can save out of their earnings.

At present the amount is normally restricted to 50 per cent of their earnings. Secondly, Britain will be prepared to give more liberal treatment to applications by private individuals to remit money for compassionate purposes to relatives or dependants in the countries concerned. Thirdly, emigrants from Britain to the countries in question will be allowed to take with them up to £5,000 of their capital spread over a period of four years, instead of the previous maximum of £1,000. Finally, the United Kingdom will give similar treatment to foreign nationals who leave it to take up permanent residence in any of these countries. At present such persons can transfer only £1,000 These relaxations relating to "invisible" transactions have been notified to OEEC and have been made in accordance with the resolution of the Council of OEEC of November 2, 1949, asking member countries to achieve the maximum relaxation of exchange restrictions on such invisible items. The relaxations have been specifically withheld from Belgium and Switzerland because the British authorities are still apprehensive of gold losses to these countries.

* * *

Performance and Portents in New Issues

The slightly better appearance of stock markets in the closing weeks of 1949 has done little to lift depression from the capital market, which is doubtless thankful to see the end of a distinctly lean year. *The Economist* figures for capital issues published in the *Records and Statistics* Supplement this week show that the total of £125,027,991 "new money" subscribed by the public in 1949 was less than half the comparable amount of £261,549,524 for the previous year. (These figures exclude permissions to deal and stock exchange introductions which are the poorest grist to the mill of the finance houses and stockbrokers.) The "new money" total was the lowest for a full year since the end of the war. Fixed interest issues are responsible for most of the decline with a reduction from £136,748,240 to £16,919,050, while ordinary capital issues fell from £101,652,913 to £76,469,520 on the year. British Government loans, including sales of National Savings Certificates and Defence Bonds show a net repayment of £5,417,000 in 1949 compared with net borrowing of £115,557,091 in 1948. Preference shares weathered the uncertain period after the unfavourable legal judgments early in the year remarkably well and were the only category to improve on 1948, with a rise from £23,550,871 to £32,244,001.

If permissions to deal and stock exchange introductions are included, the "new money" total of £329,370,310 for 1949 is not appreciably below the aggregate of £361,918,076 for 1948. The 1948 total included the £100 million loan raised by the British Electricity Authority towards the end of that year, but this money was mainly used in 1949. If conversions are also included, the weighty influence of the 1½ per cent Exchequer Bond operation completely distorts the picture, making the grand total of all capital issues £1,111,810,950 compared with £466,145,675 in 1948.

Although these figures suggest that activity in the capital market was on a much reduced scale last year, the effective demand of industry for new finance has still been heavy and is reflected at least in part by the increase of £150 million in bank advances. Dependence on bank finance is evident from the accounts of such widely different concerns as Odeon Theatres and English Electric. The Public Works Loans Board, the Film Finance Corporation and the Finance Corporation for Industry are nowadays active providers of capital, whose operations are not regularly recorded in the market. Details have been announced this week of the FCI's provision of £1,000,000 for the Murgatroyd Vacuum Salt project and its recent additional participation in the Ultramar scheme. Further, wide resource was made in 1949 to private placing of note issues following the success of the Imperial Tobacco issue of £10 million in the previous year. Several leading industrial concerns such as General Electric (£8,000,000), Associated Electric (£4,000,000) and Vauxhall Motors (£3,000,000) raised new money in this way.

*

The prospect for active dealings and higher prices for equity shares, the virtual precondition for a bright capital market, seems distant at this early stage of 1950, and a period of quiet is to be expected until after the election. Yet at least English Electric have started the ball rolling this week by announcing their intention to proceed with a debenture issue and a small issue of ordinary shares. With so much at stake in bringing the OFS goldfield to the producing stage, new issue activity in the developing mines may prove to be a feature of 1950. At least OFS shares have got off to a good start in the New Year and were virtually the only buoyant section on the Stock Exchange this week. In the gilt-edged section the projected £3,250,000 issue of 3½ per cent 1968-73 Jamaica Government inscribed stock was oversubscribed on Thursday, a sign that other borrowers may soon be expected at the Capel Court entrance—among them South Africa for its second instalment and the Rhodesias. But even with a breathing space of over twelve months until the next big Government maturity, the coming months may not be easy in the capital market. Electioneering will not help, and who knows if an issue of British steel stock will follow in its train?

TOTALS	192·0	413·6	418·0	434·0

the figures are not strictly comparable between the separate companies; nor indeed are the recorded figures always a very good guide to the varying fortunes of each separate company over the years, since accidents of timing can cause considerable distortions.

Nevertheless, the figures make it plain that the fears expressed early in 1949 that there would be a sharp drop in life business during the year have not been fulfilled. So far indeed published figures are nearly 4 per cent higher than the figures published by the same offices in 1948; it seems, therefore, that the total of life assurance business written may again top the £500 million mark. In view of the serious fall in other forms of saving this experience can only be described as unexpectedly heartening; evidently the British people are clinging to their customary savings on life assurance while all other forms of saving (and much customary expenditure on minor luxuries) have had to be dropped. Nevertheless, for the third year running, hitherto happily confounded Jeremiahs must necessarily ask whether the present boom in life business can possibly last.

* * *

Mexican P. and L. Capital Reconstruction Plan

The delayed plan of capital reconstruction of the Mexican Power and Light Company (Mexlight) and its two subsidiaries Mexican Electric Light (Mexelectric) and Pachuca was published at the end of last week. In essence, the scheme involves an exchange of predominantly Canadian dollar securities into United States dollar securities—on the basis outlined in the accompanying table—and has been approved by the International Bank which is to provide continuing financial assistance for the group's expansion programme. Eight classes of stockholders are involved and rejection by any one class will mean the abandonment of the plan. Stockholders' meetings have been arranged to take place in Toronto in February. Consent of at least five classes of the stockholders seems assured, since solid blocks of these classes are held by the Sofina group which has signified its favour of the plan. Its holdings of these five classes range from 21.6 per cent of the 7 per cent preference of Mexlight to 64.7 per cent of the equity of that company. Sofina holds only a nominal amount of the 5 per cent first mortgage bonds of Mexlight and Mexelectric and none of the mortgage bonds of Pachuca. Hence the fate of the scheme presumably rests upon the decision of these classes. The first mortgage bonds of Mexlight and Mexelectric, of which $8,654,800 were outstanding at December 31st, are due to be refunded on February 1, 1950, though recent bondholders' meetings to consider an extension to July 1, 1950, failed to attract a quorum and have been adjourned to next Wednesday. This lack of interest suggests that the plan is unlikely to attract much active dissent. It had a satisfactory reception in London this week.

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners—there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

The Chartered Bank of India, Australia and China

(Incorporated by Royal Charter in 1853)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2.

Manchester Branch: 52 Mosley Street, Manchester, 2. Liverpool Branch: 27 Derby House, Exchange Buildings, Rumford Street, Liverpool, 2. West-End (Lordon) Branch: 28 Charles II Street, London, S.W.1. New York Agency: 65 Broadway, New York.

The Bank's branch system, under British management directed from London, serves

INDIA · PAKISTAN · CEYLON · BURMA · SINGAPORE AND FEDERATION OF MALAYA · NORTH BORNEO AND SARAWAK · INDONESIA · FRENCH INDO-CHINA THAILAND · THE PHILIPPINE REPUBLIC · HONGKONG · CHINA · JAPAN

The fifty-five pages of documentation describing the scheme show that, unless it is sanctioned, the financial assistance of the International Bank which is essential to complete the group's construction programme will not be forthcoming, and the $10 million interim credit advanced by the bank a year ago would apparently be withdrawn. This credit was due for repayment at the end of 1949 but arrangements have been made to extend it to not later than July 30, 1950. If the plan goes through, the repayment of this interim credit and a further local credit of 4,000,000 pesos will be made out of the long term credits of $26 million which would then be granted by the World Bank. But the financial position of the group is such that if the plan is rejected the repayment of these interim credits would certainly pose serious difficulties.

* * *

Record Bank Clearings

The annual statistics issued by the Bankers' Clearing House show that the total number of cheques, bills, etc., dealt with at the Town and General Clearings in 1949 amounted to a new high record at just over £86,000 million, an increase of 7.3 per cent over the previous year and of 17.4 per cent over 1947. These figures do not, of course, show the total amount transmitted through the banking system during the year; they omit the £1,900 million dealt with at the main provincial clearings and the unrecorded amounts handled at the banks' own inter-branch clearings and at various local inter-bank clearings up and down the country.

The clearing figures this year appear in considerably abbreviated form; those responsible for compiling the report have wisely left out many of the detailed comparisons, and much of the historical record which tended in previous years to obscure the main kernel of information which they had to impart. Unfortunately the most enterprising of last year's innovations—the ratios of published clearings to total deposits—has become one of the casualties of the new abbreviation. These ratios can, however, be worked out from the published figures. They suggest that the velocity of circulation of bank deposits was slightly less in the first quarter of 1949 than in the first quarter of 1948 (the ratio of clearings to deposits being: 14.3 in 1949 against 14.7 in 1948), slightly greater in the second quarter (13.6 against 13.4), and noticeably greater in the third (13.9 against 12.8). Since the turnover on account of Stock Exchange business is unlikely to have been larger in 1949 than in 1948, these figures seem to be yet another indication of the increasing level of purchases by the public as the year progressed.

* * *

Distress in British Honduras

The announcement that the Governor of British Honduras has ordered the devaluation of the local dollar (from $2.80 to the pound to $4 to the pound) has drawn public attention to the fact that this tiny colony was the only British dependency which did not devalue its currency in line with sterling last September. British Honduras has had a currency system unlike any other in the Empire ever since 1914, when the gold reserve which served as backing to the local note issue was shipped to New Orleans to escape the possible attentions of marauding German cruisers. Owing to a series of accidents (including the destruction by fire of the treasury at Belize) the gold reserve was never shipped back from the United States, although it was not until the middle 1930s that the currency position was regularised by converting the colony to a dollar exchange standard; the colony's notes, in other words, were thereafter made payable against dollars on much the same basis as elsewhere colonial notes are delivered against sterling—the Royal Bank of Canada performing substantially the same functions for British Honduras in New York as the Crown Agents do for the other colonies in London. This system has not involved any significant drain on the Empire's utilisable dollar reserve—partly because the ordinary sterling area system of exchange control over current and capital transactions can still be imposed on top of it, and partly because the dollar securities held as backing for the British Honduras note issue are worth less than $1,000,000 anyway. The system did mean, however, that when sterling was devalued, British Honduras, with a 100 per cent dollar backing for its note issue and with an economy substantially dependent on that of the United States (as are the economies of the central American republics around it) had no very obvious reason for following the rest of the Empire in the downward adjustment of rates.

Since September, however, the economic history of the colony has been one of unmitigated disaster. The main cause has been the worst drought within living memory which has had a serious effect on the production of chicle and citrus fruit for export and of food for local consumption. In addition, it is only too clear that the forests of British Honduras, from which the greater part of its export income is derived, are now a wasting asset and that the area round the town of Belize is becoming increasingly overpopulated. Devaluation may possibly permit some influx of funds seeking investment in the colony (the allegation is that this has been retarded by investors' doubts about the future of the exchange rates), but even if these are supplemented by funds from the Colonial Development Corporation, the level of investment can hardly be sufficient to allow any substantial alleviation of the people's poverty in the near future. Financial adjustments, unhappily, will not restore the forests, check the growth of population, or bring down rain from heaven.

Industry

Coal in 1949

The decisive feature of the British coal budget in 1949 was that home consumption did not increase by the amount forecast. A mild winter and a long summer deserve, perhaps, the credit for this. Home consumption in 1948 was 192.7 million tons, and the last Economic Survey allowed for it to be increased to between 198 and 200 million tons in 1949. In fact, inland consumption by the end of the first 51 weeks had reached only 191.6 million tons, and this was an increase of only 2.6 million tons over the corresponding 51 weeks of the previous year. Exports have thus been enabled to come up to expectations, while distributed stocks, at 15.6 million tons on Christmas Eve, were half a million tons higher than they had been twelve months earlier.

The production record for the year was once again saved by a spurt in the few weeks before Christmas. The target for the year, having at one stage been pitched higher, was put in the Economic Survey at 215 to 220 million tons. But the progress made up to September was poor, and Mr Gaitskell, in his message to the industry this week, recognises that when the appeal for greater output was launched in September the realisation of even the lower of these two figures looked "very unlikely." In the event, the last quarter of the year saw a marked increase in output per man-shift (from 1.16 tons in September to 1.23 tons in mid-December), while at the same time the shrinkage of the labour force was for the time being, at least, arrested. Coal output from the mines reached an aggregate of 202,674,100 tons (provisionally estimated) for the whole year. This was nearly 6,000,000 tons more than the deep-mined output in 1948. Opencast output added 12,439,700 tons; this was not so much less than the estimate as had at one time been feared. Total output for the year thus amounted to

215,113,800 tons. The comparable figures for previous years are shown in this table:

SALEABLE OUTPUT OF COAL

	1946	1947	1948	1949
Deep-mined	181·2	187·2	196·7	202·7
Opencast	8·8	10·2	11·7	12·4
TOTAL	190·0	197·4	208·5	215·1

The Minister of Fuel and Power, who initiated the autumn appeal and may be supposed to be considerably relieved by its outcome, sent a message this week to the trade unions in the industry and the Colliery Managers' Association as well as to the Coal Board, thanking them all:

> The efforts which you have all made have been crowned with a large measure of success despite the fact that, over the year, manpower in the industry has declined by 16,000.

This is temperate praise. To have said more would, however, have been hyperbolic. The essential thing now (as last year's experience shows) is that the effort of the last three months should be intensified rather than relaxed, so that the industry does not once more fall behind by the autumn and have to rescue itself by yet another last-minute spurt. Before everything else, attention needs to be directed to reducing the still unreasonably high level of absenteeism.

* * *

Dispute over Free Coal

The unfortunate dispute over concessionary coal for Lancashire and Cumberland has not yet been solved and may again cause trouble unless progress is made quickly. After prolonged discussions between the Coal Board and the National Union of Mineworkers' executive last summer, it was agreed that each district should be asked to give up a certain proportion of its cheap coal for the benefit of the Lancashire and Cumberland miners who, for some obscure reason, have always been denied this privilege. A number of branches have, however, refused to surrender any coal and the union has asked the board to reconsider its original decision not to increase the total quantity (5,000,000 tons) which is made available to the mineworkers.

It is a difficult decision to reverse. The board has hitherto resisted pressure on the ground that the Lancashire miners have received compensatory privileges in other directions. It is seeking, as part of a long-term policy, to rationalise the industry's wage structure and to end such anomalies as the distribution of varying quantities of concessionary coal. It can reasonably blame the mineworkers themselves—or at least the intransigence of some of their branch organisations—for the failure to reach accommodation on this question for the time being. At the same time a strike in Lancashire, which might well follow a refusal to help, might cost far more coal than would the granting of the concession. There is little doubt that the feeling in the coalfield on this subject has influenced the Lancashire miners in their decision to oppose the wage stabilisation policy of the TUC.

The board's answer is expected within the next two weeks. The matter is urgent, because the arrangement was supposed to start on New Year's Day, and the Lancashire miners, though they have been assured that the eventual settlement will be retrospective to that date, are growing impatient.

* * *

British Power Plant for Seattle?

Two British manufacturers of electrical equipment, Ferranti Ltd. and the English Electric Company Ltd., are waiting to learn whether the Seattle municipal authorities will find reasons for not accepting their tenders for plant for the Seattle power station. Bids had been invited for fifteen transformers, nine water-cooled and six oil-cooled, and two rectifiers complete with switchgear. The accompanying table shows that on all the items, the British firms underbid the American by a comfortable margin:—

TENDERS SUBMITTED TO SEATTLE MUNICIPAL AUTHORITY

	Nine Water-cooled Transformers	Six Forced Oil-cooled Transformers	Two Rectifier Units and Switchgear
	$	$	$
Ferranti Ltd.	694,440	514,860	...
English Electric Co. Ltd.	768,411	571,632	134,210
Pennsylvania Transformer Co.	752,000	720,000	...
General Electric	844,000	751,000	159,229
Westinghouse	885,462	805,118	171,707
Allis-Chalmers Manufacturing Co.	980,000	876,000	157,075
Gough Industries Inc. of California	1,126,125	1,321,200	...

No legal obstacle exists to prevent the Seattle authorities from accepting foreign tenders and if the British tenders are accepted it will not be the first time that British equipment has been sent to the United States. Reports in the American press suggest that the authorities are somewhat embarrassed by the British tenders, and the *Wall Street Journal* quotes hints from local engineers that the British plant may not meet certain specifications. A big issue is being built out of the postwar British practice by which makers retain the option to increase their contract prices by up to 10 per cent to cover increases in costs before delivery.

A favourable decision at Seattle might lead to a useful volume of new business. The export manager of Ferranti Ltd. has been in the United States since October inviting municipal authorities to consider bids from his firm for electrical equipment of all kinds. Engineers who have attended the biennial International High Tension conferences have found that although American electrical engineering projects are generally on a larger scale, they tend to fall short of the technical standards of plant built in Britain and Europe. This may not be recognised in the United States; there can, however, be little dispute that British costs are considerably lower than American. This is not merely a temporary result of devaluation. Because transformers are largely hand-made—even the windings are put on by hand—the high American labour costs give the American manufacturer an initial disadvantage which neither standardisation nor any comparable aids to productivity can enable him to overcome. Unless there is a revolution in power-station engineering, transformers will continue to be individually designed for each contract. In these circumstances, there should be a promising market for British generating equipment. If it develops, will the result be that the American industry may seek protective measures by official or unofficial means?

* * *

End of Shipbuilding Boom

Merchant ships completed in Great Britain and Northern Ireland in 1949 amounted to about 1,400,000 tons gross, the highest total since the war. This total compares with 1,221,000 tons gross in 1948 and 948,000 tons in 1947, and it shows that a freer flow of components and raw materials, particularly steel and timber, is enabling ships to be completed at a faster rate than has been possible in recent years. One passenger liner, for example, was recently delivered to her owners 16 days before the contract date—an occurrence common enough before the war, but a matter for comment in 1949. Nearly one-third of the year's output was for foreign account, so that if the total output is valued at £115 million, then about £35 million of foreign exchange was earned by the industry in 1949, compared with about £39 million in the previous year.

About 2,000,000 tons gross still remain on the stocks or are fitting out, while the order books contain another 1,250,000 tons to be laid down. Most shipyards, therefore, will remain fully employed for the coming year and may

have work to tide them over a much longer period; but some yards are already beginning to feel the lack of follow-on orders. During 1949, in fact, orders were booked for only 400,000 tons gross, compared with orders for 1,345,000 tons in the previous twelve months. The intake of new orders was less than one-third of the output of completed ships, this explains why the chairman of the Shipbuilding Conference said on Monday: "The longer term outlook is not without its anxieties."

This is clear evidence that the postwar boom in shipbuilding is now over; the demands of liner and tanker owners who had to replace war losses at any price having been satisfied. The resultant position need not be unhealthy. It is true that competition is beginning to be felt from Japanese and continental shipbuilders; in these circumstances the British industry has the primary task of reducing its production costs to a level which will encourage the owners of ordinary cargo vessels to undertake their necessary replacements. Tramp tonnage under most flags, including the British, is still well below its prewar figure, and the age and size composition of many fleets is still seriously out of balance; ships either of warbuilt standard size, or of the older age groups, preponderate. For the next year or so, the process of readjustment to more normal conditions in the shipyards will be accelerated, and if increasing efficiency and improved delivery times are achieved there is a chance that lower prices will attract new orders for normal replacement.

* * *

Cotton Workers' Holidays

The United Textile Factory Workers' Association has decided to try again to secure its claim for a fortnight's holiday with pay, which was rejected by the employers. It is asking for two weeks' annual holiday, plus six statutory holidays, to bring the cotton industry into line with 64 other industries. Like the miners, whose claim for an extra week's holiday was recently rejected both by the Coal Board and by their Arbitration Tribunal, the cotton workers have chosen a bad time to make their request. A fortnight's holiday has become the general practice in many industries since the end of the war and is obviously a desirable thing.

But the loss in output and the addition to the wages bill which it would entail would fall heavily on the cotton industry at a time when the need is so urgent for it to increase its overseas earnings and reduce its costs. The unions maintain that the loss of production would not be more than about 1 per cent, and would be offset by the gain in recruitment which would follow such a concession. They also contend that the employers could well afford to meet it out of profits. This has become the favourite argument for use in support of any claim.

The argument is not without force so far as it goes; large profits are still being made, and in many markets the cotton firms are not having to meet keen price competition. Some employers might be tempted to feel that they can afford to make concessions. But the national interest seems to point in another direction; if the trade is to gain ground in the other competitive markets where hard currencies are to be earned, its costs need to be reduced. The increase in productivity should come first, and the higher standard of life afterwards.

* * *

Fuel and Labour in the Potteries

The Staffordshire pottery industry, by carrying out a programme of re-equipment which has cost more than £4,000,000 since the end of the war, is creating for itself a serious local fuel problem. The modernisation programme involves the replacement of intermittent kilns by continuous tunnel ovens, most of them using gas. Although the West Midland Gas Board has recently brought a new gasholder of 5,000,000 cubic feet capacity into use and has others under construction, it cannot always guarantee to supply individual ovens with the volume of gas needed to keep them working day and night. Some projected installations have, therefore, had to be postponed until adequate gas service can be given.

While modernisation has won back workers who were leaving the industry because of its bad conditions, the managements do not find continuous ovens an unmixed blessing. Since they have to be kept continuously at work, their capacity must be matched by the size of the market; otherwise, pottery manufacturers must either use their ovens uneconomically or accumulate goods in warehouses. To this extent, the continuous tunnels have introduced an element of rigidity into production—a rigidity of which the industry, at least in the production of high-quality ware, has no previous experience. And this has happened at a time when export sales are becoming less universally easy. Two of the industry's best markets, South Africa and Argentina, were greatly restricted in 1949. A certain sales resistance developed in Australia. New Zealand restricted the value of imports. Sweden, Spain, Denmark and France all proved disappointing customers. Only in Canada, the United States and India did exports continue to expand.

Certain manufacturers have been unaffected. Experience has shown that the highest quality china and earthenware—the output of which is never large—finds a market even at high prices. But there has been a tendency among firms of this class to produce less china and more earthenware. The exports of such firms are still hampered by a production problem common throughout the industry, and in some cases they have been obliged to reduce the output of their potters. This is the shortage of decorators, which appears to have become permanent. There are not enough women even to do the comparatively simple work of applying transfers, lithographs and other techniques developed in substitution for the work of the older skilled decorators. The manufacturers recently told the Ministry of Labour that they had jobs for 10,000 women, and received no encouraging reply. The Ministry is willing to bring in unskilled Italian women in the hope that they will prove trainable, but the pottery towns are short of housing, and the employers feel that, if foreign workers are to be induced to settle permanently, it is not advisable to house them in hostels. Nor does the industry yet contemplate putting men to do this traditionally feminine work. Men's rates of pay are much higher, and the manufacturers do not think the trade would bear so great an increase in costs.

* * *

Railway Charges and Deficits

Only the first day's proceedings in the hearing of the Transport Commission's application for increased freight charges were available as this issue of *The Economist* went to press. The Transport Tribunal, sitting on this occasion as a consultative committee to advise the Minister of Transport, was told on behalf of the Commission that the proposed increase of one-sixth in freight charges was expected to produce £28 million in a full year. This is the size of the estimated deficit for British Railways for 1949—and the deficit is expected to rise to £35 million this year. It was claimed, therefore, that the increase sought was the bare minimum to enable the Commission to keep its head above water.

Counsel for the Commission argued—and it would seem with force—that any subsidy would be illegal. The Commission must secure that its revenues will be sufficient to meet its charges, taking one year with another. To leave things as they are would put the Commission in an impossible financial position. On the question of efficiency, counsel argued that no general inquiry into efficiency would be appropriate as part of an emergency application for an increase in charges. And Mr R. H. Wilson, giving evidence as Comptroller of the British Transport Commission, made a further point that to wait until it was possible to introduce the charges scheme required by the Act (which would not be until 1952 on the most optimistic expectation) would burden the Commission with £80 or £100 million of accumulated deficits which it would be impossible to recoup except by distorting the charges schemes themselves. The proceedings are expected to continue next week.

Commodities

Slack Demand for Wheat

The international wheat agreement is exerting a profound effect on world trade in wheat. During the first five months of the new season, which opened last August, sales by both the United States and Canada have been restricted almost entirely to members of the agreement. Shipments from America are, in fact, little more than half of the volume in the corresponding period of 1948. Until November, ECA dollars could not be used to buy American wheat under the international agreement, since, it was argued, the American Government was already paying a subsidy of nearly 50 cents a bushel to enable its farmers to sell at the agreed maximum of $1.80 a bushel. But after this decision was reversed, importers from western Europe still showed little eagerness to buy. American exporters recently asked the government to grant subsidies on all American wheat and flour sold abroad and not to restrict their assistance to sales made under the agreement. This request, however, was rejected on the grounds that it would nullify the advantage enjoyed by signatories of the agreement.

Some Americans hold that importing countries are refraining from buying in the hope of forcing the price for wheat down. Last summer's dry weather enabled the farmers of western Europe (who now use combine harvesters extensively) to bring their domestic wheat crop to market very early, a fact which (according to the American view) enabled importers of wheat in Europe to delay their purchases until the first half of 1950. There is some force in this argument. In Britain, for example, movement of wheat off farms between August and October was much heavier in 1949 than in 1948. Nevertheless, there are more fundamental factors in the weakness of demand for export wheat. Five countries alone—France, Germany, Italy, India and Japan—were responsible for the large increase in wheat imports during the postwar years. Demand from other countries has remained virtually unchanged compared with prewar, and some (including Britain, Belgium and Denmark) are importing less than before the war. France has already disappeared as an importer and has undertaken to export 3,300,000 bushels in each of the next four seasons, while the domestic breadgrain crops in the other four countries showed a substantial increase last summer. A recent issue of Broomhall's *Corn Trade News* revises the estimated volume of world wheat exports during the current season to 820 million bushels against 912 million bushels in 1948-49. And even this estimate may eventually prove to be on the high side.

* * *

Falling Prices in Prospect?

This slump in the wheat trade will affect the United States more directly than other exporters. Japan has recently purchased wheat from Canada (a private barter deal in exchange for textiles), Argentina and Australia; Germany is buying from Argentina, Czechoslovakia and Hungary; and Italy from Argentina and Russia. Hitherto these countries bought their supplies from America. Canada, at the moment, is a serious competititor with the United States. Its export surplus of wheat is estimated at 240 million bushels, of which 203 million bushels are due to be sold under the international agreement, leaving only 37 million bushels for the "free" market. Yet already in the past month the price of Canadian "free" wheat has fallen from $2.29 a bushel to $2.15 a bushel (Canadian currency) and is now selling at some 35 US cents a bushel below the equivalent American price.

On present reckoning, exports from the United States this season may amount to no more than 320 million bushels compared with 456 million bushels in 1949-50; such a reduction in the volume of export sales would raise the end-of-season stock from a little under 300 million bushels to 400 million bushels. Although the United States has experience of carrying wheat stocks of 600 million bushels, they did not coincide with huge surpluses of maize and other feeding-stuffs. It is these ever-growing surpluses which, in the end, may force the American Government to modify its present support of high domestic prices. Until that happens, there is little chance that importing members of the wheat agreement will be able to buy wheat below the agreed maximum price. So long as one exporter can exact the maximum price from its customers, the others are likely to follow suit.

This has already been seen in the negotiations between Britain and Australia for 60 million bushels of wheat; the negotiations have lasted nearly eight weeks and are still not concluded. Australia has in fact declined to sell to Britain at less than the sterling equivalent of the maximum price under the international agreement, which rose from 9s. to 12s. 10d. a bushel owing to devaluation. Britain, on the other hand, feels that Australia should not attempt to gain the whole of this "windfall profit" and should therefore accept a price below the maximum. The advantage evidently lies with Australia, which is the only large wheat exporter selling for sterling. Its harvest this year is now expected to total over 200 million bushels, leaving at least 120 million available for export. Its guaranteed export under the international agreement is 80 million bushels a season. Already Japan and other Asiatic countries have made bids for Australian wheat. These countries, however, are unlikely to take the whole surplus available, so that Britain may yet achieve some slight concession in price.

* * *

Saving Canadian Bacon

The British and Canadian negotiators have been able to master the apparently intractable problem of the 1950 food contracts. The British spokesmen made plain at the outset of the discussions that there would only be sufficient dollars to buy the 140 million bushels of wheat under contract in this last year of the four-year wheat contract and a certain quantity of cheese. There would be nothing to spare for purchases of Canadian bacon and eggs. Canada, however, has no alternative outlet for its bacon—at least not until it can export pigs and pig products freely to the United States, as will be possible after July 1st. The Canadians, therefore, were anxious that Britain should take part of this year's surplus output. Then prices added a further complication. Britain is buying bacon under contract from Denmark and Poland; if a higher sterling price had to be paid for Canadian bacon (to take account of devaluation) the prices under these contracts would also be affected.

This tangle has been cut by agreeing to divert $25 million which Britain would otherwise pay for Canadian wheat this season to buy bacon and other Canadian products. Thus, instead of taking 140 million bushels by the end of June, Britain will buy only 127½ million bushels. The remaining 12½ million bushels will be held over until 1950-51, though they will still have to be paid for at $2.00 a bushel. Canada in return has agreed to sell Britain 60 million lb. of bacon at 29 cents a lb. Last year's contract was for 160 million lb.

at 36 cents a lb., so that both price (in Canadian currency) and quantity have been substantially reduced. The new sterling price will be 5 per cent higher than last year's.

The new Canadian price is 3½ cents a lb. below that which the Canadian Meat Board is authorised to pay Canadian farmers. This export subsidy, which on 60 million lb. amounts to $2,100,000, will be met by the Canadian Government. The bacon contract will cost Britain almost $17½ million, leaving a further $7½ million from the $25 million saved on wheat to be spent on other commodities. Some $5,000,000 is expected to be earmarked for canned salmon (the exact amount will depend on this year's salmon catch) and $2,500,000 on spruce. Thus, after a year's absence, Canadian salmon will once more make a welcome appearance on the British market. The cheese contract has not yet been concluded but the price is expected to be reduced from 30 cents to 26 cents a lb., representing an increase in the equivalent sterling price of 13 per cent over last year's price. Canadian eggs are apparently not to be included in this year's purchases.

* * * *

Forecast for Rubber

The rubber market has recently been exceptionally firm. Last week the London spot price rose to 1s. 3⅛d. a lb., only a fraction below the postwar peak of 1s. 3⅜d. reached in July, 1948. The market has since been rather quieter and spot reacted slightly to 1s. 3d. But in a last-minute spurt of business late Wednesday afternoon, following a rise in prices in New York, the London price rose to 1s. 3⅛d. a lb. Final figures for world production of natural rubber in 1949 are not yet available, but preliminary estimates put the total at 1,460,000 tons—some 115,000 tons below the forecast published by the Rubber Study Group last April, and 60,000 tons lower than in 1948. Consumption is estimated at 1,420,000 tons, the same as in 1948, but 30,000 tons lower than the previous forecast. If allowance is made for American stockpiling, stocks of natural rubber at the end of the year might prove to be only 700,000 tons compared with 760,000 tons on January 1, 1949.

These figures could to some extent explain the bullish sentiment of the market. Instead of the expected slight surplus in 1949 (after stockpiling purchases have been taken into consideration) there was a modest deficit. But the future for rubber is still none too clear. American consumption last year amounted to 570,00 tons compared with the forecast of 600,000 tons. Consumption of synthetic rubber, though lower than in 1948, was still very high, totalling 412,500 tons. In Britain, consumption of natural rubber was slightly smaller than anticipated but purchases by European countries and Russia were larger.

There is still uncertainty about the future of American synthetic rubber production and of purchases for the strategic stockpile. The synthetic plants are shortly to be transferred from government to private ownership. But American rubber manufacturers are still not certain whether synthetic production will permanently be a commercial proposition, given free competition with natural rubber after devaluation. But it might be wiser for producers of natural rubber to expect considerable development of synthetic rubber. Congress is apparently anxious to cut governmental expenditure, and some reduction of funds for strategic purchases is highly conceivable.

The prospects for natural rubber in 1950 are that world stocks are likely to increase rather than decline. A further reduction in Malayan output may occur, though it would most probably be offset by a further expansion in output in Indonesia. The demand for rubber depends on the level of industrial activity, which is already very high. Some reduction in the price of rubber must therefore be regarded as possible. But provided that a major recession does not develop either in the United States or Europe, the reduction in rubber prices need not be sharp.

Shorter Notes

Martins Bank—the first of the clearing banks to announce its results for 1949—reports a further slight increase in net profit, from £719,520 to £725,170. This implies that depreciation on investments caused by the fall in gilt-edged has been provided for out of inner reserves. The dividend is unchanged at the customary rate of 15 per cent.

*

Each of the "Big Three" discount houses whose accounts are made up at the year-end has maintained its dividend at the customary level. The National Discount, the only one of the three companies to show a fall in published net profits in 1948, now shows an appreciable advance, from £251,123 to £286,465; the Union Discount shows a slight advance (from £305,270 to £310,000); while Alexanders shows a perceptible fall, from £175,464 to £150,400—but this company's profits had risen very steeply in the previous year.

*

Dealings began on Thursday in the ordinary shares of the two new Tate and Lyle subsidiaries, Silvertown Services—quoted at 17s. 3d.—and Tate and Lyle Investments quoted at 4s. 3d.—formed to take over non-sugar refining assets under the company's segregation scheme. Silvertown Services and its subsidiaries provide lighterage and road transport services for Tate and Lyle. The capital is £331,500 in 244,000 6 per cent cumulative £1 preference shares and £87,500 in 1s. ordinary shares. Tate and Lyle Investments include the group's holdings in West Indies Sugar Company, Caroni, John Walker and British Sugar Corporation. The capital consists of £2,200,000 in 450,000 4 per cent cumulative £1 preference and the remainder in 5s. ordinary shares. The ordinary shares in these companies are being distributed to the ordinary stockholders of Tate and Lyle whose £1 units ex rights are now quoted at around 60s.

*

All foreign owned enterprises in Hungary are included in an Hungarian Government decree published last week nationalising enterprises which employ more than ten persons. A special legal statute is to provide for compensation. Shares of Hungarian concerns held abroad must be handed over to the nearest Hungarian diplomatic authority within 90 days; otherwise the shares will be invalid and no compensation will be received. Undertakings whose ownership is based on the 1947 Peace Treaty are excluded from the nationalisation order. British-owned firms to be nationalised include First Hungarian Thread Company, a subsidiary of J. and P. Coats, the British Hungarian Jute Manufacturing Company, the Hungarian Rubber Goods factory and the Shell Oil Company.

*

In conjunction with Gray's Carpets and Textiles, the Hambro Trading Company of America Inc. has established a trading subsidiary, Gray's of London, to market British exports of textiles in the dollar area. Two other subsidiaries have already established selling organisations in the United States for British ceramic ware, home furnishings and fabrics, and wallpaper.

*

A block of over 900,000 5s. ordinary shares representing about one quarter of the equity in International Combustion (Holdings) has been placed by Helbert, Wagg & Co. with financial and investment companies. The shares are available in the market at 16s. 6d.

*

The full details of the Ultramar scheme for raising £1,000,000 new money now announced follow the general lines given in the December 3rd issue of *The Economist*. The Finance Corporation for Industry will provide £250,000 and the remainder will be raised by an issue of convertible debentures to unsecured loan and ordinary stockholders.

COMPANY MEETINGS

MITCHELLS AND BUTLERS LIMITED

REASONS FOR REDUCTION IN PROFITS

MR ROBERT H. BUTLER ON COMPANY'S PROGRESSIVE POLICY

The sixty-second annual general meeting of the ordinary stockholders of this company was held at the White Horse Hotel, Birmingham, on Thursday, January 5, 1950, under the presidency of Mr Robert H. Butler.

The chairman, in moving the adoption of the report and accounts, said:—

Ladies and gentlemen, since our last meeting we have appointed Mr C. Stanley Best a director of the company, and in accordance with the articles of association he submits himself for re-election later in this meeting.

Mr T. A. Rickard has been appointed secretary of the company in place of Mr Powell.

Now turning to our balance sheet, the warning I gave in my speech last year has unfortunately proved to be justified and the profits show a considerable decrease. We have thus been forced to withhold the bonus of 2 per cent. which we have paid for the last three years.

As I forecast last year, there are two main reasons for the reduction in our profits. Firstly, this year has seen the full effect of the Catering Wages Act which has cost us a very considerable sum, and secondly, costs of materials have increased. There has also been a slight decline in output. It must be remembered that the company owns a very large proportion of fully licensed managed houses, probably greater than any other brewery company in the country, so that during a trade recession not only our wholesale, but also our retail profit is affected; the latter more so as it is almost impossible to diminish the running costs of a licensed house.

REDUCTION IN PRICE OF BEER

The reduction of 1d. per pint in the price of beer last April imposed a further charge on our profits which was not anticipated this time last year. When this reduction took place the Chancellor of the Exchequer called upon the brewers of the country to bear 3s. of the 24s. which this reduction costs. Some people might say that we could have rectified this position by altering the strength and qualities of our beers. This we did not consider for one moment.

In fact, during the present year the average strength of the beer sold by your company has been materially greater than in the previous year. This, in my opinion, has upheld the company's goodwill, but in the short run it has been at the expense of the company's profits. I am pleased to say that the public has shown its good taste in its preference for higher quality beers.

We feel that present day conditions of penal taxation and excessive costs are but a passing phase, and we are confident that the company's traditional policy of marketing high quality goods is fully justified.

FALL IN CONSUMPTION DESPITE PRICE REDUCTION

When the Chancellor reduced the beer duty last April he stated that there was a marked falling-off in the consumption of beer, and presumably by the reduction of 1d. per pint he hoped to check the fall, but this has not materialised and we find that today there is a continued drop in the barrelage of the country. There are indications of a shortage of money available to our customers with the ever-increasing costs of all goods and commodities they have to purchase, and I fear that unless a much greater reduction is made in the beer duty to enable the price of beer to be lowered, without any additional impost on the brewer, your profits are bound to show a further decline.

NEW PURCHASES

In continuance of our policy of expansion, we have made a number of new purchases of licensed houses, and I am sure you would be interested to have a few details of the more important ones.

The Royal Hotel at Ashby-de-la-Zouch, a well-appointed residential hotel, opens up an entirely new trading area to us and I am pleased to say the hotel has proved very popular and our products are appreciated.

The Mytton and Mermaid on the outskirts of Shrewsbury is a recent acquisition. Architecturally it is a charming house, in a beautiful setting by the riverside, and will cater for a first-class trade. Trading reports there are so far very good.

I referred last year to the purchase of the "Standard" in Piccadilly Circus. I am very glad to report that the house is doing exceedingly well, and we have now had the opportunity to redecorate and refurnish it. In addition, we have opened a restaurant in Haymarket, known as the Hay Wain restaurant; it is an entirely self-contained, high-class restaurant, and although it has been open for only a very few weeks it is already establishing its own reputation not only with Birmingham people visiting London, but with Londoners themselves.

Coming nearer home we have also taken over the famous Priory Hotel at Walsall, which we feel is a fine acquisition. We have supplied our beers there for many years and the extension of the catering facilities which we propose will, I feel sure, be welcomed by residents and visitors to the town.

Finally, I come to the Plough and Harrow Hotel, Edgbaston. This is, as you all know, a well-known and historic hotel, and I want to say at once that it is not our intention to change its character in any way, but naturally alterations must take place to provide the necessary services that are required by visitors in these days. I am glad to say we have just been granted a building licence which will enable us to carry out a substantial part of our improvements scheme.

IMPROVEMENTS TO ENCOURAGE TOURISTS

In these and other houses, in spite of the present high cost of building, we are pressing forward wherever possible with necessary alterations and improvements, as we feel that by so doing we are playing our part in encouraging tourists from America and other overseas countries to stay with us, and so helping the Chancellor in his pursuit of the all-important dollar. In this connection, I should like to pay tribute to the British Tourist and Holidays Board, who are giving excellent publicity in the United States and elsewhere, to the merits and attractions of the British inn.

ACQUISITION OF MESSRS THATCHERS OF NEWPORT, MONMOUTHSHIRE

Stockholders will also be aware that we have taken over the brewery and bottling stores of Messrs Thatchers, of Newport, Monmouthshire, but this purchase is not included in the accounts now before you. This Monmouthshire and South Wales area is not a new trading district as far as we are concerned, for we have traded there for well over 30 years, and we have always found that the company's products have been most popular.

Owing, however, to heavy costs of transport and delays in the delivery of our goods we have been handicapped in the past. Delays on the railway have proved a source of great annoyance to customers and have not infrequently caused loss of trade to both parties. Now that we have acquired this company it will be possible for us to bottle our beers at the depot and also handle our draught ales there. While it is not our intention to brew at Newport, our goods can be transported there in bulk and thus handled more cheaply, and without any of the delays they have previously suffered. With this recent purchase we acquired 20 licensed properties in and around the area.

Earlier I have told you that the fact that we owned managed houses has cost this company a very considerable sum of money in the past year. At the same time, I feel certain that our policy of management, together with the selection of first-class tenants of other houses, does provide the best service to the public. We are able to give them the finest buildings and surroundings they could wish for and we are able to see that the service our licensees give is suitable for each type of house.

We take the utmost care to select good tenants, who, with the aid of very favourable tenancy agreements, can run their houses in the way we should wish. I know for a fact that throughout the whole of the country brewers are united in their desire to serve the public well, whilst, at the same time maintaining a friendly relationship with their managers and tenants.

LICENSING ACT, 1949

The Licensing Act, 1949, came into force during the year. Co-operation between all sections of the trade brought about certain amendments which were to the advantage of the trade and the public generally, the most important being the omission of adjacent and intervening areas from state control by the new towns authorities.

Stockholders will remember that two years ago I referred to the necessity for erecting special buildings on the large housing estates then being developed, at the same time as the dwelling houses which they were designed to serve. I stated than that the demand by the public for licensing facilities was so great that the local authorities concerned, together with the appropriate Ministry, should be prepared to authorise the erection of temporary licensed premises to meet that demand.

At the first possible opportunity, therefore, we have taken steps to deal with this matter, and I am pleased to say that during the past year we have received the approval of the Birmingham licensing planning committee in respect of five temporary premises which we are prepared to erect to meet this demand. We are making every endeavour to get the necessary licences so that these temporary buildings can go forward.

Mr D. Davey Cole seconded the adoption of the report and accounts, which was carried unanimously.

ALLIED BAKERIES, LIMITED

SATISFACTORY RESULTS

The fourteenth annual general meeting of Allied Bakeries, Limited, was held on December 30th in London, Mr F. G. Russell presiding in the absence of the chairman of the company, Mr W. Garfield Weston.

The chairman, in the course of his speech, said: We are still under the heavy handicap of raw material rationing and scarcity. Our principal ingredient, flour, is still subject to limitation of supplies based on usage during the last year of bread rationing, and this prevents any progress as far as production is concerned, and has an adverse effect in view of continually rising costs without the benefit that can normally be expected from increased production. Operating costs as well as ingredient prices have continued on the upgrade, and it has only been by the adoption of strict economy measures and continually improving production procedure that we have been able to maintain our financial results at a satisfactory level.

Principal new acquisitions during the year comprise a group of bakeries in Aberdeen, a modern bakery in York, and an up-to-date biscuit factory in the North of England. All these businesses are well-established, and the directors are confident that they will form a valuable addition to our group.

The net profit of your company for the year under review comes out at the very satisfactory figure of £759,467. This compares with £830,136 last year. The surplus on operating of the group at £2,870,000 shows a slight increase of some £15,000 on last year's comparative figure of £2,855,000. The amount required for taxation still amounts to the tremendous figure of £1,272,000. The net profit is £1,098,000 as compared with £1,240,000 last year.

The report was adopted.

TURNER AND NEWALL LIMITED

PHENOMENAL DEMAND FOR ASBESTOS
BRIGHT IMMEDIATE PROSPECTS
MR W. W. F. SHEPHERD'S STATEMENT

The annual general meeting of Turner & Newall Limited will be held on January 26, 1950, at the Chartered Accountants' Hall, Manchester, when it is expected that Mr W. W. F. Shepherd, the chairman of the company, will preside.

Mr Shepherd's statement to the stockholders has been circulated to them with the report and accounts and, after dealing with the accounts of the company, it contains a detailed review of the company's operations during the year to September 30, 1949, both at home and abroad. Mention is made in particular of the increased production at the Rochdale factory of Turner Brothers Asbestos Company Limited and the fact that that company's new factory at Hindley Green is now in production, the continued demand for the products of Ferodo Limited, that company's large building programme being also referred to and the increase in the number of its service depots throughout the country, the continued heavy demand for the asbestos-cement products of Turners Asbestos Cement Company Limited, including the very large orders received for Everite asbestos-cement pressure pipes, and the satisfactory results for the year as shown by the Washington Chemical Company Limited and Newalls Insulation Company Limited and J. W. Roberts Limited.

Reference is also made in the statement to the activities of the manufacturing companies located abroad, including Keasbey & Mattison Company which had experienced a year of satisfactory trading, the fact that the new factory at Montreal is now in production, and the continued large demand for the products of Asbestos Cement Limited in India.

The following are extracts from the statement as regards other matters referred to therein :—

AFRICA

Our African mining companies have continued to operate to the maximum capacity of their milling and grading plants in the face of serious difficulties arising primarily from acute shortages of labour and materials. Demand remains phenomenally high, and to obtain maximum output in an endeavour to meet it has been a constant strain on the resources of our mines. Last year's production programme was achieved, but only by abnormal efforts which could not be continued for long, and, even so, it was insufficient to meet completely our own factory requirements and those of other manufacturers. Our policy of sharing our raw material resources with others was, however, maintained, with the result that our own factories in the United Kingdom and elsewhere had to operate at a level somewhat below their machine capacity owing to shortages of raw asbestos.

This policy of permitting others to share our raw material resources was not altruism but a contribution to the continued development of the industry, in which we have a high place, but which we cannot expect to have exclusively for ourselves. During the earlier part of 1949 I made my first postwar visit to our African organisation, and found that progress during recent years had been very great in every way; today we have at Shabani and at Mashaba in Southern Rhodesia, and at the Havelock mine in Swaziland, townships of substantial size of which any company would be proud.

Technically and commercially I think we can reasonably claim to lead in our field in Africa and the amenities provided for our personnel, both European and African, are unsurpassed, indeed seldom approached, by any other mining organisation which I have seen or of which I have heard in that continent. The Prime Minister of Southern Rhodesia, Sir Godfrey Huggins, P.C., C.H., K.C.M.G., spoke to me very appreciatively on this point.

CANADA

The world shortage of raw asbestos has also been reflected in the demands made for the product of Bell Asbestos Mines Limited, who have striven to meet, as far as possible, requirements greater than their normal production capacity. They have, however, maintained the increase of 10 per cent. to which I referred last year, and the high standard of the quality of their fibre is unimpaired. Preparations for transfer to an "underground" basis of ore recovery continue, and it is expected that this change will be made in 1951.

EXPORT TRADE

Our export trade, during the year under review, has been substantially maintained near the high level of the previous year. Some small decreases have occurred, largely as a result of import restrictions in various countries. Such restrictions have, however, been partly offset by the improvement in world transportation facilities which has taken place, and has made prompter delivery possible.

Export markets throughout the world are very vital to us, and we are accordingly anxious, in common with other large exporters, that international currency difficulties should not hamper our efforts, but clearly this is a question over which we have no control, and we must confine ourselves to ensuring that we take the fullest advantage of such opportunities as do exist.

DIVIDEND ON ORDINARY STOCK

Your board recommend a final dividend of 11¼ per cent. on the ordinary stock in respect of the past financial year, and this, with the interim dividend already paid, makes a total of 15 per cent. for the year. Available profits, although slightly lower than last year, would have justified a somewhat larger distribution and your board considered this point with great care. They took into consideration the fact that a distribution at the rate of 15 per cent. per annum is slightly lower than the average of the five immediate prewar years and it would have given them great satisfaction to have raised this year's distribution had it not been for the continuance of the points to which I referred last year. These are three, and the up-to-date position with respect to each of them is as follows.

The Chancellor of the Exchequer still calls for support in anti-inflationary measures, by appealing for restraint in the distribution of profits and considers that this is a necessary contribution by industry if similar restraint is to be expected on the part of trade unions in relation to wage claims. Your board have not felt that it is reasonable to ignore the Chancellor's appeal, but they do feel that in the absence of legislation to limit dividends, they cannot continue beyond this year to fix the rate of distribution on the ordinary stock in relation to anything other than the current profit-earning capacity of the business, after making appropriate provision for the future, and they will be guided accordingly when considering the results of the present financial year.

NEED TO CONSERVE RESOURCES

The second point to which I made reference last year is the incidence of present general price levels on the programme for replacing existing fixed assets and acquiring additional ones. We are still faced with the fact that the cost of fixed assets is approximately double that of 1939, and consequently absorbs considerably more capital than would have been the case in 1939 conditions. It is necessary, therefore, to retain in the business more of our earnings than would have been the case had the general price level not increased so substantially.

The third point to which I referred last year, was our large current programme of capital expenditure. This programme is now nearing completion in a number of directions, but we have certain newer projects under consideration and the necessity for caution in the disbursement of our liquid funds still remains in order that we may not be handicapped in expansion projects by lack of capital.

Your board hope, therefore, that the ordinary stockholders will appreciate their current dividend decision and realise that all of the reasons therefor are of a temporary character, although conservation of funds to supply additional working capital is always likely to be with us to some extent so long as we remain progressive in our activities.

FUTURE PROSPECTS

In the world conditions of today it is obviously impossible to make any reliable long-term forecast of probabilities and I must therefore continue my practice of the last few years and confine my comments to a short-term basis. On such a basis our prospects remain good. I informed you last year of signs that we had probably reached the peak of the profit-earning capacity which was likely during the next few years, and suggested declining profits as a probability of the then immediate future. This has been borne out by events, as will be apparent from the figures now before you. This tendency is likely to continue during the current financial year, but there is still no reason for any anticipation of slump conditions.

In the absence of any action of governments which affects us fundamentally we expect to be able to report quite favourably to you next year, and if we receive slightly less volume of business it will not necessarily mean proportionately less available profit, as we shall be in a better position to maintain satisfactory services in our factories, a problem which is always difficult when they are being pressed for the maximum amount of actual production each week.

Briefly, then, the immediate future looks quite bright, in the absence of any dangers at present unknown, and over which we should have no control.

May I again, before concluding this statement, express to the officials and employees of our various organisations, at home and overseas, our thanks for and appreciation of their efforts during the past year, and our hope that, in the not too distant future, tax legislation will permit them to retain, for their own use, a larger proportion of their earnings than is the case at present.

NEW ZEALAND LOAN AND MERCANTILE AGENCY

MR W. H. TATHAM'S REVIEW

The fifty-fifth annual general meeting of the New Zealand Loan and Mercantile Agency Company, Limited, was held on December 30th at Winchester House, Old Broad Street, London, E.C., Mr W. H. Tatham, O.B.E., the chairman, presiding.

The following is an extract from the chairman's review circulated with the report and accounts for the year to June 30, 1949:

The company has continued its satisfactory progress. Turnover both in Australia and New Zealand, in all departments, has again been greater than that of the previous year, but unfortunately our working costs are continuing to increase and taxation is as heavy a burden as ever.

I think it is as well to remind stockholders that the company does not own properties and, therefore, that it does not get the advantages from the prevailing high wool prices which might arise from sales of its own wool. Nevertheless, in addition to being able to increase our reserves and after making adequate provisions, it has been possible to recommend the payment of the same dividends as before and increase the carry forward by £17,111 to £87,707.

The alteration in the New Zealand rate of exchange has resulted in a gain in net assets of £227,526 and this book profit, which is really a reimbursement of a previous exchange loss, has been placed to the general reserve. We have added £22,474 from profit and loss account so that the general reserve is now up to the satisfactory figure of £1,000,000.

Increased costs, taxation and depreciation have adversely affected the £80,850 increase of trading profits. The first two particularly are matters beyond our control and, although the subject of increased costs is not unknown to stockholders and is not peculiar to Australia and New Zealand, nevertheless, the impact on a business such as ours, whose profits are inevitably affected by world prices and climatic conditions, is serious. If and when wool prices fall, salaries, wages and other running costs will not necessarily follow to the same extent, with consequent adverse effects on net profits.

THE FUTURE

Weather conditions to date, and the condition of the Stock generally in both Australia and New Zealand, are good and the outlook is favourable for the current year.

Wool prices at the beginning of this season were sharply down, which seemed to indicate a reduced demand. Immediately after the devaluation of the £, almost dramatically, the falling prices turned and prices for most wools are now at their highest this year. Russia, Japan and America commenced to buy substantial quantities, and other consuming countries whose currencies had not been devalued, or fully devalued, are also competing vigorously, possibly having held off the market in anticipation of our devaluation. United Kingdom manufacturers who had allowed their stocks to run down in anticipation of still lower prices have also entered the markets.

Statistically, the position of wool is still sound in that demand, at least for the finer sorts, is officially estimated to be 17 per cent. greater than the seasonal supply. Presumably, however, a rise in unemployment or other adverse changes in prevailing conditions would materially affect the estimated figure of consumption.

Altogether, it would not seem unduly optimistic to say that the stockholders can anticipate, subject to events, the current year being a reasonably successful one.

The report and accounts were unanimously adopted.

COMBINED EGYPTIAN MILLS

CONTINUATION OF MODERNISATION POLICY
EFFORTS TO INCREASE EXPORTS
MR A. BRYCE MUIR ON THE YEAR'S PROGRESS

The twentieth ordinary annual general meeting of Combined Egyptian Mills Limited was held on December 29, 1949, in Manchester.

Mr A. Bryce Muir, J.P., in the course of his speech, said :—We have had a satisfactory year.

General reserve account now stands at £350,000, and we have created a stock contingencies reserve of £100,000.

We are continuing our policy of modernisation and re-equipment, begun before the war, in spite of the heavy cost of new machinery, heavy taxation, and inadequate allowances for depreciation. We availed ourselves of the benefits of the government re-equipment scheme. Since the qualifying date we have spent over £600,000 on capital account, part of which will be eligible for the subsidy. Our commitments on capital expenditure amount to £817,000. This will be spread over the next three years.

INCREASED PRODUCTION

Production of yarn has increased this year, the percentage of spindles worked being 79.51 per cent., against 74.60 per cent. last year.

During the year there have been many difficulties in international trading affecting our exports. For some months before September 18th, rumours and denials and further rumours of devaluation checked business. The high prices of Egyptian cotton also handicapped the sale of fine counts of yarn. It was particularly difficult to sell to hard currency countries especially as they were able to buy Egyptian cotton for dollars many pence per lb. cheaper than this country could for sterling. In spite of these difficulties, however, we ended our year's trading with practically no additional unsold stocks of yarn. This was mainly due to a judicious switch over to qualities of yarn in greater demand.

OVERSEAS TRADE

Before the war, Germany was the largest overseas outlet for our yarns and we are glad to report that during this year greater progress has been possible in reopening and supplying our old connections there—in western Germany only at the moment. We have been able to sell to most of our former markets and, in all, our yarns are being exported to more than 40 countries. We are making every effort to develop and expand exports of yarn and also of fabrics containing our yarn to America, Canada, and other hard currency countries.

It is obvious that the world still needs large quantities of textiles, but import restrictions, together with currency difficulties, are limiting the volume of business for which there is a demand. We have, however, a good order book.

DEVELOPMENT OF SPUN RAYON

Our development in spun rayon was unfortunately upset by the concentration policy during the war, and two of our mills which were building up a successful business were closed down for about five years. When they were permitted to restart it was conditional upon cotton being spun to meet the then urgent needs of the home market. This was one of the unfortunate effects that concentration had on some of our mills. We have now three mills producing increasing quantities of spun rayon and have plans for still further development.

Devaluation of the £ will not only raise the price of cotton, but must affect also many of the commodities used in our mills, and therefore add to our cost of production. Higher prices for raw materials must also call for increased financial resources. As the raw cotton commission is now prepared to sell for deferred and forward delivery—although without guaranteeing precise qualities—a difficulty with which we must cope—we hope it should not be necessary for us to carry such large stocks of particular qualities of cotton as has been necessary in the past. The conservative policy of your board is being justified, for it is essential that we should have sufficient free financial resources to enable us to increase and develop our business.

COTTON PRICE AND CROPS

Although world cotton crops have increased considerably, the American agricultural loan policy, guaranteeing farmers 29 cents to 30 cents per lb. has maintained high prices there. Scarcity of dollars has transferred buying to sterling area cotton with the obvious effect of forcing prices higher, and since devaluation this has become more acute.

Although the raw cotton commission has been carrying large stocks, the prices of which have been raised to approximate replacement values, the question of future supplies of cotton is a difficult one. The industry is so vital to this country's welfare, both for home and export, that one can feel assured that whatever imports are cut cotton will be among the last on the list.

YARN MARGINS

In April this year the Yarn Spinners' Association announced that the Board of Trade had made an order releasing cotton yarns from statutory price control. The association therefore decided that until further notice the margins under the existing system of statutory control should become minimum margins rather than fixed margins. This gives scope for quality and salesmanship which were previously handicapped. The phrase "price control" seems to have led to misunderstanding. The Yarn Spinners' Association, comprising all spinners who sell single yarn, stipulates only for margins, based on cost of production of various qualities and counts, to be added to the price of cotton after it has been cleaned. The margins are in no cases more and in many cases are less than can be justified by the results of searching inquiries into costs made by accountants appointed for the purpose by the Board of Trade. These margins reflect the costs of wages, coal, power, electricity, and consumable mill stores, plus interest on capital values calculated at less than half replacement value, and also based on full-time running—which, owing to labour shortage, is very rarely obtainable—together with depreciation at normal rates, but also based on less than half replacement value. Certainly, nobody could afford to build a new mill and sell as low as the existing minimum margins, however efficiently the mill was operated.

The main purpose of the Yarn Spinners' Association is to maintain reasonable security for employer as well as for employee, while insisting on efficiency, and so to avoid the price-cutting wars of the past which brought such misery to the trade. Rather it is to secure, when the sellers' markets pass, uniform action to meet changing situations.

It is in no way a restraint of trade but allows for free competition over a minimum margin of costs worked out on a very conservative basis.

PENAL TAXATION HANDICAP

As an instance of the present heavy taxation of industrial profits, you may notice that profits tax at £120,140 alone exceeds the dividends paid to preference and ordinary stockholders by £25,032. In addition to this we have had to provide an amount of £338,680 for income tax. This penal taxation handicaps very severely the re-equipment which we wish to carry out and is an unjust burden on industry.

At the last annual general meeting in reply to stockholders, I announced, on behalf of the board, that, if circumstances justified it, we would consider a moderate increase of dividends this year. Since the formation of the company no dividend had been paid on the ordinary shares until last year, when a maiden dividend of 4 per cent. was paid. The board are fully conscious of the need for restraint in dividend policy and feel that a rate of 6 per cent. is reasonable in all the circumstances and gives full weight to the economic conditions of the time.

We feel that in spite of the unsettled world and financial and exchange conditions the cotton trade can look forward to full and reasonably profitable employment for some time ahead for the world has been starved of textiles.

The report and accounts were adopted.

McDOUGALLS TRUST, LIMITED

PROFITS HIGHER DESPITE RESTRICTIONS

TRADE NOW FULLY COMPETITIVE

MR KENNETH MOORE'S SPEECH

The sixteenth annual ordinary general meeting of McDougalls Trust, Limited, was held at the registered office of the company, 3, Thames House, Queen Street Place, London E.C., on December 30th, Mr Kenneth A. E Moore, the chairman, presiding.

The secretary (Mr Reginald E. Clark), having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen,—At our annual general meeting a year ago today I referred to the restrictive conditions to which the production and sale of McDougalls Self-Raising Flour were subject. Those conditions persisted throughout the year ended September 3, 1949, and it is something of an achievement that the group's trading profits for the year at £317,572 are slightly in excess of those shown by the preceding accounts which covered a period of fourteen months.

This satisfactory result is partly the outcome of efforts to offset rising costs by increased efficiency, and partly the result of some broadening of our activities embarked upon since the war, with notable success.

RESTRICTIONS WITHDRAWN

Towards the end of August, 1949, the official restrictions on the sale of self-raising flour were withdrawn, with the result that the trade is again we are glad to say, fully competitive, though still trammelled by a network of regulations and frustrations. These include the obligation to produce flour at 85 per cent. extraction, compared with the prewar figure of about 72 per cent.; the prescribed maximum retail selling prices, some of which are unremunerative, and the fact that the wheat we mill, other than home-grown wheat, is not of our buying nor wholly of our choice, but that allocated to us under the vagaries of bulk purchase.

Fortunately, the home-grown wheat crop of 1949 was, on the whole, of superlative quality, an important matter to us as we use, and indeed like to use, a very high percentage of the best English wheat.

In this connection, existing arrangements between the Ministry of Agriculture and farmers give the farmer no premium for quality. Not unnaturally, farmers are thus encouraged to sow certain wheats which, though they give a high yield per acre, are of indifferent milling quality. It would, I feel, be in the national interest for the arrangements to be modified so that, instead of a flat price for all home-grown wheats, quality should reap its reward, as was the case in prewar days under the operation of the Wheat Act 1932, in a free market.

STORAGE PROBLEMS

While on the subject of home-grown wheat I should mention that, in the past, the traditional and well-tried method of storing English wheat was in stack on the farm, to be threshed as convenient over the subsequent months. The wheat stack is now being ousted by the increasing use of combine-harvesters—which thresh as they reap—and this is resulting in storage problems likely to reach serious proportions in coming years. Under existing conditions there is no economic incentive for farmers or millers to provide, at great capital cost, the extended drying and silo facilities required to meet the increasing flood of threshed wheat at harvest time. The Government already has certain silos, constructed during the war, and more are planned, but so far as I am aware, these fall far short of the prospective requirements.

The most convenient and economical place for wheat silos is alongside flour mills, and I venture to suggest that the Government should, as a matter of urgency, consider ways and means of making it economically feasible for millers to extend their silo accommodation so that waste and deterioration of the English wheat crop may be avoided in the coming years

DIVIDEND AGAIN 10 PER CENT.

To return to our domestic affairs, we are recommending the maintenance of our dividend at the customary 10 per cent. Thus we are proposing to withhold from distribution £117,000, representing rather more than one-third of the group's trading profit.

It is a matter for regret that the effective rate of taxation on these savings is nearly 80 per cent., owing, largely, to the incidence of profits tax; thus the net addition to our resources as reflected in the increased carry-forward is no more than £26,309.

Our dividend has not been raised for thirteen years. During that period the capital employed has increased by over £500,000 through the ploughing-in of profits not distributed; production has been more than doubled, and profits, though they represent a smaller margin per unit of sales, have increased in total as a result of the increased volume of sales.

STRONG FINANCIAL POSITION

Thanks to the stable dividend policy pursued for years past, the financial position, as shown by the balance sheet, is, by all the usual tests, a very strong one, but we are sorry that taxation at its present rate has brought almost to a standstill the very desirable process by which this and other businesses have been built up over the years by the ploughing-in of undistributed profits.

I wish to take this opportunity in which you will no doubt wish to join as shareholders, in thanking our staff and employees for their contribution to the year's work.

The report and accounts were unanimously adopted; the retiring directors, Mr Charles McDougall and Mr C. G. Williams, were re-elected, and the remuneration of the auditors, Messrs Ball Baker and Company, was fixed.

AERATED BREAD COMPANY LIMITED

COMPETITION FROM CIVIC RESTAURANTS

The annual general meeting of the Aerated Bread Company Limited was held on December 30th in London, Mr J. G. Girdwood, C.B.E., C.A., chairman and joint managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to October 1, 1949:

There has been no relief from restrictions and no noticeable easing of the controls under which we operate; initiative and enterprise are not allowed free play. Shortage of commodities has continued; the prices of many of our supplies have been raised; rates of wages have been increased and hours of labour have been reduced. The cost of fuel, the price of gas and railway rates have all been increased following on nationalisation of these industries. Heavy increases in local rates and substantial advances in rents on renewal of leases have been experienced, while the prewar cost of repairs to property and branches has been multiplied approximately three times.

RENOVATIONS AND REPAIRS

During the year we have spent large sums on renovations, rehabilitation and repairs to our branches, but much still remains to be done. Our efforts in this direction are strictly limited by Government controls and regulations, and we have found it quite impossible to make any real progress in the replacement of the many branches which were lost during the war. At the same time we have had to face competition from the new Civic Restaurants in London opened by the London County Council. The total number of such establishments has been stated to be 109, and it has been announced that further such places will be opened in the near future.

It is difficult to avoid the conclusion that facilities for extension and development withheld from companies in the catering industry such as ours, are being much more freely granted to Local Authorities. Not only so, but under the Civic Restaurant Act, 1947, Local Authorities are given power to operate restaurants and are permitted to incur losses for three or more years which may be charged against rates.

We are very heavy ratepayers, particularly in the areas ruled by the London County Council. In the past year we have had to meet greatly increased charges for rates—and why? According to the L.C.C. estimates for 1948-49, expenditure on these restaurants amounts to £108,000 for that year and £182,000 for the year 1949-50. We are at all times ready, and able, to meet fair competition, but is it right that out of our efficiency and skill in our trade we should be required to subsidise the inefficiency of competitors in our own industry? In the year covered by this review the amount we have paid in rates alone totals much more than the sum required to meet the net ordinary dividend recommended.

DIVIDEND 10 PER CENT.

The trading for the year has resulted in a net profit to the parent company of £159,755, sufficient to pay the dividend on the preference stock, maintain the dividend on the ordinary stock at 10 per cent., add £50,000 to general reserve and increase by £13,057 the carry-forward to 1950. Our policy is to give the public the highest possible value at the lowest possible cost, and, expressed as a percentage to turnover, our net profit for the year represents a very modest rate, which by any standard could not be judged as other than extremely reasonable.

We go forward in the knowledge that we have a highly skilled and energetic technical and administrative staff, capable of tackling every problem natural to the industry in which we are engaged; we have keen and loyal workers, and the company is in a position of great financial strength.

The report was adopted.

NYASALAND RAILWAYS, LIMITED

SATISFACTORY TRAFFICS

The eighteenth ordinary general meeting of Nyasaland Railways, Limited, was held in London on December 30, 1949, Mr W. M. Codrington, C.M.G., M.C., chairman and managing director, presiding.

The following is an extract from his circulated statement:—

During 1948 our gross working receipts were £336,111 as compared with £325,839 in 1947. This was due not only to good crop traffics, but to the maintenance at a satisfactory level of the import traffics caused by re-stocking and re-equipment after the war. While the main crop traffics, tea, cotton and tobacco, all registered increases, there is very little expansion in other agricultural production in spite of low developmental rates which exist for its encouragement.

Expenditure has risen in almost every department. This is due to increases in wages and salaries, and, above all, to the very greatly increased cost of all forms of stores. Moreover, every department of the company was working all out to employ the materials which began to arrive during the year in overtaking arrears of maintenance. There is at present no indication that the increase in our cost is halted.

During, and since the year covered by our accounts good progress has been made with the various works and improvements to which I alluded in my statement last year.

ENCOURAGING PROSPECTS

General prospects for Nyasaland, on whose prosperity we depend, are encouraging. A large amount of the British taxpayers' money has been injected into the colony, both in the form of grants under the Colonial Development and Welfare Act, and through the government owned Colonial Development Corporation. Further, privately owned capital is also being invested in the colony. It is perhaps inevitable, that as a result some slight symptoms of inflationary tendencies should be discernable. This need be of no great moment, provided that the transfusion which is now taking place results in increased vigour in the whole body economic of the colony.

Much of the expenditure now being incurred, such as that on roads, education and so forth is definitely of a long-term nature and will only yield a dividend in the future. Some of it will entail an increase in the general overhead cost of the administration which has got to be borne by those who live and produce and do business in the colony. Production by the European section of the community shows signs of growing; but the total European inhabitants only number two thousand, and any spectacular increase either in their number or in their production seems at the moment unlikely.

PEASANT PRODUCERS

The African population, on the other hand, numbers over two millions, and, thanks to medical and welfare measures, is said to be increasing rapidly. And yet we see little indication of any considerable expansion in production, particularly by peasant producers. It is true that production of dark fired tobacco has increased considerably, but unfortunately the same cannot be said of other commodities which would seem to lend themselves to production by Africans. Although it has been reported that there were many thousands of acres of land suitable for the cultivation of cotton, progress in this respect has been very disappointing. Last year we carried only 3,799 tons of this precious dollar-saver, although the price has risen to a height which should surely prove attractive to producers. Other commodities such as groundnuts, for which we have quoted low development rates in the hope that production might be stimulated have proved even more disappointing.

It is noteworthy, too, that the recent drought found Nyasaland, a country in which there are many thousands of acres available for maize production, so totally unfurnished with reserves of this staple article of food, that large-scale importation by the Government at considerable cost became necessary. It seems to me that the most important, and perhaps most difficult, problem which faces us as a colonial Power is that of finding the correct form of encouragement, incentive, or whatever may be necessary to secure that the African population makes a vastly increased contribution, not only to its own prosperity and well being, but also to the overhead costs of administration under which it enjoys peace, tranquillity and the opportunity of a better life.

CHOICE BEFORE THE COUNTRY

It has sometimes appeared to me that Nyasaland in some respects supplies an echo in miniature of economic trends in this country. Here, we now realise that the post-war period of honeymoon finance has definitely ended. Controls are being reduced or abolished, and administrative expenditure of Government is being severely pruned. At the same time, all classes are being urged to produce more in order to safeguard their standard of living and the benefits of the social services which they enjoy. It seems to me possible that Nyasaland will soon be faced with a similar choice. Either she must prune her overhead expenditure and eliminate some of the administrative refinements and controls which have accrued since the war, while at the same time increasing the productivity of all classes of the population, or alternatively she must risk a deterioration in the conditions in which all classes of the community will be called upon to live.

Recently, the Governor, Sir Geoffrey Colby, issued a call to all sections of the population to intensify production during the coming season. This is an appeal to which all sections of the population, in their own interests, should respond. We, for our part, will see to it that no effort is lacking to ensure that everything that Nyasaland produces and everything that Nyasaland requires to import shall be transported with expedition and efficiency.

The report was adopted.

J. BROCKHOUSE AND COMPANY, LIMITED

EXPANSION ABROAD

The fifty-second annual general meeting of J. Brockhouse & Company, Limited, was held on December 29, 1949, at West Bromwich.

Mr J. L. Brockhouse, M.A., chairman and managing director, in the course of his speech, said: The past year has been one of further expansion of your company, particularly overseas. We have, for a long time, even prior to the war, been urged to set up a manufacturing organisation in the Union of South Africa.

In 1945 we took a substantial holding in B.M.S., Limited, of Johannesburg, a firm making allied products to our own, particularly in the transport field, and during the year under review an opportunity arose to secure a majority of the ordinary shares, and your directors felt that this was an occasion which should not be missed and the company is therefore now a subsidiary.

In conjunction with the Indian Motocycle Company we have formed the Indian Sales Corporation, which has the exclusive right in the United States to deal with Indian products and with the Indian Dealer Organisation. We have started to market through this corporation a comprehensive range of British motor-cycles and bicycles, as well as certain products which your company now makes.

This company's activities extend over a wide range, and it is very seldom that we are full to capacity in all sections. I am pleased to inform you that the general Order Book position is keeping up, and the future outlook for business is satisfactory. We are still facing rising costs in industry and eventually this is going to have serious repercussions on our ability to maintain exports, even at the present level, let alone increase them.

The report was adopted.

KEYSTONE KNITTING MILLS

A SATISFACTORY YEAR

The twenty-first ordinary general meeting of Keystone Knitting Mills (1928), Limited, was held on December 30, 1949, at Elstree.

Mr H. N. Lewis (chairman and managing director), in the course of his speech, said: My first pleasant duty to-day is to draw your attention to the fact that this company now "comes of age," this being our twenty-first annual general meeting. In these circumstances I am delighted that I can again report a very satisfactory year. Sales have increased by approximately 25 per cent. over the year to June, 1948, and bearing in mind that sales for the year were more than 30 per cent. above the preceding year, the current year's sales are no less than 66 per cent. in excess of the trade for the year to June, 1947.

NYLONS EXPORTED TO U.S.A.

During the year we have produced fifty-one gauge full-fashioned Nylon hosiery in considerable quantities. Nylon yarn is allocated to us on the distinct understanding that most of the first-grade products are exported, and I can inform you that Keystone Nylons have been exported to many countries, including the United States of America.

The profits for the year have not increased in the same ratio to sales, for your directors have taken a longer view, and what, in their opinion, is a much more satisfactory one as far as the company is concerned. Arrangements were made to import plant from the United States of America, and the initial starting up expenses, which must inevitably be considerable, as well as the cost of training the new operatives, have all been written off in the year under review. This company was indeed fortunate to have obtained its new plant, which consists of multi-section 51 gauge full-fashioned knitting machines with ancillaries necessary for the processing of Nylon hosiery, on very favourable terms and prior to devaluation.

The net profit for the year, after providing for taxation and all expenses, was £29,776, as compared with £25,212 for the preceding year.

The company has purchased for £46,111 the entire share capital of a company manufacturing fabric which is ideally suitable for use in our lingerie manufacturing department. The basis of this purchase was eminently satisfactory.

Regarding future prospects, as the company's manufacturing capacity is fully booked for some time ahead, and a further considerable increase in sales has taken place subsequent to the end of the financial year under review, I am confident that when we meet next year I shall again be in a position to present another satisfactory report.

The report was adopted.

AVON INDIA RUBBER COMPANY, LIMITED

TURNOVER MAINTAINED

MAJOR R. F. FULLER ON EFFECT OF DEVALUATION

The sixtieth ordinary general meeting of the Avon India Rubber Company, Limited, was held on December 30th at the offices of the company, Bath Road, Melksham, Wilts, Major R. F. Fuller, D.L. (the chairman), presiding.

The Secretary (Mr E. H. Lovell, A.C.I.S.) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman, which had been circulated with the report and accounts for the year ended October 1, 1949:—

The fifty-ninth annual report and accounts submitted to the shareholders of the company show that the net profit for the year, before providing for taxation, amounted to £166,936, compared with £289,901 in the previous year. After making provision for all requirements, including taxation on the profits of the year, the net profit remaining is £67,936, which compares with £130,247 in the previous year.

I am pleased to report that our turnover has been maintained. Unfortunately, I also have to inform you that our materials cost us some £60,000 more this year for a production equivalent to that of last year without any corresponding increase in selling prices. Furthermore, owing to the change from a sellers' to a buyers' market competition tended to become keener as the year advanced. Under these conditions the result of the year's trading is considered satisfactory. Current assets exceed current liabilities by £609,874, an increase of £2,592 over the previous year. Further additions to our fixed assets to the value of £147,866 have been made during the year, bringing the total expenditure since October 1, 1944, to £501,487. Our capital commitments at the end of the financial year were £61,879.

THE OUTLOOK

You will expect me to give you some indication of our future prospects. You will be aware of the sharp rises in prices of all our principal raw materials following devaluation of the pound, and increases in costs are inevitable. Even in materials where it might have been thought that devaluation would have had little influence, prices have risen. Opportunity was taken during a temporary recession in trade in the early part of the year to make economies that could be maintained. The comparatively favourable trading position which was thereby created may well be threatened by the adverse influences of devaluation upon our affairs, the full impact having yet to be felt.

On the other hand there may arise from devaluation some indirect help to the company's export trade, although it must be borne in mind that the volume of our business in a number of important countries is controlled by the amount of currency which they make available for their purchases. It is encouraging to report, however, that our export trade in the past year was more than maintained, and that our sales, as a whole, are running at a satisfactory rate in the current year.

The report and accounts were unanimously adopted and a final dividend of 7 per cent. on the ordinary shares, making 10 per cent. for the year, was approved.

The retiring directors, Major R. F. Fuller, D.L., and Mr J. P. E. Walker, were re-elected, and the remuneration of the auditors, Messrs Tribe Clarke and Company, having been fixed, the proceedings terminated.

SINGER MOTORS, LIMITED

THE NEW SM. 1500 SALOON

The annual general meeting of Singer Motors, Limited, was held on December 30th in London, Mr A. E. Hunt, chairman and managing director, presiding.

The following is an extract from his address:—

The report of the directors, accompanying the balance sheet as at July 31, 1949, and accounts for the year ending that date, could only set out the reasons for the loss of £44,069 and give an indication of the improvement since, in a very brief, though I think adequate, manner.

The reason for the loss of £44,069 in the year under review is the reduction in the number of cars and units produced (and therefore reduction in turnover) compared with the previous year. The output was in fact only about 55 per cent. of that for the year ending July 31, 1948.

CHANGEOVER ACHIEVED

At the annual meeting in December last year it was stated that it was planned to bring into production the new car SM.1500, which would take the place of the Super 10 and Super 12 saloons, and it was indicated that it would be an achievement to get production running smoothly in the "next few months." The changeover was achieved before the end of the financial year, but to do so production of the Super 10 and Super 12 saloons had gradually to come to an end, while that of the SM.1500 gradually had to be built up from nothing.

Discontinuance of the Super 10 and Super 12 saloons and their substitution by a completely modern production was essential, because the former were basically pre-war cars with slight improvements.

The SM.1500 saloon is the answer to this necessity, and with its introduction we are satisfied that the final hurdle in the change to a complete postwar model has been satisfactorily surmounted.

The hopes that we had in the SM.1500 saloon as the time when the prototypes became available have been fully justified, the demand for the model both overseas and at home being eminently satisfactory. Our other model, the 9 h.p. roadster (now fitted with a 4-speed gearbox), continues in production. All roadsters have been exclusively for export for many months.

The present rate of production is above the average rate of output for the year ended July 31, 1948—our best postwar year—and we confidently look forward to at least maintaining this average rate of output. The stock and work-in-progress at £357,430 is less by £71,851. This is accounted for by the changeover in production.

THE BALANCE SHEET

We have now written off the whole of the balance of expenditure on dies, jigs and tools for past models. (These included those for the 9 h.p. roadster.) Expenditure on tools, etc., on the SM.1500 is being written off by relation to the number of cars produced.

Regarding our war-damaged factories in Coventry, some progress has now been made, and quite recently we received a licence to rebuild the destroyed portion of the Canterbury Street works, and it is hoped that this licence will be the forerunner of other licences to rebuild completely the destroyed portions of the other two works in Coventry. To get the works in Coventry properly reinstated would be of immense help, and put an end to the many expedients which have to be used to get sufficient production from the Coventry works to feed the erection and assembly lines at Birmingham.

The report was adopted.

FAIREY AVIATION COMPANY, LIMITED

ANOTHER SATISFACTORY YEAR

The twenty-first annual general meeting of the Fairey Aviation Company, Limited, was held in London on December 30th.

Sir Richard Fairey, M.B.E., F.R.Ae.S., chairman and managing director, in the course of his speech, said: Your directors are pleased to report another satisfactory year's working. The consolidated trading profits amount to £236,176, to which are added the net profits of prior years of £442,963, making a total of £679,139, compared with £775,069 last year. It is proposed to pay a dividend of 2s. per share, less tax.

The main productive work of the company has been centred around our well-known Naval two-seater—the Firefly. Although we are fully equipped for every form of aeronautical engineering, our most important function is the design and production of aircraft for the Royal Navy, and our collaboration with the Admiralty and Ministry of Supply on Naval problems and future requirements is as strong as ever.

NEW TYPES

One of our new prototype aircraft, the Fairey 17, has now started its flying trials. This machine embodies the principle of independent co-axial twin turbo-propeller engines, a system which your company pioneered in our P.24 piston engine in 1939.

Another of our prototypes will shortly begin trials, but for reasons of security I can say little about it except that in this aircraft we have broken away from the more orthodox type of design, and that its possibilities are even wider than those of the Fairey 17.

Both aircraft have been built with our new patented system of "Envelope Jigging." This system, which has recently attracted attention in the Technical Press, should result in a quicker and more efficient production of any new type.

I mentioned in last year's statement certain pioneer work in the Guided Weapon Field which we were conducting with the encouragement of the Ministry of Supply. Our work in this direction is developing very satisfactorily. Our associated company, Fairey Clyde Aviation Company Proprietary, Limited, in Sydney, is already working and servicing not only our own types of aircraft but others in use with the Royal Australian Navy. We had recently formed, with the consent of the Treasury, the Fairey Aviation Company of Canada, and had acquired an excellent factory at Halifax, Nova Scotia. So rapidly was this company built up that we have hopes of a turnover of the order of three-quarters of a million dollars in the first year's working, and every prospect of a profit in the following year.

THE FUTURE

As regards the future, we have been notified of our manufacturing programme for the year commencing next April which should maintain our activities at a good working level. As for our work on repair and maintenance, we have, of course, finished our extensive task on the Berlin Air Lift aircraft, but we can reasonably expect an improvement on our output of spares and repair and maintenance work for our own types of aircraft, apart from the possibilities arising from new developments. Our Firefly types have been increased to include a dual control "Operational Trainer" and a "Target Tower"; these types are proving most satisfactory both at home and abroad, and additional sales of both these types seem quite possible.

The report was adopted.

LEOPOLDINA RAILWAY

SALE OF THE UNDERTAKING

AGREEMENT SIGNED

EARLY COMPLETION EXPECTED

MR C. H. PEARSON'S SPEECH

The annual general meeting of The Leopoldina Railway Company, Limited, was held in London on December 29th, Mr C. H. Pearson, the chairman, presiding.

The Chairman, in the course of his speech, said: Once again I am sorry to say an operating loss was recorded—£790,000, as against £130,000 in 1947. Adding debenture interest and other London charges, the total loss for the year was nearly £1,200,000, a result which obviously reflected a situation of the utmost gravity.

Though the immediate cause of the increased working loss must be attributed to a reduction in receipts, on the other hand it must be pointed out that these diminished receipts had to be set against working expenditure which over the last few years has been inflated almost beyond measure.

Increases in the price of materials, especially fuel, have, of course, played their part, but it is the wage bill that, above all else, has contributed to this result directly attributable to rises in rates of pay as a consequence of continuous inflationary pressure.

WAGES RAISED

Incidentally, I would have you note that in this actual year, 1949, by decision of the Government, further general increases in wage levels have had to be conceded, statutory contributions to the employees' pension fund raised, and obligatory payment for rest days and holidays enforced. The conjoint effect of these measures has been practically to double the pre-existing payroll and correlated costs, adding an estimated additional 140 million cruzeiros annually to expenses, or, say, £1,870,000 at the old exchange rate of Cr.$75 to the £.

Current expenditure on staff now comprises about three-quarters of total working costs, and in itself exceeds gross traffic revenue.

EVENTS LEADING TO SALE AGREEMENT

And now I turn to the course of events leading up to the signature of the agreement regarding the sale of the company's undertaking in Brazil, and I would ask you to consider what I say against the background of my previous observations on the present working conditions of the railway.

You will recollect that last year you were told of the visit paid to Brazil by Lord Hawke, Major Baring and the Secretary in the early part of 1948 in response to an invitation of the Brazilian Government to discuss the future of the railway, and that, at the time of the annual general meeting last year, we had no knowledge of the action the Brazilian Government intended to take.

It was not until the middle of January, 1949, that news was received that Dr. José Vieira Machado was on his way to London, as the representative of the Brazilian Government, to treat with us regarding the future regime of the railway. The result you know; an announcement was made to the press in May last at the time of signature of the agreement, and the information then given is summarised in the report that is before you.

RATIFICATION NEEDED

Let me make the position quite clear. The agreement is an "ad referendum" agreement: ad referendum to the National Congress of Brazil; ad referendum to you and all other classes of stockholders in the railway. It only becomes binding when ratified by both sides; we, here, proceeding by means of a scheme of arrangement, under Section 206 of the Companies Act, 1948.

As explained in the directors' report, various matters have combined to delay completion of the scheme, but I have every reason to suppose that the time is now approaching when it can be brought to completion and submitted to you for approval. I should not omit to mention that one of the parties to the scheme will necessarily be the holders of the Five per cent. debentures of The Leopoldina Terminal Company, Limited, which are guaranteed as to principal and interest by your company. I must, however, emphasise that the assets of the Terminal Company—namely, their interests in the Cantareira Company—are entirely outside and unaffected by the agreement entered into by the railway company.

Meantime, the process of ratification in Brazil goes forward normally; a summary of the anticipated procedure is given in the directors' report.

PRESIDENT'S MESSAGE

It is worthy of note that, in the message to Congress signed by the President of the Republic of Brazil and accompanying the Project of Law, a passage appears which reads in translation as follows. I quote:—

"It is necessary at once to point out that the position of the Leopoldina is not unique; it is the result of internal and external factors which have in general affected in diverse manner all railway activities in Brazil."

There are other references in the President's message and in the accompanying report of the Minister of Transport which make clear that, in the view of the Brazilian Government, the company's difficulties cannot by any means be attributed to causes within the company's own power to control. Your board believe this view to be correct, and they are grateful to the Brazilian Government for their acknowledgment of the fact and, indeed, for the evinced sympathy which has throughout marked their relations with the Government.

The report and accounts were adopted.

EBONITE CONTAINER COMPANY

SOUND LIQUID POSITION

The twenty-fifth annual meeting of Ebonite Container Company, Limited, was held on December 30th in London, Mr W. E. Smith (chairman and managing director) presiding. The following are extracts from his circulated statement:—

The profit of the parent company amounts to £37,853 and the amount carried forward from last year £31,714; after making the various provisions shown in the appropriation account and allowing for the payment of a final dividend of 12½ per cent. less tax, making a total of 17½ per cent. for the year, the amount to be carried forward is £41,076.

The Government takes by way of taxation for the year the sum of £31,500, nearly four times what you—the shareholders—receive by way of dividends.

The consolidated balance sheet shows that the current assets exceed current liabilities by £181,865. The liquid position is therefore sound, and in uncertain times like the present your directors consider this to be the right tendency. Our plant is working to capacity. Orders show no recession, and I see no reason why we should not anticipate satisfactory results for the current year also.

Our subsidiary, Messrs. Ferguson Shiers, Limited, has had a more difficult year. Shortage of cloth, due to Government control, has affected the proofing department. Soft rubber mouldings have continued to fall off. Exacting research on other lines is now showing results, however, and new lines are now in successful production. These help to compensate for the foregoing, and your directors hope to see better results in the current year. This subsidiary company plays a vital part in helping the parent company's ebonite production and is very valuable to us.

The report was adopted.

THE PLESSEY COMPANY

CONFIDENCE IN FUTURE

The twenty-fifth annual general meeting of The Plessey Company, Limited, was held on December 30th in London, Mr A. G. Clark (chairman and managing director) presiding.

The following are extracts from his circulated statement:—

The consolidated profit and loss account shows that the trading profit was some £30,000 higher at £261,965. We have also brought to credit £32,660 in respect of profits made in earlier years.

Against the increased income must be set a fall of some £20,000 in our miscellaneous revenue. Taxation is over £40,000 higher at £106,629. As a result our final net profit figure, after taxation, is £84,194, or some £19,000 more than was the case last year.

The tax charge is heavy in comparison with last year, and this increase is largely due to the particular incidence, as between one year and another, of the initial allowances and wear-and-tear allowances on our equipment which are made when computing the tax liability.

The profit for the year would have been higher had the conditions obtaining in the earlier months of the year continued throughout. However, early in 1949 deterioration in business became evident. These adverse conditions persisted past the end of our financial year on June 30th, but I am glad to say that improvement has now taken place, and I am hopeful that the improvement to which I have referred will be continued over the next few months. Beyond that point it is, in these days, difficult to speak with any certainty.

The opening of the Birmingham television service this month, and the opening of other regional services over the more distant future, should lead to a very considerable increase in the demand for television components, and our production of these components is therefore being developed steadily, so that we shall be able to cope with the greater volume of trade which will be available.

So far as the other branches of our business are concerned, there has been no change calling for particular comment. The orders in hand at the present time are of satisfactory volume, and continue to indicate the broadening nature of the business which we handle.

STRONG BALANCE-SHEET

Our balance-sheet position continues strong. The deterioration in trading conditions, together with the fact that because materials are now easier to obtain, we have been able with safety to reduce stocks and get them into better balance, has resulted in a reduction of some £500,000 in stocks and work-in-progress, but because there is a seasonal element in much of our business June 30th happens to be a date at which our work-in-progress always tends to stand at an exceptionally low figure

I have said that for the moment it is not possible to see far into the future. Over recent years life has not been easy for manufacturers such as ourselves. Fluctuations in volume and changes in the nature of the business available to us have been more numerous and violent than would normally be expected, while the difficulty of maintaining a balanced labour force has been great. However, we are the more confident for the future since the company is thoroughly sound from the financial point of view, is possessed of first-class resources for production, and remains well abreast of current developments in the technical field.

The report was adopted.

Investment Statistics

Company Notes

The Bristol Brewery Georges.—Group trading profit declined from £691,058 to £564,331, and net profit from £268,202 to £211,034 in year to September 30, 1949. Figures for 1947-48 relate to 14 months' period in respect of subsidiaries. The dividend is 18 per cent, tax free (22 per cent, tax free). Net current assets were £38,225 (£122,498) at the year-end.

Lancashire Cotton Corporation.—Trading profit amounted to £2,599,286 (£2,070,780) in the year to October 31, 1949. Net profit was £1,435,992 (£1,195,186). At October 31, 1949, fixed assets, less depreciation, were valued at £4,013,009 (£3,960,412), total current assets £8,993,622 (£6,797,745), and net current assets, £6,511,936 (£4,356,399).

Raleigh Industries.—Group trading profit declined from £1,507,078 to £1,472,764, and net profit from £594,424 to £583,147 in the year ended August 30, 1949. Turnover rose 17½ per cent. Net current assets were £2,661,202 (£2,476,462) at the year-end.

Hawker Siddeley Group.—Trading profit of the group increased from £2,919,671 to £5,532,608, and net profit from £1,090,438 to £1,912,012 in the year ended July 31, 1949. Net current assets increased from £5,842,849 to £11,652,568. Bank overdraft has been reduced from £2,122,839 to £806,468, against which balances at bankers and cash amount to £1,785,159 (£857,265).

Turner and Newall.—Group trading profit declined from £7,726,099 to £7,572,283 and net profit from £2,547,050 to £2,099,494 in the year to September 30, 1949. The dividend of 15 per cent is unchanged. Some £779,144 (£959,555) has been written back to profit and loss from provisions and liabilities no longer required. Consolidated fixed assets, *less* depreciation, amounted to £7,483,816 (£5,977,349), stocks to £7,969,615 (£6,511,004), and net current assets to £17,378,505 (£15,917,267) at the year-end.

Apex (Trinidad) Oilfields.—Oil revenue after provision for Trinidad expenses, development, depreciation and contingencies amounted to £1,203,251 (£883,551) in the year to September 30, 1949. Net profit was £469,113 (£330,299). At the year-end fixed assets, *less* written off, were valued at £879,786 (£775,311), total current assets at £2,852,945 (£2,105,144) and net current assets at £2,129,960 (£1,538,453).

Tobacco Securities Trust.—Total revenue in year to October 31, 1949, was £779,692 (£792,165) and net revenue £435,104 (£429,321). The dividend is unchanged at 22.54 per cent.

Kern Oil.—Gross consolidated profit amounted to £844,015 (£758,923) and net profit to £219,933 (£182,864) in the year to May 31, 1949. As already announced the distribution has been increased from 12½ per cent to 15 per cent (including bonus of 5 per cent). Total group output was 1,909,059 (1,840,887) barrels. Fixed assets *less* depreciation were valued at £908,239 (£804,173); total current assets £1,315,781 (£1,130,774) and net current assets £660,489 (£624,719) at May 31, 1949.

Maconochie Foods.—Group profit declined from £187,429 to £225,581 in the year ended August 31, 1949. Net group profit was £37,827 (£58,192). Total interim dividends 12½ per cent (same).

Venesta.—Total profit fell from £393,466 to £341,363 and net profit from £133,291 to £124,750 in the year to June 30, 1949. The dividend of 10 per cent is unchanged. Net current assets amounted to £1,363,731 (£1,455,608) at the year-end.

Radio Rentals.—Net profit subject to audit, amounted to £138,654 (£89,244) in the year ended August 31, 1949. Net profit was £150,162 compared with £113,150 for the previous period which exceeded 12 months. The dividend of 25 per cent is repeated.

Hammonds United Breweries.—Group trading profit declined from £713,604 to £604,122 and net profit from £320,191 to £253,235 in the year to September 30, 1949. The distribution for the year is unchanged at 20 per cent. Net current assets were £492,692 (£41,758) at the year-end.

Capital Issues

Jamaica Government.—Lists opened and closed on January 5, 1950, for the issue of £3,250,000 3½ per cent inscribed stock 1968-73 at par. Amounts payable on application £10 per cent; January 23, 1950, £40 per cent and March 1, 1950, 50 per cent.

Kalgoorlie Electric.—An issue to shareholders of £250,000 5 per cent convertible debenture stock is to be made at par; £50,000 is to be redeemable in 1955 and the remainder either in equal parts yearly to 1967 by drawings, or wholly at the company's option at £102 per cent after 1955.

Kennings.—Preference shareholders are offered 100,000 5½ per cent cumulative £1 preference shares at 21s. a share. Shares not taken up may be applied for by preference and ordinary shareholders.

English Electric.—The company has under consideration a programme of financing which includes an issue of debenture stock and a small rights issue of ordinary shares to ordinary shareholders. It is intended to increase the authorised capital from £6,500,000 to £8,000,000.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'T'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (m) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (k) Assumed dividend 18½% after capital bonus. (l) To latest redemption date. † Free of tax. (m) Yield basis 35% after capital bonus. (n) Yield basis 25½% after capital bonus.

Statistical Summary

EXCHEQUER RETURNS

For the week ended December 31, 1949, total ordinary revenue was £66,286,000, against ordinary expenditure of £45,211,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £12,097,000 the deficit accrued since April 1st is £34,268,000 compared with a surplus of £260,821,000 for the corresponding period a year ago.

The Colombo Conference

THE Colombo conference is now well launched on its "sea of troubles." Apart from the supremely encouraging fact that a Commonwealth of equally free Western and Asian nations can meet together in Asia to discuss Asian affairs—an all but inconceivable idea only five years ago—the situation that the Commonwealth Ministers have to study in Colombo is dark indeed. The split within their own ranks, between Pakistan and India, will not appear on the official agenda. Yet all the mediatory powers of the Commonwealth are presumably being mobilised to end a situation in which these two nations—which are, among other things, each other's best customers—not only spend over half their budgets on military preparations directed against each other but have actually declared a commercial war.

High on the official agenda is the problem of drafting a peace treaty for Japan. This task, which confronts the Commonwealth with a difficult choice between the revival of some military capacity in Japan and the risk of a successful Communist coup, has not been made any easier by the United States' failure to resolve the same dilemma. It appears that an American draft treaty had been expected as a basis for Commonwealth discussion. The State Department has not, however, succeeded in reconciling the need for some Japanese forces with that of reassuring Japan's neighbours, particularly in the Philippines. Nor has a way been found to combine the American military authorities' desire to retain bases in Japan and the islands with the need to leave no opening for Communist attacks on "American *imperialism*." A preliminary draft would undoubtedly have given a focus to Commonwealth discussion and it is unlikely that the Australian and New Zealand governments—which have delayed their recognition of Communist China in order to keep in step with American policy—will be ready to commit themselves without a prior knowledge of the attitude of the United States.

The issue of Indian-Pakistani relations and the peace treaty for Japan are, in reality, subordinate to the main item on the Colombo agenda—the menacing, ubiquitous and baffling problem of Communism in Asia. If official speeches are any guide to the conference's attitude, it would seem that a great deal of emphasis will be laid upon plans for accelerating economic development in South-East Asia so that the apocalyptic promises of Communism can be met by the sober reality of rising standards of living. Before the conference opened, Mr Noel Baker gave an interview to the press, much of which he devoted to the economic assistance Asia would require; and in Mr Senanayake's opening address, the theme that economic development is the answer to Communism was taken up again. This view is, of course, very widespread in the free world and has been encouraged by the Chinese collapse. The Nationalists received American armed assistance but the regime proved too corrupt and incompetent to make use of it. The argument has therefore tended to swing to the other extreme. The whole answer is believed to lie in curing the

economic and social conditions which encouraged the defection of the Chinese peasant; and since the task before the Colombo conference is to prevent the repetition of the Chinese collapse in other parts of Asia, the conclusion appears obvious. Economic projects and considerations must have pride of place.

*

There are two reasons why this line of approach is false, or at the best represents only a half-truth. The first is the time factor. Economic development among backward millions still haunted by the Malthusian spectre is a slow business. Yet the pressure of Communism on Indo-China, Malaya and Burma is of today, on Siam and Indonesia and the Philippines, at the best, of tomorrow. The second reason is that at every turn economic development is dependent upon strategic and political considerations. In the Colombo discussions, as in every other attempt to deal realistically with the world's ills, economic projects are a useless vanity until a sound political basis for them has been laid.

The most immediate requirement is obviously that of defence. Communists at least do not share the western illusion that one can dispense with bayonets provided there is a promise of bread. The French workers who are trying to sabotage the despatch of arms to Bao Dai's armies in Indo-China, the guerillas in the Malayan jungle and the Burmese countryside believe in the priority of force. The first assurance that the Commonwealth needs to give not only to its own Asian partners but to the newly formed independent Asian nations is of assistance against violent internal or external attack. The matter is admittedly one of great delicacy. Countries which have only just seen the armies of the western colonial powers depart do not want them back again. The provision of military supplies and technical advisers would not, however, be open to the same objection, particularly if the offer of Indian and Pakistani officers and experts were a central feature of the scheme. In this context, the absorption of both in the Kashmir dispute entails the gravest possible weakening of independent Asia's capacity to resist Communist imperialism. It appears that a scheme exists, at least on paper, for making an offer of joint British-Indian military and financial assistance to Burma. The precedent might be extended so as to include other Commonwealth members and to offer aid to other threatened nations.

Such a policy would, naturally, entail careful co-ordination with American strategic plans. Nevertheless, it would not amount to the formal "Pacific Pact" for which some propaganda has been made. This proposal, with its suggestion of clearcut fronts in a world-wide cold war, has been received with some hostility in parts of Asia, particularly in India, where resistance to Communism at home is still found consistent with the hope of neutrality in the world at large. The more modest alternative of guaranteeing military supplies and technical advice might be said to resemble American policy at the time of Lend-lease. It would leave the governments which were ready to resist Communism in no doubt of the support they would receive, but it would not entail the formal mutual obligations of a full-scale military pact.

It is not simply the primacy of military security that should dislodge economic problems from first place at the Colombo conference. Even where the substance of the matter is economic—for instance, in the whole range of projects for investment and development—political considerations are, in fact, decisive. The scale and effectiveness of economic development throughout the area turns upon the competence of the governments concerned. In one sense, the western powers are extremely fortunate in the political development of the last few years. The authority of the governments in India, Pakistan, Ceylon and Indonesia is based upon the only emotion capable of providing an antidote to the secular religion of Communism. Nationalism, recently triumphant in the struggle against colonial dependence, still has a magnetic appeal for the masses. The new identification of Communism with Chinese expansionism, the scourge of Asia's past, may also help to maintain the emotional hold of the new national governments on their peoples. But this same nationalism, while it creates a real measure of political stability, can also become an insurmountable obstacle to speedy and efficient economic development. The dilemma which defeated the Americans in China lay between the incompetence and corruption of the officials handling American aid, and the nationalist resentment that forbade any American to handle it directly himself. It is possible, indeed likely, that the position in the Asian Dominions and in Indonesia is not so tragic. All have had experience of western administration throughout the country for over three centuries. All have in the immediate past been able to profit by Burma's melancholy mistake in dispensing too soon with European advisers and officials. Yet the underlying dilemma remains between the insufficient numbers and insufficient experience of Asian officials and businessmen responsible for development and the nationalism which forbids too great a dependence upon outside instruction, experience and advice.

*

There is perhaps no better instance of this obstacle to progress than the attitude of Asian governments—or indeed of governments in other under-developed areas—to the vital issue of agriculture. Even if there were no other lesson to be gained from the Communist victory in China, it is that reconstruction must begin with the peasant and that agricultural investment must have the highest priority. Improved methods of agriculture, better implements, rural roads and water supplies, the beginnings of electrification—it is by such means that a genuine economic revolution can be achieved not only in South East Asia but in the Middle East and South America as well. Yet the plans of most of the local governments are concentrated upon ambitious projects for industrialisation, inspired by the nationalism that prompts them to achieve independence from the old industrial centres of the West. It may be that the new government in Indonesia will prove an exception to this rule. It is seeking American loans to accomplish in the first place a special plan of development for agriculture which includes the use of better seeds, better fertilizers, improved breeds of cattle and greater use of the country's fish supplies. But in countries where the official outlook is less realistic, what can western advisers and experts do to persuade governments to accept an emphasis on agriculture which in their eyes still suggests "colonial servitude?"

One possibility deserves examination at Colombo. Mr. Noel Baker spoke of Britain's hope of working through the specialised agencies of the United Nations and referred to the possible role of the World Bank. Experience

and guidance given through an international agency on which Asian, American and European peoples meet on a footing of equality might prove more acceptable than the same assistance offered under a national flag. Hitherto, it has been hard to discern any distinctively British or Commonwealth policy in relation to the United Nations agencies. In fact, the only noteworthy event in recent months has been the rebuff delivered by the Colonial Development Corporation to the World Bank. But the Commonwealth, acting in close co-operation with the United States, could undoubtedly influence the policy of the agencies and at the same time enhance their authority. By seconding to them the ablest experts, scientists and administrators and making them the chief channels of western aid to Asia, the immense obstacle of Asian nationalism might still be by-passed. The United Nations is now considering an $86 million programme of technical assistance to backward areas. The direction is set, the machinery exists. But there is little sign of British or even American enthusiasm to set the vehicle in motion.

It is not only over the Asian aspect of economic development that political considerations are paramount. It cannot be emphasised too often that, for the time being at least, any "bold new programme" of western investment in Asia must be a decision of political necessity far more than a normal economic venture. The conditions that will tempt private western capital—and that means, to all intents and purposes, private American capital—into Asia on a sufficient scale do not for the time being exist and must first be created. Capital cannot be tempted out when political conditions are uncertain, when exchange control threatens the convertibility of profits and the repatriation of capital, when possibilities for investment are wide open at home. It is a fact that in the first three years after the war private American investment abroad amounted to only $2 billion—and three-quarters of that figure was invested in oil. There can be no realistic reliance on the hope that "the job will be done by private investment." It will not. The decision to assist the economic development of Asia—a vital and necessary decision—must be taken by governments and sustained by governments. Later, certainly, private investment may be tempted in by such expedients as government guarantees or remissions of tax. But here and now the decision to extend aid is political. In other words, it is the United States and the Commonwealth Governments that must decide to act. President Truman, it is true, accepted the need for government action a year ago, but his programme of $25 million for technical assistance has still to receive congressional approval.

If one point emerges more than any other from a consideration of Asia's immediate needs, it is that no programme can be effective without the closest co-operation between the Commonwealth and the United States. Possibly it is on this issue that the most momentous political decision has yet to be made. For each to accept the other as a close partner in Asia is in fact a very grave and far-reaching decision and it is not at all certain that either side has faced the implications. The British have on occasion shown profound distrust of American activities in Asia, particularly in India and the Indian Ocean. On the American side, as for instance in some of the proposals for the disposal of the sterling balances, there have been signs of a lingering suspicion that both sterling area and Commonwealth are an anti-American plot. This kind of rivalry is a ruinous political luxury in an area under imminent Communist threat. So great are the needs of Asia—military and economic—and so small, relatively, the resources that the west can put at its disposal, that Anglo-American competition is nothing short of ludicrous. Even if nothing closer and more confident can be managed, the two systems can at least establish spheres of predominant responsibility—America, say, in Japan, the Philippines, Siam and Indonesia; the Commonwealth within its own territories and in Burma. But such a division should be regarded as a pitiful minimum. The real need is for joint action in the sphere of military assistance, through each agency of the United Nations in economic development, in direct political negotiation. The statesmen who have been conferring at Colombo have the chance of laying the foundations of such co-operation on the side of the Commonwealth, and who shall say whether that opportunity may ever recur?

The Liberals' Dilemma

THERE is no party for whom the imminence of the general election is more fateful than it is for the Liberals. For them the 1950 general election must be decisive. They hope to increase their representation in parliament from its present strength of ten; and though the ambition to hold the balance in the next parliament is chimerical, any increase would show that the long ebb tide had turned and would encourage hopes of one day again becoming a force to be reckoned with at Westminster. But, if, on the other hand, the Liberals win only their present ten, or perhaps even fewer, seats, then that will be the end—not indeed of Liberalism—but of the Liberal Party as a political party in the accepted sense. The party which was once the driving force of British politics, the party which despite its slow decline has still the greatest record of achievement to its credit, faces its last chance. It behoves not only Liberals but all who care about liberalism in its non-party sense to examine the way in which the Liberal Party intends to fight the election.

It is necessary, first of all, to justify the use of such apocalyptic language, for at first sight it would seem that the Liberal Party has a reasonable chance both of attracting votes and of winning seats next month. The various opinion polls have been registering a popular vote for the Liberals varying between ten and fourteen per cent. If the Liberals had candidates in every constituency this would mean a Liberal vote of between 2,500,000 and 3,500,000 (compared with rather less than 2,250,000 in 1945). If there were any direct connection between votes and seats it would mean a parliamentary representation of between 60 and 85 seats. But even the 400 candidates that the Liberals claim to be putting into the field will leave more than one-third of the constituencies uncovered. When allowance is made for this (and also, of course, for the presumption that the candidates will be put up in the most promising places), the public opinion polls would indicate a Liberal vote of not more than about 10 per cent of the total poll—that is, of not much more than last time.

More important than these exercises in arithmetic is the melancholy fact that for a small party there is no equation that relates popular votes to successful parliamentary candidates. It is true that there is an empiric calculation by which (as a correspondent suggested last week) the relative parliamentary strengths of the two major parties can be deduced from the relative amount of popular votes accorded to them. But with a system of direct representation, the same does not hold true of a party which has fallen out of the running for effective power. In fact any arithmetical calculation may well be inverted ; that is to say, the Liberals may increase their popular vote and yet lose seats. For it is an inescapable fact that the Liberal is almost bound to lose in a contest where he has opponents from both the major parties. Of the ten present Liberals, eight were elected in 1945 in straight contests. But one has lost his seat already through the abolition of the university vote, and of the rest only one (Mr Hopkin Morris in Merionethshire) is not yet threatened with both Labour and Conservative opponents next month. There are, of course, possibilities for which such calculations as this cannot allow. The Liberal candidate, having read the gloomy prognostications of the public opinion polls and the newspapers, might well say with Chesterton:

> And when the pedants bade us mark
> What cold mechanic happenings
> Must come, our souls said in the dark
> "Belike ; but there are likelier things."

But heroics do not make good politics ; and while hoping for the best, the friends of the Liberal Party would do well to cherish no illusions.

★

In these tragic circumstances, the strategy that the Liberal Party pursues in this election should have two—possibly somewhat divergent—objectives. First, it should, of course, strive to achieve the best result possible in this general election. But secondly, it should take account of the contingency that, when the results come in, Liberals may have to abandon the attempt to pursue their aims through parliamentary representatives of their own, and it should, therefore, aim to put the Liberal movement into as favourable a position as possible for the new course that will then have to be set.

Not every section of opinion within the party approves of the policy of nominating 400 candidates. There is one school of thought that argues that this will merely dissipate the very limited resources, of money and of manpower, that are available, and that it would have been far better to have concentrated on fighting effectively some fifty seats where Liberal ideas and organisations are well entrenched. But most of those who hold this view are not only—it may be not even mainly—concerned with the fortunes of the Liberal Party ; they are also anxious not to lose any chance of turning the Government out. The strong probability is that, at this election, many more Liberals would vote Conservative in the absence of a Liberal candidate than would vote Labour ; and if so, the fewer Liberal candidates the better the Conservatives' chances. This is not always so—it may be that a small centre party always tends to split the opposition vote, whatever the complexion of the party in office—but the universal belief that it is so this year accounts for the fact—contrary to the fashion of the 'thirties—that it is Lord Woolton who most assiduously woos the Liberals and deplores the stubbornness of their candidacies, while Mr Morrison is almost paternal in his benevolence towards them.

But the main body of Liberal opinion stands pat on the view that it is not their business to worry about which of the other parties will be helped or hindered by their action ; their job is to do the best they can for the Liberal Party. From this point of view, the argument for concentrating on fifty constituencies has one fatal defect. For which are the fifty constituencies where the Liberal candidates have a sporting chance, in a three-cornered fight, even with all the resources of the party concentrated behind them ? Except for the barest handful of Welsh seats, the Liberals' hopes turn on the accidents that can happen in large numbers. Even those who hope for thirty seats cannot name them. And obviously, if this is the case, the more candidates the greater the chance of lucky accidents. To concentrate on fifty constituencies might not produce one more seat in those fifty, but it would throw away the chance of picking up a few in the other 350 that would be abandoned.

★

So far as this election is concerned, therefore, there is some logic, of a rather desperate kind, behind the 400-candidate policy—at least for those Liberals who are really indifferent between the other parties. But when the question is seen against the background of the future course of a party that may have to abandon parliamentary ambitions, then it is far more open. If the Liberal future is that of an extra-parliamentary movement seeking to achieve its aims, not through its own members of parliament, but through those of other parties, does the promotion of 400 candidates help or hinder ? On the one hand it can be argued that the appearance in a constituency of a Liberal candidate immediately makes it unnecessary for either the Socialist or the Tory to pay any attention to Liberal views ; the absence of a Liberal candidate forces them both to woo the Liberal vote. Moreover, if the Liberals are doomed to banishment from Parliament it is perhaps better that they should cease upon the midnight without the shame and discouragement of four hundred defeated candidates, and nearly that number of lost deposits. But on the other hand, if the Liberal movement is to start upon an extra-parliamentary career, the more votes it can point to the better, and the only way to get votes is to go out and collect them. A Liberal poll of 3,000,000 would be a clear warning to both the major parties that there is a considerable body of opinion in Britain which believes neither in Socialism nor in Conservatism. It would provide a firm base upon which new plans, for action on other lines, could be laid. It must not be supposed that the party chiefs have not pondered long and painfully upon this balance of arguments. Whatever they do, it is a choice of evils. Whatever the result, it is all too likely that they will be blamed for it. The friendly observer will perhaps accord the benefit of the doubt to the 400-candidates policy. This time it may do Liberalism, on balance, more good than harm. But unless, by a miracle, the last fling succeeds far beyond the bounds of what seems possible, other methods will have to be sought in the future.

Retrospect of Parliament—I

The Political Scene

THE twelfth Parliament of the present century is not to meet again. The prorogation will be extended and Parliament will be dissolved on February 3rd for a new general election on the 23rd. A general election ought to be concerned wholly with the future. In fact, a great deal of the campaign looks backward, in the attempt to attract praise and divert blame for what has been done in the lifetime of the dead parliament. It is proposed in a short series of articles to review the parliamentary history (as distinct from the policies and administration of the Government) of the last four and a half years.

A political historian of the future, reviewing the Parliament of 1945-50, might be struck by four things. First, despite the further growth in the importance of the party machines, caucus government has not yet arrived in Britain ; the parliamentary leaders are still the masters rather than the servants of their parties. Second, both the major parties have managed to preserve their own cohesion within parliament and to prevent rifts within the parties from having any serious political effect. Third, despite the fury of political attack and counter-attack in the press and on the hustings, there has been a surprising measure of agreement on many aspects of policy. Over important areas of public affairs, notably foreign affairs and international economic policy, there has been more agreement than disagreement between the opposing front benches. Fourth, despite a strong infusion of young blood into the heart of Westminster, the leadership of the parties is almost exclusively in the hands of the older men who formed the wartime Cabinet, many of whom were in high office or high in their party's counsels in the thirties.

The first two developments have been particularly noticeable in the Labour Party. One of the most striking political tendencies of the postwar years has been the increasing ease with which the members of the Government have been able to dominate the annual party conference and to ignore any adverse resolutions passed there. This was, of course, largely due to the mere fact of being members of a government, armed with information and responsibility. But it is, nevertheless, important, since the constitution of the Labour Party was specifically recast, after the MacDonald-Snowden debacle, in order to impose a large measure of control over the parliamentary leadership of the party.

In the second place, within the Parliamentary Labour Party, the beginning of this Parliament saw a move by a section of its back benchers which, had it succeeded, might have introduced something like the caucus systems of Australia and New Zealand, and have extended considerably the influence of the rank and file over their leaders. From the autumn of 1945 onwards, the left wing of the Parliamentary Labour Party set out to bend Mr Bevin's foreign policy towards the left. They followed this with efforts to influence policy on manpower (and, in particular, on conscription) and to a lesser degree on economic matters. That this had any success at all was due partly to the inexperience of the majority of the new Labour MPs and partly to the energy and ability of the left wing. The attempt at control was developed through the series of specialised committees which the Labour Party had established in 1945, and in particular in the External Affairs Committee. Instead of devoting itself to research, this body evolved into a pressure group which, first over Indonesia, then over Greece, and later over the reform of the diplomatic service, set out to exercise influence from below over Ministers. It took all of Mr Bevin's massive strength—backed on occasion by his equally effective impatience—to check this process. By March, 1946, he brought the issue to a head by demanding and achieving what was, in fact, a vote of confidence at a party meeting. The pressure was then turned on Mr A. V. Alexander, whose retreat in April, 1947, on the issue of conscription was due directly to this pressure from below. This aroused alarm among the party leaders, who then emasculated these specialised committees, transferring their functions to a series of regional groups where the more active members of the left wing were swamped effectively by the loyal majority. Moreover, events abroad had come to the rescue of the Government, for by early 1948 even the most obdurate fellow travellers in the party had been silenced, if not converted, by the intransigence of Soviet policy.

Mr Herbert Morrison, the Leader of the House, contrived to win this internal struggle without having for-

£1,000 ON RETIREMENT . . .

. . . at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12*s.* 6*d.* from age thirty. Only £4 18*s.* 4*d.* more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application

OUTSTANDING VALUE IN LIFE ASSURANCE

mally to retrace the step of relaxing the more rigid forms of party discipline which he had taken at the beginning of the Parliament. Nevertheless, the discipline of the Labour Party is every whit as strict in 1950 as it was in 1945. There can also be no doubt that the pressure of the party machine on the individual Member of Parliament, whatever his party, is now greater than ever. He has had to work far harder than ever before—though the greater part of the reason for that is to be found in the pressure of his constituents—and he has been less free to decide for himself how he should vote. But this growing strength of party discipline is exercised upon the back benchers in the interests of their leaders; it is the direct opposite of caucus control as it has developed in other countries.

The united front which the Labour Party now presents is, of course, partly ascribable to fear that disunity would give the Conservatives their opportunity. But a great deal of credit must go to Mr Herbert Morrison, who has shown himself to be one of the great parliamentary tacticians. Moreover, the Prime Minister, though he will not rank as a great national leader, is heard with respect and authority not only in the Cabinet, but in the parliamentary Party.

*

For the Conservative Party at Westminster this has been a difficult four and a half years. It has had to learn to do something which does not come naturally to the Tory mind—to oppose a government on matters of principle rather than to exercise its "natural" right to govern empirically. It was a process which was complicated by the fact that on a wide range of subjects the Opposition discovered that Labour policy was very close to its own. On the principles of foreign affairs, on defence and export policy and on the principles of the main social reforms such as national insurance and the health service, they could differ only in method and not in aim. This severely restricted the number of issues on which they could restore their morale by launching a real offensive. Mr Churchill did his best to rally his troops by picking a quarrel in the autumn of 1945 on the slowness of demobilisation, but it was not until the repeal of the Trade Disputes Act came up in 1946 that the Opposition could discover any real *point d'appui*. Even the first nationalisation measures—the Bank of England and the coal mines—had behind them a large volume of non-Labour support, so that the real battle of nationalisation was not joined until road transport was included in the Transport Bill. It was not until the debate on the Steel Bill began in 1948 that the Conservatives could launch an attack in Parliament with a strong body of popular support at their back.

Inside the Conservative Party in the House of Commons, an elaborate system of sixteen specialised committees was developed to formulate policy and allow for a detailed study of measures. This system has had the advantage of ensuring that speakers should be well briefed and of bringing forward likely back bench speakers. The Conservative Party also developed a highly skilled parliamentary secretariat. The 1922 Committee of back benchers has remained active, but there have been no "revolts" comparable to those within the Labour Party or within the Conservative Party itself at the time of Munich. The Tory Reform Committee and the Progress Trust, both active in the last Parliament, have disappeared. The Tories have shown assiduity and a high degree of discipline throughout this period, but for all this the spirit of urgent and penetrating opposition has developed slowly—indeed, the lack of it has been the subject of frequent taunts by Mr Morrison.

Mr Churchill started off by assuming the full responsibilities of the Leader of the Opposition, and the mocking deference with which he asked Mr Morrison the "business question" each Thursday became a parliamentary institution. But as the months went by and as Mr Churchill's energies became devoted to more congenial tasks, this day-to-day leadership fell more and more to Mr Eden. This process was accelerated after the Conservative candidate's failure in the South Hammersmith by-election had produced definite, if polite, murmurings against Mr Churchill's dilettante leadership. But on all major occasions Mr Churchill's vigour has been undiminished, and several of his speeches in this Parliament, such as that on Palestine in the summer of 1946, will rank among his greatest efforts, worthy of comparison with all but the pick of his wartime masterpieces.

But, in general, the Tories have been slow in learning the technique of opposition and there have been only too many occasions when, as in last November's groundnuts debate, they have wasted an obvious opportunity. This weakness has not been confined to the back benches. Though Mr Eden has developed immensely as a parliamentary figure during these years, his lieutenants have been often inadequate. Sir David Maxwell Fyfe, Mr Stanley and Mr Butler are the only members of the Opposition front bench whose performance in this Parliament has enhanced the reputation with which they began it. This is not to disparage two very important—and very dissimilar—figures in the House of Lords. Lord Salisbury has shown himself to be the only parliamentarian of Mr Morrison's calibre, and a man capable of thinking in terms of statesmanship. Lord Woolton, who has achieved a reconstruction of the Conservative Party machine which exceeds the most sanguine hopes of his colleagues, has emerged as a figure of immense power in Conservative Party counsels. It is arguable that, were it not for the titanic figure of Mr Churchill, the Conservative Party might be in danger of that kind of rule by the party machine which they have always condemned in their opponents.

For the Liberal Nationals, it has been a Parliament marked by one continuing indignity—the Government's refusal to see them as anything but Tories in disguise—and they have produced no parliamentary figure capable of rising above this treatment. The orthodox Liberals, however, have managed to make their mark as an independent party despite their sadly depleted ranks. Mr Frank Byers has emerged, after a shaky start, as one of the most promising young men of this Parliament. But ten members are too small a number to carry the burden of day-to-day parliamentary representation, and there have been some issues on which a Liberal voice has not been heard at all.

This Parliament has seen the disappearance of a familiar, if small, party—the ILP. Its prestige in the Commons derived largely from the personal influence of Mr James Maxton, and after his death in 1947 the other three members drifted rapidly enough into the ranks of orthodox Labour. In the same way the one Common Wealth member, Mr Millington, soon found his way to the Labour benches, and another, Sir Richard Acland, had the Transport House cloak flung over him for the Gravesend by-election. The place of the ILP has not been taken in any way by the "Prittites"—the four ex-Labour MPs who, during 1949, gathered around Mr D. N. Pritt. They have never in fact sought really to function as an independent group, partly because at least three of them have hoped to be re-instated in the Labour Party, and partly because they split very rapidly over the issue of Tito. Nor have the Communists been effective spokesmen, even of their own cause.

*

The future political historian might observe a fifth development during this Parliament, the rise in the prestige of the House of Lords at a time when its powers and composition were most in question. On the whole, defence, colonial policy, Commonwealth affairs and general economic policy have been discussed on a much more informed and more authoritative plane in the upper than in the lower house. Lord Keynes on the America Loan, the India debate, the debates on the Parliament Bill, on Marshall Aid, and on devaluation far outstripped in brilliance and insight their counterparts in the lower house.

The historian would almost certainly conclude that it has been an important Parliament—and not only or mainly by virtue of the legislation it has passed. The renewed party conflict, the greatness of the issues involved, the new status of an MP as the friend of his constituent against the machinations of bureaucracy, have contributed towards removing from the status of burgess or of knight of the shire the taint associated with the word "politician" in the thirties. The long queues for admission to the public galleries of the House of Commons are a sign of renewed contact between the people and their legislature.

Housing Policy—II

Housing Costs

THE previous article advanced the thesis that, once the emergency shortage of houses was made good—a point that, with the provision of the millionth house since the war, must be closely approaching—the future of the house-building industry would largely depend on the level of costs.

On this crucial point of the cost of house-building, there is remarkably little authentic information. The Minister of Health has sedulously declined to give any figures of housing costs either for the regions, or the country as a whole, on the pretext that this would deter contractors from lowering their tender prices. This argument may have had some force in the early days, when contractors or local authorities had had little experience of postwar conditions. It carries no force now when contractors are fully aware of the policy of their local councils as regards costs. What is necessary is that the country as a whole and ratepayers in particular should be aware of the burdens they are expected to carry and of the great privileges that the tenants of new council houses enjoy. How many of the occupants of a new 10-storey block of flats in St. Pancras, are aware that the average subsidy per flat is £2 a week?

In the absence of official figures on costs *The Economist* has on two occasions made its own inquiries. The fruits of the first inquiry were published in the issue of July 10, 1948. The results of the second are printed below. It must be emphasised that the sample is very small and that the conclusions must, therefore, be very tentative. If, however, they do not reflect the national situation, Mr Bevan has only himself to thank. The fact that these figures do not exaggerate the national situation is borne out by a speech made by Sir Thomas Bennett at the Housing Conference at Brighton on November 24th last. Sir Thomas as a private architect may no longer have access to the official figures which he could command when he was Director of Works and Controller of Temporary Housing at the Ministry of Works during the war, but his views and his figures must command respect. They are reproduced at the bottom of the table.

The table shows that while the contract price of these houses has been between £1,200 and £1,300, extras may be as much as £200 more. In addition the cost of land and site preparation adds another £180 to £230 to the price; of this the cost of land is usually much the smaller part—in most cases £25 to £75 a house. It is small wonder that the Minister of Health has recently issued instructions to local authorities to reduce the cost of roads and amenities on the site. Before the war the average cost of buying the land and preparing the site averaged £70 a house.

The figures also show that in the case of only two authorities were rent and subsidy together sufficient to balance the economic rent. Even this exaggerates the solvency of Authority 2, since architects' and quantity surveyors' fees and clerk of works' wages and incidentals are not, in this case, included in the rent calculations. These might add another £30 to the capital cost.

The average figures of costs, which apply to houses completed in 1948 and 1949 only, conceal a fairly wide range of costs and some difference of practice in the items charged by authorities to their Housing Accounts. Of the houses completed in 1949 the final capital cost varies between £1,576 and £1,960. Nor from the letters received from local authorities was there any indication that costs had begun to fall. In his speech Sir Thomas Bennett calculated that at current costs a three-bedroomed house of 1,120 square feet would cost £1,735 to build and that the average cost of land and site development would be £200, making a total of £1,935. These figures are high compared to those obtained by our own inquiry. On the other hand they refer to more recent contracts, and are intended to cover the whole cost of site development, which some authorities charge in part to other accounts, such as the Highways and Open Spaces Accounts.

Whichever of these figures is nearest to the real local or national averages it is clear that local authorities cannot go on meeting deficits on their housing accounts indefinitely—particularly as they are already paying £5 10s. for each house each year as their contribution to the statutory subsidy of £22.

In the case of the London County Council the deficits are even more serious. Figures given at the meeting of

the Council on December 6th reveal an annual average deficit over the six months January to June, 1949, of £14 12s. 2d. per house for 3,424 houses. This means that instead of a statutory subsidy of £22 per house a year, the actual subsidy is £36 a year or all but 14s. a week. The only present alternative to the payment of these additional subsidies at the ratepayer's expense is to put up the gross rents charged for the new houses to something like 30s. a week—in which case it is believed that the tenants will not be the sort of family for whom subsidised houses were intended under the 1946 Housing Act.

It should be clear that a situation such as this cannot continue for long. Very few local authorities are able or willing to bear upon their rates any concealed subsidies on top of their statutory commitment of £5 10s. per house per year—and in view of the defects of the rating system it is not right that they should. As the deficits mount and the pressure for houses slackens, a point will come when the local authorities begin to curtail their housing programmes. So long as the shortage of houses was a crucial national problem, pressure from Whitehall has driven them along. But it too will diminish as the emergency passes and the need for economy grows. Within a very short time, it is going to be necessary for everybody concerned with housing policy to do some hard thinking on the first principles of the matter. And if the process of taking thought resulted — say in 1951—in a pause in the building programme it might do good, not only in the context of wider economic policy, but also in the narrower framework of the building industry, by cutting out some of the ground beneath the present monstrous level of costs.

COSTS AND RENTS OF HOUSES COMPLETED BY LOCAL AUTHORITIES IN 1948-49.

Authority and Rateable Value	Average Contract Price	Average Extras	Average Land and Site Costs	Average Total Cost	Weekly Rent (incl. Rates)	Weekly Rent (excl. Rates)	Annual Surplus or Deficit Per House

Sir Thos. Bennett's Figures	1,562	...	220	1,899	30 10	23 10	Nil

Notes.—1. All houses included in the survey were completed in 1948 or 1949. The number of houses covered by authorities 1 to 7 numbered 2,024. Authorities 8 and 9 did not give figures of the numbers of houses.
2. The figures in column (5) include the cost of architects' and surveyors' fees, loan costs and incidentals during construction.
3. The deficits shown in column (8) are reckoned after deducting the statutory subsidy of £22 per annum per house (of which the local authority pays one-quarter).

It can be taken for granted that all sections of opinion would agree to the indefinite continuance of subsidised building to clear the slums and to relieve ascertained overcrowding. It is obvious that any such programme should be in the hands of the local authorities and that if it were pursued energetically (though here again high costs impose a handicap) it would keep them very busy. The real question is whether, over and above this, there will be throughout the 1950s a justification for general subsidies in aid of the building of houses that are required neither for the clearance of slums nor for the relief of overcrowding (within the meaning of the Act). If the answer is Yes, then the financial burden is going to be heavy. At present the statutory subsidy for 100,000 dwellings (including a fair proportion of flats) works out at £2,600,000 a year, plus an unspecified further amount in deficits on the local authorities' housing accounts. A total of two million subsidised houses (enough to house not more than 1 in 6 of the total population) would cost the taxpayer and the ratepayer some £50 or £60 million a year. If this one-sixth of the population were at all closely identified with the poorest sixth, who could not otherwise afford decent housing, this might perhaps be a reasonable extension of the welfare state—if the welfare state could afford it. But as everybody knows, it is merely the accidents of geography and local government which provide citizen A with a model house at 20s. a week and a £30 subsidy while an equally deserving citizen B pays 10s. for an unsubsidised hovel or £2 for two furnished rooms. This sort of thing is neither democratic nor provident.

But if, on the other hand, the general subsidies were abolished, as they were in 1931, it would become impossible to build new houses of the standard dimensions to rent for less than 35s. or even more a week. The present situation is not like that of 1931, when costs were low and falling, so that the economic rent of an unsubsidised house was not above the level that was conventionally regarded as proper. It may be, however, that the conventional ideas are wrong. The average earnings of an adult male wage-earner are now officially estimated at £7 per week (which is also just about the point at which a married man with two children begins to pay income tax). A gross rent (including rates) of 35s. a week would represent exactly 25 per cent of the wage, which is high, but would not be regarded as nearly so high in some other countries as it is in England. If the gross rent could be got down to 30s. a week, then it might reasonably be said that any family with average earnings could afford to pay it.

It should not be by any means impossible to secure reductions in building costs of this magnitude. Moreover, there is another set of possibilities. The Englishman has not only come to expect to get his housing for a lower proportion of his income than other people, he has also come to expect more house for it. As Sir Thomas Bennett pointed out in the speech already referred to, the typical 3-bedroom house in America covers only 792 square feet, against the present British standard of 1,120 square feet; there is usually no hall and no shed, though the tenants may obtain permission to erect a shed. In Sweden houses are of a standard at least equal to our own but in general the number of people living in them is higher. In Switzerland tenants and tradesmen are expected to walk farther and the provision of roads for vehicles is much less lavish.

Any suggestions of this kind would, of course, provoke an outcry from Mr Bevan. It is admittedly hard to retreat from a standard once it is set up. But what is the justification for conferring this standard, at very heavy public expense, on a small fraction only of those who deserve it? Housing subsidies, unlike other forms of consumers' subsidies, cannot from their nature be equitable.

* * *

Along what lines, then, does future housing policy lie? There seem to be four broad lines of policy. First, it seems clear that at current costs subsidised building by local authorities cannot and should not take so large a share of the resources of the building industry. The main preoccupation of local authorities in the future should be slum clearance and the relief of overcrowding and to this end fresh surveys of local conditions will be needed. The main purpose of this building will be to enter those fields which private enterprise has so far conspicuously failed to harvest—particularly in the blighted areas of big cities. And since most of these families will be in the lowest income groups a very serious attempt will have to be made to omit luxuries which these tenants cannot be expected to pay for.

Secondly, private enterprise should be given a freer hand within the territory to be left to its share. Once the immediate shortage is overcome (and subject always to the supply of imported timber), anyone should be allowed to build any house that he can pay for. It is unfashionable now to utter any reminder of the fact that when houses are added, even at the top of the value range, houses are vacated further down. There is no social disgrace in secondhand houses, as there is in secondhand clothes—indeed, the best people prefer them. Provided that secondhand houses are kept from degenerating into slums and that the provisions against overcrowding are enforced, they can provide excellent housing for the poor at a fraction of the rent of a new council house. There is no point at all in aiming at a new house for every working-class family. Even if such a right were admitted for this generation, the achievement of it would itself deny it to the next.

Thirdly, if after these measures it can still be shown that there are families which cannot find adequate housing within their means, then the right remedy and the economical remedy is to subsidise these exceptional families rather than to subsidise houses which they may never get to occupy. In practice, this would mean a diversion to family allowances of some of the money saved by cutting off housing subsidies.

Fourthly, by some relief to landlords from the rigours of the rent control acts, and by greater publicity concerning current building costs, the country should be re-accustomed to rents which bear some relation to the economic costs of building and maintaining property. As it is, large numbers of tenants are now paying 1939 rents on 1949 wages—with the result that the ratepayer, the taxpayer or the private landlord is meeting costs which large numbers of tenants could readily meet themselves.

These suggestions are not intended to be more than tentative. For the salient fact that emerges from a reconsideration of postwar housing policy is that it has been conceived in the context of conditions that are now passing away, and under the pressure of political emotions so fierce that the one paramount object was to build houses without asking why and wherefore. It is easy now to recommend a progressive return to sanity. It is rather more difficult, amid all the confusion, to be sure where sanity lies.

Europe's Committees

IF Mr. Bevin, for whatever reason, does not return to the Foreign Office after the General Election, his successor should ask at the earliest possible moment to be provided with a wall chart of Europe's committees. Nothing less than a wall chart will do; for it is already been ascertained that a whole page of *The Economist* would not suffice to present the full tangled pattern of committees in which Britain's policies for defence, trade, economic recovery, political co-operation and cultural comradeship have become enmeshed with those of its western partners. Even the wall chart would be incomplete without a key to the whole range of initials (MAP, OEEC, etc.) that Ministers are now expected to know and without some system of push buttons and red lights which would make clear in a flash the course that is being taken by any paper of importance.

With such aids to understanding a Foreign Secretary might hope to grasp the consequences of referring important proposals to all appropriate committees. Thus the question of producing a standardised jeep for west European forces should be weighed not only by the financial and economic committee, military supply board, and joint logistics committees of the Council of the five Brussels Pact governments, but also by "Uniforce," at Fontainebleau, by the north, west and south European planning groups under the Atlantic Pact, and by a supply board in Washington. It might be wise, too, to refer the matter informally to the appropriate sub-committees of the Organisation for European Economic Co-operation in Paris, lest the project should affect their estimates of Europe's production, surplus steel capacity, and raw material needs in 1953. Even when that had been done, it might be advisable to ask a committee of the Consultative Assembly of the Council of Europe whether the jeep should have a right-hand or left-hand drive, and a speedometer marked in miles or kilometres.

The layman can only guess at the total number of committees now directly or indirectly concerned with the security, economic recovery and unification of western Europe. There exist sub-committees unknown even to public relations officers, and the full panoply of the Atlantic Pact system has not yet been deployed. But this much is certain: the Consultative Council of the Brussels Treaty (five members) have four Ministerial committees and a permanent commission; they have, in addition, nine advisory committees, plus the whole of Lord Montgomery's staff at Fontainebleau—say a dozen committees. In short, the Brussels Pact system, the lowest layer in the palimpsest built up in the last two years, has some 25 committees demanding the periodical

attention of Foreign, Defence and Finance Ministers, and the regular attention of permanent officials who have normal diplomatic duties as well.

The Council of Europe (12 members) is yet young—barely nine months old. But it has already produced fifteen committees and sub-committees one of which demands very close attention from Foreign Ministers. The others involve considerable travelling and homework by Members of Parliament and protracted argument with the Treasury about expenses. And this is only the beginning. Those who hope most of the Council are determined that western Europe shall eventually have committees for everything. Here they are beginning to compete with the Organisation for European Economic Co-operation in Paris, the functions of which have steadily broadened out in the course of planning and distributing Marshall Aid. It appears to have some 20 committees (most of them vertical and the rest horizontal), two of which demand periodic visits by Ministers and the rest of which call for careful watching by the Foreign Office, the Treasury, the Board of Trade, the Ministry of Supply and the Bank of England.

As might be expected, it is the last and mightiest project of all—the Atlantic Pact—that promises the most proliferation. Its founders are quite aware of the danger and have wisely concentrated as much power and responsibility as possible into the so-called Standing Group of American, British and French chiefs of staff working in Washington. But below them a complex mixture of committees and sub-committees is seething into life. Each of the five regional planning groups into which the 12 member nations have been divided would like to take a shape similar to that of the Brussels Pact military organisation already referred to.

At a modest estimate, therefore, it will take some 100 committees of varying size and degrees of importance to plan and execute the military, financial, economic and political policies in Europe to which this country is committed under its various treaties with neighbours and allies. What the cost to the British Exchequer is in foreign currency and pounds no one seems able to tell. How many men and women are involved is not known exactly. In the Treasury alone a rough estimate puts the number at 50, and the scale of effort demanded may be judged from the fact that when the OEEC (17 members) is in full session well over 1,000 persons are assembled in Paris.

It is not surprising that resentment and doubt about the usefulness and sincerity of much of this committee work are growing among British representatives and are influencing—often unconsciously—what they write and say about the whole European enterprise. They have, perhaps, a better right than some of their continental colleagues to feel in this way because it is their work that has set the standard for Europe in thoroughness and honesty of purpose. Many of them have their committee responsibilities added on to their normal duties, with the consequence that fatigue and pressure on time become associated with the idea of European co-operation—just because it is something additional, and too often something rather vague and inconclusive.

It is easier to see why the western committee system has grown so luxuriantly than to suggest ways of pruning it at such an early stage of growth. From the first the serious and ultimate aim of the British and of many Europeans has been the Atlantic Pact, the partnership with America through which alone security and economic recovery might be achieved. But the way to the Atlantic Pact lay through the Dunkirk Treaty, the Brussels Pact, the Marshall Plan and all that it implied in the way of common planning. As for the Council of Europe, it has provided one way out—not only for the British—of some of the dilemmas raised by Mr Bevin's policy of western union and its advocacy by the largely right wing European Movement. In other words, a part of what has been erected in the last two years might, on close examination, prove to be merely scaffolding, and not part of the permanent executive and planning structure that is needed to make Atlantic and European unity a reality.

*

It is probably too early to make this examination; much of the scaffolding is still needed if only to conceal the design of the main building. There has been too little time for healthy competition among Europe's five score committees to mark out the weak from the strong. Smaller countries have tasted only the first thrills of entering into the defence councils of the mighty. The Council of Europe is only just beginning, through its committees, to clarify some of the ideas with which it asserted its claim for public attention. As for the OEEC, its future after 1952 is uncertain. But what is possible and desirable straight away is that the British and the French—that is, the largest and most influential of the western European nations—should resolutely set their faces against any further growth of the committee system, and should give attention to the overlappings, delays and irritations that already exist. This is a matter in which they should act together, because any independent proposal from London in favour of pruning will simply revive the old accusation that the British are dragging their feet. The French can afford even less than we can the dispersal of scarce talent and the frustration of able men into which they have been rushed by the urgency of Europe's needs and America's expectations. And on security grounds alone it is most important that the planning organisation of the Atlantic Pact should be kept small and compact.

It is important, too, that statesmen and their advisers should not be harassed by jobs and journeys that are not of first-class importance. Too much of the committee work now going on in Europe springs from a desire of all governments to have an equal say on everything, to keep tempers sweet and prestige erect. Too often matters are referred to committees in the hope that officials sitting around a table will be able to find reasons for putting off decisions about which Foreign, Defence and Finance Ministers are loth to consult their cabinet colleagues. This is, in fact, the main weakness of Mr Bevin's "functional approach" to European unity—that it entrusts to committees, which are by nature indecisive, and to officials, who are by training cautious, investigation of ideas which demand not only careful study, but also generosity of mind. One result is that the wood is sometimes not seen for the trees. The committees, indeed, do almost everything but "function" as European bodies, and their meticulous work provides the maximum opportunities for what Mr Churchill in 1940 condemned, in a minute on a Foreign Office draft:

> The ideas set forth appeared to me to err in trying to be too clever, to enter into refinements of policy unsuited to the tragic simplicity and grandeur of the times and the issues at stake.

NOTES OF THE WEEK

At Last

The announcement made from Downing Street on Tuesday night that the dissolution of Parliament will be proclaimed on February 3rd so as to bring about a general election on February 23rd has been welcomed with relief. Parliament will not be recalled, and the Labour party rally at the beginning of February has been cancelled for reasons of time and expense. There will be a new government in power by the beginning of March able to devote itself to the task of framing the year's financial and economic policy. The only administrative casualty may be the February review of farm prices—which the Government must be most anxious to postpone, since it is committed, as part of the cuts in expenditure, to reducing the subsidies on agriculture.

Presumably there will be three weeks of fairly quiet campaigning followed by three weeks of intense activity once the candidates have been officially nominated. During the first period it would seem that the political broadcasts will be of great importance. They had a considerable effect upon the course of the 1945 election and there is reason to believe that the importance of the wireless as a means of influence has increased even further since then. In fact, Mr Churchill's broadcast may be the decisive factor in shaping the opinions of that fraction of the electorate which has not yet made up its mind. There will therefore be considerable nervousness in Tory circles when Mr Churchill takes the air on January 21st, lest he utter something as politically suicidal as his "Gestapo" speech of 1945.

The 1950 election will be fought not only on a new register, but under a new Representation of the People Act, and the whole election will be conducted under the shadow of uncertainty about the proper definition of election expenses. It is a great pity that the question—so charged with party bitterness—could not have been authoritatively cleared up before the election began. In fact, most of the interests concerned with opposing nationalisation have decided not to be silenced by uncertainty, although they have all quite correctly decided to stop their poster campaigns.

* * *

The State of the Unions

The TUC General Council has secured its majority for wages stabilisation, but it has won a somewhat hollow victory. The vote in favour of the official policy at the special conference of union executives was 4,263,000 against 3,606,000 compared with 5,421,000 to 2,032,000 for the policy of restraint at a similar conference in February, 1948. The present figures are perhaps a more honest reflection of the state of mind of the unions, and show that fewer union executives supported the policy with their tongues in their cheek than two years ago. Thus the Amalgamated Engineering Union and the National Union of Railwaymen, both of which have claims outstanding, voted openly against the General Council. Most of the building unions, on the other hand, decided in the end to vote in support, having been able to square their support for wage restraint with an assurance that their own cost-of-living sliding scale would be exempted from the general standstill proposals.

The most serious blow to the TUC has been delivered by the miners. Both the executive of the National Union of Mineworkers and the special delegate conference had agreed, admittedly by a narrow margin, to recommend to their branches that the TUC's policy should be supported, even though this meant dropping the claim for the lower-paid workers. Only one district—the Midlands—actually voted in favour, and large majorities were recorded against the policy in Scotland, South Wales and Kent. The NUM was the only union to consult its rank and file, and the response is a significant indication of the current mood of the workers. The miners' vote, as one of their leaders pointed out, does not affect in any way their loyalty to the Labour Government. Nevertheless the fact that the districts have voted solidly against their leaders' advice is an unpleasant shock both to the general council of the TUC and to the Government.

* * *

Protests from the Civil Servants

Hard on the miners' rejection of the wage stabilisation policy comes the publication of the correspondence between the Association of First Division Civil Servants and the Prime Minister on the salary increase proposed by the Chorley Committee. Last week-end, when it became known that the protest to the Prime Minister had been made, Sir Stafford Cripps gave a tart and schoolmasterish rebuke to those sections of the press which described it as a revolt of the higher civil servants. But the Association's letter, couched in such phrases as "deep sense of injustice," "despondency and cynicism" and virtually accusing the Government of trying to run the administration on the cheap, is certainly startling enough to merit the prominence given to the protest in the press.

The central fact is that the two staff associations, representing the administrative and professional grades of the civil service, wrote to the Prime Minister protesting against the Cabinet's decision not to implement the increases in pay recommended by the Chorley Committee in February, 1949. These were due to come into effect on October 1st and were postponed, as part of the policy following from devaluation and wages stabilisation, only two days before that date.

With the whole edifice of the Government's wage policy in jeopardy, the Prime Minister's refusal was to be expected. But the previous sympathy with the civil servants for their enforced example to the nation is heightened by the detailed statement which accompanied the letter to the Prime Minister giving in chronological order the stages in the negotiations for higher salaries since 1943. It is not an edifying story, and there is all too much evidence that the Treasury has used every device to postpone or shelve the issue. Even so the civil servants might still have just squeezed through before the *débâcle* of devaluation if the Chorley Committee's proposals had been implemented, as promised, in August or September. As it was, the Treasury's decision to implement them on October 1st in the event proved fatal.

The association made great play of the price which will have to be paid in the form of lowered morale and decreasing efficiency. The Prime Minister rejected these as pessimistic forebodings. Nevertheless the present situation should not be allowed to continue for very much longer. The civil servants are too dignified and responsible to press the matter to the point of a strike—to this extent, the word "revolt" is unjustified—and the Cabinet, knowing this, will be all too ready to forget the subject. It is an unpleasing reminder that there has been no Government policy for wages or salaries during the past four and a half years, but simply a series of unplanned retreats before pressure from the unions.

*

Some explanation should be given of the decision of the First Division Association to go to arbitration. The Civil Service Arbitration Tribunal will only be asked to adjudicate on the salaries of the two lowest grades of the administrative class, and the association will not press for the award to be

implemented until the Chorley recommendations for the higher grades are put into effect by the Government. The object of the arbitration is to get a decision on the lower grades, which were not covered by the Chorley Committee and on which the Treasury has refused to come to any conclusion.

* * *

Chinese Puzzles

With Parliament not sitting and public attention concentrated on the election date, the question of whether and when the "Central People's Government of the People's Republic of China" should receive British *de jure* recognition aroused neither impassioned nor very intelligent debate. It is true that the experts on international law entered the arena, but no sooner had one appeared to justify the Foreign Office arguments by principle and precedent than another appeared to demolish both.

Those who have in the past indulged in the most persistent criticism of Mao Tse-tung and his men did so because there was a marked tendency to maintain that they were more Chinese than Communist, and that the lessons of eastern Europe would have no application in Peking and Shanghai. Such illusions seem to have been dispersed and Mr Mayhew has made quite clear the reserve with which the British Government will approach men who have made no secret of their hostility. This makes it all the more clear that the British Government have deliberately played the only card they held against the Chinese Communists without any clear idea of what the benefits might be. Quite apart from the failure to keep the Commonwealth Governments in line, and the risks of falling out of step with the Americans, recognition may prove to have been a serious blunder. The testing time is yet to come, when the rights of consuls, the claims of traders and the treatment that British subjects may expect to receive come up for discussion.

There is no doubt that American public opinion may be deeply irritated by some of the consequences of the British action. It seems inevitable that governments which recognise the Peking government will have sooner or later to vote against the retention of Nationalist representatives of China at the United Nations—that is, against the Americans. Already there has been a scene in the Security Council, of which the Nationalist Dr Tsiang is the chairman. And among these governments will be some that are either receiving or hoping to receive American military and economic aid. The State Department has the tolerance and wisdom to take such a situation in its stride, but there will be other powerful voices which will try to exploit it.

President Truman has cleared up the misunderstanding over American intentions in Formosa, but he is going to postpone recognition until Peking shows "that it will observe its international obligations." Clearly, the time that will take will depend not only on the skill of British diplomacy and on the behaviour of Mao Tse-tung, but also on the President's estimate of election prospects.

* * *

Resistance Movement for Germany

Nowhere does the Communist "peace campaign" inspire more bellicose language, more militant imagery than in the Russian and Communist directed Socialist Unity Party which controls eastern Germany. The "national front" which it is trying to build up all over Germany through propaganda committees has had its tasks defined with special emphasis during the last three weeks, which include the meetings held last month in honour of Stalin's birthday. According to Wilhelm Pieck, the east German President, there is to be "unity of action among the working class of Germany," and "every form of resistance must be employed to overcome national oppression and build up the national resistance movement." (The enemy is, of course, "the British US colonial masters and their lackeys.") In other words popular resistance to the occupation authorities in Federal Germany is to be preached and organised from Berlin; and, if the western Germans strongly resist such preaching from such a source, there will—if necessary—be civil war. Pieck can have meant nothing less by saying that

> The coming struggle . . will be waged against the enemies of the people with such intensity that they will not know whether they are coming or going.

The project is less fantastic than it might seem. Admittedly, the majority of western Germans do not want to live under the kind of regime that Pieck and his Soviet masters have created, and their fear and hatred of the Russians is one reason for the remarkable lack of hostile activity—whether by sabotage, demonstration or strike—against the Americans, the British and the French. But the programme of the National Front, drawn up and published last October, is calculated to rouse nationalist feeling strong enough—in certain circumstances—to overcome distrust of the Communists. It demands the unity of Germany, abolition of the Ruhr Statute, a peace treaty granting "complete sovereignty" over foreign policy and trade, a struggle against the inclusion of Germany in the Atlantic Pact and European Union, and "an end to expropriation of the German economy by foreign capitalists"—which is as close as the Communists dare go to demanding the end of the Marshall aid on which Federal Germany's food and raw material supplies depend.

Although this programme says nothing of the terms on which Germany could be united, it may have a certain appeal to the type of reckless German nationalist who believes he can run in harness with the Communists and then break away when success is in sight. To encourage such wishful thinking Pieck has declared that

> membership of the national front of democratic Germany does not depend on the political or social position or the outlook of any particular individual.

* * *

Berlin-Moscow Honeymoon

The Americans, British and French would do well to watch carefully the story of the Berlin-Moscow honeymoon. It might one day provide a colourful chapter in a white paper on policies in Germany. The record of endearments publicly exchanged in the last three months is as remarkable as it is nauseating. Pieck has boasted of the "unshakeable Stalin watch on the Elbe," and the Russians have reminded the Germans of Stalin's wartime phrase "Hitlers come and go, but the German people remains." Stalin's works have begun to appear in a new German edition so that "mass study" of them can be undertaken. Fritz Selbmann, Minister of Industry, has reported to a public meeting how Mr Vyshinsky said to him, when recently visiting Berlin:

> We shall conquer the world not with atom bombs, but with something which the Americans cannot produce—with our brains, our ideas and our doctrines.

This throws a startling light on Stalin's telegram of October 13th, which declared that "the German and the Soviet peoples have the greatest potentialities in Europe for executing great enterprises."

There is clearly danger not only to free Europe but also to the Russians themselves in the extravagant wooing of nationalism in which their German agents are being allowed to indulge. For it is not improbable that some German Communists hope one day to see a united nationalist movement, strong enough to throw off its dependence on direction from Moscow.

More Evidence on Capital Punishment

One thing emerged quite clearly from the evidence submitted last week by Lord Goddard, the Lord Chief Justice, to the Royal Commission on Capital Punishment: he is completely out of sympathy with the whole purpose of the commission. It was set up to consider whether the law prescribing the death penalty for murder could be modified by the establishment of degrees of murder. It marks an attempt, therefore, to find a compromise between the large body of people who hold that the death penalty should be entirely abolished and the large body of people who hold that it should be reserved for the worst murders. The Lord Chief Justice belongs to neither body. He belongs, or appears from his evidence to belong, to the minority who hold, not only that the death penalty should be retained, but that it should be enforced more strictly than it is at present. In his view, and in that of Mr Justice Humphreys, who gave evidence on the same day, there are at present too many reprieves through the exercise of the prerogative of mercy on the Home Secretary's advice. Women, they held, should not escape hanging, nor should the age of liability to suffer the death penalty be raised from 18 to 21. The black cap worn by the judge when pronouncing sentence should be retained because, said the Lord Chief Justice, it is traditional, and he saw no cause to interfere with tradition established over hundreds of years without some cause. The members of the Royal Commission must have felt themselves back in the nineteenth century.

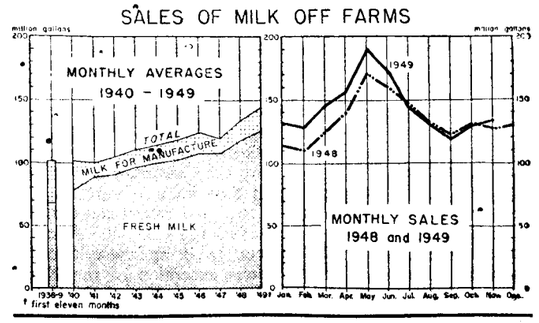
In fairness to Lord Goddard it should be said that in his written memorandum he supported the proposal for making the law conform to modern practice where one person kills another in the course of committing a felony. This, he pointed out, could be achieved by restricting an indictment of murder in such cases to those where the felony involved violence. Where, however, the Lord Chief Justice is entirely opposed to modern practice is in the Home Secretary's enquiry into the state of mind of a murderer under sentence of death even though the issue of insanity was disposed of at the trial. Both he and Mr Justice Humphreys argued that when a murderer is reprieved as the result of this enquiry it amounts to a flat reversal of the jury's verdict, the reasons for which are not made public. They would restrict this enquiry to cases where the issue of insanity was not raised at the trial or where a convict becomes insane between trial and execution.

If they are right in their interpretation of the Criminal Lunatics Act of 1884—and presumably the Royal Commission will have something to say on this point—the question of insanity and liability to hang would be more confused than ever. For the medical commission undertaking the inquiry would still apply medical standards in assessing a murderer's state of mind in contrast to the legal standards of responsibility or irresponsibility that are applied by juries. A murderer, therefore, who was indisputably insane in the medical sense, but had been found by a jury to be legally sane, would hang, whereas a similar murderer, the question of whose insanity was not raised at his trial, might escape hanging. A jury cannot possibly be expected to say whether a person is insane in the medical sense or not, and Lord Goddard's argument amounts to a plea that medical assessments should have no place in determining whether the death sentence should be carried out—in other words that there should be more executions.

* * *

Bonuses for Dick Turpin

Sir William Lawther, the president of the National Union of Mineworkers, reverted at Brighton last Sunday to the question of the motor magnates' tax-free bonus, and did much to confuse what is already a sufficiently confusing issue. There are ample grounds for deploring the payment to Mr Lord of Austin's and Sir John Black of Standard's, or indeed to anyone else, of sums of this magnitude for considerations of this sort. The agreements in respect of which they were paid are in restraint of enterprise and competition—a good reason for condemning them in any circumstances. The elephantine tactlessness, from a political and psychological point of view, of bestowing six-figure fortunes on already well-to-do individuals at this particular juncture, needs no stressing. The morality of arranging the rewards of success in industry in such a form that they do not attract tax is a matter for argument; no one is legally or morally bound so to arrange either the payments he makes or those he receives so as to incur the maximum amount of taxation, and while the accepted distinctions, for tax purposes, between capital and income remain what they are, no blame can as a matter of principle be imputed to those who take advantage of them. It may very reasonably be held, however, that principle has been stretched rather far in this case—even if the Inland Revenue should fail in the attempt to treat the payments concerned as income.



When, however, Sir William Lawther refers to these bonus payments as "the gangster methods of the Dick Turpin era" and a "wicked destroying of our national wealth," one can only recognise the incoherence of lost temper. In both cases the shareholders concerned specifically approved the payments. In neither case did any question of legality arise—whatever may be the outcome of subsequent disputes over taxability. In neither case is there any suggestion of such duress as arises, for instance, during a strike in an essential service. It is really hard to see where Dick Turpin or the somewhat anachronistic gangsters come in—or, for that matter, the "wicked destruction," since it was to the payments themselves, not to the consideration for which they were made, that Sir William alluded.

His objection is, only too obviously, to large rewards *per se*. It has always been a weakness of the Socialist case against the rich that it failed to distinguish between the return for outstanding services rendered and the tolls exacted by exploitation and the organising of scarcity. He who induces, by whatever means, his fellow-citizens to enrich him beyond a certain vaguely conceived maximum is, in this view, a public enemy. In this instance—a borderline case if ever there was one—this confusion reduces what might have been a reasoned and powerful attack to an ill-directed sputter.

* * *

Plenty of Milk

The announcement that milk is to be unrationed from January 15 until further notice marks the achievement and passing of one at least of the planners' "targets." Under the five year plan for agricultural expansion announced in the summer of 1947, by 1952 milk production was to be increased by 23 per cent over its prewar figure. As the accompanying chart shows, sales off the farms were already, by 1948, more than 23 per cent higher than the average of

1936-39. This does not, however, mean that total production was this much higher, because before the war a much bigger amount was used on the farms in cheese and butter making than is the case today.

Indeed, the contrast between the amount used on the farms now and then emphasises the difficulty with which the Ministries of Agriculture and Food and the Milk Marketing Board are now faced. It is no longer a question of securing a bigger annual production of milk, but a question of how to secure an adequate amount of milk in the winter months without over-production in the spring. In spite of the increase in autumn calving, the supply of milk, as is shown on the chart, is still very uneven throughout the year. The surplus milk of the period of plenty can be manufactured into cheese and butter; but the manufacturers cannot be expected to keep their plant idle in the period of scarcity, and in this period, therefore, the consumption of liquid milk has to be restricted in order that manufacturers can be allocated a minimum amount of milk throughout the year. The question is whether, in order to restrict the consumption of liquid milk as little as possible, the Government has not encouraged the production of too much milk over the year as a whole. If more could be used on the farms, as happened before the war, the spring glut would not be so obvious. But labour for dairy cheese making is scarce, and farm butter is not profitable with present prices for liquid milk. Farm cream is a more likely outlet, and the report that sales may shortly be allowed again is welcome.

As has repeatedly been pointed out, however, the most sensible step would be to raise the price of liquid milk to the ordinary consumer when supplies fall, with possibly a corresponding reduction in the period of abundance. An increase in price should reduce the demand enough to allow manufacturers an adequate amount in the autumn and winter without the need for rationing and allocation. The present rigid price system encourages a waste of milk by leading to over-production in the summer.

* * *

De Gasperi and the Socialists

The "cabinet crisis" for which Italy has been waiting for some weeks has now occurred. Signor De Gasperi has resigned and has been instructed by President Einaudi to form a new Cabinet—his sixth.

The timing of the Government's resignation may have suggested to the outside world that it was connected with the tragic riots in Modena in which workers, protesting against the laying off of men in a local factory, clashed with the police and lost six men and many wounded in the shooting which followed. In fact, the Cabinet's retirement had nothing to do with the demonstrations, but followed a timetable fixed by the comings and goings, consultations and decisions within the Italian Socialist Party.

The story began in the autumn of 1949. At that time, the Socialist Party was divided into four splinter groups: on the extreme left, the Nenni group, virtually indistinguishable from the Communists; next to them were the followers of Signor Romita, who broke away from the Communists as late as 1949; then came the followers of Signor Silone, who had abandoned co-operation with the Communists in 1948; and finally, the group of Signor Saragat, who were the first to abandon the Communists in 1947 and had in addition sent three Ministers to the fifth De Gasperi Cabinet. Attempts were made during the summer to bring these Socialist splinter parties (with the obvious exception of the Nenni group) into a single anti-Communist but independent Socialist Party, but the condition laid down by both Signor Silone and Signor Romita was that the new grouping should not participate in the "clerical" coalition of Signor De Gasperi and should not be committed to such major acts of policy as Italy's adherence to the Atlantic pact.

In order to show that they did not rate office above unity, the Socialist Ministers resigned in October, and it was this breaking of the coalition that decided Signor De Gasperi to reconstruct his Cabinet once the Socialist attitude had become clear. In December, the Silone and Romita sections united with the warm blessing of the Socialist International and the British Labour Party, both of which hoped to see a strong Socialist Party outside the Government as the basis of effective and non-Communist opposition. The Saragat group, however, could not accept the terms proposed and remained outside the new fusion. This month, at their own conference, they decided in favour of rejoining the coalition, and a week later Signor De Gasperi proffered his resignation and began the task of reconstructing his administration. Many of his own Christian Democrats would prefer to see all Socialists excluded from the new Cabinet, but the riots at Modena are only one more warning that a government without a courageous social policy cannot guide Italy through the next uneasy years.

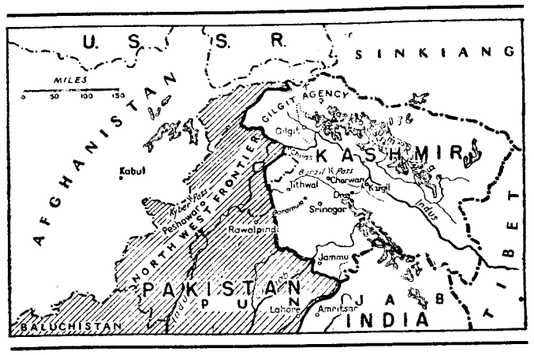
Voice for Europe's Businessmen

In recent months there have been murmurs of dissatisfaction from some of Europe's private industrialists and bankers at the treatment accorded them by the international agencies that are now moulding the future of western Europe. In particular, it is felt that they are being cold-shouldered by the Organisation for European Economic Co-operation at Paris. The OEEC, it is alleged, has become an exclusive club of civil servants, government planners and technicians who tend to neglect the experience and advice of private businessmen and even to ignore their existence.

One explanation for their discontent is the fact that, as a large part of western Europe swings from *dirigisme* into the *laisser-faire* camp, the representatives of private business are becoming a more potent—and more vocal—force on the Continent. Sooner or later they were bound to speak up and demand a larger share in the shaping of Europe's economic future.

The absence of a closer working partnership has also been deplored by a number of OEEC officials themselves, who for some months have questioned the realism of taking decisions and drawing up plans without consulting the business interests who are to execute them. This is by no means characteristic of all of OEEC's activities. Fully half the Steel Committee, for example, is composed of representatives of private industry; but elsewhere in the organisation the process of mixing government and free enterprise has apparently failed to keep pace with the speed at which state controls have been relaxed and the private entrepreneur has again come into his own.



It has been suggested that if OEEC cannot make use of his talents, the private businessman may join forces with the only alternative organisation open to him—the Council of Europe. If this happens on any substantial scale, the consequences are not hard to predict. Europe will be confronted with two organisations, both pledged to some form of "integration" and each appealing to a different set of ideologies; on the one hand there would be an OEEC, associated in the popular mind with government, planning, and Socialism, and on the other hand a Council of Europe, flavoured strongly by Conservatism.

Examples of this tendency to division are already numerous, the most recent being the experiment with regional unions—Uniscan and Finebel. These would draw a line horizontally across Europe, roughly separating the northern *dirigistes* from the southern liberals and leaving Holland to dangle in the centre. The complaints of the private businessman are, in fact, only a new reminder that one of the chief riddles for the would-be federalists to solve is how to unify an area which is half planned, half *laisser-faire*.

Rivals on the North-West Frontier

Sardar Najibullah Khan, an able and cosmopolitan Afghan, has recently achieved for his country a considerable success—the conclusion of a five-year treaty of friendship with India. This was signed by himself and the Indian Premier, Mr Nehru, just before the latter left for the Colombo Conference. Between them they have accomplished what must look to many people like an encircling movement around Pakistan, where Najibullah Khan conducted abortive negotiations for a friendship and commerce agreement a couple of years ago—not without testing the ground in London beforehand. Today, Afghanistan is at daggers drawn with Pakistan, and the new treaty cannot fail to rouse legitimate misgivings in Karachi, already alarmed by the support given in a malevolent Indian press to the Afghans' frontier and other grievances.

The North-West Frontier of the Indian sub-continent has long been both troubled and glamorous. What is the position there today? There are three salient features. First, Afghan hostility has grown steadily since Najibullah Khan failed two years ago to secure from Pakistan satisfactory commercial access for Afghanistan to the sea through the port of Karachi and the recognition of a "free Pathanistan"—whatever that may mean. Secondly, provocative propaganda and radio broadcasts from Kabul have been increased both to the North-West Frontier Province of Pakistan and to those Pathans who live under Pakistani rule. Thirdly, in spite of this, the Indian—now Pakistani—side of the frontier has seldom been quieter. This is very largely due to the fact that Pakistan has successfully adopted a new policy—which the British propounded in the late nineteen thirties but did not carry out owing to the war—of substituting civilian administration for military rule.

Friendship and trade between India and Afghanistan are obviously desirable; but it is deplorable that India and Pakistan should not be pursuing a common policy towards the neighbour that sits on a Commonwealth strategic frontier, and that Delhi should be the place chosen for an airing of Afghan grievances against Pakistan.

A Board Without a Job

The British Tourist and Holidays Board was set up by the Board of Trade in 1947 to expand the work of the Travel Association and to become a large scale tourist promotion agency. But in the course of its short and uneasy life it has apparently found that this is not nearly so simple as it sounds. The British habit when experimenting with new forms of organisation is to make do and mend with whatever lies to hand, to collect together a few promising people and leave them a free hand, a little cash, and wide terms of reference. Often—surprisingly often—it succeeds, and the instrument and the job it is to do develop, as it were, hand in hand. The Tourist Board, however, all patchwork and vagueness though it was at its inception, has not found itself.

The Board set up four ambitious committees, to deal with its £400,000-odd income, and assigned to them tourism, catering, home holidays and hotels. Tourism, together with five-sixths of its income, was handed over to the existing Travel Association, a going concern with twenty years' experience of tourist promotion behind it. Vain efforts were then made to think up some work for the other three committees, but it was found that most of the odd jobs were already being tackled elsewhere, while more ambitious or imaginative efforts were ruled out by the Board for lack of either corporate status or statutory authority.

Its constituent committees have at last grown tired of falling over each other's feet in the effort to find something worth doing to justify their existence, and are now conferring with the parent department with a view to combining themselves into a simpler team and receiving more precise instructions. At the same time their godparent, the Catering Wages Commission, has been shaking a disappointed head over them in its annual report. Now the Select Committee on Estimates has turned a very cold and searching eye on their activities and announced baldly that they had better be told what to do, given the authority to do it, and subsidised with more discrimination.

Much of the trouble is that tourism in this country is not an industry but a facet of many industries which earn their bread and butter in other ways. They will not easily believe that a collective "tourist consciousness" will eventually pay, and the Board has proved that timid half measures to convince them are a waste of time and money.

Labour on the Farm

A paper recently read to the Agricultural Economics Society by Mr F. G. Sturrock comes to the disturbing conclusion that the productivity of agricultural labour has fallen in recent years and may now be lower than before the war. Productivity is defined in this context, not as the output per worker, which, because of the switch to crop production and the improvement in yields, has certainly risen, but the amount of work accomplished per worker measured on a standard basis of "work units." The calculation of labour efficiency in terms of "work units" has been developed further in the United States, where it was even used as a basis for deferment of call-up. There is no doubt that in America labour efficiency on the farm has increased considerably as a result of mechanisation and improved techniques. In Britain it appears from a sample analysis (which may not, of course, be fully representative) that "labour-saving devices are not in fact saving labour."

This is all the more disturbing in view of the increased size of the wages bill. A sample of East Anglian farms shows that the wages bill increased from 27 per cent (1938) to 37 per cent (1948) of farm expenditure. Since the numbers employed in agriculture are unlikely to increase, the expansion of production and the continuance of agricultural prosperity now turn mainly on better use of existing labour, including, of course, the farmer's own.

*

Various factors may account for a decline in labour efficiency. Increased mechanisation undoubtedly saves man hours, but often it does not save labour costs, either because the farm is too small to dispense with a worker or because the farmer has to meet the peak demands resulting from increased crop production or because he is frightened of laying men

off while labour is scarce. While it would be grossly untrue to say that British agriculture is over-capitalised, it is the case that mechanisation has proceeded in a rather random way (under the influence of high prices) and that many farmers could well make a closer study of the relationship of machines to labour utilisation.

But there is another factor operating. All studies agree that there is a very wide gap, in labour utilisation as in other matters, between the best and the average farm. British agriculture is suffering from a malaise of too much security and too little incentive, so that, as Mr G. S. Browne pointed out in another paper to the society, "the country has not gained in production in a proportion in any way commensurate with the cost of the expansion programme. The great benefits which improved techniques could confer are not being reaped.

* * *

Help for Malenkov

An important change of duties in the Soviet Politbureau cannot be allowed to pass unnoticed, even if nothing but guesses can be made about its significance. Against the background of the celebrations for Stalin's birthday Tass announced that N. S. Khruschev, party boss of the Ukraine, has been replaced in the important headquarters at Kiev (not by a member of the Politbureau) and has been made secretary of the party organisation for Moscow city and province. At the same time Khruschev has become a secretary of the Central Committee of the Communist Party and so moves into the very heart of things.

Formerly the only Politbureau member to hold this key position was Stalin himself; subsequently Malenkov became joint secretary with Stalin and thereby seemed to come into the running for the succession. Now Khruschev is there to form a triarchy. The most likely explanation seems to be that Stalin wishes to maintain a balance of power within his *entourage*, and that he has found it wise to provide Malenkov, that rapidly rising personality, with a colleague who has a reputation as an organiser, ten years' experience in the Politbureau, and the Order of Lenin for his work in connection with the building of the Moscow Underground.

The Cominform and Japan

Violent attacks in *Pravda* and in the Cominform journal published in Bucharest on the Japanese Communist leader Mr Nosaka appear to indicate that a determined effort is about to be made to intensify anti-American agitation in Japan. So far, it seems, the Japanese Communists have been much too peaceful and moderate. What Russia requires is something really violent and troublesome which would be too much for the American authorities in Japan to handle. Mr Nosaka's idea, on the other hand, is reported to be that the Communists should go slow until there is a peace treaty which would clear the field for more aggressive Communist activity against the Japanese Government; at present the Communists can hardly make any serious disturbance in Japan without a direct clash with the occupation forces, which would probably result in suppression of the party as a legal organisation.

When Japan surrendered in 1945, the Communist Party had been more effectively suppressed there than in perhaps any other country, not excluding Nazi Germany. The principal leaders were in prison, with the exception of Mr Nosaka, who was with the Chinese Communists and whose activity during the war had been confined to propaganda to Japanese war prisoners. The Americans, as part of the democratisation of Japan, at once set free all the Communists in the prisons and allowed Mr Nosaka to return from China; soon a strong party was in being and had begun the bitter, but discreet, anti-American propaganda campaign which it has been carrying on ever since. At an early date, however, a division on tactics developed. The old party war-horse Mr Tokuda, after sixteen years in gaol, was all for making loud Marxist noises, while Mr Nosaka was for a policy of guile and subtlety, designed to exploit every kind of Japanese grievance or aspiration and even to avoid committing the party to an attack on the monarchy. More recently, since the Communist victories in China, Mr Nosaka has been busy seducing industrialists with tales of the trade they can have with China if only they will use the good offices of the Japanese Communists for making contacts.

All this bears a close resemblance to the "national front" line in Germany of the German Communists and the attempts to win over west German industrialists with prospects of opening up the Communist-controlled east European market. But similar little games with the bourgeoisie in Japan apparently do not meet with the same approval from the directors of international Communist policy. It may be that they are regarded as too dangerous for a party which has no base of power under Russian control, as the Communists have in Germany; the Russians may fear that these tactics will cause the Japanese Communists to lose their militancy and degenerate into mere parliamentarians lacking homicidal zeal. Or it may be that Mr Nosaka, whose past connections have been more with the Chinese Communists than with Russia, is for that reason distrusted in Moscow.

* * *

The Battle of the Icons

A religion must have visible emblems, both to stimulate the devotion of the faithful and to distinguish them by the test of public worship from the sceptic and the infidel. In Russia, in accordance with the ancient practice of Byzantine Christianity, the devotion of the Church has been traditionally centred on pictures of saints, and this habit has been taken over by Russian Communism.

Within the Soviet Union this involves no complications; no question of precedence can arise, for the hagiology is fixed, with Marx and Engels as the precursors, and Lenin and Stalin as the fulfilment of prophecy. But it seems that in China difficulties have arisen over the pictorial layout required by the victorious Communists. At the time of the proclamation of the People's Government in Peking, photographs in the world press showed portraits of Marx, Engels, Lenin, Stalin, Mao Tse-tung and Chu Teh, all in a row adorning the gateways of the old Chinese capital. In this array of new divinities the foreign element outnumbered the Chinese in a ratio of two to one. Peking does not appear to have been openly critical of the official display; but in more recently conquered cities, and notably in Shanghai, it has been the object of remarks embarrassing to the Communist authorities.

To justify the Communist practice, a Shanghai newspaper recently produced an article reproving people who "cannot reconcile themselves to the practice of displaying portraits of such international figures as Marx, Engels, Lenin and Stalin." The reason why "the bandit Chiang" had not displayed the portrait of the President of the United States was that he wished to conceal the connection, whereas the present friendly relationship between China and the Soviet Union was "entirely honourable and above suspicion," so that there was no need for concealment. China was now freed from "imperialist, feudalist and compradore-capitalist oppression" thanks to the ideological weapons provided by Marxism-Leninism and "the various forms of assistance offered us by the international forces under the leadership of the Soviet Union."

A concession, however, is to be allowed to the ungrateful Chinese. The writer explains that it is not necessary to display portraits of the "international figures" on all occasions, but only on occasions which are directly related to them. So it seems that patriotic Chinese will not perpetually have to contemplate the visage of Stalin at every turn, but only at times when its absence might be reported as an affront by local Russian representatives.

Shorter Note

Volume I of the Papers of the Royal Commission on Population, dealing with family limitation (HMSO, 4s.) embodies the results of an inquiry among some thousands of married women, so selected as to constitute the nearest possible approach to a random sample. It provides an unprecedented wealth of material on the use and effectiveness of various methods of birth control, on fertility and infertility, and on contemporary attitudes to family size. To the lay reader perhaps the most interesting point is the disclosure of the high proportion of pregnancies which are still unwanted or, at least, unplanned. About 23 per cent of all pregnancies among women using control (of all types) fall into this category. Evidently the forces tending to a fall in the birth-rate have by no means exhausted themselves. In the less reliable assessment of motive it is worth noticing that the reasons mentioned for family limitation are overwhelmingly economic, relating either to income or to housing difficulties.

London's Water

OUR supply of water has of late engaged some of the attention it deserves, and Parliament will, in the ensuing session, be called on to take measures for increasing it and obtaining it from different sources. Numerous pamphlets—the usual heralds of a fierce parliamentary contest—have been published, either impugning the conduct of the present water companies or advocating some mode of supply different from theirs. . . . Since 1807, however, when attention was very forcibly directed to the subject, and some new water companies were started, the water has been filtered and purified before it has been delivered. In the large reservoirs mentioned belonging to each company the water deposits much of the matter suspended in it. It is passed through beds of "sharp sand" to filter it, and chemical as well as mechanical means are employed to make it fit to drink. . . . The Thames water has, in fact, long been renowned, and for many years, we believe, no other was allowed to be supplied to our men-of-war when fitted out in the Eastern naval ports. It had a reputation, like Madeira, of becoming sick—depositing what did not properly belong to it—and then improving by age and a sea voyage. Such facts should be very satisfactory to the Londoners, for, after all that is said on the subject, do what scientific men or schemers will, artesian wells have failed; tapping the chalk at Watford does not promise much; the water of the Verulam and the Oundle will be neither purer nor so abundant as that of the Thames—do what we may, therefore, the Thames must ever be, as it has been since the 15th century, the chief source of our supply. . . . After all the noise, too, that has been made on the subject, the quantity of extraneous matter derived from the population, notwithstanding their increase, bears but a small proportion to the volume of water and the earthy impurities every shower washes into it from all the surrounding country. Clearly, therefore, our business on this subject is not to leave the Thames, but keep out of it as much as possible every contaminating substance, and adopt every means in our power to render perfectly pure every drop of water we take from it.

How many People Make a Football?

When quality and ability to stand up to knocking about are evidenced in a product, thoughts are seldom given to the diverse processes and operations and their attendant craftsmen, which contributed to the finished article.

Processing can be even more important than the material itself; and Spence Chemicals are made to meet users' essential technical requirements. Alum for Tanning, and TPO (Titanium Potassium Oxalate) for the dyeing and staining of leather are but two Spence Products which are used in the production of high quality finished articles.

Letters to the Editor

Overseas Students

SIR,—I was glad to read in *The Economist* of January 7, 1950, that you support the activities of the British Council in helping colonial students who are studying in this country. From my personal experience as a Palestinian Arab student in this country, I can assure you that the colonial and other students also appreciate what is done for them by the British Council.

On the start of the hostilities in Palestine early in 1948, I, with many of my Arab colleagues, had our financial resources from Palestine abruptly and completely cut. One of the conditions attached by the Home Office to the grant to us of permission to stay in this country was that we enter no employment either paid or unpaid without permission, and the authorities at the beginning refused to alter this condition, thus leaving us without any visible means of support apart from the meagre assistance granted by the National Assistance Board. Repeated appeals to the various Arab States and to the Arab League for help failed. After over a year, the International Students Service assumed responsibility for our maintenance, and the funds which this organisation collected for this purpose came mainly from British private sources. Now that these funds have been exhausted, the British Council has assumed responsibility for our maintenance. It will not, of course, be long now for us to complete our courses of study.

It is natural that I should feel embittered about the course which events took in Palestine, and that I should have laid some of the blame on Britain. But now, I must admit that I have been deeply touched by the help given to me in my desperate need. I am now grateful to Britain and its people and my original animosity has been replaced by love.—Yours faithfully, PALESTINIAN ARAB

Gray's Inn, W.C.1

Electoral Facts

SIR,—Your Correspondent's article on Electoral Facts rightly makes forecasting dependent on the findings of public opinion polls; too great faith should not, however, be placed on their accuracy. It is wrong to suggest that their main sources of error are "ineradicable biases and sampling fluctuations" and that Dr Gallup's failure in 1948 was in large measure due to "carelessness and over-confidence engendered by past successes."

The error in a poll prediction is the net result of gross swings of support between the date of interview and Election Day; swings due to voters who changed party, to voters who had not intended voting, and to intending voters who did not vote. If these swings cancel out, well and good; but it is dangerous, as Dr Gallup discovered, to assume that they will.

Moreover, the poll respondent may be unintentionally insincere until confronted with the need for action to suit his words. Answers to the question: "If there were a general election tomorrow, how would you vote?" have full meaning only when it is purposeless to elicit them because the election is today. The outcome of a national election, whether in this country or in the United States, depends on human decisions and hence on factors more delicate and numerous than public opinion polls can accurately record.—Yours faithfully,

Maresfield, Gerrards Cross, Bucks H. FIELD

The WEA

SIR,—There are three statements in your note on the Workers Educational Association over which my experience differs from that of the writer of the note.

First, students' homework has not dwindled. I attended a tutorial class in Rotherham in 1914 and the written work required and produced was not better in quality and quantity than obtains in many tutorial classes now. Except for the years of the recent war I would say it has not varied much in 35 years.

Second, the mingling of persons of different status produces in my experience good educational results. I had a tutorial class in economics two years ago which consisted entirely of manual workers and I found it lacking in the vigour and stimulus which comes from the pooling of experiences gained in different walks of life. Incidentally the Rotherham class had as students along with clerks, foundry workers, etc., the secretary of the British Wagon Co. and a Congregational minister.

Thirdly, as to the title, if there were no organisation which catered specifically for manual workers there would be few working-class people taking advantage of adult education of a liberal kind. Since the Government subsidises the cost of teaching, classes must be open to all who wish to join, but the WEA in its publicity and its subjects tries to attract workers.

This is not to suggest that we do as well as we ought but we keep on trying.—Yours faithfully, RICHARD EVANS

Senior Staff Tutor, Department of Adult Education

University College of Hull

Burma in Dissolution

SIR,—Your leader on Burma in Dissolution appears to give priority "to the task of strengthening the Central Government and its military forces."

When Burma left the British Commonwealth its Government took over a country in good running order with any amount of good will as well as cash credit and military forces. What are the causes of its present weakness?

The Burmese Government requires *awza*—a compound of respect, face, character, reliability, credit, standing—in order to "restore the authority of the state." An increase in arms would be merely an increase in the process of dissolution which began when the Government had arms, cash, and prospects, unless an attempt is made to discover and to remove the causes of the present position. For it is becoming well known that in the Karen "rebel" areas such as Toungoo there is no disorder or dacoity or racial trouble but a peaceful condition of affairs with schools functioning, food sufficient, prices low; and the capture of an area by government forces is the signal for an outbreak of large scale dacoity. There have been attacks by a Spitfire upon Toungoo—where there is no sort of defence for the inhabitants against the air—one of which caused four casualties, two of them fatal, and those two Burmese!

Mr C. F. Grant's letter calling for assistance to shift the Karen people into a Karen area is much more realistic, but there is reason to suppose that a considerable section of the Karen people would prefer to live among the Burmese if they could be justly treated, and would not wish to be segregated. In the coming trouble with China—which has been on the menu ever since the Japanese surrender—the internal support of the Karen people is essential to the Burmese, but the present aim of extermination will merely increase the empty spaces of Burma into which the Chinese can enter with ease.—Yours faithfully, TAWTHA

Books and Publications

Du Côté de Chez Schacht

"Dollar Crisis: Causes and Cure." By T. Balogh. Basil Blackwell. 269 + xli pages. 15s.

MR BALOGH is a writer to whom it is unconscionably hard for a dissenting critic to be fair. Though not in fact an extremist he expresses himself with all the extremist's bludgeoning intolerance; his manner is pontifical and his manners downright bad. The temptation is almost overwhelming to roll up one's sleeves, slip a heavy weight into a sock, and administer tit for tat to the best of one's abilities. The temptation should be resisted. This book deserves serious study and contains much that is valuable even to those who most fervently dislike its author's views.

Its main thesis can be broadly stated as follows. The disproportion between the economic power of the dollar and non-dollar areas, while exaggerated by war, is not a once-for-all difficulty remediable by once-for-all measures and avoidable thereafter by adherence to the classic rules of international competition, but a continuing dynamic element in the world economic situation. Any large segment of the world economy whose rate of economic progress is sensibly greater than that of the rest imposes on them a deflationary strain which may be, and in this case would be, intolerable if it were not deliberately counteracted. (The ordinary arguments to the contrary, concerning relative advantage, increasing specialisation, and so forth, are dismissed as "theological" and—*pace* Keynes—wholly irrelevant.) The United States' own problem of dynamic equilibrium is itself virtually insoluble except by an overspill of investment into underdeveloped areas. These problems can be solved in conjunction, but only thus. Mr Balogh envisages an international investment fund, embodying and expanding the principles of the Fourth Point, fed by the contributions of the richest members (particularly the United States) and working through loans and grants—the interest on the former not accruing to the lenders to create new transfer problems but financing the latter. Coupled with an international bank of issue, its notes acceptable as lawful reserve by all central banks of member states, this mechanism should at the same time safeguard the United States from boom and bust and convert its influence on world economic affairs from a deflationary menace to a promise of progressive expansion.

So far, so good. The idea might be hard to sell to the United States and the mechanism might prove complex and hard to work. But at least it is a genuinely international and constructive idea supported by arguments of powerful logic to which no summary paragraph can do justice; and one can place much more faith than Mr Balogh in the alternative classical forces of equilibrium without feeling it desirable or feasible to give them their heads forthwith. To turn, however, from the long-run issue to matters of immediate policy, internal and European, is to plunge into a real Schachtian miasma. Mr Balogh's primary assumption, enlarged upon in due course, is that the healthy economy is one that enjoys a controlled but permanent inflationary tension and a constant pressure towards equality. Any country whose inflationary tension is (intentionally or otherwise) lower, whose egalitarianism is less drastic, than those of its most left-minded neighbours, is by definition anti-social. The virtuous (e.g. Britain) must therefore be safeguarded against the unemployment-mongers (e.g. Belgium) by an elaborate system of deflation-proof bulkheads; controls, so far from being relaxed, must be multiplied and tightened; notably, they must be applied to capital movements within the sterling area—a wide *Lebensraum* may obviously have its inconveniences.

To criticise Mr Balogh's notion of a healthy economy would be unprofitable here. Let his case, therefore, be granted—controls, penalties on success and all. The majority, let it be assumed, like it that way; the minority, let it be further assumed, are as much the majority's fair game as were Hitler's Jews. The ideal, then, is a steady "inflationary tension," with the surplus purchasing power steered by rationing into "innocuous" uses (e.g., travel in otherwise insufficiently overcrowded railway corridors), with productive resources steered by controls to wherever economic strategy demands, and—here comes the real rub—with a corresponding redeployment of labour by collectively determined wage differentials. Only those countries whose economies measure up to this ideal are fit for membership of democratic international society. . . . Surely this is a more wildly unrealistic basis for economic policy than any provided by the "theological" adherents of liberal economics. (For Mr Balogh the word "liberal" is of course a term of abuse.) Traditional British respect for law has only just stood up (or has it?) to the present degree of control—supposed, moreover, to be temporary. In no other country is there either the standard of civic morality or the administrative expertise (Mr Balogh is severe enough even on British experts) to work permanently, dynamically and rationally such a system—unless, of course, all pretence of democratic procedure be abandoned. If the nations of Europe have retreated from the controlled, chronically-flatulent economy it is not because their masses are disfranchised or their leaders malevolent halfwits; it is because they found the thing unworkable. What response, in administrative skill and public compliance, could be expected for the further, and in Mr Balogh's view essential, extension of control to the wage system? No economist can answer. The really relevant views would be those of Buttercup, the TUC horse; and even were they, *per impossibile*, to be favourable, one doubts whether his Continental counterparts would prove equally quiet to ride or drive.

The German Record

"The Struggle for Democracy in Germany." Edited by Gabriel A. Almond. North Carolina University Press. $4.00. (London. Geoffrey Cumberlege, 21s.) 345 pages.

THE seven American experts who contribute to this symposium on postwar Germany have to a certain extent been overtaken by events. The situation in Germany has changed so radically since the establishment of the Federal Republic that any study which is obliged to stop at the end of 1948 is bound to make the reader feel that he has been left in the air. Yet the basic problem with which the book deals still remains to be solved. The task of turning Germany into a stable working democracy secure against both Nazi and Communist totalitarianism is only just begun.

The seven studies in this book are concerned with two main aspects of this task. They begin by tracing the liberal democratic spirit in Germany from the opponents of Bismarck to the underground opponents of Hitler; and they go on to describe the policies—political, economic, administrative and cultural—of the four occupation powers and their effect upon the rebirth of German political life. They are distinguished by a careful and wholly praiseworthy attempt to treat these controversial topics with objectivity. They are also, unfortunately, distinguished by a certain dullness which detracts from their readability but does not detract from their value as a source of useful information on the economic and political facts of life in postwar Germany. A rather surprising omission is any adequate account of the problem of the German refugees from the east. The most absorbing and interesting chapters are those dealing with "resistance and repression under the Nazis" and with the "social composition of the German resistance." The information on the extent of the German resistance must always be scrappy and incomplete owing to the success with

which the Gestapo uncovered and destroyed it during the war years. But all that can be gleaned from surviving anti-Nazis and from those Gestapo reports and statistics which escaped destruction at the time of the German surrender, is here set forth in a fascinating study.

A Hurried View

"A History of France." By André Maurois. Jonathan Cape. 540 pages. 25s.

M. MAUROIS has followed up his popular History of England with a single volume history of France which sets out to tell the whole complicated story of that country from the cave dwellers of Perigord to the present time. His survey is an intelligent one but it hardly justifies the claim made by one critic on his behalf that he is in "*la lignée de Renan, de Taine, de Toequeville.*"

The book is strikingly conventional in the bourgeois-nationalist-mildly-Catholic tradition. Louis XIV is "the Great King," who "dominated the Great Century"; from the Revolution and the Empire "the French have preserved love of glory and a feeling for greatness," and, on the authority of M. Etienne Gilson, we learn that for five centuries "everything which was French was universal, and everything which was universal was French."

A writer who seeks to tell so long and crowded a story in a single volume has to decide what to leave out in order to gain room to interpret the facts of his story. In his determination to be complete M. Maurois is compelled to hurry his breathless reader through events inadequately explained. This is felt particularly in the field of social and economic history, where neither the havoc caused to France by Louis XIV's reign, nor the background of the Revolution of 1789, nor the effects of the industrial revolution of the nineteenth century are analysed in any depth. Even from his own strictly political point of view M. Maurois' sense of proportion seems deficient. The Commune of 1871 is dismissed in two paragraphs and, though we are told that "from the June days of 1848, and the days of the Commune, dates that secession of the proletariat from which France has so greatly suffered and which has made her political life so different from that of England or the United States" the theme is never developed. No serious effort is made in later chapters to trace the development of the Socialist and Communist parties in France or of trade-unionism as a political force.

Many readers will turn with special interest to M. Maurois' account of recent events. They will find his attitude to France's wartime allies somewhat grudging. The responsibility for Munich is placed squarely on British shoulders; "the French Government sacrificed everything on the altar of its agreement with England, and England refused to become involved, alleging the traditional reasons—her inability to consider hypothetical cases, the need to consult with the Dominions." Readers of Mr Wheeler-Bennett's book will not need to be reminded that this is a much over-simplified version of a complicated story, and not even his patriotic reticence can excuse M. Maurois, as historian, for failing to give his readers any glimpse of the unsavoury activities of M. Bonnet at that time. Again, no one could deduce from these pages the immensity of effort and sacrifice required from the United Kingdom, the Dominions, the United States and Soviet Russia to secure the liberation of Europe, and of France. It may, or may not, encourage M. Maurois' wartime hosts in the United States to enter a third world war quickly to be told that "France is Europe's vanguard" and that "when the main army follows it only after a space of three years, the vanguard is in danger of being overwhelmed." But it would make the history of France itself more intelligible if M. Maurois showed more clearly that Europe's vanguard, France, was in serious moral as well as military disarray before the battle began in 1939, and that, for all the heroism of its Resistance at home and abroad the story of its liberation cannot be told in terms of Petain and Darlan, Giraud and de Gaulle, but demands a wider canvas than he has chosen to employ.

Bird's-eye View only

"Asia's Trade" By B. G. Ghate. Geoffrey Cumberlege. Oxford University Press. 160 pages. 12s. 6d. 7 Rupees.

IF MR GHATE ever asked himself "Is my book really necessary?" he must have hesitated a long time over the answer. He makes no claim to original research; his figures come from the "Network of World Trade" and the "Foreign Commerce Yearbook." His own suggestions are planning gone amok. He proposes, for example, inter-Asian Corporations to market the handicrafts and allocate the capital equipment of the whole continent; there is not the slightest hint that he realises the administrative difficulties, the red tape and the inter-Asian ill-will which would inevitably result. He draws pretty organisation charts for his corporations and does not even say where the staff would come from. There has been far too much of this academic scheme making in recent years. It is time that it was realised that each handicraft, each type of machinery requires a separate skill, and that their production and sale are not suitable subjects for universal bureaucrats.

Mr Ghate's book has, nevertheless, its justification. The "Network of World Trade" has to be predigested before the majority can absorb it with pleasure; and Mr Ghate predigests admirably. His tables are well chosen and his exposition is lucid. All the main points are well brought out; one sees the great importance of rubber and jute as dollar earners; the dependence of the whole of Asia on just a handful of exports—rubber, tin, jute, rice, textiles—the disastrous effect on Japan of the drop in the American demand for silk and the size of Indonesia's favourable balance of trade before the war. For those who want a bird's-eye view, and no more, Mr Ghate's book can be warmly recommended.

THE DEBATE ON THE FOREIGN POLICY OF SWEDEN 1918-1939
by HERBERT TINGSTEN
translated by JOAN BULMAN
probable price, 21s. net

In this book, the author, who is Editor of *Dagens Nyheter*, sets, against a lightly sketched background of Swedish foreign policy in general, an account of the debate that raged on the subject of international affairs, in the public life and the Press of Sweden between the world wars. It is unique in its field, being based upon an exhaustive first-hand acquaintance with Rigsdag reports, as well as with all the relevant books, newspapers and periodicals of the period.

AMERICAN SURVEY

Welcome Back to Congress

(From Our American Staff)

A NEW *décor*, if not new decorum, awaited the Senators and Representatives as they trooped back to Washington to start the new year and the second session of the Eighty-first Congress. Last July, the House and Senate chambers were taken over by builders; ejected legislators finished the session cramped and suffocated in the conference and caucus rooms of the House and Senate Office buildings. But now the job is finished, and whether or not 1950 is the opening of a new half-century—the President has made it clear that he, along with *The Economist*, does not so regard it—it opens a new era of convenience and opulence on Capitol Hill.

Gone is the supporting maze of steel superstructure which for some years has kept the roof off the heads of the legislators. The Senate is now illumined by an oval of indirect lighting and the House by an octagon surrounded by plaques for each State—plus four hopeful vacancies. The walls are covered with damask in a design of Phrygian Caps and Liberty Bells, copiously encircled by laurel; the colour is blue and grey for the House, gold for the Senate. In the galleries, no one any longer sits behind a post, not even the marble personages, designated with some uncertainty by the doorkeeper as "late statesmen," that occupy niches at the upper level. As to the comfort of the new seats, there is disagreement; possibly the engineers held the not unreasonable view that most politicians are pre-cushioned.

Consequently, the President's visit to the House to deliver his annual message on the state of the union was staged with extra glamour. As usual, the galleries were filled early, with wives of members identifying points of interest to their neighbours: "That's FDR, Junior, standing by the second table. Looks like his father, doesn't he? . . .Yes, his mother's here, over in the diplomatic gallery with the little bit of red on her hat. . . . The member in the wheel-chair is Mr Prosser, from Cleveland. It's arthritis. Poor man, his wife had it, too. . . ." Then the doorkeeper announced successively the members of the Senate, the diplomatic corps, the Cabinet, and the President of the United States.

★

After pronouncing the state of the union good, and giving the upsurge of science first place in his review of the first half of the twentieth century, the President indicated what he thinks should be done to keep conditions good and make them better. The emphasis on domestic, rather than foreign, projects in Mr Truman's list might have been anticipated in an election year. In the area of foreign affairs, the Congress applauded his general statement that "we can never be tolerant of oppression or tyranny," his promise of continued wholehearted support of the United Nations, and his intention to maintain "a strong and well-balanced defence organisation," but his recommendation that common measures for regional defence be taken, and his request that conscription powers be renewed, were received in silence. Support of the European Recovery Programme was greeted with mild enthusiasm, as was a not-too-pointed reference to Point Four, with special attention to the Far East, though his plea for the International Trade Organisation roused no echoes. There was a dutiful response to the President's conclusion that the democratic nations must show that the benefits of their way of life can be extended to all nations and races, and not allow themselves to be forestalled by the promises of the Communists.

On the domestic side, a review of the economic progress of the last fifty years, to a present national production of $255 billion a year, was received with equanimity, broken only by applause when he underlined the need for workers and unions to "increase productivity and obtain for labour a fair share of the benefits of our economic system." Perhaps it was this applause that led Mr Truman, in the following paragraph, to reverse his text and the usual order of the first and second groups when naming the traditional trinity of business, labour, agriculture.

When it came to specific domestic measures, the President recognised the claims of business by suggesting new legislation to aid the small businessman; those of labour by proposing, once again, repeal of the Taft-Hartley Act—here, applause carried conviction and received forbidden support from the galleries—and inauguration of a labour extension service to parallel the educational work of the agricultural extension service; those of agriculture by endorsing farm income supports—without mentioning the name of the Administration's Brannan plan, which is looked upon with suspicion both by many Congressmen and many farmers. With the three major interest groups thus placated, he continued with a list that included housing and rent control; conservation of natural resources; public electricity projects—in New England as well as the Columbia Valley; the St Lawrence Seaway; and a series of scientific measures such as the recognition and exploitation of new assets in minerals, sea-water and plant-throwing, hate[illegible]elopment of useful power from atomic energy, and the creation of a National Science Foundation. Enlargement of the social security system to increase protection against the hazards of old age, unemployment and ill-health, aid to education, civil rights legislation, and liberalisation of the Displaced Persons Act completed the list and brought the President to the question of finance.

The first paragraph of this section began: "At present, largely because of the ill-considered tax reduction of the Eightieth Congress, the government is not receiving enough revenue to meet its necessary expenditures." To know what he said immediately thereafter, it was necessary for members

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

to make subsequent reference to the text of the speech. For the chamber suddenly exploded into sound: the routine reading and the routine enthusiasm were drowned in jeering laughter mixed with whistles from the Republican side. The President went on reading; his adherents manfully supplied applause to drown the laughter. As the competition continued, newspapermen in the press gallery began to try to remember a parallel instance of such treatment of a Presidential message.

When order was restored, the voice on the rostrum had reached the following sentence of the peroration: "We do not seek material prosperity for ourselves because we love luxury; we do not aid other nations because we wish to increase our power." So spoke the President, ending his report as head of state. It now becomes the function of Mr Truman to seek material prosperity and increase his power as head of the Democratic Party, and there is every indication that this is the task that will claim his primary attention until Congress goes home.

In all democratic countries, it is well understood that the last days of an administration's mandate are an unlikely time for leadership. Sometimes incumbents whose position seems strong mark time, doing nothing quietly, lest applecarts be upset. This year, and in spite of a strong position, the Democrats are apparently planning to do nothing as loudly as possible, with the expectation that this procedure will attract still more adherents. A genuine effort will probably be made to secure passage of the Bill to extend social security benefits and coverage, which has already gone through the House. But the plan to give priority to a ban on discrimination in employment (the most controversial of all civil rights measures) and to re-propose repeal of the Taft-Hartley Act is generally held to be a technique for rousing the Negro and labour vote in the big cities, rather than a serious effort to secure action. The labour vote is also an element in Mr Truman's continued sponsorship of the Brannan plan, since both some farmers and many consumers favour it. The solidarity of the Catholic vote may account for the reluctance of the Administration to make a strenuous effort to pass the Bill for federal aid to education, though the version approved by the Senate offers a way out by leaving to the several States the problem of deciding whether Catholic schools should receive a share of federal assistance. Mr Truman's legislative shopping list for this session may, therefore, be designed primarily for window-shopping—and dressing.

Scientists Take Stock

[FROM OUR AMERICAN STAFF]

TWENTY years ago, at the end of 1929, most Americans, while trying to assess the significance of the autumn's crash on the stock market, were refusing to believe that things were not as they had seemed during the preceding years. But time brought disillusionment, not only to individuals but also to the groups to which individuals belong, to families, to businesses, to trades unions, to universities, and, not least, to the state. Reactions were varied, but one was, and remains, almost universal: a widened interest in research. A baffled society, still uneasy today in spite of the recent prosperity and unprecedentedly high standard of living, wanted to know what caused the stresses and strains, even more how to achieve permanent prosperity and progress in the future—and it turned to research for the answer.

Some idea of what this appeal to research has meant could be formed in New York during the last week of 1949, when the annual meetings were held of many of the professional societies to which research men and women belong. Thousands were there—no one knows how many—jamming the city's hotels, flocking into several dozen specialised sessions every day, representing the social, the physical and the mathematical sciences. They were members of more than a dozen national organisations, most of which in turn contain sub-groups of specialists, and each one of the thousands attending left many colleagues at home, to whom oral and written reports are now being made. The formal sessions at which hundreds of prepared papers were read were only a part of the intellectual activities of the week. For every such session there were hundreds of conversations in corridors, lobbies and hotel rooms; in addition there was the "slave market," where would-be employers inspected possible new members for their staffs, and those seeking jobs, or changes in jobs, searched for new pastures. Some idea of the interest in the meetings—or at least of the judgment of skilled editors as to the interest—was shown by press reports, extensive in many papers and on the front pages of the *New York Times* and the *Wall Street Journal*.

This research profession, stimulated by popular demand to a size beyond the possible imagination of twenty years ago, flourishes in every part of the country and in every kind of institution. Every adult age group is represented, women are nearly as prominent as men, in numbers at least, and refugees are numerous. There are economists, econometricians, statisticians, psychologists, marketers, teachers, mathematicians, biologists, chemists, physicists, political scientists—and many others. There are pure thinkers, experimenters, policy-makers and executives—and more frequently than ever before the same person wears different labels on different days or even at different hours.

★

This gathering of what might be called the Fifth Estate engaged in four major pursuits. First, and perhaps most important, it examined the validity of professional disciplines and techniques. And the president of the statisticians was not the only one to question both their quality and their method. Second came reports of progress and results of work under way or just completed. All branches had much to present, including an important array of encouraging discoveries in the physical sciences. Third were the predictions, largely among the economists, and almost unprecedentedly unanimous. The year 1950, they said, would be another year of high prosperity for America, with total output and income only a little below 1949, much as 1949 was a little below 1948, and with the first half of the year perhaps slightly better than the second half. Finally, there were recommendations for what should be done. Among these strong emphasis was put on reductions in the federal budget, with particular outspokenness from Mr Paul Douglas, former president of the American Economic Association and professer at the University of Chicago, now Democratic senator from Illinois.

What occurred was a vast cross fertilisation of the professions which will affect projects and policies and students for an indefinite time and to an incalculable extent. Apart from that, no adequate summary of hundreds of formal and informal sessions is possible. Yet, it is possible—in the spirit of the profession—to formulate two hypotheses about the effects of this great dedication of men and money to enquiry into society and nature.

First, numerous analytical tools and methods have cer-

NEW YORK Herald Tribune EUROPEAN EDITION

tainly been developed ; more trained minds are focused on economic and social problems now than twenty years ago and there is more interchange among them. Knowledge is being accumulated more rapidly, and is being much more widely disseminated both within the professions and to the public. Large and impressive-looking defences have been erected both against the factors known, and against those thought to have contributed to depression in the past. More than four years have now passed since the end of the war, yet the American economy has not collapsed, as it was so widely expected to do both at home and abroad. Twice it seemed to be on the verge—immediately after the war, and again early in 1949—but both times the decline stopped far short of anything that could be called depression. This is at least *prima facie* evidence for the hope that some advance towards the goal of economic stability at a high level may have been made.

Second, this intensified, organised inquiry, building on the accumulated capital of knowledge, may be moving towards a long stride forward which will not be comparable with the creeping advances of the past. Atomic fission and the recent advance in expectancy of life may be precursors of startling alterations in the availability of resources and in social and individual behaviour. The cynic and even the realist heap such scorn on these suggestions, as reviving the "New Era" delusions of the twenties, that not many dare to develop such ideas very far even in their own minds. A thousand doubts can be poured upon them for 1950—and for decades in the future. No sane man would invest much money in them, nor counsel others to do so. But however wrong this research may be in detail or in timing, the world is more apt to benefit from, than to be harmed by, such daring suppositions.

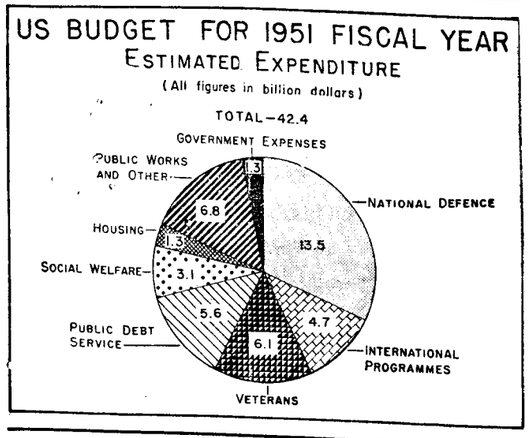
American Notes

Deficits in Prosperity

President Truman's budget for the fiscal year ending on June 30, 1951, covers the first period during which receipts are likely to be substantially affected by the fall from the peaks which were reached by incomes, employment and output towards the close of 1948. The new estimates also cover the third successive year in which the US Government has failed to balance its accounts, even though peacetime prosperity has achieved heights which were hardly imagined until recently. A year ago the President estimated that the current year's deficit would be less than $900 million, on what then seemed to be a rather shaky basis. In fact, the deficit for the fiscal year 1949-50 is now put at $5,500 million and that for 1950-51 only slightly lower, at $5,100 million.

BUDGET RECEIPTS AND EXPENDITURES
(Fiscal Years to June 30th)
(In Million Dollars)

	Receipts	Expenditures	Surplus(+) or Deficit(−)
1948	42,211	33,791	+ 8,420
1949	38,246	40,057	− 1,811
1950*	37,763	43,297	− 5,534
1951*	37,306	42,439	− 5,133



* Estimates.

Even so, Mr. Truman, from the tone of his budget message as well as from that of the annual economic message which he sent to Congress a few days earlier, obviously believes that the national economy is nicely balanced and that it should be possible to maintain stability and steady growth. He has long propounded the doctrine that the federal budget should be much more than a simple regulator of business activity. He believes that it should be a conscious instrument for the long-term expansion of the national income, and his proposals for 1950-51 are once again based solidly on the Employment Act of 1946 and on the pattern subsequently outlined for the development of the welfare state.

The President estimates that budget receipts during 1949-50 will fall by about $450 million, a relatively modest decline which is attributed mainly to the setback in company profits from the 1948 peak. On the expenditure side, the 1950-51 estimates call for a reduction of $860 million, about 2 per cent, and it is wholly natural that, in a year in which the President's party will face a bitter election campaign, the impact of lower federal expenditures is to fall upon the sector defined as "International Affairs and Finance."

*

The 1951 budget provides for an expenditure of $4,700 million on foreign activities, $1,300 million, or more than 20 per cent, less than is estimated for 1950. All segments of the European recovery programme, including that portion of aid to western Germany which has previously been provided separately, will be more than $1,000 million below the amounts provided for the same purposes in 1950. The President gave his usual warnings to Congress, and to the wider audience concerned, about the folly of cutting these expenditures any further, but they clearly represent the maximum aid upon which the debtor countries can rely, and the minimum reductions which Congress will make in appropriations for foreign affairs. The way in which the Administration has conditioned this part of its programme to meet probable Congressional reactions is well illustrated by the proposal that only $35 million should be appropriated as the essential first step in the Fourth Point programme for the development of backward areas.

Appropriations for military aid under the Mutual Defence Assistance Act will also be cut according to present estimates. For the current year Congress has provided about $1,400 million. For 1951 the Administration is asking authority for only $1,100 million, although actual expenditure will be almost twice as large as in 1950 because of the time-lag in military procurement.

With the cut in foreign items substantially greater than the decline in expenditure as a whole, the domestic items are allowed more in 1951 than in 1950. The difference is almost exactly accounted for by national defence expenditures which, including stockpiling and other ancillary items, are up, by $400 million, to $13,500 million. Estimates for economic development have gone up, as has provision for welfare and social security, while benefits to ex-Servicemen are $825 million lower on the year.

An illustration of the influence now exerted on the national economy by the federal budget (on a strictly cash basis rather than on the nominal figures given in the President's estimates) may be found in Mr Truman's declaration that the surplus of all government bodies, federal, state and local, amounted to $8,000 million in the calendar year 1948, while in 1949 there was an actual deficit of $3,000 million. Similarly, on federal account alone, the cash deficit now estimated for 1950-51 will be lower by $2,400 million than the budget figure. In the past year the Administration and Congress, sometimes working in direct opposition, seemed to enjoy remarkable good luck in the timing of moves which quickly arrested the impact of deflation. Mr Truman will be very fortunate indeed to repeat this achievement, but the experience of 1949 does at least suggest that vigorous action by the government may find an economy that is more responsive to stimulative measures than is generally recognised.

* * *

New Doors in the Far East

When President Truman announced last week that the United States had no designs on Formosa and that it would not give military aid or advice to the Chinese Nationalists there, he was finally locking the door of a stable already empty of a Far Eastern policy, and getting ready to back a new Asiatic horse—or horses. He is not yet, however, prepared to admit that a red one can be a legitimate runner, in spite of the embarrassment which this refusal to recognise the Peking government is causing to the State Department, both in the United Nations and as a result of the determination of one American shipping line to send its vessels through the Nationalist blockade of Shanghai.

Those Republicans, more noisy than numerous, who have been responsible for the storm over Formosa, are now venting on Britain their anger at the President's rebuff. They threaten to exact a penalty for its recognition of the Communist regime in China by cutting its Marshall aid next year. Failure to check Communism in one region hardly seems a reason for weakening the efforts that have successfully contained it in another, but there are many Americans who find it difficult to reconcile abandonment of the anti-Communists in China with the support being given to them in Europe. The strain on the bipartisan foreign policy has been increased by the Administration's failure to consult Congress before the President made his declaration on Formosa. This failure, largely explained by the speed with which the storm blew up, affronted Senator Vandenberg, one of those Republicans who realise the dangers of giving military aid to Formosa. It is not yet possible to judge whether Mr Vandenberg was appeased during the day which the Secretary of State has now spent with the Senate Foreign Relations Committee.

Nor is it yet known if Mr Acheson obtained the views of the Committee on whether "the general area of China," for which Congress has allocated $75 million, now includes Indonesia, Indo-China and the other Far Eastern regions where the promotion of Asiatic nationalism seems to offer the best hope of curbing Communism. By closing the Formosan door, and making it clear that the United States has no imperialist motives in China, the President stopped a hole through which American influence in the Far East had been draining away. It is now a question of finding a forceful and practical means of discouraging Communism in Asia. Many Republicans agree that this must be done ; if Senator Vandenberg can restrain his fire-eating colleagues as firmly as Mr Truman has quelled his, there may yet be a bi-partisan approach to the new doors that must be opened in the Far East. Without it, the present Congress is unlikely to do more than push them ajar, if that.

Session with a Dead-line

The second session of the Eighty-first Congress begins with one eye on the clock, for members, however deep their other disagreements, are united in a desire to disperse at least by July 31st, to prepare for the autumn campaign. A flying start is made easier this year because no time need be spent in organisation and many Bills are already in an advanced stage. Compared with Mr Truman's long list of pie-in-the-electoral sky, there also seems to be substantial agreement between Senator Lucas and Senator Taft, the Democratic and Republican spokesmen in the Senate, that the three main issues before this session are tax revision, the extension of social security and civil rights measures. In the Senate, the Democrats, at least, have attempted to speed up proceedings by promising to offer no irrelevant amendments—such as civil rights riders—that might provoke filibusters and perhaps kill the Bill under consideration.

They have not promised, however, not to vote for amendments submitted by others; and the Bill to repeal the discriminatory federal taxes on coloured margarine—on which the Senate is once more embarked—is a tempting target for Republicans who are attached either to butter or civil rights. Twenty-six dairy-State Senators hope, if they cannot kill the Bill outright and perpetuate the 64-year-old penalty taxes, to forbid the sale of coloured margarine in inter-state commerce, thus depriving States with no margarine industry of their own access to butter's much-maligned poor relation. One ace up their sleeves is the anxiety of the south to have the cotton quotas raised; planters may trade margarine—which provides an outlet for cotton-seed oil—for Republican aid in rewriting the allotment formula.

*

Though the Republican leaders nominally oppose it, the Margarine Bill may also be saddled with a Republican rider cutting excise taxes on luxuries. The Administration has come round to the view that they must go. In his economic message, President Truman urged that expansion, rather than mere stability, must be the aim of economic policy, and he promised a programme of tax revision that would stimulate business activity and investment. The catch is that, in the Administration's view, any concessions in regard to excise taxes must be paid for by new levies.

Republicans and many Democrats, however, have returned with a firm resolve to eat their political cake and have it, too: to cut taxes without authorising any new levies. The Administration has only a slender hope of averting this by insisting that tax reductions and offsetting increases be done up in one parcel. The Republican defence from charges of financial irresponsibility is that they will cut expenditures: a special committee is ceremoniously going to attach a "price tag" to every spending Bill. But even Senator Taft, who believes that excessive spending is the primary concern of voters, concedes that the most strenuous economy—always hard to practise in an election year—could hardly reduce the deficit by more than $3 billion, leaving a $2 billion gap.

* * *

FBI on Trial

It is the Federal Bureau of Investigation that is on the defensive in the pre-trial hearings on the conspiracy and espionage charges against Miss Judith Coplon and Mr Valentin Gubitchev, a Russian engineer employed by the United Nations. Judge Ryan has announced that he must dismiss the indictment unless the Government can prove that its case is not based primarily on information secured by tapping the telephones of the defendants. An appeal, on this ground, has also been lodged with the Supreme Court against Miss Coplon's conviction last June of stealing secret government documents.

That the FBI taps telephones—in a limited number of cases and with the express permission of the Attorney-General—is not denied. It does so under a rather strained interpretation of the Communications Act of 1934, which forbids "any person, not authorised by the sender, to intercept any communication and divulge or publish the existence or contents . . . thereof." The Department of Justice maintains that this wording permits wire-tapping if the information so secured is not made public, though this is hotly disputed by a former chairman of the Communications Commission, who regards wire-tapping as a threat to civil liberties. A Supreme Court ruling, however, makes it clear that information derived from tapping wires may not be used as evidence in a federal court. This is the trap into which the FBI may have stumbled. Its attempts to extricate itself have been far from dignified: the memory of its agents is singularly hazy, certain records have been destroyed, and it appears that the first court trying Miss Coplon was misled on the wire-tapping issue.

A number of unsuccessful attempts have been made to persuade a reluctant Congress to make federal wire-tapping respectable. Most Attorney-Generals find it intolerable that they are prevented from using it to secure convictions in cases of treason, espionage, kidnapping and extortion, while private practitioners, who have no desire to take their findings to court, often get off scot-free. State law varies widely; in New York, private wire-tapping is a felony, but the courts may authorise wire-tapping by the police and evidence so obtained is admissible when a case is tried.

Many New Yorkers, including the members of the Bar Association, feel that the police resort to wire-tapping in trivial cases that do not justify the violation of privacy and the risk of abuse, and they suspect that a substantial amount of unauthorised wire-tapping goes on. Last spring Mr O'Dwyer, the Mayor, charged that telephones were being tapped by his political enemies. The uproar in New York may be one reason why the Attorney-General agreed, last year, to delete from a new security Bill the section that would have legalised federal wire-tapping and permitted the use of information so obtained as evidence. But the promising vein struck by Miss Coplon's counsel is already being exploited by other defence lawyers, and, in self-defence, the Department of Justice may have to apply once more to Congress for relief.

Shorter Notes

The War Assets Administration, which went out of business at the end of 1949, had disposed of nearly $27 billion worth of government-owned surplus property since it began operations in 1946. Buildings and equipment valued at $10.5 billion were given away to local authorities for use as schools, hospitals, and so on. The remaining properties were sold for rather less than one-third of their original cost.

*

The accident rate this New Year's Eve is said to have fallen below expectations. This may be in part due to the service offered by the police in one New Jersey town: the members of the force held themselves ready, upon request and without charge, to drive home from Christmas and New Year celebrations any citizen who felt incapable of taking charge of his car himself.

*

The Commodity Exchange Authority has recommended that the top limits on trading in futures, which already apply to cotton and the principal grains, should be extended to eggs, soyabeans, wool tops and cottonseed oil, as a safeguard against developing tendencies towards excessive speculation in these commodities. The CEA already has power to control these, but no funds. It has asked, and the President supports the request, that the power should be extended to a number of other commodities, including coffee.

Let us help you determine how to

SELL THE $ MARKET

The huge American industrial market can yield some attractive and *dollar-earning* orders for British products—probably for *your* products

But to sell the American market you need to know it thoroughly With the help of McGraw-Hill's industrial research organization, you can find out exactly where your most profitable sales potential lies, how to tailor your product to American needs how to plan your sales and publicity drive.

The Board of Trade is ready to make dollars available for a well-conceived research project. Why not utilize our nation-wide staff of 400 field investigators and our corps of skilled market analysts in New York?

We'll be glad to plan with you a survey fitted to your own particular needs. Just call HOL 0056 or write

HEADQUARTERS FOR INDUSTRIAL INFORMATION

Another important reason for the speed and flexibility of Underwood Sundstrand Accounting Machines.

You're looking at the control plate of an Underwood Sundstrand Accounting Machine. This little device does virtually all the "thinking." The operator simply inserts forms and enters figures. From there, the Control Plate takes over and enables the machine to complete the work automatically. You get controlled accuracy, too. Printed evidence of accuracy is automatically furnished, on either a proof tape or an audit sheet, the instant each posting is completed. May we explain further, without obligation, in your own office?

Simplicity in Aligning Forms. Operators insert forms directly to the writing position in one fast, easy motion.

Diversification of Trade

The impression of recent diversifications is intensified by the trend of trade relations with other countries also. In 1947, 1948 and 1949 alike, the United States has furnished about 20 per cent of Hongkong's imports, or double its pre-war percentage, while taking about 10 per cent of Hongkong's exports, or the same proportion as before the war. Trade with the United Kingdom doubled in 1948 over 1947; the home country furnished 14 per cent of Hongkong's imports in 1948 and again in 1949 (considerably more than its prewar share), but took only 5 per cent of the Colony's exports in 1948, and a little more in 1949, which represents the same proportion as before the war. Imports from Japan, which were as much as 30 per cent of Hongkong's total imports before the war, are now of course a comparatively small item, but have risen from 1 per cent of the Colony's imports in 1947 to 2 per cent in 1948 and 3 per cent in 1949; exports to Japan, negligible before the war (less than 1 per cent) show 3 per cent in 1948 and 1949. Trade with Europe shows similarly small proportions, but similar rises.

More Business with America

This outline of the distribution of Hongkong's trade is illuminating. The above calculations are all of course in Hongkong dollars at current values. The figures given must be visualised as percentages of a trade which has greatly increased, in money terms: taking the 1938 figure in each case as 100, the following are approximately the recent figures: 1947 imports were 235 and exports 170; 1948 imports 335 and exports 226 and in 1949 imports 450 and exports 320. Thus, for example, trade with the United States, though keeping the same percentage of Hongkong's total trade, increased by 50 per cent in 1949, trade with the United Kingdom by 33 per cent, exports to Japan by 45 per cent—and so on. There have also been remarkable changes in the relative profitability of trading in different groups and with different destinations.

Devaluation should have made little immediate difference to Hongkong, where the position was already that of an effectively free market, but it led swiftly to price rises on the basis of increased replacement costs. Sir Stafford's appointed rate of $2.80 on "D-Dash Day" was exactly that given in the exchange shops of Hongkong on that date. By Christmas the rate had declined in the latter to 2.40. Nevertheless, to regard Hongkong as a "sterling leak" is a gross oversimplification, which may be unjust and untrue. Official returns divide Hongkong's trading partners into three groups —"hard," "sterling," and "other"—and disclose adverse visible balances with each, of fluctuating amounts, but tending to be around £1 million sterling with each group per month. But it is impracticable to attempt to estimate even roughly how much this is counterbalanced by an amount of hard-currency revenue—direct or indirect, visible or invisible —which accrues in the process in Hongkong or elsewhere in the sterling network. In respect of China alone, the number of US dollars handled is phenomenal.

Headquarters for the Far East

In April, 1949, the Hongkong Government placed restrictions on dealings in gold and bullion with the effect of diverting traffic in gold to Macao, but these were subsequently relaxed to some extent. Many rich refugees from China have brought with them what may perhaps be called "liquidity psychoses"—the outlook formed in a land of hyper-inflation and chicanery. But that is, of course, far from being the whole picture. Hongkong is now the headquarters for all substantial and serious Far Eastern interests, Chinese and foreign. The "Yellow Oxen" (by which ancient Chinese term were known the various "spivvish" elements prominent in pre-Communist Shanghai) and impurely speculative motives in general find far less scope in Hongkong than is sometimes imagined.

Anglo-Canadian Food Negotiations

[FROM OUR OTTAWA CORRESPONDENT]

FOR ten years Canadian agriculture has flourished on government contracts with the United Kingdom. When Britain's wartime supplies from Europe were cut off Canada became the nearest source of food and many other sorts of necessaries. The Canadian farmer was faced with a challenge to produce the things Britain needed, whether they were the things he was accustomed to growing or not. He learnt even to produce a new kind of bacon to meet the British taste. The prairie farmers started keeping pigs as they had never done before. The dairy farmers turned out cheese and dried milk and eggs in record quantities. Canada did indeed make great and successful efforts to meet Britain's needs, and payments difficulties were never allowed to stand in the way.

Financially the taxpayer carried the chief burden through loans and mutual aid. The farmers' contribution was in effort and energy. Farm incomes reached higher levels than ever before. Hundreds of farmers cleared off mortgages and debts, and many of them now face the postwar world with up-to-date equipment, buildings in good repair and more prosperous than they ever remember. They have also enjoyed high hopes. Again and again their leaders have assured them that Britain provided a secure market, and that their chance of stability lay in long-term contracts with the United Kingdom. These hopes were shaken but not destroyed at the end of each postwar year, when the time came to renew the food contracts. The 1949 experience has virtually killed them.

Rivalry from Europe

Two things seem to have ended the ten-year period of stability for the farmer—the restoration of European suppliers to full production, and the dollar shortage. It is impossible to distinguish the effects of these two causes. On the one hand it is obvious that, as Denmark and the Netherlands and other European countries got back on their feet, they would look for a resumption of their prewar market in Britain. Even if dollars had not been involved, Britain could not have spurned them for the sake of the Canadian farmer without hindering European recovery and contradicting the aims of the European Recovery Programme. This argument has never been clearly presented to Canada and perhaps would not have made much appeal if it had. Nor have Britain's postwar purchases usually been compared with prewar days. By that comparison they compare very well in volume—let alone price. But Canadians have tended to compare them with the wartime peaks, and of course they have fallen below that level.

Even the explanation that Britain had no dollars has been accepted very slowly, partly because of British policy. In the annual negotiations over each of the last three years the British representatives started by saying that Britain could not afford more than so much. But each time, after a good deal of bickering, the British Government—and responsibility is with Ministers rather than civil servants—has finally expanded its supposed "maximum" figure. When Whitehall said it had x dollars to spend, Canadians began to think this meant x plus y, and y was the extra to be got by tough bargaining. In the days when Mr Hugh Dalton was Chancellor of the Exchequer, days to which Mr Gardiner, the Minister of Agriculture, looks back with avowed regret, the bargaining did not even have to be too tough. Mr Dalton was not good at saying no. But even since then the maximum dollar allocation has been surprisingly flexible. As late as May, 1949, a month before Canada's general election, Mr C. D. Howe, the Minister of Trade and Commerce, was able to go to London and draw forth an extra $20 million to buy some embarrassing surpluses which might have meant election trouble.

December, 1949, at last changed all that. The British stated their maximum expenditure, and to everybody's surprise they stuck to it very closely. The weeks of negotiation produced no more than an agreement to spread the total expenditure more widely over some additional commodities. There is still time for a weakening, in the bargaining over prices and quantities; but so far the front has been maintained. The British at one time even sprang a surprise by suggesting that the time had come to abandon contract buying. After a closer look they agreed to contracts for bacon and cheese in 1950, but there is still a strong impression that these will be the last food contracts between the British and Canadian Governments.

One of the awkward things about the Canadian food contracts is that they were based on a calendar year, while Britain's dollar budgeting has to be based on the ECA year from June to June. Commitments for the second half of each year have, therefore, meant allocating dollars for a period for which there were no firm estimates either of other expenditure or of receipts (whether from ECA or dollar trade).

The British Government approached the 1950 negotiations with a total of about $600 million (US) for purchases in Canada for the ECA year 1949-50. Deducting what had been spent or committed in 1949, and allowing for metals (which are a "must") and wheat (which is under contract until the end of July and is still needed after that), there was nothing left except $25 million (US) for cheese, of which the Ministry of Food needs 110 million lb. from North America to maintain the ration in 1950. The Canadian price is below the American price, though it is still far above New Zealand's or Australia's; and Britain would like to take all it can get from Canada subject to a fair price settlement. The Canadian negotiators tried to persuade the British Government that export sales in the second half of the year would be up enough to justify increased expenditures on Canadian goods. The British professed to find these estimates on the optimistic side and said that anyway they could not make commitments on the basis of hypothetical trade returns.

Eventually the negotiators fixed their attention on wheat, and it turned out that Britain had rather higher stocks than it needed, having agreed at the Washington talks in September to take some of the American surplus (largely as a sop to the farm lobby to permit the use of ECA funds to buy Canadian wheat). Wheat is not an immediate anxiety to Canada. Eager buyers are being found for all that is left over and above the British contract; and after the end of July the International Wheat Agreement guarantees sale of 203 million bushels. If it has to be invoked Canada can only demand the minimum price of $1.50 (US), but present prospects are that the 1950 crop at least will command a better price. In these circumstances it was suggested that Canada should postpone delivery of 15 million bushels out of the 140 million due before the end of July. This was rather more than Britain could accept, but it did agree to postpone 12½ million until the following crop year. This left about $25 million (eleven-twelfths out of this ECA year) for other commodities.

The next stage was to reconcile the list of things Britain needed badly enough to justify dollar expenditure with the list of surpluses Canada needed to get rid of. The compromise list comprised bacon ($17½ million), canned salmon ($5,000,000) and spruce wood ($2,500,000). It excluded eggs, newsprint and pitprops, which were all sore points for Canada in one way or another.

The price for cheese has not yet been fixed, but it is expected that it will be reduced from 30 to 26 cents a lb. A price of 32½ cents to the farmer has been fixed by the Canadian Government for bacon, but according to the contract just signed, it will only get 29 cents from the British Government instead of 36 cents, as last year. The contract will be for about 60 million lb., and the Government wants to collect this as early in the year as possible because it intends to open the United States border, which has been closed to pork products, at a suitable time later in the year, and certainly before the main marketing season in the autumn. America already has considerable quantities of pork products on hand: indeed, there is a constant threat of bacon being declared surplus under the ECA provisions. But with the British market unable to take the whole expected surplus there is little alternative but to let farmers take their chance in the American market.

This is symptomatic of the reorganisation of Canadian agriculture which may now be inevitable. With the reduction, and probable early end, of the British contracts the government has lost what was an automatic floor price. Support prices, already announced for bacon, will have to be considered for other products. But the ratio of agriculture to industry is much higher in Canada than in America, and the economy would be overburdened if it tried to carry as large a load of farm subsidies. Farmers have a clear warning to make their production as flexible as possible.

Holland's Defences

[FROM OUR CORRESPONDENT AT THE HAGUE]

HOLLAND'S defence expenditure, as a percentage of the whole budget, looks impressive. Current expenses for defence were calculated at 517 million guilders in the 1949 budget, and at 601 million (out of a total of 2,681 million) in that for 1950. The figures are only meant as an indication of the real cost; supplementary defence estimates for 1949

are being asked for, and the 1950 estimates are being completely revised.

On reading the successive government statements of the last five years on defence, it is impossible to trace a general line of policy along which Dutch forces should logically be built up from the near zero point they were at in 1945 to the well-fitting part of western Europe's defence they should form now, or, at any rate, in a very short time from now. The broad line of development goes from forces that were mainly serving in Indonesia (a large part of the Dutch navy and, at the highest point in 1948, 84,000 infantry of the "Royal Army") to a small army in Europe with some anti-aircraft guns, some aircraft and large reserves.

The authorities are as yet unable to give an approximate idea of the financial gains and losses resulting from the shifting of the military focus from Indonesia to Europe. In introducing the 1950 budget estimates in September, the Minister of Finance called military expenditure "in the long run unbearable," but wisely refrained from indicating to what extent it should be reduced. Part of the defence cost is caused, indeed, by temporary measures; demobilisation of troops who served in Indonesia costs a lot, and the war still takes its financial toll, as the German occupation left Holland practically without good barracks. Part of the supplementary estimates for 1949 is intended for building camps.

After these temporary expenses have been met, however, some costly commitments remain. The 30,000 troops who remained in Holland during the postwar years were mainly used for depot and garrison duties, so that Holland was practically undefended by its own means. Now that the Indonesian question is being settled, a new defence system is to be set up, which was initially thought to consist of an army of "a few" divisions with depot and garrison troops and reserves, and an air force of day fighters, night fighters and tactical aircraft to support ground forces. The navy, somewhat reduced, should play its traditional role of guarding communications.

Size of the Annual Draft

How many men are available for these duties? Every annual class gives a draft of about 40,000 men. There has been a plan to increase the draft to 50,000, which should be made possible by the increase of the population and, if necessary, by a more lenient medical examination; but no more has been heard about it recently, probably because equipment and barracks are not available, and because industry needs its share of the younger generation too. The ideal number of annual classes is 15, one of which should be drafted and trained, six of which should constitute the army, six the territorial reserves, and two the depot troops.

All this is only an "ideal" picture, however, as the classes of 1941 to 1944 have never been drafted, and will not be. Moreover, the first half of the 1950 class will not be drafted, apart from a few thousand men, on account of lack of training facilities. Realistic observers are afraid that the "few" divisions Holland should contribute to the defence of western Europe will not be available before the end of 1952, and possibly later.

The 85,000 men who served overseas cannot be entirely integrated into the Dutch military system. The legal term of service of the returning soldiers has been extended by the government in spite of much popular dissatisfaction. It would be unreasonable, however, to keep them in the army any longer and, as people have not been sufficiently prepared for the demands made by an efficient defence of western Europe, it would be political suicide for the government if it did so. The point, though regrettable, is easily understood.

More difficult to understand is the reason why the demobilised soldiers will not be immediately available as reserve troops. It is, however, a fact that their jungle fighting and patrolling in Indonesia have not made them conversant with modern American equipment, nor can this lack of training be made up at the points of concentration in Indonesia where they are now awaiting their return. Once back in Holland they will be given new training, but the duration of the training (once planned at six, now already at three weeks) looks suspiciously like the German wartime scheme of training barbers' assistants as engineers in five weeks.

All the same the layman would say the 85,000 men can hold a rifle and fire it if necessary. The military pundits however, say that, as the returning soldiers live in scattered places, they had better *not* be called up in their old units, as this would cause a lot of travelling to and fro at zero hour. Four military districts are being set up now in which all those available will be incorporated regionally; a beautiful idea, but it will not bear fruit before, say, the end of 1951. And the layman wonders why.

Men Back from Indonesia

Apart from the (Dutch) Royal Army there was a "Royal Indonesian Army" of 34,000 men in Indonesia, 40 per cent of which was Dutch. Many of the Indonesian soldiers are strongly anti-Republican-minded. Officers and soldiers of this army (which fought with the Dutch) have the choice of joining either the RIS forces or of coming to Holland. Part of them will certainly choose the latter way, but it has not yet been settled what their exact position and, therefore, their usefulness, will be; officers' ranks were not quite identical in both armies, and professional private soldiers are something the Dutch army never had.

Another reinforcement could have come from volunteers. It was first thought that the six "reserve" classes after the six active ones should ideally consist of "territorials," and it was hoped provisionally that the new "national reserve" could fill the gap. In organising the "national reserve," however, there has been much delay, and, as a result, no more than 4,000 Dutchmen have so far enlisted in it.

It is abundantly clear that a solid Dutch contribution to western Europe's ground forces cannot easily be made. Both the professionals from Indonesia and the national reservists are insufficient in numbers. The only hope lies in training new annual classes and in re-training the returning demobilised conscripts.

View of the Taxpayer

Dutch compulsory service is for 12 months. An 18 months' period has been under consideration, but it is very doubtful whether, even if the military could convince the civilian Ministers and, with them, a people already overburdened with taxation, of the necessity for much larger expenditure, enough barracks, NCOs and equipment for training could be found. Even with 20,000 people being drafted every half year, as at present, all these factors are causing trouble.

The same argument applies, of course, to the re-training of demobilised ex-conscripts; but there is a strong case for arguing that only physical impossibility, and not bureaucratic red tape, may hinder these 80,000 from being prepared immediately at least for a general mobilisation.

The taxpayer's views are important, but they should be weighed against a well-balanced estimate of strategic risks to be covered in western Europe. The Dutch can say that Field-Marshal Lord Montgomery, in criticising strongly last summer Holland's refusal to provide him with effective ground forces before 1951, did not point out what he precisely expected and asked for under the circumstances. But, even if Lord Montgomery should have been unreasonable in his criticisms, the Dutch can hardly refuse more substantial help than they have so far offered.

A Sensible Policy for Process Steam

BY SPIRAX

Every year something over 400-million tons of steam is generated, used and paid for in this country. The business of steam is a major industry.

Of that total, 130-million tons or so of steam is used for industrial processes, other than public services and power supply, at a notable cost of more than £90,000,000.

Are you in charge of an industrial unit which shares in this vast quantity of steam? If so, it might seem an impertinence to ask what you do with it. *But it is pertinent to ask if you are getting your money's-worth.*

Your production economy is finally decided by the manner in which your steam is used. In this series of short notes, appearing fortnightly, we are offering recommendations known to be capable of increasing the earning capacity of any kind of process steam plant by the application of simple, sensible methods.

Correspondence to: **Spirax Manufacturing Co. Ltd.** (Economist Enquiries), Cheltenham, Glos.

NOTES IN THE SERIES: *Jan.* 28, "Who controls your steam stores?"; *Feb.* 11, "Do you get full value from your steam?"; *Feb.* 25, "What steam costing will tell you"; *March* 11, "Meter your steam to get the facts"; *March* 25, "Why have a boilerhouse?"; *April* 8, "Four pillars of process steam wisdom"; *April* 22, "Process heat transfer decides plant earnings"; *May* 6, "Resistant films *v.* process economy"; *May* 20, "The air film handicap on output"; *June* 3, "Removing the air film handicap"; *June* 17, "Water film against process output"; *July* 1, "Individual steam separation"; *July* 15, "How are your steam traps chosen?"; *July* 29, "Better steam trapping, better output economy"; *Aug.* 12, "The steam circulation system"; *Aug.* 26, "Steam pressures under control"; *Sept.* 9, "Thermostatic control simplified"; *Sept.* 23, "Intelligent use of 'waste' heat from steam"; *Oct.* 7, "Flash steam on the agenda"; *Oct.* 21, "Better condensate return systems"; *Nov.* 4, "A place for the automatic pump"; *Nov.* 18, "Heat transfer summing up"; *Dec.* 2, "The more you know about process steam"; *Dec.* 16, "Two instructional courses for steam executives"; *Dec.* 30, "For advice on process steam problems."

BREAKDOWN ON THE TUBE

Emergency calls for replacement of burnt-out boiler tubes are not uncommon, and one of the causes can be scale deposited in the boiler from the water. The modern way of avoiding scale formation in industrial boilers is by conditioning the boiler water with Calgon (sodium metaphosphate) one of Albright & Wilson's phosphates. Calgon not only prevents the formation of scale in boilers but will keep feed pipes and valves clear as well. It will in fact, all be clear to you if you will ask for a copy of our technical booklet "Phosphates for Boiler Water Conditioning."

CALGON

a very little Calgon prevents a lot of scale

THE BUSINESS WORLD

Sterling Area Government

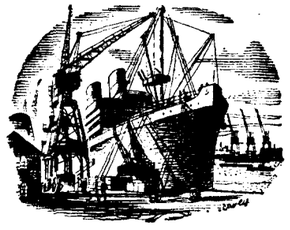
THE affairs of the sterling area have occupied a considerable place in the less-publicised sections of the agenda for the Colombo Conference. Each delegation has its quota of financial experts and although the economic discussions have been kept to the so-called "official level," that level is so high as to merge imperceptibly into the Ministerial ranks. The Colombo Conference is the first full meeting of the Commonwealth family since the devaluation of sterling. It will, therefore, have ample material for discussion: the more humdrum questions of the balance of payments of the sterling area with the dollar world, and higher issues of policy which have called for a re-examination of all the factors—including the machinery—which maintain the cohesion of the sterling area.

The devaluations of last September and the new status of India, Pakistan and Ceylon as completely independent members of the sterling club have created a new situation and new problems. The basic factors that bind the sterling area have, indeed, remained unaffected by these changes. It is still the force of common interests, convenience and efficiency which provides the cement for the structure. The pooling of reserves, the centralisation in London of the essential banking operations for the whole area, the freedom of payments within it, the similarity of exchange control applied by each member to all transactions with the non-sterling world—these are all issues on which the joint action of the members is dictated primarily by regard for their own self-interest, and certainly not by dictation of any kind from the centre.

The events of the past few months and the appearance of countries of non-European stock and traditions as co-equal members have, however, called into question the adequacy of these important but somewhat intangible and informal links in the structure of the sterling area. The devaluation of sterling was a step which clearly affected every member. Yet it was taken by Great Britain without specific consultation in advance with the others. Two months before devaluation the Finance Ministers of the Commonwealth were assembled in London and discussed the agenda for the Washington talks then looming ahead. As the Indian Finance Minister has since disclosed, devaluation was not on the Washington brief as discussed at the July conference. His critical remarks after the September devaluation may have been prompted partly by political considerations, but they carry with them the unmistakable implication that such unilateral action by Britain and such complete delegation of authority by the other members of the sterling area as were symbolised by the devaluation of sterling would no longer be acceptable.

★

It may be asked, therefore, whether the time has not arrived to supplement and reinforce the ties that bind the sterling area by somewhat more formal machinery for consultation and for reaching concerted decisions than exists at present—whether, in fact, something in the form of a written constitution may not be needed to hold the club together. In approaching this question it is well to recognise at the outset that some progress has, in fact, been made towards the creation of such consultative and executive machinery. Still within the quite informal and elastic form of the present system, a great deal has already been done in this direction. At the highest level of policy-making, there are the now regular meetings of the Finance Ministers of the Commonwealth countries. There have been two such conferences so far, and the financial talks at Colombo must now be added to this series. It is perhaps unfortunate that the first two meetings coincided with moments of financial crisis for the sterling area. The first was held in September, 1947, soon after the suspension of the short-lived convertibility of sterling. The second was the meeting last July, when the gold reserves were again ebbing away at an alarming rate and creating a situation that was soon to require the devaluation of sterling.

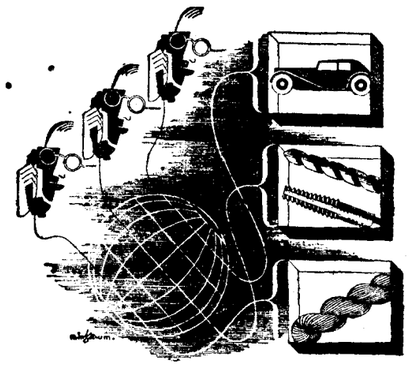


★

These meetings of Commonwealth Finance Ministers should, and probably will, become both more frequent and less dependent on the emergence of crises. It is unlikely that 1950 will pass without another such meeting. The annual assembly of Governors of the International Monetary Fund and the International Bank, at which the Finance Ministers of the Commonwealth countries are normally present, provide regular opportunities for such meetings. That is not to suggest that the Commonwealth conference should be held at the same time and place as the meetings of these international institutions. Washington becomes too frequently the venue for these assemblies to make such a suggestion acceptable. But the fact that the Finance Ministers will be in transit to and from their respective capitals at such times should provide opportunities for meetings of the Commonwealth family at some other convenient place. It is true that these meetings are not restricted to the sterling group. Canada also attends them. This, however, is a wholly desirable and immensely valuable membership in so far as it reminds the sterling area that it can never be an isolated autarchic bloc but that it must live with—and, at the moment, assisted by—the dollar world.

Such annual, or even more frequent consultations between Ministers cannot, however, provide the necessary mechanism for regular interchange of views and information and for the discussion of policy as and when unforeseen emergencies occur. The Ministerial conferences, moreover, will find themselves unduly restricted to mere fact-finding unless preparations are made for them by an organisation or secretariat in virtually continuous session. Such an organisation already exists in London in the form of two committees, the Sterling Area Statistical Committee and the Commonwealth Liaison Committee.

The first was set up on the initiative of the British Treasury in 1947 to serve as a forum in which the self-governing Dominions might give and seek from one another information about balances of payments, the gold and dollar reserve and cognate matters of common interest to them as members of the sterling area. The countries represented other than Great Britain are Australia, New Zealand, South Africa, Southern Rhodesia, India, Pakistan, Ceylon and Eire. A Canadian representative sits on the committee as an observer. The chairman and secretariat are provided by the British Treasury. The Board of Trade, the Commonwealth Relations Office and the Bank of England are also represented on the committee. The representation is composed entirely of officials. The British officials are of "assistant secretary" rank, while most of the Dominions are represented by members of their respective High Commissioners' offices. The committee meets approximately every three weeks, but papers are continuously circulated among its members. The discussions at the regular meetings are based largely on the Bank of England's regular documentation of the balance of payments, showing the position of each member of the sterling area in relation to the gold and dollar reserve. The various members give one another the fullest information about their commercial and financial negotiations with non-sterling countries.



This statistical committee was set up to receive and impart information, and has no pretence to any policy-making function. The problem of sterling area policy is the province of the second body, the Commonwealth Liaison Committee. This committee is not a creation of the Treasury but of the Cabinet Office. Its chairman and secretariat are provided by the Commonwealth Relations Office and Cabinet Office respectively. It is concerned much more with the problems of policy than with the collection and imparting of statistical information. It does not, however, actually formulate policy; its job is to explain the policy, to attempt to secure approval of it by all its members, and to ensure co-ordination of their separate policies. Canada is represented on this committee as a full member and not as an observer. Eire, though represented on the Statistical Committee, is not a member of the Liaison Committee. Although the latter body was formed soon after the SASC, it was only after the meeting of Commonwealth Finance Ministers last July that it began to acquire real weight and responsibility. It remains a clearing house for ideas and suggestions rather than an executive instrument of policy, but discussion of policy by a body of such authority consisting of representatives who are in constant touch with their own governments must have a considerable effect on policy decisions when they are taken The functions of this committee must not, however, be overrated. It is unlikely that any definite policy decision has ever been put up to it or been discussed by it. But as a regular meeting place for financial representatives of the Commonwealth, and with its own permanent secretariat, it is bound to have an increasing part in the sifting of ideas on sterling area policy and, therefore, an increasing—though always undefined—influence upon the ultimate formulation of that policy.

It helps both ways

The Westminster Bank provides a service to both exporters and importers that covers all aspects of foreign trade. As the volume of post-war exports increases, a number of people inevitably enter into foreign business for the first time, and it was for such people that the Westminster Bank issued their booklet on *The Foreign Business Service of the Westminster Bank*. The booklet describes some of the problems of overseas trade and gives an account of the services that are provided by the Bank to meet them. Ask for a copy at your local branch

THE BANK OF AUSTRALASIA
(Incorporated by Royal Charter 1835)

MANAGER: G. C. COWAN
Head Office: 4 Threadneedle Street, London, E.C.2
Strand Branch: 263 Strand, London, W.C.2. (Opposite Australia House)

Since so much of the effective policy-making and technical execution of policy is done within the Bank of England, it is sometimes suggested that that institution should in fact be converted into a central bank for the sterling area as a whole and that its members should consequently have some representation on the Court. Any such suggestions imply a total misunderstanding of the functions of the various central banks within the sterling club. Each bank is, of course, responsible for the supply and control of currency and credit in its own country, and though there obviously needs to be some harmonising of their respective policies and actions, such harmony cannot be sought by trying to achieve complete uniformity—of a kind, say, which might be attempted if authority were delegated to one central institution acting for the whole sterling area. Any such move would be completely out of keeping with the essence of the political and, therefore, the economic relations between the member countries. This, however, is not to say that the Bank of England has failed to take account of its wider responsibilities as ultimate banker of the sterling area. The Old Lady of Threadneedle Street has an astonishing knack of keeping up with the times. For some years past—and well before the SASC was formed—it had begun to provide some Commonwealth representation among its Advisers, the highest executive rank after the Executive Directors. The relations between the Bank of England and the various central banks of the Dominions are friendly and their efficacy could not be improved by giving the Dominions a more formal representation in the Bank than exists at present.

A written constitution for the sterling area, or a formal delegation of policy-making authority to new committees or existing institutions, would introduce not merely immense and dangerous scope for legal squabbles but also a rigidity and formalism wholly out of keeping with the political traditions of the Commonwealth. Any such evolution would, moreover, call for the withdrawal of Canada from its present constructive collaboration in the financial affairs of the sterling Commonwealth. Problems of collaboration of the kind revealed by the circumstances of sterling's devaluation, and other problems which will assuredly arise in future, are not to be solved by any such evolution as this. More frequent meetings between the finance ministers of the Commonwealth and improved permanent liaison through the SASC and CLC, are the best answers to the problem of maintaining the essential community of economic interest and cohesion of policy between the various members of the sterling area.

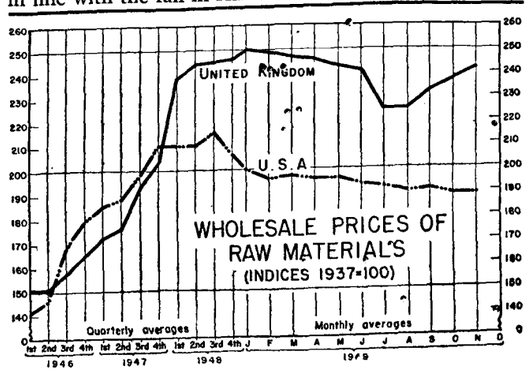
The main threat to the sterling area today does not arise from any lack of formality or precision in its government or mechanism. The danger is that the restrictions which continue to be placed on the freedom with which sterling is used in international transactions, at a time when world trade is breaking away from the abnormal bonds of wartime and immediate postwar controls, may encourage the various members of the sterling area to cease using London as their banker and to create their own direct payments arrangements with non-sterling countries. The fear and pusillanimity with which sterling exchange control is still being operated are beginning to undermine the cohesion of the sterling area. This is a political, far more than a technical, problem. It is one of the thousands of issues on which the electorate will in effect be called upon to decide next month without even realising that they exist.

Prices since Devaluation

IT is full early to attempt to measure the effect of devaluation upon the structure of prices and costs in the British economy. Last Monday, Sir Stafford Cripps claimed, so far as retail prices were concerned, that his devaluation eve forecast that prices would not go up by more than a point or so by the end of 1949 had been bettered by the actual performance. Higher prices for bread and flour pushed the index up by two points, and lower prices for clothing cut it down by two points. But this particular forecast never seemed to contain great merit. Over the space of three months or so, price control can perhaps be made fairly effective, and there is now perfectly clear evidence that before devaluation the Government trading departments were busy laying in stores of imports, thus forestalling part of the inevitable and eventual rise in import costs which devaluation was bound to cause.

By the use of a series of methods—ranging from control to hortatory appeals to the "better instincts" of the business community, designed to show that it would be patriotic on their part to give away part of their substance to the consumer—prices have in fact been kept under moderation and restraint. But nothing that has happened during the past four months disposes of the argument that devaluation must work towards a relative increase in sterling prices and a relative fall in dollar prices. The chart which accompanies this article shows only the first stages in the working out of this process. Wholesale prices of raw materials in the United Kingdom stood at 225 in August (1937=100), compared with 190 in the United States; the corresponding index figures for November show a rise in sterling prices of raw materials to 241 and a slight fall in dollar prices to 189. The contrary trend of the two price indices is not conclusive evidence of the impact of devaluation, for both are heavily weighted by the prices of domestically produced raw materials, on which devaluation has only a remote and indirect effect.

★



For a more direct measure of these effects, the movement of import prices is undoubtedly a better guide. Here the consequences have been immediate and of a far more significant order than the movement, such as it yet is, of retail prices. The average prices of all imports (1947=100) rose from 111 in September to 122 in November, the latest month for which figures are available. The following table gives the movement of prices for the various groups of imports:

BRITISH IMPORT PRICES, 1947=100

	Sept.	Nov.	% Increase
Food, drink and tobacco	108	117	8·3
Raw materials, etc.	119	127	6·7
Manufactures	106	124	17·0
TOTAL	111	122	10·0

These movements are not in any sense alarming, unless it be to those who regard stability of all prices for all time as a desirable economic aim. They are part of the natural adjustment of import prices (for goods from dollar and overseas sterling sources alike) to the fact of a 30 per cent cut in the dollar value of the pound. Obviously, the full cost of these price increases has yet to be encountered; the higher import price of raw cotton is not yet reflected in the retail prices of cotton clothing, nor the higher cost of copper in higher prices for finished electrical equipment. All that has happened, so far, is the first stage in the drawing together of the two great pricing systems in world trade—the sterling system and the dollar system. The devaluation of the pound to a more realistic level compared with the dollar has destroyed the illusion, which prevailed up to September 18th, that dollar goods were unnaturally cheap; in fact, sterling was unnaturally dear. During the first half of 1949, this disparity between the two price systems was still very marked; the removal of subsidies on raw materials in 1948 had exposed the major difference in the levels of the two sets of prices, and in the recession in world prices during the period before devaluation, sterling prices did not fall fast enough to close the gap.

Although devaluation has made a beginning on the breaking down of the barriers between these two disparate price systems, the actual achievement in this direction is easier to sense than to measure. The impact has varied considerably on different commodities. Dollar prices of all sterling area products fell when the new exchange rate was established. But there all similarity ends. In the accompanying table, the sterling and dollar prices a year ago of six commodities (rubber, cotton, copper, lead, zinc and tin) have been equated to 100. Several of the dollar prices are now back, more or less, to the same level as before devaluation. For example, rubber in New York (price index 95 for September, 1949, compared with 100 in January) fell throughout October, but has since recovered almost to the September level. The sterling price index has risen from 105 in September to 119 for December. Here the effect of heavier American purchases, perhaps destined for stockpiling, has been particularly marked. Another instance of a similar recovery in American prices, coupled with a more pronounced rise in sterling prices, is to be found in copper. In the United States, copper is quoted at 18½ cents a lb., compared with 17⅝ cents at the beginning of September and 16 cents in June. Zinc prices fluctuated in New York in October, and although by the end of the year they were again up to the September level, they still showed a 44 per cent drop during the year; the corresponding fall during the year for the sterling zinc was a mere 13 per cent, whereas in August, before devaluation, the fall in price (40 per cent) was closely in line with the fall in American zinc.

Lead and tin, for differing reasons, must be regarded as special cases. Before devaluation, lead was selling for 15 cents a lb.; then certain European countries found it profitable to ship supplies to the United States and the price fell promptly to 12 cents, where it has since remained. This fall in dollar lead has been reflected in sterling prices, which at the end of 1949 showed a fall of 20 per cent compared with September. Tin is exceptional because private trading in the metal was resumed in mid-November. In the past week or two, the market has begun to show signs of settling down; in dollar terms, tin prices are about 25 per cent lower than before devaluation, and in sterling terms about 5 per cent higher (after losing the automatic 30 per cent "boost" which the Ministry of Supply imparted immediately after devaluation).

American cotton prices fell steadily between May and November last year, but were slightly firmer in December. Here the effect of devaluation on sterling prices has been immediate and lasting; the Raw Cotton Commission's price up to August was only one or two per cent higher than it had been in January, but there was a big leap in September (price index 127) and a further advance in line with the American recovery to close the year. Wheat and maize have followed a similar course since September. Surpluses were then the bugbear and prices fell; they remain enormous, but prices have risen, largely, it seems, because American support prices for wheat and maize are little below market prices, and it is less trouble to farmers to put their crops "in loan" to the Commodity Credit Corporation than take the trouble to sell them on the market.

In all these comparisons it is possible to see two distinct factors at work. One is the direct monetary adjustment to devaluation. The other is the response of prices, particularly dollar prices, to the recovery of economic activity in the United States during the later months of 1949. To this recovery there are two possible exceptions—petroleum and timber—but as a broad statement it is valid. But already salutary adjustments in relative prices are in train. Egyptian cotton has only risen slightly in terms of sterling since September, whereas the sterling cost of American cotton has risen by the full 44 per cent. Argentine maize can be bought for sterling at about 5 per cent more than the equivalent American price; a year ago the differential was practically 20 per cent. It remains to be seen how this new—and healthier—relationship between sterling and dollar prices will develop in future.

This is only an interim account of what has happened to prices since last September. Devaluation has not by

any means produced its full effect on the internal structure of costs and prices in Britain, but it has at least begun to put international prices into better comparison. The big question mark for 1950 is whether world prices of many staple products will continue to fall. In recent weeks, economic activity in the United States has led to an improvement in the prices of basic raw materials. Will the current high level of industrial production continue throughout 1950? One need not, perhaps, contemplate the possibility of a sharp setback in economic activity in the immediate future, but it must be recognised that present prices of industrial raw materials are singularly dependent upon the economic trend in the United States. Beyond this, perhaps the most vital factor in the commodity markets at present is the existence of large surpluses of certain farm products in the United States. Stocks of cotton will be sufficient to meet a year's exports; there will be over 400 million bushels of wheat in stock, which is more than the total American export for a whole year; and there is a clear prospect of a glut of maize. The fate of these stocks is bound up with American price support policy, crop control and international agreements; but it is hardly conceivable that their existence will not exert a depressing influence on world prices. That possibility holds out some promise of an eventual improvement in the terms of trade between Britain and the dollar world. But it does not hold out any promise at all of an immediate fall in the sterling cost of British imports of food and raw materials. The Government negotiators are attempting to keep the increases in such costs as low as possible—witness their handling of discussions with Denmark and Australia. They would have greater chance of success but for the awkward fact that the readjustment of all soft currencies against the dollar last September has, in the case of many products, set a new price standard based on the dollar and no longer on soft currencies. That is the natural and inevitable consequence of devaluation—a consequence to which the British economy will have to adjust itself in 1950.

Business Notes

Business and the Election

Already before the Prime Minister's statement, business on the Stock Exchange had shrunk before the approaching shadow of the general election. Now that the date is known, the instinct of investors is to retire into their shells and await the decision on February 23rd. A month or so ago there was some disposition to assume that if the Labour Party were to be defeated, a fairly sharp post-election boom might occur. Now there is a disposition to distrust both premises. The possibility of a close election is becoming uppermost in the City's calculations. In consequence, the shares of companies due for nationalisation if the Government is returned have turned distinctly dull—steel shares illogically so, since a Labour victory would mean payment at the prices already determined by statute. Of the potential victims in a new programme of nationalisation, Tate and Lyle shares have reacted rather sharply, but industrial insurance shares and cement issues have not betrayed much concern.

As the election draws nearer, and the City and business community begin to form more definite views about the outcome, there may be more significant price movements than the small fractional adjustments which have occurred in the gilt-edged market this week. On the one hand, the campaign will divert attention from the basic economic and financial problems which in normal times are the constant concern of the market. But, on the other hand, it will not delude many investors into supposing that the result, whatever it may be, will bring quick solutions of the country's economic difficulties or quick relief from the particular burdens of taxation, controls, and restraints which now rest on the business community. It will be time to begin discounting the possibility of significant changes in the direction of domestic economic policy when the outcome of the election is known, for even on the assumption of a change in the colour of the Government, the likelihood of rapid and vigorous reorientation of domestic policy rests on calculations of the effect of such changes on the external balance—that ultimate and limiting factor in the choice between alternative economic policies.

The election may also bring problems of its own, if a political campaign directed against the City should be exploited as electioneering propaganda. There have already been hints of this kind, and it would be an act of sensible self-defence if the city institutions were prepared to meet such a campaign with factual explanation of their role in the British economy.

Britain's Deficit in 1949

No one is likely ever to accuse the "austere" Chancellor of complacency; but the tone of Sir Stafford Cripps's economic review of 1949, given to a press conference early this week, came closer to self-satisfaction than any considered Ministerial survey for a long time past. The year's production achievements, discussed in a subsequent Note, have admittedly been distinctly heartening. But nowadays the only valid test of the success or failure of Britain's economic effort is the resultant progress, if any, towards narrowing the all-important dollar gap. With this overriding objective in mind, most well-informed observers will agree that the impression conveyed by the Chancellor's survey, taken as a whole, was several shades too cheerful. This bright emphasis was, no doubt, partly inadvertent—one reason, presumably, why the dollar problem was not spotlighted in this particular review was that detailed figures of the state of Britain's balance of payments with the dollar area are not yet available for the full year.

The Chancellor did, however, give provisional estimates of the "overall" balance of payments. Total UK exports for 1949 are estimated at £1,785 million, an increase of 13 per cent by value on the corresponding total for 1948. Imports, valued c.i.f., are estimated at £2,273 million compared with £2,078 million. After allowing for re-exports of £59 million, the visible deficit (again on the c.i.f. import valuation) is therefore estimated at £429 million, compared with £432 million for 1938. As the net balance of invisible items is expected to show little variation from last year, the "overall" account is expected to show a deficit of roughly the same magnitude as the £110 million estimated for 1948. Since there was only a very small deficit in the first half of 1949, this estimate implies that in the second half of the year the annual rate of deficit was around £200 million—a very striking contrast with the surplus, at an annual rate of £90 million, estimated for the second half of 1948. Fortunately, the prospect is probably less sombre than these comparisons suggest, since the depression of exports in the pre-devaluation quarter was certainly not made good by the covering operations in the quarter immediately following devaluation. In other words, the half-year's figures were probably over-weighted by the shunning of sterling goods before devaluation and insufficiently weighted by the stimulus which devaluation has given—though the basic level has, of course, been lowered by the resultant worsening of the terms of trade.

One reason for the deterioration was the change in Britain's trading relationship with the OEEC group of countries. Both in 1947 and 1948, as well as in the first quarter of 1949, Britain was running a moderate visible surplus with these countries, whereas in the second quarter of 1949 there was a visible deficit at a monthly average rate of £7.3 million, and this widened to no less than £13.1 million a month in the third quarter. Sir Stafford regards these figures as proof that Britain's policy of "liberalising" imports from OEEC countries has been more generous than their reciprocal policies. However that may be, there is reason to believe that this particular disequilibrium has been substantially diminished since the devaluation. As for dollar trade, Britain's exports to North America in October-November showed a large recovery, in terms of sterling, from the low point reached in the third quarter of the year; but in terms of dollar values their annual rate in these two months showed a further decline of 7 per cent, to a level no less than 22 per cent below that reached in the first quarter of the year.

* * * *

Disinflation Sustained?

Instead of deploring the relapse of the "overall" balance of payments into deficit, the Chancellor put his main emphasis upon the resultant addition to supplies of goods available for use at home. In his survey of the domestic scene, he pointed out that since the expansion in exports was balanced over the full year by a rise in imports, the estimated increase of about 4 per cent in the national income was wholly available for apportionment between government expenditure, personal consumption and investment at home. On the basis of experience during the first three quarters of the year, public spending is estimated to have risen by about 3 per cent, but in view of the rise in prices, the increase in real consumption is assumed to have been smaller than this. It is suggested, however, that "consumer satisfaction" was greater than in 1948, because the range of choice was wider. Much more questionable is the Chancellor's proposition that, because the increased spending was directed towards necessaries, it must have been merely a consequence of the increased flow of goods and did not, therefore, obstruct the dollar drive. Argument on these lines might conceivably be tenable if the objective were merely to prevent a fall in the volume of exports or any widening in the "overall" deficit. As it is, this line of approach is merely a corollary of the underlying policy which, for fear of creating a little transitional unemployment, shuns all measures which might produce that flexibility in the national economy which is indispensable if the nation's effort is to be properly mobilised in the drive for self-sufficiency.

Significantly, the Chancellor's reaffirmation of the "absolute need" to maintain a disinflationary condition was qualified by the words "without plunging into deflation" and by the remark that it is "by no means easy to do this while maintaining full employment." It is almost axiomatic that disinflation thus defined is bound to be insufficient to enable Britain to develop its maximum "dollar-exporting" potential. The Chancellor for his part is not yet certain whether the cuts announced in October will be sufficient to ensure this kind of disinflation but, equally, he sees no signs yet "in the contrary direction." Since he also sees no likelihood of any reduction in the rate of net withdrawals from small savings, this opinion looks a shade optimistic. Similarly, he finds nothing in the budget figures for the first nine months of the year to suggest that the above-line budget surplus for the year (after allowing for supplementary estimates of expenditure) will not be realised. This assertion was supported by figures showing that, if the budget forecast is to be fulfilled, revenue in the current quarter needs to exceed expenditure by £482 million, whereas in the similar quarter of 1948-49 the excess was £570 million. As the Chancellor admitted—and as *The Economist* pointed out last week—it is too soon to make firm deductions from the figures; but it is a pity that he quoted them in this form, without pointing out that the final quarter of the last fiscal year benefited from some very large non-recurring receipts.

The Chancellor remarked that his view of the budget would not have been materially different even if it had embraced "below-line" as well as "above-line" expenditure—provided, however, that borrowings by local authorities from the Public Works Loan Board cease to rise at their recent rate. From the point of view of disinflation, this particular deterioration in the Exchequer position is not, of course, of immediate significance. If the local authorities are merely borrowing in anticipation of expenditure subject to physical controls which are strictly enforced, the Treasury's excess lendings merely provide indirect support for the gilt-edged market. When asked whether the proper way of checking these borrowings was to raise the rates of interest charged by the PWLB, Sir Stafford replied that "to make any real difference" the rate would have to be raised by one per cent or more, and that such a rise would cause a sharp rise in rents which the Government would not countenance. There was no question, therefore, of any increase in PWLB rates, nor would the Chancellor consider using the rate of interest as a means of checking the deterioration in National Savings—on the argument that those who save through the National Savings movement are not influenced by the return which is offered for their money.

Industry

The Production Record

The Chancellor started his review with an exposition of the trend in home production, and it was understandable that he should do so: "Upon that," as he observed, "is based the possibility of our progress." Further, if the achievement of the British economy in the past four years is considered in quantitative terms of physical output, it is solid and impressive. Failure has been in other directions—in costs, in flexibility, and in applying the fruits of the physical effort to the special task that faced Britain in world trade. In dealing with the physical achievement, the Chancellor was on good ground.

The interim index of industrial production (1946 = 100) stood at 128 in November; then, and in each of the first three quarters of 1949, it showed an improvement of eight points (or about 7 per cent) over the corresponding period of 1948. Thus the impetus gained in 1948 has not been lost, and the rate of increase of the total industrial product promises that the five-year objective laid down in 1947 will be reached in a much shorter time:

> When the long-term programme was drawn up the expectation was that manufacturing output would increase by a quarter in the five years from 1947. Most of that increase—20 per cent out of the 25 per cent—has in fact been already achieved in two years.

As the stately succession of quantitative achievements was unrolled by the Chancellor, it became necessary to remind oneself that the bases of comparison were not always strictly homogeneous, and to bear in mind the possibility that they might, as selected, tend to put the most cheerful face on each separate matter. Thus, "Coal showed an output per manshift rising above the last prewar year—an achievement not yet paralleled elsewhere in Europe." No doubt it is a fortunate thing that the British coalmines, which were spared direct devastation from war, have not fallen further behind the standards of the better European coalfields than they already were in 1939. Even so, is output per manshift the decisive unit of comparison? Ought it not, perhaps, to be output per man-year—and if that basis is chosen, are the British coalfields in advance of their own 1939 standard, or not? In vehicle output, the rise in the index last year was

no less than 24 points, and this is dazzling, but how does productivity—and how do costs—in the vehicle-building industries compare with productivity and costs in 1939? Alternatively, how do they compare with the same factors in the United States, with which they might, one day, have to compete?

The increase in livestock population over 1948 seems to have been impressive; "nearly half a million more pigs, over a third of a million more cattle, and over a million more sheep and lambs, than a year earlier." Livestock multiplying itself at this rate would seem to solve the protein question—until it is remembered how greatly the livestock population had been depleted. How would these figures look in comparison with prewar, or what would, in this case, be the relative rate of recovery as compared with France or Germany?

Qualifications of this kind need, however, be uttered only when the production statistics are being made to bear rather more than their due weight of glory; there were moments on Monday when it seemed that this might be happening. It would be misguided to dispute that the progress made by the British economy in the last two years, in terms of physical effort and output, has been massive. And if it is true that someone is making (as the Chancellor seemed to suppose) "the ridiculous suggestion that our people are not working," there is no lack of evidence in disproof.

* * *

Supply and Demand in Steel

British steel output in December, in spite of the Christmas holiday, was high enough to bring the total for the year to 15,552,900 tons. Since the last Economic Survey estimated at between 15¼ and 15½ million tons the maximum output which the industry could achieve "in the most favourable circumstances," the industry has the satisfaction of having for the third year in succession once more exceeded the official target. Interest begins to centre on the future balance of supply and demand; how much longer will it be possible to consider steel, even in theory, as a scarce commodity?

In the estimate of the Iron and Steel Federation, as the accompanying table shows, stocks have increased by some 1,200,000 tons in the past two years. They are now probably abnormally high; 1,400,000 tons are held by the steel

industry, 380,000 by the merchants, and almost 4,000,000 tons by industrial consumers, making a total of perhaps 5,760,000 tons. The federation is definite in its opinion that British steel supplies have in general caught up with, "if not outdistanced," demand. It concedes the difficulties that remain in certain classes of tubes and in motor-body sheet; but a more varied and flexible supply at the finishing end, rather than a general increase in output, is the overriding need.

This seems to be borne out by the trading experience of the past year. The volume of orders on the books of the British steel companies reached its post-war peak last January, and has since fallen by about 20 per cent. An increased rate of supply, overtaking demand, was the first cause of this reduction; but since April the volume of new orders has been declining. In the analysis of the steel position and prospects which the federation published this week, other features—which make strange reading after a history of shortage that had begun to seem endless—point the same way. The fall in the demand for plates made it necessary to close down the heavy plate mill at Port Talbot. For the same reason it was decided to amend the development project of the Consett Iron Company, which considers it unwise to concentrate on plate production to the extent that had been intended. This company, while it is still improving its plate rolling plant, is now to instal a continuous billet mill to supply billets to its rolling mills at Jarrow. Efforts have been made to overcome the shortage of sheets; Ebbw Vale and Shotton have increased their output, and the rate of supply of sheets is now claimed to be 25 per cent higher than in the first half of 1949. But imports from the United States will continue to be necessary until the Margam strip rolling mill comes into operation in 1951; when that happens, sheet supplies will be transformed.

* * *

Allocation and Exports

Already, however, it begins to look improbable that the detailed official control of steel distribution can be maintained much longer, whatever the complexion of the Government after February 23rd. For some time the federation has been pressing its case against the allocation of specific tonnages to firms—which, since the war ended, "could not be done with any pretence to accuracy, and could not be made on any rational basis." The present form of control was perhaps suited to a state of general shortage of steel:

> It loses its justification, however, as soon as the shortage, by and large, is overcome and the problem is that of determining the strength of demand for this as compared with that finished product.

Clearly the present piling-up of stocks supports this argument; so does the experience of innumerable consuming firms, which find themselves able to get more steel than their allocation, and this in spite of the general inflation of steel "paper". The future course of the steel expansion plan will be watched primarily for its contributions to quality and variety of finished steel, and for its effect on costs. Technical improvement is indispensable if the cost-raising tendencies which are still at work in steelmaking materials are to be outweighed.

Some information is given about the movement of costs since the devaluation of sterling. Contracts for iron ore are now being negotiated at about 5s. a ton above the prices which ruled in 1949. The scrap now coming from Germany is costing 13s. 6d. a ton more than in September. The price of fuel oil to steelmakers (who, as bulk users, may have fared better than some consumers) has risen by 15s. 6d. a ton. The net effect of these factors may be to increase the cost of a ton of crude steel by about 7s. 6d., and there is no reason to suppose that they have yet exhausted their effect. The proposed increase in railway freights would be likely to add a further 10s. a ton to the cost of heavy steel products and 15s. a ton or more to highly-finished products: "This would make a general advance in steel prices inevitable."

Costs may well be the factor which decide whether, as

The Trusted Friend

When making a will it is natural that one's thoughts should turn to an old and trusted friend, a sterling character of unquestioned integrity, a man of affairs and judgment and of wide experience and sympathies, who, as executor or trustee, can be depended upon to carry out one's wishes with every scruple known to honest men.

Assuming the possession of such a friend, how may one be sure, with abundant evidence of the insecurity of life on every side, that he will be able to act without serious inconvenience, or even act at all?

Think of a Bank as a trusted friend and all these essential qualities and qualifications become translated from the mortal risk to the certainty of continuity.

DISTRICT BANK
LIMITED
ESTABLISHED 1829

the expansion programme goes on, the British steel industry will continue to be able to sell the whole of its product. For the present (and with the advantage over American competitors which devaluation conferred) British steel prices are relatively low in the world market. This is one reason—and there are other technical considerations to reinforce it—why the industry, while it accepts the Geneva forecast of an unmarketable European surplus, is reasonably hopeful about its own immediate export prospects.

* * *

Development Councils in Suspense

The question whether development councils are to be imposed on unwilling industries is one of the issues which will not now be decisively settled until after the election. The Commons debate on the draft order for a wool textile development council was postponed early in December, when the industry made known its intention of taking action to test the legality of the Government's proceedings. When the debate takes place it will be in a new House of Commons.

For the clothing industry, however, a development council had already been given Parliamentary approval (though after a sharp debate) and the Government was already committed. The membership of the council was announced last week by the Board of Trade. The choice of the chairman (Capt. J. Fox-Williams, who is a managing director of a firm which manufactures architectural metalwork) presumably expresses a desire to find a person independent of the trade, but who has business experience and believes in the usefulness of the council: Capt. Fox-Williams was a member of the working party on light clothing which in 1947 supported the idea of a joint council "on a federal basis" for the light and heavy clothing industries.

The other appointments follow a pattern which has come to be expected. Mr Edgar Lawley, the chairman of Lawley Group Limited, is one independent member; the other is Mr R. E. Yeabsley, the chartered accountant. Three manufacturers from the heavy clothing section and two from the light clothing section, together with the group manager of the Co-operative Wholesale Society clothing factories, make up the six employers' members. Six trade unionists represent the workers' side. A third independent, and a member "having special knowledge of distribution of the products of the industry," are still to be appointed.

The new development council could now settle down to its work if a general election were not imminent, if legal action had not been instituted on behalf of the employers against the Board of Trade, and if the trade in general were prepared to accept its new leadership. In this connection the annual report for 1949 of the garment manufacturers' section of the Manchester Chamber of Commerce is relevant; it records that the section, and the joint committee of the clothing trade on which it is represented, have not merely opposed the setting up of a statutory body, but have "refused to take any part in its establishment or work should it be set up."

These are not propitious circumstances for the birth of an institution. The Clothing Industry Development Council seems likely to need the good wishes which Dame Anne Loughlin, the most distinguished of its trade union members, expresses in the January issue of *The Garment Worker*. The National Union of Tailors and Garment Workers (Dame Anne writes) supported the development council idea in the days of the working parties, and "we have received no evidence to justify changing our view."

* * *

Manchester on Restraints of Trade

This time of year sees a series of annual meetings of sections of the Manchester Chamber of Commerce, and is therefore fertile in expressions of Manchester opinion on the state of trade. These have tended to be a good deal less cheerful than the cotton industry's general productive and selling performance in 1949 might lead an innocent onlooker to expect. The Dominions section had disappointments to record in the Canadian trade; it was felt at one time that the objective of 80 million square yards of piece goods exports might be attainable, and the fact that after ten months of the year only a quarter of this figure had been reached gave "real disappointment and concern." The chairman said that British exporters were fully aware of the urgency of selling to Canada, but some of them questioned whether Canadian buyers had an equal appreciation of the importance of buying from Britain.

The Latin America and West Indies section is much concerned with the persistence of import licensing, which (it complains) distorts trade and is "so subject to the pressure for protection from local manufacturers." Trade to Argentina suffered from the indecision which preceded last year's trade agreement and the curious Argentinian manœuvres which followed it—culminating in the announcement in the autumn of eight different exchange rates for the peso. Even now, the first batch of permits covers only 10 to 20 per cent of the amount earmarked for consumer goods in the agreement.

The India section had trouble with the increasingly severe import licensing measures in India and Pakistan, and with a new Ceylonese policy designed to put the import trade into the hands of Ceylonese traders. The Burma trade suffered from the condition of Burma, but if this is unavoidable the difficulties created by the short period of validation of Burmese import licences are not. Further, trafficking in import licences in Burma seems to have reached serious dimensions:

> It is believed that the resale value of licences for cotton piece goods reached a very substantial figure, which had a most unfortunate effect of increasing unnecessarily the cost of cotton piece goods to a level far beyond what it need be and so tending to place United Kingdom goods beyond the reach of the poorer classes.

This report acknowledged that the government at Rangoon is trying to stop the traffic.

* * *

Japanese Competition

Expressions of dislike of restraints of trade should not, however, be taken to signify that the Manchester exporters are facing the prospect of Japanese competition with cheerful unconcern. The China and Far East section of the Manchester Chamber of Commerce expresses the hope that the proposed Anglo-American cotton trade mission to Japan will help to produce a long-term policy:

> for there is yet no sign of a true realisation in official circles of the fundamental dangers in the present redevelopment of the Japanese cotton textile industry.

Among the recent "far-reaching developments" on this front which are causing concern, the first was the decision by the American command in Japan (SCAP) to abolish the "floor prices" for Japanese exports other than silk. This, coupled with the complete return of the Japanese export trade to private hands—and indeed to the hands of the same big combines which took so much trade away from Lancashire before the war—makes the British exporter feel that "a most serious form of competition is only a matter of time."

The second development is the trade agreement which provides for an increase of 100 per cent in the volume of trade between the sterling area and Japan. The increase for textiles does not approach 100 per cent, but the agreement is described as a disturbing influence on Lancashire trade until the full facts about it are known. The third matter for concern, as the China and Far East section sees it, is more intangible; it is

> the policy of certain Colonial Office officials who appear only to be interested in obtaining the cheapest textiles for their market no matter from what source they come.

It ought, perhaps, to be said in defence of these heretical administrators that they have a duty to watch the interests of the colonial inhabitants, who (there can be little doubt) like to get their textiles cheap. And they have a further, and urgent, duty to ensure that textile supplies, which act as an incentive to colonial production, are prompt and sufficient. One complaint made by the Africa section is against the Japanese prices: "With the removal of price control it is now possible for Japan to supply grey cloth at a price almost equal to the present cost of UK yarn on the loom." But a second complaint is that the Japanese are beating Lancashire on delivery times:

> It is indicated that Japan will produce printer cloth to customer's own specification, engrave new rollers to customer's own design and deliver the finished article in about six months. Printer cloth of UK manufacture is quoted at three to four months' delivery, plus a further six to nine months for processing of ordinary types, and twelve months for such lines as 48-inch wax prints.

This, though it is intended as a complaint, would be taken by many people as a damaging admission. The Africa section goes on to suggest a revision of the Congo Basin treaties, which restrict the possibilities of discriminatory tariffs over a wide area of Africa. But so long as delivery dates for British goods continue to be remote, are not suggestions of this sort a waste of time?

* * *

Extending the Vauxhall Works

The big new machine shop which is taking shape on ground adjoining the Vauxhall motor works at Luton is more than a simple extension; it is intended to make possible the remodelling of the entire plant. Recent statements by the company have shown its awareness of the need for such a remodelling. The directors' annual report for 1948 reported an increase of 21 per cent in output as compared with 1947, but complained of the difficulties of making progress with "the replacement of obsolete and worn-out equipment by more modern and efficient plant." What was envisaged (as a statement by the chairman and the managing director showed at the same time) was "a tremendous job of modernisation of our methods, our machinery, and of our equipment generally." Since (as they said) "there is little more that can be gained by exhortation or by asking people to work harder," better equipment and better methods were the only way of achieving a major reduction in costs—a need which this management, at least, has very much in mind.

The existing floor space is, however, being fully used, and there can hardly be any question of stopping production while a major reorganisation is carried out. A new building is necessary to give room for manœuvre. The machine shop now being built will provide 750,000 square feet of new floor space; the engine and gearbox sections will be moved into it, and the remaining sections of the works will then be reorganised one by one. Some £10 million is to be spent—£2,250,000 on buildings and services, and the remainder on machinery and tools, which will be British except for some special machines such as multiple gear-cutters. The company raised £3,000,000 in the City last year in 4 per cent Notes, and a further £1,500,000 as a revolving credit; a large part of the expenditure is to be financed from the company's own resources.

Work on the foundations for the new shop began last spring, and it is hardly possible to avoid noticing how rapidly the building is going ahead. The cause is unusual. The steel structure was bought ready-fabricated from the United States, where the parent company, General Motors, had prepared it for a plant which proved to be no longer required. (This was the project for a "small" American car, which General Motors on second thoughts decided to drop.) The structure was imported during the summer, and will have reduced the total length of the construction work by about two years.

The building may be ready for occupation by September this year, but is unlikely to be in full production until the autumn of 1952. No estimate has been given of the effect on the total capacity of the works. Output of Vauxhall and Bedford vehicles last year was 84,176 units, of which 34,100 cars and 23,800 trucks and vans were exported. This increase of 9,600 units over the 1948 output, without any change in the number of workers engaged, is impressive. The next step will be to bring about, by means of the technical improvements which are planned, a further substantial increase in output while keeping the labour force still at roughly its present numbers.

* * *

Electric Lamp Agreement

The two biggest independent producers in the electric lamp industry—that is, firms which are not members of the Electric Lamp Manufacturers' Association—signed an agreement last Friday which opens up the prospect of pooling their already considerable productive resources. They are Thorn Electrical Industries and Ekco-Ensign Electrical, the lamp-making subsidiary of E. K. Cole Ltd. The firms intend to continue to compete for orders, but those orders may be carried out in whichever factory of either partner can most conveniently handle them. Such an arrangement is expected to increase efficiency and reduce costs. Should this happen, it will be of particular interest if the prices charged by these two firms, which together account for a little under 30 per cent of the industry's total output of lamps, should be reduced below those charged by members of the Association who produce 60 per cent of all lamps. The prices of all the big producers are now roughly the same and are lower than they were before the war.

The agreement has an important bearing on the production of fluorescent tubes. Early in 1948, Thorn Electrical Indus-

Ruhr Steel Brings Out Its Reserves

A spectacular rise in the shares of the leading German steel combines has taken place in the last few months, followed, as the accompanying graph shows, by a slight recession after profit-taking at the end of the year.

The development is of some interest outside Germany. The revaluation of shares reflects a complete change in the financial policy followed by the German steel companies since the end of the first world war. For various reasons, including fear of socialism and the Allies, the policy of paying out profits in high dividends was at that time abandoned. Instead, hidden as well as open reserves were built up by writing down fixed assets to their scrap value. The dividend stop later imposed by Hitler accorded with this policy, which was based, as far as the companies' directors were concerned, on a typically German concentration on building up the strength of the business. Finally, with increased world prices, the discrepancy between the book and actual values of plant widened to extraordinary proportions.

The steel companies have now an opportunity of bringing the true values of their enterprises to the light of day; they are preparing their first D-mark balance-sheets since currency reform, and may by law revalue their assets up to a certain limit without tax liability. All the leading combines have chosen to take this step. They have announced to their shareholders that old Reichsmark shares, instead of being cut drastically on conversion into D-mark holdings, will probably be converted at 1:1.

THE RISE IN SHARE QUOTATIONS OF THE LEADING GERMAN STEEL COMPANIES

In reversing their financial policy, the steel companies are grooming themselves to attract fresh capital, foreign and domestic. It would be a mistake to assume that as a result of these accounting changes they have suddenly manufactured vast reserves of investment capital. The need for fresh money, to the extent of some £166 million, remains unchanged.

Doth not the appetite alter? A man loves the meat in his youth that he cannot endure in his age.
Shakespeare

Even in the leisurely days of William Shakespeare apparently it was possible for man to become satiated with good eating. The science of food as we know it now was unheard of then, as were for that matter the "meat" shortages which we all regret.

In the bustle of life in this day and age a man need no longer suffer if time, or years, will not permit him to assimilate his food, or if he lacks that "pep" which only a generous protein intake supplies.

He can get adequate and enjoyable nourishment from a cup of PEPTALAC, the predigested milk and wheat food drink.

PEPTALAC is an ideal source of protein for the busy man—and his family too. It imposes no strain on the digestion and can occasion no regret.

Made in an instant by the mere addition of hot water—"The milk is in it!" Get a tin today and enjoy "the pep" that only PEPTALAC can supply.

Finance and Banking

Transferable Sterling

At his press conference this week the Chancellor of the Exchequer was asked whether any further agreements had been made between the transferable account countries similar to those with Egypt, Czechoslovakia and Spain. These restrict the use of transferable sterling to payments for imports from other countries in the transferable account group and prevent all use of such sterling for triangular transactions involving trade with countries (and particularly dollar countries) which are outside the group. Choosing his words very carefully, the Chancellor said that no other "agreements" of this kind had been made but that "arrangements" had been made restricting the use of transferable accounts to direct commercial operations.

The distinction between "agreement" and "arrangement" is probably significant. The agreements made with countries such as Egypt are between governments, have to be notified to the United Nations, and are open to the scrutiny of the whole world. In certain cases the formality of such agreements is probably an essential condition of their observance. In other cases, the matter can be left to less formal arrangements or understandings, arrived at between the Bank of England and the central banks of the countries concerned, by which similar restrictions can be put on the completely free use of transferable sterling. The arrangements made with the Netherlands belong to this category. It is probable that, whether by "agreements" or by "arrangements," the whole range of the transferable account countries has now been drawn within the net of these increased restrictions on the free use of their transferable sterling. This fact has become widely known, and commercial opinion in many of the countries concerned has interpreted the development as a virtual abolition of the

transferable account system and a withdrawal by Britain into strict bilateralism in all its payments arrangements with non-sterling countries.

This is too harsh a verdict to pass on the latest development in British exchange control policy. Admittedly, the virtual ban on the use of transferable sterling for third party transactions goes some way to demolish the pretensions of sterling to be a truly international currency, even within this limited group of countries. But sterling remains truly transferable between them without prior authorisation from the Bank of England for genuine commercial operations, and this should cover by far the greater part of their need for sterling. The Bank of England, moreover, will readily grant permission for third-party transfers of a genuine commercial character. Nonetheless, this latest chapter in the evolution of sterling exchange control, however much it may be explained and excused in terms of the defence of the gold reserve and as an attempt to defeat the market in cheap sterling, must be counted as a retreat from the goal of convertibility.

* * *

Bank Profits—and Gilt-edged Losses

The profits statements of the big banks are always inscrutable, but rarely have they seemed so unrevealing as those issued for 1949. No one would guess, merely from examination of the statements, that this has been a year in which the banks, like all other big institutional investors, have had to provide large sums for depreciation of investments—depreciation which must have amounted to a multiple of the sums now announced as net profits. The statements of all seven of the largest banks are now available, and four of them actually show small increases in profits—ranging from 0.8 per cent for Martins to 2 per cent or a shade more for Lloyds, Midland and Westminster. The declines amount to 1 per cent or less, except for the District Bank, whose larger movement (a fall of 3.9 per cent) is apparently due to the fact that this year the transfer to pension fund is made before, instead of after, striking the published profit. For the seven banks the aggregate profit is £9,685,702, compared with

* After providing an undisclosed contribution to pension fund.

£9,639,871, an increase of 0.5 per cent. Needless to say, therefore, the depreciation on investments has been absorbed without any draft either upon published reserves or upon the aggregate undistributed (published) profits available after paying the usual dividends, and even without any change in the formulæ by which published profits are defined. To the discerning observer there is just one pointer to what has been happening behind the scenes: a quite unusually high proportion of the disclosed undistributed profits has been returned to inner reserves. Barclays has transferred no less than £700,000 to its contingency account, the National Provincial and Westminster have each provided £600,000, the Midland £500,000 and Lloyds £200,000.

To those who are well aware of the year's experience in the gilt-edged market, such accounting as this affords a most heartening demonstration of the impressive extent of the inner reserves which the banks have accumulated in the past. But if ever there was an occasion for departing to some extent from past conventions and for telling the public more of the underlying facts, it was surely this year, on the eve of an election campaign in which there is almost bound to be a revival of the irresponsible charges that City "conspiracies" explain the recent collapse in gilt-edged. The public might have been told that the banks have suffered heavily from the fall in the market, that they have safely absorbed the book losses because conservative financial policy had enabled them to accumulate very large inner reserves against precisely such contingencies as this, but that these reserves are by no means inexhaustible and that present taxation policy makes their replenishment much more difficult than formerly. No true impression of how the banks have fared in the past year can be gained without taking account of this overshadowing factor of investment depreciation. Apart from this, however, it has certainly been another good year—one of comfortably rising gross current profits, and doubtless also of rising net profits after making all necessary provisions apart from the provision for investments.

Egypt, Israel and the Balances

At his press conference this week Sir Stafford Cripps again made it clear that the Government's overdue policy of tightening up on releases from the blocked sterling balances was not to be implemented by any general convention with Britain's major creditors, but was to be applied during the course of the ordinary annual discussions with each separate creditor instead. The first of these annual discussions—with Egypt in Cairo—has now started; the second—with Israel in London—is due to start on January 25th.

Egyptian holdings of sterling at present amount to over £300 million—the residue of the bill paid by Britain for the privilege of saving Cairo from Axis occupation between 1940 and 1943. From these balances Egypt was allowed to draw up to £30 million last year, of which £5,000,000 was convertible into dollars and another £5,000,000 into (partially dollar-financed) oil. The negotiations are going to be complicated this year by the fact that the Egyptian delegates are apparently coming to the talks with a whole series of ambitious "supplementary proposals" which they wish to place on the agenda. They are reported, first, to be reviving their claim to a share of the sterling area dollar pool. Egypt has laid claims to this ever since it left the sterling area two and a half years ago; as the country seems to have been a net drawer upon, instead of a net contributor to, the hard currency pool during its period of full sterling area membership, the basis for this claim is hard to understand. Secondly, it is reported to be asking for freedom to use sterling for payments to bilateral account countries (especially Belgium) and for "indirect" transactions within the transferable account group—this, of course, was formerly permissible. Since the British Treasury—as another Note this week explains—has only recently completed its arrangements for stopping this use of transferable sterling by other countries, it is likely to remain obdurate on this point. Finally, Egypt is also reported to be asking for a gold guarantee on its sterling balances—retroactive to last September. In view of the fearsome precedent such a guarantee would create, this request must obviously be refused as well. When all these sallies from the representatives of the new Egyptian Government have been beaten off, the British negotiators will have to get down to their main task of screwing down sterling releases this year below the over-generous figure agreed upon last time.

* 162517

Israel's sterling balances are at present believed to be rather less than £30 million after allowing for the release of nearly £7,000,000 between last May and last October—there have

been no releases since then. For nearly six months, however, there has been a wrangling bout in progress at Tel Aviv on the claims and counter-claims arising out of the cessation of the Palestine mandate. If Britain could really establish a claim against Israel for the honouring of all the obligations usually assumed by "successor" governments (payment for war stores left behind, for Civil Service pensions, and so on), the sums due from Israel might be enough to wipe out that country's sterling balances at one swoop. In the absence of more definite information, it is impossible to say how far any such claim can really be pushed. It would be a great boon, however, if the existing difficulties between the British and Israeli Governments could be cleared away without generating too much ill-feeling and without draining away any further unrequited exports. Israel is one of the few countries which has some prospect of running a dollar surplus on current visible and invisible account over the next few years but which is likely, even so, to run a substantial deficit with the sterling area in years of normal trade.

More Life Assurance Results

Returns for new life assurance business in 1949 have been published by a further twelve offices since *The Economist* of last week went to press. These figures, which likewise are not strictly comparable guides to the volume of business transacted by each separate company, confirm the impression noted last week that new life assurance business

NEW LIFE ASSURANCE—SUMS ASSURED BY 13 OFFICES

Free Gold Prices

During the last few months a certain amount of attention has been attracted to the fall in the price of gold on the numerous free and quasi-free markets now operating under conditions of varying difficulty and sharply fluctuating supply in different parts of the world. The price of "free" gold on the New York market is now down to $39 per ounce (that is to only $4 per ounce above the official price), compared with over $46 per ounce before devaluation. In Bombay and Hongkong the price of gold in terms of devalued rupees and Hongkong dollars is no higher than it was in September, while in Egypt, which also devalued, the price in piastres is only 3 to 4 per cent above the September level.

It would be a mistake, however, to try to set too much store by the experience on these markets. The price of gold on the free market in New York is to some extent a barometer of the pressure exerted by rumours of an increase in the official dollar price of gold; rumours which President Truman did his best to scotch last November, but which Sir Stafford Cripps, probably unwittingly, seems to have revived by his observation at last week's press conference that the sub-committee set up during the tripartite talks to consider this question was still sitting. Prices on the numerous free markets in the Near, Middle and Far East, on the other hand, are mainly affected by ordinary forces of supply and demand, the trends of which in recent months are well illustrated in the annual bullion reviews recently published by Messrs Mocatta and Goldsmid and Messrs S. J. Japhet and Co. The Oriental markets, which boom only in times of scarcity, have lately been fed by premium sales of gold from South Africa and by disbursement of hoards from China (where fear of expropriation by the Communists has been apparent). At the same time, the demand for hoarding purposes from within India and Pakistan (which are both suffering from foreign exchange difficulties) has largely dried up. In these circumstances, the natural forces of supply and demand have inevitably driven the price of gold down; it has even been suggested that the premium to be gained from unofficial sales is now so small that such a large gold producer as South Africa may soon find the game no longer worth the candle of International Monetary Fund irritation which it sets alight.

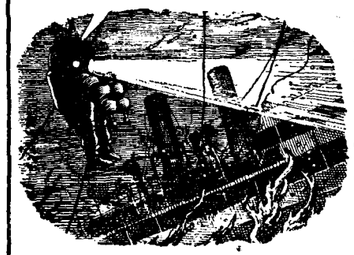
Burma Aid Ended

The British Government has decided to end the arrangement whereby it has been providing temporary finance for the continuance of full scale rehabilitation work by the Burmah Oil Company on its properties in Burma. This finance was arranged early in 1949 following the decision of the company to discontinue its own expenditure on rehabilitation work. Burmah Oil has expended some £8,250,000 up to the beginning of 1949 in its strenuous efforts to repair the damage done to its properties during the war. The cost to the British Government since it assumed its responsibility last year is estimated not to have exceeded £2,000,000. While a considerable section of the pipe line remains in rebel hands without any likelihood of being retrieved, expenditure on this scale would seem intolerable. The Burmese Government itself has failed to raise funds to assist in the work as it promised when the company stopped spending from its own resources last year. The future position is obscure, though suggestions for the provision of funds from other sources are being canvassed. Shareholders in Burmah Oil have not been unduly upset by this week's announcement. It has not been generally appreciated that large sums have been spent on rehabilitation in the past year. In fact the price of Burmah Oil Shares has risen slightly to 52s.



It has been announced this week in Rangoon that Irrawaddy Flotilla has been awarded compensation amounting to £309,173 by the Burmese Inland Water Transport Nationalisation Commission for its whole undertaking in Burma. A claim for £1,452,000 had been made by the company.

PARK FOUNDRY CO. LTD · BELPER · DERBYSHIRE

ordinary capital of Firth Brown Tools, holdings in an English company, Hack Saws, Limited, and in a Canadian subsidiary. Independent valuations of these interests have been made except in the case of the Canadian company, for which the price has been reached after negotiation. Two separate transactions are involved. John Brown and Company, which has a majority interest in Thos. Firth and John Brown, is to acquire the ordinary capital of Firth Brown Tools for £978,000, while in turn Firth Brown Tools acquires the two minor interests for £142,015. A sum of £95,183 is payable to the Canadian company. Of the remaining £1,024,832 payable to Thos. Firth and John Brown, £960,500 will be left on loan to John Brown at 4 per cent interest repayable in five years, leaving £64,332 presumably to be settled in cash.

*

In the event of steel nationalisation taking place, notice of repayment of the loan portion cannot be given earlier than twelve months after the transfer date laid down in the Iron and Steel Bill. This ensures that John Brown is not required necessarily to find the money for the purchase until that date. But the preamble to the scheme makes it clear that in selling its interests in the engineers' tool industry, Thos. Firth and John Brown have in mind the substantial new capital required for Firth-Vickers Stainless Steels, which it owns equally with English Steel Corporation. This company's new works is being constructed in conjunction with Samuel Fox and Company. Hence it is possible that the money may be required fairly soon. If nationalisation does not take place the provision of funds by the proposed sale to John Brown will be largely an inter-group transaction. In the other event, funds for Firth-Vickers Stainless Steels would have to be found by the new Iron and Steel Corporation, while John Brown would be assisted in repaying the loan from the compensation received for its interests in Thos. Firth and John Brown. It is to be noted that the payment of £95,183 envisaged to the Canadian company would entail a transfer of dollars. It is understood that arrangements for this have to be made.

* * *

Dollars for the OFS?

American interest in financing the development of the Orange Free State gold mines shows signs of broadening following the visit to South Africa of Mr James Murdoch, the president of Noranda Mines. On his return to Canada last week Mr Murdoch stated that in conjunction with South African finance houses his group was considering a plan for the provision of $30 million over a three-year period. One assurance sought from the South African Government was that dividends would be transferable and capital should be returnable in dollars. The Kennecott Copper Corporation is already in the field assisting Middle Witwatersrand with interim capital. Others may follow. Meanwhile, Sir Ernest Oppenheimer, in Johannesburg at the end of last week, envisaged an outlay of up to £200 million before the thirteen mines at present projected came into production. Some £130 million of this money would be needed to bring the mines themselves to the production stage and the remainder would be spent in the provision of necessary services and amenities.

* * *

Bolivar Railway Scheme

The Bolivar Railway Company has this week issued a circular to its stockholders asking for power to sell the undertaking to the Government of Venezuela. Negotiations for the sale have been proceeding for some time. The directors ask for power to sell the undertaking for not less than £615,000 plus claims and expenses equivalent to some 22 per cent of the sale price.

An agreement appears sufficiently near for the company to recommend a scheme for allocating the purchase money. This provides for the £10,000 outstanding prior lien debenture to be repaid at a premium of 20 per cent, for full repayment of the £180,000 "A" and £141,900 "B" debenture stocks without arrears of interest and for a 60 per cent payment on the £273,241 "C" debenture stock also without interest. The £136,620 outstanding funding certificates would receive 10 per cent of their nominal value. The £292,800 5 per cent and £277,749 6 per cent non-cumulative preference stocks would both get 5 per cent of their nominal value and 2½ per cent would be paid on the £170,000 ordinary stock. The residue would be split between the "C" debentures and the "A," "B" and "C" stocks in that order.

It will be recalled that the company's railway was taken over by the Venezuelan Government in 1948. It is only recently that any great hopes were held out of a satisfactory settlement. Stockholders may regard the outcome of the negotiations so far with some satisfaction, though there is often many a slip in negotiations of this sort. The "A" debenture has jumped to 89 compared with a nominal price of 45 a month ago, while the "C" debenture has advanced from 20 to 50 over the month. The junior issues were marked down sharply this week. A similar scheme is expected in the near future for the La Guaira and Caracas Railway.

* * *

Anomalies in Tin

The London tin price appears to be settling down at around £600 a ton spot. Available supplies of tin are still very restricted, and on December 31st stocks of tin in the London Metal Exchange warehouses amounted to only 11,125 tons of refined grades and 2,568 tons of common grades. The forward price has tended to recover somewhat in recent weeks, reducing the backwardation to £17. This is still an excessively wide margin for three months' delivery, though it is considerably smaller than in the opening weeks of the market, when backwardation was at one point nearly £70 a ton. It may still take a month or two before a more normal relation between spot and forward prices emerges. Shipments of tin from Malaya were surprisingly heavy in December, totalling 8,192 tons. But only 60 tons were sent to Britain while 7,275 tons went to the United States. Total shipments from Malaya in 1949 amounted to 54,523 tons against 47,214 tons in 1948.

*

Trading in tin futures was resumed on the New York Metal Exchange last week. As in London, backwardation was considerable in the initial dealings. In the past, trading in the New York market has been mainly based on the Reconstruction Finance Corporation's quotations: the RFC controls the Texas smelter and disposes of its output. The Ministry of Supply has also kept step with the RFC in selling the stock it recently transferred to the United States, but Malayan producers have frequently shown willingness to undercut what might be termed the "official" quotation. This has given rise to a peculiar price anomaly. Normally English Refined tin sold at ½ cent a lb. below the price for Straits tin, whereas nowadays Straits tin can often be bought 1 cent a lb. cheaper. As available supplies increase, this anomaly will no doubt disappear, and similarly, too, the RFC's influence on the market will wane.

Shorter Notes

The Bank return of January 11th reveals that the fiduciary issue has been restored to £1,300 million after standing at £1,350 million for the month since December 12th. The reserve of notes in the Banking department now stands at just under £20 million compared with just over £40 million before the start of the Christmas shopping rush.

*

The National Chamber of Trade and the National Union of Small Shopkeepers are asking the Prime Minister and the President of the Board of Trade for another postponement of the Census of Distribution. The date on which it is to be taken has already been moved from early 1950 to early 1951, following representations from shopkeepers who argued that it should be carried out when trade conditions were more normal. The same argument is now being put forward with this addition: having seen the dummy forms distributed by the Board of Trade to show traders the information which will be asked, the traders are afraid that the information may facilitate the introduction of a planned distributive system.

*

A team sponsored by the Anglo-American Council on Productivity sailed this week to study methods of producing and handling cardboard boxes in the United States. Production in Britain is already highly mechanised, but producers are very short of labour, and particularly of skilled labour. The team is therefore anxious to see to what extent American manufacturers have been able to reduce manual handling and get the maximum efficiency from unskilled workers. Another productivity team left last week to study American methods of diesel locomotive production.

The £4,250,000 share of the insurance risk on the two Cunard "Queen" liners, which has hitherto been covered by the Government, has now been taken over by the insurance market. The total insurance risk covered in the market on the *Queen Elizabeth* now amounts to £6,850,000 and that on the *Queen Mary* to £6,250,000. Since the heaviest risk previously borne on any one ship has been the £4,750,000 on the *Caronia*, the market's readiness to carry this new obligation is a welcome testimony to its present strength.

*

Coal output for the first week of the year was 3,724,000 tons, of which 3,536,600 tons were deep-mined. This is more than a million tons higher than output in the last week of 1949—when, however, the Christmas holidays reduced production by 1,310,100 tons. New Year holidays are estimated to have caused a loss of 509,600 tons. If they are taken into account, output in the mines would appear to be continuing at a level of more than 4,000,000 tons a week.

*

Underwriters were left with 90 per cent of the £2,550,000 3½ per cent Jamaica stock 1968-75 offered for public subscription last week; a further £700,000 of stock was placed before applications opened. It was incorrectly stated in the issue of January 7, 1950, that the loan had been oversubscribed; the official result was not announced until *The Economist* had gone to press.

*

In a note on Canadian requirements for electrical equipment in the issue of December 24th, it was stated that the Canadian Standards Association did not publish its standards. These standards are, in fact, published and copies can be obtained from the British Standards Association.

Rayon in your home

More and more in the modern home, you rely on rayon for beauty and comfort. Rayon by itself, or used with wool, cotton, or silk, provides a host of things to delight the house-proud. Rayon goes to make your sheets and pillowslips . . . your bedcovers and tablecloths . . . your curtains and carpets and chaircovers. The complete list is very long, and all the time it grows longer still, as increasingly the beauty of rayon becomes appreciated, and its versatility realised.

MARTINS BANK LIMITED

MR A. HAROLD BIBBY'S REVIEW

PROBLEMS OF INFLATION

REDUCTION OF NATIONAL EXPENDITURE

The one hundred and nineteenth annual general meeting of members of Martins Bank Limited, will be held at head office, Liverpool, on February 7th.

In his statement circulated to members, the chairman, Mr A. Harold Bibby, D.S.O., D.L., writes:—

It is with deep regret I commence my remarks by recording the death, in December last, of the Right Hon. Lord Biddulph, D.L., who joined the London Board in 1919 when the bank acquired Cocks, Biddulph and Company. In reporting also the retirement of Mr Walter Hargreaves, LL.D., from the Leeds Board, and in recording thanks for his valuable advice and help over a period of twenty-nine years' service and for Lord Biddulph's long association with the bank, I add my continued appreciation of the work of our local boards at London, Manchester, Newcastle upon Tyne and Leeds. These enjoy a considerable degree of autonomy, to the great advantage of our customers in their respective areas, and by representation on the general board effectively link together our widespread connection

I am pleased to be able to submit to the members of the company the balance sheet and profit and loss account for the year ended December 31st last, indicating both a satisfactory profit, slightly in excess of the previous year, and an expansion of our business. Like other banks and institutions dealing with money, our figures since the outbreak of the war have expanded greatly, due mainly to inflation, but members may be assured that, to a lesser degree, it is also due to the broadening of the basis of our business in our older offices. The new branches, mostly opened just before the war, have also played a prominent part in this expansion. A steady growth in the number of our customers indicates the extended use of the facilities we offer. The services of our trustee and foreign branches are more widely used than ever before and have necessitated considerable increases in staff.

THE BALANCE SHEET

Current, deposit and other accounts have risen by £16,875,370 and now stand at £305,289,697 which is a record in the history of the bank. The ratio to deposits of our more liquid assets, consisting of cash, balances with the Bank of England and other banks, money at call, Treasury bills, Treasury deposit receipts and bills discounted, continues at the high figure of 54.6 per cent. A decrease of £25,500,000 in Treasury deposit receipts is reflected in an increase in money at call and in Treasury bills. Thus, against a narrow reduction in earning power may be set some advantage of flexibility in carrying the proportion which falls to us of the country's unfunded debt.

Our advances have increased by £3,603,422. It is in the national interest, during the difficult economic period through which the country is passing, that bank borrowing should be confined to the finance of trade in the ordinary course of business and it is a wholesome feature of the present position, in contrast with the postwar period following the first world war, that money is not advanced for the speculative holding of commodities, stocks or securities. Also, as is well known, the Capital Issues Committee control borrowing for capital purposes which, however irksome, is at present inevitable as a means to ensure the best use of the country's resources. While seeking to meet all legitimate proposals which would assist agriculture and industry, especially the export trade, our officers have resisted advances which might lead to inflation.

In a footnote on the balance sheet your attention is drawn to a liability of £595,000 in respect of contracts for the purchase and alteration of several properties. The increase of our business in London and district and of the work of our foreign branch has made it imperative to acquire additional space to relieve the pressure in Lombard Street, and a large part of the above-mentioned amount relates to the purchase of a property in close proximity to that office. You will also see from the accounts that we have transferred to premises redemption account a sum of £100,000. This and earlier provisions have kept the item of bank premises and other property on a conservative basis but need for further provision will persist as conditions permit for modernisation, extensions and acquisitions. For instance, town planning under the Town and Country Planning Act will involve us in expenditure. It will be noted in the profit and loss account that there is no allocation to reserve for pensions as in former years. Instead, provision has been made before arriving at the net profit in conformity with the general practice of banks.

TRIBUTE TO STAFF

I have continued to keep in close touch with officers of the bank upon whom we depend to maintain our reputation for courteous and efficient service to our customers and I extend to every member of the staff the warmest thanks of the board for their diligence and faithful service.

THE SHOCKS OF 1949

The events of 1949 in the fields of trade and finance were critical. At the beginning of the year there were signs that the adverse balance of trade with the dollar countries was being reduced, creating a feeling of optimism, but there were other signs to be noted. The sellers' market was thought to be waning, costs of production were advancing and increased competition abroad was felt in our export trade. Full employment, a keen demand on the home market for all kinds of goods, extensive capital re-equipment in industry and, above all, the decisive but not fully appreciated effects of Marshall Aid obscured the real position. Nevertheless, the true situation was observed by our industrial leaders and in my statement to you last year I commented upon certain aspects of our nation's fiscal measures which were inimical to recovery, particularly high taxation, inadequate allowances for depreciation of machinery and other industrial equipment, and the need for greater individual efforts. The 1949 Budget was presented with an optimistic background though taxation was not reduced and expenditure was increased. Unfortunately, as a result of serious increases in our trading deficits with America, the Budget was followed a few months later by devaluation of the £ sterling. In the meantime the effects of inflation were carrying costs higher and encouraging demands for wage increases which are not supported by the Trades Union Congress who recognise the difficulties. Devaluation has already added to the cost of manufactures.

INFLATIONARY CAUSES AND EFFECTS

These problems of inflationary effects and high costs of production seem to be almost insurmountable but I think they can be overcome. In inflation, which for practical purposes means a too low volume of production and a too large amount of credit, there can be three operative factors, namely (1) through national and public expenditure (2) through the banks giving excessive credit or (3) by the payment of high wages for an inadequate output of work.

TAXATION TOO HIGH: NEED FOR REDUCTION OF GOVERNMENT EXPENDITURE

As regards the first cause I am sure I am voicing the feelings of many in saying that there is need for a drastic cut in government expenditure far in excess of the figure of £250,000,000 which has been mentioned. I cannot here analyse budgetary expenditure but I offer some comments on the result of large budgets, namely, taxation, the easement of which seems essential. Directly or indirectly, taxation enters into almost every calculation made by industrialists and business men and even by the wage earner. It is true that increased initial allowances for depreciation on new capital goods have been introduced, but this only antedates the allowances and does not meet the difficulty of covering the doubled or trebled cost of replacing worn-out plant and machinery depreciated on the basis of the old tax allowances. The strain on both fixed and working capital in industry is growing. Though now probably on the downward grade, the level of profits is still high, in some cases too high as a result of controls but there is generally insufficient residue after taxation to finance the purchase of additional new plant and machinery so essential to increase output and to produce the goods required by the exacting customers in the dollar markets. Stocks of raw materials and manufactured goods have substantially increased, calling for more finance. Some of these stocks may be accumulating because of selling difficulties, indicating the risk of price reductions and losses facing manufacturers in the future.

A scrutiny of recent company balance sheets shows that their holdings of cash, gilt-edged and other securities are less, while bank overdrafts have increased merely to sustain in many cases the same volume of activity at higher prices, and, possibly, higher gross paper profits. Net profits, it can be positively stated, are in many cases insufficient to meet replacements, and the incidence of the profits tax discourages the introduction of new capital for the same purpose.

INCENTIVES

Finally, on this subject of taxation, may I say a few words about incentives. Reward for risks should be adequate. Our great foreign trade was built on the basis of successful risking of capital and labour and can only be maintained by continued enterprise and initiative, both of which need stimulation. As regards our working population, it is to be hoped that the schemes, now receiving official notice, of payments by results as incentives to greater efforts, will not be thwarted in their effect through P.A.Y.E. Many successful schemes for participation in profits by the workers are now known to be in operation and, in certain industries, there should be opportunities for the introduction of others. In the interest of workers the form of participation is important for, when times are good and earnings high, there is a disposition, quite understandable, to raise the style and cost of living without leaving an adequate margin to provide for contraction when times are bad. It may therefore be wise for employees and employer to agree that a suitable proportion of any increased earnings, as the reward of greater production, should be saved. Such a provision would be in the interest of the worker and the country alike.

As regards the second possible cause of inflation, through banks, I have already dealt with this aspect when referring to our overdrafts and I need only add there can be no doubt that bankers have understood and fully respected their obligations in the restraint of inflation.

JOINT EFFORTS BY EMPLOYERS AND EMPLOYEES TO PRODUCE MORE

The third cause, high wages for an inadequate output, is one which we have failed to bring home with conviction to the workers in general. It is fair to say that the predominant motive activating the conduct of many a worker is the fear of unemployment. He has been indoctrinated with the belief that if he works too hard producing too much, he may find himself unemployed because of over-production; also, that if he works too hard, though he himself may be employed, his brother may not be so fortunate and the belief in the need for what is termed solidarity has resulted too often in the pace of output being reduced to the capacity of the inefficient. In addition there is unfortunately a resistance to the introduction of new mechanical labour-saving devices and instances can be cited of the insistence of labour that the same number of men should be used after the introduction of such devices as were employed before their advent. This is no new feature for it has persisted since the days of the burning of Arkwright's "Spinning-Jenny."

The truth is there is greater danger of unemployment if we do not use advanced mechanical aids, because we shall cease to be competitive with countries in which a more enlightened view is taken. In the U.S.A., if a gang of workmen have a slacker in their number it is unnecessary for the management to intervene; the other members insist on the withdrawal of the inefficient member, knowing that, otherwise, their joint earnings will suffer.

I believe it is unnecessary to return to longer hours except in cases of emergency, or that workers should forfeit other advantages they have gained subject to a willingness to work conscientiously when they are at work. Any other course will lead to disaster and it is plain beyond dispute that in conditions of independence we only have as much as we produce and these remarks apply to all sections of the community. Herein lies the substance of our economic problems awaiting solution as we approach the day when reliance upon our friends must cease.

INDIAN IRON AND STEEL COMPANY

INCREASING COSTS

MR T. LESLIE MARTIN'S SPEECH

The thirty-second ordinary general meeting of The Indian Iron and Steel Company, Limited, was held on December 30th in Calcutta.

Mr T. Leslie Martin, the chairman, in the course of his speech, said: Production of pig iron showed a decrease of approximately 52,000 tons, mainly on account of a temporary reduction of output as the result of an accident that threw out of action furnace No. 2 at the beginning of the year at your Hirapur works. Against this, however, was the fact that this furnace was at that time due to be blown out for relining, and the opportunity offered was therefore taken for carrying out this work, which would, in any event, have necessitated taking this furnace off production.

On the sales side, the drop in sales tonnage as compared with last year was accentuated by the stock variation of the previous year, with the result that this item shows a considerable reduction in comparison to 1948. I am pleased to report that, due, in the main, to the better prices realised for the company's products, the value of sales recorded an increase of approximately one crore of rupees, or £750,000. That the increase in selling prices of pig iron which took place in February, 1948, was essential is borne out by the fact that, despite this additional income, the gross profit on sales recorded an increase of no more than Rs.4 lacs, or £30,000, and practically the whole of this was absorbed by the additional cost of staff and labour benefits and increased interest charges. As a result, the net profit, before provision for taxation, shows an improvement of only Rs.60,000 over that of 1948. Owing to the grant of a more liberal allowance for depreciation, the taxation liability is, however, Rs.5½ lacs, or £41,250, less, and this has enabled your directors to recommend to you the payment of an increased dividend of 10 per cent., as against 7½ per cent.

GROWTH OF COSTS

Last year I drew attention to the ever-increasing cost of raw materials, remuneration of labour, etc. The figures for the year under review are higher than last year. They are fully illustrative of what is happening in Indian industry to-day—namely, that the expenditure necessary to keep production going is so great in comparison with income return that little margin is left for shareholders or for retention in the business by way of reserves.

I regard the economic crisis which has inevitably overtaken this country as only a temporary phase inseparable from the teething stage of an entirely new political regime. In a sense it is a blessing in disguise, for it is undoubtedly bringing home to the Government, the industrialist, the investor, and the labourer a closer realisation of the gravity of the problems we have to face and the fact that any procrastination in putting the utmost effort into their solution, such as living within our means and a much greater production is fraught with imminent danger to the stability of our entire political and economic fabric.

So long as there is a shortage of iron and steel, and until such time as a certain amount of over-production creates healthy competitive conditions within the country and this industry is able to do without protection against the certain revival in the not too distant future of foreign competition, it is in the national interest that a carefully planned control of prices and quality of production is necessary.

PRICE CONTROL

The prices of steel have been under control in some form or other since 1939. Selling prices were fixed by negotiation between the Government and the main producers until the beginning of 1948, when the Government referred this question to the Tariff Board for investigation and report.

After a detailed and careful investigation the Tariff Board submitted its report to the Government about the middle of March this year and recommended retention prices about Rs.9, on the average, below those ruling for pig iron sold to consumers other than the Steel Corporation of Bengal. In consequence of a representation made by us to the Government, the matter was apparently referred back to the Tariff Board and an increase of Rs.2 per ton towards "contingencies" over the rates originally proposed was recommended by the board. This recommendation was accepted by the Government. The net reduction, therefore, is about Rs.7 per ton, or some Rs.20 lacs or £150,000 in the year's revenue on sales outside the iron sold to the Steel Corporation of Bengal and this arrangement is to remain in force for one year from November 1st last, after which costs will again be reviewed and any revision in prices made, if necessary.

MEASURES TO CURB INFLATION

We all appreciate and welcome the anxiety of the Government to curb inflation and to bring down the cost of living by a reduction in the prices of essential commodities. I would, however, urge on the government the desirability of the application of the axe first to the prices of real essential commodities such as food and clothing and that the iron and steel industry should have a lower place in the order of priority.

I have no doubt that you will all join with me in expressing our sincere appreciation of the government's decision to grant us a loan on terms which may be regarded as favourable in the present condition of the money market.

The Hirapur works extension scheme, which includes the construction of a new battery of coke ovens and other auxiliary plant has already cost about two and a quarter crores of rupees. This expenditure has been financed out of your own resources, supplemented by loans from the banks and the whole scheme has been largely completed. We have also had to incur considerable expenditure at our Kulti works on the modernising, mechanisation, and complete reorganisation of our foundries for pipes and general castings. This has caused a heavy financial strain on our cash resources and the loan from government will enable us to complete the full scheme.

I feel reluctant to dilate on how labour has deteriorated during the last six or seven years so far as its productive effort is concerned whilst there has been a progressive increase in its emoluments. Any lengthy reference to this question seems almost superfluous, for there is seldom a speech by any chairman in which the matter is not referred to or discussed. The government also, I believe, now recognise that the complaints of the employer against labour are not altogether unfounded.

As you know, we have altogether four blast furnaces; two at Hirapur and two at Kulti. For a considerable time only one furnace was in operation at Kulti. We have recently blown-in the second furnace. I hope that every endeavour will be made by the government departments in charge of the control of iron and steel and the supply and transport of coal, ore, and other raw materials to afford us the necessary facilities so that we may keep all the four furnaces in blast. I might also mention that pig iron is a useful earner of foreign exchange and I trust the government will not lose sight of this and permit a greater freedom for export of iron overseas.

RAILWAY TRANSPORT

The burden of railway transport both on raw and finished materials has been steadily increasing and there does not appear to be immediate prospect of this being lessened. There would seem to be no real reason for freight regulations and structure to be dissimilar when the whole railway system of this country is owned and controlled by the government, more especially when the inward and outward traffic of identical industries is concerned. Your two works in the Burnpur area are served by both the East Indian Railway and the Bengal Nagpur Railway

whose respective rules are, in many cases, different and often to our disadvantage. This matter has been represented to the Government and we earnestly hope that some equalizing action will be taken at an early date.

Turning to the question of a possible merger of this company and the Steel Corporation of Bengal, speculation on which is revived from time to time, I have nothing to add to what my colleague, Sir Biren Mookerjee, chairman of the Steel Corporation of Bengal, stated in his speech at the last annual general meeting of that company. The proposition, however desirable it may appear on abstract grounds, cannot even be considered until the earning capacity and the assets of the two companies become reasonably comparable and until we see a tolerable prospect of the shareholders of both the companies agreeing that such an amalgamation would be to their mutual advantage.

The report and accounts were adopted.

REAL ESTATE DEBENTURE CORPORATION, LIMITED

PROPOSED BONUS ISSUE

The annual general meeting of the Real Estate Debenture Corporation, Limited, was held in London on January 6th. Colonel G. S. Brighten, D.S.O., O.B.E., chairman and managing director, presiding.

The following is an extract from his speech circulated with the report and accounts for the year to March 31, 1949:—

Immediately following this meeting your directors intend to declare the first interim dividend on account of the year to March 31, 1950, at the rate of 5 per cent. actual, less tax.

Revenue during the year under review has continued to show a sustained and considerable improvement. The interim dividend was 7½ per cent. and the final dividend proposed is 5 per cent.

On August 1st last, the outstanding debenture stock was repaid at a total cost to your company of £176,000. This was achieved, with the exception of an amount of approximately £25,000, by means of the proceeds of the sale of two of your company's properties. By careful negotiation we secured prices for these which realised a sufficient sum to carry out the virtual extinguishment of the debenture debt.

These sales will result in your company having a figure of something over £100,000 to the credit of capital reserve, and we do not see any reason why the stockholders should not have some benefit from the direct result of the prudence and foresight exerted in the past, and compensation for the lean time they have had for so many years.

Recent restrictions have prevented the directors from exercising their intention to declare a "one for one" bonus, but they are exercising the company's rights under the regulations and are recommending a bonus issue of "one for two" by a capitalisation of £44,528 10s. from capital reserve.

My personal view is that the value of your company's assets at current market prices shows a figure in excess of 27s. cover for each 5s. stock unit, and may well be more.

You may take it that it is my view that the disposal of the two properties referred to above will not affect the profit of this company for the current year, or indeed in the future.

Five years' careful and successful work, coupled, of course, with some general advantages for which we are in no way responsible, but also with others which are attributable to ourselves, have brought us to a position when we are rapidly coming to see success of no inconsiderable nature in our affairs.

The report was adopted.

CHARTERHOUSE INVESTMENT TRUST LIMITED,

SATISFACTORY PROGRESS

The twenty-fifth annual general meeting of this company, will be held in London on February 1st

The following is an extract from the statement by the chairman, Mr H. N. Hume, circulated with the report and accounts for the year to November 11, 1949:—

The Charterhouse Group as it has now come to be called, made satisfactory progress during the year. After providing for dividends, £39,714 in the aggregate has been added to the reserves and carry forward of the three main constituents. A further provision of £30,000 has been made for depreciation of securities in the Charterhouse Finance Corporation and this has the effect of showing the net value of stocks and shares in the balance sheet of that company at £15,042 less than the lower of cost, market or estimated value.

During the year we sponsored a considerable volume of issues and placings, all of which were successfully completed. Competition from the less responsible type of issuing house was noticeably less and it appears that serious industrialists are increasingly realising that it is in their best interests to entrust their financing to the well-established houses which can be relied upon to give them sound advice and good service.

PROFITS TAX

During last year the market for ordinary share issues faded away to almost nothing and companies wanting to raise capital were forced to issue loan or preference capital carrying a cumulative annual obligation to pay interest or dividend. Implementation of my previously expressed views that capital not bearing such an obligation should be issued whenever practicable was made less possible by the ill-conceived profits tax which in October last was still further increased for political as opposed to business or taxation reasons.

Looking back over chairmen's annual remarks, an interesting point that strikes one is the number of references made to "abnormal" conditions or to hopes of conditions becoming "more normal." We have come to use the word "normal" in these remarks when we really mean "better," and better times must surely mean that period when men of goodwill are permitted to trade without (or at any rate with the minimum of) interference from their governments.

All engaged in finance are always trying to look ahead and to shape their policy so that the well-tried and smooth working capitalistic system which has brought so much benefit to the entire world can be adjusted to meet modern conditions and thus continue to serve its purpose.

CITY'S BEST CONTRIBUTION

I believe that the best contribution the City can make to the common cause is to try and work in with the Civil Servants (as was successfully done during the war) by encouraging them to study our ways and our processes of thought, by trying to break down the "isolationist" attitude they tend to adopt and by proving to them that the vast majority of traders and financiers are not to be judged by the few dishonest people who cross their path.

We have concluded a number of profitable transactions since the beginning of our current financial year, and have a fair amount of potentially profitable business under negotiation. We have decided to open in Australia and I am sure you will join in wishing every possible success to Charterhouse Australia Proprietary Limited.

LAKE GEORGE MINING

INCREASED PROFIT

The thirteenth annual general meeting of the Lake George Mining Corporation Limited, was held in London on January 10th, Sir Godfrey Fell, K.C.I.E., C.S.I., O.B.E., the chairman, presiding.

The following is an extract from the chairman's circulated address.

The consolidated profit and loss account shows that the group operating profit for 1948-49 at £324,843 was £33,044 more than in the preceding year. Seeing that, owing to labour troubles, the mill operated for only 80 days, and that the mine was in full operation for only 67 days, these results, while gratifying, may come as somewhat of a surprise. The explanation of course, is that the accumulated stocks of concentrates on hand and in transit taken into the balance sheet at June 30th, 1948, were sold during the early part of the financial year at high market prices.

During the year under review, the cost of keeping the mine dewatered and other maintenance charges amounted to about £A.11,000 a month, while the mine and mill were closed down. Now that they are again in operation, it is essential that Lake George Mines Pty. Limited, should again build up a strong liquid position and increase its reserves of stocks, sadly depleted by the strikes; and I feel sure shareholders will agree that it was therefore prudent for the operating company not to declare a dividend on the results of the past financial year, and thus enable the corporation to declare a maiden dividend. But for the disastrous and prolonged strike, followed by the coal miners' strike, the position would have been very different. However, our recent labour troubles are now over, the terms of settlement are generally approved and we may therefore look forward with reasonable confidence to an absence of labour troubles in the future.

AN INCENTIVE TO GREATER PRODUCTION

The final scheme, which was accepted by an overwhelming majority, has the great merit of making the amount of the lead bonus dependent in part on output, thus affording an incentive to greater production.

There is still a shortage of labour at the mine, since many men left the mine on the outbreak of the strike to seek employment elsewhere and have not returned to Captain's Flat, while others, who were persuaded to join the Miners' Federation, a Communist-controlled union, which was responsible for fomenting the strike and hindering its settlement, have not all decided to sever their connection with that union and rejoin the A.W.U., membership of which is now made a condition of employment at the mine. The Miners' Federation has, by order of the Court, been debarred from functioning in the company's area.

The coal miners' strike, following on the strike at the mine, postponed the resumption of work for a further two months. Work was resumed on August 15, 1949, and has proceeded without interruption, and on a profitable basis, since that date. Given an absence of labour troubles, an adequate labour force and a continuance of reasonable prices for lead and zinc, the output from the mine and mill should be considerably higher than for the past few months.

Your board desire again to record their thanks to Mr Tom Owen, chairman of the operating company, and his colleagues.

The report was adopted.

BASS, RATCLIFF AND GRETTON, LIMITED

MR ARTHUR MANNERS'S SPEECH

The sixty-third annual general meeting of the ordinary stockholders of Bass, Ratcliff and Gretton, Limited, was held on Monday, January 9, at the registered offices of the company, High Street, Burton-on-Trent.

The chairman, Mr. Arthur Manners, presided, and was supported by the following members of the board.—Mr. C. A. Ball (deputy chairman), the Rt. Hon. Lord Gretton, O.B.E., Mr A. G. Manners, Mr W. P. Manners, and Mr P. D. Manners, with Mr I. D. Pugh (secretary), and Mr W. S. Carrington of Messrs. Whinney, Smith and Whinney (auditors).

The secretary read the notice convening the meeting, and the auditors' report.

The chairman said:—"Gentlemen—you have received the report of the directors, and statement of accounts for the year ended September 30, 1949, and I suggest that they be taken as read.

"I think you will agree that the directors' report and accounts in the form they are now submitted, with explanatory notes allows the publication of all figures and facts which are available at the date when the accounts are issued thus allowing members of the company to study such facts and figures in advance of the general meeting, so as to be in a position to ask for any further information or explanation that they may require, I therefore do not think you would wish me to take up your time in enumerating in detail the variations in the figures.

POSITION MAINTAINED

"I feel sure you will concur with me, that in spite of many handicaps, your company continues to maintain its position, due to the enthusiasm, goodwill and energy of the employees of the company and its subsidiaries. I know that you will join with me in expressing to all of them our sincere thanks and good wishes.

"I now beg to move that the report of the directors and the balance sheet for the year ended September 30 last, be adopted; that the half-yearly dividends paid on December 31, 1948, and June 30 last, on the 5 per cent. preference stock of the company, and the interim dividend of 5 per cent, on the ordinary stock, paid on June 18 last, be approved; and that a final dividend be and is hereby declared of 15 per cent. and a bonus of 4 per cent. on the ordinary stock, making with the interim dividend of 5 per cent. paid on June 18 last, a total dividend of 24 per cent. for the year, all free of tax, such final dividend and bonus to be payable on or after January 17, 1950."

Mr C. A. Ball seconded the resolution, which was carried unanimously.

The retiring directors were re-elected—Mr C. A. Ball on the motion of Mr R. I. Tooby, seconded by Mr S. C. Robotham; Mr A. G. Manners, on the proposition of Mr M. F. R. Moreton, seconded by Mr E. C. Walters; and Mr P. D. Manners, on the proposition of Mr. S. C. Robotham, seconded by Mr W. James.

The remuneration of the auditors, Messrs. Whinney, Smith and Whinney, was voted on the proposal of Mr E. C. Walters, seconded by Mr F. Hanson.

ASSOCIATED BRITISH MALTSTERS

GRAIN STORAGE PROBLEM

The twenty-eighth annual general meeting of Associated British Maltsters, Ltd., will be held on January 30th in London.

The following is an extract from the statement of the chairman, Mr H. Nutcombe Hume, C.B.E., M.C., circulated with the report and accounts for the year to August, 31, 1949:—

Trading results proved very much better than seemed likely at this time last year, but the current year's trading is likely to be difficult. Beer consumption is now definitely falling and there is unlikely to be any recovery so long as the present extortionate taxation continues and whilst we continue to live under a "planned economy" which persists in the belief that men will work harder to produce goods for export and want none of the good things for themselves. The independent maltster for sale is liable to suffer a disproportionate drop in trade at such times, since the brewer-maltster naturally keeps his own maltings fully employed as long as possible. Moreover our costs of production are still increasing and margins of profit are liable to decrease.

The harvest of 1948 began with most disastrously wet weather, but finished under quite favourable conditions, and the malts made from the 1948 crop barleys were much better than could have been expected. A good deal of the credit for this result is due to maltsters making every possible effort to cope with the barley as it came from the combine harvester, by placing all their drying capacity—malt kilns included—at the disposal of this great effort.

USE OF COMBINE HARVESTERS

Between the harvest of 1948 and 1949 a large number of additional combine harvesters came into use and the difficulties of coping with the vast quantities of grain—mainly barley—thus thrown on to the market at harvest time were greatly increased. Fortunately the 1949 harvest was one of the driest on record, so the immediate problem was one of handling, transport and storage rather than of grain drying. What would have happened if it had been a wet harvest it is difficult to imagine, but undoubtedly there would have been a national disaster.

We are informed that an additional 2,000 combine harvesters will be in commission by the harvest of 1950, but practically no further steps have been taken to provide the necessary additional grain drying and storage capacity. The last completely dry harvest in this country, comparable with that of 1949, was in 1911, and it was followed in 1912 by what is considered the most disastrously wet harvest in living memory. If history were to repeat itself, and if no additional provision is made in the meanwhile to dry and store the increased combined grain, the present national effort to increase the production of grain will have been completely wasted. Like so many other experiences in this country, I suppose we shall have to encounter the disaster before anything is done about it. But the authorities cannot then say they have not been warned.

Our Export Company is at a great disadvantage in competing with malt exporters in foreign countries in consequence of the Government's control of grain prices, which results in suitable malting barley grown in this country being by far the most expensive in the world. If it were not for this fact we could compete successfully with the malt produced anywhere. Even now, thanks to the organisation which we have been building up during the past 10 years, and to the fact that the finest quality of malt in the world is produced in this country, we are able to secure a share of the world's export trade in malt; but with the passing of the sellers' market, price will become an increasingly important consideration.

NOTICES

EAST AFRICAN INSTITUTE OF SOCIAL RESEARCH MAKERERE COLLEGE, UGANDA

Applications are invited for the following appointments in this newly established Institute:—

Senior Linguist, with specialist knowledge of at least one East African language. Salary on scale £950 x 25 to £1,050 per annum. Candidates should be prepared, if possible, to take up appointment in March, 1950.

Four Anthropologists. One experienced field-worker, salary £695 x 25 to £770 per annum; three junior field-workers, salary £620 x 25 to £720 per annum. Appointments to be taken up June-September, 1950.

Sociologist, with practical experience in conduct of urban surveys, salary £695 x 25 to £770 per annum. Appointments to be taken up June-September, 1950.

Secretary, with administrative and, if possible, library experience, salary according to qualifications. Appointment to be taken up in March, 1950.

All appointments are for three years in the first instance. Passages including family) provided on appointment and on leave, which is normally taken after two years; expenses of field-workers paid: child allowance £50 per annum per child (maximum of £150). Superannuation on F.S.S.U. basis.

Applications (six copies), giving the names of three referees, should be sent to the Secretary, Inter-University Council, 1, Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date, February 18, 1950.

STUDENT, ex-service, who hopes to graduate in Economics and Statistics next June, requires information of any vacancies in business requiring the application of statistical techniques.—Box 310.

FOR Sale.—*The Economist*, 1947 (5 short), 1948 (complete), 1949 (4 short).—Offers to Box 318.

THE TRADES UNION CONGRESS

INVITES APPLICATIONS

for the post of Secretary of the Research and Economic Department. Thorough knowledge of economic and political theory essential and actual experience of research work desirable. Salary £700, rising by three annual increments to £850 per annum.—Particulars of the appointment and form of application obtainable up to January 16 from Vincent Tewson, C.B.E., M.C., T.U.C., Transport House, Smith Square, London, S.W.1.

ARMITAGE AND RIGBY LIMITED

This Company invites application for the post of Export Manager. The Company trades in cotton and rayon piece goods. Personal knowledge is needed of the markets overseas, the goods they take, and their ways of trading. Journeys abroad will be necessary, and foreign languages are an advantage.

We are looking, not for a young man at the beginning of his career, but for a man of experience who knows the trade. He will be expected to take responsibility at once, and show himself capable of it.

Application should be made by letter to the Chairman. All applications will be treated with absolute confidence.

14, Bridge Street, Manchester 3.

A BANKING CAREER IN THE EAST

THE EASTERN BANK LTD. has a few vacancies in executive positions for suitable men willing to enter into a banking career in the East. Applicants should be between 20 and 24 years of age and unmarried.—Applications, which should include particulars of banking training, should be addressed to The Secretary, The Eastern Bank Ltd., 2-3, Crosby Square, London, E.C.3.

ACCOUNTANT, fully qualified, wanted by National Trade Organisation in London for Accounts and Office Management. Minimum salary £500 p.a.—Write Box 312.

Investment Statistics

Company Notes

Allied Leather Industries.—Consolidated net profit amounted to £20,781 (£19,530) for the year to June 30, 1949. A dividend of 10 per cent is recommended for the year.

Charterhouse Investment Trust.—Total profit for the year ended November 11, 1949 was £117,923, compared with £120,523 in 1947-8. Investments taken at cost less realised surpluses were valued at £927,624 (£918,251) at the year-end.

Steel Barrel Scammells.—Consolidated trading profit of the subsidiaries increased from £90,281 to £106,069 in the year to June 30, 1949. Total current assets of the group at June 30, 1949, were £380,180 (£348,053) and liabilities and provisions £196,202 (£205,057).

Michael Nairn and Greenwich.—Group trading profit declined from £749,203 to £636,638 in the year to September 30, 1949. Net profit amounted to £359,679 (£419,542). The dividend of 15 per cent for the year is repeated. Net current assets increased from £5,094,788 to £5,297,633.

Cardiff Malting Company.—The balance on trading account increased from £31,733 to £34,924 in the year ended September 30, 1949. The dividend of 17½ per cent for the year is repeated.

Robert Deuchar.—Trading profit fell from £432,884 to £231,832 and net profit from £198,536 to £89,364. The ordinary distribution of 20 per cent tax free, is repeated.

Teacher (Distillers).—Consolidated profit for the period January 1, 1949, to September 30, 1949, was £313,525 and net profit £139,036. A dividend of 7½ per cent is proposed for the nine months' period.

Enfield Cycle.—Trading profit for the year to July 31, 1949, amounted to £216,470 compared with £97,975 in 1947-48. Net profit increased from £31,778 to £67,782. Net current assets at the year-end were £326,383 (£260,769).

Tobacco Securities Trust.—Recommended dividends for the year to October 31, 1949, are 17¼ per cent (same) including 5 per cent interim already paid on the ordinary capital, and 10.2857 per cent (same) on the deferred capital, and not as stated in the issue of January 7, 1950.

Tollemache's Breweries.—Consolidated trading profit amounted to £82,201 (£172,940) in the year to September 30, 1949. Net profit was £44,419 (£69,129). Net current assets at September 30, 1949, were £194,460.

Moulder Line.—Total profit amounted to £499,689 (£509,099) in the year to December 31, 1949. Depreciation provision absorbed £374,562 against £232,399; the charge for taxation was reduced from £238,000 to £88,000. Including payments on account of new tonnage, the fleet was valued at £1,730,000 (£1,650,371) at the year-end and net current assets at £605,086 compared with £643,958 a year earlier.

Radio Rentals Ltd.—Total group profit rose from £323,382 to £460,487 in the year ended August 31, 1949. After provision, inter alia, of £240,892 (£165,538) for depreciation on radio and television sets and £35,715 (£21,354) taxation, consolidated net profit amounted to £150,162 (£115,454). Group current assets at August 31, 1949 were £67,810 compared with net current liabilities of £40,102 a year earlier. The net book value of radio and television sets, etc., has been increased from £818,371 to £929,390 on the year.

Carreras.—The balance of profit for the parent company amounted to £968,327 (£1,009,426) for the year ended October 31, 1949. A dividend of 35 per cent is recommended on the ordinary, the "A" ordinary and the "B" ordinary shares (same).

Sisal Estates.—Consolidated profit amounted to approximately £229,000 (£193,266) in the year to June 30, 1949. It is recommended that the total dividend for the year be increased from 20 per cent to 30 per cent.

Henlys.—Consolidated trading profit declined from £300,594 to £259,912 in the year to August 31, 1949. The year's provision for taxation has been reduced from £168,525 to £132,763. A total dividend of 100 per cent is recommended for the year (same).

Capital Issues

The Jhanzie Tea Association.—It is proposed to issue £150,000 6 per cent cumulative redeemable convertible unsecured loan stock at par to existing shareholders in the proportion of £7 new stock for every 20 ordinary shares held. Applications for any excess stock are also invited from shareholders. The loan stock is convertible 1950-60 at 25s, and redeemable 1960-64 at 102, 1965-69 at 101 and finally on January 1, 1970 at 101.

Henry Ballantyne and Sons.—Arrangements are in hand for marketing the 6 per cent cumulative £1 preference shares of which there are 110,000 in issue.

British Industrial Plastics.—A private placing has been made of £250,000 4½ per cent unsecured notes 1955-59.

Fulford Trumps.—Shareholders are offered 45,000 5½ per cent cumulative £1 preference shares at 22s. a share.

Radio Rentals.—It is proposed to offer 100,000 5s. ordinary shares at 10s. a share to existing shareholders.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'.
(a) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield.
* Assumed average life 14 years 5 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (k) Assumed dividend 18½% after capital bonus. (l) To latest redemption date. † Free of tax.
(m) Yield basis 35% after capital bonus. (n) Yield basis 26⅔% after capital bonus.

Statistical Summary

EXCHEQUER RECEIPTS AND EXPENDITURE

For the week ended [illegible] total ordinary revenue was £[illegible] against £[illegible] in the corresponding week of last year. Total ordinary expenditure was £44,900,000 and [illegible] consisted of [illegible] issues to the Exchequer, £2,780,000 [illegible] repayments of [illegible] borrowing [illegible] allocations to [illegible] Funds. Net [illegible] borrowing since April 1st was £[illegible] compared with £[illegible] for the corresponding period a year ago.

5, Gracechurch Street, London, E.C.3.

REFUGE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £18,000,000
ASSETS EXCEED £107,000,000
CLAIMS PAID EXCEED £198,000,000
(1948 Accounts)

YOUNG business man (30), 1st Class Honours Economics (incl. Statistics), fluent Italian, German, French, some years' experience of business at policy level, seeks change from present post, which offers insufficient scope.—Box 320.

EXPERT ANALYST COMPANY ACCOUNTS WANTED. Only highly experienced applicants entertained. Must be quick and accurate worker, conversant calculation earnings, asset values, etc. Good salary, prospects and pension right man.—Box 317.

ECONOMIC ADVISER, BOARD OF TRADE

The Civil Service Commissioners invite applications for the post of Economic Adviser to the Board of Trade. Candidates must be at least 30 years of age on January 1, 1950, and must possess a good degree, preferably in Economic subjects, and have a wide experience of current economic problems. The duties of the post include, among other things, the giving of advice from an economic point of view on a wide variety of questions affecting trade both home and overseas.

The appointment will be for three or five years and will carry a salary of £1,700 a year for a man, slightly lower for a woman. Superannuation provision under Federated Superannuation System for Universities.

Particulars and application forms from Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 2921; completed application forms must be received by the Secretary by January 31, 1950.

THE PROGRESSIVE BUSINESS MEN'S FORUM
"POLITICAL PROPHECY"
A Discussion between
Kingsley Martin, Editor, "New Statesman and Nation," and *R. Palme Dutt*, Editor, "Labour Monthly."
Chairman: *Lord Strabolgi*.
Thursday, January 19, 1950, at 7.30 p.m., at Heal's Restaurant, 196 Tottenham Court Road, W.1.
Visitors 3s. 6d.

COMMERCIAL organisation with world-wide interests invites applications from first-class Statisticians (30-40) to fill a position on the planning and organisation of a new Statistical Department. Successful applicants, who should have good commercial experience and a sound knowledge of economics, preferably on accounting work, will be required to organise the analysis of Statistical material and report on economics and financial trends. Commencing salary of up to £1,500 per annum according to age and experience, with good prospects.—Write, with full details of qualifications and experience, to Box F. 419, Willings, 362, Gray's Inn Road, London, W.C.1.

BANKERS

We specialise in all financial transactions with The Netherlands

54, 55 & 56, Threadneedle Street, London, E.C.2

ROYAL BANK OF CANADA
DIVIDEND NO. 250

NOTICE IS HEREBY GIVEN that a DIVIDEND of 2½ per cent., being at the rate of 10 per cent. per annum upon the paid-up Capital Stock of the Bank, has been DECLARED for the three months ending February 28, 1950, and will be PAYABLE at the Bank and its branches on and after March 1, 1950, to shareholders of record January 31, 1950.

By Order of the Board,
B. STRATH, London Manager.
6 Lothbury, London, E.C.2. January 11, 1950.

HIS MAJESTY'S COLONIAL SERVICE, GOLD COAST

A vacancy exists for the post of DIRECTOR OF COMMERCE AND INDUSTRY in the Gold Coast. The Director is responsible for the administration of the department and its further organisation in matters relating to promotion of industrial development, commercial and trade intelligence, supply in times of emergency, import and export licensing controls, liaison with commercial interests, and the marketing of some agricultural produce.

The salary of an officer appointed on permanent and pensionable terms will be £1,750 a year, or £2,150 a year if appointed on contract both figures including expatriation pay. Government quarters (usually partly furnished) are normally provided, and a deduction of £150 a year is made for rent. Free passages are provided for the officer and his wife on first appointment and leave. Income tax is at local rates, which are very much lower than those in the United Kingdom. The tour of service is from 18 to 24 months, and leave on full salary is granted at the rate of 7 days for each completed month of resident service. Candidates will not be eligible for permanent and pensionable appointment if over 45 years of age, but candidates of up to 50 years of age may be considered for contract appointment. Applicants should have organising ability and considerable knowledge of commercial practice, together with experience in commerce and industry.

Application forms can be obtained by applying in writing to the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1. The closing date for the receipt of completed application forms is February 15, 1950.

QUALIFIED Chartered or Incorporated Accountant required; preferably with degree in Economics, primarily to supervise installation and control of mechanised accounting system covering total importation of specific fruit from South Africa. General business capabilities essential, as eventual scope will cover wider field. Applicants should not be over 45 and should apply, stating salary required, to Box No. 309.

ASSISTANT Editor required for metalliferous mining weekly published London. Applicant, who should be under 45, must be a competent financial journalist and sub-editor, with specific experience in the mining company field and with some knowledge of mining economics and/or mining engineering. Beginning salary according to qualifications from £750 up to £1,000 in case of exceptionally qualified man.—Write Box 311.

Missing Component

TO the troubled world of Asia, the week has brought two events of great, perhaps even of decisive, importance. The first is the acceptance by the Commonwealth countries of a joint responsibility to give economic assistance to South East Asia. A Commonwealth committee is to be set up in Canberra to discover what the contributions of the individual countries can be and to combine them in a single plan. Without the advocacy and vision of Mr Spender, the Australian Foreign Minister, it is doubtful whether anything so clearcut and promising would have emerged. It is by far the most ambitious and apposite Commonwealth initiative ever made in peacetime and the fact that Asian and European Dominions are concerned in it as equal partners only increases its significance.

Within a day or two of the announcement of the Spender Plan, another authoritative statement on Asian policy was made in Washington. For some weeks, the future shape of American policy in the Far East and South East Asia had been undergoing a concentrated battery of criticism from sections of Congress and the press. Through the hubbub it was difficult to make out what the main lines of American strategy would ultimately be. The Secretary of State has, however, succeeded in making the position of the Administration clear. There will be no military interference in China. For the time being the United States accepts military and economic responsibility for Japan, for the occupied Japanese islands, and for the Philippines. In the area to the south west—in other words, in the countries whose future security was most closely considered by the Commonwealth at Colombo—the United States can accept no direct responsibility but is ready, together with other nations, to offer economic help wherever it has some hope of being effective. This is the policy of the "missing component." American assistance can be relied upon to complete schemes already prepared and supported by other peoples, but it cannot concoct, finance and administer any scheme entirely on American initiative.

Here, clearly, is a hopeful coincidence of policy. The Commonwealth is setting to work to draft a plan. The United States has announced its interest in such a plan once it is shown to be workable. It is some time since anything even so potentially promising has happened in Asia, but there are some formidable obstacles in the way of further progress. In the first place, the likelihood of any large financial contributions from the United States is not very great at present. Eleven per cent. of the current American budget—which is in deficit—is already devoted to foreign aid. In any case, it is important to keep the issue of economic aid in a proper perspective. At the moment, some premature rejoicing is undoubtedly being caused by a supposed resemblance between present plans in Asia and the first formulation of the European Recovery Programme in 1947. Then as now, it is argued, the countries most concerned were asked to co-operate in assessing their needs and the degree to which

they could help themselves. Then the United States stepped in to provide the "missing component" of dollar aid.

But the analogy is misleading. In Western Europe in 1947, there were mature national communities with established administrative and economic structures, but suffering from the one specific difficulty of an immediate shortage of dollars. The Marshall Plan was thus the direct reply to a specific economic need. In Asia, the position is different. The primary problem of underdevelopment cannot be met by a few billion dollars for a few years. A far more longterm, sustained and diversified programme is needed. Above all, the continent lacks most of the essential political pre-conditions of successful economic planning. This is not an argument against making a beginning in Asia. But it is an argument for avoiding an exclusively economic approach. The institutions, the traditions, the administrative framework which made the Marshall Plan effective, hardly exist in Asia. Mr Acheson said as much in his speech when he pointed out that economic aid "cannot furnish determination, it cannot furnish the will and it cannot furnish the loyalty of a people to its Government." He might have added "it cannot furnish administrators, experts, tradition and experience, either." All these things are primarily political and no economic programme can succeed if such vital political preconditions are neglected.

*

The importance, therefore, of the Colombo Conference is that it provides the possibility that economic aid can pass through the relatively efficient channels of a Commonwealth secretariat. Unhappily, it is by no means certain that American opinion views the outcome of the conference in this light or that the United States can be persuaded to see the vital importance of the political scaffolding which only the new Commonwealth can provide. The reason is not simply the old deeply ingrained distrust of the British Empire. In the last six months, a more specific reason for questioning the British role has crept into public discussion in America. The root of it is the fact that since 1945 the chief extraneous assistance to South East Asia has taken the shape of releases from the sterling balances owed by Britain to India and Pakistan as a result of the war. Such releases make up the bulk of the £750 millions which is Mr Bevin's estimate of British assistance to Asia since 1945. Only a simple calculation is necessary to discover that Marshall Aid to Britain in 1948 and 1949 falls not far short of this sum. Throughout 1949, concern has been growing in the United States over the instability of sterling and with it the demand that the sterling balances should be scaled down in order to reduce inflation in the sterling area and restore the convertibility of sterling. It seems, at first sight, so easy to kill several birds with one stone by simply transferring Britain's Marshall Aid to India, cancelling some of the sterling balances and funding the rest. The United Kingdom, the argument runs, would not be hurt on balance, since it would be relieved of the drain of having to make releases of the sterling balances, and American aid to India, which now goes *via* London, would be more effective if it went direct.

The economic fallacies of this argument are obvious enough. Those who believe that the sterling aid given by Britain to India is interchangeable with the dollar aid given to Britain by the United States have not troubled to ask whether the actual flow of goods—of which the dollar sign and the sterling sign are only symbols—can be switched so lightheartedly. In fact, the bulk of Marshall Aid supplies to Britain is made up of food and raw materials. The percentage up to April, 1949, was 85 per cent. Britain's exports to India and Pakistan consist, however, almost completely of manufactures. Last year, the amount of wholly or partly manufactured articles exported by Britain to India amounted to 93 per cent of all Britain's exports there and to 90 per cent in the case of Pakistan. To suggest that Britain's sterling exports of manufactured goods to India and Pakistan should be cancelled and America's dollar aid of food and raw materials to Britain switched to Asia is to propose that the British people should avoid malnutrition and mass unemployment by eating the machines they had ceased to export.

*

Not many Americans and possibly no responsible officials would go so far as to propose the cancellation of Marshall Aid to Britain and its transfer to India. The more general view is that Britain should, in the interests of monetary stability, drastically reduce its sterling releases and that America should grant compensating aid directly to South-East Asia. There is clearly much economic good sense in this argument and discussions on these lines are proceeding in Washington. The crucial question is, however, whether in discussing the shape of economic aid, the American negotiators may overlook the political aspect of the Commonwealth's role in Asia. Commonwealth and Sterling Area together have much more than economic significance. In a vast amorphous area, they provide the first outline of a free co-operative system through which aid may be channelled and the best use of available resources secured. But it would be foolish to believe that this view is widespread in America. A responsible newspaper in the nation's capital, discussing the proposal that the sterling balances be scaled down and direct American aid to Asia substituted, remarked

> It would have the disadvantage from the British viewpoint of loosening the tenuous ties that link the British with states that were formerly part of the empire. But the hard fact is that Britain cannot finance her overseas ventures indefinitely at the expense of the American taxpayer.

This clearly is the utter negation of partnership. It is the voice of political competition, of rivalry, of distrust. If the Colombo Conference represents no more than a British "overseas venture," then the political framework in Asia into which Mr Acheson's missing component is to fit simply does not exist. No doubt, in an ideal world, a better foundation than the old battle scarred, loosely knit, greatly discredited and unaccountably surviving British Commonwealth could be imagined. No doubt, given time, America itself by direct action might create comparable channels of contact and understanding. But at this eleventh hour in Asia, availability is the greatest political asset and that, for all its weaknesses, for all the "tenuousness" of its links, the Commonwealth still possesses. At the present moment, this fact is the western world's most practical political advantage in Asia. It would be suicidal folly if by a perverse reversal of priorities, plans for future economic aid were allowed to weaken and destroy their only political foundation.

What Next with Wages?

THE policy of stabilising wages, urged on the Trades Union Congress by Sir Stafford Cripps, and by it in turn on its constituent unions, was endorsed at last week's special conference by a vote of roughly 7 to 6. In fact, the approval of the policy was even more half-hearted than the figures suggest, for the majority was swollen by the block vote of the two big general unions, and recent experience shows that at least one of these, the Transport and General Workers, finds it far easier to embrace a policy than to secure the observance of it by its members. Nevertheless, the vote was affirmative and the policy of the wage freeze is now the official doctrine of the TUC. The politicians of the Labour Party are no doubt duly thankful for the result, for it provides the logical rounding out of the economic policy with which they are going to the country. No longer can be it said against them that they control everything except wages. Now everything is under control—in the colloquial, if not the literal sense.

*

In actual fact, of course, nothing could be more mistaken than to suppose that last week's vote decided anything. It unsettled more than it settled. The Trades Union Congress, as it has often explained, is exactly described by its title ; it is not even a federal body ; and it has no powers over its constituent unions other than those of persuasion. It is perhaps more significant that the miners, the engineers and the railwaymen have made clear their opposition to the freezing of wages than that another group of unions, with slightly larger membership, have reluctantly agreed to accept it. For the next few weeks, no doubt, none of the pending claims will be pushed very strongly. But once the election is out of the way it is likely—highly probable with a Labour Government and virtually certain with any other—that several unions will do their utmost to secure higher wages. If the officials refuse to do so, the members will act on their own behalf. So far from being put upon the shelf for the duration of the election, the future course of wages, and of costs of production, ought to be brought to the centre of the stage.

The policy of the stabilisation of wages goes back to the early days of the war. In wartime, it is a good, indeed an inevitable, policy, for a number of reasons. Inflation is quite unavoidable in a major war, and the first necessity is to prevent the primary inflation arising from the necessities of war finance from developing, *via* wages and the cost of living, into a rapid spiral of secondary inflation. Moreover it is reasonable to believe that a war is a temporary emergency and that what is then done can be undone before long.

But once the war is over, the position changes fairly completely. For one thing, inflation is not inevitable in peacetime ; it is not even desirable, and instead of trying to neutralise its effects, the better course is to remove the cause. Secondly, the objections on the score of unfairness become much stronger—especially if the policy is not equally enforced. A premium is put upon pushfulness. When the Association of First Division Civil Servants complained to the Prime Minister the other day that "the main reason for not paying the salaries which the Government admit to be proper is because we have conducted our case with model patience and restraint" they were merely underlining the premium that an unenforced wage freeze puts upon anti-social behaviour. And thirdly, though it is reasonable in wartime to aim at preserving the *status quo ante* for the duration of the war, such a policy is obviously ruinous if it is applied for an indefinite period in peacetime. The official explanations still talk in terms of a short-period crisis, but the pretence that anyone can see an end to it is wearing very thin. It would be unthinkable, if it were not happening, that anybody should deliberately contemplate, as a policy of indefinite duration, the petrifaction of the present structure of wages and other personal incomes and the inhibition, so far as possible, of any movement at all in one of the central regulators of the economic machinery.

These are the reasons why in recent months public opinion has been getting increasingly troubled about the freezing policy. On the one hand, so long as the general economic policy of the Government does not remove the danger of inflation—and so long as it adheres to the present extreme definition of full employment it cannot do so—the absence of any check upon the rise of wages and of costs of production is obviously dangerous. Thus the acceptance of a wage freeze by the trade unions becomes a test of their public spirit, and all men of goodwill will cheer when the General Council of the TUC manages to get its mount over the fence, even if there is only an inch to spare. But on the other hand, people are increasingly asking how long the policy can be continued, the more so as, at every reprise, a new batch of corollaries seems to be required to mollify the trade unionists, whether it be the denial to the senior civil servants of their right to increases no larger than the average trade unionist secured before the war was ended, or whether it be a further extension of the principle of standstill to suppress change and movement and enterprise and progress in some other branch of the economy. How long should a policy, whose justifications lie in temporary expediency, and whose long-term perils are obvious and great, be continued ? When does the short term become the long ?

*

But these arguments of principle about desirability and undesirability are about to be swept into the discard. The matter is about to be settled by much more forceful means. Last week's vote means (short of a miracle) that the policy of freezing wages will not work. It is extraordinarily difficult to believe that it can be maintained after the election. And if it goes, a great deal more goes with it. The policy would never have reached its present almost precise form if the leaders of the TUC had not been forced by remorseless logic to see that the Government's general policy was nonsense if wages were left free. They could not even, after the devaluation of sterling and the engagement of Labour's prestige behind

the new fixed rate of $2.80, take refuge in the belief that, in practice, it would be good enough to slow down the rise in wages.

So the policy of controlled inflation is nearing its terminus. The more clear-sighted of the union leaders and of the socialist intellectuals see this clearly. One of the clearest analyses of the situation that has appeared anywhere was in an article by Mr Bryn Roberts, the General Secretary of the National Union of Public Employees in the November-December issue of the union's journal. "Full employment," he says,

> is a good thing. But if it is achieved by allowing large numbers to be employed in jobs of no economic worth, full employment can lead to disastrous consequences. . . . Wage freezing, like an aspirin, may provide temporary relief, but it makes no lasting impression upon the basic causes that give rise to the malady. . . . If the trade union movement and its political arm fail to subdue the economic forces that are now undermining the national economy, we shall inevitably become subject to some form of extreme left or right totalitarianism.

Mr Roberts finds the solution in a tighter control of everything—

> We believe that until all our industrial and labour resources are brought under effective control and directed as the crisis necessitates, we shall continue the present ruinous drift

—and he has enough logic to see that this complete control must cover both the fixation of wage rates and the direction of labour, which he believes the wage-earners would then accept, since "direction of labour is only odious when it is applied solely to the workers." A marked recrudescence has been noticeable in recent weeks of the advocacy in socialist circles of controls for their own sake, as a means at once of seizing "economic power" (whatever that may be) and of bringing coherence and logic into a policy of inflation and full employment. It is questionable in the very highest degree whether the trade unions would in fact consent to a wage freeze and to labour direction, however much they were placated by the hamstringing of capital and the trussing of enterprise. And, of course, the vision of such a policy is terrifying to anyone who ranks the liberty of the individual or even economic progress above socialist doctrines. But at least it is a logically consistent policy.

The other alternative, of course, is to be in earnest about disinflation, to remove the inflationary pressure that is the cause of all the trouble. In the distorted atmosphere of an election, this is represented as the policy of wanting the Great Depression back for its own sake, as a means of disciplining labour. This is silly rubbish. Nobody wants unemployment for its own sake. What is necessary is to screw up the courage of the politicians, on either side, until they do not shrink from policies that will rescue the economy from petrifaction simply because they run some risk of creating some unemployment somewhere.

In any event, after the election, it will be somebody's responsibility to think out a new economic policy. There are only three possible choices, which can be crudely distinguished as follows:

1. Continue as at present, with neither more nor significantly less than the present controls, let inflation continue and costs rise and let the Treasury and the Bank of England worry about what happens to the pound sterling.

2. Clamp down controls on everything, including wages and the distribution of labour, and take no back answers from anybody, including the trade unions.

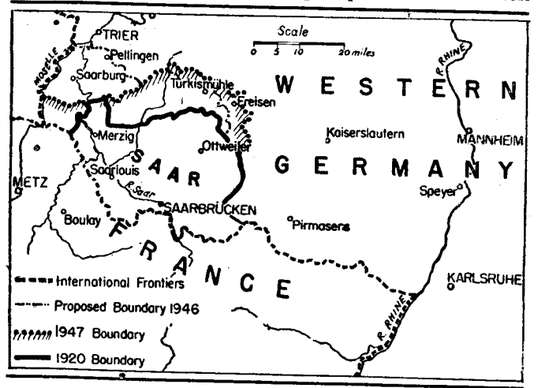
3. Make a determined effort to get rid of the inflationary pressure once and for all by tackling its causes in high Government expenditure, in subsidies and in cheap money—and do this knowing that it will hurt.

No parliamentary candidate can claim to be talking sense about economic policy unless he makes a clear choice between these three courses.

France and the Saar

IN a matter of days Frenchmen and Germans have been set at loggerheads by the kind of blunder that harried, and finally wrecked, attempts to improve their relations twenty-five years ago. It is true that the circumstances and the personalities have changed; but the attitudes and the utterances awaken mournful memories of the past. A wise and liberal French Foreign Minister, the Lorrainer M. Schuman, visits in Bonn a moderate and friendly German Chancellor, the Rhinelander Dr Adenauer. The purpose of his visit is to further the work of conciliation and co-operation begun many months back. Like all French Foreign Ministers, M. Schuman has to be firm and explicit on one or two specifically Franco-German matters and, like all German Chancellors, Dr Adenauer has to be patriotic and obstinate on the same matters. Each is hampered by the need to satisfy critics at home and each, therefore, finishes by striking attitudes less conciliatory than he intended. The optimists in both countries are discouraged, the extremists encouraged; no one knows who is really to blame. In the attempt to establish innocence, the press on both sides is plied by official spokesmen with arguments that go far beyond what is relevant.

That, roughly speaking, is what has happened over the Saar; and all the diplomatic, juridical and economic points that have been introduced into the dispute merely obscure the essential facts. The control of the Saar territory of 1,000 square miles and 900,000 people is of great strategic and economic value to the French, who believe that they could tie the Saarlanders to them for good if they were given sufficient time to establish durable economic, political and cultural ties. The Germans, on the other hand, believe the Saar to be German since its inhabitants speak German, they want rather than need its coal and steel, and they regard its detachment from Germany as an autonomous state to be nothing less than annexation. And the Saarlanders themselves are a typical frontier people, who three years ago voted without hesitation for a government amenable to French wishes and who, three years hence, will vote with equal readiness for return to Germany. So complex is the history of the relationship of France and Germany to the Saar that it is impossible to say that it simply ought to belong to the one or the other; it is rather a question of judging which has in the long run the greater attractive power on the inhabitants, and to adjust policy accordingly.



That, at least, is how the matter appears when viewed from London in the light of the declared policies of 1950. If greater unity in western Europe and the close association of Federal Germany with its neighbours are the main objects of French—as of British and American—policy towards the Bonn Government, then it is important to prevent uncertainty about the Saar's future from becoming an international issue. Unfortunately, however, the policies of 1950 are still frustrated by the policies of 1945. The process by which the French have brought the Saar to its present position has been conducted with some stealth and much skill, so that what is now being proposed—what M. Schuman was anxious to explain to Dr Adenauer—appears as the logical end to a plan laid four years ago. By the standards of Potsdam it was a good plan; the economy of the Saar was to be integrated with that of France and the territory—under French control and detached from occupied Germany—was to be prepared for "autonomy." That meant that Germany was deprived of an important arsenal, while France gained control of mines and plants which now produce 15 per cent of its iron and steel and 20 per cent of its coal.

The attraction—and the weakness—of this policy was that it could be represented to the French politician as tough and to the German as gentlemanly. The French could not be accused of annexing territory and taking reparations as the Poles and Russians could; yet they were in fact acquiring a form of reparations for the enormous damage caused by Hitler's armies. This plan was put up to the Council of Foreign Ministers in April, 1947, was rejected by the Russians but accepted later by the western governments.

In fairness to the French, it must be admitted that they have promised repeatedly that there can be no final settlement of the Saar's position until a peace treaty with Germany is signed; that is also the view of the American and British Governments. But that peace treaty still seems a long way off and the Germans ask, not unreasonably, whether it will be signed before the French have done in the Saar things that cannot be undone by their American and British allies. It must be admitted, too, that the French position is juridically impeccable; they have not put a foot wrong and have hitherto made it possible for Dr Adenauer, in his first three months of power, to be both discreet and tactful on the subject. Why then has friction suddenly developed? It is only three months ago that Dr Adenauer agreed that the Saar should send its own representatives to the Council of Europe, a clear enough sign of its temporary separation from Germany; why does he now feel it necessary to tell a press conference that "we shall have to protest as strongly as we did in the case of the Oder-Neisse line"?

Part of the explanation is that the Federal German Government feels itself much stronger since the Petersberg agreement of November. Its appetite for concessions from the occupying powers has grown. Its political power depends largely on its ability to meet nationalist criticism with periodic diplomatic successes. When it became known before Christmas that the Saar premier, Mr Hoffman, would be visiting Paris to discuss the territory's further advance towards autonomy and final economic arrangements with France, a campaign was begun in the German press. It was alleged that the French intended to obtain a lease of the Saar mines for a period of 50 years as well as a decisive voice in the control of the railways—which suggested that the French were preparing a set of *faits accomplis* which could not be disturbed by the German peace treaty, when it comes. The French deny that they wish to, or even need to, "corner" the Saar economy, which has been far more prosperous in association with them than it ever was under the Nazis. And they emphasise that what is to be discussed in Paris this month follows logically on all that has happened hitherto: reduced powers for the French High Commissioner, equal fiscal treatment of equivalent industries in the Saar and in France, the free movement of workers between them and regularisation of the position of the mines and the railways. No one seems to know who, in fact, holds the title to the Saar mines, but the French declare that their ownership can be settled only in the peace treaty with Germany.

It is clear that both parties are in important respects right. The French do not intend annexation, but they wish to deny the strategic and economic advantages of the Saar to the Germans as long as possible. The men

who now rule Federal Germany know that they cannot defend this distinction against their critics, particularly at a moment when the Russians are doing all they can to stimulate nationalist feeling throughout the country. The real question is—who is being wise and who is being foolish within the limits set by political realities?

Let it be admitted that the tone of the Germans in the last ten days has been arrogant and impatient; their threats are ill-chosen and foolish. They have failed to appreciate the great distance that French policy has moved towards conciliation. But what else was to be expected from a government that is harassed by nationalist attacks from the right and the left, that sees the allegiance of its citizens being bid for from east and west? The French, on the other hand, could have let well alone in the Saar, at any rate during the period that the Adenauer Government is finding its feet in European society. They should have realised that the desire for some new form of political and economic association of nations in western Europe is a real political force in Federal Germany, one of the very few constructive aspirations to be found there. It should be obvious, too, that exclusive arrangements between France and an important frontier region cannot be squared with the kind of talk that has been heard from French representatives in the Council of Europe or with suggestions—supported by Mr McCloy, the American High Commissioner—that the Ruhr Authority be extended to cover the heavy industries of Germany's neighbours. Dr

Adenauer's claim that the Saar problem should be considered "in the light of European interests" is both reasonable and logical.

If the future is to bring Germany into a satisfactory relationship with its western neighbours the course for the French—and the Americans and British—is quite clear. Indeed, it has been stated in black and white by their foreign ministers. It is to create in western Europe a political and economic framework into which Germany can be fitted as an equal partner. So long as there is no sign of that framework taking shape, so long will the politicians of the Federal Republic continue to play the nationalist game in the old way and to suspect others of doing the same. The French move in the Saar question is ill-timed; the support given to it from London and Washington is a warning that policy towards the Germans is full of inconsistencies, and policy for western unity still without real shape or purpose.

Parliamentary Retrospect—II

The Sphere of the Cabinet

IN turning from a review of the work of the Houses of Parliament to that of the Government itself, the observer moves into a more rarefied atmosphere. The way in which the cabinet goes about its business is to a large extent shrouded in secrecy, and even where this is not true it is difficult to divide the developments in government and administrative technique which are of permanent importance from those which derive merely from the accidents of circumstances and personality.

The Labour Party, before it came to power, was wedded to what has come to be known (not quite accurately) as the Haldane principle of grouping the departments of state under a number of senior ministers, each mainly responsible for making policies. This was the avowed intention of the party as set out in Mr Attlee's book "The Labour Party in Perspective," in which the desirability was set out of forming a small, body of ministers, constituting an informal, if not a formal, inner cabinet, and each "in his own sphere the representative of the Prime Minister in relation to a particular group of services." On this analysis, Mr Bevin would have kept a watching eye not only on the Foreign Office, but also on the Commonwealth Relations and Colonial Offices, Mr Bevan on the Ministry of Works as well as the Ministry of Health, the Chancellor of the Exchequer on the economic ministries as well as the Treasury, and the Lord President on the Home Office and a number of miscellaneous departments and committees concerned with domestic policy.

The departments have certainly tended to form themselves into groups. Indeed this is an inescapable and permanent development, not only because with a proliferation of functional ministries it is essential to ensure that they are all in pursuit of a common line of policy, but because in each of the major spheres of governance a key department has emerged. Thus the cold war has made the Colonial Office an intimate associate of the Foreign Office on one side and of the Treasury on the other. The Treasury, owing quite as much to the pervasive dominance of exchange control problems as to the personality of Sir Stafford Cripps, has emerged as the arbiter of policy over the whole range of economic affairs. An interesting endorsement of the permanence of this method of grouping ministries under an informal chain of command is given by the strong evidence that the Conservative Party intend—if they are returned—to continue it. Indeed they may well extend it by bringing the Ministries of Food and Agriculture much closer together, presumably under the aegis of Lord Woolton.

On the surface, this looks like the deliberate implementation of a conscious policy. In fact, it is very doubtful whether the conscious and deliberate element has been large. The grouping of departments is largely a legacy from the war and the pressure of events would in any case have continued it. And the groups do not hang together in the way the Haldaneites have always advocated. There are no super-ministers and there is no non-departmental cabinet. The cement has rather been provided by the growth of the system of cabinet committees—itself also a legacy from Mr Churchill's administration.

This is a field in which the inquiries of the constitutional student are not welcomed, since even the revelation of the existence of specific committees comes close to compromising the doctrine of the collective responsibility of the whole ministry. But it is clear from such information as is available that there has been a great growth of the use of committees of the cabinet in recent years. Cabinet committees, of course, are no new thing, but in the past they appear to have been temporary bodies, created *ad hoc* to tackle a specific problem and reporting back to the cabinet. Apart from the Committee of Imperial Defence—which was a special case, since it included the heads of the services and even ex-ministers—the only continuous committee before the war appears to have been one, variously known as the Home Affairs Committee and the Legislation Committee, whose main task was to marshal the queue of Bills aspiring to appear before Parliament.

During the war the Defence Committee swelled and sub-divided. It was reconstituted after the war and functions now, in a much more detailed and day-to-day fashion than the Committee of Imperial Defence. Mr Attlee is the chairman and there is a permanent secretariat capable of commanding considerable respect in Whitehall. It is possible that if there were a strong Minister of Defence the importance of the committee would diminish, but during Mr A. V. Alexander's tenancy of that office it has been necessary for the Prime Minister and other senior ministers to keep a watchful eye upon defence questions. The formal grouping of three service ministries under the Minister of Defence has theoretically led to a decline in their status, but they still retain considerable influence in the Defence Committee, on which they are directly represented.

The Legislation Committee concerns members of the cabinet not only in their official capacity, but also as leaders of a party. Mr Herbert Morrison is the chairman, as Leader of the House of Commons, and in the recent parliament, where legislation has been dovetailed into a very tight schedule, involving calculations many months ahead, it has had an obvious importance.

The chief newcomer to the ranks of standing committees of the cabinet, and a body of importance sufficient to be regarded as a major innovation, is the Economic Policy Committee, the heir and successor of the Lord President's Committee of wartime. As its name implies, it is concerned with the formulation of general economic policy, which nowadays makes up a large part of the whole business of government. Its membership is given by Mr Francis Williams in his book "The Triple Challenge" as Mr Attlee, Mr Bevin, Mr Morrison, Sir Stafford Cripps and the Lord Privy Seal, with other ministers attending as required. The interesting point to note is that it is once again the Prime Minister, and not a super-minister at the head of a group of departments, who is the chairman. It was this body which hammered out the scale of the cuts in governmental expenditure last autumn, and one of the reasons for the delay in announcing them has been attributed to the fact that one of the protagonists, the Minister of Health, did not see the draft programme until it came before the cabinet, so that all the arguments had to be thrashed out again. Other committees, for instance, those on manpower or nationalised industries, have jostled the Economic Policy Committee for pride of place, but it is now clearly pre-eminent.

There is a less influential body, the Production Committee under the chairmanship of Sir Stafford Cripps. Mr Williams has called this "the executive arm of the Prime Minister's Economic Policy Committee." Its membership consists of the President of the Board of Trade, together with the Ministers of Supply, Fuel and Power, Agriculture, Transport, Works, Labour and Health (on housing questions). It meets regularly—sometimes as often as once a week—and it makes decisions on questions of detailed economic policy such as major capital developments, the siting of major factories, priorities for scarce materials and so forth. It has been given wide limits of authority by the cabinet, including such matters as the investment programme and the preparation of the Economic Survey.

Such information as is available about the cabinet committees has been given at some length in order to illustrate the fact that it is their strength and influence, rather than the system of grouping lesser under greater ministries, which is the significant development of recent years in the machinery of government. With the possible exception of the President of the Board of Trade, who has remained strongly under the influence of his predecessor, Sir Stafford Cripps, departmental ministers are on the whole guided more by the decisions of the cabinet committees than by a senior minister. What has developed is not a system of super-ministers so much as a system of minor cabinets. The extent to which the grouping system *à la* Haldane has failed to mature is evidenced by external relations. Mr Bevin has not intervened—that is, not with any consistency—in the affairs of any department beside his own and except where foreign and imperial affairs mingle—such as Palestine or Malaya—he has not extended his sway over the Colonial Office nor until very recently over the Commonwealth Relations Office. The interesting point here is that there is no cabinet policy committee on external relations as a whole.

There is another significant development which relates to personalities rather than to constitutional developments. In most of the major crises which have confronted the Labour government—except Palestine and groundnuts—the Prime Minister has taken charge by forming an *ad hoc* cabinet committee under his own chairmanship. This was true of the food crisis in 1946 and the fuel crisis in 1947. It was the Prime Minister who saw the Indian problem through its successive stages. Mr Attlee has, it seems, taken the view that he himself is the reserve of energy and talent among the upper members of the cabinet, willing to delegate but also willing to take the reins back from an unsteady or unsuccessful driver. In Whitehall the Prime Minister is a figure almost unrecognisably different from the Mr Attlee whom the public, and even Parliament, know.

Whatever they may have been in other directions, in their impact on the machinery of government the Labour Ministers have been the reverse of revolutionaries. They took over the machine as they found it after the war and the changes they have made have been empirical rather than doctrinaire. Indeed, from the outside, the present Ministers have seemed to be more the prisoners, and less the masters, of the machine than their prewar predecessors. It would be wrong to assume that this is due to any personal inferiorities; it is much more likely to be due to the very great growth in the volume and complexity of business coming before the higher ranks of the Government, both the officials and politicians. Indeed, the most urgent need in the further development of British administrative methods is to find some way in which the intolerable pressure on a man who combines the role of policy-maker, executive, parliamentarian and constituency representative can be reduced. The first duty of the cabinet is to decide. If at times in the past four and a half years the power of decision has seemed to be atrophied, the main reason is to be found in personal fatigue.

Personal Incomes—I

Redistribution of Income

A GREAT deal will undoubtedly be heard in the next few weeks about what has happened to the incomes of different classes of people relatively to the cost of the standard of living they have come to expect—and of what is likely to happen to them in the next five years on the rival hypotheses. Indeed, under the surface—and perhaps on it as well—this is the dominant issue of the election. There will be much argument about who is, and who is not, "better off" than before.

As a contribution to the factual foundation for all such arguments it is proposed, in this and two following articles, to set out, as objectively as possible, such statistics and other information as can be collected to shed light on changes in personal incomes during the last ten years. This first article is intended to review the changes in the general pattern of British incomes. Most of the evidence is taken from the National Income White Paper of last April (Cmd. 7649). The latest statistics in it are for the year 1948 and some series stop at 1947. This time lag, though unfortunate, does not greatly affect the conclusions that can be drawn, since the postwar structure of personal incomes was already clearly defined by 1947 and 1948, and any changes that have taken place since then are almost certainly small in relation to those that went before. The second article will review in more detail the information that is available, from sources other than the White Paper, on wage-rates and wage-earnings. The third article will consider the statistically more difficult cases of salaries, profits and other incomes.

TABLE I.—PERSONAL INCOME IN DIFFERENT RANGES

Range of Income Before Tax	1938			1947		
	No. of Incomes	Average Income in Range		No. of Incomes	Average Income in Range	
		Before Tax	After Tax		Before Tax	After Tax
	000's	£	£	000's	£	£
£250—499...	2,000	340	331	7,900	341	313
£500—999...	670	679	619	1,850	662	536
£1,000—1,999 .	224	1,357	1,156	485	1,348	957
£2,000—9,999 .	98	3,673	2,602	165	3,618	1,939
£10,000 and over	8	21,875	9,500	10	18,400	4,300

The total of personal incomes in 1948 was £9,592 million—96 per cent above the 1938 level. But, because of the much larger slice removed by direct taxation in 1948, the proportionate rise in spendable income was not so much. At 82 per cent greater in 1948 than in 1938, the amount of money which individuals had at their disposal had increased in almost exactly the same ratio as the average market price of consumption goods (including, of course, any indirect taxes incorporated in them). On the face of it, therefore, the British people might be thought to be as well-off in 1948 as they were before the war. Indeed, the White Paper puts the volume of consumption at 3 per cent higher. But, these bare figures require some qualification. First, even if their money will buy as much as before the war, consumers will certainly consider themselves worse off if their choice in buying is more restricted or if the quality of goods is judged to be inferior. These are matters of consumer satisfaction for which there is no quantitative measure. The second qualification is that the same amount of purchasing power was in 1948 divided among a population grown larger by some 5 per cent.

By far the most important factor, however, is that a very large part of the purchasing power has changed hands. Table I shows how taxation by 1947 had crippled the large income to such an extent that, by prewar standards, the very large income had disappeared. Towards the lower end of the income ladder, numbers were swollen considerably. There is no official estimate of the number of incomes in the lowest group of all—below £250 a year. But there must be many fewer of them than there were before the war, when a wage of £5 a week was still above the average. Nevertheless, the total sum accruing to the incomes in this group was practically the same in both years. At the other end of the scale, the opposite has happened. Surtax payers have increased in numbers, but their share of the total income, after direct taxes, fell from 8.0 per cent in 1938 to 5.4 per cent in 1947. It is a pity that the statistics giving the numbers of incomes in different ranges of *net* income are no longer available, since these are the most revealing. The latest of that series relate to the financial year 1945-46 and, although they are now five years old, one comparison is worth recalling. There were in 1945-46 only 885 incomes of £4,000 a year or more after tax, compared with 19,000 in 1938-39. At the top end of the scale, the equalisation of incomes is believed to have gone further in Great Britain than in any other country.

TABLE II.—THE PURCHASING POWER OF INCOMES

Year	Income Before Tax	Direct Taxation as % of Col. (1)	Col. (1) as Index	Col. (3) Adjusted by Col. (2)	Col. (4) Adjusted by Consumption Prices
	£ million	%	1938=100	1938=100	1938=100
	(1)	(2)	(3)	(4)	(5)
A—WAGES					
1938	1,735	3·1	100	100	100
1946	3,095	9·2	178	167	106
1947	3,530	8·1	203	193	114
1948	3,975	8·6	229	216	120
B—SALARIES					
1938	1,110	5·0	100	100	100
1946	1,630	17·7	147	127	80
1947	1,750	14·9	158	141	83
1948	1,850	14·8	167	150	83
C—PROFITS, INTEREST AND RENT					
1938	1,693	15·0	100	100	100
1946	2,585	26·0	153	133	84
1947	2,695	22·0	159	145	86
1948	2,858	23·0	169	153	85
D—DISTRIBUTED PROFITS OF COMPANIES (Included in C)					
1938	506	15·0	100	100	100
1946	711	26·0	141	122	77
1947	744	22·0	147	134	78
1948	730	23·0	144	131	73

The facts at the other end of the scale are no less striking. The share of the total income going to wage-earners has risen very sharply. The proportion of wages

to the total of all gross incomes obtained from work and property (that is to say, the total of all personal incomes except social security payments and other transfer incomes) increased from 37 per cent in 1938 to 44 per cent in 1948. If the comparison is made on the more telling basis of income after the payment of direct taxes, the rise was from 39 to 48 per cent. So, in 1948, wage-earners received nearly half the total disposable money. Salaries and profits both declined in the same period. The total of salaries, after the payment of direct taxes, fell from 25 to 21 per cent of the aggregate and the combined category of profits, interest and rent (also after direct taxes) fell from 34 to 28 per cent.

These changes are shown in another way in Table II. Each of the main categories of income has been adjusted by the amount of direct taxation taken from it, and then this net income has been deflated by the rise in the market prices of consumption goods. The last column is, therefore, an attempt to reassess the purchasing power of the different categories of income (taking each one in the aggregate) in terms of 1938 values, expressed as an index which was 100 in 1938. "Profits, interest and rent" include professional earnings and farmers' incomes. One part of this mixed category—the distributed profits of companies—has been treated separately, though in doing so it has been necessary to assume that, in each year, distributed profits bore direct taxation at the same rate as applied to the whole group of "profits, interest and rent"—an assumption that almost certainly leads to an understatement of the actual rise in taxation paid on dividends.

What can be deduced from Table II? The estimates in the final column for 1948 show total wages to have increased their 1938 purchasing power by 20 per cent and both salaries and profits to have lost some of theirs; salaries are down by 17 per cent and company profits by 27 per cent. All these figures relate to the categories of wages, salaries, etc., as a whole. It would be wrong to say that the average wage or the average salary moved in the same way, since there may have been changes in the number of incomes included in each category. Unfortunately, the numbers of wage-earners and salary-earners are not distinguished in any manpower statistics. For wages, there is a better guide to the size of the average pay packet in the twice-yearly surveys made by the Ministry of Labour of industrial earnings of manual workers which, while excluding some important industries (notably coal mining) and agriculture and the whole range of non-manual occupations, nevertheless cover a large number of wage-earners. Table III shows some of the figures of earnings, before and after adjustment for direct taxes paid and for price changes. The average wage-earner has kept ahead in the race against prices—but men not as much as other workers. If the wage-earner is a family man paying little or no income-tax, he will have fared even better than the figures indicate. Throughout these comparisons no account has been taken of increased social services, although the employees' contribution has been deducted as a part of direct taxation.

TABLE III.—AVERAGE WEEKLY WAGE EARNINGS

,, 1948.....	114 0	214	112	134 0	194	102
,, 1949.....	119 4	224	116	139 11	203	105

The adjustment for direct taxation has been made on the assumption that the rate of taxation shown in the White Paper for wages as a whole applied to the average wage in each case. The adjustment for price changes has been made on the basis of the consumption price index shown in the White Paper.

The position of the average salary-earner is not known so exactly, but there is no doubt how he stands in relation to the wage-earner. The numbers of salary earners would need to have fallen by 15 per cent between 1938 and 1948 if, individually, their average standard of living was to be unchanged. This has certainly not happened; it is generally believed that the numbers have actually increased, perhaps by some 5 or 10 per cent or even more. In that case, the average salary-earner would be even worse-off than the figures of aggregate salaries in Table II would suggest.

The average rise in the prices of consumption goods which has been used to adjust incomes in Tables II and III is shown in the White Paper and covers all goods and services bought by the public. Between 1938 and 1948 the rise was 80 per cent. Because of different spending habits, it may well be wrong to assess the changes in the cost of living for wage-earners and salary-earners alike. No official figures can help to decide. The interim index of retail prices, although not labelled as a cost of living index, is related to working-class budgets and has replaced the discarded Ministry of Labour working-class index. The interim index is the one to which the wages of about 1,500,000 workpeople are linked by sliding scale arrangements. But it only started in 1947. Still less is known about middle-class expenditure, for no large-scale surveys have ever been attempted. The usefulness of an "average" budget for higher incomes groups is questionable. When less than half the household expenditure is on essentials, there are obviously enormous variations in spending between different families. However, something is known about the prewar

TABLE IV.—ESTIMATED COST OF LIVING INDICES (1938=100)

Date	Working Class Index	Middle Class Prewar Income Groups			
		£250–350	£350–500	£500–700	£700 & over
Average 1938...	100	100	100	100	100
June, 1946.....	150	155	161	167	171
,, 1947.....	161	168	174	180	184
,, 1948.....	177	180	188	194	199
,, 1949.....	179	185	192	199	203

The working-class index is the one published by the London and Cambridge Economic Service. The middle-class indices are rough estimates made by *The Economist* using as basic material some prewar surveys carried out by the Civil Service Statistical and Research Bureau.

spending habits of a small group of salary-earners and these, adjusted for price changes, have been used as a basis for some very rough estimates of middle-class cost of living indices shown in Table IV. Without making any claim to statistical accuracy they confirm what is

TABLE V.—COMPARABLE GROSS INCOMES—TODAY AND 1938

Gross Income 1938	Net Income after Tax in 1938	Present day Gross Income to give Same Net Income after Tax as 1938	Present day Gross Income to give Equivalent 1938 Purchasing Power
£	£	£	£
500	492	519	1,160
1,000	888	1,107	2,700
1,500	1,278	1,716	5,000
2,000	1,640	2,401	8,000

generally felt to be true—that the higher the income, the greater the rise in the average prices of what is bought.

If these differences in the cost of living of different sections of the community are accepted, then the gap between the relative rewards of the wage-earner and salary-earner today, as compared with before the war, is even wider than the figures given here indicate. The average wage-earner would be some 20 per cent better off in April, 1949, than before the war. Perhaps the extent to which many middle-class homes must have adjusted their standards of living can be seen most simply from the size of income necessary today to give the same purchasing power as before the war; some comparisons are made in Table V.

The great majority of wage-earners have had steady increases of pay over the last ten years and have obtained a higher command of goods than they had before the war. Around this general trend, there have been many shifts in the relative fortunes of different sections of the wage-earning community. This aspect of wages will be discussed in the second article.

NOTES OF THE WEEK

A Ragged Start

With a period of over six weeks between the announcement of polling day and its arrival, all the political parties have been nervous of losing the attention of the electorate by beginning their campaign too early. Consequently, as far as speech-making goes, the election has got off to a rather ragged start. On the Labour side Sir Hartley Shawcross has appealed for a contest without bitterness or hatred—an appeal presumably addressed as much to his own more violent colleagues as to his opponents. Mr J. B. Priestley in a political broadcast last Saturday pursued a line which was simply an inversion of the traditional Tory approach—that is to say, that Labour could be trusted in its second term of office to eliminate the faults which it has displayed in its first. Sir Stafford Cripps has spoken of the insecurity of democracy—democracy in this case having the unusual meaning of rule by the Labour Party. Mr Herbert Morrison in his desire to please everyone has toned down his original dark forebodings about responsibility for election expenses into a sunny admonition to "be careful." The Conservatives, on the other hand, appear to be holding their fire until after Mr Churchill's broadcast on Saturday and the publication of their policy statement early next week. Even though they are revealing their hand a full week later than the Labour Party, many Conservatives believe it is still too early to begin the national campaign in earnest.

But if the battle of words has hardly begun, the battle of the pamphlets has been joined in earnest. This week has seen the publication of the Labour Party's manifesto and an explanation of its modified policy on industrial assurance. The Co-operative Party has published a statement of its aims and the Liberal Party has issued the report of its trade union commission (although this can hardly be called a campaign document) and a statement of its agricultural policy. The main statement of Liberal policy will not be issued until after its special rally at the end of January. In the meanwhile there are rumours that the determination of the Conservatives to contest every seat in the island may be tempered by a willingness to stand down in favour of certain strong Liberal candidates, as has happened in Huddersfield West—a gesture which looks to Mr Morrison (who has become very solicitous for Liberal candidates, since their existence splits the anti-Socialist vote), and even to some Liberals, very much like the kiss of death.

It is still too early to say what will be the major issues of the election, but it is clear from the Labour Party's pamphlet on "The Future of Industrial Assurance" that Transport House is most anxious not to alienate unnecessarily the support of any section of the community. The emphasis in the document, which is designed to explain the change of policy from "nationalisation" to "mutualisation," is on reassuring the agents of the industrial assurance companies that they have nothing to fear from Labour's policy. Apart from this it is difficult to see how mutualisation is to differ in its effects from nationalisation. The new programme (which will be examined in greater detail next week) does nothing to correct the two defects which were the major objections to the original programme of nationalisation. In the first place, mutualisation, just as much as nationalisation, will seriously undermine the confidence of the rest of the world in the British insurance industry and jeopardise its foreign earnings, since the pamphlet makes it clear that it is the whole of the industrial companies, not simply their industrial life business, that is to be taken over. In the second place, because Labour is so anxious to placate the workers within the insurance industry it has committed itself to promises of security which make it quite certain that mutualisation will make none of the economies of staff or operating costs which would alone provide any justification for tinkering with industrial assurance.

* * *

Labour Believes in Labour

The progress of party policy statements from their first reasoned exposition to the last eve-of-poll exhortations recalls that paper game in which an anecdote passes from player to player, is slashed by each to half the length at which he receives it, to emerge eventually as a crude but quintessential three-word headline. "Let Us Win Through Together," the campaign version of "Labour Believes in Britain" (which was published last April), nicely illustrates this process. *Progress is impossible without planning* appears in both texts. The first stressed the need for "continuing consent and co-operation," for government machinery which shall "never hamper but always stimulate" industry, and denounced "totalitarian planning." The second contains no warnings, no hint of desirable modification, no reservations whatever, and depicts the Tories as irresponsibly bent on smashing the entire machinery of control. *Work for all* takes pride of place in each. In 1949, difficulties must not be underestimated, adaptability must be preserved; in 1950 there is no reference to either, but the Tories are pilloried as the wilful architects of mass unemployment on the prewar scale. *The socialised industries* get a section to themselves; a wholly roseate picture now replaces last year's reasoned explanation of the tasks confronting them. And so forth. There is a significant change in one title: *Square deal for consumers* has become *Cost of living*, reflecting popular concern. Food subsidies get more, not less, space, and with "A vote for the Tories is a vote for dearer food"—the parlour game is nearing its final phase. The section on the social services, otherwise retaining a remarkable balance, omits earlier references to the redistribution of wealth already accomplished—possibly lest "the rich" should present a less obvious target?

The most disappointing feature of the manifesto is that such contacts with economic reality as remained in the earlier document have now almost completely disappeared. Incredible though it is, there is no reference, not even a passing allusion, to the fact that, throughout Labour's term of office, full employment and the wage-earner's standard of living, the two pillars of Labour's appeal, have been sustained by American charity. It is American aid that has enabled Labour to defy the laws of arithmetic and make two and two come out at five. The manifesto simply assumes that the juggling act will continue as hitherto. What will Labour do when American aid is withdrawn or the long world-wide postwar boom comes to an end? The Labour Party evidently wishes the elector to assume that it has no clue to this, the decisive question of the next five years.

There are good things in Labour's policy, not only generous aspirations but practical propositions. If unreason and ignorance are summoned to the polls, Labour is not alone in having found them invaluable allies. But the party which, above all others, needs for the success of its policy the informed and constructive collaboration of the whole mass of citizens can least afford to discourage reason and foster intolerance. The building of social democracy calls, among other more tangible constructions, for a new technique in the electoral parlour game.

* * *

The Less We Are Together

The manifesto's treatment of foreign policy is both perfunctory and cryptic. If it is intended to disguise from the elector the great and decisive influence that relations with other countries—notably, of course, with the United States and the Soviet Union—have had on his affairs, then it is laying up trouble for the future when the cold war goes on and Marshall Aid does not. If it is intended to keep western Europe guessing about the part that "Labour Britain" would play in Europe, then it gives the Conservatives the opportunity to make a far more impressive bid in principle without being any less non-committal in fact.

What is truly surprising—indeed shocking—is the omission of any reference to the fact that close relations with the United States are the very foundation of British policy, and must remain so. Indeed, the manifesto might have made a very fair and weighty point out of Mr Bevin's successful handling of Anglo-American relations, despite the lapses which have occurred. Having left America out—doubtless for fear of criticism of those who wish to "keep left"—it was decided to bring Russia in, with a sentence which ignores the cold war and the fear which inspires a defence budget of £800 million:

> We will remain at any moment ready to co-operate fully with Russia, as with any country that is prepared to work with us for peace and friendship.

Having apparently decided that foreign policy need be given only thirty lines in a pamphlet of twelve pages, it was doubtless difficult to make any distinction between the kind of co-operation that is possible with America and France, and the kind that is possible with Russia and Communist China. But it is alarming that the increasing parochialism of Labour thought on foreign affairs should have been made so evident in a document that will be studied closely all over the world.

Those who aspire to the exercise of world power cannot afford to be silent about its risks and responsibilities, especially when they declare that they will "work realistically for peace."

* * *

Mao in Moscow

In a speech to the National Press Club on January 12 Mr Acheson asserted that the Soviet Union was trying to attach to itself four northern "areas" of China; the process, he said, was complete in Outer Mongolia, nearly complete in Manchuria, and in its earlier stages in Inner Mongolia and Sinkiang. Mr Acheson emphasised this Soviet encroachment in defence of his own policy towards China; he argued that America must keep out of any further intervention in China so that the attention of the Chinese people could not be diverted from Soviet actions into anti-American channels.

The hope is evidently that, if China is left alone and not subjected to any interference from the west, it will soon quarrel with the Russians over the northern borderlands. It has, however, always been somewhat difficult for either Britain or the United States to deplore the Russian encroachments, for the basis of both the final separation of Outer Mongolia from Chinese sovereignty and the economic stranglehold of Russia on Manchuria was the secret agreement at Yalta, to which President Roosevelt and Mr Churchill were parties. The Chinese Communists bear no responsibility for the cessions made to Russia in 1945, and though it may be admitted that Mao Tse-tung would greatly increase his popularity in China if he could obtain a revision of the treaty in China's favour, it is not so easy to persuade the Soviet Government to surrender treaty rights—which in Moscow's view Communists ought to be more, and not less, ready than other people to observe.

Certainly the Communists have not been leading the Chinese public to expect any concessions in this field; Outer Mongolia has been recognised by China as a sovereign state and there is now no basis for any Chinese claim to it, while on the subject of Manchuria the newspaper *Ta Kung Pao*, formerly China's most respected independent journal and now used as a Communist mouthpiece, explained to its readers that the Russian acquisitions in Manchuria were quite proper because

> these measures were necessary for keeping watch over the resurgence of Japanese fascism and for preventing the infiltration of American imperialism to establish bases in Manchuria for attacking the Soviet Union.

The long duration of Mao's stay in Moscow is probably to be explained by the desperate economic needs of China and the hard bargaining which, as the East European satellites have discovered, must precede any Soviet aid to even the friendliest foreign states. The indications are that the Soviet Union may hope to supply China with capital goods from German industry—including west Germany, if its industrialists will accept, or be permitted under the terms of Marshall Aid to accept, a Communist-controlled clearing system. In any case the Soviet Government will retain for itself the position of intermediary for the making of trade agreements between China and Germany or the European Cominform countries; very rigorous political terms will certainly be imposed for any economic assistance rendered, and the action taken against American consular property was perhaps a gesture required of Mao to prove his anti-American sincerity. Mao seems to have spent a long time in Moscow for a leader with so many urgent tasks facing him in his own country, but as affairs in Peking are in the satisfactory Muscovite hands of Liu Shao-chi, the Kremlin is no doubt well pleased to prolong its hospitality to Mao as long as may be required.

New Approach to the Atom?

Mr Acheson has told a press conference in Washington that the United States government does not intend to modify its plans for the international control of atomic energy. It does not seem likely, however, that this statement will put an end to the rumours and fears that have spread through the American community in recent weeks. The start of them has been the highly "unsecret" secret of the possible manufacture of a new bomb, in which hydrogen would be used, and which would be unpredictably more powerful than any atomic bomb yet created. The lay mind is a little punch drunk at the horrors of possible atomic destruction. Morally, too, it is worried by the possible creation of power whose only purpose can be the obliteration of life. Atomic energy, at least, can ultimately be controlled for industrial purposes. It appears that the fission of hydrogen can be used for nothing but destruction.

It is natural when dark fears and questionings torment the public mind that responsible men, both scientists and politicians, should look again at the problem of the control of atomic energy. Some of them, including, it is said, Mr David Lilienthal, the outgoing chairman of the Atomic Energy Commission, believe that a new attempt to negotiate with Russia should be undertaken. It is true that the Baruch plan of control, which Russia has consistently rejected, was accepted by all non-Soviet nations as the only feasible form of control but, whereas in the last year, the Russians have made one or two concessions designed to strengthen the international supervision of atomic energy, American official thinking has remained unchanged—and, according to Mr Acheson, still remains so. In logic, the American case is strong, but logic may weaken in face of widespread public alarm. There will undoubtedly be a growing tendency to believe that a rather less than foolproof scheme that gives some hope of agreement is perhaps better than a completely satisfactory scheme which is certain to be rejected and thus cannot postpone even for a year the atomic arms race.

Soviet Death Penalty Restored

Last week it was announced that elections are to be held in the Soviet Union. Now it is said that Soviet workers are working harder in honour of the event. In due course it will be announced that the unopposed candidates have been returned by anything upward of 97 per cent of the electorate. All this is simply the normal functioning of the Stalin Constitution, and will attract neither surprise nor interest. But the Kremlin itself provided an odd comment on this picture of domestic harmony by announcing in the same week the restoration of the death penalty for traitors, spies and saboteurs.

Two lines of speculation about this latest measure have been suggested. The first is that Stalin is now preparing a spectacular trial in the Soviet Union itself which will require nothing less than a death penalty at its climax. The second is that there is unrest in the Soviet Union. There is no tangible evidence available outside the Soviet Union to support either of these suggestions, and they are both unlikely. The Soviet Union, after achieving "socialism" and defeating Germany, is pictured in its propaganda about itself as being an unshakable and monolithic structure, a true stronghold of peace and democracy. Such a picture would be marred in the eyes of everybody by a repetition of the public trials of 1935-38 or by the exposure—on Bulgarian or Hungarian lines—of "Anglo-American agents" in high quarters. And what, after all, would be the gain, when those who have recently fallen out of favour can be removed as quietly as was Voznesensky the planner?

As for the second suggestion, one can indeed point to Malenkov's recent call for "criticism from below" even of the highest officials. This call was significant if not new, and it might lead to some dismissals. There have, too, been many complaints of late in the Soviet press about inefficiency in heavy industry, about the slackening tempo of increases in productivity, some of which may be attributable to the "sabotage" now punishable by death. But all this does not amount to evidence of organised opposition.

It might be wiser to accept the interpretation offered by the Soviet statements on this subject. When capital punishment was abolished in 1947, it was explained that such punishment had always been a temporary expedient in the Soviet Union, and that the expectation of a long period of peace permitted it to be removed. If the death penalty has now been brought back it is because the Politburo considers that the international situation requires it. For there should be no doubt that the Politburo really believes itself threatened by the "capitalist encirclement." Apart from this propaganda about a possible struggle, it has carried out a number of measures which could have been inspired only by fear of war. It has imposed an unparalleled security ban, it has manufactured fighter aircraft on a large scale, and it has built up stocks of strategic materials. The reintroduction of the death penalty for political offences is best considered in connection with these other measures, and as a move to strengthen the power of the Soviet security forces.

Liberals and the Trade Unions

It is courageous of the Liberal Party to have issued at this moment the report* of its commission on the trade unions, for it is unlikely to win the approval of the powerful elements in the trade union movement. The Liberal Party is temperamentally and politically able to undertake inquiries—as it did in the case of old people—with a detachment which is impossible for the two major aspirants for political power. In this report its commission (which was made up largely of business men and trades unionists) has concerned itself not with economic questions but with questions of union organisation, size, political activity and the protection of the worker and the community from abuses of power. Its main conclusions may be extremely unpalatable to the larger unions: while admitting that bigness is not necessarily harmful it views with alarm the tendency of the larger general unions to get larger still and it would set up an arbitrating body to protect the small unions against the rapacious appetite of the big general unions. The concern of the Liberal Party for the craft unions is not wholly altruistic: the skilled workman, who has seen the wage differential between skilled and unskilled labour being gradually narrowed under pressure from the general unions, may be losing his loyalty to the Labour Party and the TUC. The report makes a number of proposals for improving the methods of democratic control and accountability within a union, including the abolition of the block vote. It makes recommendations for overhauling the law relating to political affiliation, and it would make a union responsible for an illegal strike if more than half the members took part, if the leaders failed to take reasonable steps to prevent it, or if union funds were used to support it. It would not, however, put back the more obnoxious provisions of the Trade Disputes Act.

Not all the proposals in the report would stand the test of practical application, but at least a start has been made in considering an overhaul of the organisation of labour—the only form of voluntary association from which the sanctions, which keep the rest of the community on the rails, have been almost completely withdrawn. Trade unionists of all kinds would do well to study this report even if they reject its conclusions and to ponder whether it would not be better to reform the structure, methods and rules of the unions from within, in order to fit them for their enhanced responsibilities.

Co-operation and State Socialism

"Building the New Britain" is the title of the Co-operative Party's policy statement which was published last week. It is not couched in terms of an election manifesto, because of the party's parliamentary allegiance to Labour, but it serves the same purpose. Beginning with a review of the difficulties and achievements of the Labour Government, it puts in admirably simple, if somewhat dogmatic, terms the Socialist case for full employment, food subsidies, high direct taxation and a large measure of government control of industry. It asserts the ethical superiority of the principle of fair shares over expedients which take the form of "bribes to the few," and the economic effectiveness of workers' consultation and "industrial democracy" in preference to the old carrot-and-stick incentives. Thus far, apart from one or two critical references to purchase tax or agricultural marketing boards, it covers familiar ground.

The interesting part of the pamphlet, however, is its second half, dealing more specifically with co-operation itself. The real issue which is still to be resolved between co-operators and orthodox Socialists is the right of a section of the community to shoulder the responsibilities and bear the risks of self-supply and self-government in particular industries where consumers feel this to be preferable to state socialism. The Co-operative Party has here gone some way to clarifying its claims. It suggests that where some sort of social ownership is decided upon for an industry, unless a centrally administered monopoly is essential any units already working on co-operative lines should be exempt from nationalisation. Co-operation, in fact, is as much a form of socialism as is state control, and, in strongly localised industries or those with a limited class of consumers, it is the preferable form. Although this argument is cogently presented, it loses a good deal of its force by not being applied to concrete cases. It contrives in this way to ignore the awkward fact that the Socialist's argument for social ownership is in every case that it makes possible the presumed advantages of absolute central monopoly.

The writers are on much more profitable ground when they say that co-operative principles "are too significant in social content to be regarded merely as institutional doctrine." Their emphasis on the vital need to encourage by every possible expedient the individual's interest in his economic environment and his responsibility for it is a refreshing appeal to common sense.

When Will Rationing End?

Speaking to the Fabian Society this week, the Minister of Food spoke jubilantly on the ending of the world food crisis and the ending of the dollar crisis in so far as it affected Great Britain's supplies of food. The consumption of different classes of food in 1949 compared with 1938 is shown on the accompanying chart. In the second half of last year, the consumption of oils and fats had actually passed the prewar figure. Mr Strachey's jubilance ought to be diminished somewhat by the unreliability of the estimates of prewar consumption on which his comparisons are based. Nevertheless, most people will agree with him that supplies of food, in bulk, are now adequate however much some may want more of this or that commodity, and however much some will disagree with him that the end of the world food shortage is mainly due to the Ministry of Food's policy of bulk buying and long-term contracts.

But if total supplies of food are now adequate, what comes next? Whichever party is returned after February 23rd will have to decide what form food policy will take now that it is no longer governed by world shortages. There are some things that could be unrationed immediately and

Travel LONDON-PARIS by

NIGHT FERRY BRITISH RAILWAYS GOLDEN ARROW

with advantage. The obvious examples are margarine and cooking fat. Many people are not taking up their rations, and the abolition of rationing would enable part of their shares to be distributed to those who find the ration too small. Other foods, notably butter, could be unrationed if the subsidy were removed or lowered. Others are border line cases, which could probably be unrationed with safety even at present prices. The points system, which six months ago might have been extended to make a halfway house in

the unrationing process, has now outlived its usefulness and might well be abolished.

The end of a large part of rationing, which in logic seems inevitable although some time ago Mr Strachey discounted the likelihood of any derationing this year, will put the future of the Ministry of Food in question. A note on page 160 discusses the recommendations of the Select Committee on Estimates on the Ministry's trading activities. Whatever the fate of these, the end of rationing, whether it comes this year, next year or sometime soon, will remove its main function.

* * *

Rake's Progress in Germany

Federal Germany's performance as a member of the European recovery programme is causing some anxiety to those who look ahead. The effect of liberalisation policies on its foreign trade (which is described in an article on p. 140 of this issue) is only one sign of the rake's progress which is going on. With few exceptions, there is little sign of an "export drive." It is still the main object of manufacturers and traders to charge the home public prices that will enable the seller to recoup lost capital, and re-equip himself on a standard better than that of prewar days. The home market is still good—though more and more are trying to share the existing slice of small, rich cake. The German trader prefers selling a limited amount of high-priced goods, to entering the mass production market and supplying the common man. In the Republic's cities there are plenty of Ritzes but no Lyons.

The market for all but goods of the best quality is dwindling. Rationing—which has in practice been non-existent for a long time past—can be officially abandoned as from March 1st because there is no longer a large enough public to absorb the supply of the better foods though there are still enough to buy champagne and caviare. "Gluts" have occurred in butter, milk and meat. The black market in butter has disappeared, and it has proved hard to get rid of imports of Danish butter at DM 2.96 for 500 grams, a price which is equivalent to about two hours' wages per pound. Supplies have greatly increased, both from home and external sources (the pig population in particular rose by 50 per cent last year), but prices have not shown a corresponding drop.

Western Germany has in fact bounded a year ahead of its official estimates of its food requirements and is making little attempt to prepare itself against the day when Marshall Aid ends. Not only is there an inadequate effort to export, but little is being done to increase the output of the country's agriculture, which is backward by American and British standards. Both businessmen and farmers will have to exert themselves to cut costs. The plain facts are that German exports are not rising to anything like the same extent as imports, and are still only a fraction of the prewar figure; during the second Marshall year they are expected to reach to more than $1.2 billion against imports of about $2.3 billion, and at the moment Germany is not paying for more than 10 per cent of its purchases from the United States, the greater part of which consist of wheat.

The Germans are inclined to be hopeless about the chance of permanently reorienting their trade in order to achieve a balance in their payments. They are criticising the Marshall Plan, and yearning for markets in eastern Europe, Asia and Latin America. The result of liberalising trade in ERP Europe has strengthened the questioners who ask: "Is it desirable to expand exchanges between the western European countries? Trading cameras for cauliflowers is all very well, but the cameras might have been sold to Argentinas or Russians, the people who supply, or could supply, us with wheat." Clearly this line of thinking is economically well-founded and politically full of dangers for the west.

A Rest from the Veto

Within a week Soviet delegates, closely followed by their obedient satellites, have walked out of all councils and commissions at present sitting at Lake Success. They say that they can no longer sit at the same table with delegates of Kuomintang China. How temporary and how final is their decision? It is not clear how long they will persist in this attitude or what they can hope to achieve by it. Even the Jugoslavs, who hold no briefs for the Chinese Nationalists, are doubtful of the usefulness of the Soviet action.

A more actual question is whether the Security Counc can get on with its work while the Russians stay awa Once before they confronted it with a similar problem. I 1946 Mr Gromyko left the council table during a discussio on Persia's complaint against Soviet machinations in Azer baijan. On that occasion the council, taking as its tex article 27 of the Charter, which says decisions require a affirmative vote of 7 "including concurring votes of per manent members," decided it could not take decisions o substance while one permanent member of the Big Five wa away. But much water has rolled under the bridges sinc then. On several occasions one of the big Five has abstaine from voting on a major decision and abstention has no counted as a veto. The Soviet Union has done so many times, and Britain abstained when Israel was admitted t Uno. Abstention has therefore come to be regarded as lacl of opposition, and therefore as acquiescence in the majority view. If this view prevails, the Soviet action is no obstacle to continued work by the council.

It is also being asked in Uno what action the council car usefully take if the Russians persist in staying away. Clearly it cannot set up a new atomic energy commission. To do so without their concurrence would be impolitic and useless. Likewise it cannot get on with appointing a military staff committee, to which they would not belong. But it can handle all procedural matters which they have held up by labelling them as matters of substance. It might also proceed with a fresh survey of the list of applications for membership, which badly needs looking at again. Such desirable

candidates as, for example, Eire, Portugal and Italy, have hitherto failed simply on account of the Soviet veto, which was applied because the western countries did not back such Soviet candidates as Bulgaria. To place this item on the Council's agenda would be to achieve one of two results: either some deserving members would be admitted, or the Russians would come running back, China or no China, to establish their right to veto "undesirables."

Pattern for Poland

The intellectual contortions and humiliations of character which the Sovietisation of Poland is demanding of its political leaders have been vividly illustrated in *The Times* by articles describing the attacks made on Gomulka, former Secretary-General of the Polish Communist Party, before the executive council of the Polish United Workers' Party last November. A notable feature was the admission by a Communist editor that by many peasants Gomulka is regarded as the hero of Poland and its defender against the Soviet Union. If this is true, then two things seem probable in the near future: a trial of deviationists designed to strike fear into people who hold such views, and a fresh attempt to push the peasants further towards collectivisation. The key man in this second matter is Mr Hilary Minc, who has attacked Gomulka as bitterly as anybody.

But even he, as head of the State Economic Planning Commission and virtual economic dictator of Poland, may recall nowadays how many of his past pronouncements have smacked of Titoism. At any rate, he has felt it expedient to indicate, both by word and deed, that he may be willing to depart from the comparatively sound, non-political economic policy which he has hitherto insisted on following—very much to Poland's advantage. He has recently struck a blow at private retail trade—the last real outpost of private enterprise in Poland. The network of state-owned retail shops which is to be set up must eventually, because of their superior resources, squeeze out and supplant the private shops; and the openly avowed object of the "compulsory organisation of private trade" which is to be set up is to integrate private retail trade into the state plans and to give the merchants and their employees ideological training.

Mr Minc has also thought it expedient to publish last month an article in *Pravda*, which is in effect an apologia for his policy. He is careful to insist that planning in the people's democracies does not represent any kind of compromise with capitalism, but is just like Soviet planning. He also tries to remove or confuse the impression he has hitherto given that he is not enthusiastic about the collectivisation of agriculture. He declares that the agricultural development of a people's democracy must pass through two preparatory stages before it reaches the final stage of collectivisation, and that Poland is now going through the second stage. He contends that the present stage in eastern Europe is comparable to that of the NEP in the Soviet Union under Lenin. But the third stage is definitely to come, in which all farms would be collectivised and the kulaks liquidated.

Since Mr Minc's defence of a policy of collectivisation by stages was published in *Pravda* it must presumably have Russian approval. It is obvious, however, that everything will depend on the vigour with which the policy is applied, and on the amount of resistance which it meets. Mr Minc may or may not have had a real change of heart, but it is certain that the Polish peasants will remain most unwilling to fulfil the role allotted to them by the Kremlin.

* * *

The Professors on Technology

The argument about the place of technology in the universities has been given fresh material. "A Note on Technology in Universities" (HMSO, 4d.) has been published by the University Grants Committee as the result of the finding of a sub-committee evenly balanced between university professors of pure and applied science and eminent industrialists. As such it must command respect. It is probable that it gives a fair interpretation of the "university view" on this subject in so far as this is seen by those who look at university affairs from the angle of the pure and applied sciences. Whether it equally represents university opinion as a whole, including that of the non-scientists, is more doubtful. But at least it is likely to be as good and as well-informed a collective opinion as it is possible to get.

It is clear that the sub-committee does not contemplate any radical alteration in the present situation. The foothold which technology had gained, with some 5,300 students before the war, has been enlarged, and there are now about 11,000 students of technology. The findings of the Technical Personnel Committee of the Ministry of Labour (discussed in *The Economist* of January 7, 1950, page 17) suggested that it will not be necessary to increase these numbers much further as those in training for most of the technical professions are sufficient to meet the demand for their services. Nor does the sub-committee of the University Grants Committee approve of the development of para-university institutions such as the Massachusetts Institute of Technology with an independent status beside the universities. It would prefer to see such further expansion as is still necessary at the level of the universities carried out in the departments of the universities themselves; it recommends that in these departments there should be much better arrangements for research and more postgraduate work.

What, however, the committee's Note does not tackle, and it is a crucial omission, is the question of how to raise the status of technology and the quality of its teachers in the country as a whole if the universities stand pat where they are now. Various proposals are in the air, such as the creation of a Royal Society of Technology with power to grant degrees. These are not in a narrow sense the universities' affair, though their co-operation would be necessary. What is more surprising is the very definite line taken in the report against any new higher technological institutes of university status. This view is likely to be disputed. Even if the universities are prepared to run longer courses, and to encourage more technological research, can they meet the nation's requirements without some half-way house between the universities and the technical colleges?

Planning the Consultant Service

The Ministry of Health has published this week, in the form of a booklet*, the advice it has given to regional hospital boards since January, 1948, on the planning of their consultant and specialist service. It takes the form of a brief summary, under each specialty, of the number of beds per 100,000 of the population required in the hospitals of the region and the number of consultants and assistants required to serve both in-patients and out-patients.

Reading it one cannot escape the feeling that those responsible for the guidance were living in a dream world. It is based on needs rather than on resources; it gives, that is, estimates of what would be required in a perfect hospital service, planned and organised from scratch without regard to finance. The advisers certainly recognise that in some specialties there are not enough surgeons or physicians to staff the hospitals, but this is regarded as only a temporary drawback. No suggestions are put forward of what plans, in view of the limitations that undoubtedly exist on money and manpower, ought to be given priority. On a point of detail the criticism may here be made that the "guidance" gives no hint that the regional boards should treat the provision of beds and staff for tuberculosis as a matter of urgency; indeed, the emphasis is rather the other way, for the former tuberculosis officer of the local authority, who was the focal point in the detection and prevention of tuberculosis before the health service was introduced, is to become the chest physician, a consultant for all diseases of the chest and with his energy and interest consequently dispersed. A large section of medical opinion regards the merging of the tuberculosis service with the general hospital service with anxiety lest the treatment and prevention of tuberculosis should lose what priority it had and the attitude of the Ministry of Health, as revealed in this booklet, will increase these fears.

It may be argued that a blueprint of hospital development drawn up on needs at least gives a good indication to regional boards of what they must plan for. But experience has shown that when new facilities, in the shape of a new unit or department, have been provided, the demand for them is often far greater than had been allowed for. There is certainly a place for planning in the establishment of a national consultant service. But it should bear a closer relation to facts. As it is there is reason to think that the staffing of the consultant service has got out of hand by the appointment of more registrars than can be expected to obtain consultant posts when they have finished their training. The Ministry of Health should follow the recent example of its counterpart for Scotland and provide a factual survey on this point.

* "The Consultant Service." Stationery Office. 9d.

The Parental State

There is now more than ever amongst literary men an inclination to make the government the schoolmaster and guide of the community, and invest it with the characteristics of a parent. It is called on to bring up all the people in the ways of virtue, and protect every one from even the consequences of his own and his parent's faults and vices. These are quite new functions for government to assume. They have not hitherto been exercised; they are not in accordance with any former theory or idea of government, which was considered to be merely the protector of natural rights previously in existence. The experience we have had of the success of government in the functions it has already exercised, is by no means favourable to its assuming all these new functions, and if they can only be exercised by the government appropriating the property of individuals, as above all things property ought to be held sacred, we can have no hesitation in saying that it will be wrong for the government to exercise them. We can only conclude, therefore, that the gentlemen who, with a tumultuous voice from every part of the empire, demand the interference of the government to teach the people, to distribute wealth, to organise emigration, to adjust land and labour, have never duly considered all the vast interests, moral and physical, interfered with and endangered by their schemes.

The Economist

January 19, 1850

Letters to the Editor

The American Press

SIR,—The article, "Paper, Paper, Everywhere," from your American Staff, which was printed in the December 31st issue of *The Economist*, was read with considerable astonishment in the offices of *The New York Times* in London and New York. The article spoke of the alleged pressure of advertisers on American newspapers. It then added, "The existence of this pressure is always hotly denied even in the face of strong circumstantial evidence. The history of the attempts of the Arab Information Office to place advertisements in *The New York Times* and *The New York Herald Tribune* to counteract the flood of Zionist advertisements does not suggest its absence."

So far as *The New York Times* is concerned, the implication of this last sentence is not only untrue but verges on the libellous. Your American Staff obviously did not inquire very deeply into the facts before making this damaging allegation. The facts, as supplied by Arthur Hays Sulzberger, the publisher of *The New York Times*, are as follows:

The New York Times published one advertisement signed by the Institute of Arab-American Affairs, 160 Broadway, New York, in its issue of February 19, 1946. On March 5, 1946, *The New York Times* published an advertisement signed by The Arab Office, Washington, D.C. Both of these advertisements related to the situation in Palestine. *The New York Times* has no record of any other advertisements sponsored by the Arab organisations or from the Arab Information Office.

There was, however, another advertisement about which your American Staff may have heard. In April, 1946, a Ben Freedman submitted for publication in *The New York Times* a page advertisement signed and sponsored by the "League for Peace with Justice in Palestine." *The New York Times* did not know of any such organisation and accordingly started to investigate. In the meantime, the advertisement was published by the *Herald Tribune* on May 2nd. The advertisement stated that in the "League" were representatives of the Christian faith, persons of Arab ancestry and persons of the Jewish faith. But *The New York Times'* investigation disclosed that the only Christian sponsor was Mr Freedman's wife, who was a Catholic. Mr Freedman represented the Jewish faith and a Mr Katibah, Secretary of the Institute of Arab-American Affairs, represented the Moslem faith.

In the first advertisement the address given as the home of the "League" was that of an advertising firm through which Mr Freedman had placed the advertisement. Immediately after the publication of the advertisement the firm refused to accept further orders so long as its address was given as the League's headquarters. A subsequent address proved to be the office of a public stenographer whose business was to provide desk space, a mailing address and a 'phone rental service for a small monthly fee.

As a consequence of its inquiries *The New York Times* declined to accept Mr Freedman's advertisement for publication.—Yours faithfully,

CLIFTON DANIEL, JNR.

The New York Times,
Fleet Street, E.C.4

[Our American Staff comment on the above letter as follows: The article specifically and deliberately referred to "the history of the attempts of the Arab Information Office to place advertisements in the *New York Times*" because we were well aware that that newspaper had published at least one advertisement from the Arab Office. If we had meant to convey that they had refused to take any advertisements, we would have said so. The Arab Office was not satisfied with the treatment it received and complained that the *New York Times* had altered and weakened the advertisement it published—for instance, a statement that many Jews in Palestine were treated in Arab hospitals was removed. Also, publication was delayed and finally took place on November 7, 1945, the day on

which the results of the New York mayoral election diverted the interest of the public from any other topic. Considering the large number of advertisements from Zionist organisations printed in the New York press and the controversial nature of the contents of some of them, we agree with the Arab Office in thinking that the date of publication and the removal of such harmless matter suggest a reluctance on the part of the *New York Times* to allow the Arab Office to use its limited funds in the most effective way for the presentation of the other side of the case.

The article could have referred to the actual refusal of other papers to accept any Arab advertisements at all, but the purpose of the article was not to hit easy targets, but to point out where even the best papers have sometimes failed to achieve the standards claimed for the American press. The three morning papers mentioned by name in the article, the *New York Times*, the *New York Herald-Tribune* and the *Washington Post*, are the three best in the United States, and it was precisely for that reason that they were used as examples.]

Pakistan and India

SIR,—Would you please permit me to correct some of the facts in Sir Firoz Noon's letter on the above subject in your issue of January 7, 1950?

(1) He maintains that India is starving its millions for political reasons even when Pakistan is ready to sell wheat. At the current rate of exchange Pakistan wheat works out (excluding transport costs) at Rs. 1 per bushel *more* than American or Australian wheat (including costs of transport). The reason for non-purchase is, therefore, economic and not political and we are able to get all we want from Australia and elsewhere.

(2) His real anxiety is that we are not underwriting private incomes of big landlords like himself in Pakistan by buying at whatever prices Pakistan dictates. This is not India's business.

(3) He says that at the time of partition Hindus removed from the West Punjab all banks, cash deposits, etc., etc. The real fact is that Hindu property estimated at about Rs. 4,000 crores still remains blocked in Pakistan. Real estates apart, this property includes investment in securities, shares, gold and jewelry and bank deposits, most of which are blocked by Pakistan ordinances.

(4) He maintains that India is trying to break Pakistan's economy by a boycott of trade. The simple fact is that we buy from Pakistan Rs. 117 crores worth of goods annually, of which about Rs. 85 crores represents the value of jute. We cannot buy jute at the prices fixed by Pakistan because we cannot sell the manufactured goods on the basis of this cost. It is purely an economic consideration.

(5) He maintains that the holding up of jute is actuated by considerations purely affecting private business and that the Pakistan Government has no hand in the hold-up. The fact is that jute was loaded in steamers by the private merchants—jute which was paid for in cash *before* devaluation—and it is this jute which is held up by the Jute Board, which is an agency of the Pakistan Government. They have also held up in-transit jute coming from Assam to Calcutta and are now agreeable to let it go when India replied by withholding coal.—Yours faithfully,

Bombay K. S. MANI

The Commonwealth Fund

SIR,—In your issue of January 7th, you refer to the "three" Fellowships for Civil Servants offered by the Commonwealth Fund of New York. In 1950, five Fellowships are open to Dominion Civil Servants, two to Colonial Civil Servants, and five to Home Civil Servants—three for the administrative grades and two for the technical and professional grades.

May I take advantage of this explanatory letter to inform your readers that the London headquarters of the Commonwealth Fund at 35 Portman Square has recently been named "Harkness House"? The many men and women in this country who are indebted, directly or indirectly, to the Commonwealth Fund and to the Pilgrim Trust, will be glad to know that the name of the late Edward S. Harkness is now commemorated in London.—Yours faithfully,

S. GORLEY PUTT, Warden

Harkness House, 35 Portman Square, W.1

The WEA

SIR,—The Note in *The Economist* entitled "Classes Without Workers" impels me to the retort that though there may not be as many manual workers in WEA classes as we should like to see, that is quite a different thing from suggesting that the WEA is running classes without workers.

I should have thought that *The Economist* above all papers, would have recognised the immense changes which have taken place in the ratio of industrial and professional occupations and would have appreciated the fact that professional workers (shop assistants, postal workers, railway clerks, etc.) are just as much legitimate material for adult education as any other type of worker.

The WEA itself, of course, is largely to blame for the misconceptions which have arisen with regard to its services to the community, and what is obviously very necessary is a complete overhaul of a statistical basis which makes it possible for so much misleading comment. That, however, is a small point. What is important is the surprising comment in which you suggest that the receipt of a grant from the Ministry of Education and from a body like the National Union of General and Municipal Workers, makes it difficult for us to decide between "propaganda and pure instruction." We are not very much concerned with pure instruction. It is not our business. There has not been the slightest difficulty because the grants have been given for quite different purposes. It is an established tradition, of which we are proud, that the WEA has been able to retain its independence and its non-party, non-sectarian approach, without either direction or interference from the Ministry of Education and that the grants from the Ministry have been given on no other condition than that the movement should retain its objective outlook.

It has also been the proud boast of the WEA that within the last few years the trade unions have expressed their appreciation of the work of the WEA by coming to its assistance in a financial crisis. The unions have not expected the WEA to undertake propaganda, and would have been the first to resent it.

Finally, we ourselves recognise that the Association must meet changing conditions. No movement has been more honest in examining its own position, but I hope that the last conclusion we shall reach will be to decide that a voluntary movement, democratically controlled by its own members, offering facilities for the discussion of controversial and tendacious subjects, can be "fitted into the schemes of after-school education."—Yours faithfully,

E. GREEN, General Secretary

The Workers' Educational Association, 38a St. George's Drive, S.W.1

William Thompson

SIR,—May I inquire through your valuable columns whether any reader has any information about the socialist, economist, co-operator and writer on social questions, the Irishman, William Thompson (1775-1833)? Though largely forgotten today, he played an interesting role in the social thought and ideas of his time.

I am engaged in research on Thompson, and his ideas, and would be extremely grateful to know if any reader knows of any letters, manuscripts or other writings of William Thompson, or of his co-workers, such as William Pare and Mrs Wheeler.—Yours faithfully,

RICHARD K. P. PANKHURST

Books and Publications

Economic History

"The Growth of English Society." By E. Lipson. A. and C. Black. 448 pages. 21s.

IT is interesting that both Mr Lipson and Sir John Clapham in their mature years should turn to that most difficult of academic tasks, the short economic history. The need, like that for a satisfactory introduction to economic theory, is great, but, in contrast to economics, the attempts have been fewer and, on the whole, more successful. This is due, undoubtedly, to the tradition that the mature scholar is the only person fit for such a project. There have recently been some valuable contributions in this field from Professors Clark, Ashton and Clapham; and now Mr Lipson has condensed into one volume a life's reading and writing of economic history. It is not a work of original research, and those who are familiar with the author's other writings will find themselves treading familiar ground. Nor is it, as the title suggests, a social history. Its contents are best described by the sub-title, "A short economic history." Within the inevitable limits imposed by the demand for brevity and completeness, for generalisation and accuracy, Mr Lipson has written an excellent, and to date, the best account of English economic development from the tenth to the twentieth century.

Mr Lipson's methods are traditional. He divides his subject chronologically and analytically into four periods; the corporate middle ages, the planned mercantilist age, the *laisser faire* Industrial Revolution, and the age of revived economic nationalism. In so far as economic history can be divided into periods, this arrangement, now sanctified by usage as orthodox, is the most satisfactory for Mr Lipson to illustrate his thesis of the "ebb and flow" of economic life, and, in particular, of the cycle of state control and individualism, which is elevated to the status of an historical law. On this basis Mr Lipson exhorts us "to profit by the experience of the past," and to return to "a free commercial system, and . . . the spirit of initiative and enterprise." However, the pattern, even with admitted qualifications, is too rigid, and there is a false impression of uniformity in the idea that English history since Elizabeth can be divided into periods characterised respectively by planning, individualism, and revived planning. Again, Mr Lipson's approach is historical, and not theoretic. This resistance to the dehumanising of economic history is admirable, but it has also its disadvantages. The "new economic history" is in that intermediate position where it is sufficiently technical to baffle the historian and not sufficiently well documented to attract the economist, but Mr Lipson makes no contribution to this interesting methodological problem.

On points of detail, also, Mr Lipson's interpretation is sometimes questionable. His belief in competition, for example, leads him into error. It is doubtful that the "golden age" of English agriculture can be attributed to the healthy effect of international competition after the repeal of the Corn Laws; or that Britain's present plight can be blamed entirely on to the abandonment of gold and of the open door in commerce. Again, Mr Lipson is fond of re-arguing dead issues. No one these days believes that mercantilism was an inappropriate policy for its age, or that Adam Smith was the originator of *laisser faire*. On the other hand, there is not a topic of importance that has escaped Mr Lipson, and some of his chapters, on the Free Trade movement, for example, must be considered as important essays in interpretation.

Unsorted Impressions

"Instead of the Brier." By Anne Dacie. The Harvill Press, Limited. 318 pages. 10s. 6d.

THE author of this book went abroad towards the end of the war to see for herself what exactly was involved in the relief and reconstruction of war-devastated Europe, particularly in Jugoslavia. She worked in the first DP camp established by the Allies near Bari. Later, in October, 1945, she went to Jugoslavia, partly as a newspaper correspondent and partly to write reports for the European office of Unrra. She was forced to retreat to Trieste after about eight months, having fallen out of favour with the Jugoslav authorities. But she had made such energetic use of the time at her disposal—visiting five of the six federal republics of Jugoslavia and being the first foreign journalist to penetrate into the Jugoslav zone of Trieste—that she finally left Belgrade with her mind and her notebooks fairly bulging with experiences and impressions. Unfortunately she never seems to have managed

ECONOMICS—Postal Tuition

- Founded in 1887, U.C.C. provides tuition for the B.Sc.Econ. Degree of the University of London. The College is an Educational Trust, not conducted primarily as a profit-making concern, and has a staff of highly qualified Tutors.
- SELF-EDUCATION COURSES are available in Economics, Economic History, Public Administration, Social and Political Theory, Statistics, Foreign Languages, Accounting, etc.
- PROSPECTUS, giving full particulars, free from the Registrar,

PLANNING OUTLOOK

A Journal for Economists, Geographers, Town Planners and all who are interested in Town and Country Planning.

Issued twice yearly: Spring and Autumn.
Annual Subscription, 15/-.

Published for the Department of Town and Country Planning, King's College, Durham University, by *Geoffrey Cumberlege*, OXFORD UNIVERSITY PRESS, Amen House, Warwick Square, London, E.C.4.

LIGHTNING decisions can be taken by the man who is unhampered by any knowledge of the facts — or by the man who knows his subject inside out.

Facts and opinion on overseas markets, on prices and trends, on production and exports, may be obtained through:

The Economist Intelligence Unit,
22 Ryder Street, London, S.W.1.

to sort them out and decide which were worth keeping and which were better discarded. The result is that one has to plough through a great many rather tedious irrelevancies such as the author's frequent disagreeable encounters with bugs in her bedroom and her one highly agreeable encounter with Russian officers when stuck in an hotel lift, in order not to miss the really interesting descriptions of Jugoslav places, people and conditions just after the liberation.

Last of the Bosses

"The Purple Shamrock." By Joseph F. Dineen. W. W. Norton. New York. 322 pages. $3.75.

THIS is the unvarnished tale of a very remarkable man, Mr James Michael Curley, four times Mayor of Boston, twice gaoled, once Governor of Massachusetts, once a Congressman. He was the last of the old-style bosses to lose his throne; but though he was defeated last November in a bid for a fifth term, he rolled up more votes—at the age of 75—than ever before. His political audacity is still unquenched. Even this book—fair and objective, and therefore hardly a campaign biography—was turned to good account on the platform.

Mayor Curley rode into political power on the waves of Irish immigration that swamped the old Boston aristocracy, and in a political career that has lasted 50 years, has lived to see the Boston Irish themselves throw up an aristocracy that found Curleyism an embarrassment. Loyal son of the Church though he is, the hierarchy disowned him in the end. But if Mr Curley had been purely a Tammany organiser, even though one of genius, he would never have secured the hold on Boston's affections that survived even a penitentiary sentence for fraud. He was, to a real extent, a New Dealer before Roosevelt, a believer in public works and public action in the day when most political bosses were still thinking in terms of soup kitchens and coals and blankets. He changed the face of Boston, gave it roads, bridges, hospitals and playgrounds. If he took his cut, he gave value for it. Even Mr Roosevelt, in the days before the Chicago convention of 1932, did not disdain his aid, although afterward he found it embarrassing to repay the political debt in the coin Mr Curley thought he had earned.

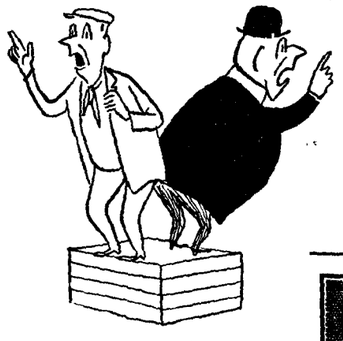
Mayor Curley's financial pyrotechnics were, of course, breathtaking; patient, determined men searched through mountains of papers for years hoping to find the trail that would lead to his downfall. Mr Dineen has been a critical student of Curley and Curleyism for 30 years. But, his account goes at such breakneck speed, that it can produce little in the way of a balance sheet of profit and loss. What he does suggest is that, Curley or no Curley, a feeble and archaic city government, coupled with meagre salaries for government servants, made corruption and mismanagement inescapable. Mayor Curley at least had the vision and energy to make them yield some tangible benefits to the people of Boston. It is now the time of Curley's enemies to prove that a "reform" administration can provide both clear and effective government.

Shorter Notices

"The London Mystery Magazine, 1950." Distributed by Hulton Press and printed by Hazell, Watson and Viney. 128 pages. 2s. 6d.

THE exigencies of paper rationing—shortly to be abolished—have made the reading public quite unaccustomed to the arrival of a new magazine. The appearance of *The London Mystery Magazine* is therefore to be welcomed on this ground alone. But to judge from its first numbers, it should be well received by the enthusiasts for both detective and adventure stories as a well-designed and edited pocket magazine which may fill the gap to be left by the departing *Strand*.

"Account Settled." By Dr. Hjalmar Schacht. Weidenfeld and Nicolson. 322 pages. 15s.



THIS book was reviewed in *The Economist* of March 5, 1948, after its publication in Hamburg, in German, under the title of "Abrechnung mit Hitler."

AMERICAN SURVEY

Electioneering and Economics

(From Our American Staff)

PRESIDENT TRUMAN, sending his three statutory messages to Congress at the opening of its new session, and dealing in turn with the state of the nation, the economy and the budget, told, three times over, a story of great success achieved in the past and of confident hopes for still better things to come. Such optimism appeals to Americans at any time, and never more than now, when the world's problems blow around them from every corner of the compass and the memory of depression still lingers behind their present buoyancy.

The President's beguiling thesis is one not only for today, but also for tomorrow. His argument starts from the confident assertion that the risk of an economic recession was overcome in 1949 and that business activity and employment can be kept at satisfactory levels with little difficulty. It goes on to maintain that conditions overseas are improving, and that the amount of foreign aid required to preserve peace and stability will diminish fairly rapidly from now on. For the rest of the century, at least, science will continue to improve the lot of mankind everywhere and in the United States it will quadruple national output. With incomes, and therefore tax receipts, rising and with the cost of liquidating the war's consequences at home and abroad falling, the budget will balance itself in time, and for the moment a deficit need cause no concern. Existing welfare programmes can thus be afforded and new ones undertaken, especially since they make for a better and more productive country. There are, it must be added in fairness, some qualifications to this argument, but they do not at any point really compromise the general theme of a beneficent future.

SUMMARY OF US BUDGET

(Fiscal Years beginning July 1st)

	1949 Actual $ Million	1950 Estimate $ Million	1951 Estimate $ Million
BUDGET RECEIPTS:—			
Direct taxes on individuals	18,725	18,668	18,938
Direct taxes on corporations	11,554	11,175	10,518
Excise taxes	7,551	7,631	7,642
Employment taxes:—			
Existing legislation	2,487	3,048	3,343
Proposed legislation	...	...	1,450
Customs	384	375	375
Miscellaneous receipts:—			
Existing legislation	2,072	1,289	1,096
Proposed legislation	...	...	60
Deduct:—			
Appropriation to federal old-age and survivors insurance trust fund:—			
Existing legislation	1,890	2,245	2,515
Proposed legislation	...	...	1,200
Appropriation to medical care insurance trust fund:—			
Proposed legislation	...	...	250
Refunds of receipts (excluding interest)	2,838	2,177	2,151
TOTAL RECEIPTS	38,246	37,763	37,306
BUDGET EXPENDITURES:—			
National defence	11,914	13,148	13,545
Veterans' services and benefits	6,669	6,905	6,080
International affairs and finance	6,462	5,964	4,711
Social welfare, health, and security	1,907	2,297	2,714
Housing and community development	282	1,006	1,329
Education and general research	70	125	434
Agriculture and agricultural resources	2,512	2,671	2,206
Natural resources not primarily agricultural	1,513	1,845	2,218
Transportation and communication	1,622	1,894	1,682
Finance, commerce, and industry	120	225	212
Labour	193	219	243
General government	1,170	1,223	1,267
Interest on the public debt	5,352	5,725	5,625
Reserve for contingencies	...	50	275
Adjustment to daily Treasury statement	+ 272	...	...
TOTAL EXPENDITURES	40,057	43,297	42,439
DEFICIT (−)	− 1,811	− 5,533	− 5,133

Figures are rounded and do not therefore add up exactly to totals.

The proposition is plausible and agrees with views widely held in the United States and frequently expressed before. But it is pushed so far as to become an inconsistent combination of Coolidgean complacency on the one hand and of quasi-socialist doctrine on the other. Mr Truman's refusal to worry about the budget and the condition of business, for example, is hardly compatible with his many plans for special assistance for particular groups. And the variety of interpretations which can be placed upon the messages is demonstrated by the thundering invective from the right against their socialism and the complaints from the left that Mr Truman has gone Tory.

The explanation is, of course, that the messages are primarily political, designed to attract as many different shades of opinion as possible. This was made unmistakably clear by the legislation which the President recommended. The welfare programmes, the regulatory powers, the plans for development of natural resources, are little more likely to be enacted at this session than they were on the previous occasions when they were put forward. But, as far as next November's election is concerned, that makes little difference to the President and his party, who will still be able to claim credit for proposing the legislation.

But, unfortunately, the messages have economic, as well as political, implications and, when they are looked at in this light, the soundness of the President's proposition is doubtful. It is by no means certain that recession has really been routed or that the rally after the steel strike can be depended upon to continue. Business investment, one of the bases of the present high level of economic activity, is certainly tending to decline and the President himself asks that efforts be made to encourage it; in the opinion of business men this would best be done by abandoning proposals for the expansion of the welfare state. Private construction has been another basic element and is also declining; it will hardly be strengthened by the suggested prolongation of rent control. Automobile production and sales are a third bulwark which may weaken before long; the proposed new taxes for broader social security schemes will not reinforce this market. Finally, the President may be viewing affairs abroad with undue equanimity or giving domestic programmes a higher priority over international considerations than they deserve.

But it is the explicit abandonment of any idea of balancing the federal income and outgoings, the relegation of this

problem to some vague future, that is perhaps the most distressing of all. Fiscal theory has undergone numerous changes in recent years, but, until now, lip service at least has always been paid to the principles of budget balancing and debt reduction under suitable conditions. The new approach is not a step towards economic stability over the years. Yet the President says, most revealingly, that

> the major question in my mind is not whether we are doing too much, but whether the budgetary requirements of the major national security and war connected programmes have constrained us to undertake too little toward supporting and stimulating the realisation of our country's great political development.

Nearly as distressing is the degradation of the economic message from the analytical survey which it was intended to be when it was instituted less than four years ago. Now it contains little that has not already appeared in other federal publications and, worse, it is in large part blatantly political. Many join the *New York Times* in questioning whether such a message serves any useful purpose.

All these observations do not mean that the United States is going to smash in 1950. The almost unanimous forecasts of a good year, though a little less good than in 1949, seem likely to be correct—even if they are almost unanimous. But they do mean that Mr Truman's programme, though it may win him another election, is too fragile to stand either serious analysis or even a little adverse pressure.

Tax Policy

[FROM A SPECIAL CORRESPONDENT]

ANY American tax programme must be considered in the light of postwar tax history. Since the end of the war Americans have had the benefit of two major tax reductions. The Revenue Act of 1945 gave business a green light by repealing the excess profits tax from January 1, 1946. The Revenue Act of 1948 reduced the individual income taxes of married people, particularly those with incomes between $10,000 and $100,000, for it was they who profited most from the new privilege of dividing the family income, for tax purposes, between husband and wife. The same Act reduced revenues from the estate tax by about 30 per cent even though Congress had not raised these rates during the war. The drive for further tax reduction is concentrated on those excise taxes that were increased, or first put into effect, during the war and have not been lowered.

Further tax cuts, however, are a highly controversial matter in view of an expected budget deficit of $5.5 billion this fiscal year and another of $5.1 billion in the year ending on June 30, 1951. There is a large body of informed opinion which opposes a deficit when production and employment are at a high level. There is a good deal of less well informed, and largely emotional, opposition to a deficit under any circumstances, even those of a cold war, and especially for a government which has a debt of $250 billion. This school of thought, if it may be called that, makes no distinction between the fiscal policy appropriate for a national government and that which should govern a private individual.

There was no doubt some political motivation, but there was also much grim truth, in the statement, contained in the Economic Report that the President presented to Congress in the middle of 1949, that the 1950 deficit was "caused primarily by the untimely tax reduction" of $5 billion made by the Eightieth Congress in 1948. The President had strenuously opposed this cut, but by July he felt that the moderate downward trend in economic activity made it unwise to attempt an immediate correction of this mistake, either by a drastic slash in expenditures or a substantial increase in taxes. The President's fear was that either of these policies would aggravate the downturn in business and lead to a lower national output and a further net loss in revenues.

Improved economic conditions enabled the President to take a somewhat different position in his Economic Report issued on January 6, 1950. This Report looks forward to eventually balancing the budget through a fiscal policy which reduces expenditures somewhat, stimulates business investment and consumption to the highest possible level, and relies, for moderately increased revenue, more upon an increased tax base than upon increased tax rates.

It is an open secret that the President's attitude to taxes represents a compromise between two more extreme positions taken by his closest advisers. One group urged that the budget should be balanced in a time of great prosperity such as the present if it is ever to be balanced at all. The other group pointed to a disturbing fall in business investment and feared that tax increases might accentuate a decline in economic activity to be expected in the latter part of 1950. Faced with these conflicting views, the President decided against immediate budget balancing either by drastic retrenchment or by a drastic tax increase; instead, he recommended a moderate reduction of expenditures and a moderate net increase in taxes as a means of reducing the deficit.

* *

The details of the President's tax programme are as yet unknown, but its broad outlines are clear. The tax recommendations shortly to be transmitted to Congress will undoubtedly call for the reduction of excise taxes, the enactment of some tax incentives and the plugging of loopholes. It is almost certain that the reduction of excises plays a large part in the President's programme to stimulate business. In his Economic Report in July the President recommended the repeal of the tax on transportation of goods; this time he will probably go further and suggest the elimination of certain of the most oppressive excises adopted during the war to diminish demand.

This month's Economic Report promises that the President's recommendations will make the tax structure "more equitable and stimulate business activity." A more liberal carry-over of business losses will undoubtedly be one of these proposals. There has been discussion of other changes, such as accelerated depreciation and some other dubious investment incentives, but to accept all the suggestions would involve too great a loss of revenue at this time. There are many loopholes to be closed by a programme designed to reduce inequities. They include the present exemption from taxes of interest on state and municipal securities, and the allowance of a special deduction for depletion of natural resources, particularly oil and gas and certain metals, based upon a percentage of output instead of the cost of the depleted property. In spite of efforts in 1942 to make them share the burden, life insurance companies still pay virtually no taxes. The estate tax has a number of glaring weaknesses, and it is generally believed in administration circles that the estate and gift taxes should play a more adequate role in the tax system. Of course, changes in these taxes will bring no additional revenue in the fiscal year 1950 and very little in the fiscal year 1951.

With the indicated increase in revenue from these changes offset by a substantial loss from excises, the President's programme will have to include some increases in individual or corporate tax rates if it is to bring in any more receipts in the near future. The response of Congress to these proposals is not easy to judge. If talk in Washington is to be believed, Congress will undoubtedly embarrass the President by almost doubling his recommended cut in the excise taxes. The closing of loopholes is a thankless legislative task because it is invariably opposed by vested interests which fight vigorously to retain their special privileges. Previous attempts to close some of the same loopholes have been unsuccessful, even in wartime, and even though the justice of the suggested changes was apparent to all disinterested observers.

Recommendations for changes in the estate and gift taxes have a better chance of success, but these changes will hardly produce a very substantial revenue in the immediate future. Congress is almost certainly going to refuse to increase the rates of individual and corporate income tax, particularly in view of a reliable report that the President's advisers are split on this issue. Furthermore, this part of the President's programme will furnish ammunition to those who demand a cut in spending—particularly for foreign aid—on the ground that the deficit cannot be reduced by additional taxes.

What will happen if Congress sends to the White House legislation calling for no net increase, and perhaps even for a net decrease, in revenue? If the economic prospect is good, the President may veto the legislation, and his veto may be upheld. This will mean a deadlock on the question of tax increases and reductions. On the other hand, if the current decline in business investment should continue, and if the economic outlook should be cloudy when the question comes to the President, he may welcome a net tax reduction as a stimulant to business. He would then sign the Bill, possibly with a protest that it did not contain some of the provisions he originally suggested.

American Notes

Far Eastern Defence

Mr Acheson's able defence of the refusal to intervene in Formosa has carried conviction to all but those Republicans, as hot-headed in Asia as they are lukewarm in Europe, who had gone out too far on the Formosan limb to climb down gracefully. Their hope now is to cushion their descent by uncovering disagreements among the President's military advisers, and Senator Connally, after two refusals, has finally announced that the Secretary of Defence, Mr Johnson, and General Bradley, the chairman of the Joint Chiefs of Staff, will testify before the Foreign Relations Committee on January 26th. This is likely to prove a disappointing fishing expedition. There is no reason to believe that the Joint Chiefs ever favoured military intervention in Formosa and, while Mr Johnson is known to have urged a stronger policy in the Far East, it is doubtful whether he will declare Formosa to be essential to Pacific defence, as Senators Taft and Knowland hope.

In his able speech to the National Press Club, Mr Acheson traced the American "defensive perimeter" as running from

Why not draw on American knowledge to

SELL THE $ MARKET?

The big-spending American market can yield some attractive *dollar-earning* orders for British-made plant and materials—probably for *your* products.

"But," you say, "if I am to compete in this market I must know more about it." That's where we come in. McGraw-Hill's industrial research organization can make you just as well-informed about the U.S. industrial market as any American firm. American manufacturers have been relying on our facilities for many years.

Using McGraw-Hill's nation-wide staff of 400 field investigators and our skilled market analysts in New York, you can measure exactly where your most profitable sales potential lies, you can tailor your patterns and colour-schemes to American tastes, you can plan a successful sales and publicity program.

The Board of Trade is ready to make dollars available for well-conceived research projects. And our representative in London will be glad to plan with you a survey fitted to your particular needs. Just call HOL 0056 or write

the Aleutians in the north, through Japan, to Okinawa in the Ryukyus, and on to the Philippines—that is, to the east of Formosa. He did not, as Senator Connally optimistically assumed, refer to this line as "impregnable," even (apparently) in the secret testimony which he gave to the Congressional committees. There are only two quite subsidiary Philippine bases; on Okinawa the neglect of four years is only beginning to be remedied; Alaska constantly bemoans its vulnerability; and in Japan the maintenance of effective bases is intermingled with future problems of internal security and the assurance of a livelihood to the population. But if it is not impregnable, the line drawn by Mr Acheson is becoming permanent. In his speech he gave an assurance that, with or without benefit of a peace treaty, the defences of Japan would not be weakened. For the first time he revealed that the United States will, "at an appropriate time," offer to hold the Ryukyus (including Okinawa) under trusteeship of the United Nations, but he insisted that under no circumstances would they be given up. The United States already holds the Marianas, Caroline, and Marshall Islands under a "strategic trusteeship" agreement that permits the closing of certain areas to inspection.

But the question of American security in the Pacific, large as it may loom to Congressmen in search of an issue, is not the most pressing problem. Mr Acheson has demonstrated successfully that the Administration avoided taking the wrong line in China, but his conclusion that "something under Point Four" was all that could be provided for non-Communist South-east Asia suggests only a snail's pace in the right direction, particularly as a mere $25 million is to be spent for the whole American programme of technical aid next year. Even the recognition of the Chinese Communists, a step favoured by Mr Acheson, both as an acceptance of the realities, and because Japan desperately needs the Chinese market if it is ever to be independent of American aid, has been further postponed by the seizure of American consular property in Peking. In the Republican view, this is proof that "appeasement" in the Pacific is as futile as it was in Czechoslovakia. Certainly it is an awkward hurdle for an Administration that has promised that recognition will await proper observance of international obligations on the part of the Peking Government.

New Moves in the Coal War

Mr Robert Denham, counsel to the National Labour Relations Board, has begun what Mr John L. Lewis, the United Mine Workers' leader, calls "an orgy of legal bloodletting." Mr Denham has acted upon the mine-owners' appeal to the NLRB against the UMW's allegedly unfair labour practices—its refusal to negotiate a new contract and its attempt to force a settlement by means of the three-day work week. He has applied to the courts for a temporary injunction requiring Mr Lewis and the UMW to desist from these practices while the NLRB investigates the charges. The court may do no more than order Mr Lewis to bargain with the mine operators, and in this case Mr Denham's action may have little immediate effect on the eight months' deadlock in the coalfields. But it has at least made it easier for President Truman to continue his refusal to take part in the coal dispute. Since Congress reassembled, some of his most faithful supporters, as well as his Republican opponents, have been urging him to intervene, but he still insists that, despite local difficulties, there is no national emergency to justify his use of the Taft-Hartley Act.

It would be embarrassing for Mr Truman to have to resort to the Act which he wants repealed and Mr Lewis, who would not be loth to humiliate the President, has been increasing the pressure on him by intensifying the war of attrition against the coal operators. Since the beginning of the year, groups of miners have been staying away from work with a uniformity that belies the spontaneity with which Mr Lewis says they acted, first in Illinois, then in western Pennsylvania and neighbouring coalfields. This second stoppage was directed against mines owned by the steel companies, who are now trying to make up the losses caused by their own strike in November, and who are usually more amenable than other mine-owners. This year, however, they are among the most recalcitrant and have retaliated by cutting off the miners' credit in the company-owned stores.

Perhaps this convinced the miners that Mr Lewis's game was not worth their candle. When he "suggested" that the 65,000 men who were idle last week should return to work, they refused to obey what has always in the past been regarded as an order, declaring that they were tired of part time wages and were determined to bring the dispute to a head. For some time there have been suggestions that Mr Lewis is driving his miners too hard, but it is by no means certain that their apparent revolt is any more spontaneous than their usual obedience. Evidence that his men are getting out of hand might be a useful shelter for Mr Lewis as his cold war warms up.

Civil Air Battles

The domestic airlines, a sick industry throughout the prosperous years from 1946 to 1948, fought their way back to financial health in 1949 despite the recession. The major domestic lines are expected to show a net operating income of nearly $26 million for 1949, compared with $2,000,000 for 1948. This is the reward for a stringent economy campaign, as well as the result of a steady increase in the number of passengers carried. Domestic air travel in 1949 exceeded that in 1948 by over 800 million passenger-miles, reaching an all-time high, while the safety record for scheduled flights was within a shade of that set in 1939 and 1946, the two best previous years.

Many of the new air passengers have been attracted by cheap "coach" services, run at slack periods and often at half the cost of standard journeys. Since the end of December it has been possible to fly from New York to the west coast for $127, compared with $181 for first-class comfort. The only trunk routes not provided with coach service are those of United Airlines, which may not be able to hold out much longer. A sharp dispute, however, has broken out over the extension of the coach principle to transatlantic flights. Pan-American, largest of the transatlantic lines, has long been pressing to experiment with cheap travel, but has been repulsed by the Civil Aeronautics Board. Then, in view of Holy Year and the need of providing tourist dollars for Europe, the CAB gave preliminary permission to Pan-American to charter planes for pilgrims to Rome, and invited the whole industry to submit applications for charter flights at low rates. These may be made available to only religious, charitable, or educational groups. The proposal is strenuously opposed in the courts and before the CAB by Trans-World Airlines, which has an exclusive licence to serve Rome, and no desire to cut its rates further. TWA objects, with equal vigour, to the preliminary approval by a CAB examiner of the purchase by Pan-American of American Overseas Airlines, the third American line licensed for transatlantic flights.

TWA maintains that this is a long step toward monopoly in the field and toward the single "chosen instrument" system long favoured by Pan-American. The objection is shared by the Department of Justice.

The Air Transport Agreement between the United States and Canada is also held up pending a Supreme Court decision. The agreement gave American aircraft traffic rights at Gander, Newfoundland, in return for certain concessions, of which permission for Trans-Canada Airlines to run a service between Montreal and New York was the most important. But Colonial Airlines, with a long and profitable monopoly of the route, protests that the agreement was unconstitutional, in that it never received the approval of Congress.

Making College Ends Meet

America's nationwide system of public universities, which in theory enables almost any boy or girl to study for a college degree, has encouraged the belief abroad that it is a country of college graduates. It is therefore surprising to hear, from the US Commissioner of Education, that 76 per cent of suitable high school students fail to go to college and that there are at present at least 2,000,000 young men and women who deserve, but cannot pay for, a higher education. Perhaps even more surprisingly, it was to Britain that the Commissioner came, late last year, to study the solution that is being tried here. President Truman has now asked that a limited programme of federal aid for capable students should be begun during the present year. The full scheme is expected to involve an annual expenditure of $300 million for scholarships of $600 a year and guaranteed loans to some 437,500 undergraduate and graduate students.

Even in the public colleges, average fees for tuition have gone up by 35 per cent since 1941, although they remain very low for residents within the city or state financing the college. Board and lodging are the main expenses of a student at a public college and these are 50 per cent higher than in 1941. Even then, there were many young people who could not manage to work their way through college, and university authorities are now agreed that charges must not be put up any further, since this would eliminate too many worthy students. As the number of ex-service students, financed by government grants, declines, the problem becomes pressing, not only for the young people themselves, but for the universities which have been drawing a substantial proportion of their incomes from these grants since the war. University research programmes are also now very dependent on government grants, and it is difficult to see how the college authorities justify their unyielding objection on principle to federal aid as a way out of their financial difficulties. Most of them, however, now favour the plans for direct grants to students which the government is drawing up, although there are some who regard even such a scheme as a forerunner of the federal control which leads to dictatorship.

*From *New York Times* survey of 630 institutions of higher education

But many of the colleges are nearer to being beggars than choosers. Twenty per cent of the 1,700 institutions of higher education in the country are operating on a deficit, Yale, Columbia and Chicago amongst them. In some of the big liberal arts colleges, both public and private, the number of students is down by from 5 to 10 per cent this year. However, the total number of students, at a record 2,500,000, is 1,000,000 more than in 1941 and is thought to have become fairly stable. This, paradoxically enough, has brought the financial problems of the colleges to a head, by involving them in building programmes which, according to the *New York Times*, will cost about $2½ billion over the next few years. Appeals for funds are going badly, expenses are rising and incomes from endowments, on which private colleges rely very largely, are falling.

It is this which has driven about a quarter of the colleges to invest in business enterprises and real estate, from airports to dairies; Yale, for example, has recently bought the building of Macy's department store in San Francisco and leased it back to the firm. Many of these operations are entirely ethical, although perhaps somewhat risky, but some educational institutions are taking advantage of their exemption from corporation income taxes to enter into unfair competition with orthodox business firms, a practice on which both Congress and the Treasury have their eyes.

Conserving Timber Resources

The cult of the Christmas tree has brought into being a large seasonal trade. Last year 21 million were cut in the United States, some by specialist tree farmers, of whom Mr Elliot Roosevelt is perhaps the most famous. By the time the trees had been trimmed and transported to market, they were worth about $50 million. Some years ago conservationists protested that the cutting of trees robbed the forests of their young, and asked that trees should be sold in pots, so that after the celebrations they could be planted in the garden. Now many families have two Christmas trees, one in the house and the other shining across the street.

But Christmas trees are only a minor part of the American timber trade, which employs over 1,000,000 people and is the basis of the nation's fifth largest industry. There are over 460 million acres of forest land in the United States capable of producing commercial timber. In 1948, 36 billion board feet were cut, compared with an average of just over 23 billion in 1935-39. Demand is likely to remain high, because of the large amounts of timber needed for housing in a country where many dwellings are built almost entirely of wood. The unexpected increase in construction activity last autumn has again driven timber prices, which fell during the summer recession, up to a level which should enable small firms, as well as the established giants, to keep busy during the coming year.

According to the federal Forest Service, these small firms hold about three-quarters of the 345 million acres of privately-owned forest land and three-quarters of the cutting which they do is destructive; they pay little attention to restocking, or to such possible consequences as soil erosion and water shortages. It is calculated that, of an original stand of perhaps 8,000 billion board feet of timber, only about 1,600 billion feet remains, and that the annual cut exceeds the annual growth by 50 per cent. Even on large properties some 40 per cent of cutting is destructive, although many lumber firms undertake reafforestation programmes as a matter of self-interest.

Last January the President asked Congress to consider forest conservation as an investment "necessary to our progress in the future," and in September Congress passed an Act providing for a 15-year programme of planting trees and grass on public lands and national parks. But this Act covers only the 89 million acres of federally-administered forests. There is no centralised control over timber, apart from federal regulations on fire fighting which apply to about four-fifths of timber land. In this case, control is justified by the need for a quick and determined attack on a particular danger spot, but when Senator Anderson last spring proposed a more general federal supervision of timber conservation, he was making a revolutionary suggestion. Nineteen of the States have forest laws, though the Forest Service considers most of them inadequate. Those of Oregon and Washington are probably the best, and the constitutionality of their system, requiring that 8 acres out of each 160 be left uncut for natural reseeding, has recently been upheld by the Supreme Court.

Housing the Forgotten Man

The "Apartments to Let" sign is once more to be seen outside new blocks of flats (which are not subject to rent control) and one enterprising firm, at least, tempts new tenants with offers of free removal. Two States, Texas and Nebraska, have discarded rent controls; others have modified them; while the federal Housing Expediter has decontrolled a number of areas and permitted many rent increases. Has the housing shortage then come to an end? Despite the fact that over a million new homes—houses and flats—were put in hand in 1949, compared with a previous peak of 937,000 in 1925, and despite the fact that the building of rental accommodation has surged forward, the Administration does not think so. One of the first Bills it presented to Congress proposes a totally new scheme for housing the middle-class and is also designed to put the federal insurance of mortgages—the main prop of the boom—on a permanent and more liberal basis. The housing boom is not to be permitted to sag, both on the score of meeting housing needs and because it is a key to the stabilisation and expansion of production and employment.

In the view of Mr Truman and his economic advisers, the building of homes, although it has reached a new peak, has failed to keep pace with the growth of the population and of the economy since 1925. They believe that rent controls should be extended for another year from June. But even this hope—which must be implemented by a reluctant Congress—does not satisfy the big cities, where the shortage in inexpensive homes is still acute; New York City, for example, claims the right, now being tested in the courts, to protect tenants from the rent increases approved in Washington.

The "forgotten family" in the Administration's housing book is one receiving an income of from $2,400 to $4,400 a year. It is thus too well off to qualify for the Subsidised housing authorised last year (when it materialises), but unable to pay the rents demanded in the new blocks rushed up under the government mortgage insurance scheme. To meet its needs, it is proposed to create a new corporation, empowered to sell its government guaranteed bonds on the market, up to a total of $2 billion, and to make long-term loans at 3 per cent to housing co-operatives or other non-profit groups interested in erecting moderate-priced accommodation. This is a modification of an earlier proposal, made in the hope that the House, which last year threw out the scheme for by a degree of insulation between the government and its new beneficiaries. In the Senate hearings, however, the provision has drawn the fire not only of Senators who speak with the voice of the real estate lobby, but of Senator Douglas, that hardy liberal, who cannot understand why the middle-class co-operative should receive loans at 3 per cent while borrowers under the government insurance and GI programmes must pay 4 or 4½ per cent. The housing co-operative is a device infrequently used in the United States and, on the record, Congressional scepticism may not be altogether unjustified.

Shorter Notes

The *New York Sun*, the first successful penny (one cent) newspaper in the United States, the second oldest of the city's papers, has sunk after 117 years with only one day's warning. It has been bought by and merged with the *New York World Telegram*, owned by the Scripps-Howard chain, but some of its best-known and most conservative writers, such as Mr George Sokolsky, have gone to Mr Hearst's reactionary *Journal-American*. The *Sun* had been unable to offset increased costs by sufficient additional advertising; during the past ten years newspaper advertising linage in the city has gone up by fifty per cent, but the *Sun* last year carried less than six per cent of it, compared with ten per cent in 1939. Its circulation had been falling, and last September was only 277,500, while the *World-Telegram* sells 365,000 copies on weekdays.

*

The US death rate in 1948 was the lowest ever recorded, at 9.9 per 1,000 population. Deaths from heart disease and cancer increased slightly, as did those from poliomyelitis and polioencephalitis (the total from the latter two was 1,895). Deaths from the major infectious diseases continued to decline, and so did those from accidents, even from motor accidents.

*

The methods used by the US Fish and Wildlife Service to take its annual inventory of the big game under its care vary from checks in the true path-finding spirit, such as counting the animals' tracks and surveying the extent of browsing in a given area, to a census made from aeroplanes. Caribou are still few and far between and the moose, bison and grizzly bear, which suffered so much from the hunter's enthusiasm at the beginning of the century, remain relatively scarce. But the big game population of the United States adds up to about 7,750,000, of which the largest proportion are deer, chiefly white-tailed or mule; elk, antelope, black bear and peccary are also relatively abundant.

THE WORLD OVERSEAS

New Patterns for the Commonwealth

(From Our Special Correspondent at Colombo)

THE Colombo conference was the first meeting of Commonwealth Foreign Ministers to be held; far more important, it was the first Commonwealth meeting ever held in Asia. The conference was not merely in Asia, it was about Asia; Asia's problems dominated the scene, and the big figures of the meeting were the Asian ministers. By meeting on their home ground, the new members of the Commonwealth were enabled to lose any sense of juniority, and it was soon apparent that they were more self assured than most of their colleagues. Mr Bevin was in such poor health throughout most of the meetings (though he noticeably rallied after the sacred tooth of Buddha was exposed in prayer for his recovery) that it was obvious he would not continue as Foreign Secretary for long. Two Pacific Dominions both sent delegates who were new to the job, and it was a subtle pleasure to see an old hand like Mr Senanayake explaining the meaning of the Commonwealth and the traditions of its meetings to Mr Doidge, who had come to New Zealand's foreign office almost direct from Shoe Lane.

Pandit Nehru's Leadership

Since Pandit Nehru is both Prime Minister and Foreign Secretary of India, it was easy for him to become the dominating figure of the conference, as has happened before in London. The now assured position of the Asian Dominions gave him new assurance. He was no longer the slightly godlike figure whom everyone sought eagerly to placate, nor was his will enforced by implied threat that he would walk out. Nehru was the leader because he was the most brilliant man present, knew most about the questions involved, and is the head of by far the largest state in the Commonwealth. It was easy to imagine that the seat of power, if it were ever to leave London, would move not to Ottawa but to New Delhi—as Saki foretold in 1913. In the new security of this position, Nehru was far less hard to please than ever before.

At the final meeting of the conference, held in the presence of about fifty journalists and twenty-five public, assembled ministers saw fit to indulge in a display of irritation with the press which was embarrassingly childish though not entirely unjustified. But it was significant that their indignation was roused because the unity and good temper of Commonwealth representatives had been questioned. One expects to hear at Commonwealth meetings platitudes about "bonds light as air and strong as iron," but it was fascinating to hear them from Mr Nehru and Mr Senanayake.

Education of Ministers

How much did the Colombo conference achieve beyond that "valuable exchange of views" so regularly announced? In his final speech, Mr Pearson of Canada spoke of the amount he had learned about the problems of Asia. Indeed, the educational value of bringing foreign ministers to Asia cannot be exaggerated. All of them, except Mr Sauer of South Africa, and Mr Bevin, who had to hurry home for the election, will spend a full month seeing Asia; not merely Ceylon, with their own eyes. Moreover, they received during the conference two lectures of the highest western standard, one by Mr Bevin on European affairs and one by Mr Malcolm Macdonald on South-East Asia. That such education was not unnecessary was revealed by one minister's question, "When will Britain recognise Franco?" and another's query to Nehru, "Do you advocate a policy of scuttle in South-East Asia?"

A more practical result was some closing of the ranks. When the conference began, there was a distinct cleavage between the views of Canada and Australia on the danger of regionalisation of the Commonwealth. Canada insisted that, since it is fully extended in its commitments to the North Atlantic area, it cannot be interested in South-East Asia. Australia insisted that the Far East was being neglected for the North Atlantic area. The conference managed to bridge this gap by agreeing that aid in the Far East should be given by the Commonwealth as a whole, but with each country contributing proportionately to its interest. Thus Burma is to receive £7,500,000 from the Commonwealth: but when the hat is passed, no one expects Canada or South Africa to contribute more than a mite. Thus formal unity of the Commonwealth is preserved.

The reconciliation of east and west groups was helped by the good sense of Mr Pearson and the very welcome replacement of Dr Evatt by Mr Spender. The new Australian Foreign Minister was, after Nehru, the big success of the party. The Spender plan, though its origins went far beyond a single man, was his in the sense that his initiative and drive brought it through the conference and his wise indiscretions brought it out into the open. In essence it is simple: it calls for study by the Commonwealth of the needs of South-East Asia and an attempt to co-ordinate aid to that vital area.

Marshall Plan Model

But the Spender plan also has in it the seeds of something great. First of all it acknowledges that the only way to stop Communism in that area is by raising living standards; talk about a military Pacific pact or any joint defence measures was completely quashed by Nehru's refusal to discuss it. Secondly it recognises that the job cannot be done by the Commonwealth alone; therefore all the interested countries are eventually to be invited to join in the discussions. Thirdly, the plan adopts the phraseology and methods of the Marshall plan, which has a certain psychological appeal both to America and to Asia, as well as the benefit of two years' practical experience.

In the political discussions of the conference the hopes of checking the Communist threat were far from strong. Mr Malcolm Macdonald made an urgent and almost desperate plea for every possible effort to save from the Communists the rice bowl of South-East Asia—Burma, Indo-China and Siam. But no one can suggest how the running sore of the Karen war in Burma can be stopped. Over Indo-China there was a sharp debate in which the British contention that Bao-Dai should be recognised, because French policy had become more liberal, was resisted by Nehru. The Indians are very bitter indeed at the continuance of French rule in Pondicherry, and there is no hope that the new

Vietnamese state will be recognised by India as long as relations with France remain so strained.

The debates over the recognition of Bao-Dai, over the Japanese peace treaty and over the recognition of the Communist government in China showed that no progress has been made towards the ideal of a unified Commonwealth foreign policy. Canada and South Africa are positively opposed to the idea ; India is willing to lead, but not follow ; Australia and New Zealand support the idea in theory but, for instance, refuse to recognise the Peking government. The "exchange of views" may have made quarrels less likely, but contrary actions remain. It is questionable whether agreements in principle and disagreements in practice constitute a satisfactory basis for Commonwealth policy.

Better Organised for Business

It was most noticeable that such disagreements did not occur in the economic field, and this was generally attributed to the excellent organisation of the economic secretariat, set up with so much misgiving by Commonwealth finance ministers last July. It has had the effect of keeping all the governments informed of the state of the whole sterling area, and it has made each government aware of the contribution it can make to balancing the dollar account. Thus, without any pressure except the weight of facts and figures, the secretariat has greatly influenced Commonwealth policy in the agreed direction.

It would therefore seem likely that the most important step taken at this conference has been the decision to set up two more Commonwealth standing committees—one in London to study the Japanese treaty and one at Canberra to produce a basis for the Spender plan. In 1946 it seemed highly unlikely that the Dominions would ever agree to any central secretariat. Yet, as the new Commonwealth has developed, it has begun to face problems which are too great to be settled by brief meetings or frequent telegrams. Having over the past quarter of a century relaxed the bonds of membership as much as possible, there is now a desire on the part of members to draw closer together in consultation. Before 1939 the Commonwealth conference was a family reunion every five years with a formal and ceremonial background: in the past two years there have been four businesslike meetings, the most recent at the centre of the problems and not at the traditional centre of the Empire. The Soviet strategy in Asia has revealed the Commonwealth as the main barrier to Communism. At Colombo it has begun to equip itself for the job.

Germany's Free Trade Crisis

A CRISIS has arisen in Federal Germany's foreign trade, as the result of the experiment in liberalisation which was inaugurated last autumn. New bilateral trade pacts with Switzerland, Austria, Holland, Norway and Belgium-Luxembourg concluded at that time reduced the number of goods still subject to quota restrictions on the German side to a comparatively small list. In the treaty with Belgium, Germany still retained restrictions, or even bans, on a number of important Belgian exports, notably textiles and food ; but a wide open door was left to Holland and, to a lesser extent, Switzerland.

Germany's partners also made varying concessions in these agreements. Belgium freed almost every type of German goods, while the Dutch felt bound to retain a comprehensive list of restrictions. A nicely balanced list of reciprocal concessions was agreed with the Swiss, after representatives of the rival watch-making industries had worked out an exchange that would safeguard both parties. It may be noted that, when the Germans and French sought to conduct a similar exercise in practical integration for their watch and clock industries as part of the new agreement that is about to be concluded, objections were made by the American authorities in Germany—so hard is it to steer between Mr Hoffman's demands for a free trade unit in western Europe, and American fears of new cartels.

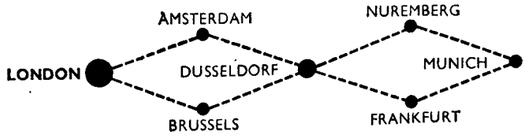
Apart from reducing quota restrictions, Germany's bilateral agreements raised the gold point—in other words, the level at which settlement of outstanding balances must be made in gold or dollars. The purpose was to do away with a factor which has strangled German trade in the past few years. In the treaty with Holland, the dollar clause was in practice eliminated altogether ; the Dutch—to whom a revival of trade with Germany is vital—led the way in Europe by accepting the D-mark as a valid international currency. Under the payments agreement, it was indeed, stipulated that, if Germany should owe the Netherlands more than the equivalent of $15 million, the Dutch had the right to ask for settlement in dollars ; but the Netherlands also undertook not to exercise this right as long as Germany continued to leave Dutch imports free of restrictions. In practice, therefore, the Dutch agreed to risk holding D-marks, though eventually they will spend all their D-mark balances in Germany.

Effects of Liberalisation

In addition to concluding liberalised bilateral trade treaties, the Germans followed the Organisation for European Economic Co-operation's demand for liberalised trade terms applicable to all ERP countries. Its list, submitted last October, freed completely 36 per cent of imports from ERP countries ; together with items freed on condition that others reciprocate, the list covered nearly three-quarters of trade with the ERP countries—which accounts for the bulk of the western German total.

So much for the letter of the agreements. In practice, they have further distorted the picture of Germany's trade, which is already out of its prewar focus. An importing spree started among German traders, out to make the most of the present boom in "non-essentials" and high-quality goods in the Republic. Allocations of foreign exchange have been over-subscribed many times over, often by men-of-straw. Only 15 per cent of applications for Swiss textile imports, for example, could be allocated. Germany in December regained its position as Switzerland's best customer ; imports from that source rose in the month by nearly 50 per cent. Holland's exports of vegetables to Germany bounded back to their prewar level. The Dutch, it is reported, have been buying goods in third countries—such as wool from Australia and chocolate from Belgium—in order to keep up with the boom in German orders.

For their part, the Germans have, however, fared badly, partly owing to the fact that return orders from their trade partners consist to a great extent of machinery, which is naturally slow to bring in foreign exchange, but partly owing to the poorer response of importers to the opportunity for raising their purchases of German goods.



Passive Balance within Marshall Area

The active balance which the OEEC estimated that Germany would have with ERP Europe—and which it has in fact had in the past—has been changed to a growing passive balance. Imports in October were no less than 41 per cent more than in the previous month, while exports have climbed far less. The *Bank Deutscher Laender* and the ECA Mission in Germany are now concerned lest Germany (which has in the past earned dollars from various countries including Britain) should have to pay out dollars to settle its balances ; the authorities are seriously worried lest Germans be drained of foreign exchange for buying essential raw materials. Finally, Germany's conditional aid under ERP is threatened if the drawing rights it has granted to other countries are not used. The German banking authorities

TWO AIR-ROUTES TO Germany

Two great air-lines — K.L.M. and SABENA — co-operate to offer you the quickest, most convenient way to Germany by air. Fast, frequent services operate from the United Kingdom on two alternate routes — Via Amsterdam or Brussels — serving Dusseldorf . . . Frankfurt . . . Nuremberg . . . Munich.

Fares : London-Dusseldorf 10 single, £18 return
Frankfurt : £12.18 single, £23.4 return
Munich : £18.17 single, £33.19 return
Nuremberg : £16.8 single, £29.11 return

K.L.M.—SABENA

Reservations from all Air Travel Agents or any K.L.M. or SABENA office.

Above is based upon report in London "Evening News," 18/2/49.

Shortage of police man-power is likely to be a major problem for many years to come. It is unfortunate, therefore, that thousands of police must daily be employed on traffic control duties.
Anything which will assist in putting them back on the beat is playing its part in beating the present crime wave. ELECTRO-MATIC VEHICLE-ACTUATED SIGNALS are already doing this at thousands of busy (and not so busy) traffic intersections up and down the country.
Have you considered them in relation to the man-power problems in your area ?

INSTALL EVA ELECTRO-MATIC VEHICLE ACTUATED SIGNALS and put the Police back on the beat

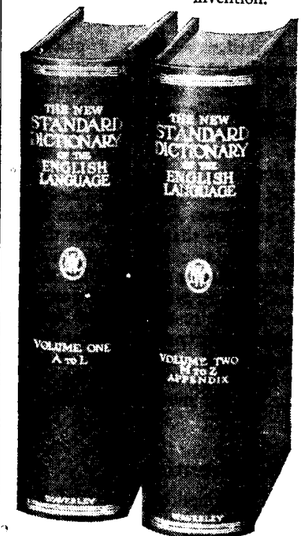
THE NEW STANDARD DICTIONARY

OF THE ENGLISH LANGUAGE.

Defines nearly Half a Million Current Words & Terms



Compiled and Edited by 380 Scholars and Specialists of International Repute

Up-to-date from Cover to Cover

7,000 ILLUSTRATIONS. Many Full Colour Plates

AUTHORITATIVE, comprehensive, up-to-date, superbly produced, and possessing many exclusive and original features, THE NEW STANDARD DICTIONARY is the finest work of its kind in existence. The enormous task of creating it was entrusted to a brilliant staff, chosen from the foremost representatives in every field of knowledge, who have given complete, clear and accurate definitions in the light of the most recent advances in knowledge. In its 3,000 pages this monumental work gives reliable information on every conceivable subject. Over 130,000 words and names brought into prominence through recent developments are included. These cover the World War, political changes, exploration and travel, and progress in every field of scholarship, art, science, commerce, industry and invention.

Sent to You FREE on approval for 7days

Handsomely and strongly bound, each volume measures 12½ by 9½ ins. A thumb index is provided.

Invaluable to Business Men, Public Speakers and Writers

Every business man and woman will appreciate the inclusion of clear and full definitions of commercial, financial, legal and industrial terms.
To the speaker and writer this Dictionary will provide a wealth of ideas and inspiration. Particularly valuable features are the 31,000 historical references; 16,000 biographies; 32,000 quotations; thousands of synonyms and antonyms—not merely a list of synonyms, but with differences of meaning and use carefully explained and the finer distinctions brought out by means of comparison.

Post the FREE Form To-day

Just sign and post the form below, and on acceptance we will send you this work, carriage paid, to examine for one week free.

FREE EXAMINATION FORM

To The WAVERLEY BOOK CO. LTD. (Dept. Eco. 1), 96 and 97 Farringdon Street, LONDON, E.C.4.

Please send me, carriage paid, for seven days' FREE examination, THE NEW STANDARD DICTIONARY, complete in two volumes. It is understood that I may return the work within eight days with no further obligation. If I keep it I will send you the first payment of £1 1s. eight days after delivery, and eleven monthly payments of £1 1s., thus completing the purchase price of £12 12s.

have been forced to point out that unless liberalisation leads to an increased two-way flow, Germany will have to invoke the safety clause which permits OEEC countries to reimpose restrictions.

The situation is one which might well have been foreseen; and the British in Germany who have so often been galled by the ignorant criticism of their own economic policies may be forgiven if they feel a certain amount of that typically German sentiment, *Schadenfreude*.

Generalised conclusions, however, should not be drawn from the effect of Germany's essay in liberalised trade, since German conditions are peculiar. The market is still comparatively starved, and the psychology of the people made a burst of importing inevitable. The Germans would like to return—and find it hard to grasp why this should not be so—to the days of Schacht and Funk, when almost every European country had to sell more or less unrequited exports in return for blocked balances in Berlin. The idea of getting something for nothing is deeply imbedded in the German mind.

Jordan, Israel and the Arab World

[FROM OUR SPECIAL CORRESPONDENT IN AMMAN]

THE Hashemite Kingdom of Jordan occupies a place in the Arab world entirely incommensurate with its size, population, wealth and political importance. With the exception of the Lebanon, which while far smaller is infinitely richer and has three times its population, Jordan is by far the smallest of the Arab countries. It has, however, three assets: King Abdullah, the Arab Legion, and its geographical position which, since the end of the British Mandate in Palestine and the emergence of Israel, has thrown Arab Palestine into welcoming Jordanian arms. It is more than likely that these two countries will eventually become one, but which will in fact absorb the other is not clear. Had it not been for their past wretched leadership and their present division of opinion, it would have been a simple matter for the Arabs of Palestine to bring Jordan under their control and for them to form the ruling and official classes. Even now, except that King Abdullah will be the ruler, it is probable that the future Jordan State will be run far more by Palestinians than by Jordanians.

British Non-Intervention

Within the boundaries of his own kingdom King Abdullah relies, as he has always relied, upon the Arab Legion to preserve order and to maintain himself in power. Without the support of this force the King could not keep his throne for a week, though it is difficult to imagine any of the Jordanian politicians or tribal leaders being sufficiently powerful to hold the country together even for a short period. King Abdullah and his close advisers are aware of this and realise that they owe their position—anyway indirectly—to the British, who are responsible for building up, training, maintaining and financing the Legion. Despite this knowledge, British influence rests lightly upon the King in all but what might be termed major military matters. During two world wars he was a firm and loyal friend to the British. He accepts British support as his just reward and would not—indeed does not—welcome advice unless he requests it, and then on a purely friendly basis. There is practically no day-to-day contact between the British Legation and the Royal Palace. Relations are excellent—possibly because of this strict non-intervention—and in a time of crisis Abdullah turns to Britain; but only after he has, if one may say so, got himself into a mess through his marked impulsiveness. Apart from the officers of the Arab Legion there are three British officials employed by Jordan—all men of outstanding ability—an archæologist, a land survey expert and a financial adviser (although that is not his official title).

The reasonable attitude King Abdullah adopted towards Israel once the fighting had ceased, and which made him distinctly unpopular with fire-eating members of the Arab League, was due as much to the influence of Glubb Pasha as to advice from the British Minister. So it was again when a succession of *coups d'état* in Syria made Damascus a tempting prize to the king, whose objective has always been a revival of the old Arab Empire with himself at its head. He believes he would be welcomed by the majority of Syrians, especially by the tribes in the frontier regions; and he is certain that his Legion could quickly dispose of any opposition the Syrian Army might put up. He could expect a storm of rage and reproach from Egypt and Saudi Arabia, but the likelihood of any military action from the first is remote and from the second impossible. But so long as he cannot obtain British support for such a move and whilst the Legion is directed and led by British officers, he is reluctantly obliged to postpone the happy day. It is not to be imagined, however, that Abdullah has abandoned this long cherished project. In all Abdullah's contradictory utterances there is always one consistent note: it is that any means are justified by the end—when the end is Damascus.

Obstacles to Agreement

In the meantime, and perhaps as a preliminary step, there is no doubt that he is anxious to come to terms with Israel. Despite various denials by his Cabinet Ministers, discussions have been proceeding between Jordan and Israel. But, despite surprising mildness on the part of the formerly intransigent Israelis, who are so desperate for food supplies from Jordan that they are ready to agree to almost anything, the problem has been complicated by the attitude of the Palestine Arabs. Their hatred of the Jews is still alive, and effaces in their minds the financial and economic advantages of agreement. The Israelis refuse to begin full scale negotiations without the presence on the Jordan side of Palestine Arab representatives—despite their refusal to recognise the fusion of Arab Palestine and Jordan. They are also putting up as a main demand that Jordan should denounce its treaty with the British. It is believed that this is mainly bluff, much as most Israelis would like to see British influence finally removed from Jordan. But they are certainly anxious that British influence should not extend into Palestine via the Anglo-Jordanian Treaty.

On this point they seemed doomed to disappointment. The matter is not entirely clear, but Article I of the annexe to the treaty lays down that in case of war or menace of war "the High Contracting Party will invite the other to bring to his territory or *territory controlled by him* the necessary forces of all arms." There is no doubt that Jordan, through the Arab Legion, is controlling Arab Palestine, and will continue to do so. And there is no likelihood of Abdullah renouncing the treaty and giving up the appreciable British subsidy upon which not only the Legion but indeed his country as a whole depends.

Need for Balanced Trade

From every point of view Jordan's economic situation is, at least, difficult. Imports into Jordan and Arab Palestine (excluding all forms of refugee relief) amounted to nearly £P13 million in 1948 whilst exports were £P727,638 and re-exports £P1,783,636; there is every indication that last year's figures will be similar, except that imports are likely to be around £P9,000,000. Obviously this deficit cannot go on. The British Government have indicated that they will continue to contribute £P3,000,000 towards the cost of the Arab Legion, as part of its basic Middle East security plan; but the Amman government can expect no further

grants to help balance its budget which, for the year 1949-50, amounts to £P2,344,402. (This excludes the cost of the Legion and the special supplementary budget for Arab Palestine.)

The boom created by the Palestine war shows signs of coming to an end and, although Amman is being rebuilt and everyone is putting his profits into real estate, there is noticeable fear for the future. Unless peace is signed with Israel, which could sell to Jordan many of the manufactured products which now come from Britain on the long and expensive route via Beirut, Damascus and Derra, Jordan cannot continue to import at anything like the present rate. Its sterling balances amount to only £P6,500,000. Redemption of former Government of Palestine notes which produced £P8,000,000 to the end of 1948 and less than £P5,000,000 last year will soon come to an end. Hopes of striking oil are diminishing and revenue from pipelines crossing the territory is not large, and will not become so for a long time—if ever.

Prosperity for Smugglers

Smugglers are the most prosperous people in Jordan today and their prosperity offers a hope for the future. They are in two classes; drug smugglers who take hashish from Syria to Egypt by rough and dangerous routes and who can, economically if not socially, be disregarded. The other class deals in foodstuffs and creates by its activity and profits a trade that can be of considerable profit to Jordan. It is reliably estimated that £P150,000 worth of goods, mainly meat and vegetables, passed from Arab Jerusalem to Jewish Jerusalem during November.

Even greater hope rests in the projects recommended by the Clapp Mission and there will be full co-operation by the Jordanians and also, with tactful handling, by the Palestine Arabs. Irrigation works in the Jordan Valley, such as the Wadi Zerka and Wadi Kelt schemes drawn up by expert American engineers attached to the Mission, open new fields to agriculture. It is perhaps not generally realised that spring vegetables can be grown in the Jordan Valley at least one month earlier than anywhere in Europe or the Middle East. But this project involves a vast improvement in communications if marketing arrangements are to work, and lends special point to King Abdullah's insistence upon an outlet for Jordan to the Mediterranean by a corridor running across Israel, a proposal the Israelis are adamantly refusing.

Assuming that Jordan will before long officially and legally include Arab Palestine, its future depends ultimately on better relations between Jordanians and Palestinians. There is no doubt that, on the whole, the Palestinians provide far better material in the persons of former officials of the Palestine Government, than is to be found in what was once called Transjordan. Too many senior posts are now occupied by men selected more for their loyalty to King Abdullah than for their capabilities. Few Christian Arabs are employed although, by reason often of their special training in mission schools, they are often more advanced than their Moslem brethren. Indeed the Christian Arab is finding life extremely difficult.

Jordan will hold general elections on May 11th to elect forty members of its new Chamber. Twenty will come from Jordan proper and twenty, including three Christians, from Arab Palestine. The resulting government should be reasonably representative and will, it is hoped, work smoothly. While many Palestinians are disgruntled and oppose Abdullah's readiness to reach an agreement with Israel, they will probably slowly decide to make the best of things.

right FIRST time, right ON time, right EVERY time

In fact you just can't go wrong with "RECORDON." Its extra clear recordings will give all your correspondence and reports the clear cut precision of spontaneous dictation, faultlessly transcribed.

If time is money to you "Recordon" will prove the finest investment you can bring to your business. Write for fully descriptive literature on this very latest development in magnetic dictating units.

Microphones and Receivers extra as required.

£49.10.

'RECORDON'

MAGNETIC DICTATING UNIT

THERMIONIC PRODUCTS LTD. (Dept. E3), Morris House, Jermyn St., Haymarket, S.W.1. *Telephone:* Whitehall 6422 (5 *lines*).

BANK-UNITS

AND THE DEVALUATION OF THE £.

INVESTORS in Bank-Units secure a freely marketable investment spread over the shares of 45 Dominion, Colonial and Home banks and discount companies.

The Trust Fund, 55% of which is invested overseas, is as under:

Canadian $ bank shares	30%
Australian banks	8%
Other Dom., Col. & O'seas banks	17%
Home banks	29%
Discount companies	11%
Trustee securities	5%

Next year Unit holders should benefit from the devaluation of the £ and from the Managers' policy during the past few years of investing in the $ shares of Canadian banks (now nearly one-third of the Trust Fund). The sterling income from these $ banks will increase. Distributions on Bank-Units for 1950 should therefore exceed those for 1949 and enable the recent steadily rising trend to be continued.

Offer price 16th Jan. 21/10½. Yield (conservatively calculated on net cost including commission and 2% Gov't. Stamp Duty, and subject to *reduced* rate of tax, allowing for D.I.T. relief) £3/12/5% which may be further increased by up to ¼%, according to the amount of the Unit holder's income for tax purposes, by claiming additional double income tax relief. (N.B. Surtax payers obtaining this relief would be assessed for surtax on a higher income.)

Units can be freely bought and sold at quoted net prices (and full information obtained) through any Stockbroker or Bank.

Planning Norway's Defences

[BY A CORRESPONDENT]

THE main function of Norway's armed forces must be to hold on to sufficient of the country to enable help to arrive from its allies. This is the kernel of the 880 page report of the Norwegian Defence Commission which was published on December 6th. It is not a startling conclusion in itself. But against the background of Norway's neutrality and pacifism it is nothing short of revolutionary; or, more accurately, it would have been, if the Commission had not taken over three years on their task. For this assumption is inherent in Norway's adherence to the Atlantic Pact, which was old news by the time the report was published. Nevertheless, both the Commission and the Norwegian Government are to be congratulated on facing the lessons of 1940—and on planning to act on what they see.

The Commission included representatives of all the political parties—with the single Communist member permanently dissenting—as well as service experts. It aimed at

cutting Norway's defensive coat according to the cloth available. That being so, it had already agreed on the basic task of Norwegian forces by the time the Atlantic Pact was conceived. This development, therefore, did not alter the shape of the proposed structure. But it is not true to say that it made no difference. For it gave it the solid foundation of American support—a very considerable difference. (It is probable that, if there had been no Atlantic Pact, close ties with Britain would have been sought.)

To perform their task, the Norwegian forces should, it is recommended, be organised with three principles in mind. First, they must be in a position to develop their maximum effort as soon as possible after the attack. Second, they must be capable of fighting as long a delaying action as possible. Third, they must have made preparations to ensure that allied help comes as quickly as possible and is immediately effective.

The topography of Norway both helps and hinders these objectives. It is favourable to delaying actions, but unfavourable to the speedy concentration of forces. The Commission proposes to overcome this by creating four self-contained defence areas manned by "combined regiments," that is, balanced striking forces of all arms. Their task is to hold on and at all costs to avoid being cut off from the west. (The Commission obviously regards an attack from Denmark and South Sweden as the main threat. Hence the chief naval base at Horten is to be moved to Bergen—very much nearer Scapa Flow; and special armoured units are proposed to keep the vital airfields of Sola, Gardermoen and Stavanger in Norwegian hands.)

Men and Material

The report reckons that its proposals should be made effective in the six years from 1950 to 1955 at an annual cost of 300 million kroner—kr. 110 million for the Army, kr. 70 million for the Navy, kr. 90 million for the Air Force, and kr. 30 million for combined activities, including the Home Guard. An additional sum of kr. 700 million will be required during this period for equipment, and kr. 300 million for supplies and constructional work. Thus the total outlay will be kr. 2,800 million (£135 million)—about 3 per cent of the national income—in the next six years.

The main change in the Army will be that it will have a twofold organisation consisting of a field army and, secondly, of local defence troops. These latter will be based on 18 local defence districts with permanent staffs. That they will have a very important role to play may be deduced from the emphasis on delaying tactics and the speedy mobilisation of forces. Their equipment is to be strengthened according to the Commission's recommendations, and their final strength will be 120,000 men. (There are already 93,000 men in the Home Guard, nearly all volunteers.)

To the Air Force is assigned the task of maintaining an organisation capable of accommodating allied contingents as quickly as possible. The Navy is to be strengthened by the addition of at least three submarines, 13 MTB's (orders for the first two of which have just been placed) and two minelayers. Various existing ships are to be refitted. The main submarine base will move from Trondheim to Bergen and the Navy will be organised into Coastal Commands with bases at Horten, Kristiansand, Stavanger, Trondheim and Harstad.

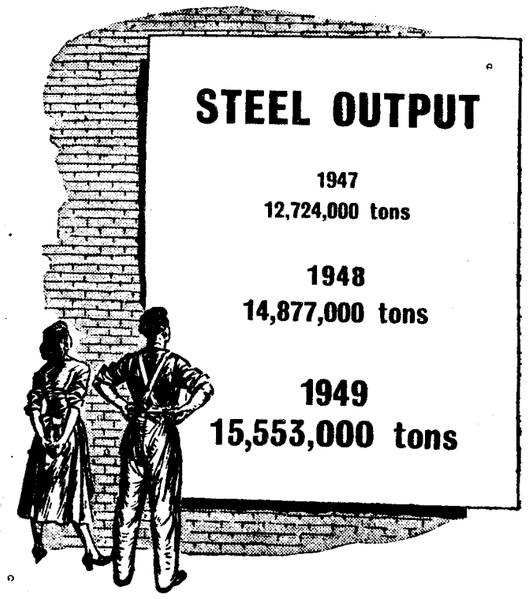
Slight changes are recommended in the length of conscript training. Soldiers will train for nine months, sailors and airmen for eleven, and specialists in all services for twelve. A great effort is to be made to build up an efficient corps of officers.

Problem of American Aid

As a corollary to this expansion and modernisation of Norway's fighting forces, the production of small arms and munitions in Norway is to be increased. But the bulk of equipment must still come from abroad. Much of it would, on the face of it, come from the United States under the Military Aid Programme. But its supply raises one of the major difficulties inherent in the Atlantic Pact. How is a small country whose forces are equipped with non-American weapons going to assimilate large quantities of American weapons? The Norwegians are equipped in the main with British weapons. They are trained in British methods. It would clearly lead to inefficiency in the field and undesirable expansion of the staff if a part of their small forces were now to be issued with American equipment with all the new problems of supply and maintenance involved.

The answer seems to be that the Americans should concentrate only on filling in the gaps in the modern equipment possessed by Norway and supplying the whole issue of certain new items; but that arrangements should be made, with Britain for example, to maintain supplies of standard items such as rifles. In due course the standardisation of weapons within the Atlantic Pact area will solve the problem.

By then the fate of the Defence Commission's report will have been decided. But it is not likely to be before next May; and the report is unlikely to be accepted *in toto* at a time when import cuts of the order of 600 million kroner are envisaged. It is nevertheless a practical and painstaking attempt to answer a most perplexing question.



Bleached...

The chemical industry's achievement in respect of chlorine is one of production. The consumption of chlorine has increased steadily since its discovery in 1774, and in recent years great efforts have been necessary to meet the ever-growing demands for this important chemical. Chlorine is one of the most reactive of the elements and, for this reason, it is never found free in Nature. In 1799, Charles Tennant of St. Rollox Works, Glasgow, combined it with lime to produce bleaching powder, and from that day forward, chlorine and its derivatives became intimately associated with the progress of industry. Now, in liquid or gaseous form, this versatile chemical is required in enormous quantities for the bleaching of paper and textiles, for sterilising water supplies, and for the manufacture of acids, disinfectants, drugs, plastics, refrigerants, solvents and countless other important chemicals, including the powerful 'Gammexane' insecticides.

Today most chlorine is produced by passing an electric current through brine. This process yields caustic soda and hydrogen as well as chlorine. Caustic soda is itself a valuable product, and the hydrogen may be combined with chlorine in a separate process to yield hydrochloric acid—yet another chemical of the utmost value to modern industry.

ICI

A record that makes you think

The proved policy of the steel industry has yet again given the nation a year of outstanding achievement. The output for 1949 was once more an all-time record — 15,553,000 tons.

Open competition has spurred on the industry. Co-operation in research and development is keeping British steel supreme in quality and low in price. Government supervision protects the public interest.

What better proof could there be that the present policy is the most practical way of putting all the resources of the steel industry at the service of the nation?

STEEL

is serving you well

BRITISH IRON AND STEEL FEDERATION

THE BUSINESS WORLD

European Clearing Union

THE main outlines of the new European Payments Scheme have been agreed by the Payments Committee of the Organisation for European Economic Co-operation and will be submitted for approval to the Council of that organisation at its impending meeting in Paris. The present Intra-European Payments Scheme still has more than five months to run before it completes its course ; but no tears would be shed if that scheme could be replaced before its terminal date on June 30th next. The balance of payments estimates for 1949-50 on which it is based are being completely falsified by events. Some of the drawing rights established under the scheme have not yet been touched and the conditional dollar aid from the United States which, in turn, is anchored to utilised drawing rights is therefore being imperilled. The unrealistic character of these estimates has, moreover, been accentuated not only by the actual course of trade but by a purely technical consequence of the currency devaluations of last September. For the purpose of the IEPS and for the determination of drawing rights, the European surpluses and deficits were expressed in dollars by conversion from the various local currencies at the pre-devaluation parities. When reconverted into European currencies at the existing parities, the figures bear very little resemblance to the realities of present intra-European trade. That is one reason for the obsolescence of the present IEPS.

But, apart from this weakness of the existing arrangements, there is an urgent need to establish the payments machinery in Europe on a truly multilateral basis and to bring it into line with the efforts the OEEC countries are making to liberalise their mutual trade and to relax exchange control restrictions on "invisible" transactions. The time has come, moreover, to establish a European payments system which is less directly linked to Marshall aid than the present IEPS ; what is needed is a scheme which, although launched as part of the European Recovery Programme, will be capable of being dovetailed into the system that will obtain when there are no more conditional grants from the United States and when, indeed, there will be no more Marshall dollars of any kind.

*

It has been recognised, therefore, that the first objective must be to ensure the complete inter-transferability of western European currencies arising from current transactions. The new payments scheme must make it possible for each ERP country to view its balances of payments with its colleagues as one single problem and not as a set of largely insulated bilateral relations. If, however, these balances are to be completely transferable or convertible into one another, there is a danger that certain countries may find themselves extending credits to most of their colleagues on an inordinate scale and that a chronic debtor may be given unlimited licence to indulge his propensity for living at other countries' expense. The scheme must therefore incorporate some form of sanctions—a strict limit to overdraft facilities or so-called gold points—both to act as a deterrent to the debtors and to offer some incentives to the creditors. The second main objective of any new scheme must be to allow intra-European trade to develop freely and to be liberated from the virtual strait-jacket into which it has been compressed by the present IEPS, which makes drawing rights conform to inevitably fallible estimates of what future balances of payments may be.

To secure these objectives it is proposed to set up a new European Clearing Union—its precise title has not yet been finally decided—to take over the work now done through the Intra-European Payments Scheme. This organisation will keep clearing union accounts for member countries and will do so in terms of a new European unit of account which will be given a defined gold or US dollar equivalent. Among the proposed names for the new unit, one of the present favourites is the "*écu*" derived from the initials of the Union, but also a word with a good European tradition. Each member country would be given a quota of new style drawing rights at the Union, the quota to be calculated on the basis of its foreign trade for the preceding year, probably made subject to yearly adjustment in accordance with changes in this trade. The members would not pay any local currencies or gold into the Union, but would be allowed to overdraw their accounts up to the amount of their quotas ; they would also be able—indeed the creditors would within limits be required—to accumulate credit balances with the Clearing Union. Both overdrafts and credit balances would be expressed in terms of *écus*.

*

Every month, or at other intervals to be decided, each member country would notify the Union of the amount of its holdings of other members' currencies currently earned, just as it now notifies the Bank for International Settlements under the IEPS. The Union, like the BIS at present, would then proceed to a bilateral compensation of the positions notified to it, the undischarged balances then emerging as the net credit or debit positions of each member vis-a-vis the Union. One point which is not yet clear is whether the existing bilateral payments agreements in Europe would have to be swept into the new ECU machinery or whether ECU would be superimposed on them. Whatever decision may be taken on this point, it is intended that the Union should be a lender of last resort whose facilities would be used only after the applicant member had exhausted its available resources, including any overdraft limits established under existing bilateral agreements. Thereafter, in order to complete the compensation, the members would have the right to overdraw their Clearing Union accounts.

Two limitations would be placed on the use of ECU facilities. The first would restrict the amounts both of overdrafts and of accumulated balances, and the second would limit the duration of these debit or credit balances. The facilities provided by the Union would not be intended to cover more than seasonal swings in the balances of payments of the member countries. Anything more permanent than these seasonal deficits and surpluses would have to be financed by a more permanent type of ECU credit, or by ECA grants. If, therefore, the periodic compensation required the use of facilities going beyond the individual quotas, or if the amounts involved were left outstanding for more than a given length of time, it would be necessary to fund a part of the overdrafts and corresponding credits.

When debts or credits were thus converted into longer term credits, the creditor would obtain a partial payment in dollars or gold and, correspondingly, the debtor would pay part of his debt in the same medium. The consequent withdrawals of gold or dollars from the ECU would not, however, necessarily be equal to its receipts of gold and dollars. It is possible that one country might be a creditor against all the rest and would, therefore, reach the limit of its quota and exercise its right to withdraw gold from ECU, long before any debtor had reached the limit of its overdraft facilities and was therefore compelled to make gold or dollar payments. For that reason it would be necessary—or at least desirable—to launch the ECU with a hard currency reserve, which could be provided in the first place from ECA dollars. It is also conceivable that the ECU could rediscount some of its claims. It might, for example, acquire dollars from the International Monetary Fund. Any such transaction, however, would require the reversal by the IMF of its ruling not to supply dollars to countries in receipt of Marshall aid.

The distribution of ECA dollars through the channel of ECU would provide one of the methods by which, during the remainder of the ERP period, part of the available Marshall aid would be distributed according to merit and not according to "need"—as measured by estimates of deficits in balances of payments. The prospect of gold receipts and payments would not, however, provide a sufficient mechanism to ensure the maintenance of even approximate equilibrium in the balances of payments between the countries concerned. The ECU should therefore be authorised to give advice to and, if necessary, to bring pressure to bear upon member countries, whether persistent debtors or creditors, whose position was deemed to be caused by mistaken economic policy. It might also be open to the ECU to authorise member countries which were losing gold to apply quantitative restrictions in their trade with countries taking gold from the pool. Another form of pressure would be the levying of interest on all overdraft facilities extended by ECU. It would seem reasonable to assume that the BIS, which has acted so efficiently as agent for OEEC in operating the European Payments Scheme, should take over the work of the new ECU.

It will be seen that in its main outlines the scheme bears a very close resemblance to Lord Keynes's scheme for an international clearing union. Its main difference from that scheme is that ECU would operate within a European and not a truly international context. The "banking principle"—that is, the inevitable equality of aggregate international debits and credits—which played so fundamental a part in the Keynes scheme cannot, therefore, apply with equal force to the European scheme. For this reason, the possibility of some conversion of the *ecu* into gold or dollars must be contemplated. The Keynes scheme also went out of its way to penalise the persistent creditor almost as much as the persistent debtor. It is unlikely that any such device would prove acceptable to those who are now formulating the new European Payments Scheme.

Whatever refinements and amendments may be introduced into the scheme before it is submitted to the Council of OEEC at the end of this month, and whatever may be the details which may subsequently fill out the present outline, it is evident that it represents an immense advance on the present IEPS. That scheme has done excellent work, but it is fast outliving its usefulness. There may be real differences of opinion on the question whether the new scheme, as here outlined, provides the most promising solution to the problem of European payments ; but as between ECU and IEPS there can be no room for doubt.

Report on Power

IT is easy to forget the simple grandiloquence with which the notion of nationalising electricity was presented to Parliament by Mr Shinwell, then Minister of Fuel and Power, three years ago. Mr Shinwell, who was moving the second reading of the Electricity Bill, was on safe ground when he submitted that "the supply of electricity and, in particular, its distribution, are at present organised on a basis which must be regarded as completely out of date." But advantages of a positive kind were to flow from the nationalisation of the industry and from an imaginative State fuel and power policy. The new boards would be "able to undertake rural development on a national and systematic plan." The industry which they controlled would "enjoy the benefits of large-scale organisation." The private companies had promised "grandiose schemes of rural electrification without any conception of where the stations and plant are to come from," and this was "humbug." But it would all be changed: every effort would be made to speed up development plans and the production of power plant:

> This Bill fortifies the endeavours of the technicians in the electricity supply industry, and affords them the opportunity of putting into effect development plans which, up to the present, have far too often been impeded by sordid financial considerations.

Perhaps those fine phrases would have been better unspoken, but now that the British Electricity Authority has issued its first report* they can properly be recalled. The authority, together with the fourteen Area Electricity Boards, has been in charge of the power generating and distributing system since April 1st, 1948. It enjoys wide powers, high industrial priorities, and—with power to borrow up to £700 million apart from its compensa-

* British Electricity Authority: First Report and Statement of Accounts, 13th August, 1947, to 31st March, 1949. HMSO.

tion stocks—an unprecedented freedom from "sordid financial considerations." No one supposes that the authority could have transformed the power supply facilities or worked any other miracle in this short time. But it is fair to look to it for a systematic approach to its task and a policy aimed at removing the faults for which

the old system was blamed. Neither this report, nor the Authority's known performance to date, contains anything to suggest that such an approach or such a policy exists.

The report has one major success to record: the consolidated accounts of the Authority and the area boards show a surplus of £4,391,684 for the first operating year which ended last March. This figure is reached after providing for depreciation of fixed assets to the extent of £30.61 million, the writing off of "intangible assets" of the dispossessed undertakings to the extent of £700,000, and £341,836 spent by area boards on changing the systems of supply. This is considerably more than the predecessor undertakings succeeded in applying to the same purposes in 1947-48.

It is worth noting that no provision has had to be made for income tax or profits tax, though the Authority is "assessable" for these. This is "a consequence of the wear and tear and initial allowances appropriate for the year"; in short, the rate of capital expenditure is so high that the initial allowance exceeds the liability for tax. Indeed, though the report does not suggest it, the Authority seems unlikely to have to pay tax so long as it keeps up its present rate of capital expenditure—some £95 million in the year under review and more than £100 million a year at present—and so long as the initial allowance remains on its present basis. There is, however, a deferred liability here which would emerge abruptly if new investment had to be greatly cut down.

In their scope and detail, the accounts and statistics published follow the good example set by the National Coal Board; though the same cannot be said of the report itself, which is turgid in manner and labyrinthine in arrangement. The total revenue from the sale of electricity to consumers rose from £168.4 million in the last year of the "authorised undertakings" (and £163.7 in the preceding year, 1946-47) to £191.4 million in the Authority's first year. This is by no means wholly explained by the increase (from 35,983 million in 1947-48 to 39,058 million in 1948-49) in the number of units sold. As the report explains, the old undertakings were already in the aggregate making a loss in their last year, and this would have amounted to £7,000,000 in 1948-49 if immediate increases had not been imposed in the deficit districts and the minimum flat rate of ¾d. had not been introduced in two-part tariffs. Thus the average revenue per unit sold rose from 1.123d. in the last year of the old system to 1.176d. in the first year of nationalisation.

It is of interest to see how this money was spent. Interest and dividend payments declined, and taxation, as it happened, disappeared. Financial appropriations, in which depreciation of fixed assets is the largest item, fell slightly to 0.319d. a unit. But the working expenses of producing electricity rose from 0.782 to 0.857d. a unit; almost half of this increase is accounted for by the higher cost of coal, and the remainder by the higher cost of other materials, of labour and presumably of administration. Thus, although an appreciable increase was achieved in thermal efficiency at the works, its effects were outweighed by the cost-raising tendencies at work in the economy at large. Coal prices had risen shortly before the Authority took over, and this was a flat-rate increase—and, therefore, unfavourable to a big consumer of the cheaper kinds of coal. As the year went on, however, and the technicians succeeded in raising average thermal efficiency from 20.86 per cent to 21.15

* Average per unit purchased. † Average per unit sent out. ‡ Of this total, 43,199 million units were sold (42,576 million to Area Boards and 623 million to railway undertakers) and 794 million used in transmission.

per cent, the fuel cost per unit sent out declined from 0.429d. (April to June, 1948) to 0.409d. (January to March, 1949).

The British Electricity Authority made a loss of £607,149 on its own operations; this is attributed to "the fact that the charges recovered from the area boards did not in the event yield sufficient to cover the Authority's related costs and charges." The area boards, which resell the Authority's electricity to consumers, made an aggregate net profit of almost exactly £5,000,000. Urban and industrial areas, it is fairly apparent, were responsible for this profit. London made a surplus of £453,724, the Midlands area £183,241, Yorkshire £156,623, and the north-west £124,081. Two areas made a loss, and both of these (the eastern and the south-western) are predominantly rural areas; the question appears to be raised at the outset whether the policy is to be to pay for rural electrification out of profits made in the industrial districts. In fact, however, the Authority has yet to evolve a policy on this question; undertakings in these two areas were faced with losses heavier than the average when the boards took over, and it was not found practicable to remove these large deficits at one stroke.

Higher plant efficiency is the inevitable and proper aim of the engineer; new, bigger, and better plant the obvious way to achieve it. To blame the power-station engineers for constantly wanting new power stations would be a waste of time. But the central authority has more to consider than plant efficiency itself; it has to relate the economies gained by higher thermal efficiency to the burdens assumed by heavy capital investment. It should also have a clear sense of the relationship between its investment programme and the other calls on the national investment resources—otherwise not only the notion of an integrated fuel and power policy but also the whole idea of purposive economic development become meaningless. The Authority's attitude on questions of this kind, and not any deficiency in its immediate trading, is the vital matter on which the report gives no satisfaction.

First of all, the idea that new and more efficient power stations will make electricity cheaper needs to be exploded. The report is informative about costs of construction:

> The capital cost of generating stations per kilowatt of installed capacity is now about three times as much as before the war, and the new stations and extensions of existing stations projected for 1950-53 will cost on average about £50 per kilowatt installed.

In the year under review, the authority ordered new generating plant to the tune of £45 million. No industry engaged in expansion or re-equipment can afford to ignore the cost of new plant. It happens that capital charges are a far larger part of the cost of a unit of electricity than of the average industrial product, and the cost of new power plant is at present so high as to aggravate this drawback progressively. The report recognises that capital charges "will grow in relative significance" as the expansion programme proceeds, and the present low level of tariffs will be threatened:

> Unless offset by increasing technical efficiency, coupled with expanding sales, the growing burden of capital charges may necessitate higher tariffs.

But this is only half the truth, for two reasons. No foreseeable technical superiority of the new plants over the old is in the least likely to offset their increased initial cost in full. Power from plants now being built will, therefore—however efficient they are—cost more to produce than the power which the old plants are producing today. Thus, until the cost of new plant falls substantially, electricity will tend to be dearer as more and more new plant is installed.

To suppose that "expanding sales" in themselves offer a remedy is fallacious for the same reason. Unless the present load pattern is changed, sales can be expanded only by building more plant; for the existing plant is already stretched to capacity, and more, at peak load times. To the extent that demand increases and the Authority is able to instal the new plant to meet it,

An Account of STEWARDSHIP

AT THE END of 1949 our **Deposits** amounted to over **£1,130 millions.** Four of the chief ways in which we have employed these vast sums entrusted to our care are as follows :—

Advanced to Trade, Industry, Agriculture and other borrowers : **£271 millions**

Invested in British Government Securities, including Treasury Bills and Treasury Deposit Receipts : **£571 millions**

Loaned at Call or short notice to the Money Market (which in turn invests mainly in Treasury Bills and short-dated Government Bonds) : **£112 millions**

Held as Cash in our tills and with the Bank of England and other Central Banks : **£93 millions**

LLOYDS BANK LIMITED

electricity will cost not less, but more. If the plant could be more fully utilised, then sales could be expanded without extra investment, and costs might begin to come down. But this can be achieved only by spreading demand more evenly—over the year if possible, but at any rate over the day.

On the day of maximum potential demand last year (February 4th) demand fluctuated between about 3,200 megawatts at 2.30 a.m. and about 10,500 megawatts at 8.30 a.m. A part of the demand at 8.30 had to be shed. No doubt the British Electricity Authority understands that an increased demand at 2.30 a.m. would be a help, while an increased demand at 8.30 would be a hindrance and a waste. In fairness, it has to be said that the load factor (which expresses the average degree of utilisation of plant) was increased from 47.4 per cent in 1947-48 to 49 per cent in 1948-49. This seems to have been achieved partly by the exertions of the technicians (who by now have gone about as far as they can go), but mainly by the load-spreading schemes for industry, the restrictions on lighting and the appeals for economy. By such stop-gaps, and by good luck, emergencies are overcome. But the problem of peak loads is not merely an emergency ; it is permanent, and inseparable from the search for an economic system of electricity supply. To blame the Authority for having failed to find a solution in its short life would be absurd ; but is the essential question being tackled at all ?

There is no sign that it is: and the remarkable complacency with which the report discusses the recommendations of the Clow Committee makes it difficult to believe anything but the worst. The Clow Committee made an immediate recommendation and some long-term recommendations. The first was the unfortunate winter surcharge ; the Authority does not conceal the reluctance with which it acted upon a "request" from the Minister of Fuel and Power to introduce the winter surcharge, and its claim to have taken "all practicable steps" can hardly, in the context, carry any conviction.

But this was no more than an immediate, stop-gap suggestion ; it would be useful to know what has become of the more important suggestion that the possibility of differential time-of-day charges should be studied ; these would make current cheaper at off-peak times and very much dearer at peak times, so that, for example, heat storage at night would become an economic practice. Is anything being done along these lines ? It seems not.

Instead, the Authority appears to be pinning all its hopes on a capital expansion of dreamlike dimensions:

> At March 31, 1949, the total installed capacity of generating plant under the control of the Authority and connected to the Grid was some 12,900,000 kilowatts, and upwards of 30,000,000 kilowatts of new plant will probably be required to meet the increase in demand and provide for replacements in the next twenty years.

No doubt this would be perfectly splendid ; but it means a sustained average of 1,500,000 kilowatts of new plant a year over 20 years, and the total bill would be £1,500 million at present costs. The Authority's nearest predecessor, the Central Electricity Board, had prepared a programme up to 1952, which "called for a rate of installation more than double that achieved in any prewar year"—and in one year for an installation of 2,150,000 kilowatts. Notice was given to the plant manufacturers to increase their productive capacity, but "limitations were imposed upon the Board's programmes by the Government's capital investment programme for 1948." In any case, however, plant was not being produced fast enough ; the Ministry of Supply looked into the matter, and found that the boiler manufacturing and pipe fabrication capacity allocated to the home market would barely stretch to 1,800,000 kilowatts in a year. Even this made assumptions about supplies of labour and materials which have never yet come true.

Instead of 3,051,000 kW of new plant which was to be brought into service in the three years 1946-48, 1,042,000 was in fact installed. Amended estimates of future "shortages of plant capacity in extreme cold weather" were then made, and the day of surplus was put off till 1952-53. These amended estimates were amended once more last spring and the expected surplus of 498,000 kW for 1952-53 was converted into an expected deficit of 666,000 kW—a burst of realism which may be explained by the modest figure of 566,000 kW of new plant which was actually commissioned in 1948, consisting of 239,000 kW from the 1946 programme and 327,000 kW from the 1947 programme. But in spite of everything—in spite of the total of barely over 700,000 kW achieved in 1949, instead of the 1,328,000 kW which was planned—the Authority is still thinking of a rate of installation of 1,500,000 kW of new plant a year by 1953, and hoping that supply will equal demand in 1954. This estimate is not in the report ; nor is the fact that the Authority, in an attempt to get free from the shortage of British boiler plant, has asked the Government for permission to buy American boilers for three of its new stations.

Released, if only temporarily, from sordid financial impediments, the electricity supply industry has found itself bogged down not less firmly in unpleasant economic facts. This ought not to be blamed, as the report appears to blame it, on the cruel world—the consequences of the war, or the unaccountable failure of a supplying industry to live up to extravagant promises which ought never to have been believed. If there is one service which should be required, above all others, from the board of a nationalised industry it is that this kind of happy-go-lucky expansionism—with all that it implies in resources pre-empted, immobilised, and going to waste—should be unthinkable.

The Cost of Transport

THE Transport Tribunal, sitting as a consultative committee to advise the Minister of Transport, has this week concluded its hearings of the British Transport Commission's case for increasing railway freight charges by one-sixth. The Minister is required by the Transport Act "to consult with, and consider the advice of" the permanent members of the Tribunal, about any application for increased charges in the transitional period between the creation of the Commission and the introduction of "charges schemes" which the Act requires the Commission to prepare and submit to the Transport Tribunal. Such charges schemes (affecting both rail and road charges) are bound to involve long preparation. So far, only the broad principles governing conditions of carriage and chargeable distance have been drafted by the Commission and submitted to traders for discussion. The detailed work on the fixing of rates (including such formidable tasks as dealing with the million or more "exceptional rates" and knitting road and rail charges together to provide an integrated pattern for all different forms of inland transport) is bound to be intricate and lengthy ; thereafter, when schemes are drafted, it will be for the Transport Tribunal to consider and, if necessary, modify them, before they are put into effect. Thus the "transitional provisions" under which the present application has been heard, are likely to obtain for at least two years more—Sir Bruce Thomas, K.C., the chairman of the Tribunal, observed that it would be "pretty good going" to have a charges scheme in operation by 1952.

The decision to hear the case in public calls for praise. The hearings have produced a vast amount of factual material, which throws a clear light on the railways' difficulties and on the attitude of the Commission and Railway Executive. It has not been a comfortable procedure for witnesses from either of these two bodies, as the following interchange between the comptroller of the Commission and the chairman of the Tribunal suggests:

> The Transport Commission is alone, I think, in this country out of any major industry, in that it has this obligation —
>
> This unpleasant procedure ?
>
> Yes, Sir,—to prove its case.

It is fortunate, in the public interest, that at least one nationalised industry should have to give a public account of its charging policy, and submit its affairs to scrutiny before an expert and independent tribunal. It is a salutary experience, from which the railway companies and the public profited before the war, and one to which other public boards (including several which were represented at the enquiry) might with advantage be exposed.

What emerges from the hearings ? It would be improper to attempt to weigh the evidence ; that is the duty of the committee and the final decision on the application rests with the Minister. But it is permissible to outline some of the contentions which were put forward, both by the applicants and by the respondents. Total traffic receipts of British Railways last year fell by more than £10 million, from £331.9 to £321.3 million. Estimates submitted to the committee suggested that the Transport Commission's deficit for 1949 would be approximately £21 million, and for 1950 some £30 million. The gross yield from the 16⅔ per cent increase in freight rates which is sought would be £36 million on estimated freight receipts (before the increase) of £210 million ; from this gross increase a deduction of almost £10 million has to be allowed for probable loss of traffic. Thus the benefit of the increase in freight charges, after discount for possible loss of traffic, might be put at £26 million—not enough to cover the estimated deficit in 1950, even if the increase had operated for the whole year, and still leaving the 1949 deficit to be carried forward.

The argument before the Committee has turned largely on one point—whether this estimate represented the best that the Commission could be expected to do, both in attracting traffic and in operating economies. The forecast presupposes some further net increase in railway operating costs of £2 million this year, and a loss of traffic of £5 million. Thus the marked deterioration of railway costs and revenues which dominated the Commission's economic position last year is, in the absence of any increase in charges, expected to continue. If charges were not increased, the Commission would, on its own showing, be faced with accumulated deficits ranging up to £100 million by 1952—a hopelessly unsatisfactory condition from which to contemplate the introduction of charges schemes. Moreover, the accumulation of deficits on such a scale would hardly appear to satisfy the obligation which rests on the Commission to balance its revenue account "taking one year with another," whatever that phrase may precisely mean. And a deliberate policy of running a deficit in order to subsidise the user of transport would appear to be ruled out by the terms of the Act itself.

It is, in one sense, unsatisfactory that the railways should have to seek an increase in charges before an integrated charges scheme could be worked out and approved. But it would be even more unsatisfactory if deficits were allowed to accumulate until such schemes could be introduced. Hence the main question, in this transitional stage, is whether the railways are doing their utmost to secure increased revenue and to reduce their costs. There was much emphasis during the proceedings on the decline in marginal spending power, with its particular consequences in falling passenger revenues. Apart from the fall in passenger receipts, it is probably true that even on the best assumptions about future traffic—even applying, say, the volume of traffic recorded in 1929 to the conditions of today—the railways would still be faced with the problem of the deficit. It is, fun-

damentally, a problem of costs, but it is being tackled, rightly or wrongly, as a matter of increasing revenue from those classes of traffic to which increased charges can be made to "stick" most effectively. Much was made of operating efficiency by all participants in the enquiry. The witness for the Commission argued that to get £20 million off the prospective accumulated deficit of £100 million by 1952 would represent an "enormous economy." He anticipated economies of £2 or £3 million on the railways this year (the figure for 1949 was about £7 million). To say that railway staffs were "excessive" would, he suggested, be "a delusion," a delusion for which the critics of the Commission "at one time probably had a little ground." No substantial pruning could take place in 1950.

Comparisons of productivity on the railways and in industry occupied a considerable part of the hearing. It will be for the committee to decide which side had the better of the argument—whether the Commission is right in its view that only piecemeal economies are now possible, that no case exists for a drastic reduction of staff, and that the major economies which, it is hoped, will emerge from integration cannot be expected for many years to come; or whether railway staffs and railway management compare unfavourably in respect of productivity with what has been achieved in some other sectors of British industry. It is, perhaps, surprising that comments on railway efficiency dealt only on this broad basis of comparison with other industries; the method of organisation of the Commission and the Railway Executive raised from the outset this very problem, yet at no point in the proceedings were the relations between the two bodies submitted to any examination pointed towards efficiency. In this sense, the proceedings were anomalous. The application for increased charges was properly made by the Commission, but the test of its validity would seem to rest much more directly upon the efficiency of the Railway Executive in the exercise of the powers which have been delegated to it by the Commission.

Another argument to which the committee will have to give careful attention is the suggestion made on behalf of the National Coal Board, with the support of the gas and electricity authorities, that coal should bear something less than the full increase which is proposed. It was argued on behalf of the Commission that it would be inappropriate, in the present application, to make any changes in the long-standing relationship between the charges for different classes of freight traffic. That, it was suggested, would be a matter for deep study when the charges scheme was being prepared. It was argued on behalf of these large users of transport that coal-train traffic was highly economic, that it was not easily diverted to other forms of transport (a point not fully conceded on behalf of the Commission) and that higher freight charges on coal might foster the erection of power plants on the coalfields. Recent indications, said a witness for the British Electricity Authority, suggest that it is cheaper at present coal freights to transmit power over a distance of 35 miles. The BEA's average haul is 40 miles from pit to power station. The gas industry produced the suggestion that higher freight charges would encourage the production of water gas by using gas coke. The force of such complaints was indeed a little diluted by the contention on behalf of the Transport Commission that if the railways could get the quality of coal which they used in 1938 at 80 per cent more in price than they then paid, they would save £13½ million—say, half the increase in charges which they are now seeking. No estimate was presented of the further increase which would have to be borne by general merchandise if the increase in coal freight rates were kept below 16⅔ per cent. Indeed, the argument on behalf of the coal, gas and electricity industries was in the nature of a general plea that they should not bear the full increase (without specifying what increase they should bear) in view of the importance of coal in the economy of the country.

No one would attempt to deny that the consequential increases in costs and prices which would be caused if freight charges are increased by one-sixth will be large and unwelcome. For the steel industry (which has had some success in absorbing higher costs in the past, but has yet to experience the full effects of devaluation on the prices of imported iron ore and steel scrap) the extra cost of transport would represent about 10s. per ton on steel ingots. But nothing is to be gained by chicken and egg arguments about which of the basic industries started the sequence of higher costs. All of them have been affected in various ways by the general process of inflation and rising wages which has been proceeding for two decades. Some of them have been more successful than others in sheltering the consumer from the full effect of rising costs—the coal industry least successful, perhaps, while steel, electricity and even the railways have been more successful. To some extent, success in absorbing rising costs depends upon full output and the spreading of overheads. In steel and electricty, this condition still obtains. On the railways, it has become less true each year since 1946.

The argument about railway productivity is thus concerned with the ability of railway management to reduce railway costs and improve efficiency to carry the reduced level of what must now be accepted as normal traffics. It is on this point that the evidence submitted on behalf of the Commission and the Railway Executive leaves room for misgiving. The general line of argument was that no spectacular economies were immediately in prospect; no suggestion of staff economies was admissible; the big economies would have to wait for integration, still some years off; and, as was stated by the Commission's witness with a touch of unguarded complacency, "we are getting very nicely along the road of economy." These attitudes suggest that there is nothing to prevent an annual application for higher charges, if the general level of costs continues to rise. If the Commission and the Executive value their standing with the public, they will take care to correct this impression. They will have to do better than to argue that higher costs are a matter entirely outside their control, that management can do little or nothing towards immediate economies, and that major economies will come in good time. The prospect of nationalised industries engaged in public debate about one another's costs has been an engaging experience for the ordinary consumer who has had to suffer their higher prices without much opportunity for open complaint. But the debate has exposed the fallacy of supposing that all costs are given, and are not susceptible to change. The real problem, which will stretch far beyond the present application, is to secure those real economies in inland transport which were supposedly the justification for nationalising the transport industries. So far, only the first tentative steps have been taken towards merely beginning this task.

Business Notes

Bankers' Plea for Disinflation

The bank chairmen this year certainly merit a particularly careful hearing. All but two of their annual "speeches" have now been issued, and they are full of shrewd advice upon, and searching diagnosis of, Britain's economic difficulties. None of them supposes devaluation to have been any magic prescription, or even an act of statesmanship. As Sir William Goodenough of Barclays Bank remarked, it has offered merely a temporary breathing space and neither it nor the "consequential measures" makes any positive contribution. Its inevitability was merely, in the words of Capt. Eric Smith of the National Provincial, "a belated admission of previous error—and, for an importing country, of very grievous error." Lord Balfour of Burleigh, of Lloyds Bank—who again makes an outstanding contribution to the year's symposium—makes the same point in greater detail. Devaluation, he emphasises, was the result of four years of overspending; it might have been avoided if, when American prices were rising, Britain had curbed the excessive outlays "responsible for over-full employment and the wages spiral to which that gave rise." All the bankers agree that the basic cause of the past financial mismanagement has been the excessive level of expenditure, especially Government expenditure, and all plead now for stern retrenchment as the first essential of national policy. Otherwise, as Lord Balfour forthrightly remarks, "a fresh crisis at no very distant date can hardly be avoided." Like Sir William Goodenough, he doubts whether the ordinary citizen—sheltered by subsidies, by an inflationary wages structure and by secure employment "even in the least essential occupations"—regards the recurrent crises as having any significance for him.

Aggregate bank deposits—of the nine clearing banks whose accounts are so far available—have in 1949 shown only a tiny expansion, in contrast with their rapid growth in every previous year since 1938; but this more reassuring trend has not deceived the bankers into supposing that the inflationary menace has receded. On the contrary, all of them regard an effective disinflation as the prerequisite of any real progress. Lord Balfour remarks that "for all the Chancellor's efforts . . . we have merely enjoyed the unique experience of paying over, in peacetime, 40 per cent. of our income to the tax-gatherers and still failing to halt inflation." Retrenchment is needed not merely to ensure a sufficient disinflation, but also to provide scope for the tax reliefs which are the only means of restoring lost incentive. The bankers question, however, whether the cuts already made or projected will suffice to achieve even the first of these objectives. Mr A. H. Bibby of Martins Bank calls for economies "far in excess" of the planned £250 million, while Lord Balfour says bluntly that disinflation cannot be adequate unless it involves such a curtailment of spending as would bring about a contraction of employment in the industries catering for the home market. Without some moderate transitional unemployment, the bankers forcefully argue, there can be no hope of avoiding intractable mass unemployment in the long run. So long as over-full employment continues, any sufficient redistribution of manpower remains impossible and the menacing wages spiral will persist. The economy is "petrified in the pattern of 1947."

* * *

Duty to Provide Incentives

Nor, despite the heartening expansion achieved in the past year or so, do the bankers see any reason to suppose that increases in production will avert the need for the stern measures which they advocate. Lord Balfour, after noting that the London and Cambridge index of production gives a "less flattering" picture than does the official index, regards the increase in output per head since prewar days as a very poor return on the net capital formation undertaken by private enterprise in the past four years. But, like his colleagues, he does not expect any all-out effort—

> in an environment from which the discipline of dismissal has been largely removed and the positive stimulus of reward deadened by penal taxation. Human nature being what it is, we cannot yet afford to dispense entirely either with the stick or the carrot, and until we have a nation of angels it is the duty of the Government so to handle our affairs that people have a monetary incentive to do the things which are in the national interest and to refrain from doing those that are not.

Few of the bankers venture upon any detailed indication of where they think the main weight of the economy axe should fall, but Sir Walrond Sinclair, the new chairman of Williams Deacon's, mentions capital expenditure first and Government expenditure second. Several of the chairmen emphasise that general retrenchment, so far from being an attack upon the social services, is the means of ensuring that the economy becomes strong enough to sustain them.

Only Lord Balfour makes any really forthright pleas for the use of interest rates as an instrument of control, though passages in several other statements—notably those of Capt. Eric Smith and Sir William Goodenough—point in the same direction. Arguing from the anomaly of the maintenance of differentially low rates for the Public Works Loan Board, Lord Balfour points out that the resultant disproportionately low level of rents is leading to wasteful use of housing accommodation. Neither economic use of resources nor real relief from the crushing tax burden can be expected while the systems of pervasive subsidies continue. Indeed, "our present plight is due in no small measure to this Governmental habit of paying out money to ten people, and getting it back from nine of them, in order to help the odd one who needs helping"—a singularly penetrating and graphic comment.

* * *

Programme for 1950-52

The memorandum submitted by the British Government to the Organisation for European Economic Co-operation on the programme for the next, and last, two Marshall plan years must be read in the light of this governing reservation:

> The figures given in this memorandum should be regarded as illustrative material and not, in any sense, as a forecast. . . . They do not form a programme in any ordinary sense of that term.

Despite this qualification, any essay in probabilities such as is provided in the document (Cmd. 7862) cannot be ignored. Even if orders of magnitudes are forgotten, it shows the general direction in which the ideas of ministers and their advisers are moving. The purpose of the memorandum is to show how Britain intends during the next two years to move towards dollar solvency and to strengthen its reserves and the position of sterling in the world.

The latter objective is restated in unequivocal terms. The Government's intention was to emerge from the ERP period with gold and dollar reserves about equal to the $2,200 million with which that period began. It is reluctantly

admitted that no plans can now be made for the recovery of the reserves from the level of $1,688 million to which they had fallen at the end of 1949. But the objective is none the less to be kept very much in mind:

> A nation which is the centre of a multilateral trading and financial system conducting transactions with the dollar area alone of about $7 billion a year and also providing the currency in which a large part of the world's international trade is carried on necessarily receives the impact of every ripple in the world economy and cannot satisfactorily carry on with reserves of less than $2 billion. Before the war the UK had $10 billion in present day purchasing power and could suffer a large temporary loss of dollars without a crisis.

The general policy through which this approach to dollar solvency is to be achieved is set out under four headings: (1) the devaluation of sterling, (2) anti-inflationary action and income stabilisation, (3) growth of productivity, and (4) freeing trade over the widest possible area. Illustrative figures have been prepared of the progress which the United Kingdom hopes to make towards the objective of dollar solvency in the next two years. These figures are themselves based on four assumptions: that ERP aid to the amount of $720 million is received by Britain in 1950-51 and of $480 million in 1951-52; that American industrial production and gross national product remain throughout at the level maintained in the second half of 1949; that dollar prices remain at the October, 1949, level; that there is no general inflation in the non-dollar world. On these "favourable" assumptions, the British dollar accounts for the current and the next two Marshall plan years might work out as follows:

UNITED KINGDOM DOLLAR ACCOUNTS

Millions of $

	1949–50	1950–51	1951–52
United Kingdom :—			
Imports	— 1,389	— 1,180	— 1,040
Exports and re-exports	603	720	830
Net invisibles	— 95	— 80	— 150
United Kingdom current account	— 881	— 540	— 360
Rest of Sterling Area	— 63	60	180
Capital transactions and third country payments	— 295	— 270	— 300
Canadian credit	111	50	—
Drawing on reserves	22	— 20	—
E.R.P. Aid	1,106	720	480

The table suggests a small drawing on reserves during the current year, to be regained next year, and a roughly balanced position—given $480 million of ERP aid—in the last Marshall aid year. There is no sign here of the rebuilding of the gold and dollar reserves set out as one of the main objectives of policy.

* * *

Invisibles and Dollar Imports

One of the more striking movements brought out by the table above is the increase in the net deficit at which the invisible items will be running in 1951-52. This, in the main, is due to the fact that at the end of 1951 the time will have arrived to make the first payment of both capital and interest (subject to any relief which may be afforded by the waiver clause) on the United States and Canadian lines of credit. Altogether, these items will cost $174 million a year and the reminder of this unpleasant reality is one of the ruder shocks administered by the White Paper. It goes out of its way to point out that the interest alone on the two lines of credit will be substantially more than the whole of the prospective dollar receipts from tourism. It will also be seen from the table that the main relief to the dollar situation is expected to come, first, from a further reduction in dollar imports into Britain and, secondly, by increased net earnings of dollars by the rest of the sterling area. The expected trend of dollar imports for some of the more important commodities is shown in the following table:

TREND OF DOLLAR IMPORTS

Millions of $ (f.o.b. values)

	1948–49	1949–50	1950–51	1951–52
Bread grains	356·1	331·0	261·6	226·0
Sugar	79·6	106·8	67·3	51·6
All other foods and agricultural products	144·6	96·1	46·1	36·1
Tobacco	46·8	93·5	68·6	68·6
Chemicals	43·6	44·9	38·3	38·3
Crude oil	20·2	20·7	20·2	44·0
Petroleum products	144·0	112·8	104·6	71·7
Steel-making materials	16·9	14·8	9·5	6·3
Steel	13·3	19·7	20·7	3·0
Copper	53·2	34·0	32·0	34·6
Zinc	31·7	19·0	18·6	17·5
All other non-ferrous metals	144·0	116·4	116·8	112·0
Raw cotton	128·0	98·7	118·6	113·6
Other textile materials and products	22·0	7·9	7·8	7·8
Timber	69·4	59·8	53·0	40·5
Pulp and paper	43·1	22·2	13·2	13·2
All other raw materials	36·1	35·7	37·1	37·1
Equipment	134·0	131·2	125·0	100·0
Other manufactures	18·0	23·9	20·7	17·7
TOTAL	1,544·6	1,389·1	1,179·7	1,039·6

The exports of the rest of the sterling area to North America are expected to provide the major positive factor in the attack on the dollar gap. These have always been vulnerable to changes in American industrial activity, as events during 1949 abundantly showed. Everything, however, is being done to encourage such exports as those of cocoa, tin, rubber, jute, wool and tea to the dollar markets, and it is assumed that receipts from the United States stockpiling will continue up to the end of the year 1951-52.

Industry and Wages

Coal in 1950

The National Coal Board is not committing itself to any over-generous expansion of coal output this year. Lord Hyndley, the chairman, said on Thursday that, while "the sky is the limit," a realistic forecast would be 205 to 210 million tons for the year. This figure—which concerns deep-mined output only—is not an impressive increase over the target stated in last year's *Economic Survey*. But it compares better with the actual deep-mined output (202,700,000 tons) achieved last year. If a presumptive 13 million tons of opencast coal is added, the total coal output suggested for this year is 218 to 223 million tons. This fits in with the figure of 221 million tons given by Mr Joseph Latham (Director-General of Finance of the National Coal Board) in his evidence submitted to the Transport Tribunal. Mr Latham also mentioned a figure of 226 million tons for total saleable output (which would include opencast coal) in 1951. He made the qualification that any forecast for 1951 can only, at this stage, be conditional.

The figure of 205 to 210 million tons can be taken, however, to represent the Coal Board's considered programme for this year. It is not an extravagant figure, but is none the worse for that. The assumptions about manpower on which it is based are not altogether firm; in particular, the present high level of absenteeism can hardly be accepted with complacency. But Lord Hyndley said on Thursday that the forecast of output presupposed an average output per man-shift at the face of between 3.12 and 3.19 tons, and the higher of these two figures assumes an increase in productivity as the reorganisation of the collieries takes effect. The forecast does not—for once—assume any enlargement of the labour force. Lord Hyndley said that the Board would "probably finish the year with about 700,000 men on the books"; the present figure is 709,000. There seems to be no great agitation over the decline in mining manpower which happened in 1949; the emphasis is now on higher production from a labour force not much larger than 700,000 workers.

STABILITY IN CHANGING CONDITIONS

A customer of the Three Banks Group has the comforting knowledge that however rapidly trade conditions may change either at home or overseas, he has at his disposal the combined skill and wide experience of a Group in touch with financial and business interest in all parts of the world, and the benefits of a Banking Service that is adaptable, individual and complete in every detail.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London & Branches

GLYN, MILLS & CO.
Founded 1753 London

WILLIAMS DEACON'S BANK LTD.
Founded 1771 Manchester, London & Branches

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners – there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

The Chartered Bank of India, Australia and China

(Incorporated by Royal Charter in 1853)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2.

Manchester Branch: 52 Mosley Street, Manchester, 2. Liverpool Branch: 27 Derby House, Exchange Buildings, Rumford Street, Liverpool, 2. West-End (London) Branch: 28 Charles II Street, London, S.W.1. New York Agency: 65 Broadway, New York.

The Bank's branch system, under British management directed from London, serves

INDIA · PAKISTAN · CEYLON · BURMA · SINGAPORE AND FEDERATION OF MALAYA · NORTH BORNEO AND SARAWAK · INDONESIA · FRENCH INDO-CHINA THAILAND · THE PHILIPPINE REPUBLIC · HONGKONG · CHINA · JAPAN

How is the 1950 output to be distributed? The export target "to which we are at present working" is more than 22 million tons (an increase of some 3,000,000 tons over last year), and 5,000,000 tons of this will be taken by bunkers. This allows for a home consumption of between 196 and 201 million tons, as compared with 195.1 million in 1949, 192.7 million in 1948, and 177.8 million in 1938. Is home consumption of coal to settle permanently at a level 20 million tons higher than before the war?

* * *

Film Trade Uncertainties

Two film trade associations have published their comments, made at the request of the President of the Board of Trade, on the recommendations of the Plant Committee. While it goes without saying that the trade is glad of support in its campaign for a reduction of Entertainments Tax, there is no sign that the employers view with anything but horror the committee's other proposals designed to introduce competition into the film distributing system. In the opinion of the Cinematograph Exhibitors' Association, the idea that any cinema with a suitable earning capacity should be enabled to bid for any film would lead to chaos: "They would bid for the good films. None would bid for poor films." Exhibitors would be hampered by uncertainty about the films they would be able to book; and "the possibilities of evasion would probably be sufficient to defeat the proposals."

Pre-releases in the "key" provincial towns (which used to be customary) are dismissed as "unworkable." The idea that circuits should be deprived of a monopoly, in districts where they happen to hold one, by the forced sale of some cinemas, is opposed also; the association points out that the "independent" exhibitors thus created might use their independence to show fewer British films.

Perhaps the strongest opposition, however, is reserved for the committee's proposal that a new body of independent persons should be set up to administer the changes and control certain features of the trade. Another body, the Kinematograph Renters' Society, sees in this proposal the road to dictatorship:

> The creation of the proposed body—responsible solely to the President of the Board of Trade—would give the President a degree of authority over the film industry that far transcends anything sanctioned by existing law or by established commercial practice.

Indeed, so strongly does it feel that it proposes, until this scheme is dropped, to withhold any support of the committee's other proposals. The producers' association has not yet published its comments, but plain indications have been given that these will be, on some points at least, "pretty strong."

The work of the Plant Committee is only one of the matters of policy concerning the film trade which must now remain in suspense until after the election. The National Film Finance Corporation was expected to have exhausted its lending powers (which were limited to £5,000,000) by about this time, and it is generally supposed that this point has now been reached; the corporation has to wait, therefore, until some money comes back, or ask for extended powers. For the present it can only wait. The quota for British films for the year beginning next October has to be fixed by the President of the Board of Trade by April 1st, and the Films Council has first of all to make its recommendation; but this will clearly have to wait until the identity of the President on April 1st is a little more certain. The talks with the American industry on the renewal of the Anglo-American film agreement will, it is known, have some awkward and controversial ground to cover; these too have been deferred, with the consent of both sides, until after the general election.

Rayon Production Record

Rayon output, which has risen steadily during the year, reached its highest monthly figure in November, when a total of 27.8 million lb. was produced. This is 17 per cent higher than the average for the first eleven months of the year and seven per cent higher than production in October. The accompanying table shows a slight decline during October, but that was due to temporary dislocation while new plant for rayon staple production was being installed. Total output for the eleven months to November was 261.9 million lb.; this is 28 million lb. more than production for the whole of 1948 and if December output does no more than equal the monthly average for 1949, the 1948 total should be exceeded by more than 50 million lb.

The staple fibre section of the industry has now more or less achieved its planned capacity of 150 million lb. a year. The industry anticipates that by 1952 combined production of staple and continuous filament will have reached 400 million lb. a year. A considerable amount of continuous filament plant (of the order, presumably, of 50 to 60 million lb. of capacity) remains to be installed before the 1952 estimate of total production can be realised.

November	15·6	12·2	27·8	1·52

* Including other synthetic fibres.

Exports fell slightly from April onwards; their decline is only partly explained by an increase in the amount of rayon piece goods exported. World exports of rayon fell off generally as supplies began to be easier, and consumers who had previously bought whenever they could, found that their stocks were too high. Rumours of devaluation also encouraged buyers to delay their orders as long as possible. These orders have been coming in at an increasing rate since devaluation. The demand for British rayon yarn and fibre is still considerably more than the available supplies can meet; the industry has been able to increase its supplies to home consumers only by bringing new plant into operation. Figures of staple consumption are not available. The home weaving industry took 45 per cent of the total of continuous filament yarn produced. Between 16 and 17 per cent went to "industrial consumers," and 12 to 15 per cent was exported. Hosiery manufacturers took between 8 and 10 per cent, warp knitters 9 to 10 per cent, narrow fabrics 3 per cent, and lace makers 1½ to 2 per cent.

* * *

New Cement Plants in 1950

Cement output in 1949 totalled 9,287,000 tons, nearly 9 per cent higher than in 1948. Exports were also higher, 1,858,000 tons were sent abroad compared with 1,628,000 in the preceding year, but still fell considerably short of the demand. The rise in output was obtained only by bringing back into operation plant which by customary engineering standards was long past its useful life.

In 1950 the cement industry will bring into operation the first new capacity to be installed since the war. A

plant in north Wales belonging to the Tunnel Portland Cement Company is about to start work. Associated British Portland Cement Ltd. expects a new plant at Shoreham to be working by July and extensions installed by the Rugby Portland Cement Company at its plant at Rochester should be ready in the spring. In addition, Associated British Portland Cement is bringing another old kiln back into operation. These together are expected to produce another 300,000 to 400,000 tons a year. When the demand for cement shows signs of slackening, manufacturers will reduce capacity by closing down again some of the oldest works. But the industry does not expect this to happen in 1950, or perhaps in 1951 either. If, therefore—as seems likely—virtually all the plant at present working stays in operation through 1950, the output for the year should not be less than 9½ million tons.

* * *

Motor Trade Competition in Brussels

The Brussels Motor Show is proving to be the nearest thing to a completely free market which the motor industry has experienced since the war. Arrears of demand in Belgium have been met, money is less plentiful, and car sales are made on a highly competitive basis. 'Devaluation altered the rate of exchange from 176 to 140 Belgian francs to the pound, and from 43.83 to 50 francs to the dollar. It made American cars considerably dearer in Belgium than those of any other exporting country although American manufacturers take advantage of the Belgian tariff provision which imposes a duty of only 9 per cent *ad valorem* on cars imported for assembly in Belgium, as against 24 per cent on the import of assembled cars.

Visitors say that changes in models make it difficult to compare current prices with those of models shown a year ago, but the price of the Chevrolet Styleline Sedan, which is assembled in Belgium, was previously Frs.109,500 and is now Frs.119,500. The prices of cars from all other countries show reductions. Among British cars, the Morris Minor has been reduced from Frs.69,800 to Frs.61,700 and the Hillman Minx from Frs.85,000 to Frs.69,000. Prices of the French Citroen and the Italian 500 c.c. Fiat have fallen from Frs.87,500 and Frs.58,000 respectively to Frs.79,850 and Frs.52,300. Czechoslovak cars are appearing in increasing numbers, and the 1,089 c.c. Skoda has come down from Frs.75,900 to Frs.63,500. There are also more German cars. The prices of German commercial vehicles are far higher than those of other manufacturers, but their car prices are competitive in spite of some criticism of finish. The General Motors subsidiary, Opel, is showing the Olympia, a very rough equivalent of the British Ford 10, priced at Frs.61,500. The larger Opel Kapitän is priced at Frs.80,000. Hansa has one model at Frs.95,000 and BMW three, at prices ranging from Frs.95,000 to Frs.135,000. The British Ford 8 is Frs.52,500; the Volkswagen is Frs.52,900.

Builders Reject the Standstill

The National Joint Industrial Council of the building industry has decided to continue its cost of living sliding scale arrangement. This, in spite of Government and TUC policy, was no surprise. The sliding scale has been in operation for thirty years and (as the unions' representatives pointed out at the TUC conference of executives last week) it differs from the practice in other industries in that it is on an annual and not a monthly basis. The bulk of the rise in the cost of living, they contended, occurred before and not after devaluation and was therefore outside the scope of the TUC recommendation. Moreover, the fact that the agreement just concluded by the National Joint Industrial Council stipulates that no other wage claim can be entertained until February, 1951, makes the builders feel a moral justification for their action.

Under the agreement, nearly a million operatives will receive an extra ½d. an hour, or 1s. 10d. a week, from February 6th. This, it is estimated, will cost the industry about £4,500,000 a year. In addition, building labourers, who are about half of the total labour force, will receive an additional ½d. an hour. This is the second instalment of an increase by stages, agreed upon last year, which will eventually bring labourers' wages within 5½d. an hour of craftsmen's wages. The third and last stage will be in July. These increases in wages serve to emphasise the need for pressing on with plans to raise productivity and reduce costs in other directions, by more efficient site lay-out and organisation, the introduction of more mechanical handling and the extension of incentive schemes. The report of the building industry's working party, due next month, may make some contribution towards improving efficiency in this trade where improvement is overdue. The building industry tends to be conservative on both sides. It was slow in adopting systems of payment by results, although progress has recently been made in introducing such systems in housing and general construction. There is no doubt that these have helped to keep costs stable. But they have not gone very far, as yet, in producing the much-needed improvement in productivity in the building industry.

Binding Cases

Binding cases for THE ECONOMIST *and* RECORDS & STATISTICS *can now be supplied. These new cases, made by Messrs.* EASIBIND LTD., *are in stiff, dark blue cloth covers, and are gilt-lettered on the spine. The cases are of a new design and provide an extremely effective and firm binding.*

The case for THE ECONOMIST *will hold 26 issues and the half-yearly Index; that for* RECORDS & STATISTICS *will hold 52 issues. The year can be stamped on the spine.*

The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, **not** *to* THE ECONOMIST, *but to—*

EASIBIND Ltd.,

(Dept. E), Pilot House, Mallow St., E.C.1.

A binding case can be sent on approval, if required.

Commonwealth Sugar Talks Adjourned

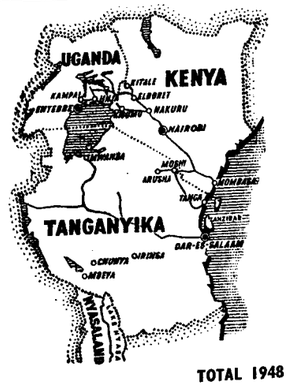
The Commonwealth sugar talks, which were adjourned in London last week-end, succeeded at least in one respect—in confusing the observer. Even the belated communique issued by the Ministry of Food on Monday evening did little to clarify the story. The British consumer might have supposed that the Ministry's policy aimed at a deliberate restriction of Commonwealth sugar production, at a time when it is buying sugar for dollars from Cuba.

But the situation is not quite so nonsensical. The Ministry of Food has long-term contracts in force with all Commonwealth sugar producers, to take their exportable surpluses until 1952. The recent talks were concerned with the subsequent five years—until 1957. Agreement (subject to certain reservations) was reached with the two Dominions represented, Australia and South Africa, for this period. Britain has guaranteed a market for 300,000 tons of sugar a year from Australia and 150,000 tons from South Africa;

COMMONWEALTH EXPORTS OF SUGAR UNDER THE BRITISH PROPOSAL
('000 Tons)

Year	B. W. Indies and Mauritius	Australia	South Africa
Pre-war average	960	400	193
1949	1,200	400	20
1952	1,400	....	....
1957	1,550	600	200

prices are to be determined annually. In addition Britain offered to find outlets for a further 300,000 tons of Australian sugar and 50,000 tons of South African sugar each year. Before the war, Australian exports amounted to 400,000 tons annually and South African to 200,000 tons.



The Colonies were offered a guaranteed market in Britain of 1,100,000 tons a year and a further offer was made to find additional outlets for 450,000 tons. Again, prices were to be agreed annually. These proposals would have given the British West Indies and Mauritius total exports of 1,550,000 tons to Britain compared with prewar export of 960,000 tons. The offers, however, were not accepted. The colonial producers sought a guaranteed market for more than 1,550,000 tons and they also demanded a fixed price covering the whole period. They claimed that the sugar industry was vital to the welfare of the Colonies and that the price for their produce should be sufficiently high to ensure long-term stability. On the other hand, the Ministry argued—and rightly—that the price should be determined by commercial considerations and that any subvention which might be necessary for social or political reasons should be paid direct by the Colonial Office from tax revenues and not from higher prices charged to the consumer.

International Complications in Sugar

There are two particular complications in the world sugar market. First, from 1950 onwards Canadian sugar-refiners are to buy their own supplies and, it must be expected, in the cheapest market. Hitherto, the Ministry of Food had purchased sugar on behalf of Canada. Britain has also been responsible for supplying New Zealand, Ceylon and certain sugar importing colonies. This latter arrangement is to terminate in 1952. Thereafter, Britain will be prepared to guarantee Commonwealth producers only a share in its domestic market. The additional outlets it has offered to find would be sought in other Commonwealth countries where preferential import duties are in force for Empire sugar. These tariff preferences give Commonwealth producers a considerable advantage over foreign sugar. But—and this is the second complication—Cuba and other dollar sugar producers enjoy a highly protected market in the United States so that they are capable of selling their surplus exports at prices which could easily undercut those of the Commonwealth producers, even given the advantage of imperial preference. Britain and most of the participants in the prewar sugar agreement have undertaken to reintroduce an international marketing scheme "when the time

BRITISH IMPORTS OF UNREFINED SUGAR

is ripe." Cuba, however, would only be party to it if it is allotted a share in the British market, and without Cuba, the world's largest exporter, such an agreement could hardly operate.

Britain has therefore suggested that Commonwealth production should not be expanded to the point at which the entire British requirements are covered by preferential supplies. It is clearly wrong to infer from this surely sensible attitude that Britain is deliberately restricting colonial output to help foreign producers, or even to help dominion producers. The offers made by Britain contemplate an increase of 52 per cent above their prewar level, and of 50 per cent in Australian exports, and a sufficient increase in South African exports to restore the prewar quantity. From 1953 onwards, the proposals would have meant that Britain would be taking double its prewar quantity of colonial sugar while imports of foreign sugar would fall to one-third of their prewar level. Tempers are strained and spokesmen for the British West Indies have not minced their words. But they are not last words for talks with the colonial producers are expected to be resumed in March.

Freeing the Food Trades

The report of the Select Committee on Estimates* dealing with the Ministry of Food coincided with the publication of the Labour Party's election manifesto. The differences of attitude are striking, despite the fact that the composition of the Select Committee broadly conforms with the strengths of the parties in the House of Commons. The whole drift of the Select Committee's report is in favour of restoring the trade in food to normal commerce. The Committee holds that the present system of handling and distributing meat should be overhauled and that opportunity should be given for freer consumer's choice and for the skill of the butcher in buying. Again, the Committee was "impressed" with the evidence in favour of reopening the London and Liverpool grain markets, even despite the currency problems which would make such a step difficult. The report favours the early reopening of the London tea market, and would expect administrative economies to result. The same conclusion was reached after its investigation of the Ministry's handling of cocoa.

These recommendations are by no means startling; but the fact that they have been put forward with the authority of a Select Committee is important. They postulate drastic changes in the existing policies of the Government for procuring the country's food supplies. The Labour Party manifesto makes exactly the opposite points. Far from urging any reduction of Government control over the food trades, the manifesto demands that the present system should be made permanent. Its reference to meat is particularly interesting, in the light of the criticisms made by the Select Committee. It states that since the Ministry of Food took over the importing and wholesaling of meat ten years ago, "the job has been done efficiently and economically" and that the present system of distribution should become a permanent public service. By contrast, the Select Committee holds that "there is room for economy" in the Government handling of meat and that "the present machinery of procurement and distribution should be overhauled."

More Natural Rubber for America?

President Truman presented to Congress early this week his long-term plan for the control of the American synthetic rubber industry. The compromise Bill which was hurriedly passed by Congress last March is due to expire on June 30th. The President has, therefore, recommended legislation to cover the next ten years. The total synthetic production capacity to be maintained will be equivalent to an output of a million tons a year. But most of the plants will be kept in stand-by condition. Authorisation is sought to enable the President to dispose of certain synthetic rubber plants to private owners. At present the plants in operation are owned by the American Government but run by private firms as the Government's agents.

The vital factor in this programme, so far as natural rubber is concerned, is the minimum consumption of general purpose synthetic rubber (GR-S) which the American rubber industry will be required to absorb. The President thought that this minimum level should be at least a quarter of the combined annual consumption of natural rubber and GR-S and not less than 200,000 tons a year. The latter is the theoretical minimum enforced by the present Rubber Control Act, though actual consumption of GR-S last year, aided partially by the administration of the R.1. regulation, was over 400,000 tons. R.1. defines the minimum proportions of GR-S which American manufacturers must use in tyres and inner tubes. An adjustment to this regulation was made last September after the Washington tripartite talks, when it was agreed "to open to natural rubber a substantial additional area of competition in the United States." It resulted in a cut equivalent to 25 per cent in the minimum quantity of GR-S used. In practice, however, there was no corresponding reduction in actual synthetic rubber consumption, although natural rubber was selling at between a fraction of a cent and 2 cents a lb. cheaper than GR-S.

The extent to which the natural rubber market might be helped by the proposed legislation depends firstly on how the new law (when passed) is administered and secondly on the competitive strength of GR-S, when production is in private hands and when the system of pooling patents no longer obtains. If the minimum consumption of GR-S is to apply only to tyres and inner tubes and not to the whole range of rubber products, less rather than more natural rubber might be consumed. If, for example, the new proposed minimum of GR-S consumption were applied in 1949 it would have amounted to about 225,000 tons compared with the minimum of 200,000 tons which was in force. If, of course, actual consumption of GR-S could be brought down to this level, the consumption of natural rubber would expand by nearly 200,000 tons a year on last year's figures. But at least President Truman was aware, in his message to Congress, of the importance of natural rubber as a dollar earner for the sterling area. And from these remarks it might be inferred that the President would do much, within the prescribed legislation, to promote the consumption of natural rubber in the United States.

Trade Talks with Europe

The New Year season of financial negotiations is now in full swing. Apart from the talks on sterling balances with Egypt and Israel (discussed in a Note in last week's issue) and similar talks with Iraq (which are reported to be the next assignment on the agenda of the British team of negotiators now in Cairo) most of the discussions now in progress or in immediate prospect are with European countries. Some of these are concerned not with the mechanism of payments, but with the programme of mutual trade. The coming talks with the Netherlands and those now taking place with Austria (with which Britain has not had a trade agreement before) fall into this category. So, apparently, do the "technical" talks with Danish trade representatives in London; under the present trade agreement Denmark is paying post-devaluation prices for its imports of British coal but still receiving pre-devaluation prices for its butter, bacon and eggs—an anachronism which will now almost certainly have to be adjusted to Britain's cost.

Deafness . . .

and the retired person

Retirement following a full working life brings the prospect of long promised pleasures with leisure to enjoy them.

Yet such a prospect can be only partly realised if retirement is marred by increasing deafness, restricting social activity, and cutting you off from friends and loved ones.

The ability to enjoy retirement to the full is available with the help of BONOCHORD, a new, improved hearing aid, developed after years of experience in dealing with the problems of deafness.

If deafness is YOUR problem, you should know that this modern aid has brought better hearing in 85% of cases, under medical supervision. Why not let us try to help you? There is no obligation.

NATIONAL INSTITUTE FOR THE BLIND
(Registered under the National Assistance Act, 1948)
224 Great Portland Street, London, W.1

The more important of the present talks are, however, chiefly the Treasury's responsibility. All these discussions threaten to encounter the same problem: most European countries which are now running an export surplus with the sterling area are understandably inclined to strain at the present limits of the convertibility leash. Britain's potential Ukiscan partners, now gathered in London, plainly believe, for example, that the terms of any regional project should allow them to use their sterling accumulations for purchases from countries outside the inner ring of the transferable account system (including Germany, Argentina and Brazil). Similarly, the Swiss Government, whose negotiators are now also in London, has some reason to feel aggrieved at the workings of the present Anglo-Swiss financial agreement, which expires on March 11th. Under this agreement the Swiss agreed to hold sterling up to a gold point of £15 million (without any revaluation guarantee), and their holdings seem to have been nearing this mark on the eve of devaluation. Since then the serious decline in British tourist expenditure in Switzerland (holidays in Switzerland are prohibitively expensive at the new exchange rate) has brought about a rising Swiss deficit on current account with the sterling area. This deficit has been given unwanted publicity in Switzerland of late and it seems likely that the Swiss will ask for a loosening of British import and payments restrictions if the terms of the present financial agreement are to be renewed. It is reported that the Germans, talks with whom may closely follow those with the Swiss, will have similar proposals to air.

One other piece of news on financial negotiations has been released this week. Protracted discussions with Poland on compensation for formerly British-owned nationalised property and for servicing of Poland's pre-war debt have now broken down; the Poles would discuss only their own offer, which was pitched absurdly low. The present Anglo-Polish trade agreement does not provide for any sanctions which can be applied in the case of such a breakdown; creditors in this country can therefore draw only limited satisfaction from the fact that in the long term Poland, alone among the Iron Curtain countries, has an economy which can keep running only on the basis of extended trade with the west.

* * *

Exporting for Dollars

The recovery in British exports to the United States and Canada since devaluation has been encouraging but by no means startling. The detailed trade figures for December were due to be published as this issue went to press. Preliminary figures show that the dollar value of British exports to the United States declined slightly in December; in contrast, exports to Canada increased slightly. By the end of 1949, Britain's dollar earning capacity in these two markets had not regained the high level attained in the first quarter and was, in fact, 10 per cent lower than the average for 1948. The recovery in the Canadian market, however, looks more promising than in the United States. The trend for the past two months has been upwards, although in December the total of Canadian dollars earned was still less than in the first nine months of the year. The improvement in the American market was already noticeable in the third quarter of 1949 (that is, prior to devaluation) and the number of American dollars earned in both November and December was higher than in any period except the first quarter of 1949.

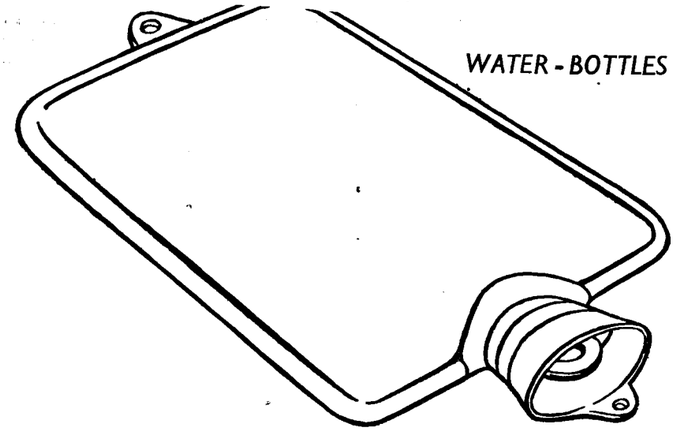
Wholesale Prices since Devaluation

Devaluation had little further effect on the level of wholesale prices in December. The Board of Trade index rose almost imperceptibly—by less than one-half of one per cent—making the total rise since August 5 per cent. This increase masks the full effect of devaluation, since domestic prices have been less affected than import prices. The three main categories (basic materials, intermediate products and manufactured articles) reflect this point.



In December, the index for basic materials rose by 1.8 per cent (10 per cent since August), intermediate goods by 0.8 per cent (5 per cent) and end products by 0.2 per cent (2 per cent). Raw materials have, therefore, shown the largest increase, and their higher cost will inevitably have its effect on the prices of the other two main categories later on.

Cereals is the only item in the food and tobacco group which has shown any major rise since August. Other food prices have followed their usual seasonal fluctuations—in December apples and tomatoes were cheaper while potatoes and onions were dearer—which have tended to cancel each other out. Among industrial materials the wholesale price index for coal and iron and steel has remained unchanged since devaluation and that for miscellaneous goods has fallen. The main increases occurred in non-ferrous metals (27 per cent), wool (23 per cent), cotton (14 per cent), other textiles (10 per cent) and chemicals and oils (5 per cent). Of these five items, non-ferrous metals was the only one to show a fall in December, chiefly owing to the lower price of tin on the London tin market.

The general picture seems at first sight reassuring. But a rise of 10 per cent in raw material prices in the first three months after devaluation indicates the general rise in costs which manufacturers must face in the first half of 1950. And there is as yet no obvious sign of any downward trend in the world commodity markets.

WATER-BOTTLES AND WATER TOWERS NEED US

We make the lithopone that makes your rubber hot water bottle tough but supple, and makes it possible to tint the rubber any bright colour you like (for lithophone is the snow-white basis for brilliant colours).

We make the zinc that makes the water tank rustproof by 'galvanizing' or zinc spraying—in other words covering it with a lasting anti-corrosive zinc coating.

Those are two of the ways in which we help to make the world go round. In fact there's hardly anything you use to which we haven't somehow, at some point contributed!

IMPERIAL SMELTING

WE MAKE ZINC, ZINC ALLOY, ZINC PIGMENTS, ZINC DUST, HIGH PURITY ZINC AND CADMIUM SULPHIDES, CADMIUM, SULPHURIC ACID, METALLIC ARSENIC, VANADIUM CATALYST, FUNGICIDES AND FLUORIDES.

IMPERIAL SMELTING CORPORATION [SALES] LIMITED 37 DOVER STREET LONDON W1

SAME ACCURACY—LESS TIME

Instrument cams moulded to eliminate machining

A better job because of BAKELITE

A large number of instrument cams was required quickly. They needed to be accurate and tough, but production time had to be cut. Moulding in Bakelite materials proved much quicker and no less accurate. Just one case of many where engineering problems have been solved by moulding. Perhaps you have a particularly tricky machining job—some component that costs too many man-hours. Bakelite moulding materials offer dimensional accuracy, good finish, durability and speed of production. Why not write to us to see whether we can help? Or ring SLOane 9911.

ECONOMIC INDEPENDENCE RETARDED

LORD BALFOUR OF BURLEIGH'S STATEMENT

The annual general meeting of Lloyds Bank Limited will be held at the head office, 71, Lombard Street, London, E.C., on February 10th.

The following is the statement by the chairman, The Rt. Hon. Lord Balfour of Burleigh, D.C.L., D.L., accompanying the report of the directors and balance sheet for the year ended December 31, 1949:—

My lords, ladies and gentlemen, one or two personal matters claim attention at the outset of my annual statement to shareholders. Sir Alexander Murray and Mr R. C. Chapple Gill have decided, owing to advancing years, not to offer themselves for re-election as directors. Appointed to the board so long ago as 1929 and 1924, respectively, these gentlemen, each prominent in an important sphere, have rendered most valuable service to the bank, and all shareholders will join with me in an expression of thanks and good wishes. Mr Chapple Gill will continue to serve as a member of our Liverpool committee. Mr George Legh-Jones and Mr Kenneth S. Peacock have been elected as directors.

During the year we have set up a new committee, to be known as the Pall Mall Committee. The first members are General Lord Ismay and Major-General Robert Laycock, with Mr Harald Peake as chairman. I feel sure that all connected with "Cox's and King's" will welcome the appointment to the committee of these distinguished representatives of the Services.

Mr Guy Bown, O.B.E., has been appointed a member of the South Wales Committee, and Mr D. M. Petherick, formerly our manager at Exeter, a member of the Devon and Cornwall committee. I record with regret the death of Mr G. A. Harvey, who had been a member of the Capital and Counties Committee since its inception in 1918 and was a director of the bank from that time until 1939.

During 1949 Mr W. B. Mayles, a joint general manager, retired, and Mr F. O. Faull has been appointed in his place. I record the retirement of Mr F. S. Tull, a good friend of the bank, who represented our auditors, Messrs Price, Waterhouse and Company, for sixteen years.

On November 11th was dedicated at a simple service conducted by Prebendary Holland the addition to our War Memorial which commemorates the names of those members of the bank staff who gave their lives in the Second World War.

As stated in the notice of the annual general meeting, shareholders will be asked to approve new Articles of Association.

BALANCE SHEET

Turning now to our profit and loss account and to the balance sheet, our profit at £1,709,276 is £34,947 higher than last year. Although there has been some increase in our resources and a large expansion in our advances, staff costs and running expenses continue to rise.

On the liabilities side of our balance sheet the current, deposit and other accounts at £1,132 million show an increase of £9,000,000, which is the smallest increase we have experienced for many years.

There are several outstanding changes on the assets side of our balance sheet. Money at call has increased by £22 million, British Government Treasury bills by £60 million and there has been a welcome fall of £113 million in our holding of Treasury deposit receipts.

EXPANSION OF ADVANCES

Our advances which now stand at £271 million show a substantial increase of £45 million, but the ratio of our lending to deposits is no more than 24 per cent. That our advances would expand was anticipated in view of the large increase in prices and the heavy incidence of taxation borne by the business community. These factors made it necessary for customers to seek additional working capital for the purpose of carrying normal stocks and granting normal credit to their debtors, quite apart from any expansion in their business.

While the market for new equity capital is virtually non-existent, it seems evident that the banks will be called upon to assist their customers, in order that the industry of the country may be able to obtain the necessary finance required to carry on its business.

An appreciable portion of the increase in our advances is reflected in increased lending to farmers, as we feel that our agricultural industry, which is vital to the well-being of the community, must receive our fullest co-operation.

We have been most careful in carrying out the wishes of H.M. Treasury and have refrained from making advances which would, in present circumstances, have detrimental effects on the general economic position of the country.

INDIA, PAKISTAN AND BURMA

It is pleasing to record that our business in India and Pakistan continues to progress most satisfactorily. Owing to present exchange difficulties between the two countries, there is for the moment stagnation in mutual trading, but it is hoped that this problem will be resolved in the near future.

The conditions in Burma are still very unsettled, but we are maintaining our business in Rangoon on a much reduced basis.

I would like to record my warm appreciation of the high standard maintained by our officials and staff in the Eastern branches.

THE POUND DEVALUED

The most important change in our economic position during the past twelve months has, of course, been the devaluation of sterling last September. Seen in retrospect this was only the latest in the series of crises which make up the history of the past four years. The ordinary citizen, sheltered by mounting subsidies, by an inflationary wages spiral and by secure employment even in the least essential occupations, may find it difficult to believe that such crises have any significance for him. But it is the very fact that he has never been called upon to face up to the realities of our national situation which has made each successive crisis inevitable. In the circumstances it is not surprising if avowals from whatever quarter of the gravity of the situation are received with indifference.

For the most part, this blissful unawareness of the true state of affairs has been made possible by American and Canadian help. From the beginning of 1947 to September, 1949, the gold and dollar deficit of the whole sterling area amounted to some $7,325 million. Towards meeting that deficit we received some $5,350 million in the form of American and Canadian credits and Marshall Aid, and a further $725 million from drawings on the International Monetary Fund and the gold loan from South Africa. For the rest, the strain was taken by our gold and exchange reserves. By the eve of devaluation these had declined, since the beginning of 1947, by some $1,350 million to a level about one-third lower than that which the Chancellor had earlier indicated as the "danger point." Thus, in thirty-three months we ran through dollar loans, grants and reserves for the equivalent of over £1,800 million at the old, or £2,600 million at the new, dollar rate. The United Kingdom was responsible for about two-thirds of this drain.

A REASSURING POINT

The loss of gold and dollar reserves has not been continuous. It is reassuring that there has been, as one would expect, a moderate reflux since the devaluation. There was a previous lull during the latter part of 1948 and the early months of 1949—significantly, the only period when this country had any real disinflation. In the spring there came a very modest recession in the United States with a tapering off of the world-wide sellers' market, and our exports began to decline. Though American imports from the rest of the world were well maintained, purchases from the sterling area fell away sharply, obviously in the belief that the long-awaited adjustments of exchange rates could not much longer be deferred. The result was a fresh drain on our exchange reserves which culminated in the decision to devalue.

Given the then existing situation, devaluation was no doubt the only course. Nobody now expects any government to support its currency by severe deflation involving the creation of mass unemployment, but that renders it all the more imperative to avoid inflationary courses which ultimately leave no choice but to devalue the currency. If we had been forced to devalue in spite of sound financial policies there could be no ground for criticism. But that was not the case. Devaluation was the result of four years of over-spending that could be seen to endanger the external, as well as the internal stability of the pound. It might have been avoided if during the years when American prices were rising we had curbed the excessive spending responsible for over-full employment and the wages spiral to which that necessarily gave rise.

INFLATION STILL THE DANGER

To devalue in an unhealthy situation, moreover, enormously increases the difficulty and danger of the operation, since—in the absence of exceptionally firm counter-measures—devaluation itself must aggravate any inflationary pressures which are already present. Of such pressures there is clear evidence in the persistence of over-full employment. Not only increased imports and domestic production, but also the resources released by the recession in export demand, have promptly been absorbed by home expenditure. We are in fact getting the worst of both worlds. Taxation has been maintained at its peak war-time levels for the sake of achieving a budget surplus that would bring disinflation. Yet, for all the Chancellor's efforts, Government spending has overtaken revenue and eliminated most if not all of the supposed surplus. The nation has not reaped the hoped for benefits. We have merely enjoyed the unique experience of paying over, in peace-time, 40 per cent. of our income to the tax-gatherer and still failing to halt inflation. The only hope now of recovery is a substantial reduction in total expenditure; and unless that comes about a fresh crisis at no very distant date can hardly be avoided.

All the indications are that the very modest proposed cuts—many to have only delayed effect—are quite inadequate to secure even their limited objective. We cannot be certain that this is so, for there are so many unknowns beyond the control of the authorities that nobody's estimate, including their own, can be much better than guesswork. Among other things, the extent of the necessary cuts depends not only on how far we are successful in increasing our dollar exports but on the way in which that is achieved. The cuts that will be needed if the gap has to be filled by the diversion to export of resources hitherto consumed at home will be more drastic than if we are able simply to switch exports from soft currency markets to dollar markets.

DOLLAR PROSPECTS

First, then, what are the prospects of increasing our dollar earnings? In my view they are less gloomy than is often supposed. Surely one can take heart from the terms of the Washington Communiqué. In this, America and Canada not only pledge themselves "to facilitate, to the greatest extent feasible, an expansion of dollar earnings by debtor countries, including the sterling area"; they also put on record for the first time—an epoch-making admission—that high tariffs are "clearly inconsistent with the position of creditor countries." This is a revolutionary advance on the situation in the 'thirties when the United States was not committed to full employment and, so far from helping with liberal trade policies, was free to retaliate by an increase in tariffs or a competitive depreciation of the dollar.

Admittedly, Rome was not built in a day. Tariffs apart, the American market is a difficult one, calling for a great deal of market research and enterprising salesmanship. But we are not aiming at bilateral balance between the United Kingdom and the United States—nor even necessarily between the whole sterling area and the whole dollar area, for the ultimate solution seems bound to include some outflow of capital from North America. Meanwhile, the Canadian market, for example, does not present the special difficulties of the United States market; before devaluation, high prices were the main factor impeding our sales to Canada and greatly increased earnings should now be possible. Again, there are the so-called invisible items to consider; one may confidently hope, for example, for a substantial increase in the number and average expenditure of American visitors next season. And the dollar prices of the sterling area's important primary products—rubber, tin, cocoa, and so on—have not fallen by anything like the amount of the devaluation, which should also stimulate the output of gold.

In spite of such dangers as reviving German and Japanese competition, therefore, I believe that the dollar problem would not prove insoluble if our internal policies were right. The President of the Board of Trade has indeed assured us that there exists in the dollar area a big and unsatisfied demand for our goods. That there is a large potential demand is excellent news. But why are those demands unsatisfied? Basically, it is because the export industries have not been able to increase their labour force and because too much of the existing production is absorbed by the demands of the home market and of the soft currency export markets.

"OVERALL BALANCE?"

A simple diversion of exports from soft currency markets to dollar markets would provide far the least painful solution from the viewpoint of the United Kingdom. At first sight there appears ample scope for this, since in 1948 and the first half of 1949 we had an export surplus to the sterling area and western Europe approximately equal to our dollar import surplus. In a sense we have recently been passing on to other countries the equivalent of the aid we have received, plus a large slice of our remaining gold reserves. No doubt that was of assistance to the world economy. But Marshall Aid was extended to the United Kingdom as part of western Europe on the understanding that we should use the breathing space so afforded to achieve dollar solvency by 1952. And it is precisely because too many goods which could have earned dollars have been allowed to drift to other markets that the dollar deficit remains so menacing.

To describe this state of affairs as "overall balance" clearly begs many questions. This term is especially misleading if it is thought to imply that our whole problem would be solved if only the soft-currency surplus could be converted into dollars. The fallacy lies in the fact that there are in general no surplus export proceeds to convert. The recipient countries do not owe us money in respect of the surplus exports they receive from us, for these have their counterpart in such transactions as gifts to western Europe under the intra-European payments scheme, transfers of United Kingdom capital to the rest of the sterling area, and the repayment of sterling balances. Exports which are used for these purposes cannot at the same time help to pay for current imports. It has been possible to use something like one-sixth of our exports in this way, and still obtain imports on a scale equal to our total exports, only because we have been receiving a corresponding amount of imports as gifts or on generous credit terms from the United States and Canada. It follows that to have an "overall balance" of this illusory kind is far from meaning that we are really paying our way.

"UNREQUITED EXPORTS"

It is clear that the export of capital and repayment of sterling debt has been on such a scale as to impede the fulfilment of our obligation to close the dollar gap, and must on that score be condemned as excessive. That does not mean that sterling releases are wrong in principle. Apart from all questions of moral obligation, we have to maintain for countries like India and Pakistan the value of membership of the sterling area. "Unrequited exports" by the United Kingdom may not involve a loss of dollars for the sterling area taken as a whole if the recipient countries are thereby enabled to curb their dollar expenditures. But unrequited exports are only justified if they do indirectly save at least equivalent dollars. The 25 per cent. cut in dollar imports that we are urging upon the overseas members of the sterling area would be pointless if the latter were to replace the dollar goods in full, and not just in part, by United Kingdom exports that could themselves have earned dollars. Yet they will obviously be tempted to do precisely that.

Such demands cannot be met, even on the pre-devaluation scale, without frustrating the effort of the whole sterling area to achieve dollar solvency. The picture would, of course, look different if some permanent settlement of the sterling balances with American help were to become a practical possibility, but obviously we must not count on anything of the kind. It is therefore vital that the sterling area should exercise great restraint in importing not only from the dollar area but also from the United Kingdom. Even so, we must probably expect a sizeable export surplus to the sterling area to continue; it would be unwise to count on "switching" on any extensive scale to provide an easy way out for us.

TREND OF PRODUCTION

The second possible method of bridging the dollar gap without lowering our standard of living would be the provision of additional exports from increased production. There has, in fact, been an improvement in production, if not such remarkable progress—by comparison either with other countries or with prewar output—as official statements would suggest. Taking 1946 as 100, the official index for the twelve months to October last averaged 127, an increase of some 22 per cent. over 1938 and perhaps 15 per cent. over 1937. The London and Cambridge index gives a somewhat less flattering picture; linking this with the prewar Board of Trade index, one would estimate an increase of possibly 17 per cent. over 1938 and 7 per cent. over 1937.

In the meantime the industries concerned have substantially increased their labour force, so that these figures do not mean anything like a corresponding rise in output per head. Even the official index suggests an improvement in this respect of only 7 or 8 per cent. over the ten-year period, and the London and Cambridge index a rise of no more than 3 or 4 per cent. Such calculations, moreover, are based on not very reliable manpower statistics, while the indices themselves do not sufficiently reflect any deterioration in quality or the use of resources to produce the wrong things.

SLACKENING OF INDIVIDUAL EFFORT

So small an increase in output per head would in any case represent a poor return on the substantial sums ploughed back into industry for new plant and equipment (close on £4,000 million of net capital formation by private enterprises over the past four years). It suggests, in fact, that nearly the whole benefit of this new capital has been dissipated by a slackening in individual effort. Of that we have direct evidence in the extreme case of the building industry, where an official committee of investigation reported in 1948 a decline in productivity per man-hour of 31 per cent. Most of us could contribute other examples of poor performance from first-hand knowledge; where this is so I am sure it is due to lack of realisation of the country's need as well as to the absence of incentive. One cannot expect all-out effort in an environment from which the discipline of dismissal has been largely removed and the positive stimulus of reward deadened by penal taxation. Human nature being what it is, we cannot yet afford to dispense entirely either with the stick or the carrot, and until we have a nation of angels it is the duty of the Government so to handle our affairs that people have a monetary incentive to do the things which are in the national interest and to refrain from doing those that are not.

Nevertheless, production has been rising in recent months at an annual rate of some 5 per cent., and we must hope that the upward trend will be sustained despite the projected cuts in imports of dollar raw materials. Assuming that it will, some of the extra exports which are needed can come from additional production. But that does not solve the financial problem of preventing the rise in exports from aggravating inflation. Increased production will generate increased income; and if the additional output is to find its way to the export markets, the whole of that additional spending power must be sterilised.

MANPOWER DISTRIBUTION

In any case, a mere overall expansion in output, everybody remaining in their existing occupations, leaves our problems unsolved. We must produce the right things, and for that far-reaching changes are necessary in the distribution of manpower. Last year I predicted that there would be no substantial redistribution of manpower without disinflation. There has in fact been no disinflation and the manpower figures speak for themselves:

	"Planned" Change 1948 '000s	Actual Change Dec., 1947—Oct., 1949 '000s	
Coal	+ 32	− 9	
Agriculture	+ 55	+ 40	
Textiles	+108	+ 70	
Clothing	− 31	+ 46	
Distribution	− 31	} −51	+167
Consumers' services	+ 3		
Public service	− 23		

It will be seen that only in agriculture and textiles has the target set as long ago as 1948 been even partially achieved; in the other cases cited the trends have been markedly in the wrong direction. The position in coalmining is particularly serious. On balance, no fewer than 17,000 workers left the industry during the first ten months of 1949. Production still falls short of the prewar average, and if that does not gravely impede domestic production, or cause serious hardship to the domestic consumer, it is because coal exports have been running at only about one-third of the prewar level. The situation after the 1914-1918 War, when the British industry priced itself out of important export markets that were never regained, threatens to repeat itself.

The example of coal-mining helps to illustrate the general problem of getting manpower into the right uses. In a state of overfull employment, labour could be attracted into the undermanned industries only by the offer of higher and higher wages. But such bidding-up would in present circumstances only aggravate inflation, and the redistribution simply does not take place.

THE WAGES SPIRAL

This is the background against which we have to appraise the "wage freeze" policy. Had labour been willing a year ago to see the cost of living rise by six points without pressing wage demands, that would have gone a long way towards solving our problems. At that time, such a rise in prices would have meant a very substantial saving in food subsidies, thus helping to reinforce the budget surplus and bring about disinflation. Now it will merely reflect the rise in import prices due to devaluation, without any gain to the budget. To prevent this rise in prices from giving a further twist to the wages spiral, the co-operation of the T.U.C. is obviously of vital importance; for a continuance of the upward drift in wages—serving no economic function but merely aggravating inflation—would be particularly dangerous after devaluation. That the individual unions will follow the T.U.C. lead is profoundly to be hoped; on general principles, it is difficult not to fear that a wages spiral will continue so long as overfull employment persists.

That is the crux of the matter. For even if the wage truce is observed to the hilt, it means that our economy will become even more rigid and static unless the wage stop is accompanied by a curtailment of expenditure that would bring a contraction of employment in industries catering for the home market, releasing resources to find their way to the export industries. If that were happening it would be reflected, as I said last year, in some temporary unemployment. The abnormally low figures hitherto seen reflect merely a failure to deal with the problem of redistribution at all. Our economy has become petrified in the pattern of 1947. It is not in the real interests of any section of the community—least of all of the wage-earners—to pursue a policy which, in the long run, must result in mass unemployment of the most intractable kind, due to inability to earn the dollars with which to purchase our essential raw materials.

NARROW MARGIN OF SAFETY

Bearing in mind that, on the Chancellor's own admission, inflationary pressures were reasserting themselves even before devaluation, can one really believe that the government's "consequential measures" are sufficient to restore a healthy situation? We have seen that we are not justified in counting on much help in the expansion of dollar exports from the reduction of sales to the soft currency markets and that even if the additional exports come partly from increased production that does not obviate the need for cuts in expenditure. Admittedly, some economists outside the public service have been prepared to say that the programme may merely be "somewhat, but not gravely" inadequate for its own limited objective of offsetting the impact of devaluation. Praise as faint as this may seem just as damning as the more representative appraisal of the programme as "salvation by fleabite." To do no more than offset the impact of devaluation simply perpetuates the inflationary conditions which made devaluation inevitable. The margin of safety is perilously narrow. A realistic programme would aim at such a curtailment of expenditure as would restore some flexibility to our economy and permit a lowering of taxation to help incentive.

In saying this I do not overlook the fact that capital expenditure may conceivably decline for reasons outside the direct control of the authorities. For some time past, industry has been rebuilding its depleted working capital; if that process should cease or be reversed the effect on investment outlays might for a time be considerable.

INTEREST RATES

Nor do I overlook the fact that the somewhat higher long-term interest rates now prevailing as a result of the fall in gilt-edged must tend to produce some decline in capital expenditure. It is true that many projects that would have been financed by the sale of securities will appear much less attractive if those securities have to be sold at a heavy loss. Unfortunately, this deterrent is not having its full effect because the government is not allowing the public sector of the economy to be subject to the same discipline as the private sector. Normally, it is, above all, expenditure on building which is most responsive to changes in the long-term rate of interest; and building is now very largely in the hands of public authorities that have been deliberately sheltered from the effect of such changes.

Indeed, the Treasury is now lending to municipalities, through the Public Works Loan Board, at less than its own borrowing rates for comparable periods. Hence the fall in gilt-edged is likely to discourage only industrial capital expenditure, however essential, while leaving public authorities free to raise loans below market rates for many projects that could better be postponed at this time of national crisis. This in my view is contrary to the national interest.

ARTIFICIALLY LOW RENTS

It will be objected that any increase in the rates of interest charged to local authorities on housing loans must reflect itself in higher rentals charged to tenants; but it is the fact that, rents having been frozen virtually at prewar levels by means of legal restrictions and heavy direct subsidies, their real burden has been enormously reduced. If in order to keep rents near their prewar level we are now to incur, in addition to open subsidies, large concealed subsidies in the form of below-market rates of interest, the subsidisation of housing may well become just as unmanageable as the food subsidies.

There is another disadvantage in these artificially low rents. Over and above the burden they impose on the taxpayer and ratepayer, they lead to a wasteful use of existing accommodation: that a large proportion of houses suitable for families are occupied by single individuals is undoubtedly due largely to the effect of rent restrictions and subsidisation. This is, of course, to be expected. Where things are provided free or at prices far below their true cost, waste is the invariable result—a principle that has been tacitly admitted in the desicison to levy a charge for medical prescriptions.

That principle must be applied far more widely if we are ever to reduce taxation from its present intolerable level—an indispensable condition of recovery. Our present plight is due in no small measure to this governmental habit of paying out money to ten people, and getting it back from nine of them, in order to help the odd one who needs helping. For example, the great majority of us—for we are all taxpayers today—are at present subsidising the cost of our own food in order to protect the relatively small numbers of pensioners and those with very large families, who could be assisted in a more direct way. Indeed, they could be assisted more generously if the budget were relieved of the enormous burden of universal subsidies, while the great bulk of the people would not suffer from a rise in food prices offset by corresponding relief from taxation. The basic point is that every penny which goes through the budget raises tax rates and correspondingly reduces the incentive to effort.

NEED TO REVIVE SAVINGS

One other thing could make possible a real alleviation of the tax burden: it is a revival of saving on a scale that would obviate the need for a budget surplus. But here we have yet another of those vicious circles in which the present situation abounds, for the more provident sections of the community are being ground between the upper and nether millstones of crushing taxation and rising prices. Savings will not revive until the tax burden has been lightened. If that cannot be done by reducing the general load of taxation it should come from a great extension of special encouragements to saving, such as the existing relief on life assurance premiums; for tax concessions which promote saving carry the least risk of inflationary consequences. And savers must be given cause to feel confidence that the currency will maintain its value. The purchasing power of past savings has declined so drastically that it is increasingly difficult to persuade savers that they will not experience similar losses in future. This undermining of confidence is reflected in the heavy withdrawals of small savings, just as lack of confidence in our general situation on the part of the whole body of investors was responsible for the recent fall in gilt-edged prices. By halting the inflationary rise in prices, a sound financial policy—and that means reduced government expenditure—would work wonders in promoting a revival of savings.

CONVERTIBILITY

So far I have been reviewing the position in the light of our own pressing difficulties. But sterling is still a world currency, and world trade as a whole will not flourish until sterling is once again convertible. It is disappointing that yet another year has passed without bringing any visible progress toward that objective. Before the devaluations, one of the chief impediments to multilateral trade was the disparity, at the prevailing exchange rates, between the relatively low price levels in the dollar area and the much higher level of prices in the non-dollar world. This provided a temporary justification for the whole framework of bilateralism, with its discriminations and quotas, its rigid and elaborate exchange controls. One had hoped that devaluation, by bringing the two price levels more into line, would permit some loosening and simplification of exchange control; in particular, that it might become possible to merge the present four-score or more varieties of sterling into two or three broad groups, or even to lift exchange control entirely *vis-à-vis* some of the European countries which have followed us down against the dollar. Unhappily, no such gesture towards ultimate convertibility has been forthcoming.

Yet another major obstacle must be removed before convertibility itself can become a practical proposition. That is the problem of the sterling balances; for convertibility is out of the question, given the precarious level of our dollar reserves, so long as a vast floating mass of sterling is left overhanging the market. Undoubtedly, world recovery would suffer a grave setback if the under-developed countries of the sterling area were prevented from fulfilling their legitimate capital requirements. But we have seen that the burden of financing such development, either by new investment or by massive repayments of sterling balances, is greater than this country can bear without jeopardising its own recovery and with it the solvency of the sterling area. If the export of capital is to continue on anything like the recent scale, it can only be with the help of the United States. A solution which found some means of linking American capital to the generations of accumulated experience in overseas investment embodied in the City of London would be one of the most fruitful of all ways for the implementation of President Truman's "Fourth Point."

GOVERNMENT SPENDING EXCESSIVE

Meanwhile, we must put our own house in order. Too much public spending still lies at the root of nearly all our economic difficulties. It is this which impedes the redistribution of our labour force and the achievement of our economic independence; which compels us to retain licensing and controls after more than four years of peace; which has kept taxation at peak wartime levels, with all its deadening effect on individual effort. A reduction of the present tax burden is a prerequisite to recovery; to make that possible it is for the Government in power to choose between the more essential and the less essential objects of Government expenditure. A few months of restraint in spending, not involving any severe personal hardships, would transform the whole situation. Our productive apparatus is sound; our people are sound, given the proper incentives; it is the management of our finances which has been defective.

Indeed, the basic lesson of the past four years is the need for restraint on the part of all political parties if we are to preserve the soundness and stability of the nation's money. Sound and stable money is as much a condition of a healthy society as an incorruptible judiciary, and performs a comparable function in the sphere of social justice. Not so long ago we possessed the double safeguard of the discipline of the gold standard and the independence of the Bank of England. Both have disappeared. For good or ill, the fate of sterling is decided by the will of the majority in the House of Commons, unfettered and unrestrained.

Few would dispute that we were right to loosen the rigid bonds of the gold standard, which in the depression years led—through our clinging to an over-valued parity—to the evil of mass unemployment with its attendant misery and injustice. But a system of "managed" currency has great dangers. The whole monetary situation today is dominated by Government actions, touching every aspect of our economic life and extending far beyond the management of the currency in its technical sense. Maintenance of the stability of money is the first duty of every peacetime Government. More particularly, in an industrial economy such as ours, dependent on imports of raw materials and food, failure to keep public expenditure within tolerable bounds will lead us back, and perhaps at no distant date, to conditions of unemployment as bad as or worse than anything we have hitherto experienced.

STAFF

It is impossible to conclude this annual statement to shareholders without referring once again to the services rendered by the staff of the Bank. We are fortunate in possessing a staff of the highest quality, amongst whom there exists, I believe, a notable *esprit de corps*. They are doing excellent work under the far from easy conditions of today, and if the results disclosed in our report and balance sheet are such as to give satisfaction to our shareholders, it is to the hard work, energy and enthusiasm of the staff of the Bank that those results are due.

NATIONAL PROVINCIAL BANK LIMITED

BUSINESS ACTIVITY SATISFACTORY: OUTLOOK UNCERTAIN

DANGER OF RELYING ON OUTSIDE ASSISTANCE

REMOVAL OF EXCHANGE CONTROL THE GOAL

DEVALUATION: OPPORTUNITY AT HEAVY PRICE

CAPT. E. C. ERIC SMITH ON TAXATION

The 117th annual general meeting of the National Provincial Bank Limited, will be held at the Head Office, 15, Bishopsgate, London, E.C., on February 9th.

The following is an extract from the statement of the chairman, Capt. E. C. Eric Smith, M.C., circulated with the report and accounts for the year 1949:—

BOARD OF DIRECTORS

It is with very great regret that we have to record the death in November of Mr Ronald Malcolm, who joined the board in 1920. Mr Malcolm was chairman of our affiliated bank, Coutts and Company, from 1931 to 1946, and his great ability and wide knowledge of banking and finance were valuable assets to the boards of both companies.

Sir John Lloyd, Mr John Robarts and Mr Richard Durant Trotter have expressed the wish to retire from the board of the bank, which has thus lost the benefit of their discernment and experience in financial and business affairs, so freely placed at our disposal over many years. Sir John Lloyd, for whom we all wish a speedy recovery to health, joined the board in 1927 and placed at our disposal his outstanding ability in commercial and financial affairs. Mr John Robarts' association with banking commenced with his partnership in the old-established family business of Robarts, Lubbock and Company, which was amalgamated in 1914 with Messrs Coutts and Company. He was first elected a director in 1920. Mr Trotter joined the board in 1938, having served for many years previously as a local director in London.

During the year we have had the pleasure of announcing the election to seats on the board of Mr Herbert Henry Merrett, the Rt. Hon. Sir Percy James Grigg, K.C.B., K.C.S.I., and the Rt. Hon. The Earl of Inchcape. Mr Merrett is a prominent industrialist, and his wide knowledge and experience will be of great benefit to the bank. Sir James Grigg's services to the country during his career in the Civil Service, his war-time office of Secretary of State for War and his period as British executive director of the International Bank for Reconstruction and Development have been of the highest order, and we welcome him as a colleague. The election of the Earl of Inchcape renews the connections with his family which existed for many years when his grandfather, the first Earl, served on the board.

We regret to announce the deaths of two of our local directors, Colonel Hugh Frank Clutterbuck and Mr William Melvill Coode. Colonel Clutterbuck had served on the local board for Bath and district since 1903. Mr Coode had been a member of the local board of the bank in St. Austell since 1920. Mr Edward Bramley has retired from the Sheffield local board of the bank after over 17 years as a local director, during which time the bank has profited from his experience of local affairs. During the year the Hon. Robert Arthur Balfour and Mr Gerald Steel have joined our local board in Sheffield. They are gentlemen of eminence in the steel industry, and their knowledge will be of much value to our business.

MANAGEMENT AND STAFF

The maintenance of the high standard of our service to the public would not be possible without the loyal and willing co-operation of both management and staff, whose day-to-day work has in recent years become ever more complicated by the growing weight of regulations and controls, many of which call for detailed study.

We hope during the next few weeks to see in operation a new staff training centre. We have good reason to expect that this new venture will be of great assistance to the members of the staff who attend its courses, in helping them more thoroughly to fit themselves for positions of responsibility in the Bank's service.

BRANCH DEVELOPMENT

During the year we have opened a number of new branches, and it is our intention to continue to extend the scope of our organization. The improvement and enlargement of existing branches have also received considerable attention. We are pleased to report that, in the wider spheres of our activities, our trustee business continues to expand and further trustee branches have been opened this year.

COUTTS AND COMPANY

The balance sheet of Coutts and Company as at December 31st last, accompanies our own reports and accounts.

STATEMENT OF ACCOUNTS

The situation of the Bank at December 31st last is set out in the balance sheets and accounts which accompany the directors' report. Current, deposit and other accounts which at the end of 1948 stood at £768,660,861 are now £777,059,630. The ratio to these liabilities of the more liquid assets, namely cash, short money and bills, is 38.7 per cent. The requirements of His Majesty's Treasury in the form of Treasury deposit receipts have been lower in 1949 than in 1948. The figure at the end of the year was £98,500,000, which showed a reduction of £76,500,000.

Investments stand at £161,930,428, of which £154,858,649 is represented by British Government securities and securities guaranteed by the British Government. Securities of Dominion and Colonial Governments, British public boards and British municipal corporations stand at £2,171,749. These two items combined compare with £144,020,201 a year ago, and disclose an increase in investments of the categories described of £13,010,197. The balance is composed of our holding in Coutts and Company, Lloyds and National Provincial

Foreign Bank Limited, Yorkshire Penny Bank Limited and other trade investments.

Advances to customers and other accounts at the figure of £230,063,148 compare with £196,227,349 at the corresponding date in 1948. Full provision has been made, as in previous years, for all accounts carrying any risk of loss to the bank.

PROFIT AND LOSS ACCOUNT

Net profit for 1949 is £1,413,126. This compares with £1,383,387 in 1948. The amount disposable after adding the sum of £780,629 brought forward from 1948 is £2,193,755. An interim dividend of 7½ per cent. has been paid, which accounted for £391,026. It is proposed to deal with the balance as follows:—To pay a final dividend of 7½ per cent. £391,026; to make an appropriation to contingencies account of £600,000. Thereafter a balance of £811,703 will remain to be carried forward.

EMPLOYMENT OF RESOURCES

The way in which a bank's resources are employed is of major importance to both depositors and shareholders. The former always have been, and still are, interested in the security of their money. To the latter, the profitability of such employment of resources was also of considerable importance. Formerly, banks enjoyed very great discretion as to the use they made of the money entrusted to them: today they are subject to a variety of controls.

At the present time about 63 per cent. of this bank's assets consist, in one form or another, of loans to the Government, and the uses to which this money is put, whether judicious and sound or otherwise, have passed beyond our control. Of this total sum 30 per cent. is represented by holdings of British Government securities: it can, therefore, be easily understood by people of normal intelligence that a falling gilt-edged market is a source of very great anxiety. Recently there have been allegations that the City, inspired by a dislike of the political colour of the Government, has deliberately tried to drive down the prices of Government securities. So far as the "Moneylenders of London" in the shape of the Clearing Banks are concerned, the imbecility of such assertions makes comment superfluous.

EFFECTS OF TAXATION

The effects of taxation upon the accumulation of capital have often been emphasised, but the position, as it at present exists, calls for further comment. An income tax, which transfers nine-twentieths, or virtually half, the profits of trade and industry to the state is an intolerable burden which, reinforced by sur-tax, has to all intents and purposes extinguished the creation of capital by the individual. There remain the savings of Corporate bodies, or what survives therefrom, after the payment of income tax. This, though a sufficiently melancholy situation, does not, unfortunately, represent the full extent of the depredation.

Profits tax has still to be reckoned with and hardly ever can there have been a more ill-conceived and mischievous impost. Its name may have a soothing sound to some ears, inferring as it does the penalising of capital's share of the fruits of industry, but in fact it is a complete misnomer. Profits tax falls, in its entirety, on that portion of the profits which would normally be ploughed back into a business. It is, in fact, a deduction from those moneys out of which dead or moribund assets must be replaced and provision for further expansion found. True, the amount and gravity of the tax increase with the percentage of profits distributed, but it always falls in the same place, on the residue destined to be ploughed back. Its effect on such residue may mean anything from a deduction of slightly over 50 per cent. to total extinction. Far from being a profits tax, it is a tax on the future tools of industry, a tax on still-born capital.

YEAR OF CONTRASTS

The year covered by the accompanying accounts has been one of contrasts. Were it possible to look inwards only, the picture would be more attractive than, in fact, it is. Agriculture has enjoyed a reasonably good year. Roots, beet and potatoes have suffered from drought conditions as have pastures and direct re-seeding. On the other hand, the hay was good and so, on the whole, were the straw crops. Both were harvested under most helpful weather conditions which continued long enough to benefit autumn farm work.

Other basic industries have continued, in private hands, to produce satisfactory results. In places there are signs of a slowing up and in assessing the position, it is wise to take note of the condition of order books and stocks. Nationalised industry, alternately adulated and exhorted, has not yet reached the promised efficiency and harmony and is best left unsung.

Active conditions have ruled in most industries and trades. In some cases, especially the light engineering group, production has been limited by labour shortages. Elsewhere the lack of assured supplies of raw materials has been an obstacle preventing increased output. Although order books are reported to be still full, experience suggests that neither the possibility of duplication nor the risk of cancellation can be dismissed.

FACTORS IN THE OUTLOOK

If the present level of general business activity is satisfactory, the existence of a number of uncertain factors affecting the outlook for 1950 must be noted. Apart from the unsettling effects of the forthcoming general election those engaged in trade and industry are concerned about the ultimate effects of devaluation on the general price structure.

The export traders have continued to survive the normal hazards of international trading as well as the lectures of the Government theprists. The easy conviction of the latter that existing patterns of trade can be changed almost overnight is matched by a memory which conveniently overlooks the fact that releases from the sterling balances have materially affected the course of trade in the postwar years.

The foregoing indicates that, although the country has been for over four years the guinea pig of an experiment, the animal survives—a tribute to its constitution and stamina. Much thought should, however, be devoted to the question of what conditions would now obtain here had we not been shored up from outside. We have taken to the position of recipients of eleemosynary aid easily and readily, only occasionally biting the hand that provides it. Comparatively few people fully grasp the significance of our situation, or realise that it may not continue indefinitely. It is a comfortable feeling that it is the business of people who live in other countries to maintain us in that state of life unto which it has pleased our Government to call us. But it is also very dangerous.

When this experiment began, its practitioners were quite clear that pounds, shillings and pence meant nothing; their subsequent actions have gone some way towards turning this theory into fact. Government expenditure was immaterial. Pay packets increased, but the pound, not unnaturally, became correspondingly devalued. It is possible to persuade people internally, by juggling with subsidies, that their currency is worth more than in fact it is, but very difficult to convince the foreigner. When the pound was openly devalued this was not an act of statesmanship: it was a belated admission of previous error; and, for an importing country, of very grievous error. It was a confession that this country, through the employment of grants, loans and credits from outside sources, had built up an internal economy which made the maintenance of the external value of its currency impossible.

EXCHANGE POSITION

There is a curious, and very undesirable, attitude of mind prevalent here as regards our exchange position—a sort of feeling that it will be "all right on the day"; that tomorrow's daily press will carry a heavy headline "Dollar Problem Solved." Few people will admit even to themselves that this question is with us for a generation or more; that it must influence the lives of all of us, our domestic politics and industry; and that it will entail a complete re-orientation of our pattern of trade. It is going to be difficult however desirable, to reduce the internal level of payments other than gradually. It may be possible to get more work for the same payment. What is absolutely vital is that no greater payment should be made for the same amount of work. There was a time when a man's remuneration increased through his greater efficiency, his greater industry, or through his promotion to a higher-paid job. Far too frequently the fashion of late has been to look for more money for the same work by periodically prodding into activity the appropriate trade union officials. There is no doubt that this is fully realised and, as far as possible, resisted by responsible people in the trade unions. Resistance is, however, difficult.

Devaluation has given the exporter an opportunity, but at a very heavy price in exported human effort in relation to return. No doubt, existing markets in the dollar area can and will be expanded and new markets found there, and every effort should be made so to do. The sale, however, of consumer goods, other than specialities, on a scale that would affect the oversea domestic producer (and to create any effect it would have to be on such a scale), will never be achieved, or, if achieved, tolerated. It is unpleasant to write this, but it would be misleading and mischievous not to do so. Do not forget that there are many other countries struggling with the dollar export market.

BASIS FOR MODUS VIVANDI

A reasonable *modus vivendi* can only be achieved, and that ultimately, by a movement of dollar capital. Whoever first had the idea of attaching fixed labels to rates of exchange has much to answer for. Economic forces cannot be contained in man-made pipes be the bore 4.03 or 2.80. A rate of exchange is what will be paid, in a free market, in the currency of one country for the currency of another. It is not, and never will be, what the financial authorities of the respective countries consider should be paid.

An immense system of control and an intricate system of evasion have been built up in an effort to defeat each other and the effects of the laws of supply and demand and to postpone the evil day when it will no longer be possible to perpetuate an illusion. It is quite certain that capital will not be attracted to the sterling area unless and until it is freely movable, and without such attraction of capital it is difficult to see how our long-term, not our short-term, problems are to be solved.

The removal of exchange control is the goal towards which all our financial policies should be directed. The establishment of free exchanges would produce chaotic conditions over a period which might be protracted, but such a situation would be preferable to that which will result from a perpetuation of self-imposed financial blindness. The operation can never be painless, but, sooner or later, by this means alone can a reasonable economic future for this country be assured. No one has yet determined for how long an ostrich can maintain its head in the sand without irretrievable damage to the bird.

BARCLAYS BANK LIMITED

FIRST POSTWAR FALL IN DEPOSITS

CHANGED ATMOSPHERE IN WORLD MARKETS

GOVERNMENT EXPENDITURE A PRIME OBSTACLE TO RECOVERY

SERIOUS THREAT TO COUNTRY'S FUTURE

A GENERATION OF PROGRESSIVE EFFORT REQUIRED

SIR WILLIAM GOODENOUGH ON TAXATION

The fifty-fifth ordinary general meeting (being the annual general meeting for the year 1950) of Barclays Bank Limited will be held at the head office of the bank, 54, Lombard Street, London, E.C., on February 9th.

The following is the statement by the chairman, Sir William Goodenough, Bt., LL.D., on the report and accounts for the year ended December 31, 1949:

The proceedings at our forthcoming annual general meeting will be again of a formal nature and I am continuing the practice of sending to the stockholders with the report and accounts a statement on the affairs of the bank during the past year.

The retirement of Mr Arthur Bevington Gillett from the board of directors in June brought to an end a close and greatly valued association which had lasted for more than a quarter of a century. Mr Gillett had been a director of the bank since 1921. He began his banking career with Messrs Gillett and Company of Oxford, and, when that bank was amalgamated with Barclays Bank Limited in 1919, he became a local director at Oxford. I am glad to say that he will continue to be with us in that capacity and so we shall still be able to benefit from his help in the district that he knows and understands so well.

In my statement last year I made a passing reference to the importance which we attach to our system of decentralised control, operated through our local head offices, the value of which lies in the lively flexibility that it gives to the day-to-day working of the bank. Stockholders will like to know that we have recently strengthened our local head office at Sheffield by the formation of a local board there and I am sure that this new provision in that important industrial area will be a source of added strength to the bank and of greater convenience to our customers.

NEW GENERAL MANAGERS

We have appointed, as general managers of the bank, Mr John David Cowen, who has been our general manager (staff) since May, 1948, and Mr Edward Brimelow, previously an assistant general manager. Mr Cowen was formerly a local director at Newcastle upon Tyne and Darlington and Mr Brimelow for some years was manager at Coventry. Although Mr Cowen will no longer carry the title of general manager (staff), he will still be fully responsible for the supervision of the staff arrangements in the same way as he has been heretofore and this will ensure that staff administration remains in conformity with the policy which was adopted on the first appointment of a general manager (staff).

Stockholders will have an opportunity at the meeting of associating themselves with a vote of thanks to the staff of the bank which will be proposed there. Those who have been able to come to our annual meetings in past years cannot have failed to notice that these votes are not the mere formality that their regular recurrence in the proceedings might be taken to suggest, but are a very warm and sincere expression of continuing gratitude for a fine service valued at its true worth. While I have in mind our staff and all they have done for the bank, may I say how much I have been interested, and how much encouraged, since the war to see the steady flow of new entrants into our ranks, and to be made aware, as I have been, of their very evident keenness, which holds such promise for the future.

BALANCE SHEET FIGURES

Our balance sheet for the end of last year shows a total for current, deposit and other accounts of £1,266,243,422 which is below the figure of £1,274,660,008 at the close of 1948. This is the first time since prewar days that our balance sheet has revealed a fall in deposits compared with the end of the previous year. The information so far available shows that during most of 1949 the upward tendency in bank deposits as a whole, although less marked than in 1948, was still present. This has been in some measure a symptom of the persisting inflationary threat which we know to be very close to the surface at the present time and which it is more than ever important to hold in check.

The total of the resources at our disposal has altered little during the year, but the balance sheet shows that important changes have taken place in the distribution of our assets. These have arisen from the change of emphasis from treasury deposit receipts to treasury bills as a means of financing the floating debt, which has aroused a good deal of interest by reason of the magnitude of the operation. Our own holdings of treasury deposit receipts at the end of December had fallen to £171,500,000 compared with £302,000,000 at the close of 1948 and with the figure of £249,500,000 in our monthly statement for July, just before the really massive transfer began. On the other hand, the total of bills discounted shown in the balance sheet is £260,803,323, an increase of no less than £93,742,920 over the year, which has raised the proportion to deposits of this item to 20.5 per cent.

Whatever may be the aim of the policy underlying this striking change of direction, its immediate effect has been to impart much greater flexibility to the banking system. In our own case, our specially liquid assets taken as a whole, namely, cash in hand and with the Bank of England; balances with other British banks and cheques in course of collection; money at call and short notice; bills discounted and treasury deposit receipts amounted at the end of the year to £675,619,476 or 53.3 per cent. of our current, deposit and other accounts. Excluding treasury deposit receipts, the proportion was 39.8 per cent. compared with 31.7 per cent. on December 31, 1948. It is probably incidental that some saving will have been realised in the cost of financing the floating debt through the greater dependence upon treasury bills, which are a cheaper medium than are treasury deposit receipts.

INVESTMENTS

Our investments, which stand at £302,827,932 in the balance sheet, excluding those in the category of fixed assets, compare with £291,816,845 twelve months before. The balance sheet figure has not changed greatly, but, in common with those of the clearing banks as a whole, as shown by the figures up to November, it has increased somewhat in total amount and the rising trend has been apparent throughout the year. This fact is a good and sufficient answer to any suggestion that the banks had actively contributed to the heavy fall in the prices of Government securities by selling investments on a large scale.

The fall in security prices or, in other words, the rise in the long-term rate of interest has been one of the outstanding incidents in a troubled and eventful year, because, after almost two years of gradual change in the same direction, it has demonstrated in the clearest possible way the futility of trying to contain an economic force, whatever may be done to temper it. It would go far towards a solution of all our difficulties if this simple lesson, which needs to be applied in so many ways at the present time, could strike home, and with it the corollary that forces of this kind need not be implacable enemies but can be brought to use as very powerful allies.

The fall in security prices has naturally had its impact on the market value of our own large holdings of investments and I think I should just mention that this is the kind of possibility that is always present in the minds of all of us who are concerned with the investment policy of an institution such as ours which has a long-term programme under constant review in the light of the experience of successive generations. We have to be well prepared to withstand such serious changes as have taken place in recent months.

ADVANCES AGAIN LARGER

Our advances to customers and other accounts, which have moved in accordance with the general trend for the clearing banks as a whole, have risen to £297,969,264 against £286,419,375 at the end of 1948. They have reached new high levels during the year and have remained throughout that time a little above the average for the previous twelve months. At the same time, the increase in the total over the whole period has been smaller by far than in any other year since the end of the war and the proportion of advances to deposits, which is much less than it was in days gone by, has changed little during the year, and this in a time when prices have been rising and production expanding.

The directors report that after payment of all charges and providing for taxation and after deducting transfers to inner reserves, out of which reserves provision has been made for diminution in value of assets, the net profit for the year ended December 31, 1949, amounted to £1,866,279 11s. 7d. compared with £1,879,943 2s. for the year 1948. As will be seen from the report, the directors have allocated £700,000 to contingency account. Interim dividends at the same rates as in 1948 were paid on August 8th last and the directors now recommend the payment of final dividends of 5 per cent., making 10 per cent. for the year, on the "A" stock, and 7 per cent., making 14 per

cent. for the year, on the "B" and "C" stock, less income tax in each case.

CONSOLIDATED FIGURES

Turning to the consolidated balance sheet, presented now for the second time, we are able not only to gain a general impression of the figures of the Barclays group as a whole but to see how they compare with those shown a year ago. It will be noticed that it has been necessary to take the position of the subsidiary companies on September 30, 1949. The total assets amounted to £1,814,286,599 against £1,864,887,762 last time, while current, deposit and other accounts have fallen during the year by £48,879,382 to £1,699,395,760, which is reflected mainly in the cash item. This downward movement is attributable very largely to a decline in the deposits in South Africa of Barclays Bank (Dominion, Colonial and Overseas).

The liquid assets in the balance sheet, namely, cash in hand and with the Bank of England and Central Banks abroad, and gold bullion; balances with other banks and cheques in course of collection; money at call and short notice; bills discounted and treasury deposit receipts amounted to £848,075,106 or 49.9 per cent. of current, deposit and other accounts. Here again we see the effect of the switch from treasury deposit receipts to treasury bills that I have mentioned in connection with the parent bank, the former having fallen by £134,500,000 and bills discounted having risen by £89,836,307.

Investments, apart from those classified as fixed assets, are £455,229,831 and advances to customers and other accounts stand at £421,834,904. Both these items are higher. I think it would not be wrong to take pride in the knowledge that the great aggregation of effort underlying these figures, based on the same principle of decentralisation as has served so well in the business of Barclays Bank Limited, continues to be devoted to the service of many communities and remains an asset of considerable importance from the national point of view.

PRECARIOUSLY-BASED RECOVERY

There is nothing more for me to say that is of immediate domestic concern to ourselves, but I would like now to make a few observations of a general kind. At this time last year, we could look back upon a period which bore the marks of achievement over the whole field of national endeavour. Nevertheless there were many reasons for thinking that the recovery, although remarkable by any standards, was precariously based. It was clear that our success in dealing with the balance of payments problem owed too much to the bilateral trade agreements negotiated under the stress of the dollar shortage; that our exports contained a substantial element that brought us no corresponding claim on the resources of other countries, and that behind the aggregate figures of our external trade lay a very large and intractable deficiency with the western hemisphere which was the "hard core" of our problem. The search for alternative sources of supply, in an effort to husband dollar resources, had already brought about a sharp divergence in the trend of prices which tended to fall in "hard" currency countries and to rise in those whose currencies were "soft."

The two price systems were insulated from one another by the dollar shortage, and even between the countries of western Europe the Intra-European Payments Scheme was not working in quite the way that had been hoped and trade had remained in bilateral channels. The stimulus of competition was thus weakened, trade threatened to become more and more constricted and the already distant prospect of a return to freedom in international payments to recede. We had other preoccupations, too, and so although we looked forward hopefully, we did so without the confidence that our achievements might have justified in other circumstances.

CRITICAL SITUATION

As it has happened, the events of the past year have greatly emphasised our difficulties and have brought us to a critical situation. The tendency for prices to fall in the United States which extended so rapidly, widened the disparity between the price levels of the "hard" and the "soft" currency countries. The dollar earnings of the sterling area through the sale of primary commodities fell away and at the same time the sale of United Kingdom products to the United States had to face the shrinking demand for consumer goods, the growing keenness of competition from American producers, the substantial price reductions and the shortening delivery dates which became so quickly characteristic of the United States domestic economy

A growing sense abroad that Britain would be forced into a devaluation made the situation worse. Buyers tended to hold off in the hope of being able to buy from us more cheaply later. Those with payments to make to us delayed making them and there was a general loss of confidence in sterling. The effect showed itself, Marshall Aid notwithstanding, in the drain on the already impaired central reserve of gold and dollars held by this country as the basis for the external transactions of the whole of the sterling area. Devaluation became inevitable.

THE IMMEDIATE AIM

We should do well to realise that the events in the United States, which so materially affected conditions in this country during the past year, cannot by any stretch of imagination be called a slump. What has happened there so far is nothing more than a readjustment which has come about after a boom of unprecedented dimensions and which has arisen out of the end of the restocking phase following the war. The level of American economic activity remains far and away higher than it was in prewar days. The fact is that we have passed, on from a simple problem of production to a problem of production with the overriding complications implicit in the tradition to a "buyers'" market. It is now our imperative need to adjust ourselves to this change in atmosphere in the markets of the world, bearing in mind that we have also to accept the drying up of Marshall Aid and the lengthening handicap imposed by rapidly increasing production and constantly improving productive efficiency abroad.

Neither devaluation, nor the "consequential measures" that are being taken or may have to be taken make any positive contribution towards this vitally urgent matter: both, though inevitable, are negative in conception and they can do no more than give a temporary breathing space which can be all too easily lost. If this were allowed to happen our situation would be incomparably worse than it was before. The immediate and continuing aim is as clear as it could be. It is, if I may put it in a homely way, to secure the giving of better value for money all round. That is the aim and it is impossible to be too emphatic about it.

INCENTIVE

But although the facts are becoming more widely understood there is no very strong evidence yet that a sense of danger has penetrated far into the general consciousness. Perhaps it is hardly surprising that this should be so and that the warning voices that are being increasingly raised should go so largely unheeded at a time when the truth has not fully revealed itself; when it is relatively easy and profitable to sell goods in "soft" currency markets; when unemployment has to all appearances practically ceased to exist; when production continues to be much higher than it was before the war; when there are shorter hours of work, higher wages and holidays with pay, and when we newly enjoy what are perhaps the most comprehensive social services in the world.

It is all too clear that for these and other reasons it is not easy to press home the conviction that the kind of individual action to which we must look as the main solvent of the nation's difficulties is really necessary; that, without it, all the new-found gains may soon become nothing but a memory. There are hopeful signs that understanding is spreading more widely and plenty of evidence to show that in some conditions a great deal may be done by exhortation to bring the public mind to a realisation of the needs of the case. In so far as this can be done much may be accomplished and much saved. But encouragement of another sort is required as well to produce and sustain the national will to make the right policy effective. As much as anything else it is a matter of seeing that the steepness of the upward gradient is reduced so that the tendency will be stronger to move towards the goal. It is summed up in the word "incentive."

GOVERNMENT EXPENDITURE

I am convinced that the most effective single means of providing this necessary stimulus would be a significant reduction in the burden of taxation, which now discourages at all levels in the community the spirit that needs most to be fostered. The present rate of Government expenditure in relation to the national income with the resultant demand for revenue is one of the prime obstacles to recovery. It is directly conducive to inflation and is a serious threat to the whole future of this country.

In underlining, as I wish to do, what I had to say a year ago on this subject, let me add that none of us can fail to realise how difficult a task is the process of retrenchment. But the need to go a great deal further than has already been gone in this direction, as well as to hold fast to the principle of wise efficiency in administration to eliminate waste, is inescapable: the issue will have to be faced sooner or later. It is not a question of attacking the social services, but of producing a healthy and vigorous economy that will be able to support them and of preventing the alternative of a serious collapse in which they would inevitably suffer severely at a time when we would be in need of them most.

SUGGESTED FURTHER BURDEN

While I am on this general subject of taxation, I wish to refer to a suggestion I have seen made that a further burden should be added to death duties and offset by some reduction in taxes upon higher incomes and profits. I cannot think of anything more destructive of the kind of thrift and enterprise that is in the best interests of economic progress than the confiscatory death duties that have to be borne already. They are so high as to strike at the roots of one of the most praiseworthy of human instincts and they are a direct inducement to improvidence and waste. They are thus inflationary in the same sense as are the heavy rates of current taxation, but in this respect they have perhaps greater emphasis, and they are a cause of financial embarrassment which is damaging not merely to the individual but to the national economy as well.

It seems to me to be symptomatic of the unsound state of mind prevailing at the present time that a question like this could be raised by any thoughtful and responsible person. It would, indeed, commend itself as a sounder proposition that the burden of estate duty should be somewhat eased, not certainly in priority to a reduction in income tax and in company taxation, but, if need be, at some minor expense to the relief which ought to be given to meet the urgent need in that direction.

LONG-TERM PROBLEM

While we have so much in mind the immediate purpose of national policy, it is important to realise that our preoccupations at the moment, grave though they be, concern the means of surmounting a present crisis which requires emergency action to be taken quickly. The larger underlying difficulty which will remain when the crisis is past is not one that can be expected to yield in a short time to any treatment, no matter how sensible and effective it may be, even if it were possible, which I believe it is not, for a complete cure to be worked out in advance. We should be wise to think rather in terms of perhaps a generation of progressive effort in company with other nations to remedy the state of unbalance in the world's economy which has been growing up for many years and has been greatly emphasised by the destruction and distortions of two wars.

Our own troubles, and those of many other countries, are largely due to this state of affairs. This long-term problem is bound to make great demands upon our patience and resolution and it is impossible to rate too highly the value and importance in the task that lies ahead of a wise education of the people of this country by those in authority, regardless of party political advantage. The greatest difficulty arises from the position vis-à-vis the United States, whose economic preponderance has become so overwhelming and whose creditor status has a background so fundamentally different from that of the United Kingdom in the nineteenth century.

America's industrial power is enormous, her deficiencies relatively small and her tradition protectionist. In trading, her natural concern is not so much to satisfy her needs as to find markets for her surpluses both primary and manufactured in order to maintain the tempo of her economic life.

ESSENTIALS FOR SOUND WORLD ECONOMY

It is these undoubted facts, considered with the stringency that afflicts most of the other countries in the world, that give point to the view that one of the things most needful for the eventual restoration of a sound world economy is a strong revival of international lending in which the circumstances, as well as the interests of all concerned, call for the United States to take the leading part. This is in its essence a long-term question. Something has been done and more is in contemplation, but conditions have yet to favour the free flow of venture capital seeking an equity interest that one has so much in mind in thinking of international lending. The habit of private capital to move freely across the world has been moribund for a very long time, and it is possible that we should remind ourselves that investment of this sort is beneficial only in so far as it is calculated to bring advantage to both borrower and lender.

Past experience in this field shows how easy it is for ill-considered lending to do serious harm to both parties and most of us will remember that the virtual extinction of international investment after 1929, which had incalculable consequences for the whole world, was not unconnected with the character of the lending and the borrowing that preceded it. It is very important indeed that this experience should be well remembered and its implications kept freshly in mind for the future: it is very important not only that the flow of capital should be soundly and carefully based, but that it should be properly adventurous.

I mean by this that it must have enough heart in it to withstand the inevitable share of disappointment and failure that is the lot of capital investment of whatever kind and in whatever place, whether at home or abroad. Investment on the scale and of the nature required can hardly be expected to develop unless the prospects are such as to attract it. Before this can happen there must be clear evidence that policies which give reasonable promise for the future of individual national economies have been firmly adopted.

ALEXANDERS DISCOUNT COMPANY LIMITED

RESULTS GENERALLY SATISFACTORY

SUBSTANTIAL INCREASE OF BUSINESS

LORD COLGRAIN'S STATEMENT

The eighty-second annual general meeting of Alexanders Discount Company Limited will be held at the registered offices of the company, 24, Lombard Street, London, E.C., on Wednesday, February 8th.

The following is the statement by the chairman, the Rt. Hon. Lord Colgrain, which has been circulated with the report and accounts for the year ended December 31, 1949:—

The accounts for the year 1949 which have been submitted to you will, I hope, be considered generally satisfactory. Perhaps the past year will be remembered as one during which continual international conferences were held towards the rehabilitation of Europe west of the iron curtain, while at home a general atmosphere of unrest developed indicating political instability and public insecurity. This became most pronounced during the autumn so far as financial matters were concerned, with the result that what may be fairly described as a serious fall took place in the value of British Government securities, which was only checked by the intervention of the Government broker acting on behalf of the Treasury.

In the business with which we are directly concerned as a discount company, the two main considerations which affect us are the price at which we can borrow money and the value of short dated Government securities. The rate for short money has remained unchanged throughout the year and, if one may hazard an opinion from general appearances, it looks as if the authorities intend to maintain this position. The situation in short dated Government securities has not been maintained in a similar manner; there have been considerable fluctuations during the course of the year with the result that, while there has been a slight appreciation in the price of the shortest dated bonds compared with a year ago, the longer dated bonds are distinctly lower. There is nothing in any way unusual or artificial in this change because the value of money, broadly speaking, has definitely risen with the inevitable result that the yield of long dated Government securities is now on a 3½ per cent. rather than a 3 per cent. basis, while industrial shares give a proportionately higher yield. The prospects in the immediate future cannot fail to be uncertain in view of the general election due to take place next month; it is, therefore, a time for exercising the utmost caution.

BILL PORTFOLIO LARGER

The balance sheet figures are set out in the same form as in the previous year, and it will be seen that the total volume of business transacted shows a substantial increase. The holding of securities is smaller, thus indicating the caution which your directors think desirable under existing conditions to which I have already alluded, while, on the other hand, the bill portfolio is considerably larger. This is due to the increased amount of Treasury bills offered weekly during the last few months as against a reduction in the total of Treasury deposit receipts. The daily dealing in Treasury bills constitutes the major part of our monetary operations so that we are glad to have had the opportunity of participating in the bigger figures, in addition to which the rates at which the Treasury bills have been available are slightly more favourable than those prevailing a year ago. The total of commercial bills under rediscount is £5,398,092 compared with £7,168,160 for 1948.

The profit and loss account is presented in the usual form. It will be noted that the expenses show only a small increase, which indicates careful management in view of the rise that has taken place during the course of the year in the cost of living and in all charges. The net profit is £150,400 compared with £175,464 in 1948, while the amount carried forward to the new year is £409,000, being an increase of £28,300 over the figures shown a year ago of £380,700.

TAXATION BURDEN

When considering the result as stated in the profit and loss account, the ever increasing burden of taxation should be borne in mind and in this connection it will be remembered that after devaluation the Chancellor of the Exchequer announced a further increase in the amount to be levied under the distributed profits tax. All taxation is charged to profit and loss account before arriving at the gross profit for the year.

In conclusion it gives me great pleasure to place on record once again my recognition of the untiring efforts both of the management and the staff throughout a year that has not been free from difficulty.

KILLINGHALL (RUBBER) DEVELOPMENT SYNDICATE

BIGGER DIVIDEND: A PROBABLE INTERIM

The fortieth annual general meeting of Killinghall (Rubber) Development Syndicate, Limited, was held on January 12th at the registered offices, Asia House, 32, Lime Street, E.C.3.

Mr Jack Addinsell, the chairman, after paying tribute to the work of the staff in Malaya under difficult conditions, said:—

The results from rubber, after credits for interest, etc., and charging head office expenses, fell from £5,096 to £3,063. There are three primary causes: that owing to abnormal rains the year's crop fell off by 49,000 lb.; increases in pay to the labour force; and a decline in the average net price received.

After charging £1,360 spent on rehabilitation there remains £1,703, but we had the benefit of one year's operations by Killinghall Tin, Limited, resulting in £18,973 of tribute. The balance brought forward amounted to £17,909. It was necessary to make provision for taxation of £12,232 and it was considered advisable to build up the replanting reserve by £3,000.

Last year a dividend of 10 per cent. was paid, and your directors feel justified in proposing that the distribution be increased to 25 per cent. This will leave £16,134 to be carried forward.

Our immediate prospects are favourable and I am hopeful that before the close of the year on June 30th next your board will have been able to resume the payment of an interim dividend as in prewar days.

The report was adopted.

DISTRICT BANK LIMITED

RECORD FIGURE OF DEPOSITS—£23,000,000

OBSCURE ECONOMIC OUTLOOK

NEED FOR INCREASE IN DOLLAR EXPORTS

SIR THOMAS D. BARLOW'S STATEMENT

The Chairman, Sir Thomas D. Barlow, G.B.E., has circulated, with the report and accounts, the following statement to the shareholders of District Bank Limited, prior to the 120th annual general meeting to be held on February 10th at the Head Office, Spring Gardens, Manchester:—

It is with great regret that I have to record losses which the Bank has sustained through the death in August last of Mr C. W. Beswick and in October of Mr. W. F. Lonsdale.

Mr. Beswick was a director of the County Bank and on the amalgamation with that bank in 1935 he joined our board. He was greatly esteemed by his colleagues for the valuable services he gave so unsparingly.

Mr Lonsdale, who had been chief general manager since 1945, will be much missed by all who came into contact with him. He made many friends for himself and for the Bank, and his untimely death is felt as a personal loss by each member of the Board and by the staff.

Amongst changes in the Bank's principal executive officers I have to report that Mr S. Higginbottom and Mr D. F. Pollard, formerly joint general managers, have been appointed chief general managers, and Mr A. Dunn and Mr F. A. Rushton, previously assistant general managers, have been appointed joint general managers.

STATEMENT OF ACCOUNTS

From the balance sheet you will see that deposits have increased by £5,700,000 and now stand at a record figure of £231,000,000. To the extent that they reflect a growth in our business these figures are very satisfactory. On the other hand, the fact that banking deposits as a whole still remain at a high level is an indication that the country is not showing the measure of disinflation which has long been regarded as necessary for economic recovery.

With larger resources at our disposal we have made some changes in the distribution of our assets. To maintain the customary ratio our cash has been increased and, in order to preserve a high degree of liquidity, this item is supplemented by more money at call and short notice and also by bills of exchange. The latter are mostly treasury bills and these have been increased largely through funds released on the initiative of the Government from Treasury deposit receipts. It is to be hoped that Treasury deposit receipts will run at a lower level so as to permit a greater degree of flexibility in the banking system.

Arising out of these variations our short assets of £88,400,000 represent 38.2 per cent. of our liabilities to depositors and, with treasury deposit receipts, amount to £119,000,000.

INVESTMENTS

Our investments show an increase of over £3,000,000 and it will be of interest to shareholders to know that a high percentage of our holdings in British Government Securities is repayable in the next few years and most of the remainder at fixed dates. The market value of our investments at December 31st last was in excess of the figure shown in the balance sheet.

At a time when the national economy is subject to so many stresses and strains it is reassuring that inflationary trends are not reflected in any sharp upward movement in our advances. Indeed the small increase indicates that, in the national interest, the field of lending remains much restricted.

Increased working costs, rising prices, bottlenecks in production, capital expenditure and heavy taxation, all create a need for borrowing when business is moving along steadily. But when, as over the past twelve months, it has been expanding, banking accommodation is even more urgently required. Any restriction of credit facilities, therefore, cannot but entail disappointment to many whose projects, though financially sound and beneficial to the community in normal times, are yet ruled out by the Chancellor's "directive" because they are of an inflationary character. Indeed the attendant difficulties of the present situation greatly complicate lending policy. Although the many restrictions now imposed obviously limit the volume of our advances, certain temporary borrowings help to maintain our figures. Today some customers need accommodation pending the raising of new capital, whilst others need assistance until such time as they can decide whether their present volume of business will prove lasting enough to justify such a step.

Our lendings continue to be well spread, and the figures revealed by our usual analysis do not call for any special comment, except that I should like to point out that advances for farming are running at a higher level, an indication that, as in the past, we are assisting this industry to carry out the Government's agricultural policy.

The remaining item, liabilities of customers for acceptances, confirmed credits and other obligations, is closely related to the work of our foreign department. In addition to the normal activities associated with Exchange Control, this department has been called upon to resolve many problems arising out of the devaluation of sterling and other currencies. A particular feature of its expanding business is the increase in the volume and value of foreign bills for collection which, owing to the transition from a sellers' to a buyers' market, are again tending to replace the export credit as a means of financing overseas trade. Through its information service, the department continues to foster the development of exports and its recently published eighth edition of the "Digest of the U.K. Exchange Regulations" has been much in demand.

The business of the trustee department continues to expand as the services rendered become more widely appreciated. Recently, in order to provide more commodious premises, the trustee branch at Old Bond Street, London, has been transferred to our City Office in Cornhill. The department, however, still maintains an office in the West End for the convenience of clients.

YEAR'S PROFIT

The net profit for the year, after making the usual provisions, is £504,880. This figure may be considered satisfactory when allowance is made for the burden of taxation and increasing costs. With the amount brought forward there is for disposal £798,896 and, as mentioned in the report, we have, as in the previous year, allocated £200,000 to our general reserve. After providing for the dividend at the same rate as last year there remains £313,256 to be carried forward. It will be observed from the accounts that the bank's contribution to the pension fund has this year been made before arriving at the net profit, and it is proposed to deal similarly with this item in future.

DOMESTIC AFFAIRS

It is the policy of the bank to expand by adding to its network of branches, but, owing to restrictions during postwar years, progress has necessarily been slow. However, plans are now far enough advanced for me to say that within the next few months branches will be reopened in Oxford Street, London, and in Tunbridge Wells.

Last September the Institute of Bankers held, for the second year in succession, an International Summer School at Christ Church, Oxford. This was again very well attended, and those of our officials who took part much enjoyed the excellent lectures and discussions as well as the opportunity of meeting the many representatives who came from overseas.

The spirit of co-operation throughout the bank has been greatly helped by the regular consultations concerning staff conditions and welfare which have taken place during the year between the management and the Staff Association. As we like to know our staff individually, the general managers have continued their visits to our branches, and in this way they have been able to discuss local conditions with our officials. We have also been much pleased with the success of the managers' conferences which we have arranged from time to time and with the good results achieved by the courses held during the year at head office for senior men of managerial or official status. Not only have those who attended been able to gain an insight into policy and to benefit from the pooling of experience and specialist knowledge, but they have also had the opportunity of discussing the various aspects of their work and the attendant problems.

Before turning to matters of national interest I should like to say a word in praise of the staff. Policy is worthless without the loyal support of those upon whom its execution falls. It is, therefore, with real pleasure that once again I express my thanks to them for all the hard work they have performed and for their efficiency and willing service during the past year.

NEED FOR DISINFLATION

It is difficult to believe that after four years of peace the economic outlook could still remain so obscure. The war and its aftermath may be the primary causes of world difficulties, but this does not absolve us from the responsibility of making adjustments to remedy our own internal position. We alone can and must tackle the job.

There is no easy way out. We now have to make more available if we are to rectify our balance of payments: in short, more for export and particularly for dollar countries. We must also consume less. It is, however, to monetary policy that we must look for the major part of these adjustments. Government expenditure remains too high; consequently we are still burdened by unduly heavy taxation. By using the proceeds of taxation to finance varied and avoidable forms of expenditure, rather than to curb spending, we tend to hamper production while we fail to reduce consumption.

Indeed there is growing activity in the home market where any increase in supplies is offset by increased buying. To some extent this is due to repeated warnings of higher prices and shortages in the future. The position is the more serious since it appears that present spendings are making inroads into savings. That these should now decline means that, despite the opportunity offered by full employment, the nation is losing the habit of thrift which has stood it in such good stead in the past. The persistent decline in savings is only another indication of instability and that fear of the future which encourages spending. All this points to inflation, with its adverse effect on

initiative and efficiency, as the root of most of our troubles.

Devaluation was evidence of our shortcomings. It was an adjustment intended to nullify the effects of the inflationary policy to which we had resorted to avoid unemployment. Its inspiration has doubtless been derived from the Keynesian hypothesis which has been converted into an immutable and infallible law by his disciples. They forget that Lord Keynes was propounding a policy which was to be operated in a period of imperfect employment. It was hoped that by cheapening the pound we had found a comfortable way of wiping out our past errors. But experience will teach us that we shall not escape future unemployment through inflation but rather through realistic disinflation, involving effective economies in capital investment and current expenditure in order to check domestic consumption, reduce controls, restore freedom to prices, and so raise efficiency and output. This is the way to make exports more plentiful and more competitive as to price in those markets where it is most important that they should sell readily: here also is the way in which, in the long run, our country can most effectively protect itself against unemployment.

DOLLAR EARNINGS AND DOLLAR SAVINGS

We cannot afford to be satisfied with the present output or volume of exports. Admittedly figures have been produced to show that the recent economy cuts may, by their effect on consumption, make our dollar position "just manageable." But there is no margin to spare, and what has been achieved has been done with Marshall Aid. With world trade at its present level, and particularly with the buoyancy of American business, we require more than a carefully adjusted balance. We need to add substantially to our slender gold and dollar reserves. We cannot, therefore, afford to be complacent about the recent additions since, however gratifying these may be, they are to a large extent due to exceptional and non-recurrent factors. If we fail to build up our reserves now, what will happen should an economic depression descend upon us?

With these thoughts in mind it seems pointless to argue as to where our weakness lies, whether in production, salesmanship or price. It may well be that all three are at fault, and much time will therefore be needed to build up dollar exports. To ensure that this is done with the minimum of delay, would it not be practical to think in terms of incentives, as without them there is little encouragement to venture into dollar markets with the possibility of unprofitable business added to other attendant risks? Rewards should be highest when risks are greatest, and here something can be done for exporters without violating the doctrine of "fair shares" for the workers.

Whilst on the subject of incentives, the General Council of the T.U.C. should be warmly commended for the scheme they have recently put forward, and indeed for their whole treatment of the difficult problem of wages. Bonus incentives for hard work and increased productivity would reward the employee with higher income and the employer with lower costs. Incidentally, however, it may be suggested that the Council's complaint of swollen industrial profits takes no account of the effect of inflation which, in producing continuously rising prices, results in large profits only so long as a high level of demand is sustained. If the inflationary process is arrested, these profits will quickly diminish, and any firm which does not meanwhile plough back the greater part of what remains after payment of taxes will soon regret its imprudence. It must, moreover, be added that incentives, however admirable their motive, cannot in themselves be sufficiently effective in present circumstances. In any case they are an acknowledgment of a domestic economy overstrained by inflation and incapable of shifting manpower, production and selling effort. In the expansion of dollar exports disincentives can play an indirect yet important part. The less attractive our sales at home and in soft currency markets become, the greater the stimulus to explore dollar markets. Should we not also curtail the volume of debt settlement exports, the result of our all too liberal repayment of accumulated sterling balances?

Even if we meet with an unexpected measure of success in our endeavours to increase dollar exports, we should realise that increased dollar earnings alone are unlikely to bridge the dollar gap. To do this it would also seem that we shall be forced to give continued attention to dollar savings. Indeed it is becoming increasingly clear that a curtailment of dollar imports, though admittedly regrettable, is likely to play an important part in rescuing the sterling area as a whole from its balance of payments difficulties. As far as Britain is concerned, disinflation should go some way towards reducing our intake from hard currency countries, but in addition we must constantly review the position of the agricultural industry, for its capacity to save dollars is unrivalled, to say nothing of the desirability of increasing the rural relative to the urban population.

COTTON TRADE DIFFICULTIES

Devaluation has placed fresh responsibilities—particularly in regard to exports—on the cotton industry. Although benefits have accrued to some producers it is difficult to believe that they will be maintained for long.

In the meantime there are still many complaints as to the quality and selection of the various growths available, but this is doubtless due more to the scarcity of dollars than to any shortcomings on the part of the Raw Cotton Commission. The cover scheme which the Commission has recently introduced will be, it is hoped, of substantial assistance to the trade.

There has been an improvement in recruitment of operatives and agreement has been reached as to a more scientific method of calculating wages in the weaving section. New machinery is, however, very expensive and the question of its acquisition must frequently provoke much searching of heart. Prices of many fabrics are unduly high and it is to be hoped that their producers will keep in mind the importance of exercising restraint in their quotations if they wish to sell competitively abroad. At the same time it must be recognised that the current prices of many utility fabrics, which form a large part of the production for the home market, are extremely unremunerative to all sections of the industry.

At the present time a large quantity of grey cloth is being imported into this country from Japan for re-export in printed form to certain colonial markets. Already delivery of cloth from the printers is very much retarded and the import of more Japanese cloth may increase the period of delay still further. On the other hand Lancashire seems at present to be incapable of making good the grave deficiency of grey cloth, although for colonial markets cheap prints are essential. But whatever circumstances justify these transactions it is difficult, in the light of the inter-war years, to regard competition from Japan with anything but anxiety.

Allowing for the increased domestic production of other countries, it would seem that world consumption is, in the long run, unlikely to lead to any big increase in export demand. In itself this is serious for Lancashire, but the matter does not end there since, as time goes on, we shall have to face more and increasingly keen competitors in markets abroad. For these reasons the industry must persevere in every way to increase its efficiency and the good endeavours of those who have been hard at work during the year in its interests must be recognised.

HAWKER SIDDELEY GROUP, LIMITED

SUCCESSFUL OPERATIONS

The fourteenth ordinary general meeting of Hawker Siddeley Group, Limited, was held on January 18 in London.

Mr Thomas O. M. Sopwith, C.B.E., F.R.Ae.S. (the chairman), in the course of his speech, said: Once again I have the pleasure to report a year of successful operations. Our efforts in the export field have been particularly successful and have accounted for a substantial proportion of the increased trading profits.

In recommending a final dividend of 17½ per cent., making a total of 32½ per cent., less tax, your directors have had in mind the request of the Chancellor of the Exchequer regarding dividend limitation.

This has indeed been a notable year for the British civil aircraft industry, which, with its jet and turbo propeller airliners, shows promise of regaining world supremacy. We have played our part in this. Since our last meeting the Armstrong Whitworth "Apollo" and the A. V. Roe Canada "Jetliner" have completed many hours of test and demonstration flying.

MILITARY AIRCRAFT

The Gloster "Meteor" is still holding its position in the forefront of the world's jet fighters and shows every indication of doing so for some time to come. It is giving good service in five countries. A new and faster model, the Mark 8 "Meteor," is now in full production for the Royal Air Force. Mention must also be made of the "Meteor 7" Trainer, the only two-seater jet trainer in production outside America. Hawker Aircraft Limited still have the "Fury" and "Sea Fury" fighters in production, and an order has been received from the Royal Navy for the "Sea Hawk." Research continues with their P.1052 swept-back wing experimental aircraft.

Last year I referred to the intensive programme of research and development in which the engine division was engaged. This work continues at the same high level of activity and with satisfactory progress. The "Mamba" engine has been developed to higher powers, and is incorporated in prototypes of four aircraft. The "Double Mamba," the first engine of its type in the world, has been produced, and is flying in a new Naval reconnaissance machine. "Python" engine development continues and series production has commenced, the type having been adopted to power a Naval strike aircraft. Work is also proceeding on a pure jet engine, the "Sapphire."

A. W. Hawksley, Limited, have been given authority from the Ministry of Health to make another three thousand houses for this country.

A NEW CAR

During the past year, Armstrong Siddeley Motors have introduced a new 18 h.p. car with a much improved performance. This model was made available for the home market in September last. A special design of body on the 18 h.p. chassis has also been introduced for the overseas market and has been very favourably received, particularly in Australia, Rhodesia and South America.

Our export order book covers various types of aircraft, including Meteors, Lincolns, Lancasters, Ansons, Tempests and Furys, and in addition motor-cars, houses and Diesel engines. Meteors are also being manufactured under licence in Holland for the Netherlands and Belgian Air Forces. I should emphasise that the 1948-9 profits reflect the outcome of exceptional circumstances in export markets. Competition is becoming keener in these markets, and we cannot look for such good results next year.

The report was adopted.

Investment Statistics

Company Notes

F. W. Woolworth.—Net profit for 1949 amounted to £5,020,060 compared with £4,487,247 in 1948. The total distribution for the year—absorbing £2,887,500—is unchanged. This includes a final dividend of 27½ per cent on the ordinary capital as increased by the 100 per cent bonus. Appropriations to reserves are the same as for 1948—£500,000 to development reserve, £750,000 to general reserve and £200,000 for pensions. Carry forward is down from £8,302,032 to £1,286,073 reflecting the capitalisation of £7,500,000 by way of the bonus issue.

Steel Company of Wales.—Trading profit increased from £1,488,278 to £2,113,865 in the year to October 1, 1949. Amount carried to appropriation account was £940,576 (£606,858). The ordinary dividend of 4 per cent (same) will require £268,093 net; after bringing in £321,572 from the previous year a balance of £994,055 remains to be carried forward.

Fisons.—Group trading profit for the year to June 30, 1949, amounted to £1,163,039 (£1,317,374) and net profit to £222,639 (£223,167). A final dividend of 9½ per cent making 12 per cent for the year (same) on the old ordinary capital and a dividend of 2½ per cent on the ordinary stock issued in 1949 are recommended.

Associated Engineering Holdings.—Group profit declined from £802,610 to £736,814 in the year to September 30, 1949. Net profit rose from £209,594 to £241,261. The distribution of 15 per cent for the year is repeated. Net current assets at September 30, 1949, were £1,414,443 (£1,398,345).

Steward and Patteson.—Net profit declined from £106,252 to £91,825 in the year to November 5, 1949. A distribution of 15 per cent is recommended for the year (same).

Associated Motor Cycles.—Group trading profit of Associated Motor Cycles fell from £357,272 to £332,143 in the year to August 31, 1949. Net profit amounted to £135,354 (£146,007). The dividend of 17½ per cent is unchanged. Net current assets were £559,365 (£472,231) at the year-end.

Broom and Wade.—Net profit increased from £259,867 to £305,631 in the year ended September 30, 1949. The dividend of 22½ per cent for the year is repeated.

British Tin Investment Corporation.—Provisional net profit increased from £116,716 to £193,750 in 1949. The distribution has been raised from 10 per cent to 16½ per cent for the year.

Bignells.—Profit before taxation declined from £66,298 to £41,395 in the year to November 27, 1949. The year's dividend has been reduced from 22½ per cent to 17½ per cent.

Ley's Foundries and Engineering.—Consolidated trading profit increased from £442,526 to £521,089 in the year to September 30, 1949. The dividend of 11 per cent for the year is unchanged. Net current assets at September 30, 1949, were £1,256,732 (£1,129,473).

Webbs (Aberbeeg).—Group profit for year to September 30, 1949, amounted to £169,415, £31,733 less than in 1947-48. As already announced, the dividend has been cut from 40 per cent to 30 per cent.

Packing Materials Association.—Group trading profit increased from £157,195 to £191,771 and net profit from £63,033 to £80,105 in the year to September 30, 1949. The distribution of 20 per cent for the year is unchanged.

Ulster Spinning.—Trading profit fell from £108,302 to £59,377 in the year to October 31, 1949. The dividend has been cut from 80 per cent to 35 per cent.

W. and J. Martin.—Net profit declined from £154,498 to £135,805 in the year to November 30, 1949. The total distribution for the year is equivalent to 35 per cent on the capital as increased by the bonus issue, compared with that of 50 per cent on the old capital for 1947-48.

Capital Issues

English Electric.—Lists will open and close January 24th for the offer for sale of £3,000,000 4 per cent debenture stock redeemable 1965-85 at 99 per cent. Ordinary stockholders registered before January 14, 1950, are to be offered 589,789 £1 Ordinary shares at 35s. each in the proportion of one new share for every £6 of ordinary stock held. This issue has been underwritten by Lazard Brothers.

Ultramar.—Meetings of the company have approved the scheme whereby £1,000,000 additional capital is to be raised by a loan of £250,000 from the Finance Corporation of Industry and an issue of £750,000 convertible debentures to unsecured loan and ordinary stockholders at par.

E. Pollard.—It is proposed to issue 45,948 fully paid £1 ordinary shares as a free bonus issue in the proportion of 3 new for every 20 held.

Edward Grey.—Application has been made to deal in Birmingham in the 316,395 5 per cent cumulative £1 preference shares.

BANK of NEW ZEALAND
Incorporated with limited liability in New Zealand

Represented at over 280 points in New Zealand and at Melbourne, Victoria; Sydney, New South Wales; Suva, Fiji; Apia, Samoa.

London Office: 1, Queen Victoria St., E.C.4 O. M. Samuel, Manager.

Head Office: WELLINGTON, N.Z. P. L. Porter, General Manager.

LIVERPOOL EDUCATION COMMITTEE

CITY OF LIVERPOOL COLLEGE OF COMMERCE

(Principal: A. R. BURNETT-HURST, M.Sc.(Econ.), F.S.S.)

Applications are invited for the following full-time appointments:—

HEAD OF DEPARTMENT OF PROFESSIONAL STUDIES

Applicants should possess professional qualifications and/or be graduates in Commerce or Economics. They should have had considerable experience in business administration, together with teaching experience.

Salary: Burnham Scale of Salaries for Teachers in Establishments for Further Education for Grade III Heads of Department, £950 by £25 to £1,050, with additions for training and qualifications.

FULL-TIME LECTURERS WITH SENIOR ASSISTANT STATUS

(1) *Lecturer in Accountancy.* Candidates should be well qualified and able to teach to Final Professional Standard. Preference will be given to Chartered Accountants or Incorporated Accountants with practical and teaching experience.

(2) *Lecturer in Public Administration.* Candidates should be graduates with teaching experience, well qualified to lecture on Central and Local Government and allied subjects up to the Degree and Diploma standards of the University of London.

(3) *Lecturer in Management (with special reference to Transport and/or Export).* Preference will be given to graduates with practical and teaching experience who are qualified to lecture in specialised subjects for the examinations of the professional bodies dealing with Transport, Export, Shipping, Shipbroking, etc.

Salary in accordance with the Senior Assistants' Scale of the Burnham Scale of Salaries for Teachers in Establishments for Further Education. (Men, £700 by £25 to £900; Women, £560 by £20 to £640) *plus* appropriate additions in respect of degree and training).

Forms of application and conditions of appointment may be obtained from H. S. Magnay, M.A., Director of Education, 14, Sir Thomas Street, Liverpool, 1, to whom completed forms should be returned within 14 days of the appearance of this advertisement. Canvassing, either directly or indirectly, will be considered a disqualification.

THOMAS ALKER.
Town Clerk and Clerk to the Local Education Authority.

CITY OF JOHANNESBURG

THREE AND A HALF PER CENT INSCRIBED STOCK 1952

NOTICE is hereby given in order to prepare the Warrants for interest due March 1st next, the BALANCES of the several accounts in the above-mentioned Stock will be struck on the night of February 1st, and that on and after February 2nd the stock will be transferable ex-dividend.

For Barclays Bank (Dominion, Colonial and Overseas),
(Registrar of the above stock),
ROBERT WHYTE, Manager.

Circus Place, London Wall, E.C.2. January 11, 1950.

EXPORT and Business Executive, B.Com. Ten years agric. mach. & mfrs., prewar City Comp. Sec., also acted as engnrs.' buyer. Live contacts overseas importers and confirming houses. Linguist. Age 39. Resident nr. London. Would join existing orgn. or operate independently export dept. for manufacturer.—Box 313

The Economist's Bookshop Ltd.
caters for specialists and students in
Economics and the Political and Social Sciences
11-12 Clement's Inn Passage, Aldwych, W.C.2.
WEST END BRANCH: 30A Bury Street, St. James's

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees payable by instalments, if desired

HUDSON'S BAY SCHOLARSHIPS

Applications are invited for two Scholarships to be awarded by the Trustees of the Hudson's Bay Company Scholarship Fund for study in Canada in 1950. The Scholarships are awarded to encourage the study of business administration, to contribute to the higher education of business executives and to strengthen the links between the business communities in Canada and the United Kingdom.

The value of the Scholarships will be $1,500 (Can.) per annum, plus return transportation expenses between the United Kingdom and Canada, and the normal tenure will be one year, but in exceptional cases this may be extended to two years.

The Scholarships are open to University Graduates, and candidates must be British-born subjects ordinarily resident in the United Kingdom who at the date of applying are over 23 years of age and have not passed their 30th birthday.

Candidates will be selected by a Committee acting [illegible] no scholar will be elected without a personal interview [illegible].

In exceptional cases the Selection Committee may recommend awards to candidates who are not University Graduates but who, in the opinion of the Committee, have other qualifications fitting them for the kind of study for which the Scholarships are designed.

Full particulars and form of application, which should be submitted not later than February 21, 1950, may be obtained on application to the Secretary, Hudson's Bay Scholarships, Beaver House, Great Trinity Lane, London, E.C.4.

LEVERHULME RESEARCH FELLOWSHIPS, 1950

Application is invited for Fellowships and Grants in aid of research. The Fellowships and Grants are intended for senior workers who are prevented by routine duties or pressure of other work from carrying out research. They are limited to British-born subjects normally resident in the United Kingdom. In exceptional circumstances the Trustees may waive the condition as to residence.

The Trustees are also prepared to consider applications from groups of workers engaged upon co-operative programmes of research, particularly from those engaged upon long-distance programmes or in institutions in which the normal facilities for research have been curtailed by the war.

The duration of the awards will not normally exceed two years or less than three months, and the amounts will depend on the nature of the research and the circumstances of the applicant.

Forms of application may be obtained from the Secretary, Dr L. Haden Guest, M.C., Leverhulme Research Fellowships, 7 Bedford Row, London, W.C.1.

Applications must be received on or before March 1, 1950. Awards will be announced in July and will date from September 1, 1950.

Full Employment

FULL employment has become a categorical imperative for all democratic governments. That is the legacy of the Great Depression. Fifteen years before the Charter of the United Nations was drawn up, it would have been inconceivable that any government—let alone all of them—should have been willing to accept an obligation "to take joint and separate action" to secure full employment. Now even if this pledge were not down in black and white no government, for purely domestic reasons, dare give even the appearance of indifference to full employment. Last year, the Secretary-General of the United Nations appointed a group of economic experts—drawn from the United States, Great Britain, France and Australia—to determine by what means governments could be recommended to set about redeeming their pledge, and their recently published report provides a useful opportunity for taking stock. We are all pledged to maintain full employment. But do we know how to go about it?

The first essential for the cure of any malady, physical, social or economic, is to have a clear diagnosis and understanding of its nature. The authors of the report have no doubts on this score. Though they recognise other causes of unemployment, they find the main cause of general depressions in a periodic lack of effective demand. And the main cause of this, in its turn, they find in a recurring tendency to divergence between the decisions of those individuals and organisations who do the community's saving and the decisions of that other set of individuals and organisations who initiate its expenditure on capital and other durable goods. In short, their diagnosis is confidently Keynesian, and their remedies consequently all partake of the nature of devices for maintaining an even flow of effective monetary demand for current output.

In this general approach the authors undoubtedly correctly represent the majority opinion of economists (and of the informed public) in the free countries. It is as right and proper as it is inevitable that an international commission of economists should adopt a Keynesian approach to the problem of full employment. On the other hand, it is doubtful whether most economists would be quite so confident, not to say cocksure, about the complete and exclusive validity of their thesis. Keynes worked out his ideas, in the main, during the years of the Great Depression. Economists find them intellectually satisfying; but they would do well to remember that there has been no opportunity yet of discovering whether they really do work in practice, or of finding out what are the unexpected repercussions to which the Keynesian remedies may give rise, just as some of the wonder-working new drugs are discovered to have reactions in practice that were never suspected in the laboratory. The economists may think they know how to prevent, or halt, a major depression. But they have no right to be sure until it has actually been done. Until then, these ideas remain in the blueprint stage.

There are, indeed, some doubts that even a convinced Keynesian can feel about such a rigid and exclusive presentation of the case as this report makes. In the first place, not all depressions are alike ; indeed, it could be said that no two arise in exactly the same way or take exactly the same course. The authors of the report make some acknowledgment of this variety of experience; but the main structure of their report is obviously directed to one sort of depression in one sort of country. Thus they make a lot of the necessity for the automatic inception of a number of methods of stimulating effective demand as soon as rising unemployment gives an automatic danger signal. But what if the unemployment is due to the inability of an inflating country to pay for its necessary imports of raw materials ? To stimulate still more internal inflation in such a case would be the very reverse of the right policy. And if circumstances can alter cases, what becomes of the automatic policy ?

*

Or again, is it right to wave aside the possibility of depressions being caused by real distortions in a country's economy—distortions either in its industrial structure or in its structure of wages, prices and costs—and to believe that, given the maintenance of effective demand, they will cure themselves ? Professor J. M. Clark contributes an addendum to the report in which he asks this question and points out that, for example, employment may sometimes be increased by raising wage rates and sometimes by lowering them. His colleagues express general agreement with his note; but if so, they should have gone on to devote more than a dismissing sentence or two to meeting his point.

Nor does the report fully meet another of the doubts that is widely felt about the practical consequences of Keynesian economics. It points out that " if labour unions, farmers' groups, trade associations, cartels or business monopolies press for increased earnings in such a way as to produce a continuous upward pressure on prices " the full employment policy will be ruined. But the only suggestion for dealing with the matter is to say that " it might be necessary for governments, jointly with labour unions and representatives of management, to take action so as to ensure that such wage increases as may be granted will not lead to an inflationary price spiral." These are meaningless words. Yet this may turn out to be the crucial weakness of the whole Keynesian structure. Given the political pressure on governments to adopt an extreme definition of " full employment " and thus to put all sellers, including the sellers of labour, into an impregnable bargaining position—given also the existence of Mr John L. Lewis—the pursuit of full employment is in danger of turning into the creation of permanent inflation. Experience suggests that, of the three objectives—full employment, stable prices and free collective bargaining—it is possible to have any two, but not all three, certainly not in their full versions. Surely the choice that this imposes is one of the crucial central issues of employment policy which cannot be as easily dismissed as the report leaves the reader to suppose.

Still another theoretical doubt that one cannot help feeling about the full employment policy as here presented relates to the doctrine of compensating fluctuations. Private spending, and particularly private spending on investment, should be stabilised as far as [illegible] the argument runs—but if nevertheless it fluctuates, the spending of the government and its agencies should be made to fluctuate equally and inversely. This, as a method of maintaining a steady flow of effective demand, this is obvious common sense. In practice it means that resources rendered idle in one use are to be transferred to another, and then transferred back again when the depression is arrested. " Resources " mean men and women with votes. Is it likely to be very easy in practice?

*

These are some of the doubts and hesitations that many people feel about swallowing the thesis whole. But to say this is not to imply that the report does not serve a useful purpose. On the contrary, since this is one of the problems that must be solved if the democratic world is to survive, it is all to the good that Uno is actively concerning itself with it. In particular, the authors deserve gratitude for their illuminating discussion of the ways in which effective demand can be maintained between nations. The task of the International Bank, as they see it, is to ensure a steady flow of international long-term investment, to lend such an amount, year by year, as will, together with private international lending, make up a stable total. The Bank could hardly do this and maintain its present commercial principles ; profitable projects do not present themselves to the same total every year. But the economists are right in thinking that this is the contribution that long-term international lending can best make to full employment.

For the International Monetary Fund, the report has most ambitious and ingenious proposals. When one country begins to suffer from unemployment (and the report clearly has the United States in mind), it cuts down its purchases from other countries. They, finding themselves short of dollars, cut down their purchases from America. So the spiral begins to turn. This could be prevented if other countries could go on buying from America even though American purchases of their goods were reduced. But for this they must have dollars. Therefore, says the report, let the United States make available, through the Fund, the dollars that other countries would have earned if there had been no recession in the United States. Even as a theoretical conception, this needs thinking about ; but it is a new idea in what has hitherto been a rather barren field.

*

The next step for the United Nations should be to submit the report of the economists to a commission of practising politicians and administrators. For, as anyone knows who has had any contact with administration, the difficulty of knowing the right thing to do, and of giving a clear logical explanation of its rightness, is as nothing compared with the difficulty of getting it done. There is still a great deal to be done before the politicians, for all their abstract devotion to full employment, are really ready to do, promptly and in sufficient measure, what the economists tell them to do—even if it be supposed that the economists are quite sure what they want to have done. It would be interesting to have an experienced Washington correspondent go through the report, underline every sentence where governmental action is recommended, and give his down-to-earth opinion of the practical likelihood of that action being taken. The ingenious scheme for allowing other countries to have, in years of American recession, the dollars they would have earned if there had been no recession—to take one example—involves a commitment by Congress to appropriate the dollars, a commitment unlimited in time and amount. What are the prospects of selling this idea to practical American politicians ?

Even in countries which more fully accept the purposive direction of their economies, there are still some practical political difficulties to overcome. The report makes the point that any full employment policy must, if it is to succeed, be capable of going into reverse when inflation threatens. It says that " consumers' expenditure can be raised or lowered by changes in taxes or in certain kinds of government expenditure." The lowering of consumers' expenditure by deliberate action is not a wholly impossible political action ; but it is certainly not an easy one. Again, is it safe to assume that the investment policies of public corporations can easily be made to serve the purposes of a stabilising policy ? To take an imaginary instance: a period of full employment, bordering on inflation, is likely to be a time of heavy demand for electric power, and thus of urgent (apparent) need for heavy capital expenditure on extending generating capacity ; what happens if the head of the electricity authority is a strong personality with more powerful political connections than the economic forecasters can command ? And what if the forecasters are wrong in their forecasts, as has been known to happen ?

There is thus a long way still to go, in theory and in practice, before there can be any certainty that the pledge of full employment can be honoured. Perhaps the greatest present threat to it lies in the over-confidence of governments that they have mastered the trade cycle. Mr Truman thinks he halted the incipient American recession of a year ago ; but the promptness of private business in adjusting its prices was probably far more effective than any governmental action. Sir Stafford Cripps, in his devaluation broadcast, wondered how many of his listeners realised what " a hard and difficult struggle " it had been for the Labour Government to maintain full employment since the war—when, of course, the only efforts that have in fact been needed have been to limit the effects of an inflation that they inherited from the war.

If the politicians think it is so easy, they may have surprises coming. It is undeniable that great advances have been made in the past decade in working out methods of combating unemployment and in securing general acceptance of them. But nobody can say how effective they are until they are put to the test. That day is surely coming, but it has not yet arrived. Until it does, economists might be recommended to approach the subject of full employment with a due meed of humility, and politicians of caution.

Indonesian Prospects

THE new Republic of Indonesia has a great opportunity. It has come into being at a moment when the struggle between Communists and anti-Communists in South-East Asia is just beginning in earnest, and when the world's attention is focused on the whole region to a greater degree than at any time since the brief, unhappy period of Japanese advance in 1941. The Indonesian Republic is at present strongly anti-Communist in its social and political structure, the record of its leaders and its internal policies. And it may well be that, when the new state comes to formulate its external policy, it will not only throw its weight deliberately into the scales of anti-Communism, but will have a good deal of weight to throw, since its influence on the minds of surrounding Asian peoples is likely to be considerable. If this occurs, Indonesia is assured of a future in the full glare of world attention and with the hope of substantial western economic aid during the next few years.

It is, however, by no means yet certain that Indonesian foreign policy will in fact be so decisively anti-Communist —in spite of the attitude already adopted, first by the former Republican government in Jogjakarta towards the Indonesian Communist Party (PKI) and now by Djakarta towards both the Tan Malakka and Stalinist rebels in east and west Java. It was significant, for instance, that delegates from the Indonesian trade union organisation, attended the recent crucial conference in Peking of the Communist-run World Federation of Trade Unions (WFTU). Admittedly this happened some weeks before the transfer of sovereignty by the Dutch, but the decision to participate in the Peking plot—at which a revolutionary programme for South-East Asia was drawn up—was taken by acclamation. This trade union organisation, moreover, still claims an active membership of over 200,000, mostly in Java and Sumatra. At the same time, although it is still an obvious target for Communist influence and although it played a powerful, fellow-travelling role in the early days of the Republic, it is not now by any means a dominant voice at Djakarta. Indeed, there is good reason for hoping that the successes already obtained by the little group of four or five ruling statesmen will have given them considerable freedom of political manœuvre at least during these first few formative months. They will need to consolidate the new state quickly, before repercussions are felt from the Chinese Communist victory ; these have so far been surprisingly slight in Indonesia.

Throughout the final stages of settlement between the Dutch and the Indonesians, the example of India was much in the minds of both sides. The Indonesian leaders made a close and personal study of the way power had been transferred in India and of what happened afterwards. But the present rulers of Indonesia might be making a dangerous mistake if they now continued to follow India's lead too far, and into the realms of foreign policy. For while India can possibly afford for a time to be anti-Communist at home but neutral abroad, Indonesia cannot. It is situated far nearer the new Chinese magnet, it has a Chinese minority of more than 1,500,000, and thanks to the chances of history and the Japanese occupation, it has reached power with an administrative machine much inferior to that of India. So different, in fact, is Indonesia's position from India's on the morrow of independence that, in spite of the legitimate optimism engendered by the achievement of peace and sovereignty during the past few months, there are even now several quite distinct guerrilla actions going on against the authority of Djakarta—those of the *Dar*

ul Islam religious movement, of the various mutually dissident Communists and of the buccaneering Dutchman, Mr Westerling, in west Java, who has the sensational occupation of a number of towns to his credit.

Indonesia may some day rank with Communist China and democratic India as a major Asian power, a claimant for the support and loyalty of peoples in the little countries of South East Asia—Burma, Malaya, Siam and Indo-China—which between them have a smaller population (68 million) than the 76 million of Indonesia alone. Indeed, the first signs of Indonesia's influence on fellow Malays may already be only just round the corner. But at present, the political character of the new state has yet to be tested under the strains of real independence; its nature is still authoritarian and traditional rather than either democratic or Communist. The success of the Djakarta government, both in standing up for itself against Communists at home and in thus encouraging similar resilience among its neighbours, must in the first instance depend on the continued exercise of effective political control by its present rulers, as well as on the country's full economic recovery.

The one depends very largely on the other. There can be no economic recovery without the restoration of order and confidence; indeed, the prime object of Mr Hatta's government should be to make the country safe again. Equally, without economic progress Mr Hatta's government is unlikely to thrive—or even survive—in the face of pressure from Moslem extremists on the one side and the left wing on the other. At present, the position is reasonably favourable. On the political side, the country is in the hands of the best caretaker government available, directed by President Soekarno and an inner group of four—the Premier, Mohammed Hatta, together with the Sultan of Jagjakarta, Anak Agung and Sultan Hamid. The only outstanding Indonesian personality not in the administration is Mr Sutan Sjahrir, the leader of the two year old Socialist party; but he no longer opposes the policy of conciliation with the Dutch which led to The Hague conference. Instead, Mr Sjahrir now regards himself as the nucleus of a constitutional opposition.

In Djakarta itself the atmosphere is one of cautious relief that the transfer of sovereignty has passed off so well; and President Soekarno has done much to strike a new and friendly note, for instance, by making speeches in Dutch. Hundreds of Dutch officials are co-operating loyally with Mr Hatta's new government, which for its part, has shown a high sense of realism and statesmanship in not proposing to hustle them out of their posts until Indonesians have been trained; some of the government's followers, however, are trying to accelerate the process in a rush for jobs for themselves. Theoretically, there will be elections for a constituent assembly within a year but in fact the delay will probably be longer. Although Indonesia is composed of several separate races and they have by no means dropped their individual nationalism, there is already a tendency to recede from the excessive federalism which was inherited from the events of the past few years. In most parts of Indonesia, peace reigns; real trouble is at present mainly confined to Java.

No one could pretend that the future of Indonesia is assured; it is most uncertain. But the objective, both for the Indonesians themselves and for their customers abroad is clear: to return as quickly as possible to prewar levels of production and trade. Before the war, these rich islands produced 37 per cent of the world's rubber, 27 per cent of its copra, 25 per cent of its palm oil, and 15 per cent of its tin. They then only produced 3 per cent of the world's oil, but Indonesian reserves are now reckoned about fifth in global importance. Among other commodities in universal demand, the territory also produces manganese, bauxite, copper, lead, thorium, sulphur, cocoa, asphalt, coal, iron, platinum, sago, camphor, silver and phosphates. Before the war, foreign investments were worth some £350 million, of which 75 per cent was Dutch and much of the rest British and American.

In the light of the fact that the struggle for independence has been going on all the time, Indonesian exports have made a brave showing in the last three years. But the figures apply mainly to the federal territories, formerly administered by the Dutch—of which the main areas are Borneo, Celebes and East Indonesia—not the Jogjakarta republic which was confined principally to Java and parts of Sumatra; comparison with 1939 indicates how far there is still to go, if the new state is to exceed prewar performance and raise the standards of its people. The figures for 1949 should show an improvement over 1948, but they are not yet all available. Accordingly, some guide is provided by the total volume of exports up to and including 1948; in 1940, they were 9,000,000 tons, in 1946 300,000, in 1947 1,200,000 and in 1948 5,200,000 tons. On the prewar pattern of trade, 41 per cent of the export value came from estate agriculture, mostly rubber and sugar, 30 per cent from petroleum and mining, and 25 per cent from native production of, for instance, rubber and vegetable oils. Latest available figures of annual production and export rates give an idea of the decline in various commodities. Copra exports have been running at 240,000 tons compared with a prewar 600,000 tons and palm oil at 40,000 against 200,000 tons. Tea production has been at 16,000 tons compared with 80,000, sugar at 150,000 against 1,700,000 tons, and coal and coke at 540,000 against 1,780,000 tons.

The most crucial economic question for Indonesia is whether and how much American aid it will receive. At least $100 million is hoped for in the first year—Dr Djuanda, the Economic Minister, has already flown to America to ask for $500 million. And it is certainly in the direct interest of the United States not to stop the temporary flow of unearned dollars—hitherto channelled through the Netherlands' Marshall aid—particularly at this moment when a new and precarious chapter has opened. But none of this should excuse the Indonesians themselves from putting all their strength and political good sense into the work of reviving a country which is now their own. Their problems are by no means insuperable. They have a wealth of skilled and willing foreign experts to call on and have inherited some well-founded plans for long-term improvements to the Indonesian economy. The natural resources of their territory are much greater than elsewhere—it was the lure of the spice islands and the wealth of the fabulous East which over three hundred years ago first drew the Dutch, whom they have now supplanted. In fighting and negotiating for their independence, the Indonesians have shown a determination, courage and sagacity, which has impressed and indeed astonished many who had known them in previous years. Now, above all, is the time to reapply and develop those qualities to the full.

Parliamentary Retrospect—III

Making the Laws

TWO previous articles, which have dealt with the structure of the parties in the House of Commons and with the mechanism of cabinet government, have advanced the thesis that the Labour Government have not been revolutionaries but have merely extended and adapted the use of existing institutions. The same can be said of their effect on the procedures of legislation. A Government containing Sir Stafford Cripps, who before the war prophesied that a Labour Government could only force its programme through by suspending the ordinary constitutional safeguards, has in fact done little more than continue the age-old process of adapting the British constitution to the needs of the time.

In a review of the changes in the machinery by which the House of Commons discharges its functions, the process of adaptation can be clearly seen. One of the first acts of the new Labour Government was to set up in August, 1945, a Select Committee on Procedure. At that time Mr Herbert Morrison stated formally what had long been the view of Labour theorists. "Delegated legislation," he said, "has increased, will increase, and ought to increase"—thus inverting the words of Dunning's famous resolution and converting what had long been considered an undesirable feature of modern parliamentary government into a declared aim of official policy. But the decision to revise the procedure of the House was less revolutionary than Mr Morrison's words might suggest. It arose from an inquiry inspired by the Coalition Government, which had expressed concern over the amount of business which the House of Commons—and, indeed, Parliament as a whole—would have to cope with after the war. The scope of governmental activity and of parliamentary interest has grown so enormously that some changes in procedure would have been necessary, whatever the government in power.

The main alterations in the procedure of the House of Commons, whether recommended by the committee, or put forward by the Government itself, were adopted as part of the Standing Orders of the House in 1947. They are of two kinds—devices for expediting the passage of legislation, and those for improving the discussion of policy and finance. The chief method for achieving the former was to increase the use of the Standing Committee system—that is to say to throw more and more of the work of discussing the detailed provisions of a Parliamentary Bill into a small permanent group of members sitting "upstairs." The limitation of Standing Committees to five had already been removed, the number of permanent members of each committee reduced from thirty to twenty, and the size of the quorum lowered. Under the new Standing Order the system known as the "guillotine," the setting of a time limit to the consideration of each section of a Bill, which has been used on the floor of the House since 1881, was made applicable to Standing Committees, a business sub-committee being empowered to draw up a time table for the business of the committee. As a result of this the "guillotine" was applied to several nationalisation measures in Standing Committee, a constitutional precedent of great importance.

Under the second head—the discussion of policy and finance—the new Standing Orders increased the number of supply days from twenty to twenty-six and simplified the rules governing them. This has not, in the event, led to an extension of the capacity of the House for general debate, since the increased time has been absorbed by the far wider range of subjects to be discussed. There have been two further modifications in procedure as it affects the debating of policy. In the first place, the decision to consolidate the debate on the Budget resolutions has speeded up the yearly discussion on finance, or, rather, it has ended the duplication of debate on the financial resolutions and on the Finance Bill itself. In the second place, one of the perennial grounds of grievance—the tendency of a predominantly English assembly to neglect the affairs of Scotland—has been partially removed by widening the scope of the Scottish Grand Committee. Scottish Bills are now given a purely formal second reading in the House as a whole and the real debate takes place in the Scottish Grand Committee (to which all the members for Scottish constituencies belong); estimates relating to Scotland are also referred to it.

An allocation of time for private members' motions—one of the casualties of wartime—has not been restored, and facilities for private members' Bills were not given until nearly the end of the Parliament. On the other hand, private members have gained from a prac-

£1,000 ON RETIREMENT . . .

. . . at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12*s.* 6*d.* from age thirty. Only £4 18*s.* 4*d.* more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

OUTSTANDING VALUE IN LIFE ASSURANCE

tice of the war years which has been continued—that is, the half-hour debate on the motion to adjourn at the end of each night's business. These adjournment debates often arise out of question time, and are perhaps best regarded as an extension of it, since they almost always consist of the airing of a grievance and the statement of the ministerial reply.

This development is significant, for it illustrates a trend that goes back far beyond recent years, though it has recently been speeded up. It is not as a legislature, or even as a place where legislation is discussed, that Parliament is now most important. Most of the new law is made by the Government Departments under General Enabling Acts; and even when a project of law takes the form of a parliamentary Bill, important parts of it are either not discussed at all, or only in Committee, of which no effective report reaches the public. But as Parliament's function as a legislature is weakened, its functions as a tribunal of review grow in importance. Question hour and the adjournment debate for details, supply days for principles, are now the times when Parliament's main work is done.

★

From this point of view, it is particularly serious that no satisfactory method has been found by which Parliament can discuss the affairs of the new public corporations and nationalised industries. No uniform procedure has been followed in the answering of questions on these organisations; the broad rule has emerged that a minister should not answer questions on matters of their day-to-day administration, but only on matters of major policy; but this is a line that has proved difficult to draw in practice. There are annual debates on the reports and accounts of the boards and corporations, but these are issued only after a considerable lapse of time and there is no method by which Parliament can ascertain whether current policy is going astray. Some kind of Grand Committee for the nationalised industries could be evolved, but this method would have its own danger. The debates on the affairs of the Overseas Food Corporation have revealed the extent to which it is possible to thwart parliamentary curiosity. There is a risk that, unless some satisfactory basis for discussion can be worked out, the House will acquire a professional suspicion of the public corporations which will inevitably be reflected in the public attitude.

Another and obvious constitutional development is the alteration in the relations between the House of Lords and the House of Commons. Not only has the veto period been formally reduced from two years to one, but, equally important, after nearly forty years of quiescence, the House of Commons has again formally brought its overriding powers into use. But, quite apart from the enhanced reputation of the Upper House as a debating chamber, it has come to acquire a new importance as a revisory committee on the details of legislation. The Labour Government have made full use of its reserves of ability and leisure to improve legislation. This is one way in which the load of detailed work placed on the Standing Committees of the House of Commons and on the House itself has been transferred.

★

But to turn from the way in which Parliament has modified its procedure to the more fundamental question of the relations between the executive and the legislature is to find far less ground for satisfaction. It is very easy to place a wrong emphasis upon the growth of the executive power. But Bagehot and Dicey in another age, Lord Hewart and Mr C. K. Allen in our own, have in their turn pointed out the dangers of the growth of an irresponsible executive power masquerading under the guise of parliamentary government. And there is no doubt that in the past five years the Labour Party in office have shown not only no concern for this problem, but an obvious disregard for it. This is partly due to genuine conviction—to a knowledge that in the past the safeguards of liberty as expressed in constitutional forms have been used to obstruct social and economic progress.

Whatever their origin there have been three developments which give the students of English constitutional liberties cause for continuing anxiety. In the first place, there has been during the past five years a further and rapid extension of delegated legislative powers. In 1948, for instance, Orders of different kinds were being issued at the rate of fifty-five a week, with more than three hundred officials in eighteen departments having power to sign them. (The situation has improved a little since then.) The complexities of these Orders and the delays in publishing them have been the subject of many questions in the House of Commons. But although parliamentary control over such delegated legislation has been redefined under the Statutory Instruments Act of 1948, the means by which Parliament can exercise an effective control over delegated legislation are still inadequate.

★

The second development is the further growth of the *droit administratif*, based on the presumption that the interests of the state are superior to those of the citizens, and that the actions of officials are not to be judged in accordance with the ordinary law of the land. This is exemplified in the National Health Service Act of 1946 under which a doctor has no appeal to the courts if he is dismissed from the health service. It can be seen in the continuation of the wartime tribunals under the Agriculture Act of 1947, instead of permitting disputes between farmers and the county agricultural committees to be heard in the courts. It is present in the action of the War Office with regard to the requisitioning of land for training, and it is most clearly exemplified in the machinery of town and country planning. In a whole mass of modern legislation, the aggrieved citizen—and he may be aggrieved to the extent of losing his property or his livelihood—has no appeal but from one official to another.

The third fact which has caused considerable uneasiness is the continued existence of the Supplies and Services Act which has perpetuated the bulk of the wartime defence regulations. It was passed for five years in 1945 and was amended in wide and vague terms in 1947, apparently for the sole purpose of raising public morale during the convertibility crisis of that summer. It is the declared intention of the Labour party to continue the substance of its provisions if they are re-elected. It remains as a dangerous reserve of irresponsible power, and a constant source of temptation to ministers.

★

The most striking single fact that emerges from a retrospective glance at the activities of the last parliament is that there has been much less alteration to the fundamental structure of politics and government than might have been expected when the Labour party was swept into office. As far as the machinery of government and of the constitution is concerned, it is fairly clear why the Labour party did not have to adopt the revolutionary measures which they had propounded during the thirties. The increase in the power and the scope of government had already, under the stress of the war, been undertaken for them, and it was merely necessary to carry on the bulk of the wartime legislation and methods into the era of reconstruction. It remains to be seen to what extent the Conservative party, when in office, could, in fact, simplify the processes of government and extend the areas of individual liberty—in the past, it has shown scant respect for the principle of parliamentary control. It remains to be seen whether a Labour party returned to office would feel sufficiently secure to remove the more objectionable and totalitarian measures still on the statute book. They might both recall Bagehot's words, "The characteristic danger of great nations, like the Romans or the English, which have a long history of continuous creation, is that they may at last fail from not comprehending the great institutions which they have created."

Personal Incomes—II

Changes in Wages

WAGE records in most industries go back over many years. As with nearly all such information, however, comparison becomes less exact the longer the period over which it is made. This article discusses some of the changes in wages over the last thirty-five years and more particularly since 1938. Figures are given with apparent precision because it would be monotonous to prefix each with the word "about," but that is the sense in which they should be read. For even the most up-to-date statistics about wages do not claim to be comprehensive—and yet they are a considerable improvement on some of the earlier ones with which they are compared.

At the outset, it is important to distinguish between wage-earnings and wage-rates. Wage-earnings measure the size of the actual pay packet—"take home pay," as the Americans call it—while wage-rates are the recognised standard rates of pay in certain trades which are fixed by collective agreements or statutory orders. A wage-rate may be the price paid for an hour's work or for a certain output, but in Britain it is usually taken to be the rate of payment for a week of normal working hours—that is, the number of hours beyond which overtime rates are payable. On this basis, movements in the average level of weekly wage-rates are expressed as an index number showing the percentage changes since a certain date. In industries where there is much piece work, the movement of piece rates of wages is also taken into account. The resulting index number is often incorrectly believed to show differences in the actual wages being paid. It does not do this. In fact, it measures a somewhat hypothetical quantity because it does not take into account any redistribution of the labour force since the year on which the index is based. Consequently, earnings and rates of pay may diverge quite considerably, and have, indeed, done so in the last ten years.

A table in the previous article in this series showed that in April, 1949, the average earnings of all manual workers in the principal industries (excluding agriculture, coal-mining and railways) were 124 per cent higher than in 1938. In these same industries, the corresponding rise in wage-rates was only 73 per cent. Not all of this divergence occurred in the war period. In the two years from April, 1947, wage-rates rose by 8 per cent and earnings by 15 per cent. Overtime pay and bonuses account for some of the gap between the two series of figures, but probably most of it is due to a combination of such factors as the movement into higher-paid occupations, the up-grading of workers within industries, changes in the relative proportions of men and women and of the numbers on time and piece rates. Also, a higher output from piece workers would raise their earnings but not affect the measure of wage-rates.

The trends of wage-rates and wage-earnings can be traced over a longer period than the last ten years, although with less certainty that like is being compared with like. Information about earnings before 1938 is mainly limited to that collected at the Censuses of Production. For wage-rates, there are two well-established index numbers—one compiled by the Ministry of Labour and the other by Sir Arthur Bowley, which is published by the London and Cambridge Economic Service. The difference between the two index numbers shown in Table I is surprising only in that it is not greater. For not only do the two series differ in scope and construction, but there have been alterations within the same series. For instance, the official index published at the present time started in 1947 on a revised basis and the link with the earlier estimates can only be approximate.

Table I shows that, ten years from the outbreak of each world war, the level of wage-rates had risen relatively about the same extent. However, the movement within each decade was very different. Wage-rates—and prices—rose very sharply until 1920, but then declined;

TABLE I—MOVEMENTS OF WAGES AND PRICES, 1914–1949
(Indices, 1938=100)

	1914	1924	1938	1948	1949

The cost of living index is the one published by the London and Cambridge Economic Service. It consists of the Ministry of Labour working-class cost of living up to 1938 and since then LCES estimates based on consumption prices given in National Income White Paper. Earnings are at a particular date each year; other figures are mainly annual averages.

today they are higher than at any time in the last ten years. "Real" wage earnings—that is, money earnings after deflation by retail prices—seem to have been gaining fairly steadily over the last thirty-five years. The wage-earner's power to buy goods increased some 10 per cent from 1914 to 1924, some 20 per cent from 1924 to 1938, and a further 27 per cent from 1938 to 1947. These figures are for the average wage-earner at work, no account being taken of unemployment or of changes in the balance of men, women and juveniles. Nor has any deduction been made for taxes.

How did the relative fortunes of men and women fare in this period? In the larger part of the industrial field, the jobs being done by men and women are very different, but there is an overlap in certain industries, notably cotton weaving, clothing and certain sections of engineering. Equal time-rates for both sexes occur very rarely—if ever—and where piece rates are in force, they nearly always result in lower payment for women. But the relation between men's and women's earnings is changing. Between 1914 and 1924, average weekly earnings of men increased by 91 per cent and of women by 112 per cent. Table II shows what happened in the

TABLE II—AVERAGE WEEKLY EARNINGS, 1938–1949

April, 1947	79	107	81	117	94
April, 1948	94	124	119	161	114
April, 1949	103	137	124	173	124

second world war and following it. Again, earnings of women went up proportionately more than those of men. So did those of juveniles. Between 1938 and 1949, the proportion of a woman's average weekly earnings to a man's average weekly earnings rose from 47 to 55 per cent. On the same basis the proportion of youths' and boys' earnings increased from 38 to 42 per cent and girls' from 27 to 36 per cent. Because of the longer hours worked by men, the ratio between hourly earnings is not the same. Both men and women are now working less hours than before the war. The hours worked by those women returning particulars of their earnings averaged 41.8 a week in April, 1949, compared with 43.5 in October, 1938; the corresponding hours for men were 46.6 a week in 1949 and 47.7 in 1938. The average hourly earnings of women in April, 1949, were 62 per cent of men's compared with 52 per cent in 1938. Shortage of labour obviously puts a premium during wartime on the services of women and girls, but the trend towards more equal pay has continued since 1945.

It is not quite so easy to determine what has been happening to wages in different trades. Owing to a change in industrial classifications of firms, earnings in various industries cannot be compared with prewar figures at a date later than April, 1948. In the range of industries covered by the special inquiries into earnings, the two industrial groups in which men's earnings had shown the biggest increases since before the war were textiles (121 per cent) and iron and stone mining and quarrying (118 per cent); the two lowest were Government industrial establishments (66 per cent) and paper and printing (71 per cent). For women, the largest increases were in transport and storage, excluding railways (178 per cent) and bricks, pottery and glass (151 per cent); the two lowest were Government industrial establishments (77 per cent) and leather and fur (104 per cent). These percentage changes show (with a few exceptions) that the lowest-paid trades of before the war have had the biggest increases—that is, that a levelling-up process has been going on. But there are still large differences in actual earnings. Some of the largest pay

packets for both men and women in April, 1949, were received by those employed in the manufacture of motor vehicles and cycles. For men in this industry average weekly earnings were 170s. and for women 97s. Statistics provided by the National Coal Board and the National Dock Labour Board (which are excluded from the Ministry of Labour's survey and, therefore, from the average figures quoted above and in Tables I and II) showed that in April, 1949, the weekly cash earnings for

TABLE IV—SKILLED AND UNSKILLED WAGE-RATES

Skilled Occupation	Labourer's Minimum Wage Rate as Percentage of Skilled Rate			
	1914	1924	1939	1949
	Per cent	Per cent	Per cent	Per cent
Fitter and turner	59	71	75	86
Shipwright	55	69	72	83
Bricklayer	71	75	75	80
Engine driver	67	75	72	88

men in coal mining averaged 167s. and for all classes of dock labour 173s. 9d.; in April, 1938, men's earnings in coal mining averaged 58s. 8d. The highest earnings for women recorded in the Ministry's survey were 108s. a week in the tramway and omnibus service. Towards the lower end of the scale, weekly earnings in national and local government service averaged 115s. 8d. for men and 69s. 3d. for women.

Too much should not be read into the differences in average earnings in industry since there are wide variations in the proportions of skilled and unskilled labour. Some further information—this time about wage-rates and going back as far as 1914—has been provided by Sir Arthur Bowley and some of his estimates are shown in Table III. In the decade from 1914, dock-labourers doubled their wage-rates but coal miners' increased by little more than one-third. In the last ten years, the highest increases have been for coal and agriculture. The divergence between industries appears to have been even more marked in the second world war than in the first—although the wider scope of the statistics today may have something to do with this.

Two results of Table III are of particular interest—those showing that bricklayers' and engineers' labourers have had relatively higher increases than the skilled men in the same trade. Table IV shows this even more clearly. In both war periods, unskilled labour gained on skilled. This has sometimes been brought about by all grades receiving the same cost-of-living bonus, this raising the lower rates in greater proportion than the higher ones.

The last table in this article compares some wage statistics in different countries. Direct comparison between countries should be made with caution since the scope of the statistics varies. For instance, the cost of living index used to deflate earnings in the United States is a consumers' price index for moderate-income families in large cities; for the United Kingdom it is the working-class index estimated by the London and Cambridge Economic Service. Nevertheless, it is felt that the figures are sufficiently interesting to be worth publishing. Because the working week has lengthened in the past ten years in the United States but shortened in Britain, comparison of weekly earnings would put the "real" earnings of the United States at about 46 per cent above 1938 as compared with 27 per cent in this country. For countries where skilled and unskilled earnings are distinguished, the same relative rise in unskilled earnings can be generally observed as occurred in Britain.

TABLE V—WAGE-EARNINGS IN MANUFACTURING IN VARIOUS COUNTRIES
(Indices: Prewar; 1938 or 1939=100)

Country	Postwar Date	Scope of Index	Index of Earnings (Prewar =100)	Index of Earnings adjusted by Cost of Living (Prewar =100)
Hourly Earnings				
Germany, Bizone	June, 1949	All workers	150	94
		Men	151	95
		Women	164	103
Netherlands	Nov., 1948	Skilled men	193	92
		Unskilled men	222	106
Sweden	1948	All workers	190	124
Switzerland	Oct., 1948	All workers	201	124
		Skilled men	180½	111
		Unskilled men	196	121
		Women	221½	136
U.K.	Apr., 1949	All workers	231	133
		Men	207	119
U.S.A.	Nov., 1949	All workers	222	133
Daily Earnings				
France	1948	All workers	1,810	94

This lowering of differentials between skilled and unskilled labour is an important movement in the wages structure, and was given a sharp impetus by the second world war. Whether or not the tendency is to be encouraged is one of the problems which wage policy must decide—but which is outside the scope of these articles.

NOTES OF THE WEEK

The Conservatives' Kick Off

The only important contributions to the development of the general election campaign during the past week have been Mr Churchill's broadcast last Saturday and the issue on Wednesday of the Conservative manifesto "This is the Road." With the Gallup poll recording a decline in the electorate's preference for the Conservative over the Labour party from ten per cent in November to two and a half per cent in mid-January, it is obvious that the Conservatives must move very warily. The need for caution was evident in Mr Churchill's broadcast which—by Churchillian standards only—was a restrained and even rather bloodless affair. This, perhaps, was also due to the fact that he was speaking primarily of home and economic affairs, an area of policy in which Mr Churchill's simple moral judgments and strategic flair cannot be given full rein.

But if Mr Churchill has not provided the key to an upsurge of confidence in the Conservative party, there is no doubt that "This is the Road" contains some shrewd bait for the voters. It is longer than the Labour party's equivalent manifesto, but it is couched in much more specific terms—at least as far as promises to the electorate are concerned. Taken in their order of appearance, the following sections of the community are to benefit in one way or another from a Conservative government—the taxpayer in general, women civil servants suffering from the disability of unequal pay, tram and omnibus owners, road hauliers, air charter companies, private commodity traders and the Liverpool Cotton Exchange, trades unions suffering under the wage stabilisation policy, the white fish industry, market gardeners, hill farmers, smallholders, those without houses or the means to buy them, pensioners, the Scots, and the Welsh. There is something in the Conservative programme to please almost everyone, and something tangible and definite at that. If the Conservative leaders are really set on outbidding their opponents for leadership of the welfare state, they have certainly made a thorough job of it.

* * *

New Title Home and Away

There is no doubt that many of the groups in the community whom the Conservatives are out to help are worthy of succour or will contribute to increased economic efficiency. There is also no doubt that "This is the Road" far outstrips its Labour counterpart in realism, since it makes no secret of the extent of Britain's dependence on American charity or of the grimness of the position when Marshall Aid comes to an end. But it is the paragraphs dealing with the means by which the Conservatives hope to extend these increased benefits to deserving groups of the nation while lowering taxation and saving the economic stability of the country that are most equivocal. The pamphlet suggests economies of between one-tenth and one-twentieth of the government expenditure—that is of between £165 and £330 million. As a leading article in the *Manchester Guardian* of Wednesday pointed out, this could either be used to reduce taxation or to shore up the economic stability of the country,

but not for both purposes. In any case the pamphlet is vague in the extreme in suggesting how such economies would be achieved. It is true that it faces the issue of food subsidies, pointing out that it is the weak, not the weak and the strong indiscriminately, who should be protected. But the rest of its economies consist of vague proposals "to reduce the cost to the taxpayer by the wise buying of food" (a hint that there would still be some expenditure on subsidies) and still vaguer proposals for economies in the administrative costs of government. Despite its bold wording there is little hint of a consistent and effective policy behind the manifesto.

*

What the Conservatives have to say about foreign policy is a little more lengthy and a little less cryptic than the Labour declarations on the subject, but not much. The main emphasis is on promoting the unity, welfare and strength of the Commonwealth, and there are ambitious hints of a "permanent civil liaison staff" and of a "common advisory defence council and a combined staff." These are noticeably more specific than what is said about European union and the relations to be established with Britain's Continental neighbours. "Closer unity" is the aim to be pursued "hand in hand with France and other friendly powers," a definition identical with that often used by Mr Bevin. The question is—who does the pulling? Judging by the public utterances of the two statesmen, one might expect Mr Churchill to outbid Mr Bevin with some hint of the measures of unification he has in mind.

What is refreshing is the promise—obviously inserted by Mr Churchill himself—that the Conservatives "are not prepared to regard those ancient states and nations which have already fallen beneath the Soviet yoke as lost for ever."

Taken together, the two policy manifestoes should make it clear to friend and foe abroad that foreign affairs will play a minor part in the election—unless some remarkably disturbing or comforting news comes in the next month—and that, whoever wins, the broad lines of British policy will remain what they have been since the summer of 1947.

* * *

Reluctant Campaigners

With the manifestoes of the two main parties now launched upon the public, it might be supposed that there would be signs of quickening political activity in the constituencies. But a study of the provincial press shows that apart from a number of adoption meetings the amount of organised campaigning is still very small. The reason is probably not very far to seek—the hare started by Mr Morrison and Sir Hartley Shawcross about the possibility of charging the expenses of the anti-nationalisation campaign to election expenses has run further and faster than they had ever dared to hope. The Conservative organisation in the constituencies employs a large proportion of salaried workers and is paying rent for a number of expensive committee rooms, halls, and so forth. All these are, on a cautious interpretation of the electoral law, chargeable to a candidate's election expenses once he—as opposed to his organisation—begins directly to solicit votes. For this reason the Conservative headquarters have ordered a period of quiescence until such time as the expenses of the constituency organisation and the candidate's propaganda can be charged to his budget without overstepping the statutory limit. Like all hares, this argument goes in a circle and has also affected the Labour Party's tactics, although probably not to the same degree.

The only national campaign during the week—apart from a row between Mr Strachey and the *Daily Express* over the rations of the west Germans in which both sides joyously over-simplified a very complex argument—has been a gracefully conducted argument between Mr Churchill and the Liberal Party over the designation of certain Conservative candidates as "Conservative and Liberal" or "Liberal-Conservative." The Liberals, so far from being flattered by the Tory desires to steal their clothes, are obviously worried by this appellation; politics at the constituency level are conceived in very simple terms and the shy voter can be put off completely by competing claims to orthodoxy. The Tories' action will not command respect even among their own followers, but the Liberal Party cannot patent its own name. It is to be hoped therefore that when its manifesto is published next week its programme will stand out in such sharp distinction to the Tory manifesto as to eliminate any risk of confusion.

* * *

Changes in the Cold War?

When a sudden landslide occurs, there follows a period during which the surrounding landscape becomes suddenly unrecognisable. Familiar landmarks disappear and topographical surprises await those who believed they knew the earlier scene. It begins to look as though such a situation has arisen in the international field after the tremendous landslide of the Communist victory in China. Together with the realisation that Russia now possesses the atomic secret, the Communist triumph has changed the landscape of the cold war, yet nobody quite knows so far what the changes mean, or what their implications will be.

For the last ten days, it would seem that the Russians are a little "dizzy through success," as they tend to be after any major achievement. In the west certainly, they have been throwing their weight about. The evidence of Communist sabotage of the transport system and of national defence in France has been sufficient for the President of the Republic to ask that it be made a national issue. It was on his initiative that Communist strikes are being considered as a breach of the constitution. In Berlin, the Russians have half imposed and half removed a ban on transport, and the western authorities are left in doubt whether or not a new phase of the blockade is intended. In the United Nations, the withdrawal of Soviet and satellite delegates from the various committees and commissions has been rounded off by the Russian withdrawal from the Atomic Energy Commission, and while Mr Chou En-lai sends rude demands for admission from China, Mr Vyshinsky sends vituperative attacks on American power politics from Moscow.

A year ago, it would have been easy to lump all these events together and proclaim an intensification of the cold war, but the change in international topography brought about by the debacle in China makes such a diagnosis more doubtful. The reaction in the United States at least has been an attempt to shift the emphasis from Communism on to the problems created by Russian expansion (an article analysing Mr Acheson's recent speech on foreign policy in this sense is to be found on page 199). The response in Congress has been to deny funds to Korea. Influential statesmen and scientists are reported to be in favour of a new initiative on the problem of atomic energy and one or two influential publicists have returned to the notion that the only method of dealing with Germany and Japan is, in agreement with the Soviet Union, to impose neutrality on them. From so confused a chronicle of the week's events, it is hard to draw any conclusion save that Russian action and American reaction have ceased to be as automatic as some of the supporters of the cold war would wish.

* * *

China and its Neighbours

The conversations in Moscow between the Soviet Government and the Prime Minister of Communist China (who has now been joined by the Foreign Minister, Mr Chou En-lai) have already been drawn out to such an extraordinary length of time that the outside world can scarcely be blamed for supposing that there have been difficulties in the way of agreement. The State Department apparently takes the view that the Chinese have been resisting Russian demands for economic and political control in the northern borderlands of China (or have even been trying to obtain modifications of the rights Russia has already gained in those regions) and has contributed to the discussion by releasing information it possesses with regard to Russian penetration. It cannot be said that the disclosures add much to what is already known by anyone who has followed with care the course of events in Manchuria, Mongolia and Sinkiang, but the facts are now officially put on record—which may be helpful to the American public in getting a clear view of the Far Eastern situation, but is likely to be embarrassing to the State Department if later on it wishes to reverse the present policy of non-recognition of the Peking Government. The State Department seems to be trying to emphasise Sino-Russian conflict and to build up for America a diplomatic position as champion of China's independence against Russian encroachments, but in doing so it cannot help giving publicity to the degree of subservience to Russia already shown by the Chinese Communists—which plays into the hands of the Administration's critics, and also of the Chinese Nationalist delegation to Uno in its case against Russia. It will certainly be difficult for Mr Acheson to publish in Washington evidence of Russian intervention in China and at the same time to join in soft-pedalling a Uno investigation of Chinese Nationalist allegations to the same effect or to consent to Chinese Communist representation on Uno organs. The prospects of a convergence of British and American policies with regard to Communist China thus appear to be getting more remote, as the United States is drifting into a position from which it will be almost impossible to withdraw without grave loss of prestige.

*

It is certainly to Russia's interest that China's relations with some western nations should be as bad as possible and also that the western nations should be divided in this field of policy. Having obtained British recognition, the Peking Government has made two moves which appear deliberately designed to avert recognition from the other two principal western powers—the seizure of American and French consular property in Peking (which has led to the recall of all American consuls from China) and the recognition of Ho Chi-minh's administration as the legal government of Vietnam while the Assembly in Paris is still debating ratification of the agreement made with the rival government of Bao Dai. The recognition of Ho Chi-minh may be presumed to imply active assistance for his regime from China, which will be, as far as China is concerned, aid to a friendly and legitimate government; that this means an open challenge to France evidently does not deter the Chinese Communists who are full of confidence in their own strength after all their victories. For France the situation is one of increasing gravity.

* * *

Economic Progress in Europe

A lucid and comprehensive account of economic conditions in Europe during the third quarter of 1949 is given in the latest bulletin of the Economic Commission for Europe at Geneva. Perhaps the most striking feature of the review is its analysis of trade which shows that an improvement in European trade with the United States had occured even before the effects of the September devaluations could be felt.

To a large extent the improvement must be attributed to a reduction of Europe's imports from the United States. Figures for ten European countries show a decline in imports from $1,213 million in the second quarter of 1949 to $872 million in the third quarter. This effort was matched by the overseas countries of the sterling area, whose deficits with the United States earlier in the year did much to bring on the latest sterling area crisis. Apart from South Africa, this group reduced its imports from the United States by 25 per cent between the second and the third quarter.

Simultaneously with the drop in imports, Europe's exports to the United States also began slowly to pick up after a six-month decline. As a result of these two movements, Europe's deficit in visible trade with the United States reached the lowest point of any quarter since the end of 1946.

Tracing the progress of industrial production in western Europe during the third quarter, the report finds that the United Kingdom is the only country "where the recent development in industry can be said to be wholly satisfactory." Elsewhere there is a marked tendency for the rate of progress in industry to slow down. Even in France, where production has been expanding at a rapid pace there are signs that demand is slackening in the consumers' goods industries.

Not enough time has elapsed since devaluation for the commission to reach any hard-and-fast conclusions about its effect on prices and the terms of trade. But in some respects it is already clear that devaluation has not had the rosy consequences that some optimists expected. The rise in import prices has not been confined to imports from the United States and many of the chief world trade commodities now cost Europe more than before devaluation. The influence of these increases on domestic production costs and prices remains to be seen. Meanwhile Europe's export prices appear to have fallen in relation to import prices, and in order to maintain the same volume of imports, Europe as a whole must increase the volume of its exports.

"At least in the short run those countries which have devalued severely face a deterioration in their terms of trade. The only consolation offered by the ECE experts is that they have thereby improved their competitive position and that prices of foodstuffs and raw materials in the United States may decline further during the next year. In that case "it is possible that Europe's terms of trade after devaluation will be no more unfavourable than they were two years ago."

* * *

A Ministry of Nutrition?

Considerable support was given this week at the annual general meeting of the National Farmers' Union to a motion which called for the amalgamation of the Ministries of Agriculture and Food into a single department. The same idea occurs in the Liberal Party's statement of agricultural policy, which demands a single "Ministry of Nutrition" under a Minister of Cabinet rank "who would be solely responsible to Parliament in all matters relating to food production and distribution." The argument in both cases is that there is at present a lack of co-ordination between the Government's policy of agricultural expansion at home and its procurement of food from overseas. Many farmers seem to regard the Minister of Food as the source of all their troubles. In particular, horticultural producers object to what they view as a flooding of the home market with cheap imported supplies of fruit and vegetables.

The idea of setting up a single composite Ministry is superficially reasonable and attractive—especially in view of the probable tailing off of rationing, which will remove the Ministry of Food's main function. The real question, however, is what sort of policy a "Ministry of Nutrition" would pursue. Would it operate as a "Farmers' Ministry," shielding the home grower on every occasion from the unwelcome pressure of overseas competition? Is this what "co-ordination" would mean in practice? If so, the consumer and the taxpayer should emphatically record their veto. The Ministry of Agriculture would be the senior partner in the new combination and its first concern is with fostering and protecting British agriculture. The more protection British agriculture gets, the greater need there

is for some Minister to act exclusively as the champion of the consumer. If for administrative reasons the Ministry of Food is wound up, Mr Strachey's mantle should descend on other shoulders than that of his agricultural colleague.

The genuine troubles of the British horticultural producers could be met to some extent by the introduction of marketing schemes for certain of their products. It is important, however, that such schemes should not be a cloak for the creation of a producers' monopoly and the elimination of foreign competition. These dangers may explain the Government's delay in sanctioning the schemes for tomatoes and cucumbers put forward by the National Farmers Union. Meanwhile, Mr Strachey can hardly be blamed for trying to buy in the cheapest market. Apart even from his paramount duty to the British consumer, a reversal of this policy would make mockery of the attempted liberalisation of European trade.

* * *

Rebuff to the Canadians

The decision of the Government not to release dollars for the buying of Canadian newsprint during the first half of 1950 (and probably not for the second half as well) must be looked at from two points of view—that of the newspapers and their readers in this country, and that of the Canadian newsprint industry. On a short-term view it can be argued that Britain's need to save every possible dollar is paramount, that supplies of pulp and newsprint can be obtained—at a price—from Scandinavia, and that as the Americans are at present prepared to buy all the newsprint that the Canadians can sell, the British Government's decision inflicts no hardship on the Canadians.

That is the British Treasury's view, partly prompted perhaps by irritation at the preoccupation of the Canadians with the American market. But it takes no account of the past, the future, nor of Britain's good relations with Canada. It ignores the fact that during the recent war all supplies from Scandinavia were cut off, and that Canada was the sole source of Britain's newsprint. It ignores the probability that, if Scandinavia is put in a monopoly position, prices will almost certainly start rising steeply and that this rise in price may very soon wipe out the differential advantage granted to the Scandinavians as against the Canadians at the time of devaluation—a perfect example of economic theory on international trade working in practice. Higher prices are already expected for new contracts.

So far as the Canadians are concerned they have every reason to feel they have been badly treated. The Canadian suppliers have behaved generously. When the long-term contracts, which the Newsprint Supply Company had entered into in 1946 with the express approval of the British Government, were broken in 1947 by Government order so as to save dollars, the Canadians entered into new agreements for reduced imports in 1948 and 1949. Having realised that even these reduced imports into Great Britain could not be maintained in 1950 they asked that at least token imports could be continued at an insignificant cost in dollars so as to safeguard their interests in the British market. Even this has been refused.

The effects of such a course will depend on many unpredictable events. It may mean that in the event of an unbearable rise in the price of Scandinavian pulp no alternative supply will be available and that the size of papers will have to be reduced. Even worse results might follow if Scandinavian supplies were cut off in another war. It leaves the Canadians wholly dependent on the US market, since the other non-dollar countries such as Australia have also cancelled their contracts since devaluation. The Canadians have vivid memories of the bankruptcies which followed the collapse of the American market in the early nineteen thirties. Even a token contract would have bolstered their courage against such possibilities and would have sustained Canadian goodwill towards this country.

Arrests on the Gold Coast

Hopes that the proposed new constitution for the Gold Coast would be discussed in an atmosphere free from threats and violence have been disappointed. In the last few weeks there has been a civil disobedience campaign, including strikes and a boycott of British goods, which has culminated in the Government's arrest of Mr Nkruma and seven of his followers. His newspaper, the *Accra Evening News*, had already been suspended. Mr Nkruma was detained after the riots of two years ago, and it will be recalled that he was the only African concerned in those riots whom the Watson Commission found to have Communist affiliations. At least one of the others now arrested with him is a Communist, but it would be wrong to assume that the present disturbances are in any way Communist inspired. They should rather be regarded as a fling for personal power by Mr Nkruma. Last summer, he broke away from the United Gold Coast Convention, a nationalist party, to form his own extremist People's Party, and through his paper, the *Accra Evening News*, he launched a campaign of threats on the Coussey committee on constitutional reform during its deliberations. Undeterred by these threats, the Coussey committee produced a statesmanlike report, which was discussed in *The Economist* of October 29, 1949 (page 938); it has since been approved by the Gold Coast Legislative Council, which has an elected African majority.

It is significant for present happenings that Dr Danquah, who was detained with Mr Nkruma two years ago and is leader of the United Gold Coast Convention from which Mr Nkruma broke away, collaborated with Mr Justice Coussey over constitutional reform. Although he differed from the majority of the committee on two important points, on which he would have gone much farther towards responsible government, it is greatly to his credit that he has not tried to press his views by unconstitutional means. Mr Nkruma is trying to increase his personal prestige at the expense of Dr Danquah's by putting up his claims from self-government to Dominion status and backing them up by unconstitutional means. These included a press campaign too vile and virulent for even a colonial government, hardened to persistent anti-British attacks, to tolerate. It can never be easy to decide whether arrests of nationalist leaders and suspensions of newspapers will do more good than harm; but in present circumstances the action of the Governor of the Gold Coast seems entirely justified.

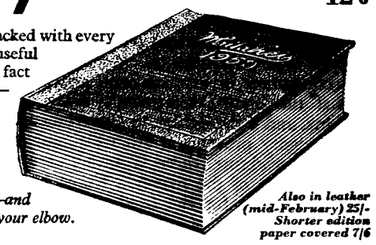
Report on France

The *Commissariat Général du Plan de Modernisation et d'Equipement* has just made public the most interesting and detailed report it has published so far. It comprises an account of the achievements of M. Monnet's organisation from 1947 to 1949 and a statement of its objectives for 1950-52. In a country perhaps more deeply divided than any other in western Europe, the *Plan Monnet* has managed to secure the approval and active co-operation of all groups and professions—civil servants, farmers, industrialists, workmen and technicians. This is not surprising since the organisation has to its credit some remarkable achievements, which are summarised regularly every six months in a series of reports of exemplary clarity.

In the current survey, issued as the plan reaches its midpoint, the opportunity has been taken to review the progress made toward the production targets set out when the undertaking was launched in 1947. It shows that coal production increased from 49.3 million tons in 1946 to 53 million tons in 1949, while steel production rose from 4,400,000 tons to 9,100,000 tons over the same period. Both industries, however, have some way to go before they reach the high level achieved in the boom year of 1929 and they must cover an even greater distance if they are to reach the goals set for them in 1952-53.

Advances in agriculture have not been as swift as some of France's partners in European co-operation would have liked to see. Production of wheat and other cereals is still slightly below the prewar average, while meat, fats and sugar are being produced in greater quantities than before the war. Two hopeful signs are the remarkable increases in the production of tractors and fertilisers that have taken place under the ægis of the Monnet plan.

* * *



Birth of a Republic

On January 26, 1950, the Indian Republic formally came into being in accordance with the provisions of the constitution which has been adopted by the Constituent Assembly. An article from a correspondent which appears on page 204 of *The Economist* this week discusses the constitution and some of the problems which are likely to arise in working it. In this country the transfer of power in 1947 is regarded as the decisive event, with India's decision to remain within the Commonwealth as next in importance. As the formal inauguration of the republic does not seem to bring about any new situation, it arouses comparatively little interest in the British public. Nevertheless, it is an important milestone in India's history, not least because the constitution, under the terms of which the next general election must be held, provides for universal suffrage. The conduct of elections with more than one party and an electorate of some 150 millions, a large proportion of whom are still illiterate, will impose a severe test on the democratic political system, which will be observed with great interest and sympathy in the west; so far India has shown a tolerance of political opposition which distinguishes it from the other two countries with the largest electorates in the world—that is to say, China and the Soviet Union.

At present the strength of the Congress party organisation and the prestige which it enjoys for its part in gaining independence for India still give it an unchallenged lead over other parties. For the time being stability in government is sufficiently assured for India to be able to afford political and civil liberties without introducing weakness and confusion into the newly created state. The danger is that the Communists may become, as they were in China in the days of Kuomintang tutelage, the strongest opposition party, and that the threat from a party aiming at dictatorship may turn the government into increasingly authoritarian courses. The healthiest development for the political life of India in the near future, an India overwhelmingly rural, would be the emergence of a strong peasant party without Communist affiliations to play the part of a truly democratic and constitutional opposition.

Dr Ambedkar, who played the leading part in the drafting of the Indian Constitution, said in his final speech to the Constituent Assembly that the contrast between political equality and economic and social inequality in the new India would have to be reduced if those who suffered from the latter were not to destroy the former. He also warned his audience against "hero-worship" and declared that "we must not lay our liberties at the feet of even a great man." The Indian Republic, inaugurated as the most populous member state of the Commonwealth so soon after the first Commonwealth Conference to be held in Asia, sets out on its career with the best wishes of the British people.

No Dollars for Syngman Rhee

The adverse vote in the American House of Representatives on the appropriation for economic aid to Korea has come as something as a shock to the Administration. No doubt the strong backing of President Truman and Mr Acheson will eventually secure the passage of the proposal, but the revolt in the House may be symptomatic of a trend which is unlikely to be confined to Korea. It may broadly be defined as an unwillingness to venture American money on economic aid where there are no military guarantees, and this is a mood which may seriously affect the application of President Truman's Fourth Point. The vote on Korea has followed the President's refusal to afford any military aid to General Chiang Kai-shek in his last stand in Formosa, and the intensive publicity sponsored by the Administration exposing the corruption and incompetence of the Kuomintang regime which deprived American aid to China of its intended effect. But it is psychologically impossible thus to " debunk " China—which used to be so extravagantly idealised by many Americans—without at the same time weakening faith in the capacity of other Asiatic governments to make good use of American aid or to resist Communism without direct support from American armed forces. If it is not worth while to help General Chiang, who has 300,000 men on an island 100 miles from the mainland, how is the Administration to justify aid to the Government in Seoul on the mainland, only a few miles from a land frontier behind which are ranged Communist North Korea, Communist China and the Soviet Union ? And if the once respected Nationalist Government of China has turned out to be such a broken reed, is it possible to build up faith in the soundness and stability of the regimes of Syngman Rhee, Bao Dai, Pibul Songgram or Thakin Nu ?

It is not merely isolationists who may show a reluctance to spend the American taxpayer's money on subsidies which seem, from their experience in China, to provide eastern countries with transport, industrial equipment or arms to be taken over intact by the Communists whenever they decide to move in. If the American Government maintains that it is essential to prevent violent Communist seizure of certain parts of Asia, the same critics can argue that it is a matter for commitment of America's own forces rather than the outpouring of American money to bolster up weak and unstable local governments. Moreover, they can point out that if corruption in other Asiatic states is anything similar to what the State Department's White Paper says it was in China, and if the American Government's respect for national sovereignty prevents it from claiming rights of supervision over expenditure, there is in any case no guarantee against sheer waste of the money. Korea has been notably casual in accounting for the funds it has already received. The sudden outbreak of toughness in the House of Representatives suggests that there is still no American policy for the Far East which can command general Congressional support.

Irish-American Amity

Our Dublin correspondent writes:—

The Treaty of Friendship, Commerce and Navigation between the United States and Ireland which was signed in Dublin last week has been described by the State Department, in the polite language appropriate to the occasion, as " the most comprehensive treaty of its kind that Ireland has undertaken to conclude with any country." Hitherto the rights of Irish and American nationals in each other's country have been governed by Anglo-American conventions of some antiquity, dating from 1815, 1877 and 1899. The altered international status of Ireland called for a restatement.

The new agreement does not make any changes of substance. In general it provides for most-favoured-nation treatment. Irish firms may now carry on business in the United States on the same conditions as American firms. On the other hand, American firms wishing to manufacture in Ireland may not escape the provisions of the Control of Manufactures Acts which lay down that over 50 per cent of the capital of a company must be Irish-owned. The continued grant by Ireland of preferential treatment to imports from Commonwealth countries is recognised by the United States Government with the proviso that the advantages shall be no greater than those in force or contemplated by Article XI of the Anglo-Irish trade agreement of 1938. Irish citizens resident in the United States may now receive social service benefits to which they were not previously entitled. Members of professions, other than law, who are not American citizens may practise in the United States provided they possess the qualifications required by American law. Irish nationals who are not American citizens may not be conscribed in the United States.

The treaty is regarded in Dublin as a valuable affirmation of the special relationship that has long existed between the two countries. But the most significant point about the treaty is the demonstration that the State Department is prepared to accept preferential arrangements between Britain and a nation now outside the British Commonwealth. This is all the more startling since the Anglo-Irish trade agreement of 1938 which, with its amendment in 1948, now governs the trading relations of Great Britain and Ireland, was in many respects a discriminatory document. An opportunity is also given to Irish firms to increase their business in the United States. The necessity of their doing so is more obvious than the possibility. Irish exports to the United States are luxury goods and, with the exception of tourism, it is difficult to see how they can be increased. The Irish role in Marshall aid, as envisaged by the Economic Co-operation Administration, is to increase the export of livestock and livestock products to the United Kingdom. It is no doubt the most useful form of contribution ; but it does not help to close the dollar gap. It involves heavy dollar purchases of grains to make possible sterling sales ; and the dollars come by way of loan. In the first eleven months of 1949 imports from the United States totalled £16½ million, while exports were as small as £370,000. Remittances and tourism help to close the gap slightly ; but whatever further aid the new treaty can give is badly needed.

* * *

The Land Commission's Role

The second annual report of the Agricultural Land Commission, and its Welsh Sub-Commission, reveals that the amount of land under the commission's control on April 1st last was no more than 62,286 acres. Over half of this land consists of the large Glanllyn estate at Bala, Wales, accepted by the state in lieu of death duties, and the rest of scattered Forestry Commission lands which have been handed over as being more suitable for agriculture than forestry. Most of this land is of poor quality, and needs costly improvements to make it reasonably productive. The commission's general policy is not to farm the land itself, but to carry out the duties of estate management, improve its properties, and let them " at a full fair rent." It is perhaps not surprising, however, that the commission's accounts show a considerable loss (rent income is only about half of management expenses). Administrative overheads have to be spread over a small area of land, and much of the farming is uneconomic.

The important question is, how much land will the commission be given to manage ? The Government will have to make up its mind quickly about the disposition of the considerable quantity of land requisitioned and farmed during wartime. Where considerable capital has been sunk in such land, or large-scale farming methods have been introduced, there is an obvious case for retaining it in public ownership. Potentially more important, however, are the large areas of marginal land, where the state may take possession in order to secure " full and efficient use." Before compulsorily acquiring such land, the Minister must consult the commission. The commission has already turned down the major project (Romney Marsh), but others (for instance, Lakenheath Fen) are being examined.

The Agricultural Land Commission is most unlikely to prove a backdoor for the nationalisation of land. It might, however, find itself entrusted with the management of very large areas of poor quality land, especially in view of the declared intention of the main political parties (reiterated in Labour's election manifesto) to make marginal land more productive. The commission is right in saying that " it can afford to take a longer and wider view than many private landowners " in incurring capital expenditure on uneconomic projects. But before schemes of this sort are launched on an ambitious scale it would be as well to ponder whether some part of the public expenditure involved might not yield better results in other directions. The ploughing-up subsidy, for instance (now terminated as a contribution to Government economy), almost certainly gives better value in terms of higher food production than an equivalent sum expended on the improvement of marginal land.

Ebenezer Howard

Sir Ebenezer Howard, born a hundred years ago this week, was an ordinary working journalist who in his spare time managed to write the classic statement of the case for new towns, *Garden Cities of Tomorrow* (first published in 1898), and to follow this up by founding the two " garden cities " of Letchworth and Welwyn. No professional town planner has done so much to guide the planning movement in this country as this amateur enthusiast. Howard's aims were entirely social. He sought to create better living conditions for the working population than could be found either in the congested large cities or in the depopulated countryside. His aim was to build towns which would combine the urban advantages of high wages and social amenities with plenty of living space and access to the countryside, and which would be small enough to have a genuine sense of community.

Such towns are not every man's Utopia, nor are they always compatible with economic facts. Greater industrial mobility, however, resulting from electric power and motor transport, makes it easier today to translate Howard's vision into practice. The stage of private pioneering, at Letchworth and Welwyn, has given way to that of public development on a large scale ; but the new towns now being built under the state's auspices bear the impress of Howard's design to a striking extent. It is his ideals—spacious living conditions, " balanced communities," green belts—which form the stock-in-trade of British town planners.

Town and country planing has behind it today enormous legislative powers and an elaborate administrative system which is the marvel of town planners in other countries. But the planners' performance to date hardly justifies their powers, the controls are vexatious and many of the plans are dead-letters. Part of the trouble lies in the dictates of economic stringency, but part springs too from the over-ambitious character of many of the plans. Ebenezer Howard was a modest man who was never turned aside from the pursuit of the good by the lure of the perfect. Something of his spirit would be very welcome today.

Soviet Pressure on Finland

The most reliable guide to the general state of Soviet-Finnish relations is the attitude of the Russians at the trade talks, which are held between the two countries in Moscow each winter, and the nature of the commercial agreement then concluded. This is a much surer indication of whether the Kremlin intends to make things awkward for the Finns than the outpourings of Soviet propaganda and their reflection by the Finnish Communist press. Towards the end of 1948, for example, while the Finnish negotiators were being quite well treated in Moscow, the Finnish Communists, echoing and echoed by the stalwart propagandists of Moscow Radio and the *Literatunaya Gazeta*, were conducting against the young Social Democrat Government a campaign of abusive threats. The obvious inference seemed to be that the days of Mr Fagerholm's cabinet were numbered ; but it still holds office and will continue to do so until the middle of next month, when the election of a new President necessitates its dissolution.

This year, however—and for the first time—the Finnish negotiators, who have been in Moscow since the end of November, are having a much harder time. The head of the delegation suddenly returned to Helsinki early in January, and another leading member came back last week. Presumably each of these visits marked a critical stage in the negotiations ; but they still drag on. The Communist press, in this instance more in step with Moscow's actions, uses the occasion to proclaim that the Social Democrat Government is now so discredited that it cannot even conclude a normal commercial treaty.

There is no doubt that this time the Kremlin is bent on changing the pattern of Finnish politics to its own advantage. There is equally no doubt that the Finns will resist, for they have rejected the Soviet protest about the harbouring of " war criminals " practically *in toto*. And to suggest that the low vote for Mr Paasikivi in the Presidential elections is evidence of cold feet as well as cold weather is to misread the Finnish situation as seriously as it was misread when, soon after the Prague *coup* of 1948, the Russians demanded—without result—an alliance with the Finns. Mr. Paasikivi has no more chance of getting a thumping Labour vote in Finland than has Mr Churchill in England. With many Socialists abstaining, it is not surprising that the Communist percentage of the vote went up. What is surprising is that the Communists, with only about 58 per cent of the electorate voting, as against 75 per cent in the general elections of 1948, have not made greater comparative

Binding Cases

Binding cases for THE ECONOMIST *and* RECORDS & STATISTICS *can now be supplied. These new cases, made by Messrs.* EASIBIND LTD., *are in stiff, dark blue cloth covers, and are gilt-lettered on the spine. The cases are of a new design and provide an extremely effective and firm binding.*

The case for THE ECONOMIST *will hold* 26 *issues and the half-yearly Index ; that for* RECORDS & STATISTICS *will hold* 52 *issues. The year can be stamped on the spine.*

The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, **not** *to* THE ECONOMIST, *but to—*

(Dept. E), Pilot House, Mallow St., E.C.1.

A binding case can be sent on approval, if required.

gains. Their total vote in fact fell from 372,000 to 317,000. But the figure for the Social Democrats also dropped, by almost a third, from 486,000 to 329,000. Such a setback will immensely complicate the formation of the new Government that takes office with the new President.

* * *

Bulgaria's Robespierre

The death of Vassil Kolarov, the Bulgarian Prime Minister, removes the last of the old guard Communists from the Sofia scene, and leaves as undisputed head of party and state the young and ruthless newcomer, Valko Chervenkov, who first became a member of the Central Committee only in 1945. (Characteristically, Chervenkov's name, chosen by himself, means "The Red Wolf.") The late Prime Minister was the last internationally known Bulgarian Communist and was secretary-general of the Comintern in the early twenties.

By a strange coincidence the latest purge in the party's Central Committee and the Government took place only two days before the announcement of Kolarov's death. Armed with the authority of Stalin, with whom he had conferred at the Moscow birthday celebrations, Chervenkov expelled six more Central Committee members and one Politburo member (the veteran Communist leader Terpeshev); demoted his dangerous rival, the former Police Minister and deputy Premier, Anton Yugov, to an insignificant junior post; and openly threatened all Communists with more purges, as such were "the lessons to be learnt from the trial of the Kostov gang of traitors." Less than a year ago, the big six of the Bulgarian Communist Party were, in order of importance: Dimitrov, Kostov, Kolarov, Chervenkov, Yugov, Terpeshev. The first three are dead, the last two officially purged, their chances of dying of old age considerably reduced.

The new inner cabinet consists now entirely of former Soviet citizens and Soviet officials. The most important of them, after Chervenkov, is Vlado Poptomov, a Macedonian terrorist, for many years deputy head of the Macedonian Department of the Comintern in Moscow (its former head, incidentally, Dimitar Vlahov, is at present vice-president of the Jugoslav Republic and a staunch Titoist). The camouflage of a "Fatherland Front" coalition has been definitely dropped, and of more than 20 ministerial posts, two only are given to ex-Agrarians and one to an ex-Republican.

In spite of the terror exercised during the elections last December, the Communist organ *Rabotnichesko Delo* complains in a leading article that "Kostovite slogans and leaflets appeared in certain places." Chervenkov, too, in his last public speech says: "We know that we have not yet liquidated all our enemies. We know that they are hiding amongst us, but we shall be able to discover them and to smash them." Many difficulties, he goes on, are to be encountered "on account of the wrecking activities of the Kostov gang," notably "in the centre of the state machine, mainly in the economic departments," which were headed by Kostov for many years. It seems that Chervenkov is the kind of man who would be flattered by being called the Bulgarian Robespierre.

* * *

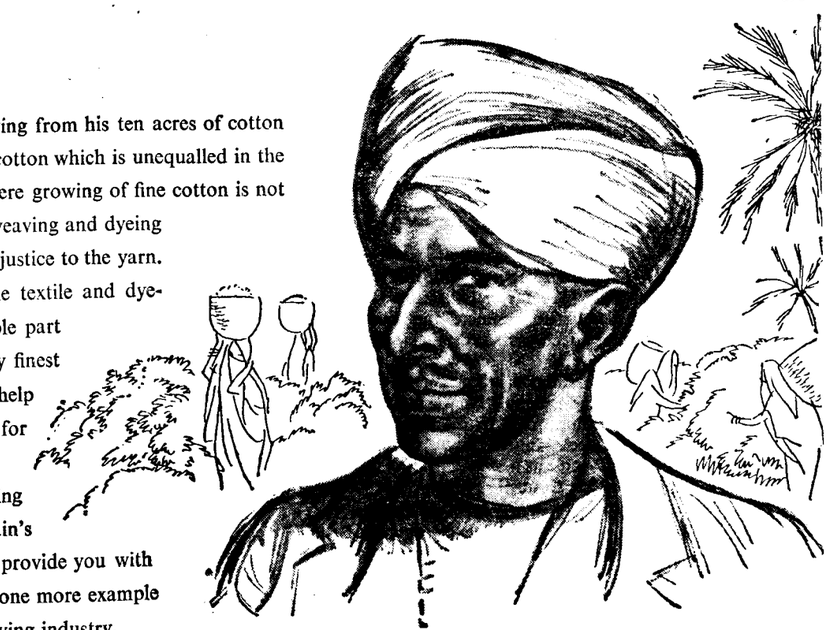
Bitter Sweet

There could hardly be a more typical, if small-scale, example of the power of controls to produce vested interests than the Ministry of Food's decision to put the hitherto unrationed near-sweets on the ration. Using off ration ingredients and considerable ingenuity, these comparative newcomers have achieved a degree of success which has disquieted the National Association of Retail Confectioners. Established lines are threatened. An exiguous but possibly expansible airlift has been established over the ration-and-licence blockade against interlopers; and the big anti-aircraft guns have been trained on their target. The paradoxical situation has thus arisen that a rationing system devised to ensure that no one should go short is being invoked to ensure that everyone shall go shorter than is necessary.

Here is, undoubtedly, the seamy side of all "fair-share" controls, be they consumer ration or quota allocation. Whether they succeed well or ill in their primary job of apportionment, whether they exert much or little distorting effect on productive effort, whether they are cheap or extravagant to administer and enforce, they all have the effect of creating a class of men in possession and of sheltering this class against the draughts of outside competition. That much of this competition is, on the face of it, likely to be snatch-and-grab and ephemeral is beside the point. The history of technical progress is full of examples of fruitful makeshifts designed in the first instance to circumvent some particular and temporary shortage.

The spirit of swat-that-innovator flourishes particularly under Socialism, but it would be wishful thinking to suppose it absent from the Conservative mind. What, one wonders, would be the response of a Conservative government to the plea of a respectable and established organisation for protection against fly-by-night innovators? The history of the inter-war years suggests that it would scarcely be less favourable. To respect free enterprise in theory is one thing; to allow it in practice, with all its possibilities of discomfort for the established, is quite another.

Let the People Expand



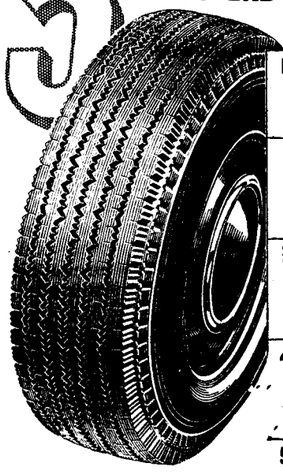
It is now known and acknowledged that the population of France, as has been elaborately set forth by Mr J. S. Mill, in his work on the principles of political economy, as one of the advantages of France, is increasing very slowly—amongst the slowest in Europe, and increasing in a retarding ratio, so that it is coming to a stop. It is now known, too, and acknowledged, that the agriculture of France is in a deteriorating condition—that its trade, certainly its shipping, is declining, and that the material prosperity of the bulk of the little landowners, composing the great majority of the nation, is at nearly the lowest ebb. . . . It is also now equally well known that, while the nation was thus continually checked in a progress essential to a healthy condition . . . the sphere of the Government operations, and its expenditure extended more and more, so that it became an ever increasing obstacle to the national progress. . . . It would seem to be one of the purposes of the press, appropriately characterised as the watchman of society, always to remember the principles of social progress, and to stand fast by them when the people are subjected to momentary delusions. Such is certainly not the case at present, and, unwarned by the example of our neighbours, there is a great and active party amongst ourselves which spreads its influence over almost all our journals, and is continually requiring a great increase in the activity of the Government and a corresponding increase in its expenditure. . . . It is a sorrowful augury for the future to see the statesmen of the foremost nations of the world incapable of devising any better schemes for the future government and improvement of society than those which have been already tried and condemned in France and in England. Progress society must make; it is the condition of its existence; population must increase, and the means of maintaining it in comfort and luxury must increase, or vice and misery, revolutions and war, will desolate the earth. Such governments as that of France, therefore, must relax its hold—must stand aside and allow the people to expand.

The Economist

January 26, 1850

MOHAMMED makes his living from his ten acres of cotton in the Sudan—finest Gezira cotton which is unequalled in the world's markets. But the mere growing of fine cotton is not the whole story. Spinning, weaving and dyeing processes must be able to do justice to the yarn. Monsanto's chemicals for the textile and dyestuffs industries play a notable part in the production of the very finest piece-goods, and thereby help Mohammed to get top value for his crop

Monsanto products are helping to increase the value of Britain's export trade, and helping to provide you with the goods you need. Just one more example of the way Monsanto is 'serving industry, which serves mankind'



Monsanto makes nearly two hundred chemicals of vital importance to British industry. If you have a chemical problem it is highly probable that Monsanto will be able to assist you

A Sensible Policy for Process Steam—2

Who Controls Your Steam Stores?

BY SPIRAX

Our manufacturing industries use 130-million tons of steam a year for processes and heating, at a cost of more than £90,000,000.

Whose responsibility is it to see there is no waste or misuse of this valuable raw material? Your storekeeper checks ingoings and outgoings of stores items; somebody else checks coal stocks; your engineer sees that your stock of steam is maintained.

But who looks after the *issue* of steam?

It hardly seems logical to have a storekeeping system that takes care of nuts and bolts when any process man can, without question, open a 2-in. steam valve or a by-pass round a steam trap and leave either open for as long as he thinks fit.

The proper "storekeeping" of steam, *the metering of the steam supply to each main department*, can probably save as much in a week as might be saved in a month of Sundays among the nuts and bolts in the stores.

Correspondence to: **Spirax Manufacturing Co. Ltd.**

(Economist Enquiries), Cheltenham, Glos.

Letters to the Editor

Europe's Committees

SIR,—The article in *The Economist* of January 14th, entitled "Europe's Committees," seems to me to express the views of many people who are anxious to see the future of Europe settled not by parleys but by practical steps taken by responsible organs.

I think it stresses a very important point in the present disorganisation of Europe. May I recall that the Council of Europe was not created just to promote the existence of numerous committees, but to co-ordinate action taken in the various fields. The reason why so many committees were created everywhere is that solutions have been sought on partial and often temporary bases and generally from a technical angle. The only possibility of putting order in the present situation and of safeguarding Europe's future is to consider these problems from the *political* angle as a *whole*. This is the spirit of Strasbourg and the aim the Council of Europe has in mind.

The Committee of Ministers of the Council and the Consultative Assembly have clearly and repeatedly expressed their attitude towards duplication and waste of manpower and time. The Council of Europe has no ambition whatsoever to replace existing organisations, but as a political body desires to put forward a policy which could be put into effect by the various existing technical organs, and to co-ordinate their actions towards achieving the common aim, which is the solution of Europe's problems.

The resolutions passed by the committees of the Consultative Assembly of the Council of Europe were certainly not "indecisive," nor is indecision in the nature of the parliamentarians who compose them. We hope to succeed because we take the problems from a new angle . . . which has never been used before.—Yours faithfully, PAUL M. G. LEVY,
Director of Information

Preparatory Commission of the Council of Europe, Strasbourg

Soviet Death Penalty

SIR,—In *The Economist* of January 21st, you speculate on the reasons for the restoration of the death penalty in the Soviet Union, dismissing the view that the Soviet government is faced with serious opposition at home and suggesting that the new measure is largely due to a deterioration in international relations. It may well be true that there is no serious opposition to the government from within because of the comprehensive police-state system but in view of the evidence of the many Russians who refused to return to their country after the recent war and the account of conditions in Russia given by such diverse writers as Freda Utley, Victor Kravchenko and Paul Winterton, there can be little doubt that the will to resist does exist most strongly in Russia and that harsh repressive measures are necessary to suppress it.

But even if the new measure is a war preparation it surely is not true that "the Politburo really believes itself threatened by the 'capitalist encirclement.'" The only expansion there has been since the war has been Soviet expansion and it would be to underestimate the intelligence of the Soviet leaders to imagine that they see potential aggressors in countries like America, Britain and France, which are more likely to make the mistake of a "peace at any price" policy. The other Soviet measures you mention, an unparalleled security ban, the manufacture of fighter aircraft on a large scale and the building up of stocks of strategic materials, are certainly war preparations but not necessarily inspired by the fear of war. They may be caused by the intention of provoking war or bullying the west into further surrenders by a show of force. Events in Bulgaria and the continued difficulties over the Austrian peace treaty despite all our concessions certainly seem to confirm the view that the Communists are preparing to resume the offensive, considered essential by Lenin and Stalin, against the non-Communist governments, with a view to further expansion of the Communist world.—Yours faithfully,
O. KERENSKY

Christ Church, Oxford

Electoral Facts

SIR,—In the article "Electoral Facts" in *The Economist* of January 7th it is contended that non-voting is not likely to affect the result of the coming British election to any large extent. In the United States, where about half the adult population are apt to abstain from voting, the importance of this factor is said to be very great, but, in the author's opinion, this is not so in Britain, where between 71 and 77 per cent have participated in the last general elections.

Recent experience in Norway seems to suggest, however, that differences in participation may decisively influence the outcome of elections, even in countries where the record of non-voting is more or less similar to that in Great Britain. 71.6 per cent of the Norwegian electorate took part in the 1947 elections, but more than 83 per cent turned out two years later. In 1947 the non-socialist parties polled 51.8 per cent of the total vote. In 1949 they polled only about 48 per cent. Their vote increased in absolute numbers, but that of the Norwegian Labour Party increased much more. When the Prime Minister attributed this to the credit which our Labour Government has got from an improved economic situation during the last two years, he seemed to imply that many dissatisfied Labour electors must have abstained from voting in 1947.

It should be mentioned that the 1947 and 1949 Norwegian elections are not strictly comparable; and it is still more difficult to compare the British and the Norwegian electorate. Yet the differences are not so great that a comparison may not be of some interest.—Yours faithfully, S. S. NILSON

Shr. Michelsen Institute, Bergen, Norway

SIR,—I was most interested to read the article "Electoral Facts" by a correspondent in *The Economist* of January 7th.

I was especially intrigued by a statement towards the end of this article that ". . . . in a reasonably homogeneous country with a two-party system and single-member constituencies, the ratio of the seats won by the parties should be at least the cube of the ratio between the votes cast for them." Your correspondent states that this formula, when applied to the last five New Zealand elections, shows an average error of only one seat and, to the last three British elections, an average error of only two seats.

I regret to say that, on testing the theory for the British elections, I am unable to prove its truth. I have used the following figures:—

1931	Conservative Vote	11,873,000
	Labour Vote.....	6,642,000
	Seats gained :—	
	Conservative	472
	Labour	52
1935	Conservative Vote	10,488,626
	Labour Vote.....	8,325,260
	Seats gained :—	
	Conservative	387
	Labour	154
1945	Labour Vote.....	11,985,733
	Conservative Vote	8,693,858
	Seats gained :—	
	Labour	393
	Conservative	189

I believe that the above figures are correct but they do not support your correspondent's theory.—Yours faithfully,
R. W. EADES

58 Inverclyde Road, Handsworth Wood, Birmingham 20

Our correspondent writes:

[Intelligent analysis of election statistics usually entails some arbitrary assumptions. These assumptions should, of course, be clearly stated so that the reader can decide whether they accord with common sense. It is regretted that pressure of space precluded the statement of how the $A^3:B^3$ formula was applied. Here are the assumptions.

1. The University seats and the votes cast in them are excluded from the calculations because of their difference in size and composition of electorate, in electoral system and in party policy of candidatures.
2. In all three elections the Liberal Nationals and other allies of the Conservatives are amalgamated with them.
3. Only those contested seats won either by Conservatives (as so defined) or Labour are taken into account.
4. To avoid reduplication suitable allowance is made for the two votes cast by electors in the 15 two-member constituencies.
5. There are many minor disagreements in published electoral statistics. These calculations are based on the figures given in *The Times* "House of Commons."

Year	Party	Votes	Actual Seats	$A^3:B^3$ Theoretic Seats	Error in Theory: Number	Error in Theory: %
1931	Nat. Govt.	13,898,395	491	490	1	0·2
	Labour	6,368,262	46	47	1	0·2
1935	Nat. Govt.	11,136,666	398	398	...	0·1
	Labour	7,873,713	141	141	...	0·1
1945	Conservative	9,499,460	208	214	6	1·0
	Labour	11,573,176	391	385	6	1·0
				Mean Error	2	0·4

If the fourth assumption—which some people may object to—is not made the mean error becomes not 2 but 10 seats. This only serves to emphasise the arbitrary and rule-of-thumb nature of the formula. As the article said there is nothing magical about it. It has no business to be as accurate as it is. But, with all its faults, it is a great deal more accurate than pure guesswork.]

France and the Saar

SIR,—You state—in your article on the Saar in *The Economist* of January 21st—that "the Saarlanders . . . three years ago voted without hesitation for a government amenable to French wishes." Having been in the Saar at the time as the correspondent of the *Sunday Times*, may I offer several comments.

Monsieur Grandval, then French Governor of the Saar, told the leaders of the Saar's three licensed political parties that if there was economic union with France there would be no dismantling and larger rations of both food and clothing—both being then desperately short. The Surêté suppressed a reply to this—an article in the local Communist paper saying that France had no power to remove factories, reparations being a quadripartite matter.

The Saarland voter had to choose between the hated Communists and the Catholic-Socialist coalition, led by emigrés, to whom I heard a high French official refer in private as the "marionettes." The Saarlander was afraid not to vote for fear of drawing attention to himself. The Surêté were then active and expulsions from the Saar were frequent. So he voted for Herr Hoffman's coalition.

Care was and is taken to guard the leadership of the Catholic and Socialist parties from elements critical of French designs. Last August I asked at the Socialist headquarters in Saarbrucken for Herr Roth, who as Secretary General of the party had told me in 1947 that the "tragic decision" to support the economic *Anschluss* had been taken "only to save the steel works from dismantling." Herr Roth, I was told, had "left for Germany." In his place I found one Herr Schaffner, wearing a French decoration which he had won fighting the Wehrmacht.

You say that "the Saar economy . . . has been far more prosperous in association" with the French "than it ever was under the Nazis." But under the Nazis Saarland industry enjoyed an 18 per cent discount on Saar coal. Today Saar coal costs at the pithead 4,500—3,000 francs a ton (52.9—35.3 marks). Ruhr coal at the pithead costs about 33 marks a ton. Southern Germany, which used to buy 30 per cent of the Saar's heavy finished goods, now buys from the Ruhr instead.—Yours faithfully, JONATHAN BLOW

3 Carlos Place, London, W.1

Definition of Profits

SIR,—The invention of the word "*Disinflation*" is, I believe, rightly attributed to you. Will you now do us all a service by creating an alternative to "*Profit*"?

If I put one potato into the ground and eventually dig up two, three or many more I have achieved an "excess of returns over outlay," having been actuated by the "Profit Motive." But this, I gather, is anti-social and indefensible on that account. Can you help me to acquire at least terminological respectability for my very human desire to see some result for my labours?—Yours faithfully, COLIN HURRY

17 Great Queen Street, W.C.2

The Liberals

SIR,—I am disappointed to see that your article on "The Liberals' Dilemma" accepts without protest the voting system under which there is no relation between popular votes and the number of successful candidates. Whatever may be the merits or demerits of the Liberal or any other party, it is surely the negation of democracy that it should be possible for that party to gain in popular support and yet to lose seats.—Yours faithfully, ENID LAKEMAN

The Proportional Representation Society

[The only sense in which the article accepted the present system was in assuming that it would operate in next month's General Election.—Editor.]

THE BRITISH CRISIS!
An American view of present-day problems
The Economic Munich
BY PHILIP CORTNEY.
An outstanding American book which caused much controversy in the U.S.A. The author argues against what he believes to be the fallacies on which present economic policies are based, and which he traces back to an inadequate diagnosis of the 1929 depression. Order from your bookseller. Price 15/- net.
★ What reviewers say:
"Mr Cortney is a disturbing man . . . He leaves the reader shaken and bewildered, with much accepted economic theorising lying in ruins around him . . . Subscribers must know that I do not grant effusions easily. When I say that this book is important I really mean that." JOHN DALGLEISH, Editor "TRAIN" *The Newsletter of Trade and Industry (London).*

Books and Publications

The Moral Revolt

"The God That Failed. Six Studies in Communism". Edited by Richard Crossman. Hamish Hamilton. 272 pages. 12s. 6d.

If it is true that in the Western world the intellectuals are the foreseeing eyes, the sensitive antennae of society, *The God That Failed* must be counted an important book. In it six men—one a poet, Mr Stephen Spender, three authors of books which will survive, Mr Koestler, Signor Ignazio Silone and M. André Gide, one a distinguished American Negro writer, Mr Richard Wright, and Mr Louis Fischer, a widely read American journalist—give their reasons for their sympathy for Communism or their conversion to it in the twenties and thirties, and the disillusion that drove them out again in the last decade. They are a reasonably representative cross-section of the intelligentsia, and just as it was their thinking and writing that very greatly influenced left wing and radical thought between the wars, it may be that their later experiences, even if they appear now only as six isolated acts of reason and will, will have the same pervasive influence upon radical thinking in the next decade. The social effect of the thought of such men is like a pebble thrown into a pond. At first there is no sign save the sudden splash of water; then as the ripples spread out, the whole surface is disturbed. The reason why Mr Koestler or Mr Spender broke with the Communists has, therefore, more than personal significance. It is likely that they are giving intellectual direction to the thinking of a new decade.

The standard of writing in these six essays is uneven. M. André Gide's contribution, skilfully pieced together by Miss Enid Starkie from his two books on Russia published in the thirties, suffers from the tendency to wandering and incoherence that such compilations normally entail. The essays of Mr Spender and Mr Fischer wander in their own right. Mr Wright's testimony has more emotion and less argument—it is, in fact, a moving short story largely told in dialogue. It is the brilliant contributions of Mr Koestler and Signor Silone that convey the real meaning of Communism's "grandeur and misery." Mr Koestler's essay, in particular, gives the atmosphere of German Communism in 1931 and 1932 with such imaginative force that the reader adds a dimension to his own direct experience of existence—an existence in the half world of Communist cells, contacts, conspirators, centres of authority, channels of information, idealism and cynicism, dialectic and double talk. For one reader at least, the bewildering American background of the Hiss trial seemed to be suddenly illuminated by Mr Koestler's experience in Germany.

The unevenness of the writing does not detract from the impressive and uniform testimony of the book. All these men, without exception, abandoned Communism because in the last analysis they could not stomach its immorality. Not so much the issue of liberty as the issue of truth and charity drove them away from the Party. For Silone, a breaking point came when, at a Comintern meeting, an English delegate's simple protest "But that would be a lie" raised a gale of laughter that rocked all official Moscow. For Gide, to be offered adulation and plenty in the midst of poverty was as intolerable in Russia as in the bourgeois West he had sought to escape. Koestler speaks for them all when he affirms his acceptance of the

> perennial commonplaces: that man is a reality, mankind an abstraction; that men cannot be treated as units in operations of political arithmetic because they behave like the symbols for zero and the infinite, which dislocate all mathematical operations; that the end justifies the means only within very narrow limits; that ethics is not a function of social utility, and charity not a petty-bourgeois sentiment but the gravitational force which keeps civilization in its orbit . . every single one of these trivial statements was incompatible with the Communist faith which I held.

The revolt is a moral revolt. The men have turned from Communism because they do not in fact believe that mankind can be redeemed by the gospel according to Marx.

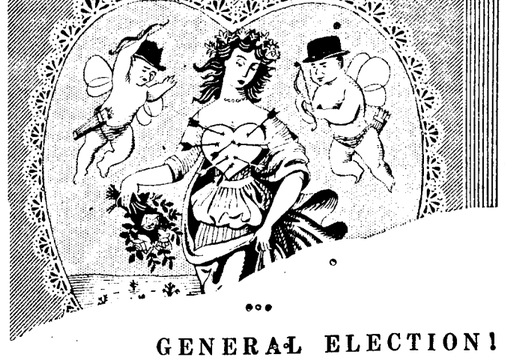
This, then, is the revulsion which we may expect to see influencing strongly the radicals of the new generation. But the book gives no picture of the alternatives to which the abandonment of Communism may lead the six men. Their version of the good society is not yet to be found in the western world. But of the west at least it can be said that in it they will be given the opportunity to continue their search free from the threat of Siberia or a bullet in the neck.

Agriculture and a Changed Economy

"The Economics of Agriculture." By Ruth Cohen. Nisbet and Cambridge University Press. 216 pages. 6s.

This book was first published in 1940. It provides a useful introduction to the main problems of agricultural economics, including production and marketing methods, price fluctuations, and the trend of earnings. The last chapter—on state intervention—has been largely rewritten in the light of recent events. The case for some measure of state intervention in an industry liable to chronic instability is brought out. However, the state can and has intervened in agriculture in a wide variety of ways, and the author has pointed out the drawbacks of some of its incursions. For instance, in prewar days the main effect of import restriction, especially quota systems, was to raise food prices to the consumer. In the case of Britain, this policy had the further effect of penalising the poorer sections of the community who eat the highest proportion of imported food. Bad effects are also likely to flow from any statutory scheme which enables an organised group of producers to control prices by restricting supplies. If the scheme (like the British hop scheme) regulates the output of individual producers by quota, then it eliminates competition and protects inefficiency. If (like the milk marketing scheme) it controls marketing outlets, without attempting to limit total production, then it is less pernicious but still liable to abuse.

The protection extended to British agriculture before the war was largely carried out by the two former methods (the fostering of producers' monopolies and the quantitative restriction of imports), which were regarded as complementary and both of which were intrinsically bad. Today, however, British agriculture is protected on a far more comprehensive scale but by different methods. In the first place, the state guarantee of minimum agricultural prices is less objectionable in principle (however badly it may be working in practice) than the method of empowering producer-controlled boards to hold the consumer to ransom. It is accompanied—for good or for bad—by a wide measure of state control over agriculture than previously existed. In the second place the cost of food policy has been shifted from the consumer to the taxpayer. Instead of helping to subsidise the producer, the consumer is now himself subsidised on a vast scale.



One wishes that Miss Cohen, who has a lucid power of analysis, had dealt in more detail with the implications of these major changes in agricultural policy. So long as the paraphernalia of complete government control over imports, rationing, and prices lasts, no major issue of policy can arise; but when, and if, something like normalcy returns, it will be a different story. The book is written from a general viewpoint but with special reference to British agriculture. The effect—since British agriculture is a unique case—is sometimes rather misleading. The differences between agriculture and other industries are discussed, but the relationship of agriculture to

CHATTO & WINDUS

En route to where the pound now buys more

Just before the paper restrictions were lifted in January 1949, the average number of people buying the Daily Mirror every day was 3,700,000. To reach this number of prospective buyers, advertisers spent £14.16.4 on every column inch of space.

Now, the number of people buying the Daily Mirror each day has gone up to over 4½ million. With the largest daily sale in the world, advertisers still only pay £14.16.4 per column inch.

In other words, the value of the pound invested on space in the Daily Mirror has increased by 21·6%.

To advertise to 1,000 people costs only ·79 of a penny per column inch.

Daily Mirror

THE GREATEST INFLUENCE IN DAILY JOURNALISM

the national economy is only tackled incidentally. No doubt an introductory text book is not the place for a disquisition on this theme, but a sensible and balanced treatise on the role of British agriculture in a changed economy has yet to be written.

Production Economics

"Manufacturing Business." By P. W. S. Andrews. Macmillan. 308 pages. 15s.

MR ANDREWS' book has accomplished what its title purports. This in itself is a refreshing change. But then this is a refreshing book. The author has drawn on first-hand experience of industry to shape an economic theory of manufacturing business. He gives the economic interpretation of the various forms of ownership ; the economics of apportioning revenue between costs and profit ; and the cost of management. He proceeds to explain the economics of the sales and marketing effort. In the final section of the book the economics of the various stages of manufacturing are brought together as a compact theory.

Any book on economics combining theory with practice is in danger of falling between two stools. The practical man may find it too remote from business as he experiences it while to the student the approach may appear rather pedestrian, lacking the stimulus of a book on pure theory. Lastly the university teacher is often apt to shirk lecturing on the economics of production for fear of seeming too remote from reality or just a *raconteur* of what he saw on a factory visit. Indeed, in its preoccupation with the causes of insufficient effective demand, economic thought in the 1930s came to be somewhat contemptuous of Alfred Marshall's painstaking interpretation of the production process. The studies published in the Oxford Economic Papers of the experience of individual firms in 1939 and 1940—Mr Andrews was one of a team engaged on that work—did much to remedy what the previous decade had left undone. This is a text book originating from this circle marrying up to date theory with up to date practice.

America in the World

"The United States in World Affairs, 1948-9." By John C. Campbell. New York: Council on Foreign Relations. London: Institute of International Affairs. 604 pages. $5.00 or 30s.

AMONG scholars of diplomatic history and international affairs there is a disposition to use "journalism" as a term of abuse for study and comment on events less than ten years old. Such persons would doubtless say of this book that it is surprisingly scholarly and objective ; mere journalists, on the other hand, will say how remarkably readable and fresh is this careful study of American foreign policy during a period of exceptional complexity, experiment, and danger. Much careful planning and hard work must have been needed to get it published in less than a year after the period it covers. It contains a valuable chronology, an extensive bibliography, and a reliable index. Here is an excellent quarry for the vulgarisers, text-book writers and pamphleteers from whom each generation under 25, in fact, gets its interpretation of contemporary history.

It is most appropriate that the introduction should come from General Marshall, for it is his firm and in many respects masterly conduct of policy that this survey covers. His definition of the right policy for America has never been better stated than in his speech of May, 1948, to the House Committee on Foreign Affairs. He defined the three fundamental tasks of American policy as follows: to dispel "serious misconceptions" in the minds of the Soviet leaders, to restore the balance of power relationships required for international security, and to assist in developing conditions of political and economic security so that democratic peoples would be able to preserve their freedom and independence in the face of totalitarian threats.

Where the vision of this book falters is when it looks back at such features of the year 1948-9 as the change in American policy towards the Germans, the tardy realisation of failure in China, and mischief done by the American attitude towards the Palestine problem. On Soviet policy, however, the tone and argument are moderate and fair, and on British policy restrained and sympathetic.

Mission to Haiti

"Mission to Haiti." United Nations Publication. 327 pages. 17s. 6d.

THE picture that is presented in the report of the Uno Mission sent out to Haiti in 1948 is depressingly familiar to anyone with even a superficial knowledge of conditions in the larger Caribbean territories. The basis of the economy is agriculture, of a primitive order ; the pressure of population on resources has forced the peasants to cultivate steep slopes in the mountains, and serious erosion has resulted ; the poverty of the people has restricted the growth of capital within very narrow limits, and fragmentation of holdings and freehold land tenure has added still further to economic inefficiency. On the top of this there is even more illiteracy, superstition, social disorder and ill health than prevails in other parts of the Caribbean. There can be small wonder that the mission accepts the findings of other expert inquiries elsewhere: that the productivity of labour is low, and that the economic problem in Haiti is "so to expand national product in relation to population as to increase real income per head, and so to distribute it as to raise the standard of living."

To say that this is another glimpse of the obvious can hardly, in these circumstances, be thought to be carping. How precisely, it may be asked, is the end thus stated to be achieved ? The mission has undoubtedly produced some very valuable studies of public administration and services in Haiti ; the chapters on public finance and credit organisation will, for instance, be of the greatest value to the Government in carrying out much-needed reforms. The long-term or "background" problems, the supply of capital and the generation of energy in the people to use it to best advantage receive inadequate attention. This is really worrying, for it is on their solution that the tidying up of details will ultimately turn.

The recommendation that possibilities of emigration should be studied will awaken no response in the minds of the disillusioned administrators of Jamaica and Barbados, who will also, in some measure, share the pessimism implied in the conclusion that "feasible industrialisation" will be limited for some time to come by a "close ceiling." The only substantial hope for the future appears to lie in the bauxite industry. The deposits controlled by the Reynolds Metal Company lie within a short haul of deep-sea loading facilities, and a potential source of hydro-electric energy would make possible the conversion of the ore into alumina, if the American tariff did not prevent its export to the United States.

AMERICAN SURVEY

End of the Truman Doctrine?

(From Our American Staff)

AMERICAN policy in the Far East was obscure for so long that it became the playground for many theoretical strategists who found Europe too constricted an area for the exercise of their fancies, but it was at last precisely defined by the Secretary of State in his recent speech to the National Press Club. It was a speech which—apart from its exceptional merits as an extemporaneous address—explained the political and philosophical basis of policy everywhere and not in the Far East alone. The only consistency which Mr Acheson would admit to be valid was the consistency of pursuing American interests ; but implicit in his speech was an underlying consistency deeper and more important than the explicit but superficial consistency of those who ask him to repeat in China what has already been done in Greece.

Mr Acheson's statement has been generally interpreted as "the end of the Truman doctrine" and it was, certainly, a formal announcement that "support of free peoples who are resisting attempted subjugation by armed minorities or by outside pressures" (in the sense in which that phrase has been employed by the Republicans) was no longer needed as a battle-cry. In fact, the emergence of Titoism took from the Truman doctrine some time ago any meaning that it ever possessed apart from the Greek-Turkish aid programme itself. The President's immediate purpose had been to sell that programme to Congress and the American people ; the doctrine has never been applicable, nor has it been applied, to other countries. (The *New Republic*, having pointed out that the Truman doctrine "led Henry Wallace to forsake the Fair Deal," prophesies that, after Mr Acheson's speech, he is likely to end his "die-hard fight" and return to the fold—which would be a most embarrassing by-product of the speech.)

But the Secretary did something more important than burying the bones of a dead policy. He expounded a new one—or, perhaps, reminded his audience of what the old one started out to be. The Truman doctrine, after all, though an isolated example, has been successful ; neither Communism nor Russia has overrun Greece and Turkey and the emphasis on the military side of the programme, which was so disliked on the left wing, has given way to an emphasis on the economic. In the Balkans, for special reasons, the Atlantic Pact phase came before the Marshall Plan phase. In the rest of Europe it did not.

In Asia, where the presence of foreign armies and foreign industrialists is a reminder of the past, there is to be an even more cautious approach. Since "it must be clear that no person can guarantee these areas against military attack, . . . the initial reliance must be on the people attacked . . . and then upon . . . the entire civilised world under the Charter of the United Nations." Administratively and industrially, "the western powers . . . know techniques . . . all of which can be helpful and those we are preparing to make available if they are wanted." Communism and its spread are to be resisted because of "the right of every people . . . to develop in their own way." This has been greeted as a new principle, but it is rather the adoption of an existing principle—that of the Commonwealth—and it may have been prompted by the realisation that Mr Nehru does not intend to join either team in the cold war.

There is, in fact, less mention of the cold war and less mention of the points of friction with the Soviet Union than in any pronouncement by a Secretary of State for a long time. There is no picture of an iron curtain with, on either side of it, forces forever opposed to each other. There is instead an implied suggestion that there are large areas which both sides could profitably leave alone. There has certainly been a discovery that there are large areas which would like to be left alone. Since the announcement that the Russians had exploded an atomic bomb, security has become, for many of these areas, less a matter of having an American army stationed on their frontiers than of developing a neutral position.

And since that announcement there has been a sudden burst of interest, in the United States, in the hydrogen bomb, which is no novelty except as a device for scaring people into either a new arms race or a new attempt to come to terms with the Russians. During the last few weeks it has been used as both: the supporters of preventive war have spread reports that full-scale manufacture will soon begin, while those who think that the Baruch plan for international control of atomic energy is something less than sacred cite the hydrogen bomb as a reason for a more flexible approach to the problem in the United Nations. There is, indeed, everywhere—and the Secretary's speech is but one example—a feeling that the state of tension which has been normal for the past three years cannot go on much longer.

*

But this is an election year and the Administration would like some dramatic success in foreign policy before November. Indeed, they would like it earlier ; last week's narrow defeat in the House of Representatives of the Bill for aid to Korea is a sign that foreign aid programmes have not got the attraction they once had. Some "positive" policy would be welcome before the European recovery debates begin. Mr Acheson's policy was genuinely positive but, unfortunately, the word has grown to mean a policy with elements of drama, a policy which collects allies and enemies. Such policies cost money and Congress does not want any more costly policies at the moment.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Although Mr Truman has concentrated his attention on domestic policies since his re-election and will no doubt base the election campaign this autumn on them, he does not, obviously, want to be vulnerable on foreign policy. The collapse of Nationalist China has made the Administration vulnerable—quite unfairly, because Chiang Kai-shek has been an exclusively Republican protégé for the last three years—and some equally spectacular victory would be appreciated. The success of a move such as 1948's suggested "Vinson-to-Moscow" mission would be a spectacular victory. But the Secretary of State must know very well how such an adventure would be suspected in the rest of the western world and, also, how unlikely it would be to produce any results. He can also have few illusions about the prospects of another meeting of the Big Four Foreign Ministers.

Mr Acheson's position is not easy. His party needs a success to offset the failure in China. Formosa itself, in spite of its present prominence in the Republican programme, is hardly likely to be a live issue by November, but the extension of Communist control to other areas cannot fail to be one. Mr Acheson's speech clearly shows that he believes that the best hope lies in not rocking the boat. But quiet and undramatic policies do not show results in time to win elections or to pass needed appropriations. The best chance of ending the cold war, in fact, is to let it die away. But there are probably few people in Congress or in the country who are prepared to wait for it to do so.

American Notes

The Hiss Tragedy

Nearly eighteen months and two long trials ago, one of America's most respected and able young men, Mr Alger Hiss, was accused by a renegade Communist, Mr Whittaker Chambers, of passing secret government papers to a Communist spy-ring in 1938. Last week a New York jury managed to agree that Mr Hiss had committed perjury when he denied having done this or having seen Mr Chambers after the end of 1936. Mr Hiss's appeal against his sentence of five years, half the maximum penalty, in jail will, it is said, be taken as far as the Supreme Court if necessary, and if funds can be found to carry on the fight. The judge refrained from fining Mr Hiss, after his counsel pleaded, as is well known, that he was already ruined financially.

The statute of limitations made it impossible for Mr Hiss to be tried for espionage but, in effect, the verdict condemns him on this as well as on the perjury charge. It is difficult not to feel that the latter accusation has been proved, but those who know Mr Hiss still find it incredible that he should have been a spy. It has long been rumoured that he is protecting someone else; certainly he never dreamt that the unreliable Mr Chambers, a self-confessed perjurer, would be believed rather than a public servant of unblemished reputation.

*

But Mr Chambers had solid facts to bear out his words—documents in Mr Hiss's handwriting or typed on the machine which he and his wife could not, try as they would, prove that they had disposed of before the relevant dates. These "immutable witnesses," rather than the changeable human ones who contradicted each other in the witness-box, were the basis of the jury's verdict. At this second trial the defence was allowed to call psychiatrists to testify on Mr Chambers's psychopathic personality but, under the expert mockery of the prosecuting attorney, they helped neither Mr Hiss nor their profession. Another new witness was Mrs Massing, ex-wife of Gerhard Eisler, who testified that she had known Mr Hiss as a member of the Communist underground in 1935. The judge's refusal to allow her to appear at the first trial had led to accusations that he was showing partiality to Mr Hiss in order to save the Administration from the shame of having one of its favourite sons convicted.

Mr Hiss's close association, in the initial stages, with the policies that have now developed into the Fair Deal at home and co-operation abroad, give his case far wider significance than the similar cases being conducted against the labour leader, Mr Harry Bridges, accused of perjury in concealing his Communist membership, and against Miss Judith Coplon, charged with giving government papers to the Communists. The tragedy of Mr Alger Hiss is more than a personal one for him. It will make other government servants, who flirted with Communism in the days when it was fairly respectable, go cautiously about liberal and international business for fear of attracting the jubilant eye of the Un-American Activities Committee. This Committee was the first to dig into Mr Hiss's past and it feels that his conviction is an irrefutable and everlasting answer to its critics in general and to Mr Truman in particular. And those who contend that the Administration's policy in China has been influenced by pro-Russians in the State Department have gained a new argument. Mr Acheson, however, with his characteristic courage, but also with the authority of the Sermon on the Mount, has declared: "I do not intend to turn my back on Alger Hiss."

* * *

Baiting the Tax Hook

Congress will not fail to rise eagerly to the President's suggestion that the war-time excise duties on transportation, long-distance telephone and telegraph charges, and such articles as jewellery and luggage, should be reduced. Indeed, it is accounted a victory for the Administration that the Senate has withstood the temptation to proceed without waiting for Mr Truman's green light. Traders are already complaining that their customers, certain of early relief, have almost ceased buying.

The greater need, however, is for measures that, in time, will increase revenues, reduce the deficit, and share the tax burden more fairly. To this end, Mr Truman urges that certain glaring loopholes in the present law should be blocked up, and that, while small business should be given some tax relief, another $1 billion should be raised from corporation, estate, and gift taxes. Mindful that once before, in 1948, another election year, Congress nimbly swam off with the bait, leaving Mr Truman holding an empty tax hook, the President made it clear in advance that he would veto any Bill providing for reduction of excise taxes unless it also provides for new revenue to offset the loss.

In the President's view, excise relief should not exceed the amount of revenue that can be prevented from running away through excessive depletion allowances for oil and mining firms, the failure to tax insurance companies on their investment income, and abuses of the capital gains tax and of the tax-exemption granted to non-profit institutions. A number of the latter operate profitable businesses without making any contribution to taxes. The House is about to vote on a Bill reducing the exemption of insurance companies. But the stopping up of all these leaks is not expected to bring in more than about half the $1.3 billion collected at present from the seven excise duties the President selected for reduction, and Congress may not be content to stop there.

Even if Congress swallows the President's line hook and sinker, which is unlikely, it will be some time before the loss of excise revenue is made up and longer before there is a net increase in revenue. Any yield from an increase in the tax rate on corporations earning more than $50,000 a year would not begin to come in until March, 1951. Loophole plugging is equally slow to show a return, while estate and gift levies are even more laggard tax collectors. Defending himself against Congressional advocates of a balanced budget now, Mr Truman urged that over-hasty cuts in spending or increases in taxes might, by setting off a business decline, make a balanced budget impossible to obtain in later years. The moderation of the President's tax proposals, and the reluctance of Congress to increase corporation levies, suggests that this risk of a balanced budget is neither very real nor very immediate.

* * *

Super-Hiroshima?

The confusion of American thought on atomic questions has been further confounded by news of a new super-bomb, as superior to the atom bomb as that is to traditional high explosives. The lid of this Pandora's box was indiscreetly lifted some weeks ago by Senator Johnson, under the influence of a television appearance, and since then there has been much speculation on the hydrogen bomb which, it is agreed, lies inside. The Alsop brothers have announced in their press column that the new horror is 1,000 times more powerful than the original atom bomb dropped on Hiroshima and that each hydrogen bomb is capable of devastating 100 square miles.

Mr James Reston and the *New York Times's* scientific correspondents have now produced more authoritative forecasts, although official secrecy is still complete. The theory of the hydrogen bomb has been known to scientists all over the world since the nineteen-thirties. It depends upon the creation of energy not by nuclear fission, but by the fusion of hydrogen atoms, the production of new suns on earth. This was, however, not feasible until the atom bomb was available to generate hitherto unattainably high temperatures and pressures. The scientific and industrial problems of manufacturing the hydrogen bomb are apparently, as far as can be judged before an actual start is made, much simpler than those that had to be solved in the development of the atom bomb. In theory there is said to be no limit to the possible explosive power of the super-bomb; in practice the Alsop estimates may be somewhat modified. But as regards expense, they may have exaggerated when they put the possible cost of the hydrogen bomb at about $4 billion, the same as the original atom bomb, produced with wartime urgency and prodigality. Mr Reston thinks something in the region of $200 million is more likely.

There is little doubt, therefore, that the hydrogen bomb is a practical proposition, but President Truman, and the small group of high officials who are understood to be studying the question on his behalf, must make up their minds whether the hydrogen bomb justifies its cost by its military value. If it is decided that the bomb is worth while from the technical point of view, then the moral issue must be faced. In time of peace this is not a matter for officials alone, but for all Americans. Still conscious of a sense of guilt that their country was responsible for the atom bomb, most of them will be revolted by the hydrogen version that does not even excuse itself with beneficial by-products. But this time they are being told that it is not a question of starting an arms race, but of keeping their place in one. The Russians can, and will not hesitate to, begin work on a hydrogen bomb. It seems probable that the United States will do the same, although President Truman will also, it is thought, in spite of his denials, make a new attempt to secure international control of atomic energy.

in triangular pats and pounds, to prevent it masquerading as its more expensive rival. This victory puts an end to the hope—rather a forlorn one—that the Southerners would put their economic interests before their racial beliefs, and swallow a civil rights rider if it were attached to the margarine Bill. It has been more common for the dairy bloc to introduce the civil rights issue—as was done this time—in hopes of blocking the margarine reform.

The Administration has no intention, however, of letting the civil rights programme drop. With a Senate filibuster barring the way, the hope of passage is remote, but Mr Truman is determined to force a showdown on this and other issues to demonstrate, for the benefit of the voters, as he said last week, "who are our friends and who are not." The Administration's Bill to ban discrimination in employment against Negroes, the Fair Employment Practices Committee Bill, is scheduled for Senate debate at the beginning of March. Last week the House was the scene of a Southern attempt to prevent a similar measure from reaching the floor at all. In the first fine rapture after Mr Truman's re-election, the House broke the long-standing and arbitrary power of the Rules Committee to pigeon-hole Bills it did not favour. The move was welcomed as a long step toward democracy and full responsibility in House procedure. In this session, however, the Rules Committee—on which even now Southern Democrats and Republicans reign supreme—revolted and demanded a revival of its dictatorial authority. The Southern calculation was that the Republicans, determined to block the "spendthrift" Fair Deal, could be counted upon to help. For this session, at least, such a retrograde step would have stifled, not only the FEPC, but the Administration's Brannan plan for farm prices, the Bill repealing the Taft-Hartley Act, and health insurance—all of them measures to which the Administration wants to demonstrate its loyalty.

The refusal of many Republicans to succumb to temptation was due to the fear that, if they co-operated with the Southerners, their Negro supporters would interpret it as a betrayal of the Republican pledge to support civil rights legislation. They knew that Mr Truman stood ready to exploit any mis-step. The reform of the Rules Committee was upheld, in the end, by 236 to 183, a considerable Administration victory. The chairman of the Labour Committee is now free to demand the discharge of the FEPC Bill—if he can catch the Speaker's eye. On Monday Mr Rayburn's eye was unaccountably hard to catch ; it alighted instead on a committee chairman fighting the worthy, and less inflammatory, battle for Alaskan statehood. The next opportunity does not arise for a month. The Republicans will watch with lively interest to see whether Mr Rayburn's loyalty to the President then outweighs his Southern instincts.

* * *

American Banks in 1949

The background against which the American banks were working through 1949 was by no means unfavourable, in spite of the sharp contraction in commercial, farm, and industrial loans which lasted from the end of 1948 until mid-summer. Relief for the banks followed the reflationary policy adopted by the Administration from the spring of 1949, beginning with the relaxation of margin requirements for the Stock Exchange, and easier regulations for instalment credit. Bank reserve requirements were cut sharply from time to time, releasing substantial balances for loans and investment. Over the year as a whole, therefore, earning assets were appreciably higher than in 1948:—

US Commercial Banks

Banks' earnings generally showed no marked change from 1948. In 1950, with the business outlook suggesting fair stability in incomes and employment for some way ahead, the volume of loans should rise further, and there will be scope for the profitable employment of funds in financing the Treasury deficit. On the other hand, it will presumably be difficult to check the advance in expenses. The banks, too, will be fortunate if they can repeat the profits secured in 1949 as a result of the rising bond market.

Perhaps the most interesting development towards the close of the banking year was the open duel between the Treasury and the Federal Reserve Board on monetary policy—and the prospect it opens of a fundamental shift in control. This controversy, which has been no more than half-concealed for many months, entered a new phase with a recent report by a Congressional sub-committee on monetary and fiscal policy. In brief, the report advocates central control for all federal loan activities, and the declaration by Congress that "the primary power and responsibility for regulating the supply, availability, and cost of credit shall be vested in . . . the Federal Reserve system, and that Treasury actions . . . shall be made consistent with the policies of the Federal Reserve."

There will be intense opposition to any loss of the Treasury's dominance over monetary policy. But this report is a powerful reinforcement of the statement, made last June by Mr Thomas McCabe, chairman of the Board of Governors of FRB, that the reflationary policy then adopted "signified removal of the 'strait jacket' in which monetary policy has been operating for nearly a decade". Altogether, it suggests that any further upsurge of inflationary pressure will meet with stronger restraints than were permitted by the Treasury from 1946 to 1948.

Shorter Notes

Mr Myron Taylor has resigned as Special Ambassador to the Vatican, a position which he has held for ten years, as the personal representative first of President Roosevelt, then of President Truman. This was a special mission, set up to deal with war and postwar problems, and it is not certain that Mr Taylor will be replaced. The United States had not previously had diplomatic relations with the Pope for many years and Protestant groups have made a habit of protesting against Mr Taylor's official presence in Rome.

*

New York's buildings age more quickly than its women, but even so the Ritz-Carlton Hotel hardly seems to qualify for demolition on this account. Only forty years old, still luxurious and fashionable, worth $2 million apart from its site, it is nevertheless to be pulled down to make room for an office building.

*

The US Tariff Commission has decided that there is not sufficient evidence to warrant an investigation of claims by American producers of narcissus bulbs and wool berets that they are in danger from foreign imports. The first such investigation was ordered last April into the case of spring clothes-pins, and the Commission has just announced that the manufacturers failed to prove that they were being seriously injured by imports of these articles.

*

What is alleged to be America's first complete new atlas since 1919 shows the change that has occurred in the US attitude to the rest of the world during that time. Unlike its predecessors, this atlas begins with maps of the world overseas, instead of with North America.

*

In the second half of this century 59 foreign governments are due to repay the United States over $13 billion, mostly borrowed since the second world war, but not including direct gifts made through Unrra, the Marshall Plan, etc. Great Britain owes 56 per cent of the total.

THE WORLD OVERSEAS

The Franco-German Dispute

(From Our Paris Correspondent)

DURING the last few days the Parisian press has been quick to point out that the quarrel over the impending negotiations between France and the Saar is really a German *ballon d'essai* in Germany's final struggle to shake off the western Allied fetters. The somewhat belated and somehow unconvincing declaration of support of the French position given by Mr Acheson at the weekend has not excluded, in French opinion, the possibility that the United States will next appear as a mediator between the two parties. Mr McCloy, in particular, is considered to represent the view that the only solution to the Franco-German malaise is the internationalisation of the Ruhr, the Saar, and the heavy industry of Lorraine, Luxembourg and Belgium within the framework of the Council of Europe. The opinion that Dr Adenauer's Saar claim was internally a put-up show is, in French eyes, confirmed by Herr Schumacher's remarks during a speech in a factory that "the policy of the Federal Government towards France has hitherto been a disastrous illusion" and "the western Powers are pursuing in the Saar a truly Soviet policy." As to the statement of Herr Dehler, German Minister of Justice, in which he denied German responsibility for the two World Wars and attributed the rise of Hitler to the Treaty of Versailles and the "pusillanimity of the French," the French public can but smile its weary "I told you so." The fact that the High Commissioners will not, it is supposed, demand the removal of Herr Dehler from his office, judging it opportune to confine themselves to the veto on the removal of petrol rationing increases, or rather confirms, France's sense of impotence before Germany.

French Scepticism

The Anglo-Saxon notion that it is the business of the western occupying powers to help Dr Adenauer gain the confidence of all Germans in face of Soviet nationalist propaganda cuts very little ice in France. The French are not much interested in the political opinions of Germans which to them seem always the same, nor in Allied preference for this or that politician, which they regard as in any case temporary. (They would much rather that Dr Adenauer *was* "the Chancellor of the Allies"). The Quai d'Orsay, which has beaten its sorrowful retreat from its earlier positions (German Confederation, separation of the Ruhr and the Rhineland and so forth) to the last ditch of the Ruhr Authority and the Military Security office, is now confronted with a German Government pouring forth cataracts of good old pan-German propaganda under the noses of the occupation authorities. M. Schuman, the most conciliatory of French Foreign Ministers and the most understanding of Germany, is subjected at Bonn to the kind of pressure which, for Anglo-Saxons, appears inevitable, patriotic and, some even seem to think, honourable. It should not be forgotten that the majority of Frenchmen of all political opinions regard this type of Allied diplomacy as silly, woolly tomfoolery.

Not that the French reaction has been violent. The Bonn crisis together with Germany's deliberate refusal to conclude the Franco-German trade pact, the signature of which has been adjourned *sine die*, has on the whole caused more pain than anger in the press. *Le Monde* does not even reject outright the solutions of the Bonn memorandum—internationalisation of the Saar and a plebiscite. The editorial simply objects to the timing of these German proposals, neither Germany nor the Saar being, in its view, at present in a position to decide the issue finally. The Socialist *Populaire* dismisses as an absurdity the German case that the Saar, being legally the twelfth *Land* of the Federal Republic, should revert to Germany politically while remaining economically attached to France.

M. Grandval's Views

Monsieur Gilbert Grandval, French High Commissioner in the Saar, has stated the position of the French Government on the merits of the case. The aim of French policy is "to develop the particularism, the independence and the political and administrative autonomy of the Saar, but without prejudice to the decisions of the peace treaty." There is no intention of creating a *fait accompli* but rather of taking the opportunity of removing the effects of French occupation. The proposed measures would be equally useful, whether the signature of the peace treaty with Germany were near or far. At the peace conference France would never claim the Saar mines for herself ; she would claim them for the Saar. In the meantime the forthcoming talks would aim to co-ordinate their production with that of the French mines in a beneficial manner. It was also obviously desirable that the link-up of the Saar railways with the French system should be continued ; it was equally desirable that freedom to work in France and the Saar should be enjoyed by the citizens of both countries, for freedom of movement was the declared aim of the Council of Europe. Finally, it was natural that he, M. Grandval, should now become something other than a high commissioner. In a reference to German motives M. Grandval said that to internationalise the Saar—or anywhere else—before it had been proved whether Germany regarded the Council of Europe as a means or an end would be a tragedy. "If, however, it *is* an end, there is no more Saar question" but Germany's good faith must first be proved.

Criticism of British Policy

British support of France has caused satisfaction. The opinion nevertheless persists that British policy in Germany has failed ; and, as always, for the reason that the British administration is obsessed with notions of democracy and justice which are as unfamiliar to the Germans as Chinese poetry. For the French, experimental democracy in Germany is a luxury which cannot be afforded in the cold war. It can be afforded neither politically (uncontrolled German resurgence is one of the few really strong points of French Communist propaganda) nor militarily. For in the measure that the idea of the defence of Europe is seriously entertained, it is entertained by the likes of General de Gaulle who envisage the creation of a nuclear Franco-German army under complete *political* control of the Allies. This is, indeed, an extreme position: most Frenchmen do not want the German army. But *no* Frenchman wants a fluid, scheming Germany nor does it occur to him that an effective method of avoiding one is to allow German politicians to denounce the Western Allies in order to win followers from Herr Pieck.

India's Republican Constitution

[FROM OUR DELHI CORRESPONDENT]

ON November 26, 1949, the people of India, having solemnly resolved to give their nation a sovereign democratic republic, and to secure to all its citizens justice, liberty, equality, and to promote among them fraternity, gave themselves a constitution; part of this came into force immediately; the rest from January 26, 1950, when the new Republic was born. This date is the anniversary of the first declaration of independence, twenty years ago.

The men who assembled on December 9, 1946, to frame India's new constitution, were not subject to strong emotion or revolutionary fervour. There had been no tennis court oath; there had not been, and was not to be, a War of Independence. Yet the three years which were to follow while their deliberations proceeded were crowded with unforeseen events of great moment and peril, which have left their mark in the difference between the constitution as at first conceived and the instrument which has at last emerged.

Before partition the framework envisaged did not differ greatly from that of the Government of India Act of 1935. The units of the federation would be strong, the centre comparatively weak; separate electorates and reservation of seats for minorities were taken for granted: the relationship of the princely states with the rest of India was still unresolved. Partition changed all that: much of the argument for a weak centre fell away, and Congress India began to feel its way back towards the days of its opposition to the 1935 constitution, when provincial autonomy and separate electorates were both anathema. Meanwhile, by a process which claimed no constitutional sanction, but which was politically both necessary and effective, the states were being welded together, with each other and with the provinces, many being taken over as centrally administered areas. A further impulse towards centralisation was supplied by the dangers, political and economic, which threatened the existence of the union, and the demeanour, not always co-operative, of provincial governments in face of them. Not least important among the events of these three years is one which has left no mark on the constitution itself, but is perhaps more significant than all its articles put together—the recognition by India of the King as the head of the Commonwealth, of which it is, by its own choice, a member.

165 Days of Debate

The stages by which the constitution took shape were these: The Indian Constituent Assembly had been set up on the recommendation of the Cabinet Mission of 1946. A "resolution of objectives" was passed, and now forms the preamble to the constitution. Committees then reported on various aspects of the constitutional field, and the first draft was prepared by Sir B. N. Rau. The drafting committee then got to work, under the chairmanship of Dr. Ambedkar, who, on his own admission, entered the Constituent Assembly with no greater aspiration than to safeguard the interest of the scheduled castes. To him, however, fell the task, during the next two years, of steering the constitution through the Assembly, of whose members comparatively few displayed breadth of view or grasp of the essentials.

From February, 1948, debate on the new draft proceeded in full Assembly; 2,473 amendments were moved. The third reading was completed 21 months later. Sir B. N. Rau's draft of 243 articles and 13 schedules had become 395 articles and 8 schedules. From beginning to end, the Constituent Assembly had sat for 165 days, in 11 sessions. By comparison, the American Constitution was completed in four months, but had only seven articles. The constitution is written in English, although Hindi has been prescribed as the national language of India. Underlying its entirely new features, its chapter on fundamental rights and its directive principles of state policy, are large chunks taken almost verbatim from the Government of India Act of 1935. One might therefore assume that it is a conservative document; indeed some of its critics have said that it is not only conservative but reactionary. But an instrument which, at one stroke, enfranchises 160 million men and women, which abolishes "untouchability", which declares all its citizens—irrespective of religion, race, caste or sex—to be equal before the law, can by no stretch of meaning be described as reactionary. Moreover, the unprecedented ease with which it can be amended—by a two-thirds majority in Parliament, and, in the case of some provisions, by a simple majority—invests it with an almost dangerous mutability.

The constitution is a compromise, not only between ideas of east and west, but between other constitutional examples. Compromise is evident in the position of the President. Like the American President he is elected; thereafter he assumes the position of the British monarch. He has constitutional powers amounting, in certain emergencies, to the right to suspend part of the constitution. He can address, or send messages to Parliament. But in all things, the President is, by convention, to act on the advice of his Ministers.

The Impress of Gandhi

Another compromise appears in the chapter on fundamental rights. It is here, and in the directive principles of state policy, that the impress of Mahatma Gandhi is most clear. These chapters include the abolition of "untouchability", the organisation of village *panchayats*, the promotion of cottage industries: they declare the right to work, to a living wage, and to equal pay for equal work: they direct the State to endeavour to prohibit consumption of intoxicants and cattle slaughter. But, in stating the right to freedom of speech and expression, the protection of personal liberty and the right to property, the exceptions and provisos are so categorically set forth, as to amount, in the opinion of some, to a denial of the very freedoms which they purport to establish.

The unification of India, greater even than that achieved under British rule, is expressed in three main ways. A single citizenship for the whole of India; a common official language—Hindi (but English to be retained for 15 years): and the integration of the Indian States with the Union, to a degree unhoped for even six months ago. The Central Legislature, and that of some of the provinces (hereafter to be called states) will have an upper chamber. These upper chambers can hold up temporarily, and direct reconsideration of, measures passed by the lower houses of which they do not approve: they cannot prevent them. The judiciary, which is to be separated as soon as possible from the executive, will guard the law and the rights of the individual. The Supreme Court of India will have wider powers than the highest court in any federation. It is the final interpreter of the constitution, the final court of civil appeal, and has criminal appellate jurisdiction in certain cases. An independent Controller and Auditor-General will guard the finances of the Union, and secure that the revenues both of the centre and of the states are not applied to any purpose without proper authority.

The features of the constitution which have attracted most controversy are adult suffrage, and the powers of the Union centre. The present, comparatively small, electorate in India is based mainly on property qualifications. At the next elections some 4,500 representatives in all the houses, central and provincial, will have to be chosen, in 4,000 constituencies, by approximately half the population of India—some 160 million voters, the greater part of whom are illiterate villagers. Dr. Rajendra Prasad, who has just been elected the first President of India, and who describes himself as a man of the village, has said this is an act of faith by which he, for one, is not dismayed.

As for centralisation of power, this has been one of the developments which has justified the leisurely progress of the Constituent Assembly. A strong federal centre has emerged, partly through allotment to the centre of the lion's share of legislative and executive authority, expansion of the "concurrent list", and giving the centre residuary powers; and partly by the provisions for overriding the authority of provincial (state) governments in emergencies. Although this concentration of power in the centre does not undermine the federal principle, it is nevertheless true that it is greater than should normally be necessary, and that it is the incompetence and intransigence of some provincial governments which have convinced the Constituent Assembly, consisting mostly of provincial representatives, of the wisdom and necessity for this arrangement, at any rate for the present.

Political Drawbacks

An outside observer, visiting India while the constitution was being shaped, might wonder whether it had any relevance to India's future. In a direct sense, of course, it has not. The seeds of disruption, as well as of unity and stability, are already planted deep, and are germinating. Which will prevail and which will be weeded out will not depend on the constitution, but on the people of India and the character they show; on the educated few who fashioned this constitution, and the unlettered many whose hands will work and may change it. The constitution itself is only a workmanlike hoe, which may help to keep the weeds down. The outside observer might be depressed, especially if he remembers the apparent apathy, more fatal than ignorance, of the Indian countryman; the corruption and selfishness among the middle classes; the disunity in the Congress Party; the centrifugal forces in the provinces; the dishonest tax payers and shy investors; internally, the menace of militant, subversive groups, of left and right; externally, bad relations with the next-door neighbour; overburdened public servants; leadership in the hands of a thin top layer of tired national heroes, who lack obvious successors.

The cumulative effect would be as depressing to the observer as reading up his symptoms in a medical dictionary. But none of these dangers are as bad as they sound in generalisation, and, despite them all, the new India has weathered the shocks and trials of its first two and a half years remarkably well. What India needs, more than anything else, is to recapture the sense of political and economic security; and that is no more than what the whole world needs. Meanwhile, it has three great bulwarks against disruption—its present national leaders, its efficient and devoted Civil Service, and its High Courts of proved integrity and independence. If the constitution-makers had achieved nothing else, they would be entitled to credit for having recognised the worth of these.

Egypt's Economic Prospects

[BY A CORRESPONDENT]

IN spite of the convulsions of the last few years, the basic facts of Egypt's economy remain much as they have been throughout the century. Everything continues to depend on the cotton crop, which still accounts for some 80 per cent of the country's exports. This year has been—like all seasons—exceptional, for bad weather retarded picking and ginning in Upper Egypt and spoilt much of the crop. The result has been that, instead of the 5,000,000 cantars of short-staple or Ashmouni cotton which the crop was expected to produce (1 cantar is just under 100 lb.), the crop will fall short of requirements by about a million cantars. The Alexandria market is at the mercy of bulk buyers from Russia, France and Britain (though Britain has not been in the market so far this season); and it can no longer rely upon the traditional corrective influence of the Liverpool futures market. The speculators of Alexandria have therefore had the field almost to themselves, and it is not surprising that this winter the price of Ashmouni cotton has risen on several occasions higher than that of the long-staple Karnak, a thing which has not happened more than once or twice in a generation. However the total crop, including the long staple cotton, is now estimated to amount to 8,000,000 cantars, which, together with the carry-over at September 1, 1949, of 3,100,000 cantars gives a total available supply of 11.1 million cantars. This is about 2,000,000 cantars less than the figure for the preceding season, so that as demand remains steady, the statistical position does provide some justification for the rise in prices which occurred after the season began last September, particularly when the devaluation of the Egyptian pound is taken into account. The price of Karnak has risen since that time by about 15 per cent and that of Ashmouni by about 50 per cent.

Egypt's imports for the first nine months of 1949 were valued at £E127.7 million as compared with £E127.4 million in the corresponding period of 1948. But exports have shown a notable decrease, the value for the same period being £E93.1 million and £E103.5 million respectively, giving an adverse visible balance of £E34.6 million in the first quarter of 1949, as compared with £E23.9 million in the corresponding period of 1948. The fall in exports last year may be due to smaller purchases by the British Cotton Commission in the earlier months; at all events there has been a fall in the percentage of Egyptian exports to the United Kingdom in 1949 compared with 1948, though the United Kingdom remains far and away Egypt's best customer in spite of the fact that since 1947 Egypt has ceased to be a member of the sterling area. The existence of the sterling balances, however, inevitably ensures that a large proportion

of Egypt's imports are bought from Britain ; in 1949, as in 1948, Britain supplied some 20 per cent of Egypt's imports. But many Alexandrine importers were complaining this winter that the rise in British prices since last September, particularly of textiles, had almost priced British goods out of the market.

Fall in Egypt's Sterling Balances

An increasing proportion of the country's trade is now carried on through multi-angular barter deals devised by the quick-witted Levantine arbitrageurs of Alexandria and Cairo. Such deals usually begin with the export of cotton, generally involve the sale of transferable sterling at a discount somewhere on the continent, and end up with the import into Egypt of luxury goods from the United States for which the Egyptian authorities would probably refuse a permit if it were a question of straightforward import. It is easier to salt away a few dollars in New York by complicated transactions of this kind than by more normal methods of trade. The National Bank of Egypt recently estimated that the actual sum received in Egypt as the proceeds of the country's exports in 1948 was £E132.6 million, whereas the figure according to the official foreign trade returns was £E143.1 million, so that somewhere or other £E10.5 million has escaped the net.

It is, of course, too soon as yet for any official estimate to have been published of the country's balance of payments in 1949. But it is significant that there was a steady fall in the outstanding total of Egypt's sterling balances—negotiations as to which began in Cairo early this month—throughout the year. The figure stood at £E326.7 million (number 1 and number 2 accounts combined) at the beginning of last October compared with £E343.2 million at the end of 1948. Some interesting official figures were recently published on the balance of payments in 1948. Current invisible exports were estimated at £E62.1 million, which included payments on account of the British forces in the Canal Zone, £E23.1 million ; Suez Canal dues, £E18.4 million—an abnormally high figure owing to the closing of the pipe lines from Kirkuk that year and the consequently heavy shipments of crude oil through the Canal—and interest and dividends received £E3,700,000. Invisible imports amounted to £E44.4 million. The principal items were interest and dividends £E6,700,000, cost of transit trade, £E4,800,000, tourist expenditure, £E3,800,000, and pilgrims' expenses abroad £E3,500,000. Allowing for an adverse balance of visible trade amounting to £E29.9 million, there was thus a net deficit on current account of £E12.2 million, covered largely by a reduction in the sterling balances of £E7,700,000. It is improbable that many of the invisible items will suffer much change in 1949, so that as the visible import surplus this year is running at a considerably higher level than in 1948, it looks as if the deficit is widening, though not yet, perhaps, enough to give cause for real alarm.

There are other indications which give an impression of some instability in Egypt's economic system. Prices, for instance, are constantly increasing, and it is misleading to be guided by the official indices, for these are based on the controlled prices at which it is almost impossible for the housewife to buy. The note issue of the National Bank has been steadily increasing, though the increase arises partly, it is true, from the higher level of cotton prices. Moreover the budget for 1949-50 finally passed last August showed that expenditure at £E187.5 million exceeded revenue by no less than £E29.7 million. Expenditure incidentally included as much as £E50 million for the armed forces, which was justified on the ground that, as the Anglo-Egyptian treaty can no longer be regarded as in operation, Egypt must now provide for its own defence. The cost of the Palestine fiasco is, of course, included. The budget deficit was to be covered by part of the loan of £E30 million raised to meet the cost of that campaign, and by drafts on the reserve fund, two future inflationary symptoms. More significant, perhaps, than all these developments is the building boom which has been raging in Cairo and Alexandria during the past two years, and which has rendered parts of Cairo, at any rate, almost unrecognisable to the British soldiers who knew it in the war. The volume of new construction is due partly to the backlog which arose during the war years, and partly to the instinctive urge of the Egyptian who has made money to put it into bricks and mortar ; a certain lack of confidence in the currency has undoubtedly been a contributory factor.

Growing Pains in Industry

On the other hand the amount of industrial activity is considerable for a country which has for so long been almost exclusively agricultural. There has been for years a well established textile industry, of course, though the recent rise in the price of raw materials has seriously reduced its margin of profit. Many other industries were started in the wave of nationalistic autarky to which the war gave rise. Not all of these are sound. There is a tendency to assume that if an intelligent Egyptian is sent to the United States for a few months it is possible to dispense with foreign technicians, and this policy has not always proved a success, notably in the plastics industry. The rayon industry, too, is suffering from growing pains. Prospects are not improved by the xenophobe measures, which the governments of the last few years have felt compelled to introduce in order to divert attention from the country's more pressing but more embarrassing ailments, and which a strong government may now perhaps do something to relax. There is no doubt that such steps have discouraged many of Egypt's traditional collaborators. The £E3,000,000 Edfina barrage scheme put out to tender last year was the first such contract for which no British firm submitted an offer, and several large contracts have recently gone to American concerns. It is to be hoped that such transatlantic confidence in Egypt's future will prove to be well founded. It would certainly be an exaggeration to suggest that the economic collapse of Egypt is impending. But that there are elements of instability on the economic as well as the political front cannot be denied.

What is perhaps most disturbing of all is the reversion to Oriental methods of a country which has had such close ties for so long with the west. The economic history of the fellahin consists of long periods of intense exploitation punctuated by short periods of intense progress. Though the British era did not bring unmixed blessings, it can fairly be called a period of progress. There is every sign that another age of exploitation has begun. The administrative machine seems to be slipping back rapidly to the days of the Khedive Ismail when its incompetence, its graft and its corruption was a byword ; and though the exploitation of the fellah has not yet attained the refinements of the Ptolemaic Age, it has reached a high degree of efficiency. Many intelligent Egyptians realise that their country has thus become a most fruitful breeding-ground for Communism, and it has become fashionable for most, if not all, political parties to pay lip-service to the idea of exterminating poverty, ignorance, and disease. Unfortunately for the fellahin it is contrary to the immediate interests of the governing classes that a campaign with this object in view should be started. It will be interesting to see whether the recent election will produce any real change of front ; many European observers will be astonished if it does.

Population Trends in Europe

[BY A CORRESPONDENT]

THE split between east and west in Europe gives added significance to all discussions concerning the size and growth of population in various parts of Europe. For it is obvious that if the two great *blocs* into which Europe is now divided

"Glad you like this sherry —it's South African

It's extremely good. I got some South African wine the other day . . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference ?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before ?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then ?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago ?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again ?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa ?

You certainly can, and very soon, too."

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk — and all that it means to your dependants — *without* this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon.

increase at widely different rates, important and far-reaching economic and political consequences will result. The approximate figures in the table below show that the eastern *bloc* outnumbers the Marshall Aid countries by rather less than one-third. There are also striking differences between the high birth and death rates of eastern European countries compared with the comparatively lower rates in north-western Europe.

POPULATION 1947
(Millions)

Marshall Aid Countries		Eastern Bloc		Other Countries	
Austria	6·9	USSR	195·0	Germany	
Belgium	8·5	Albania	1·0	West	50·0
Denmark	4·1	Bulgaria	7·0	East	16·0
France	40·2	Czechoslovakia	12·2	Spain	27·5
Greece	7·7	Finland	3·9		
Iceland	0·1	Hungary	9·3		
Ireland	3·0	Poland	24·2		
Italy	45·8	Rumania	15·9		
Luxemburg	0·3	Jugoslavia	15·0		
Netherlands	9·6				
Norway	3·1				
Portugal	8·3				
Sweden	6·8				
Switzerland	4·5				
Turkey	19·2				
United Kingdom	49·8				
TOTAL	217·9		284·0		93·5

These differences are not due to any fundamental dissimilarities in the population structure of the various countries but rather to the different stages of demographic growth which they have reached. These stages can be illustrated from the population history of an advanced country such as the United Kingdom. During the first stage, which in this country lasted until about the middle of the 18th century, both birth and death rates are high and the margin between them is small. The second stage, which lasted until about 1870, is one of rapid growth in which the birth rate remains high and the death rate falls rapidly. The third stage is one in which the population continues to increase but at a declining rate, the death rate falling slowly and the birth rate more rapidly. It is logical to conclude that this stage will lead to a fourth in which both birth and death rates are low and the population will remain stationary or decline slowly.

These stages have not occurred in isolation but have been related to various social and economic developments. For instance, the substantial fall in death rates which was the chief cause of the rapid expansion of population in most countries of north-west Europe during the 19th century, was itself largely due to the rapid advances made at that time in medical science and in public health administration. Similarly, the fall in birth rates which succeeded the fall in death rates coincided with the rapid growth of industrialisation and the large-scale migration of workers from the country to the town.

Most of the countries of north-western Europe have now reached the stage of low birth and death rates in which they can expect their populations to remain more or less stationary. The Netherlands is an exception, for there, although the death rate is very low, the birth rate has not fallen to the same extent as in neighbouring countries. In the countries of south-western Europe—Italy, Spain, and Portugal—where the birth rate is still high and the present high mortality rate will undoubtedly be reduced in the immediate future, the populations are increasing fairly rapidly although the rate of increase may later fall.

High Birth Rate in Russia

It is, however, in eastern Europe, where industrialisation and urbanisation are not so far advanced as in the west, that the most rapid increase of population can be expected. Poland, Bulgaria, Rumania and Jugoslavia come roughly into the same category as Italy and Spain, but it appears that the population of Russia itself will increase during the next twenty or thirty years at a rate quite out of proportion to that of any other European country. Its population trends are at a much earlier stage of development than those of most other countries of western Europe and it has, presumably, therefore a long way still to go in reducing its mortality rates. For instance, the level of the birth and death rates in Russia just before the war were much the same as those obtaining in this country seventy years ago. The infant mortality rate for Russia in 1940 was about 150 deaths of infants under the age of one year to a thousand live births, compared with the current rate for England and Wales of about 40. Much, therefore, still remains to be done in the reduction of infant mortality alone. Moreover, the present birth rate in Russia is extremely high, and various factors seem to indicate that it may not in the immediate future follow the usual trend and start to fall. Even if it did decline somewhat from its present very high level it would still remain comparatively high, and much of the decline would be offset by the fall in the mortality rate which will almost certainly occur. In any event, it is by no means certain that a substantial decline will in fact take place, for, ever since 1936, the Soviet Government has been taking active steps to promote a high birth rate with a good deal of success. Russian parents are encouraged to bear and rear children not only by persistent propaganda that it is their duty to do so, but also by having the economic cost of parenthood made less for them than for most other European parents. Russian bachelors, spinsters and childless couples are severely taxed.

More Productive Age Groups in East

It seems fairly certain, therefore, that the eastern *bloc*, which already outnumbers the Marshall aid countries, will increase its numerical superiority still further in the immediate future. Professor Notestein has calculated that if there had been no war, and if the population trends obtaining in Europe before 1940 continued, the total population of the Marshall aid countries, excluding Turkey, would have been about the same in 1970 as in 1940, but the total population of the countries in the eastern *bloc* would have increased by about one-third. It seems unlikely that the war will have changed materially such a marked discrepancy between the two groups, and it is probable therefore that the present numerical superiority of the eastern *bloc* will, by about 1970, be increased to about one-half or two-thirds.

Moreover, the reduction in mortality rates which will probably occur in eastern Europe will cause the proportion of the population in the productive age groups to rise substantially. Professor Notestein has calculated that, whereas in 1940 61 per cent of the population of the eastern *bloc* were between 15 and 65 years old, by 1970 the figure for this age group will have risen to 69 per cent. But in the Marshall aid countries the corresponding figures are 67 per cent for 1940 and 70 per cent for 1970, the increase being almost entirely due to Italy. Furthermore, the average age within the productive age groups can be expected to rise more rapidly in the Marshall aid countries than in eastern Europe. Therefore, unless something catastrophic occurs, not only does it appear fairly certain that the present numerical superiority of the eastern *bloc* will be substantially increased, but it will also acquire a superiority in active manpower of even more significance from an economic, political and strategic point of view.

Correction. In the article on "Planning Norway's Defences" on page 144 of *The Economist* last week the reference to the vital airfields at the top of the second column should read "Sola, Gardermoen and Værnes."

"We in industry have been slack, I think, in not getting over the simple plain facts. If that is the purpose of publicity, then the sooner we get down to thinking seriously about how to put the matter right, the better." SIR FREDERICK BAIN, F.B.I. PRESIDENT. *December*, 1948

INDUSTRY'S TROUBLES ARE OUR TROUBLES...

THE problems of Industry today fall into one of two main groups—

1. Technological problems. 2. Human relationship problems. Technological problems are, generally speaking, being vigorously tackled by managements, but the field of human relations is greatly neglected.

Public relations techniques, in the hands of skilled practitioners, can "redeploy" human relationships. Public relations advice and activity can give modern management invaluable help with that complex of opinion and attitude made up of "publics" grouped as workers, stockholders, distributors, consumers, communities, and government.

The public relations counsel uncovers resistances and maladjustments affecting your legitimate business aspirations. He proposes corrective treatments and courses of action. He is an expert in the arts of persuasion and mass communication. His services are as necessary to Industry today as those of the accountant, solicitor, production engineer, or advertising agent.

Mathew Crosse & Associates

PAYE and PERSONNEL

A Self-Contained Method for Controlling Staff and Salaries

FULL DETAILS ON REQUEST

Today, probably the biggest and most expensive item in business is . . . PERSONNEL.

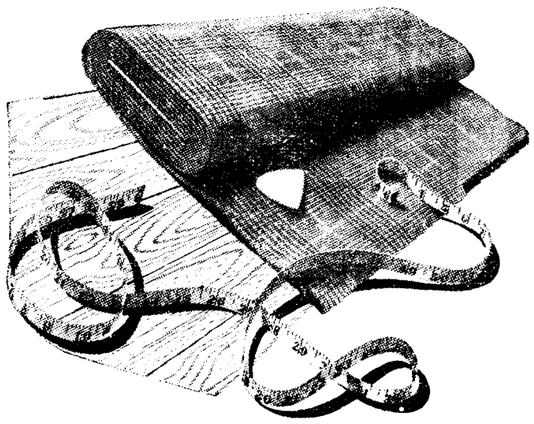
Therefore, any methods which ensure greater control and more efficient employment are more than desirable.
Indeed, if employers get that little extra output per hour per man they are not only helping their own economies—they are assisting the National need.

There is a number of Shannon visible records which subserve this end. There is, for instance, the P.A.Y.E. record which *visually* controls the pay-as-you-earn entries of every employee (and which is officially approved). And there are also visible records which show at sight which employees are fit for promotion, where they work, what they are paid, whether married or single and a host of other items of information.

These records can be had either as standard (hence quicker and cheaper) or especially to your own design. Whether you employ ten or ten thousand people, such records are applicable.

Of particular interest to the business or municipal executive who wishes to have both visual records plus the associated papers—references, correspondence, certificates, etc.—is the Shannograph system for Personnel control. The flat-top visual edge conveys a host of facts without opening any file. The hanging file itself holds all the papers. The slotted-in record card fits in the front of each file.

This system can go into your existing cabinets or other equipment.



Let us send you further information regarding these matters. Just write the word "Personnel" on your letter-heading and details will be sent at once.

NICKEL AND CLOTHING

Do you know that nickel plays an important part in the production of our clothing? Take wool, for instance . . . the equipment used on the sheep farms, the plant for producing the yarn, the tanks for dyeing it, the machinery for weaving it into fabrics, even the sewing machines — in all these nickel is present, toughening and strengthening the metals used in their construction, making them staunch against the attacks of wear, corrosion and heat. Thus nickel is contributing to the efficiency of the tools and equipment with which Britain is achieving her recovery.

THE BUSINESS WORLD

Bank Deposits and Inflation

IN this past decade, when finance has been at a discount, many fundamental truths about the working of the monetary system have been forgotten. Happily, some false notions have been forgotten, too. Among these was the belief that changes in the volume of money, or in the general price level, are infallible barometers of inflation. Admittedly, if inflationary pressure is both sustained and strong, it is bound to raise the height of these two columns. But in the relatively short run, both the money column and the price column may respond very sluggishly and may even move in the opposite direction to that expected. It is now fairly generally understood, for example, that an increase in the deficit on the balance of external payments, though it may arise from a chronic condition of inflation, actually relieves the immediate inflationary pressure in the domestic markets by providing an increased net inflow of goods for use at home. The monetary counterpart of this is a corresponding relief from the pressure to borrow—and especially for the Government to borrow—from the banks. Other influences, too, such as changes in the public's willingness to hold its savings in securities instead of cash, may prevent the volume of money from acting as a reliable register of the degree of inflation.

These, however, still seem rather sophisticated notions. Like most half-truths, the old notion dies hard. It seems desirable to explain, therefore, that the past year's readings on the money barometer may be particularly misleading. The experience of 1949, fully documented in the bank accounts and chairmen's statements which have just appeared, has been rightly welcomed for the contrast it presents with earlier years. Throughout the decade to end-1948 the volume of money was rising very rapidly; the "gross" amount of deposits at the eleven clearing banks at the end of this period was two and three-quarter times as large as in 1938, having risen at an average rate of almost £400 million a year. In 1949 it was, on balance, stationary: the year-end total of £6,201.5 million is a negligible couple of million larger than that for end-1948. True, the better index is the figure of "net" deposits, which, as far as possible, eliminates the double-reckoning of cheques in course of clearing at the accounting date; and this figure rose by £51 million in 1949. This, however, is still a very small expansion—easily the smallest since prewar days—and one which contrasts with £231 million in the previous year.

Many people are bound to enquire how this virtual ending of the great credit expansion, this turning-point in a ten-year trend, can be reconciled with all the current concern about inflation. In the past fortnight, one bank chairman after another has stigmatised inflation as economic enemy Number One. Not so long ago, the Chancellor himself was saying much the same thing, though more reticently. Does recent monetary experience imply that the post-devaluation cuts were not only more nearly adequate than is generally supposed but are also already exerting a strong effect? If not, how can these seeming inconsistencies be explained?

The old-fashioned barometer being unreliable, economists seek other means for measuring inflation; but the data needed for this measurement in 1949 will not be fully available for some weeks to come. It is possible, however, to indicate the directions in which the reconciliation may be found, and to draw some broad conclusions.

First, it should be noted that the prevalent—and certainly justified—concern about inflation does not imply that the Chancellor's efforts at disinflation over these past two years have been without effect. But for these efforts, the degree of inflation would have been very much greater than it actually has been. Secondly, much confusion arises from a difference between the planners' approach and the practical approach to this whole problem. The former generally assumes the theoretical objective of a policy of disinflation to be a true balance between the total demand for goods and the total supply currently available (including any import surplus). Another and more common way of putting this is to say that the proportion of current goods used not for consumption but for capital investment must be financed by equivalent savings out of the community's current income (with the assistance of any net borrowings abroad); otherwise the monetary demand for goods will exceed the current supply. The objective, therefore, has been to force the public to save through the medium of a budget surplus a sum sufficient to make good the deficiency of all other savings compared with the expected volume of total investment. Such an equilibrium, if attained, is supposed to mean that the economy would be in a condition neither of inflation nor of deflation. At that theoretical level, the money barometer, unless distorted by extraneous influences, would be steady, or perhaps rising very slowly in response to any increase in the total volume of national output. On this reasoning, steadiness in the total volume of money might seem to be *prima facie* evidence of a sufficient disinflation, unless extraneous influences had in fact been at work. Unfortunately, there is a flaw in this reasoning—or, rather in the assumed objective.

In the first place, this approach assumes that the economy may be in "disinflationary equilibrium" although it still has a deficit (and perhaps even a rising one) on its external balance of payments. Secondly, moreover, if an inflated economy is suffering from a serious mal-distribution of man-power and is in a state of over-full employment, leaving no scope for free movement of workers from job to job and causing recurrent bottlenecks in supplies, a disinflation intended to bring it merely to the point of theoretical equilibrium could not conceivably suffice to remove the inflationary pressures even if it succeeded in its avowed objective. They cannot be removed until enough slack has been created to permit the movement re-

quired to correct the mal-distribution and open out the bottlenecks. If such a slack arose, it would be registered by a fall in the money barometer.

If this argument is now applied to Britain's recent experience, the maintenance of unemployment at an abnormally low level throughout these past two years becomes virtual proof that the money barometer cannot have been distorted so as to give an unduly adverse reading. Even on the most favourable assumptions, therefore, its near-stability over the past twelve months could mean only that the Chancellor's disinflation effort had come near to achieving the purely theoretical equilibrium—an equilibrium at which serious inflationary pressures would still be present despite the continuing deficit on the external balance of payments. But in fact the extraneous factors seem not only to have given the barometer's change in 1949 a too favourable appearance but also to have concealed a deteriorating tendency during the year.

*

Before examining these factors, it is well to observe the broad composition of the year's credit creations and cancellations. The modest expansion of deposits occurred despite a further substantial increase in bank advances (by £145 million, compared with £172 million in 1948) and despite a resumed rise in investments (by £34 millions). These two items may be regarded as a rough—but only a rough—guide to the extent of the non-governmental demands for new bank credit. Since they together rose by nearly £130 million more than the amount of new credit created, it will be seen that the Government was substantially reducing its own indebtedness to the banks, whereas in the previous year that indebtedness was still increasing.

This striking change in the Government's need for bank finance is at first sight rather puzzling, because in the first nine months of the current fiscal year the Exchequer's financial position, without counting "below-line" items, was nearly £300 million worse than in the similar period of 1948-49. For the calendar year, however, the disclosed deterioration was appreciably less than half this sum, while the true deterioration was probably smaller still; in addition, the extra budgetary receipts (especially from social insurance funds, not disclosed in the accounts) must have been larger. So far as the Exchequer is concerned, the deterioration in National Savings was more than offset by the absence of repayments of Defence Bonds at maturity.

The fact that the Exchequer position during the calendar year has deteriorated less than is popularly supposed does not mean, however, that the nation's overall capital account—which is the statistical measurement of inflationary and deflationary factors—has benefited correspondingly. It is true that the amount of relief from overseas has not been any smaller than in 1948 (since the "overall" external deficit is again officially estimated at £110 million). But the volume of investment requiring finance has certainly been larger—chiefly, no doubt, because of additions to stocks and work-in-progress. In addition, the Government has had to finance largely increased demands upon the Public Works Loan Board. On the other hand, the displacements of overseas funds in London before the devaluation (which led foreign banks hastily to sell their sterling holdings to their own monetary authorities) probably had the effect of enabling the British Treasury to borrow directly from these authorities funds which formerly were borrowed indirectly through the clearing banks. To the extent that such withdrawals of foreign deposits took place, the published figures of deposits understate the increase which has occurred in domestic deposits—which alone have immediate significance in the context of inflation.

These various factors do not, however, suffice to explain why the Treasury in 1949 was able to repay debts due to the banks, whereas in the previous year it was borrowing. The principal explanation lies in the fact that in the early part of 1948 certain special financial operations—the repayment of the 3 per cent Conversion loan and the payments made to Argentina to enable it to finance its purchase of the British-owned railways—involved the British Treasury in very heavy borrowings from the banks. These operations caused a particularly violent distortion of the money barometer in that year, and involved a credit expansion not less than the £231 million by which net deposits rose on balance during the year. As there were no distortions of this kind in 1949, it might have been expected that, if other factors had remained unchanged, the trend of deposits would have shown a roughly corresponding reversal; actually, the

CREDIT EXPANSION SINCE THE WAR

	+169	+420	− 39	+ 63	−120

amount of net credit creation was only £180 million less than in 1948. This "improvement"—which in this context means a smaller rise or a bigger fall in the level of deposits than occurred in the corresponding period of 1948—was, moreover, wholly confined to the first quarter of the year. In that period net bank deposits fell by £292 million, which represented a comparative fall of £222 million against the similar quarter of 1948—a difference wholly explicable by the special operations. No progress was made in the second half of the year, despite the fact that the balance of payments had relapsed into substantial deficit in contrast to its opposite movement, to a position of actual surplus, in the latter part of 1948.

It will be seen that, when allowance has been made for these many influences, the movement of the money barometer in 1949 certainly offers no indication that the degree of inflationary pressure was less than in the previous year. On the contrary, its behaviour is entirely consistent with—and does, indeed, tend to confirm—the general assumption that the tempo of inflation was not only greater last year than in 1948 but was also a good deal greater in the second half of the year than in the first. This deterioration, moreover, has occurred despite the undoubted benefit which has been derived from the Chancellor's efforts at disinflation. But for these, the long process of rapidly expanding credit could never have been arrested. Indeed, if at the outset the

authorities had appreciated the kind of monetary policy that was needed to support the budget effort at disinflation, the first check to credit expansion would probably have come in 1948. If monetary policy, without becoming itself an aggressive disinflationary force, had been kept on a neutral course, even the special credit creations of the spring of 1948 ought to have proved to have been merely temporary. As it was, the lax policy of that year kept in existence the whole volume of specially created credit, thereby provoking an unwarranted rise in the gilt-edged market and making its eventual fall bigger and more abrupt. In this sense, though the near-stability of bank deposits in 1949 supports no argument that inflation was checked, it shows that the authorities have at least learnt the wisdom of restraint in their purely monetary tactics. The really fundamental factor in the contrast between the monetary experiences of the two years is that in 1949 the authorities had the courage and the sense not to resist a rise in interest rates in the gilt-edged market. They thus avoided the additional credit creations which would have aggravated the rising inflationary pressure and actually allowed the interest rate to exert some effect—though probably not a large one—in restraining that pressure.

Mutualisation without Meaning

THE Labour Party's proposals for "mutualising" industrial assurance have an odour of sanctity which is neither appealing nor convincing. If polemics about past abuses were all that reform required, the pamphlet would indeed be a document of importance. It puts a negative case against the proprietary companies, echoing all the complaints that have been levelled against them by a series of committees and private investigators for fifty years and more. They are all familiar. Everyone knows that the holder of a policy of industrial assurance pays heavily in expenses for the cover he gets. Everyone knows that, while the agent's regular appearance at the policy-holder's door encourages the continued payment of premiums on the bulk of the policies in force, there is a wide and wasteful fringe of policies which lapse or are surrendered long before their normal maturity. It is easy, too, to level charges of "profiteering" by "functionless shareholders" in the larger proprietary companies, and to depict their expansion during the last eighty years as an unending process of rapacity and greed at the policy-holder's expense.

This familiar case is faithfully set down. It is far more cogent than the proposals for reform which briefly occupy the last two or three pages of the pamphlet. The defects of "profiteering, excessive costs and overselling" are to be corrected by an Industrial Assurance Board. Three short paragraphs outline the general functions of the board: it will buy out "on fair terms" the shareholders of the companies, "vesting the ownership in their policy-holders" and "ensuring that the boards of directors of the individual offices are effectively manned to advance the interests of their policy-holders"; the board will "cooperate" with the individual offices in drawing up plans for reorganisation "designed to remove the defects of the business while protecting the staffs"; and the board "after a period of say five years" will report on its progress. The provisions are vague ("it will be the duty of the future government to work out the details"), but obviously compensation on "fair terms" involves the substitution of a charge for interest in replacement of the dividends hitherto paid out of the earnings on the funds, and possibly the payment of compensation to shareholders out of the funds themselves.

That is about as far as detail gets in the pamphlet about the function of the proposed Industrial Assurance Board and its relation to policy-holders. When it comes to staff, the proposals are more explicit. The board must discharge its general responsibility for improving the service given to policy-holders "without any worsening of staff conditions." The staff are virtually guaranteed their jobs on present conditions, until "natural wastage" cuts down their total number. Their book interest (a system already discontinued by the larger companies in this business) will be bought out for cash on terms to be agreed between the board and the agents' unions; but there is no mention of who pays the compensation and on whom the interest charge on it would fall. The keynote in the whole section headed "Principles of Reorganisation" is to win the agents' support by offering full employment, compensation for their books, and the promise that they can help to remedy "defects in industrial assurance which are not theirs, but are the faults of the system." In providing such guarantees to the staffs, of course, the Labour Party goes almost the whole way in guaranteeing that "the faults of the system" remain, for it is quite clear that there is no intention to change the

traditional collecting system by which industrial assurance has been conducted.

The two main tests by which proposals for "mutualisation" must be judged are cheaper costs and shrewder investment. It is obvious that, up to a point, expenses per pound of premium paid vary inversely with the size of the office. There are 14 companies in the business and 133 collecting societies. The former (heavily weighted by the Prudential and the Pearl) spent £27.8 million in 1948 to collect premiums totalling £97.1 million; the collecting societies spent £8.5 million to collect £22.8 million of premiums. On this showing the companies win easily, with an expense ratio of 28.6 per cent compared with 37.3 per cent for the collecting societies. It is a little odd that the Prudential should be criticised in the pamphlet for failing to reduce its expense ratio since 1929; between 1920 and 1929, this office cut its expense ratio from 40.5 per cent to 24.79 per cent, and the small rise in 1947 to 24.84 per cent presumably has some connection with the fact that prices and costs had been rising for more than a decade. To take 1947 as the basis of comparison slides with easy convenience over the fact that in 1948 the expense ratio was reduced to 23.27 per cent. Since the Prudential's expense ratio (like that of several other companies) is well below that of the average mutual society, is this not at least part of the answer to the charge that profits are "excessive"? In 1948, the industrial assurance companies paid out £1,971,000 in dividends to shareholders, or just over 2 per cent of the total premiums received. But if these company offices had been working at the same average level of costs as the mutual societies, the policy-holders would have to meet an increase of nearly £8½ million in management expenses. The calculation suggests that optimum size is important in this business, and that the company offices with "functionless shareholders" have been more successful in obtaining the right scale of operations, and in selling the more economical type of policy than the mutual societies.

If this argument were pushed to its logical conclusion, it might support a case for merging all companies and societies into a "Super-Pru" under state management. But that is not what the pamphlet proposes. It declares that there is "too much competition, too many offices, too much overlapping," but it is careful not to say how much. There is no hint or suggestion of the nature of the plan for reorganisation; it is just stated, without benefit of proof, that

> When private profit and book interest respectively are removed from the proprietary and mutual offices, it will be possible so to reorganise the business that costs are reduced in all offices.

On the score of lower costs and thus of greater benefit to the policy-holder, it must be recorded that the proposals make out no case at all for "mutualisation."

The second test involves a comparison of investment policy under the existing system and under the Labour Party's proposals. Some discretion has been learned since last summer about the alleged "financial responsibility" of the companies and the investment of "the hard-won savings of working people as the industrial assurance companies thought fit." The threat of direct control was obvious and the mollifying amendment is worth careful note:

> There will, when the industrial assurance offices all become mutual concerns, be no state control over the investment policy of the concerns, other than such general control as applies to other financial institutions.

So, when the Industrial Assurance Board has "effectively manned" the boards of the individual offices, the latter will be accountable only to the policy-holders for their investment policy. Since so little is said about the proposed powers of the board, it would seem wise to accept this notion of complete independence with a good deal of reserve. There is, too, the question of existing limitations on the collecting (that is, mutual) societies' investment policies; under the Friendly Societies Acts, the mutual offices have to invest in stocks which purport to provide greater financial security but yield a lower return. One of the first duties of the Industrial Assurance Board (the pamphlet claims) would be "to give immediate consideration to the question whether the interests of the policy-holders would be advanced if these restrictions upon the powers of the collecting societies were removed." Obviously a question of this sort should not be left to the board to decide; it should be clearly determined in advance by Parliament. That it is obviously "in the interests of policy-holders" to have a wider spread of investments than the Friendly Societies Acts allow is evident from the 1948 figures. Every pound of premiums collected by the companies was supplemented by nearly 5s. of interest earned on the life fund; the collecting societies added about 4s. 4d. Here again the difference in performance is to a considerable extent a reflection of differences in scale and expertise in the management of investment funds. It would be difficult to lay a charge of "irresponsibility" against, say, the Prudential or the Pearl; their part in canalising small savings raised in weekly premiums into industry is too well known for that. So great is the importance of the institutional investor today (when private savings are small and have to be brought together into large sums to make economical investment possible) that it lies with those who would make changes in these institutions to say exactly what they would do and to explain in detail how public advantage would result. Three of the leading industrial assurance companies in 1948 invested a gross sum of £572 million, spread in the following way:

	£ mn.	*Per cent*
British Government, home corporations and public boards	14·3	*25·0*
Dominion Government and municipal	1·9	*3·4*
Debentures and notes	12·5	*21·7*
Preference stocks	7·9	*13·8*
Ordinary stocks	11·7	*20·4*
Total Stock Exchange investments	48·3	*84·4*
Mortgages	2·1	*3·6*
Properties	4·0	*7·0*
Loans on policies	0·8	*1·4*
Other loans	2·0	*3·6*
	57·2	*100·0*

Does this table suggest any abuse of investment powers? Could it be matched or improved upon by "mutualised" offices? Could "the interests of the policy-holders" be improved by some superior distribution of new funds for investment?

Where it is not merely jejune, the pamphlet is uninformative. This is not a business which requires the "full backing of the state"; what it requires is efficient management, and the safeguarding of the public interest. If too much industrial assurance is being sold, in too small packets, that is largely due to the ability of agents to sell and to the willingness of the public to buy. An Industrial Assurance Board will not change these characteristics—indeed, by developing "new kinds of policy in order to meet as fully as possible the needs of those who wish to save through insurance" it might even add to the present forces which are keeping costs too high. The Labour Party has had second thoughts on the nationalisation of industrial assurance; but it has produced no new thoughts on how "mutualisation" would serve the real public interest. And it sticks obdurately to the belief that the segregation of industrial and ordinary branches would be "impracticable," thus putting in jeopardy the overseas earnings of the Prudential and Pearl, and affecting, in every probability, the capacity of all British offices to maintain and develop their important foreign business.

Source: Statistical Summary of the Industrial Assurance Commission

Static Profits

FACTUAL information about profits earned by industry is now provided in very considerable detail by company accounts. The analysis of the figures is available within a few weeks after the close of each quarter in these regular articles in *The Economist* and in the supplementary tables which appear in *Records and Statistics*. It is flattering to find that these compilations are prayed in aid of arguments as radically opposed as an application for a general increase of £1 a week in engineering wages and an application by the Transport Commission for a general increase of one-sixth in freight rates. The contenders may present the figures in such a way as may best assist their case, rather than in a way that would make an instant appeal to a professional accountant. The engineering unions, for example, claimed to find in the figures (which have only been available since 1948) evidence of a rise in engineering profits of close on 100 per cent since 1945-46. The table which was put in to the Transport Tribunal by the British Transport Commission a fortnight ago made a bold leap across the gulf which separates trading profits from net profits after provision for "sums normally chargeable to revenue," as the Transport Act describes them. It is in the nature of profits figures to be misunderstood, if not actually misapplied, and it is not for *The Economist* to complain if the figures are asked to bear more weight of argument than they can properly carry. But it is perhaps worth making the general point, in the light of these two recent episodes, that no argument is admissible that purports to show that the "profits" of industry X are big enough to pay a higher price to industry Y or to trade union Z unless it states precisely what "profits" mean in the particular context, what provision has been made for capital maintenance (including the necessary allowance for higher prices of new equipment), and what grounds exist for supposing that the profits shown in the given period adopted for the calculation will for all time remain adequate to support higher costs of wages or services supplied to the industry.

The last article in this series, on November 12, 1949, suggested that profits were at the turn of the tide. Figures for the latest quarter, to the end of 1949, support this conclusion, for they show that disclosed trading profits of 690 companies were scarcely changed at £197·5 million, compared with £196.9 million for their preceding trading periods. It was, in fact, a quarter when

Your money and your bank

The one hundred and fourteenth annual balance sheet of the Midland Bank, bearing the date December 31, 1949, shows that customers had entrusted to the Bank their funds which, with other balances, reached a total of £1,352,728,349.

So as to provide for calls of every description, the Bank held in cash and balances with the Bank of England no less than £112,855,092, while balances with and cheques on other banks amounted to £50,101,845. A further £84,189,630 was lent, mainly to the money market, repayable at call and short notice. Sums lent by the Bank to the Government included £298,218,662 by way of Treasury Bills, all due for repayment within three months, and £176,500,000 in the form of Treasury Deposit Receipts, all repayable within seven months, while the Bank held other British Government securities amounting to £288,836,932. Of particular interest is the amount of advances by the Midland Bank, mainly to industry and commerce. This item accounted for £331,054,930, and on no single loan or overdraft was the customer charged a rate of more than 4½% per annum.

These are the main items in the annual balance sheet, and behind the figures lies the story of great achievements by customers large and small, conducting their business through over 2,000 offices of the Bank.

MIDLAND BANK LIMITED

little perceptible change occurred either in the aggregate of profits or in their allocation to various revenue purposes and dividends. A larger sum was set aside to depreciation (£26.5 million in the latest period, compared with £23.3 million a year earlier); taxation took slightly less and contingencies and other provisions slightly more. Ordinary dividends (measured by what really matters, namely the cash amounts involved, and not by reference to the issued capital of the companies which have obeyed the behest of dividend limitation) show a fall from £22.7 million to £22.1 million. For those who lay store by the behaviour of industry on this question, let it be recorded that the 2,458 companies whose reports appeared during 1949 declared ordinary dividends worth £109.1 million after tax, compared with £109.5 million in the previous year. Industry as a whole has fulfilled its undertakings on dividend limitation with complete good faith.

*

There is a marked contrast between the trend of gross trading profits over 1949 as a whole and those of the last quarter. The latter are virtually static, whereas the year's figures as a whole reflect the expansion in total profits which was still being shown by company reports during the first and second quarters of the year. It is important, therefore, to recognise that the increase in gross trading profits from £786.6 million to £850.3 million for the 2,458 companies during 1949 belongs to time past and does not reflect the trend of the past six months. Profits have not begun a headlong descent ; but it is quite clear that they have ceased to expand.

The effect of this static phase is well illustrated in the calculations of earnings and dividends, and their relation to issued ordinary capital and true ordinary capital (or net worth) in the following table:—

NET WORTH, TRUE EARNINGS AND DIVIDENDS
690 COMPANIES REPORTING OCT.-DEC. 1949

	Preceding Year	Latest Year
	£ m.	£ m.
Issued ordinary capital	277·3	282·0
Real equity or net worth (i.e., net assets after deducting liabilities and prior charges)	636·8	703·7

* Including amounts retained by subsidiaries, and after taxation. † After tax.

figures relate to the 690 companies for which comparative figures were published during the latest quarter. The issued ordinary capital of these companies increased only slightly from £277.3 million to £282.0 million ; but their net worth increased (by the familiar process of profits ploughed back into new capital) from £636.8 to £703.7 million. Earnings available for ordinary capital (bringing in the earnings retained by subsidiary companies, and set aside to revenue reserves by the parent companies) increased by £1 million to £50.7 million, whereas dividends actually paid declined from £22.7 million to £22.1 million. The result was that the gross rate of earnings (after adding back tax) expressed as a

percentage of net worth fell from 14.2 per cent to 13.1 per cent, and the gross rate of dividend paid from 7.5 per cent to 5.6 per cent.

The latest figures raise the question of the future supply of self-generated capital for industry. Some of the industrial groups are beginning to feel the pinch of harder times. This is true, for instance, of companies in the brewery, entertainments, and shipping groups. The metal producing and using industries are more comfortably placed, and recent figures from the textile groups show no immediate sign of recession. But the consequences of a moderate fall in industrial activity, or in certain export lines on which whole sectors of industry are now largely dependent, or in the price level, might have a devastating effect on industry's ability to maintain its equipment out of current earnings, and could demolish completely any hope of financing further expansion out of retained profits. It would give stark emphasis to the effects of the profits tax on industrial finance. The main table shows that this impost cost the 2,458 companies last year no less than £91.8 million. Their total provisions for depreciation, contingencies and reserves amounted to £327 million, out of which they sought to keep their equipment in good order, to finance new plant and the extension of their business. The two figures can be directly associated, for as Captain Eric Smith pointed out last week in his statement as chairman of the National Provincial Bank,

> Profits tax falls in its entirety on that portion of the profits which would normally be ploughed back into a business. It is a deduction from those moneys out of which dead or moribund assets must be replaced and provision for further expansion found. . . . Its effect on such residue may mean anything from a deduction of slightly over 50 per cent to total extinction. Far from being a profits tax, it is a tax on the future tools of industry, a tax on still-born capital.

This puts the matter most effectively. Its truth has been obscured by the persistent rise in profits which has accompanied the pervasive forces of inflation. But stability of profits—and even more, an actual fall—will soon raise the question whether the mulcting on this scale of one of industry's main sources of capital is not jeopardising the prospects of industrial rehabilitation.

Business Notes

Mr Hoffman's Brief

Although American officials attached to the ECA have taken a prominent part in hammering out the general outlines of the proposed European Clearing Union scheme, Mr Paul Hoffman, who has arrived in Paris to take part in the OEEC discussions brings with him some important reservations on certain points of principle. The possibility which is causing most concern to the US administration is that the European Clearing Union scheme may become an instrument of discrimination against American interests. The formation of an area of interconvertible currencies, to which not only the countries of western Europe but their widespread associated territories would belong, fills certain sections of the American administration, particularly the Department of Agriculture, with apprehension.

They see in the ECU an instrument which could be used against American interests ; interconvertibility of the European currencies would not be accompanied by their convertibility into dollars for, at any rate, a considerable time. The National Advisory Council, the economic committee of the US cabinet, has also jibbed at the possibility that the ECU might usurp in Europe some of the functions of the International Monetary Fund. Mr Hoffman has therefore been instructed to ensure, first, that no discriminatory blemish is attached to the proposed Clearing Union scheme, and, secondly, that the new union does not trespass into the IMF's allotted sphere. He is to urge, for example, that there should be no usurpation of IMF jurisdiction over exchange rates. He has also, it seems, been instructed to turn down any suggestion that the United States be formally represented on the ECU. Such representation, it is held in Washington, would be inconsistent with the United States' obligations under the Bretton Woods agreements. This does not imply that ECA dollars will not be made available to launch the new scheme—but they will be dollars with important strings attached to them.

* * *

What Sort of Clearing Union?

It nows seems improbable that the scheme for a European Clearing Union, the outline of which was described in *The Economist* of January 21st, will be ready in sufficiently detailed form to be submitted for formal approval by the Council of the Organisation for European Economic Co-operation at its meeting next week. It was indicated in last week's article that certain differences of opinion between OEEC countries remained to be reconciled before an agreed draft of the statement of principles could be submitted to the Council. There is no indication that these differences have been narrowed during the past few days.

One school of thought, in which Belgium is particularly prominent, wants to make the European Clearing Union an instrument superseding all existing bilateral payments agreements. According to this view of the scheme, Britain—to take a concrete example—would no longer be subject to sterling claims held by France but would owe a corresponding amount in terms of the new European unit of account to the clearing union ; conversely France, instead of holding sterling, would hold a corresponding amount of units in its account with the clearing union. The same view of the European Clearing Union would also favour relatively small quotas (that is small margins of credit exchanged between the members), and would call for substantial proportionate gold payments as soon as those margins were exceeded. These believers in the salutary effect of hard money policies would also deprive countries which were losing gold to the clearing union of the defence of reimposing quantitative restrictions on their imports. In their view that would be an attempt to cushion the debtors against the retributive results of their "extravagance."

To the British and certain other delegations, this attitude smacks too much of the hard money school, of which Belgium has been such a prominent exponent in recent years. It appears to be tantamount to the reimposition of a particularly harsh variation of the gold standard on Europe and would lead to a contraction in intra-European trade, instead of the expansion which the mechanism is supposed to stimulate. This basic difference of view, with its ancillary differences on such questions as the size of the quotas, the amounts of the proportionate gold payments once the quotas are exceeded, and the length of time during which overdrafts and corresponding credits should be left outstanding before they become convertible into gold, make it unlikely that an agreed scheme can emerge in time to be put into operation, as had at one time been hoped, from March 31st. Although, therefore, some mention of the new clearing union scheme will appear in the interim report of OEEC which will be sent to the ECA after the meeting of

the Council, it would be unwise to expect more than a general statement of agreed principles. It would in any case be unreasonable to expect the British Government, at this distance from the General Election, to undertake any specific commitments on a scheme of such far-reaching importance.

* * *

The Seattle Power Contracts

The reports that the British Government has made an "official protest" in Washington against the rejection of British tenders for the supply of plant to the power undertaking at Seattle are, no doubt, wide of the mark; the city of Seattle is entitled to choose its own suppliers. It has chosen to reject tenders (discussed in *The Economist* on January 7th) from Ferranti, Limited, and from the English Electric Company which were well below the lowest American tender. Ferranti's price for a total of 15 transformers showed an advantage of $300,000, and the English Electric price an advantage of $170,000; the further tender of English Electric for two rectifiers and switchgear was also below the lowest American tender to the extent of $35,000. These are substantial margins, and their rejection no doubt seemed to call for some explanation by the Seattle purchasing agent. In announcing that the British tenders would not be accepted, the purchasing agent is reported to have given two sets of reasons.

The first set concerns the specifications themselves. It seems that at least one of the British firms required a year to prepare drawings instead of the 120 days specified, and that, further, it did not give the required guarantees against noise and "impedance." It is not easy to dismiss these as pure quibbles, at any rate without fuller technical information than is available. But there was an exchange between at least one of the tendering firms and the purchasing agent which seemed to have cleared up these difficulties; this may not have been strictly within the official timetable, but perhaps, too, an authority concerned to save its taxpayers' money might have been expected to give some latitude. The other reasons given refer to some topographical difficulty in erecting transformers at Seattle—which British firms with world-wide experience can hardly be expected to take seriously—and to the fear that repairs would be hampered by the remoteness of the British firms from the site. This almost certainly is a quibble, more particularly since Ferranti have a factory at Toronto, and Toronto is no farther from Seattle than is, say, Schenectady. If the Seattle agent had given fewer reasons, they might have been more readily believed.

As it is, the official British reaction has been limited to a call at the headquarters of the Economic Co-operation Administration by Sir Cecil Weir, the chairman of the Dollar Exports Board, to discuss the matter; and the discussion seems to have been fruitful though it could not change the outcome of this particular incident. ECA afterwards issued a statement; it had made inquiries and had been assured by the municipal authorities at Seattle that the decision was "in no way connected with a reluctance to import such equipment from Britain." Further, there was "a strong likelihood that British electrical firms would be favoured with future Seattle municipal business." More interesting still is this passage in the statement:

> The ECA was interested to learn that a Seattle Citizens' Committee had been formed to support the use of such imported goods in cases where savings to taxpayers will result.

This is pointed, and goes to the root of the matter; the American market can only be freely entered if Americans understand that it is not a public duty to pay high prices for domestic products. The Ferranti representative has not failed to point out the saving which would have been attached to his firm's tender. Few cities are inhabited by men so carefree and tolerant that their administrators can afford entirely to ignore questions of this kind; and from all reports Seattle is not one of them.

Banking Trends

The Banks in 1949

Until the publication of the clearing banks' statement for December it still seemed possible that 1949 would prove to be the first year since 1938 to see a fall in the level of bank deposits. This December, however, the seasonal rise in deposits was heavier than recent monetary experience had led most observers to expect. Gross deposits rose by £136 million and net deposits (that is gross deposits less balances in course of collection) rose by just under £100 million; in consequence the former were just over £2,000,000 and the latter just over £50 million above the peak figures reached at the end of 1948. The broader causes and implications of this movement are discussed in a leading article on page 211, while the experience of the individual clearing banks during 1949 is indicated in the accompanying tables.

* As shown in Clearing Banks' Monthly Statement.

It should be noted that the definition of deposits in the clearing banks' combined statement is not the same as that in the banks' balance sheets. From the balance sheet figures, however, it can be seen that seven of the eleven banks showed increases in deposits (the biggest proportional increase being the 5.8 per cent shown by Martins Bank) and four banks showed decreases ranging up to 3.5 per cent.

Among the main earning assets, aggregate advances rose by £145 million or 10.5 per cent (compared with an increase of £172 million, or 14.3 per cent in 1948). The expansion was common to all banks, and for three of the "Big Five" exceeded 15 per cent. The aggregate increase in investment portfolios by £34 million (against a fall of some £4,500,000 in 1948) reflected increases by seven banks (9 per cent by the National Provincial) and fractional decreases by four. The slackening of the annual rate of increase in bank advances and the increase in aggregate gilt-edged holdings show that banking policy has been in line with official policy—there has been no sign of any immoderate lending nor any refusal to add to holdings of Government paper as private holders have disgorged it. The small rise in net deposits over the year is explained by the fact that the volume of credit created through these two channels has not been fully offset by repayments of government debt to the banks. These repayments, indeed, are probably overstated by the £150 million net decrease in the banks' aggregate holdings of Treasury deposit receipts (down by £604 million) and of money market assets (up by £454 million), because the rise of £30 million in cash holdings was apparently mainly due to abnormal influences at the 1949 balance sheet date. But for these influences, the money market assets would have been larger and cash smaller.

An interesting innovation in the bank reports this year is an experiment by the Midland Bank to present "some facts about the bank" by simple block diagrams. These show that half the 73,000 Midland Bank shareholders each hold £100 or less; that the bank's documentary credit business has risen more than fourfold since 1938; and that the expansion of banking business, as measured by number of cheques handled, has been accompanied by only a small increase in total staff.

* * *

Discount Houses' Year

Of the "Big Three" discount houses the National Discount Company last year showed a 14 per cent rise in profits, the Union Discount Co. one of 2 per cent rise and Alexander's showed a 14 per cent fall. As usual, however, the vagaries of taxation—including this year the late increase in the levy on distributed profits—make these bare results an unreliable guide to earnings experience. It is apparent, however, from the annual statements from the chairmen of all three companies that the market has enjoyed a good year. Turnover has increased, better running margins have probably been secured on business in short bonds and even on bills (though on Treasury bills the turn is still infinitesimal), while the market has confined its bond portfolios very largely to those shortest bonds which—unlike all other gilt-edged securities—actually showed a slight appreciation at the balance sheet date.

So vigorously has the policy of going "short" been followed that Sir Charles Seligman, making his farewell speech as chairman of the National Discount Company, was able to reveal that almost the whole of his company's investment portfolio last Budget day consisted of National War Bonds 1949-51 together with a smaller holding of Exchequer Bonds 1950. The Chancellor's Budget announcement that the former stock would not be redeemed at its earliest date was, therefore, very welcome to the discount market, which also welcomed the recent decision to convert Exchequer Bonds into a single-dated stock (although, of course, the five-year life of the new stock means that it cannot play any significant part in Lombard Street's portfolios for some time ahead). Two of the "Big Three" apparently took advantage of this Exchequer Bond conversion to run down their investment portfolios—in the belief, as Lord Colgrain, the chairman of Alexander's, put it, that "this is a time for the utmost caution."

The other main feature of the discount market's year has been the expansion of its bill business. Turnover of Treasury bills has been largely increased by the Treasury's switching from deposit receipts, while commercial business has benefited from the slight rise in discount rates charged.

1949	310·8	286·5	150·4	747·7

† Including carry forward.

These rates, in Lord Kennet's words, "now give the discount market a slightly less inadequate margin of profit." Despite this rise in rates, both the Union and the National show a 12 per cent rise in commercial bills re-discounted (probably partly due to the freeing of hard wood from control); Alexander's liability on commercial bills re-discounted is, however, nearly 25 per cent lower. There is some hope in the market that there will be a further revival of business in commercial bills in 1950.

* * *

Meaningless Symbol?

The Midland Bank has always prided itself on the originality of its opinions. But never before has its departure from the broad unanimity of its fellow-bankers been so startling as that made by its chairman, Lord Linlithgow, in his latest annual statement. His opinions, as here expressed, have only one point of contact with theirs: he agrees that disinflation is needed to cure the "over-extended condition" of the economy, but disagrees fundamentally with the views not only of his fellows but of most economists and probably the great majority of business men, about the means by which this should be brought about. In particular, he deplores the suggestion that interest rates should be deliberately raised. In this a few of his colleagues might go a little way with him; but all would reject the grounds on which he rests his case.

The argument is that rising interest rates were and can be effective only in a free, flexible and open economy, whereas the British economy is now controlled, rigid and closed. Since stocks of primary materials are either owned by the Government or limited by import licensing, and since long-term borrowings "are controlled in accordance with national policy and the scale of priorities ruling for the time being," rising interest rates would not, Lord Linlithgow suggests, check the overload of demand. It is surprising that such contentions should be put forward in 1950, for all experience since the fuel crisis and even before has gone to show how limited is the coverage and how leaky the sieve of the physical controls. But even more astonishing is the assertion that "direct curtailment" is, in present conditions, to be preferred to the restraint of rising rates.

Nor is this all. We are told that rising rates would not only fail to check the excessive demand but would positively weaken the disinflationary effort through their effects on the interest bill for the national debt. On this argument, the Daltonian orgy of credit expansion (which indubitably reduced that bill for a time), must have been an heroic effort at disinflation. Lord Linlithgow would presumably say that since the total volume of spending was "controlled in accordance with national priorities" there was no reason why a lot of additional but unspendable money should not be created in a good cause. Why, indeed, should the Government not try to make the gilt-edged market now retrace its steps? If higher interest rates do no good and yet do harm both to the budget and to all "approved projects" which have to bear the burden "even" though they are of "high priority," why should the community be saddled with the damaging load of 3½ per cent? Why not make it 2½, or 1½, or zero? For surely the logical conclusion of the argument would be that the interest rate has become a meaningless symbol.

★

But, perhaps, after all, there is another explanation for Lord Linlithgow's surprising statement. A careful reading shows that it prescribes a policy for conditions as they are now assumed to exist, with physical control and planning effective and immutable. Is it possible that he is really indulging in a sly but grim jest, by demonstrating the futilities of a system which thus mocks at fundamental economic forces which it may distort but cannot contain?

★ ★ ★

Mr Beckett's Farewell

At the end of this year's address to the shareholders of the Westminster Bank Mr Rupert Beckett announced his impending retirement after twenty eventful years as chairman. His address was distinguished both by a concluding note of personal reminiscence (as "farewell went out sighing") and by the measured judgment of the elder statesman which informed its comments on national affairs.

Mr Beckett emphasised that devaluation was "a leap in the dark" forced upon Britain by an alarming fall in its dollar reserve—a fall whose development could have brought with it, among other dangers, "a possible disintegration of the sterling area into separate units." The proximate cause of this fall in reserves was a mild recession in the United States, but Mr Beckett suggested that "it would be unwise to lay too much stress on this factor"; it would be more profitable to pay urgent attention to two troubles which could be cured by our own policies—inflation and unrequited exports. On inflation Mr Beckett pointed out that it was useless to calculate and plan how resources should be allocated between current consumption, capital formation and exports "unless purchasing power in the hands of the public was adjusted accordingly"; his recipe for cutting down purchasing power was curtailment of Government expenditure. On unrequited exports Mr Beckett, while recognising the need for capital equipment in Asia and elsewhere, pointed out that it was "inconsistent that we should be urging exporters to divert goods to dollar markets, while at the same time the release of sterling balances provides purchasers in the sterling area with the funds with which to buy the same goods." These observations contain no new diagnosis but the remedy for Britain's economic dangers could hardly be more succinctly described.

Industry

Development Councils and the Future

Both the Chancellor of the Exchequer and the President of the Board of Trade last week discussed the relations between government and industry, and the future of development councils in particular; and both their speeches seemed calculated to render more remote the prospect of agreement or compromise on the setting up of development councils. Sir Stafford's theme was that the "capacity to order and control" was "absolutely essential for a successfully planned economy," and in establishing such an economy the Industrial Organisation and Development Act was a vital factor. It was the only satisfactory way in which private enterprise and State planning could successfully be combined:

> Immediately we are returned to power we must set to work in real earnest to strengthen the Act and to bring a large number of development councils into effective operation, overriding any political opposition that may be encountered. We have wasted valuable years trying to get agreement and we must not waste any more time.

The flaw in this is that it takes for granted that a development council set up by "overriding" opposition is likely to be a success. The president of the Federation of British Industries, Sir Robert Sinclair, stated the precise opposite in a speech at Leeds on Thursday, and added that the FBI would support a development council if the industry concerned wanted it, but would oppose it where the industry did not want it. Sir Stafford's words are a far cry from the assurances of consultation and good will that came so freely from the government side when the Bill went through Parliament in 1947. They are, however, mild compared with those of Mr Wilson, who picked out for the benefit of a Fabian society at St. Helen's "one or two points" in which industry "had not fully answered the national need." One of these points was the tardiness of industries to bring their less efficient firms up to the standards of the more progressive, and Mr Wilson took the "not unorganised" hostility towards development council proposals to be a sign of this: "politics rather than efficiency" had been too much to the fore in certain employers' associations.

It is less to these reproaches than to Mr Wilson's view of the future that the employers' associations can be expected to pay attention. He added that the "key to the situation" in the long run might well be in the establishment of more development councils "with undoubtedly fuller powers than they now possess"; and he spoke of legislation in a future Parliament to create those extra powers.

But it is precisely the suspicion that this might happen that has made the employers' associations so determined in their opposition. The wool textile employers, for instance, have repeatedly observed that the proposed development council for their industry, as its powers and functions now stand, would serve no purpose that could not be served at least as effectively through a voluntary body which they would agree to set up. In the light of this, they took the government's insistence on the statutory form to mean that the development council was merely the thin end of the wedge—and that, once established and accepted, the council would soon begin to acquire executive powers which would threaten their industry's freedom to conduct its business. This feeling made them oppose the government's proposals

THE TEST OF TWO CENTURIES

In the two hundred years since Glyn, Mills & Co. became a name in Lombard Street, great changes have shaped the course of history. In those changes this now famous bank has preserved unaltered its tradition of a private Banking House offering the most comprehensive financial facilities.
To-day, as in 1753, Glyn, Mills & Co. provides a banking service to meet the special requirements both of the large public corporation and of the private customer.

GLYN, MILLS & CO.

so pertinaciously that the development council for their industry is now having to wait until the next Parliament. It may have seemed suspicious, and perhaps a little old-fashioned, on their part. But Mr Wilson's speech, especially when read in conjunction with the Chancellor's, seems to justify it.

* * *

Dual Prices in the Coal Trade

The question of differential price systems for the home and export markets cannot avoid an important place in the discussions of the Organisation for European Economic Co-operation now proceeding in Paris. It is not easy to see, however, what real decisions of policy can be expected at the moment. American spokesmen, and notably Mr Hoffman himself, have made it clear that they want action in the direction of the economic integration of Europe—and that homogeneous price systems are among the ends they have in view. A committee at Paris has studied the question on the lines laid down in the OEEC resolution of last November. But there has been little sign of any change of heart among the countries principally concerned; and the British attitude has, if anything, hardened as the facts have been examined more closely.

The United Nations *Economic Bulletin for Europe* has something to say on the subject in its issue, just published from Geneva, for the third quarter of 1949. A survey is made of coal production and the coal trade in Europe since the war. The general picture is that supplies of European coal continued, during 1949, to catch up with European demand; and imports from the United States continued to decline correspondingly. In the third quarter of 1949 the United States accounted for only 13 per cent of the coal imports of fourteen European importing countries, compared with 31 per cent in the same quarter of the preceding year. The survey makes it clear, however, that there is still unsatisfied demand at present price levels; this supports up to a point the British argument that the export price level of British coal, at least, is not unreasonably high.

At the same time the survey points to certain facts which suggest that the former pattern of coal consumption in Europe, and therefore of the coal trade, is being perhaps permanently changed. The argument is expressed in figures which relate coal consumption to industrial output. The coal producing countries were naturally able during the post-war shortage to maintain higher levels of coal consumption than were the importing countries. But the importers have made efforts to raise their industrial production independently of their coal supplies. There is, in fact, a general tendency for industrial output to increase more rapidly than coal output, and to some extent this reflects the technological shift to other sources of energy.

But the shift has been encouraged by high coal prices and "the dual price policy which has been followed by the coal-exporting countries," and their influence will tend to grow:

> It seems clear that all these trends are influenced by the relatively high prices for coal charged by the European exporting countries and by the endeavour of the coal-importing countries to offset their disadvantageous competitive position resulting from the dual price policy.

The survey concludes that "the present price and market system for coal . . . may well work to the ultimate disadvantage of the coal-exporting countries by discouraging the use of coal in Europe." It concedes, however, that the system has immediate advantages for the exporting countries. These weigh heavily with the British Government. They also weigh with the National Coal Board; Lord Hyndley, discussing last week the prospects of the coal industry for 1950, made it clear that the Board did not intend to change its price policy in the near future unless the Government directed it to do so.

A Refinery Project Modified

A reduction in the authorisation of dollar aid for the refinery project at Shellhaven, on the Thames, was announced by the Economic Co-operation Administration last week; it is attributable to capital-saving measures undertaken by the Shell group of its own volition, and not to any pressure from ECA. In view of Anglo-American differences on oil trade policy, it may perhaps have been inevitable that the suggestion should arise that the reduction was in some way a retaliatory measure. But all the parties concerned have been at pains to deny this, and the facts support their denial; to get any plan through ECA takes longer than a few weeks, and the modifications now made in the Shell refinery plans were worked out some months ago. Substantially, therefore, the matter was decided before the British Government announced its plans for reducing the purchase of dollar oil.

The reduction amounts to $7,588,000—or about three-quarters of the original dollar appropriation for Shellhaven. An ECA spokesman in Washington explained that the British plan for Shellhaven had been so modified that it would cost $34 million (in sterling and dollars) instead of the $58.4 million which had been contemplated. Statements in London have made it clear that the project has been reviewed to save dollars and also to save capital expenditure all round. A review of this kind is sensible commercial practice and, no doubt, entirely healthy. It has resulted in a decision to postpone the erection of certain units at Shellhaven and to make some other modifications there. It was made easier by the fact that refineries similar to the proposed new plants have already been brought into operation overseas, and have demonstrated that their "rated capacities" had been conservatively estimated; the plants, as designed, can handle more than was said. The two new refineries at Stanlow and Shellhaven will still, therefore, be able together to handle about 6,000,000 tons of crude oil a year—not much less than was at first estimated—even though Shellhaven is to be smaller.

Since one of the Shellhaven units to be postponed is the catalytic cracking unit, it seems fair to assume that the flexibility which is the purpose of these modern units now appears less imperative than it did. Market forecasts have probably not been radically changed, but it seems not unlikely that they have been somewhat toned down. It is a useful reminder that the refinery programme, though it tends to be officially regarded as a majestic national plan, is in fact a jig-saw of commercial projects, and subject to change on commercial grounds.

* * *

Retooling at Dagenham

The Economic Co-operation Administration has become a valuable source of information about British industrial plans, about which the authors of the plans are themselves sometimes unaccountably coy. An ECA announcement this week disclosed a considerable scheme for the retooling and re-equipment of the Ford Motor Company plant at Dagenham. The company has so far said little or nothing about the scheme, but, since the dollar authorisation has now been granted, it seems likely that work is to be begun soon. ECA has authorised $4,500,000 (about £1,600,000) for the project; this is to cover the cost of tools and equipment which will be required from the United States, and the Ford Motor Company will pay the sterling equivalent; it is perhaps of interest that the American parent company in this case has not chosen to follow the example of Standard Oil, which is providing dollars to build the Fawley refinery for its British subsidiary.

The whole cost of the Ford scheme is to be about £4,000,000, so that about 40 per cent of the expenditure will be on American equipment. The plant at Dagenham

is already an integrated plant of exceptional efficiency, and it seems fairly certain that the primary purpose is not a remodelling of the plant but a general change-over to a new series of models—to be accompanied, no doubt, by some improvements in efficiency and perhaps by some expansion of output. In the last two years Dagenham has turned out about 150,000 cars, commercial vehicles, and tractors a year; output of cars and commercial vehicles was increased last year, but output of tractors was somewhat reduced. For a number of years the company has kept its output high and maintained an excellent export record, but, partly in order to do this, has kept its products substantially unchanged. A new range of European Ford models would be a considerable event in the motor industry.

* * *

Decline in Shipbuilding Orders

No change in the downward trend of shipbuilding business is recorded in Lloyd's Register shipbuilding returns for the last quarter of 1949. They show that at the end of the year there were 1,994,191 tons gross of merchant ships under construction in Great Britain and Northern Ireland, a decline of 101,026 tons in the quarter and of nearly 250,000 tons since the postwar peak of June, 1948. The British proportion of the recorded world total, however, has remained steady at about 45.4 per cent, since the tonnage under construction abroad declined by as much as 111,945 tons gross during the same quarter. The total figure in foreign shipyards is now 2,400,577 tons gross, compared with 2,512,522 tons at the end of September last—although returns from Germany, China and Russia are still excluded. The most pronounced decline has been in the United States, where only 41 vessels of 512,787 tons were building at the end of the year, compared with 50 vessels of 625,281 tons three months earlier; this was a fall of 112,494 tons in the quarter. Work in hand has declined in most countries; Denmark, France, Italy, Poland, Portugal, Finland and Sweden are exceptions.

(Quarterly av.) .	(303,035)	(315,019)	(338,338)

Source: *Lloyd's Register Quarterly Shipbuilding Returns.*

The changing state of work in the British shipyards can be traced in the accompanying table, which shows the tonnages begun, launched and completed as recorded by Lloyd's Register in the four quarters of 1949. Too much ought not to be read into the figures for one quarter alone, since totals over such a short period can be unduly influenced by a few large vessels, but if the average for the year is taken it will be seen that the rate of completion has exceeded the launching rate; and the rate at which new work has been started has lagged behind both. This can be taken to mean that delivery times are improving and that there is not always suitable work to fill every berth as it becomes vacant. There is no lack of tanker orders, which indeed now account for nearly 50 per cent of the work in progress in British yards and about 70 per cent of the tonnage still to be laid down.

* * *

Steel Company of Wales

Devaluation will not entail any increase in the cost of plant imported from the United States by the Steel Company of Wales for its development scheme. Mr E. H. Lever, chairman of the company, makes this clear in his statement with the accounts for the year ended October 1, 1949, published this week. The company has consistently pursued the course of buying dollars forward and had acquired sufficient dollars prior to devaluation to finance its purchases in the United States. The expenditure of a further £14,653,322 on the development scheme during the year shows that good progress has been made with the project which, it is expected, will be in full operation at Margam next year. Altogether £23,822,167 had been expended up to October 1, 1949. Out of contracts for capital expenditure put in hand by that date amounting to approximately £54 million, roughly £30 million remains outstanding. The chairman has again intimated that the original cost of £60 million for the scheme will inevitably be exceeded owing to rising prices. Means for financing the additional cost are under consideration. As matters stood at the end of the past year, only £6,400,000 had been advanced by the Finance Corporation for Industry out of its original guarantee of £35 million. Funds raised by the £15,000,000 3 per cent debenture issue in 1947 have now been spent on the scheme and an arrangement has been made with the Finance Corporation for Industry to advance money in monthly instalments as the work proceeds. This arrangement makes it unnecessary to hold big balances of cash. At the same time the company saves interest on its loans from the FCI.

The total interest charges have risen, in spite of this, from £358,039 to £486,534 in the past year. In addition, provisions for depreciation and furnace renewals have taken £692,286 against £555,829 from the year's profits. Against these increases, initial allowances on new capital expenditure have again rendered it unnecessary to make any provision for taxation in 1948-49. Hence the increase from £1,486,523 to £2,112,728 in trading profit on the year is reflected in a striking rise in consolidated earnings which provided 3½ times cover for the restricted 4 per cent ordinary dividend. Yet a note of caution is sounded by Mr Lever. He indicates that part of the increase in profit arises from higher export prices which he realistically regards as "temporary." The new hot strip mill promises to be highly efficient, and efficiency will certainly be needed to face the growth of competition which is probable in the early fifties.

Finance and Trade

Trade Talks—continued

The difficulties besetting Britain's trade and payments negotiations reflect the attempt to encourage freer trade without further widening the adverse payments gap. Particularly tricky problems confront the negotiators with Holland and Switzerland, though the Danish talks will prove hardly less difficult. Norwegian talks are said to be proceeding more smoothly—Norway is short of sterling. The first stage in the Dutch negotiations has been completed and the two delegations are now reporting to their governments. British imports from Holland have been rising even faster than exports to Holland, and a favourable trade balance of £4.2 million in the first eleven months of 1948 was turned into a visible deficit of £9.6 million in the equivalent period of 1949. Yet another batch of quantitative restrictions on Anglo-Dutch trade is to be removed in 1950. This is an attempt to keep faith with the aims of freer intra-European trade despite the risk that, as a result, still more sterling may accumulate in Dutch hands. The Dutch appear aware that their sterling holdings may rise in 1950, a prospect they view with a distinct lack of relish. Not surprisingly, an attempt to secure a relaxation of some of the restrictions recently imposed upon the use of Dutch account sterling has apparently featured prominently in the negotiations. Holland wishes to use some of its sterling to buy goods in the sterling area for re-export to other transferable account countries.

The negotiators in the Anglo-Swiss talks, who have been sitting for some ten days, have not only to consider the annual trade pact but also to formulate a new payments agreement to replace the three-year agreement due to expire at the end of March. Under this agreement, Switzerland is prepared to hold up to £15 million in sterling, but requires any further sterling to be converted into gold. Gold to the value of at least twice the ceiling figure has had to be shipped to Switzerland in the past three years, but at present Britain is further from the danger point than at any time since 1946. Swiss nationals had been amongst the most successful in maintaining an open bear position in sterling before the devaluation; their settlements in the following few weeks therefore made a considerable inroad into the sterling reserves of the Swiss authorities. Moreover, British exports to Switzerland picked up well in November and December, while Swiss earnings from winter sports tourists have fallen off sharply compared with other post-war seasons. Yet both parties would agree that the achievement of long-term equilibrium in the bilateral balance of payments remains highly problematical.

In the talks with Egypt, discussed in some detail in *The Economist* a fortnight ago (together with the Israeli talks which opened in London on Wednesday), the breakdown widely reported in the Egyptian press has proved without foundation. This does not mean that there may not be a breakdown at some later stage if the Egyptians do not drop the fantastic demands reported to have been advanced. But not even Egypt can be in earnest in asking, according to reports, for a release of £100 million in sterling, £10 million in dollars, and a share in the gold reserves of the sterling area. It is difficult to see why Egypt should want large amounts of sterling unfrozen at this moment, when Egypt is said to have substantial sterling balances freely available.

* * *

Features in Exports

Last year's achievement in exports was encouraging, but it cannot be said even now that Britain's sales abroad have struck firm roots. The trend during the past year is best judged by adjusting the monthly figures to a standard month of 26 working days:—

BRITISH EXPORTS
(Adjusted to a Standard Month of 26 Days)
(£ Million)

January	159	May	151¼	September	142
February.....	152¼	June	155	October	156
March	154	July	141½	November.....	160½
April	149	August	137	December.....	160

The expectation of devaluation, followed by the decision itself, sharply divide the third and fourth quarter trends. Exports of food, drink and tobacco and of raw materials were larger (by value) in the fourth quarter of the year than in the first quarter of 1949. The rise in food exports was mainly due to the higher sterling value of whisky, while the increase in raw materials reflected larger exports, at higher prices, of coal and domestic grown wool.

Manufactures recovered in the last quarter of the year, though their value did not regain the level of the first quarter. They owed much to the metal using industries. Vehicles and iron and steel manufactures reached record values, exceeding their first quarter figures by nearly 10 per cent. Vehicles, in particular, appear to have gained more from the devaluation of sterling than any other export.

ANALYSIS OF BRITISH EXPORTS IN 1949
(£ Million)

	Monthly Average					
	4th Qtr. 1948	1st Qtr. 1949	2nd Qtr. 1949	3rd Qtr. 1949	4th Qtr. 1949	Dec., 1949
Food, drink and tobacco	8·3	8·1	7·1	7·2	10·1	10·7
Raw Materials	6·6	6·5	5·7	6·2	8·9	9·0
Of which :—						
Coal	4·2	3·6	3·5	4·3	5·4	5·3
Wool	0·7	0·9	0·8	0·9	1·7	1·8
Manufactures	124·6	135·0	127·3	124·3	132·9	127·5
Of which :—						
Pottery, glass, etc.	3·9	4·4	4·0	3·9	3·9	3·5
Iron and steel mfrs.	10·0	10·3	10·1	10·3	11·5	11·4
Non-ferrous metal mnfrs..	5·1	5·8	5·2	4·8	5·4	5·6
Cutlery, etc.	3·7	4·0	3·8	3·5	3·7	3·7
Electrical goods	6·5	6·9	6·8	6·4	6·4	6·3
Machinery	20·9	23·9	22·6	22·8	23·7	22·9
Cotton goods	13·1	14·3	13·8	13·1	11·8	11·1
Wool goods	8·6	9·1	8·3	8·5	8·8	8·8
Rayon and silk goods	3·4	3·9	3·8	3·4	2·9	2·6
Chemicals, etc.	7·1	7·5	7·3	6·7	7·2	7·0
Vehicles	23·8	26·4	24·8	24·2	29·0	26·5
Others	4·2	5·7	5·9	5·4	4·6	6·6
TOTAL	143·7	153·3	144·0	141·1	156·5	153·8

Cotton exports were unsatisfactory, for they fell throughout most of the year and reached a much smaller rate than in the last quarter of 1948—as indeed did exports of silk and rayon goods. Exports of wool textiles, on the other hand, declined during the second quarter of the year, but thereafter recovered almost to the level achieved in the first three months of 1949. Chemicals, non-ferrous metal manufactures and cutlery all showed some increase in the last quarter, whereas exports of pottery and electrical goods continued to decline.

The 1949 export figures show that the export effort is highly geared to vehicles and metal manufactures. The steady expansion of vehicles and the relative stability in machinery shipments are satisfactory. But exports of textiles and other consumer goods ought to be carrying a bigger share of the effort, and the fact that they are not as yet doing so can hardly be dissociated from the Government's economic and financial policy.

AN ECONOMIC APPROACH TO THE ELECTION

AMERICAN AID AND BRITISH BURDENS

by Graham Hutton

These are among the special articles which will appear in THE FEBRUARY ISSUE of

THE BANKER

PRICE 2/6

Britain's Trade in 1949

British imports in 1949 totalled £2,272 million compared with £2,078 million in 1948 and £1,795 million in 1947. The increase owes much to the recovery which has occurred since devaluation. Yet the deficit on visible trade —£429 million—was scarcely changed compared with the 1948 deficit of £432 million, for exports also rose sharply, particularly after devaluation. Any limited satisfaction with the achievement for the full year must be qualified by the fact that the fourth quarter of 1949 still showed a wider gap than either the first quarter of the year or the last two quarters of 1948. Imports in the fourth quarter of 1949 cost 10 per cent more than in the first quarter (when the gap was narrowest) whereas the value of exports (taken alone) and total exports (including re-exports) rose by only 2 per cent in the same period. Since the volume of exports in the last quarter is estimated to have risen by only 2 per cent compared with the first quarter, little change appears to have taken place in average export prices between the two periods.

The main increase in imports occurred in raw materials, which cost £774 million, 13 per cent more than in 1948. Food imports cost £969 million and rose by 10 per cent and manufactures £509 million—a rise of 5 per cent. Imports

Note: Discrepancies in totals due to rounding off.

of raw wool increased by nearly 50 per cent but part of this rise is explained by the transfer of stocks from Australia and New Zealand to Britain. Oils and oilseeds increased by 20 per cent, cotton by 14 per cent and timber, iron ore and scrap were also larger. Among the foodstuffs, dairy produce increased by one-third and meat by 16 per cent, but imports of cereals declined in value by nearly 10 per cent.

* * *

Canadian Food Contracts

Negotiations between Britain and Canada on the 1950 cheese contract proved less difficult than had been expected. Britain agreed to buy a minimum of 70 million lb, and a maximum of 85 million lb, compared with 50 million lb in 1949. The contract represents the entire export surplus in 1950, estimated at between 60 and 70 million lb—and will also absorb a substantial part of the Dairy Board stocks. Its conclusion was assisted by a Canadian concession on the price, which is reduced from 31 cents a lb to 25 cents. Even so, because of devaluation, there will be an increase of 6 per cent in the sterling price. The Canadian Government will subsidise exports of cheese to the extent of $2,500,000. The cost to Britain for the minimum quantity (70 million lb) will be $17½ million, or $2,000,000 more than the cost of last year's purchase. Thus the burden of lower price and larger quantity is shared equally by the two countries. The maximum quantity of 85 million lb would cost Britain $21¼ million. It may be supposed that this further dollar commitment will be accepted only if British exports to Canada warrant it. Canada will thus dispose of its surplus produce without imposing any serious burden on Britain. The fact that ECA funds will not be available for British purchases of Canadian cheese (or for bacon) will not affect the settlement. Dollars for bacon will be provided by postponing the sale of 12½ million bushels of Canadian wheat under the four-year contract.

European Payments in December

Pending its fundamental amendment now under discussion in Paris, the Intra-European Payments Scheme continues to function as best it may along the lines agreed last June. The December compensations of intra-European payments have recently been completed. They involved the utilisation of drawing rights amounting to the equivalent of $44,866,000. In the six months to the end of 1949 such drawing rights had been used to the total amount of $294.9 million. This compares with a total of $802 million agreed for the whole year to June 30th next. It will thus be seen that the utilisation of these drawing rights is falling well behind schedule. To this extent a proportionate amount of conditional grants from the United States is being imperilled. In December the United Kingdom granted drawing rights to the equivalent of $11,669,000. There was no contribution to France, which has now passed through the first half of the payments year without touching any part of the total drawing rights (equivalent to $120 million) established by Britain in its favour. The United Kingdom did not have to use any of its own drawing rights during December. This is an interesting indication that a more favourable trend in Anglo-Belgian payments is being maintained; it suggests that the Belgian holding of sterling must still be below the gold ceiling and that no further gold has been lost to that country.

Basis of Tax Assessment

The first public sittings of the Committee on Taxation of Trading Profits (set up last year by the Chancellor) provided three field-days for accountants. Of the seven points on which representations were invited by the committee, several should be familiar—including, for example, the much publicised question of depreciation allowances. But the first public sittings were confined to fundamental but complex questions of the basis period for tax assessment. Under the present system, an established business is assessed to income tax for each year ended April 5th by reference to the profits of the accounting year ending next before the previous April 6th. This method is convenient enough for a continuing business; but anomalies arise in dealing with new businesses

THE "N.P.I." POLICY

not only creates capital out of income, but at a chosen retirement age the fortunate policyholder can apply this capital to provide an income for the rest of his life, without the anxieties of investment. And for fifteen years this income is tax-free.

Please write for the fully descriptive leaflet.

NATIONAL PROVIDENT INSTITUTION
FOR MUTUAL LIFE ASSURANCE
— ESTABLISHED 1835 —
48 Gracechurch Street, London, E.C.3

in their earlier years of operation, and with the closing years of businesses which cease. The weight of professional and business opinion is decidedly in favour of avoiding these difficulties and assessing income tax on an "actual" basis. The Federation of British Industries, the Association of British Chambers of Commerce and the Institute of Chartered Accountants and many others supported this change.

Under the present system, profits shown by the first complete year's accounts of a new business can be represented in whole or in part in three successive years' assessments. A business is assumed to cease and restart merely if it is incorporated as a company, or if some group re-arrangement takes place. A partnership may, at its option, be treated as a new business if a change in the firm's constitution occurs. In general, this duplication of taxation on early profits does not involve payment of excess tax. But on the occasion of cessation the profits of some twelve to twenty-three months (dependent on the balance sheet date) are never assessed to tax. The existing system, however, is not without its defenders—among them the Association of Inspectors of Taxes, a minority of members of the FBI and other bodies largely representative of smaller concerns. The chairman, Mr Millward Tucker, stated, however, that more people favoured the change than were against it.

Despite this broad consensus of opinion, however, the experts did not lose the opportunity to indulge their tendency to differ. The FBI, Chambers of Commerce, English Chartered Accountants and others favoured assessing each fiscal year (amended to March 31st) by apportioning the results shown by successive years' accounts. The Scottish Chartered bodies, and a number of other witnesses, pointing out the delay involved by waiting for the later year's accounts, preferred that the "Profits Tax basis" should be applied in full to Income Tax, so that the results of each accounting period would be assessed. This is clearly a less fundamental point; other witnesses suggested that, so long as all were assessed on "actual" profits, a different procedure for companies and unincorporated concerns might be admitted, there being some special, though not in any case insuperable, difficulties in departing from the fiscal year for the latter. Any change to an "actual" basis would involve payments on account before the exact tax liability could be determined if the Exchequer's revenue were to be maintained—unfortunately a necessary assumption.

Vulnerable Wool

Wool prices in Australia last week reached the highest levels since the war and are not far from the highest ever recorded—in 1920. The wool market today shows some close resemblance to that of thirty years ago. The fears then widely heard, that wool would be in short supply for some years to come, are heard again now. In 1920, prices rose steeply and reached fantastic heights—only to slump just as sharply. This season, the wool market opened quietly. Foreign buyers held off, waiting for the devaluation of sterling. Since October, however, prices have persistently risen: first merino wools, then crossbreds and now merinos again. Most British wool manufacturers are booked up with orders for nine or twelve months ahead. Commercial stocks in this country and elsewhere are not large, and stocks held by the Joint Organisation, which in the past five seasons have supplemented the current clips, are dwindling rapidly. If the present level of world consumption of wool is maintained, next season might well call for 300 million lb. (greasy basis) more than the new clip.

The bullish sentiment in the wool market is very confident. But two other factors are important and must be taken into account. First, the Wool Study Group last November estimated that world production of apparel type wools in the current season would increase by over 2 per cent while world consumption was expected to show a slight decline. In spite of these forecasts, prices have offset the devaluation, and some types of wool have risen in terms of gold. The second factor is that the demand for raw wool is derived from the demand for wool textiles. In Britain, retailers are again beginning to feel consumer resistance, even though the prices of wool manufactures have yet to reflect the recent increases in the cost of raw wool.

*

Next Monday, a conference opens in London to review the operations of the Joint Organisation. Since September, 1945, more than 85 per cent of the total stock has been sold (in addition to the current clips of the three Dominions). The problem facing the conference is whether the organisation should be wound up—and, if so, whether some form of marketing organisation should replace it. The proposals which have come from various organisations in Australia, New Zealand and South Africa suggest that those dominions would welcome a commonwealth marketing scheme to fix support prices for their domestic wool growers; and these would be partially financed by Britain. Such a scheme would seem hard to reconcile with the principles of the International Trade Organisation charter. And it might represent a very heavy commitment to all parties, Britain included, if wool prices were to fall sharply.

Shorter Notes

Owing to an unfortunate typographical error a caption in the advertisement columns of *The Economist* last week stated that the District Bank's figure for deposits at the end of last year was £23 million. As was evident from

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada and the United States.

the body of the chairman's statement beneath it, the true figure is £231 million—a new record for the bank. In his statement Sir Thomas Barlow attributed the expansion in deposits partly to a growth in the bank's business but partly also to the inadequacy of the Government's measures of disinflation; in this latter context he had some pointed words to say on the way realistic disinflation would help to put Britain's major industries (including especially the cotton industry) in better trim to meet growing competition from abroad.

★

Mauritius has accepted the Ministry of Food's offer for a five-year contract for sugar commencing in 1953. Britain has guaranteed it a market for 335,000 tons a year at a price to be negotiated annually. Total exports of sugar from Mauritius during this period have been planned at 470,000 tons a year. The Ministry of Food has postponed the date by which the West Indies must decide to accept or reject its offer for a long-term contract, to February 18th. The next meeting of the International Sugar Council has been fixed for February 27th.

★

The talks which took place in London last week between officials of the Danish, Norwegian, Swedish and United Kingdom Governments to consider measures to promote closer economic co-operation between the four countries concluded with the issue of a particularly evasive communiqué. It announced that "certain practical steps in the field of liberalisation of payments" had been recommended to ministers of the four countries. The responsible ministers are now in Paris to attend the OEEC meeting and it may be hoped that after they have set the seal of their approval on the results of the London talks, a more detailed communiqué will be issued. The questions under consideration in London were essentially concerned with exchange control between the four countries. It may, therefore, be assumed that the result of these discussions will be a greater freedom of payments both for current and approved capital transactions within the group.

★

An Engineering Equipment Users' Association has been formed to promote standardisation of the types of plant which its members have in common. Its founders are Anglo-Iranian Oil, Courtaulds, Imperial Chemical Industries, Lever Brothers and Unilever, and Shell Petroleum. They think there may be good opportunities for standardising plant or parts of plant such as electric motors, switchgear, pipes and flanges. Where the members agree on a standard, they will then be in a position to present a combined users' point of view to the British Standards Institution.

★

The British and Italian exchange control authorities have decided to permit British residents to sell any holdings of blocked lire (arising from dividend payments, sales of property in Italy and other transactions, the proceeds from which are not convertible) to approved banks here against sterling. The banks may then pass these lire on to their clients for tourist and other payments; although the total allotment of sterling for these payments has not been raised, the rate of exchange at which the banks can acquire the small amounts of blocked lire forthcoming (1850 lire to the £ last Wednesday) is at present somewhat more favourable than the rate for commercial payments (1750 lire to the £).

NOTICES

MINISTRY OF EDUCATION

Applications are invited from men and women between 23 and 40 years of age for admission to courses of training as full-time Teachers of Commercial Subjects and Office Arts (Shorthand and Typewriting) in Technical Colleges and similar institutions.

Applicants who wish to teach Commercial Subjects should have a University degree or professional equivalent or a Higher National Certificate in Commerce. Applicants who wish to teach the Office Arts should possess one or more recognised certificates of competency and should show evidence of at least two of the following:—

(a) a good general education;
(b) at least three years' accredited experience in business;
(c) having followed a directed course of study in some related subject up to the stage of the advanced course of the R.S.A.

Training will be given in the principles and practice of teaching and in the methods of teaching special subjects. The courses will be of three terms' duration. There will be no fees, and students will be eligible for maintenance grants for the period of the course.

Application should be made on Form 203 R.E., which may be obtained from the Secretary (Teachers R.E.3), Ministry of Education, 23 Belgrave Square, London, S.W.1.

Requests for Form 203 R.E. should be clearly marked "Technical."

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the following posts in the Department of Extra-Mural Studies.

(a) Junior Staff Tutors in Economics, Music, Psychology, Social Science, at a salary scale of £450/£25/£500 per annum, or

(b) Staff Tutors in Economics, Music, Psychology and Social Science, at a salary scale of £550/£50/£900 per annum. The initial salary to be fixed according to qualifications and experience.

Applications, stating age, academic qualifications and experience, together with the names of three referees, should be received not later than March 4, 1950, by the undersigned, from whom further particulars of the conditions may be obtained.

STANLEY DUMBELL,
Registrar.

December 30, 1949.

WANTED.—Volumes of *The Economist*, bound or unbound, for years prior to 1923.—Write R. G. DuBois, P.O. Box 4701, Cape Town, South Africa.

January, 1950.

EQUATORIA PROJECTS BOARD

ANGLO-EGYPTIAN SUDAN

The Trading Division of the Equatoria Projects Board, Juba, the Sudan, which is a commercial organisation sponsored by the Sudan Government, requires the services of a qualified accountant, aged 30 to 45, for service in the Sudan, to be chief accountant of the Division, to organise the accounting staff and to apply a system of accounting suitable for base shops, branch shops and travelling sales vans, distributed over a wide area. Candidates must be either Chartered or Incorporated Accountants. Experience in the accounts of wholesale distributors and chain-store retailers will be an advantage.

Appointment will be on a Short Term Contract on a salary scale between £E900 and £E1,200 (£E1 = £1 0s. 6d.). A Cost of Living Allowance varying between £E180 and £E390 according to the number of dependents is also at present payable. The starting rate of the salary will be fixed according to age, qualifications and experience. The contract provides for an initial probationary period of two years on satisfactory completion of which a further period up to four years may be agreed, with the possibility of extension. There is at present no Income Tax in the Sudan. Housing accommodation will be available at a moderate rental. Free passage on appointment. Application forms may be obtained from the Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Accountant, E.P.B."

GRADUATE (28) in Economics with Statistics seeks progressive position in statistical or market research department. Commercial experience and certificate. Keen and adaptable.—Box 325.

FOR SALE.—Complete set *Monthly Digest of Statistics*, Nos. 1-48. Offers.—Box 321.

FULLY qualified Accountant, required by National Trade Organisation in London for Accounts and Office Management. Minimum salary £600 p.a.—Write Box 322.

FOR SALE.—*Economist* and *Records and Statistics* complete 1947-48-49.—Offers, Crook, 6, Guildford Avenue, Chorley, Lancs.

COMPANY MEETING

MIDLAND BANK LIMITED

QUESTION OF HIGHER INTEREST RATES

VALUE OF CREDIT FACILITIES

NEED TO ENLARGE NATIONAL OUTPUT

LORD LINLITHGOW ON ECONOMIC POLICY

The 114th annual general meeting of the Midland Bank Limited will be held at the head office, London, on February 15th.

The following are extracts from the statement by the chairman, The Most Hon. The Marquess of Linlithgow, K.G., K.T., on the report of the directors and balance sheet for the year to December 31, 1949:—

The year 1949 added its full quota to the annals of Great Britain's struggle for post-war economic and financial rehabilitation. In the monetary field the outstanding events were the lowering of the gold and dollar value of the pound and the fall in values of gilt-edged securities, from which only a partial recovery was recorded towards the end of the year.

These two events were closely associated in both time and cause. The initial heavy fall in gilt-edged took place within the few months preceding devaluation, and to a large extent reflected widespread expectation of that step. It was due, not so much to any strong movement to turn holdings of gilt-edged securities into cash, but rather to disinclination on the part of potential investors, in the uncertain conditions then ruling, to take up those securities coming on to the market in the ordinary course of business. The uncertain conditions in turn arose from increasing disquiet as to the balance of payments, for it was felt that the progress earlier recorded towards closing the gap on the sterling area's dollar account had not been maintained, that the reserves of gold and dollars were once again rapidly running down, and that stern measures within the national economy would be found necessary as an accompaniment to what seemed an inescapable writing-down of the exchange value of the pound.

FEELINGS OF DISAPPOINTMENT

No one can escape some feeling of disappointment with the actual course of events; and this feeling, together with a natural anxiety for the future, has led to even more widespread and vigorous discussion than heretofore of a variety of forms of corrective action. The discussion became perhaps even more lively after the disclosure of the Government's own measures of internal adjustment, following devaluation, which by many critics were judged to be inadequate. The issue is in truth much less one of estimates and the matching of conjectural statistics than of the psychological response to the needs of the situation, and this is a factor which no man can foresee, still less predict its force. Accordingly, I shall not attempt to pronounce upon the general question; what is perhaps more helpful is that we should clarify our minds as to the appropriateness of some of the suggestions made for putting to rights the internal monetary situation.

First, then, it has been widely advocated for some time past, but particularly since devaluation, that the authorities should take steps deliberately to lever up interest rates throughout the system, with a view to reinforcing disinflationary measures already taken or yet to be applied. We need to ask ourselves, in considering this proposal, in what way and under what conditions action of the kind suggested would be effective.

THE WORKING OF INTEREST RATES

I must not allow myself to be drawn into the discussion, which has continued—and remains unsettled—among economists ever since anyone could lay claim to the title, on the precise nature and economic function of interest rates. It is, I believe, enough for our purpose to define interest rates as charges paid for the use of capital or credit. In a freely-moving system they can be described as the open-market price for capital and credit, at which the immediately available supply meets the immediately effective demand. Under conditions of flexibility, all three factors—price, supply and demand—are responsive to each other. Further, the rates for long-term capital and short-term credit tend to rise and fall contemporaneously, since both are under the impact of related forces.

What is often overlooked—though it has an important bearing, in present circumstances, upon the case for higher rates—is that the relations between rates for credit and for capital have not always been, in open-market conditions, those to which we have become so accustomed that we tend to regard them as normal. It seems to be assumed as in the regular order of things that short-term rates must naturally be well below the yields on long-term securities; whereas the records show that this is by no means an invariable feature of a truly free market. If, for instance, we look back as far as the beginning of this century, we find that in the period to the outbreak of the first world war the annual average of rates of discount for three-months' bank bills was higher than the yield on consols in no less than nine of the fourteen years. The same relationship is true of 1920 and even of 1929. The fact is that short-term rates fluctuated far more freely—sometimes violently—than long-term yields. But it is well to remember, especially when advocating the abandonment of monetary management in favour of a complete return to free market conditions, that there is no pattern of rates which can properly be regarded as "natural" for all times and conditions.

In the days of uncontrolled money markets and a freely-operating gold standard, the crux of the rates system was the Bank rate, which was raised or lowered by the central bank according to its knowledge of facts and trends, particularly in their bearing upon the size of its gold reserve, and its judgment of the needs of the moment. Variations were frequent: it is perhaps of only antiquarian interest to recall that Bank rate was changed twenty-four times in a single year, 1873; more to the point is the fact that it was altered seven times, ranging between 4 and 7 per cent., in the year of crisis 1907. A rise in Bank rate had come to be regarded primarily, as a protective device to help in maintaining and restoring the gold reserves in the central bank, and a movement up or down had immediate, if unequal, effects throughout the structure of rates.

TREND OF YIELDS

The sharp fall in gilt-edged securities, however, represented in part a temporary exaggeration of a slow trend in the direction of rising yields on fixed-interest-bearing investments. The trend might be read as a symptom of persistent disparity between the flow of investible savings, whether personal or corporate, and the demand for capital finance arising from both public authorities and private undertakings. This over-stretched condition, of what has come to be called inflationary pressure, was one element in an economic situation that ultimately called for adjustment of the dollar-sterling parity.

Naturally, other factors were at work, like the recession of business in the United States early in the year; but the causative connection between the two major monetary events of the year is clear. It must be noted, in qualification thereof, that the rise in effective interest rates was limited to the capital market; apart from minor adjustments in discount rates for commercial bills, there was no corresponding upward movement in rates for short-term accommodation, whether by way of discounts or direct borrowing from the banks. Treasury bills and Treasury deposit receipts remained as cheap a form of Government finance as they had been ever since the rates were lowered in October, 1945.

EFFECT OF HIGHER RATES

We need at this point to remind ourselves how higher rates came to have the desired effect of reinforcing the gold reserve. On the side of external currency relations, they made London a more attractive centre, in comparison with others, in which to hold internationally mobile funds, and at the same time a less attractive centre for borrowers, whether of capital or credit, on international account. Hence the external demand, in the exchange markets for sterling was strengthened while the demand for foreign currencies in exchange for sterling was diminished. Exchange rates therefore tended to move away from the point at which it became profitable for those who specialised in such business to take gold out of the central bank and ship it abroad. This was the direct effect of higher rates; the indirect effects were no less important. On the domestic side, a rise in the cost of credit gave an impulse to liquidation of stocks of commodities and the closing down of speculative positions, while higher costs of long-term funds tended to deter the carrying out of some capital projects. One effect was a tendency for expenditure on imports to diminish, while another was to induce a decline in sterling prices of goods, improving Britain's competitive position in international trade. Thus the current account section of the balance of payments was strengthened along with the rectification, by the direct effects already noted, of the capital section; together these two forces operated to maintain and restore the gold reserve.

All this, over-simplified though it is, has much more than historical interest; its relevance to current discussion becomes apparent when we recall the indispensable bases and conditions for successful operation of the system. In international relations, Britain's balance of payments had to be in continuing equilibrium, subject to no more than occasional, marginal disturbance; ordinarily, indeed, since London was the world's principal financial centre and had to stand ready to meet external demands in large volume and at short notice, there needed to be a regular surplus on the current account section of the balance of payments. Secondly, the international functions of London demanded the maintenance of substantial monetary reserves, supported by a continuous inflow of newly-mined gold and by a large volume of readily realisable claims on other financial centres. Finally, the gold standard system presupposed complete freedom of exchange transactions, whether for current trade or for the transference of capital or liquid funds, and full convertibility of sterling and other major currencies, together

with an unquestioned assumption of fixity of exchange parities.

Turning to internal requirements, if the sequence of events was to be as described, there evidently had to be a high degree of flexibility of costs and prices in industry and trade—a necessity which entailed, among other things, mobility of labour as one important element in costs, particularly for the export trade. Secondly, industry and trade had to be free to manage their raw material and other stocks, their output and their buying and selling operations in fulfilment of their own policies, shaped by their independent judgment of market conditions and prospects. And lastly, there had to be an open market for capital and credit, with free access thereto for both borrowers and lenders according to their individual assessments of the urgency of their needs and the immediate or foreseeable opportunities for the employment of funds. These, then, were the major requirements leaving aside, on the one hand, mechanical details and, on the other, the less tangible qualities such as confidence and goodwill and the state of international relations—of a system in which changes of interest rates played a powerful part in directing the course of affairs.

RELEVANCE TO CURRENT CONDITIONS

One need hardly do more than list the requirements in order to see that they are almost completely lacking today. On international capital account, Britain's external liabilities now exceed her assets and are largely of short-term character, nominally at least; her gold and dollar reserves are below what was officially regarded as the safe working minimum; exchange transactions are closely controlled, and sterling, along with many other currencies, no longer has the quality of unrestrained convertibility. In a sectionalised world, moreover, even were equilibrium firmly established on the total current account, there would remain the cardinal problem of bringing into balance that part of the total account which involves dollar currencies. Internally, there is little flexibility in the economic system, freedom of action in industry and trade is more closely circumscribed than it used to be, and access to sources of capital and credit is under official regulation. This being so, we are at least entitled to question whether an all-round rise in interest rates would serve the purpose of strengthening the country's international position or combating inflationary pressure.

Let us, then, look a little more closely at the probable consequences of such action. First, a rise in rates would not attract international funds to London while exchange control, largely on a bilateral basis, obstructs free outward movement; and overseas borrowing in London is already so closely controlled that deterrents by way of increased charges are not required. Hence the balance of payments could be affected only to the extent that higher interest rates might tend to reduce the demand for imports or to lower costs in industry and trade, and thus to improve Britain's competitive position in export markets. Whether either of these results would follow in fact is by no means certain. To a large extent stocks of primary commodities are still held by Government bodies or are limited by import licensing, while stocks of materials in the hands of industry and trade, though they have grown with the filling of pipe-lines, give little sign of having become generally excessive in relation to the current rate of absorption.

OBJECT OF REGULATED LENDING

Bank lending has been regulated with the specific purpose, among others, of preventing undue accumulation of stocks and the conduct of speculative operations. Hence the charging of higher interest would be unlikely to cause liquidation or bring about a decline in prices, to which in any event there are formidable obstacles outside the monetary field. Further, long-term borrowings, whether by new capital issues or otherwise, are controlled in accordance with national policy and the scale of priorities ruling for the time being, so that direct curtailment is a more effective form of restraint than a rise in interest rates. The rise would have to be very substantial in order to deter even private projects for which official approval had been obtained, and if some such schemes were withdrawn it would be most likely that others would be brought forward to take their place. Whether higher rates would induce a freer flow of investible funds by encouraging saving is also doubtful in the light of experience; certain it is that other factors, including taxation and the increased cost of living, have made heavy inroads into the capacity to save, irrespective of the return that may be offered as the reward to those who nevertheless succeed in accumulating a surplus of receipts over payments.

On the other side of the account, even approved projects, of high priority in the interests of economic recovery, would be made to bear the burden of higher interest charges. The running costs of industry and trade, so far as they depend on bank credit, would be increased, and this at a time when the upward pressure on costs from other directions is already hard to resist, and when margins of profit are narrowing. The financial burden of carrying the public debt, both local and national, would be enlarged, with further weakening of the disinflationary effects of a budget surplus. It is, moreover, characteristic of a rise in interest rates that the instrument is a rough and ready one, operating without any assuredly rational discrimination between one element in demand and another.

To illustrate this comment, a sharp rise in interest rates might well prove in practice to be an even stronger deterrent to some desirable projects for raising the standard of industrial efficiency than to some others which could make a far less convincing claim to priority on the ground of economic necessity. With these disadvantages to be reckoned in the balance, it is difficult to see how any case remains for an all-round raising of interest rates in present conditions. It would seem as though advocacy of this course is based less upon any contribution it would be likely to make to relieving inflationary pressure and strengthening the balance of payments than upon the notion that higher rates are a "natural" accompaniment of stringency and should be enforced as an appropriate symbol thereof—almost as if it is morally wrong for a man to have a cold without a high temperature.

REGULATION OF BANK ADVANCES

My conclusion is that disinflation has to be sought along lines other than those of higher interest rates, and this implies that, so long as we live in a controlled economy, direct action is the more appropriate procedure. Yet we need to be careful in selecting the right kind of direct action and rejecting the wrong. It might perhaps be thought, for example, that a deliberate contraction of bank lending would be a suitable means of enforcing disinflation. True it is that bank advances have been increasing ever since the end of the war, until by November, 1949, they had roughly doubled in amount. This movement, however, has been regulated throughout by reference to the indications of national policy given from time to time by successive Chancellors of the Exchequer, and if in fact the growth has been restrained in relation to business needs, then there can be little room for any "squeezing out" by resort to some new process of contraction.

Certainly, as a first standard of judgment, the present level of advances is well below prewar figures after allowing for changes in the price level. It is significant too that, alongside the growth in the total amount since the end of the war, the number of borrowing customers has risen, to judge from this Bank's records, by more than one-half.

REASONS FOR ENLARGED BORROWING

A short time ago a re-examination was made of the reasons for enlarged borrowing from the banks, and it may be useful to summarise them. First, the switch-over from war- to peace-economy meant that a large volume of production and distribution formerly financed by Government, as by the system of progress payments, had now to be privately financed. Then again, the rehabilitation of many branches of business which had undergone severe contraction called for reinstated credit facilities, as did the gradual reconstitution of stocks of goods required for the smooth operation of industry and trade. The encouragement of developing enterprise and the reconstruction of basic industries, whether directly or through the F.C.I. and the I.C.F.C., entailed heavy bank lending, while large demands have been forthcoming to meet the programme of expansion in agriculture, the imperative needs of export trade and the requirements of the building industry.

Behind all these factors making for enlargement of business demands for credit has been the upward trend of costs of raw materials, labour, social service contributions and other elements in trading and profit and loss accounts. The weight of taxation, too, has encroached upon the power of business undertakings to "plough back" profits in the process of self-financing. Moreover, the difficulty, in recent times, of raising new capital in the market, even for purposes fully approved in the national interest, has stretched the resources of many undertakings, causing them to lean more heavily on the banks for short-term accommodation. As for public authorities, local government bodies have borrowed more from the banks, especially to finance their building and other works pending the receipt of long-term loans, while the absorption of many private undertakings into nationalised corporations has by no means extinguished the need for bank credit in the current operation of the industries concerned.

"PERSONAL AND PROFESSIONAL"

There remains the fact, clearly shown in the quarterly analysis of bank advances, that a large part of the postwar increase has occurred under the heading "personal and professional." Much of the total for the group is in the nature of business advances, required by professional people for carrying on a great variety of necessary services. Some of it, moreover, represents money used in trade by people who keep one account for both business and private purposes. Another part consists of temporary accommodation for the payment of death duties prior to obtaining probate. Then, again, the housing stringency and the spate of personal removals and newly-established households since the war have entailed many arrangements for bank credit to "bridge over" the period between purchase of a house and provision of the long-term funds required, sometimes by the sale of previously-owned property or other assets and sometimes by the raising of a loan from a building society or elsewhere. For the rest, an infinite variety of personal emergencies call for temporary assistance from a bank, among them being the necessity of making financial adjustments in consequence of increased taxation.

As I pointed out a year ago, disinflationary measures, particularly in the form of taxation, have themselves contributed towards the growth of the demand for bank accommodation, well within the limits of policy as laid down by the authorities. Present rates of

taxation have tended also to diminish the flow of private saving, and have thus impeded the absorption of new capital issues, forcing business undertakings back once again upon bank credit to an extent beyond what they or their bankers would wish to regard as a regular arrangement.

With all these considerations in mind, it would seem the reverse of wisdom for the banks to undertake, or to be required to undertake, any deliberate and general contraction of the credit facilities extended in accordance with national policy as officially defined. Such action could not fail to impede the flow of production and distribution, into the export as well as the home markets; and many undertakings would be pressed inescapably into difficulties the issue of which must be restricted operation, unemployment and the deferment of many projects contributing to industrial efficiency and enterprise in overseas markets. Incidentally, curtailment of bank credit might well force business undertakings to sell their remaining gilt-edged securities, thereby contributing to a still further lowering of values. Thus, while in present circumstances a levering-up of interest rates would be likely to prove ineffective in achieving the ultimate aim of economic stability, direct and forcible credit contraction would deal only with symptoms, and might well have grave results exactly opposite to those desired.

CARDINAL QUESTION OF POLICY

Where, then, are we to seek the remedy for our over-extended condition? This condition has been persistent, varying only in degree, ever since the end of the war. Moreover, devaluation, considered by itself, was bound to intensify it by raising the sterling cost of a proportion of the country's necessary imports and calling for a larger physical volume of exports to match a given quantity of imports. The diversion of a larger share of the national output into export markets must for the time being restrict the volume of supplies in the home market, and, pending the fructification of measures aimed at higher productivity, equilibrium can be restored only by curtailment of the total demand expressing itself through public and private channels.

What the circumstances require is reduced consumption or the selective curtailment of capital construction, or both, that is to say more saving and less demand for capital funds; and I have tried to show that higher interest rates would be of very doubtful efficacy in either deterring capital projects or encouraging increased saving, while severe and general restriction of bank credit would almost certainly obstruct the further expansion of the output of industry.

GOVERNMENT MEASURES

Whether the measures announced by the Government for curtailing demand will prove sufficient to restore equilibrium is a matter on which, as I have said, statisticians differ. Of one thing we can be sure: that the final answer to the question will be determined very largely by what happens along the line of increasing productivity. If the contribution from this side of the problem could be made quickly and on a powerful scale, unwelcome forced restrictions on the other side might well be avoidable. Ever since 1945 national policy has in effect been counting upon the postwar expansion of productivity to make such headway as to outstrip an already expanded, though regulated, volume of demand; but from time to time regulation has had to be applied to the extent of restriction, falling almost invariably on demand for capital purposes. Throughout, the hope seems to have been that action by way of restriction of total demand might be minimised in the expectation of such progressive improvement of output as would establish an unquestioned balance at a level not far, if at all, below current standards of expenditure. So far that hope has been frustrated, and disappointment may be repeated unless the process of enlarging output can be speeded up.

From this it follows that the cardinal question of national economic policy remains today what it has been all through the postwar period: it is the question whether drastic action to curtail current domestic demands upon our productive resources can be any longer deferred, or whether the best means of avoiding that curtailment is not by giving industry greater latitude, in more flexible conditions than now obtain, to take such measures as are required to raise the general level of efficiency in production and distribution, and thus to enlarge the national output at a more rapid rate than has been attainable hitherto.

THE BANKING YEAR

It has been noticeable during the past year that the difficult conditions under which industry and trade have been operating have been reflected in reduced profits for many undertakings. For reasons partly general and party special to banking, our own net profit for the past year is slightly lower than for 1948, notwithstanding a further expansion in turnover and in resources averaged over the year. Higher trading profits were offset by increased costs, among which the largest in our business is that for staff, both active and retired. In 1950, as matters stand, we shall have to provide for a full year of the higher rate of profits tax, which applied for only a quarter of 1949. Out of the net profits we make two allocations. The still rising cost of any form of work on premises, and the continued delay in carrying out plans, make it desirable to set aside a further sum on this account. In addition, we make another allocation to our reserve for future contingencies. After paying the same rate of dividend as for many years past, a small increase is shown in the balance of profit and loss account carried forward.

You will find attached to the annual report some indications, given in a new form, of the continuing growth of the bank's business. These, I believe, will be of interest as a supplement to the usual "statutory" figures as set out in the balance sheet.

Deposits at the end of 1949 were just about the same in amount as a year earlier, while advances, though they still represent a far smaller proportion of our total resources than was usual before the war, have again risen somewhat. It follows that our holdings of Government securities of all kinds, including Treasury bills and Treasury deposit receipts, have declined slightly over the year, both absolutely and proportionately. Three years ago it was noted that about thirteen shillings in every pound of deposits entrusted to us was covered directly by Government obligations; today the corresponding figure is well under eleven shillings and sixpence. The change, however, is due less to the working out of a disinflationary policy in public finance—a policy which during the present financial year has been largely offset by the drain on small savings—than to the continued expansion of industrial and other demands on the banks for accommodation, springing from causes indicated earlier in this statement.

THE FLOATING DEBT

Within the total of Government obligations a pronounced change has occurred in consequence of the Treasury's policy in altering the composition of the floating debt. During the past half-year far less reliance has come to be placed upon the raising of short-term money through the disposal of Treasury deposit receipts among the banks, and far more upon the issue of Treasury bills through the weekly market tender. Treasury deposit receipts were introduced less than ten years ago, as a wartime device, and it is perhaps natural, therefore, that efforts should be made to curtail the resort to this method of meeting Exchequer requirements. It may be, moreover, that the authorities prefer the wider currency of the Treasury bill, for which the range of demand is extensive as compared with the limited scope—in effect the clearing banks, the Scottish banks and a very few others—for the placing of Treasury deposit receipts. For our part, although the return on bills is slightly less than on deposit receipts, we welcome the higher standard of liquidity implied in our enlarged holding of the most flexible of borrowing instruments.

Despite the substantial fall in values of investments, they continue to be shown, in accordance with our regular practice, at or below market prices on the date of the balance sheet, depreciation having been covered from our internal reserves.

The re-expansion of our branch system, mentioned a year ago, continues, and the number of our banking offices is now almost back to the prewar figure. The openings during 1949, however, were indicative of the broadening field of banking service, for among them were two more offices at airports and one on the new Cunarder, *Caronia*.

AN EVENTFUL PERIOD

The past year has been an eventful one in external monetary relations. In particular, the disturbances attendant upon devaluation gave rise to a multiplicity of problems in the overseas business of customers, which engaged all the resources of knowledge and experience possessed by officers of the Bank directly concerned in these affairs. In no preceding year were so many demands made upon them for information and advice, especially on trade possibilities and exchange control. We have, moreover, been anxious to put the full strength of the Bank, arising from its unsurpassed contacts abroad, behind the campaign to enlarge dollar exports from the sterling area, and to that end have collaborated closely with organisations, particularly the Dollar Exports Board, working with that major object in view. Experience has shown again how large a contribution to these ends can be made by personal contact and consultation, not only abroad, but also at home by the availability of representatives of our overseas branch at important trade shows and of officials of that branch to visit customers all over the country for direct discussion of their particular problems.

These "service" activities are, I am sure, of great importance in re-establishing the international position of our country; they are no less important to the Bank in the contribution they make towards enhancing its goodwill. It is significant, for instance, that despite the disturbed conditions of last year, especially in the months preceding devaluation, no diminution was recorded in our day-to-day foreign business. Indeed, in many directions it continued to expand. There were substantial increases, for instance, in the number as well as the amount of documentary credits opened, in the number of foreign bills collected, chiefly in respect of exports from this country, and of inland bills, arising mostly from imports. Foreign currency sales and purchases also increased, as did the use of travellers' cheques.

LONDON'S POSITION

The nature and growth of all this business indicate that London still holds its postwar position as a centre of expanding world trade, and thus makes a contribution to the country's "invisible exports." We should like to see that contribution greatly enlarged, but the fulfilment of this hope would seem

to be dependent upon the removal of obstacles to the free movement of goods and services and of payments therefor, the re-establishment of Great Britain as the focus of the world's markets for the great staple commodities, and the entrenchment of a sure confidence overseas in the future of the pound sterling. It is good to see some movement in the first two of these directions, as, for example, through concerted arrangements with O.E.E.C. countries and the partial reopening of the metal market. As for the third, it is a pity that so much attention should be given to quotations abroad for particular kinds of sterling which suffer from limitations upon their use—quotations which have little or no relation to the true comparative purchasing power of the representative pound sterling as used in the overwhelming bulk of foreign exchange transactions.

Behind all these sources of difficulty, however, lies the ever present problem of regaining equilibrium between the dollar countries and the rest of the world. If the "devaluation crisis" did nothing else, it did at least serve to bring the governments most closely concerned into more complete agreement on the nature of their respective responsibilities and, it is to be hoped, on the joint and several action to be taken to establish balanced relations on a new basis after the upheavals due to the war.

TESTING TIME

Difficulties in the conduct of our business on behalf of customers, with their infinite variety of needs, have by no means been confined to external affairs. These are indeed testing times for management and staff. I doubt if I can say more than I have said in past years about the quality of our personnel; certainly, nothing has happened during the past year that should cause me to say less. It is perhaps justifiable to claim that in no branch of business is success more dependent than in banking upon the direct relations established between people on opposite sides of the counter or the manager's desk. For these relations to be soundly based, the representative of the Bank needs to be much more than technically efficient and knowledgeable, important though that requirement is; he needs also to have those qualities of personality and character that win and retain the confidence of the customer. Thanks in part to careful selection and subsequent training, thanks also to the example of the senior men, I believe that on these tests we have a staff that is second to none. It is very largely to that fact that we owe the high standing of our Bank, not only in our own country, but also throughout the world.

On this occasion I have to make reference to a tragic occurrence which in itself illustrated the high sense of responsibility that prevails in the banking service. It will be remembered that in September last Mr A. G. S. Steele, the manager of our branch at Alston in Cumberland, lost his life in resisting an armed attack in his own office. Unfortunately, even the most careful precautionary arrangements cannot be wholly proof against the risk of such assaults, which nevertheless are happily rare; but, as would be expected, we have again reviewed our whole system to see if by any means we can reduce the danger still further.

AFFILIATIONS

An historic event has taken place, during the past year, in the life of our group of banks. More than thirty years have passed since the late Sir Edward Holden found a means by which banks operating in particular parts of the Kingdom, under distinct conditions of business and law, could be brought into mutually beneficial association without prejudice to their separate existence. In pursuing this process, which through the years has demonstrated its value, three banks became affiliated to the Midland: one of them, the Belfast Banking Company, operates wholly in Northern Ireland, and the other two almost wholly in Scotland. The capital of the Clydesdale Bank was acquired in 1920 and that of the North of Scotland Bank four years later, and even at that early date it was envisaged that a time might come when it would seem to be advantageous to combine these two into a single institution. Amalgamation was especially fitting in that the two banks were largely complementary in respect of both geography and type of business. They now operate as one.

The Clydesdale and North of Scotland Bank is comprehensive in its spread of branches all over Scotland, supplemented by representation in Cumberland and an important business in London. It thus gains in strength and stability, and its total assets exceed £180 million. It should gain also in economy of operation, and should be in a better position, through the pooling of manpower, to perform for customers all those complex, specialised services—in connection with overseas trade, trusteeship, business information and so forth—which customers, both private and corporate, have a right to expect of their banks in these harassing times. Appropriate steps have been taken to avoid any disturbance of relations between individual customers and the various branches of the two banks that might otherwise have resulted from the fusion.

I need hardly say that we, as sole shareholders of the two banks, should certainly not have consented to the amalgamation had we not been fully convinced of the benefits that would accrue to customers. Both the Treasury and the Court of Session had also to be satisfied on the proposals. We are very glad to know, too, that the arrangement was cordially welcomed by the staffs of the two banks, who we are sure will work as faithfully and progressively as ever under the combined administration. The unified bank will continue to operate with full autonomy in the day-to-day management of its business.

EXECUTOR AND TRUSTEE COMPANY

A few comments may be timely on the affairs of our other main subsidiary, the Midland Bank Executor and Trustee Company. The business of the company, which has long ranked as one of the largest among corporate trustees, grows steadily, and the past year has seen some further extension of its direct representation through branches, now to be found in twenty-four important centres outside London. Conditions in investment markets in recent times have emphasised the advantages of entrusting the administration of estates and other trust funds to a corporate trustee whose attention to their management suffers none of the disturbances inevitable in the life of an individual, and whose specialised task it is to take advantage of all the knowledge and judgment of experts in the handling of investment problems.

The task of watching over the financial interests of beneficiaries, never easy, has been made all the more difficult, over the years, by the shrinkage of the range of securities ranking as full trustee investments. Failing some extension of the trustee list, for which there is in my judgment a *prima facie* case for consideration, the alternative is found in the specific conferment of wider powers on trustees in individual cases, and this cannot be contemplated unless complete confidence is felt in the maintenance by them of the highest standard of professional service. I am sure that this requirement is satisfied, along with the essential quality of continuity, by our company, and that the sustained growth of its business testifies to widening recognition of this fact.

NATIONAL DISCOUNT

EXPANSION OF ACTIVITIES

The Annual General Meeting of the National Discount Company Limited will be held on 8th February in London.

The following is an extract from the circulated Statement by the Chairman, Sir Charles D. Seligman:—

The chief features in the Discount Market during 1949 have been further increases in the rates for discounting Bank and Commercial Acceptances, and the Treasury's policy of increasing the Treasury Bill issue against a reduction of Treasury Deposit Receipts.

It is gratifying to record a further expansion of 12 per cent. over the 1948 figure in the amount of the Company's purchases of bank and commercial acceptances during the year, partly due to the freeing of certain commodities from Government control.

The fluctuations in the prices of short-dated Bonds have been wider than during 1948, and the margin of profit from our activities in these securities has been somewhat larger.

The Company's activities have continued to expand, and the Balance Sheet total now amounts to £172 million. This is an increase of £10 million over the 1948 figure, which was in itself a record at the time.

Deposits have increased by £10 million to £166 million. This is reflected by an increase of £2 million in Bills Discounted, and by £8 million in British Government and Corporation Securities. The Liability at the end of the year for Bills Re-discounted is unchanged at £10 million.

There remains a profit of £286,465. We have transferred the sum of £176,000 to our Reserve, thereby making the total of our capital and published reserves the round figure of £5,000,000.

COTTON PLANTATIONS

RAILWAY PLANS FOR SWAZILAND

The annual general meeting of Cotton Plantations Limited will be held on February 15th in London. The following is an extract from the statement by the chairman, Mr P. D. Krolik.

Of crops grown to cover maintenance expense, tobacco produced £2,160, citrus and other crops £300. Profits from cattle are unlikely to be again available for some time; no further cases of tsetse have been reported, and vigorous steps have been taken by the Swaziland Administration; the herd now numbering 200 is increasing slowly.

Pigs and Trees.—A small experiment with one boar and two sows was initiated at Nsoko; at the moment 75 pigs of varying ages are reported healthy and thriving. We have also planted gums and pines experimentally on the drier lands south of the Ingwavuma River.

Railway Construction.—I am glad to note awakening interest in property in Swaziland from the Union; reiterated demands by Union spokesmen of all parties for incorporation of High Commission Territories within the Union, S.A. Railway construction programme within and around Swaziland, and plans by the Colonial Development Corporation have drawn attention to one of the few areas in South Africa where, to quote the Liversage report, water is running to waste, and large-scale irrigation schemes recommended therein could produce outstanding results.

Our freehold estates of 15,000 acres, much of them cleared of bush, lie either side of the Ingwavuma River at Nsoko, 20 miles from Gollel, railhead for Durban, by good road; this line is due to be linked with the line to Johannesburg at Piet Retief.

Drought early in 1949 affected crops harvested, but our manager reports the substantial total of 29.90 in. rain for the whole year; tobacco and cotton look promising for 1950.

WILLIAMS DEACON'S BANK LIMITED

SATISFACTORY RESULTS—INCREASED NET PROFIT

DEVALUATION AND THE BALANCE OF TRADE

SUGGESTED MEASURES TO MEET POSITION

SIR WALROND SINCLAIR'S REVIEW

The annual general meeting of Williams Deacon's Bank Limited will be held in Manchester on Thursday, February 9, 1950.

The following is the statement by the chairman, Sir Walrond A. F. Sinclair, K.B.E., on the report and accounts for the year ended December 31, 1949.

The proceedings at the annual general meeting will be restricted to the transaction of formal business and I propose to continue the practice of my predecessor in recent years in issuing a brief statement on the bank's affairs in advance of the meeting.

I must begin my remarks by paying a very warm tribute to Mr G. Powys Dewhurst, who indicated his desire to be relieved of office at the end of June last after serving the bank as a director for no less than 40 years, during 31 of which he was chairman. There must be few who can claim such a record, and the directors acceded to Mr Dewhurst's request with the very deepest regret. His very wide experience of affairs in general and of the cotton trade in particular have, throughout his period of office, been placed unstintingly at the disposal of the board and I am sure that you would wish me in your name to convey to him our cordial good wishes and most grateful thanks for the inestimable services which he has given to the bank, over whose proceedings he has presided with such marked distinction for so long.

During the year we suffered a further great loss by the death of Sir Douglas Garrett, a former president of the Law Society, who had been a director of the bank for the past six years. His great commercial knowledge and his wise counsel were an unfailing support to his colleagues during the whole of that period and his outstanding personal qualities endeared him to us all. We shall long mourn his loss.

We have appointed to the board, Messrs. E. A. Carpenter, O.B.E., J.P., J. G. Beevor, O.B.E., J.P., and K. G. Holden, and to all these gentlemen I offer a cordial welcome to the board table.

THE ACCOUNTS

I now turn to the accounts, from which you will see that deposits at £118,906,557 are slightly down on last year's record figure, which, as my predecessor pointed out at the time, had then been temporarily increased by special transactions.

On the assets side, the liquid items, namely cash, balances with other banks, money at call, discounts, and Treasury deposit receipts, amount in total to £59,455,367, which exceeds 50 per cent of our deposits. Official policy during the year has been to reduce the total of Treasury deposit receipts and to increase the issue of Treasury bills in their place. As a result this bank's holding of Treasury deposit receipts, which last year stood at £25,500,000 is now reduced to £16,500,000, and our discounts, largely, of course, Treasury bills, have been increased by some £5,000,000. Our Government securities show a slight reduction at £34,008,644.

Advances, at £24,833,496, show an increase of £3,979,145, of which one of the main causes is the necessity to carry increased stocks now that the sellers' market in various commodities has come to an end. As is well known, the banks in accordance with Treasury policy restrict their credit facilities to approved purposes, so that requests for advances which might have an inflationary tendency have to be refused.

NET PROFIT AND DIVIDEND

Our net profit, after making the usual provisions (which include contributions to staff pension and widows' and orphans' funds and appropriations to contingencies account out of which provision for diminution in the value of assets has been made), is £257,836, that is, an increase of £5,525 on the year. This, with the balance of £116,755 brought forward, gives us a total of £374,591 to be dealt with. After transferring £100,000 to pension fund (in addition to the usual allocation referred to above) we propose to pay dividends at the rate of 12½ per cent. on the "A" shares and on the "B" shares and to carry forward to next year £145,685. I confidently feel that you will regard these results as satisfactory.

The opening during the year of a branch at Ribbleton, near Preston, increases the total of our offices now operating to 207.

NO ALTERNATIVE TO DEVALUATION

The hopes of the opening months of 1949 are now clearly seen in retrospect to have been doomed to disappointment. It will be remembered as a year when, by spring, sterling was under pressure, so that by midsummer it was becoming apparent that the maintenance of the old 4.03 dollar-sterling rate was in some jeopardy. This was particularly disappointing in view of the fact that the preceding year 1948 unquestionably, I think, closed on a note of general confidence. Nevertheless, it had become clear by July that a revaluation of sterling was one of the courses which the Government might feel impelled to take. The obvious effect of this on the foreign debtor and on the foreign buyer needs no elaboration. As a consequence, our reserves in gold and dollars began to approach the danger point. I think it is true to say that the process was accentuated and underlined by the magnitude of some of our releases to sterling creditors in so far as this meant the despatch of unrequited exports which might have been used either to earn dollars or to obviate the need to use them.

CONTROL OF INFLATIONARY PRESSURE

In these circumstances it must be conceded that the Government had no alternative but to devalue the pound or to leave it to find its own level, but in fixing the new parity at 2.80 they took a bold decision, though there has been considerable controversy—into which I do not propose to enter—as to whether they might not have shown a like boldness in initiating internal measures necessary to buttress and support the new position. Remembering, however, that American aid will end in 1952, it is an imperative necessity that the inflationary pressure which we have experienced for so long now should be brought under control.

It will be appreciated that by itself devaluation does not improve the situation and indeed, inasmuch as food and raw materials obtainable only from dollar areas will cost more in sterling, means that we must export more—that is work harder—to pay for them. What devaluation does, however, is to create a better opportunity than we had before to right our position by making it easier to export goods because our prices will now be more competitive with those of other countries which have not devalued. Devaluation, therefore, is only a means of bringing our prices more into line with world prices, but having got down our prices, we must by every practicable measure ensure that they are kept down.

It must be borne in mind, too, that no less than 19 other foreign countries have followed our lead, most of them to a similar extent, and others like Belgium, France and Italy to a lesser extent. Our competitive position compared with that of those who have devalued to the same extent as we have done is naturally unchanged. Devaluation means a worsening in our terms of trade, so that it will be more difficult to maintain the same standard of life. All classes in the community should realise this, and the Trades Union Congress are—if I may be allowed to say so—to be commended for recommending their members to accept the present level of wages so long as the rise in living costs remain modest.

THE MAIN DIFFICULTY

Our main difficulty is to balance our trade with the hard currency areas—a difficulty which applies both to the sterling area and to the whole of western Europe which, pre-war, used to rely on the dollar surplus of the rest of the sterling area to meet its own dollar deficiency, this country acting as the intermediary by taking Europe's exports whilst itself having an export surplus with the rest of the Commonwealth countries.

It is too early yet to comment as to the effects of devaluation. The figures so far available reflect to a large extent the disturbances due to the realised expectation of that event, but we may draw some degree of comfort from the fact that the drain on reserves has, for the present, been reversed, even if a large part of the improvement is due to causes of a non-recurring nature.

In our efforts to close the dollar gap it is to be hoped that every advantage will be taken of greater American willingness at the present time to accept imports. So far, since the war, the increase in imports into the United States compares unfavourably with the increase in American production. Although industrial production in that country is, in volume, not far short of double that of the average of the years 1935-39, their imports have only increased by some 8 per cent., even though during the period the population of the United States has increased by some 10 per cent.

The change in the relative position of this country and of all the countries of western Europe as producers of manufactured goods has been brought about by two main factors. First, the mammoth increase in production in the north American continent, which in the last 25 years has gathered increasing momentum even after taking into account its extraordinary increases in the closing decades of the nineteenth century. This meant such a concentration of productive power in those areas that the countries of Europe, impoverished and relatively ill-equipped owing

to the effects of the war, would not have been able to pay for their imports from the dollar area if it had not been for American assistance of the type of Marshall aid, etc.

WORLD TRADE

The second main factor is the failure of the volume of world trade in manufactured goods to continue to increase after the first world war, apart from an interlude in the late 1920s. This is no doubt due to increasing industrialisation in all countries, particularly the primary producing countries, but its effects are very serious for a country such as ours, compelled to devote so much of its output to export and so greatly interested in seeing an extension of world trade.

It will be seen from this that our present situation derives not so much from the effects of the two wars as from fundamental causes which would have had their effect in due course. What the wars have done by dissipating our capital reserves and our overseas investments is to precipitate a situation which would probably have arisen in any event.

MEETING THE SITUATION

Although encouraging factors can be described—I shall refer to some below—it would be idle to deny that our national situation and that of western Europe is extremely grave. The measures taken to meet the situation should be:

(*a*) A drastic curtailment of capital expenditure and construction in this country, however worth while in easier times that expenditure might have been.

(*b*) All possible economy in Government administration (both of manpower as well as financial). Surely in these critical times a budget total of over £3,700 millions has room for some contraction.

(*c*) A pause in agreements which involve unrequited exports from this country. This is of major importance. If we supply goods in consideration of past (war) debts, although it is true that they help to maintain full employment, the fact that we receive on current account nothing in return must inevitably seriously retard the adjustments here which our long-term interests dictate.

(*d*) Finally, the provision of reasonable incentives.

There are a considerable number of people in this country, both workers and employers, who are at this moment responding splendidly to the call for increased output and for the expenditure of effort in selling to difficult hard currency markets at lower prices than could be obtained elsewhere. They are, of course, encouraged by numberless exhortations, but the time has come when we may reflect whether exhortation is enough, indeed whether it is good sense. There are many individual instances of incentive schemes which are working very successfully and they should be the rule rather than the exception. Those who work the harder should get some material reward for their extra efforts.

Perhaps more important still in this connection are adjustments in the taxation structure. Owing to the rigidities in our economy, modifications in taxation to lighten the load on those who are best serving the country, as well as themselves, may present some difficulties, but I have no doubt that these could be overcome. In an imperfect world, rough justice which permits the country to look its neighbours in the face again is preferable to meticulous equality achieved at the cost of dependence on others.

STEADY INTERNAL PROGRESS

Apart from the dollar problem, 1949 has been a year of steady progress inside this country. Full employment continues, though the difficulty, amounting to virtual impossibility, of getting workers into the industries where they are most needed has not been solved. Industrial productivity continues to rise—an indication of what can be done—and this healthy progress would, I am sure, be accentuated by alterations in the taxation structure referred to. Though the figures have been distorted by the expectation and outcome of devaluation, there was plenty of room for satisfaction at the end of the year in the level of exports, though not yet with the proportion of exports going to hard currency countries. Imports also, unfortunately, have been at a very high level during the year, considerably above that predicted in the economic survey, with the adverse results on the gold and dollar reserve prior to the time of devaluation. Some of the loss of reserves was inevitably a question of confidence, but since devaluation the beneficial (that is beneficial on the balance of trade) effects of the dollar import cuts in this country and the rest of the sterling area have begun to make themselves felt.

AGRICULTURE

In devoting a few words now to the principal industries in the areas served by the bank, I turn first to agriculture where, despite increased costs, the picture is an entirely satisfactory one: increased productivity coupled with the extended use of machinery. The added costs have been reflected to some extent in the increased borrowings from the banks by agriculturists. Even so, in this connection, it is of some value to consider the course in recent years of American agriculture. A large proportion of the dollar loan, Marshall and other forms of American aid both during and after the war has been inevitably used to buy food in the United States. Looking at the indices of American production, it is remarkable not only how great has been the increase in agricultural output since the immediately pre-war years—about 40 per cent.—but more important still, how the output per worker has actually increased at a greater rate than the increase of production. Comparable figures for this country are difficult to obtain but, though there has been a substantial increase here, the increase of output per head must be much less than the American figure.

It really looks as if the supply of food to quite a large part of Europe's population in the years since the war has come out of the increased productivity of the American agricultural worker, aided, of course, by ever-increasing mechanisation.

There is a lesson in this for us. Although, of course, British agriculture is already extraordinarily highly mechanised, there is no question that the introduction of more agricultural machinery offers a field in which remarkable results can be obtained. At this juncture in our national fortunes no more fruitful avenue opens.

STEEL NATIONALISATION: GRAVE APPREHENSIONS

Reports from Sheffield and our Yorkshire branches fully bear out the magnificent steel production figures which have been published in the press. Steel production continues to break new records, and it does so not by a sudden spurt but by a sustained effort. Month by month in 1949 production has exceeded that for 1948, itself a record, and the upper limit of the target set in the economic survey for 1949 at 15,500,000 tons has been reached. This is a notable achievement—even the economic survey only expected the figure to be reached under the most favourable circumstances—and its beneficial effects on other industries such as motor vehicles, which play such a prominent part in the export drive, need not be stressed.

Pig-iron production, too, will be well up on last year's figure, and is likely to exceed 9,400,000 tons.

The question of the nationalisation of the industry has now been deferred until the electorate has had an opportunity of passing judgment upon it. Some idea of its intended scope if it came into effect has recently been indicated and I feel I should not neglect this opportunity of voicing my grave apprehensions as to the effect on the national economy of the nationalisation of so complex an industry and, moreover, on industry on which so many trades depend for their raw materials.

COTTON INDUSTRY

The cotton industry remains prosperous and, although in a few markets there are signs that the sellers' market has gone, that is not yet by any means generally the case, particularly since devaluation. The industry itself derives its raw material to a large extent from dollar sources, but the major part of its production goes to the sterling area and other soft currency countries. Devaluation has brought down prices, but the need to export to hard currency countries is of paramount importance and it is gratifying to notice that some progress has been made in the Canadian market. The figures for weekly yarn production in recent weeks reached new high records, though the economic survey target was not actually attained. It is particularly encouraging, however, to see that the new wages agreement under the Moelwyn Hughes recommendations has come into force. The re-equipment scheme is making only slight headway, due possibly to the high cost of new machinery and to the fact that more of the industry's capital is needed to finance the carrying of stocks.

Generally speaking, as far as the bank is concerned, I have the pleasure to report a most satisfactory expansion in our activities. In particular, the foreign departments in Manchester and London and also our trustee departments are rendering an ever-expanding service to our friends and customers.

And, in conclusion, I should be failing in my duty if I omitted, on behalf of all my colleagues and of myself, to express to Mr King, our general manager, to the assistant general manager, and to every member of the staff throughout the service, our sincere thanks for the efforts they have made and our warm appreciation of the keenness and enthusiasm with which the affairs of the bank have been carried on.

THE BANK OF AUSTRALASIA

GENERAL EXPANSION OF BUSINESS

The 116th annual general meeting of the Bank of Australasia was held on January 26 in London.

The Hon. Geoffrey C. Gibbs, C.M.G., the chairman, in the course of his speech, said:

Our balance sheet total has now reached £137 million, a 25 per cent. increase on last year's record figures. It will be noticed that our cash balances have increased by over £2,000,000 to £13,861,068, while our advances to customers and other accounts show a further increase to almost £60 million, an increase of more than £9,000,000 compared with last year.

Increases of £1,356,000 in bills receivable and remittances in transit to £9,086,392 and of £803,000 in liability of customers for acceptances to £1,283,617 are evidence of increased business.

Current, deposit and other accounts represent a total of £110,129,736, which is an increase of over £17 million. Much of this increase is in current accounts.

The expansion in our business has been accompanied by a heavy increase in the expenses of management, but, in spite of this, the net profit of £278,290 is £7,257 more than last year. After appropriation for payment of dividends totalling 9 per cent. for the year there remains an amount of £384,221 to be carried forward, an increase of £55,540.

FIGHT AGAINST NATIONALISATION

During the year under review, we have won our long, hard and expensive battle against the Federal Government's proposal to nationalise the trading banks. It has been a stern struggle. As you all know, the High Court of Australia decided in our favour and the Judicial Committee of the Privy Council decided against the Commonwealth Government on the appeal which was made to them.

It is not for the chairman of a bank to express any political views, but this time our very existence was threatened and I feel sure that all our shareholders, of whatever political creed, will rejoice that we have a new lease of life and can again concentrate on continuing to give that service to Australia which has at all times been our aim. The political swing in Australia is all the more remarkable as Australia has been enjoying a time of unequalled prosperity.

POSITION REGARDING PROJECTED MERGER

You will remember that on February 21, 1947, an announcement was made in the Press that your directors and the directors of the Union Bank of Australia Limited, had agreed to recommend to their respective shareholders that the two banks should be merged into one institution on a share-for-share basis.

Shareholders will recall that one of the main objects of the proposed merger was, and remains, the formation of a still more powerful bank with important international connections, which would be able to meet all future requirements of the increasing expansion of industry in Australia and New Zealand.

In my last statement I told you that it was our intention to proceed with the negotiations for the merger as soon as circumstances would permit. The directors of the two banks remain convinced of the desirability of a merger, and indeed in some respects the advantages appear greater than they did in 1947, but they are unable at present to put forward a firm proposal as to when and by what means a merger could be achieved.

There are new Governments in Australia and in New Zealand who must be consulted, and we are faced with complex problems in the field of Company Law, notably as a result of the United Kingdom Companies Act, of 1948, and by the fact that our bank operates under a Royal Charter. Moreover, there are taxation and other considerations which still require lengthy study by our officials, and by our legal and accountancy advisers in this country, in Australia and in New Zealand. In these circumstances the merger proposals may well be on different lines from those originally suggested.

Therefore, all I can tell you today is that your directors still intend to place before you proposals for a merger with the Union Bank of Australia Limited, and that whatever scheme is placed before you will, I hope, be found to be fair and acceptable to the shareholders of both banks. I would repeat that the directors of both banks are determined that the interests of the staffs of both banks should be fully protected, and that they should have equal opportunities in the new combined organisation.

The report was adopted.

WESTMINSTER BANK LIMITED

DEVALUATION A LEAP IN THE DARK

THE INFLATION DANGER

THE HON. RUPERT BECKETT'S VIEWS

The statement by the Hon. Rupert E. Beckett, chairman of Westminster Bank Limited, has been circulated to shareholders with the report and accounts for the year ended December 31, 1949, which will be presented at the annual general meeting at the head office on Wednesday, February 15th. The following is a summary of the statement:—

During the past year there have been several new appointments amongst the administrative officers of the bank. Mr W. T. Ford, who was our chief general manager from July, 1947, retired on December 31st last. Over the long period of forty-six years in the bank he never spared himself in the performance of his various duties, and we are grateful to him for his eminent service. He is succeeded by Mr A. D. Chesterfield. I have to announce the retirement during the past year of two of our joint general managers, Mr J. Stewart and Mr H. Cremer. The duties attaching to their positions have now been somewhat augmented, and the number of joint general managers has been brought up to four by the appointment of Mr H. W. Norris, Mr F. W. Hardstone, Mr C. W. Deaves, and Mr L. E. Eldridge.

THE ACCOUNTS

Our current, deposit, and other accounts show a decrease, as compared with 1948, of £30 million, arising in the main from the withdrawal, as expected, of a few lodgments which had been built up for special use in 1949. Naturally we have had to face a severe fall in the prices of gilt-edged securities. I am pleased to be able to assure you that our internal funds have been adequate to meet the current depreciation of our gilt-edged investments. Obviously these funds are not inexhaustible, and it is our wish to do all we can to rebuild them after the heavy charge which the year 1949 has inflicted upon them. It seems to me that the political accusation that the City deliberately "talks down" British credit is absolutely fatuous, considering the adverse effects that such fall in credit has on the investment position of the banks.

The year's working has resulted in a profit of £1,460,557, which is an increase on last year of some £29,000, and will be disposed of as set out in the directors' report. We have thought it wise to enlarge our inner funds by a transfer of £600,000 as an additional appropriation to reserves for contingencies.

Our affiliated institution in Ireland, the Ulster Bank, continues to make consistent progress. The profits show an increase on the previous year. Our Continental subsidiary, Westminster Foreign Bank, had on the whole a satisfactory year.

DISAPPOINTING SETBACKS

The severe setbacks the country experienced in 1949 in the economic field were the more disappointing because of the moderate optimism that seemed to be justified at the beginning of the year. At the turn of the year the gold and dollar deficit had been brought within the amount of American aid currently received; and this was encouraging as appearing to ensure that at least we should not have to draw further on our reserves.

It was not until the second quarter of the year that there were unmistakable signs of impending difficulties. At the end of June the dollar reserve was found to have fallen sharply. In the second quarter United Kingdom exports had fallen and imports had risen, particularly in trade with the Western Hemisphere. No less important for the state of the reserve, the same deterioration had occurred in the sterling area generally. By September, when the loss of reserves became intolerable, it was too late for remedial action, and devaluation of the pound became inevitable as the only means of safeguarding what reserves remained.

Devaluation was a leap in the dark which the circumstances we had allowed to develop forced us to take. It raises the cost of living by increasing the prices of many essential imports. At the same time it permits reductions in the selling prices of our exports in terms of dollars; but we cannot say yet whether total dollar receipts will be greater than before.

INFLATION DANGER

The troubles which could be cured by our own policies, and which must receive urgent attention if we are to avoid further calamities, can be reduced ultimately to two; inflation and unrequited exports.

For my present purpose, it is sufficient to use the term "inflation" as meaning the overstraining of resources by the release of too much purchasing power. It is clear that the only practicable means of curtailing purchasing power is a cut in Government expenditure. The measures adopted by the Government may be expected to go some way towards checking inflation, but unless home demand is reduced by means of much larger economies the inducement to divert goods to hard-currency markets will be inadequate.

If manufacturers can find ready markets at home—and in the Sterling Area—there will be no pressure upon them to turn to the more difficult and hazardous markets of the Western Hemisphere. In any case there is a natural desire to preserve existing, and perhaps, long familiar, channels of trade. But now that a change is necessary, financial pressure is to be preferred to direct control, which is not likely to prove effective in practice.

To meet the need for more dollar exports by diverting goods from other markets may be the only possible course for the present, but the problem can be permanently solved only by an increase in production. The increases which have already occurred, encouraging though they are, are still not enough to meet the needs of the situation.

UNREQUITED EXPORTS

The high level of demand for British goods in the Sterling Area is bound up with the problem of unrequited exports. Substantial quantities of our exports are bringing in no imports in return but constitute exports of new capital and the repayment of past indebtedness. The debts we are repaying are the sterling balances accumulated by other countries during the war. We appreciate the need for capital equipment of the creditor countries, and the difficulties with which they are at present contending. But there is clearly a limit to what we can afford to pay out with one hand while we are obliged to take gratuitous aid or loans with the other.

The state of the gold and dollar reserve at the end of 1949 was more satisfactory than had been expected, even after allowing for temporary influences. A good deal of the

ncrease in reserves was fairly attributable o a permanent reduction in our trading leficit with the dollar area. We welcome he increase in our reserves; but we should oe wrong to think that it does more than give a foothold while we gather strength for he rest of the climb.

INTERNAL ORGANISATION

The question arises whether the internal organisation of our economy is likely to prove equal to the demands now being made upon it. In some ways it is developing in a manner that threatens to render it singularly ill-fitted for the task. Never has the desire for leisure been stronger than today, when the circumstances clearly call for harder work by all. But there are exceptions. There have been many welcome reports during the past year of special efforts by groups of workers—often within a single firm—which show clearly what can be done when the right spirit prevails.

On the other hand there have been numerous unofficial strikes. Part of the explanation of unofficial strikes is sheer irresponsibility in the minority, played upon, no doubt, by deliberate mischief-making. If the Unions are unable or unwilling to discipline their members, and the normal reaction of workers to the slightest feeling of grievance is to threaten the public with discomfort and inconvenience, and sometimes serious dislocation of trade; and, above all, if unofficial strikers think that they can exact concessions by such methods then the whole system of official negotiation in trade disputes will be stultified.

WELFARE STATE

Of recent years we have witnessed a change from the conception of the State as an impartial umpire in economic affairs to that of the State as the guarantor of a certain standard of material welfare. Much of the progress that has accompanied this change of ideas has been entirely desirable in itself. But the Welfare State has so far remained an organisation for distribution; its productive function has not yet received much consideration. The time has come when, if this latest Utopia is not to go the way of earlier models, attention must be transferred to the less attractive side.

What does 1950 hold in store? The overriding influence which for too long has kept our economic affairs in a state of suspense has been uncertainty in the political sphere. But the date of the General Election has now been announced. When the election is over it may be hoped that the period of temporary expedients will be at an end, and that a determined attack on our economic problems will at last be made. There is no more reason to-day than there has been at any time in the past to doubt the ability and willingness of the British people to do all that is required of them provided they have the measure of the task and are given a strong lead.

CHAIRMAN'S RETIREMENT

I end on a personal note. It has been my honour and privilege to address Westminster Bank shareholders either by word of mouth or by the written word for the past twenty years. The time has now come when it is advisable that younger heads should take control of our great institution.

I am deeply sensible of the kindness and courtesy with which shareholders have always received the annual account of my stewardship. Now on this last occasion I testify with a full heart to the unswerving help and support I have always received from my fellow directors, officers, and staff of all ranks who work for our Bank, without which support my labours would indeed have been in vain. "Farewell goes out sighing," but thanks be to all in that it has left happy memories.

THE UNION DISCOUNT COMPANY OF LONDON, LIMITED

RECORD FIGURES

The annual general meeting of this company will be held on February 16th at 39, Cornhill, E.C.

The following is an extract from the statement by the chairman, the Rt. Hon. Lord Kennet of the Dene, P.C., G.B.E., D.S.O., circulated with the report and accounts for 1949:

Our balance sheet figures are substantially increased and again attain a new high level. The total of the balance sheet is practically £280,000,000, an increase of more than £30,000,000. Loans and deposits are £30,251,630 more at £271,199,180; and bills discounted are £47,378,330 more at £212,149,148. The large increase in the total of our bills discounted and of our balance sheet is mostly the result of the tendency for public finance to shift from Treasury deposit receipts to Treasury bills. Liability on commercial bills re-discounted has increased by £2,520,629 to a new record figure of £23,388,349.

The total of our bond holdings at the date of the balance sheet showed at £62,776,257 a decrease of £15,791,486 in comparison with the total at the same date last year. This holding of bonds is very largely British Government securities of the shortest date and on an average during the year the relation between money rates and the yield on securities has allowed a margin of profit to discount houses at least as favourable as during the preceding year.

Our profits at £310,828 show an increase of £5,558. After paying the suggested final dividend of 1s. on each £1 unit of stock, the carry-forward will show an increase of £99,078 at £757,653.

APEX (TRINIDAD) OILFIELDS LIMITED

INCREASED REVENUE

The thirtieth annual general meeting of Apex (Trinidad) Oilfields, Limited, was held on January 25th in London.

Mr Malcolm Maclachlan, chairman and joint managing director, in submitting the accounts for the year ended September 30, 1949, said the oil revenue amounted to £1,203,000, an increase of £320,000, as compared with the previous year. More than a full year's revenue had fallen into this year which had seen the change in the company's selling arrangements, and the result for the year should be regarded as exceptional to that extent.

After providing £24,000 for London and New York expenditure, etc., and £710,000 for taxation in Trinidad and the United Kingdom, the net profit for the year was £469,000. The directors recommended the payment of a final dividend of 1s., free of income tax, per 5s. unit of stock, making a total dividend for the year of 1s. 6d., free of income tax, per unit of stock. The unappropriated profit to be carried forward would amount to £196,000.

The production for the year amounted to 2,882,000 barrels of crude oil and 3,368,000 gallons of casing head gasolene; deliveries of approximately these amounts had been made to the refineries.

During the year, 79,176 feet had been drilled in continuance of the programme to obtain production and to extend the tested areas of the property; 8 wells had been completed in the main field and 5 in the South Quarry area. The satisfactory development in the synclinal zone during recent years had resulted in a welcome addition to the company's production, although this had not thus far served to maintain the over-all production at its former rate.

The report was adopted.

THE BURNLEY BUILDING SOCIETY

SIR JOHN H. GREY'S REVIEW

The annual meeting of members of the Burnley Building Society was held on January 25th, at Burnley. Sir John H. Grey, J.P., the chairman, who presided, said: We are now in our centenary year, our society having been established in November, 1850. We look forward with keen anticipation to the completion of a century of housing service, with the expectation that in one year's time, when we present our 100th report, we shall be able to report further substantial progress.

Shareholders' balances at £16,907,089, compare with £14,877,359 at the beginning of the year, an increase of £2,029,730. Deposit balances total £7,919,924, as compared with £7,436,258 at the beginning of the year, £483,666 more.

Taking shares and deposits together, the increase in the amount of money invested with the society is £2,513,396.

We repeat again our distribution of 2½ per cent. to Old Series Shareholders, 2⅜ per cent to New Series Shareholders (Class A) and 2¼ per cent. to New Series Shareholders (Class B).

During the year we made 9,517 advances to a total of £6,724,424. Repayments have been heavier at £4,201,454, making the net increase £2,522,970.

We have now 39,723 mortgage accounts and the average amount owing is £578.

Careful watch is kept on all our mortgage accounts, with, when necessary, periodical review of the older types of property to prevent undue depreciation. The steadfast pursuance of this policy has contributed to our freedom from serious arrears problems.

Building by local authorities of subsidised houses is to continue with ever increasing cost to the community. Including the pre-fabricated bungalows, the cost of which is being written off over no more than ten years, the total subsidy has reached more than £60 millions a year. At a time like the present, when the most vital need is for reduction in public expenditure, it is difficult to find justification for this outlay, especially when much of it goes to tenants who could well afford to pay an economic rent, or buy their own houses.

Our profit and loss account shows gross income of £970,455. Expenditure includes management expenses, etc., £157,005. Depositors receive interest of £110,118, leaving £425,071 for disposal, increased by £98,11 brought forward from 1948. Shareholders received £373,956, representing 88 per cent of the society's net earnings. After writing off suitable amounts in respect of premises and equipment, writing down investments and increasing the investments reserve to £30,000, we find ourselves in a position to transfer the sum of £40,000 to general reserve, and to carry forward a balance of £98,368. Total assets are now £26,450,788 an increase of £2,612,994 over last year.

It is particularly gratifying to note that we have been able to increase the general reserve to £1,000,000, and that we have had no occasion to call on the general contingencies reserve, which stands at £100,000. Adding the postwar credit—income tax reserve £56,640, the investment reserve of £30,000, and the balance of unappropriated profit £98,368, our total reserves now reach a figure of £1,285,008.

When we consider that all doubtful debts have been provided for; that mortgaged properties damaged by enemy action have nearly all been restored, or the relative mortgage repaid by means of a value payment; that we have had no deficiencies on realisation, during the year, nor have we any properties in possession, or receiverships, shareholders will readily appreciate that the society's reserves assume a very real significance.

The report and accounts were adopted.

THE STEEL COMPANY OF WALES

SATISFACTORY FINANCIAL RESULTS

GOOD PROGRESS OF DEVELOPMENT SCHEME

MR E. H. LEVER'S STATEMENT

The annual general meeting of The Steel Company of Wales, Limited, will be held on February 9th at Port Talbot.

The following is the statement by the chairman, Mr E. H. Lever, which has been circulated with the report and accounts for the year ended October 1, 1949:—

The accounts which are now presented show the result of the second year of the company's trading and a further year's expenditure on the development scheme.

The trading profit of the company and its subsidiaries, which amounted to £2,113,865, was £625,587 better than that for the previous year. The profit again included an amount arising from appreciation of stock values due to national price increases of steel products during the year; this amount was £250,000, against £200,000 in the previous year. It is important to remember that if, and when, any downward trend in prices takes place there will be a corresponding reduction in profit.

The company during the year steadily increased its rate of production, and this, together with the maintenance of a high level of efficiency, has been a major contributory cause of the satisfactory financial results achieved. The profit this year, however, has also been advantageously affected by a factor which is likely to prove temporary in character—namely, the higher prices realised on products sold abroad. As world competition for export business increases this source of extra profit will not necessarily be maintained, and is, indeed, likely to be materially reduced.

DEPRECIATION AND TAXATION

Provision has been made for depreciation on the operating works and such small parts of the development scheme as have been brought into production. It has been decided to amalgamate with depreciation the provision made for furnace renewals so as to show together the whole provision which is made for replacement of fixed assets.

The charge for interest on the moneys borrowed to finance the development scheme continues to increase and amounted to £486,534 for the year under review. The whole of this sum has been charged against the profit for the year.

It is still unnecessary to make any specific provision for taxation, as it is computed that by reason of initial allowances on new capital expenditure there is no liability for taxation on the profits to date.

It is considered advisable to carry forward in the profit and loss account the balance of profit available after paying the restricted dividend of 4 per cent. for the year, and the balance so carried forward now amounts to £994,055.

It will be noted that the balance-sheet figure for preliminary expenses is £18,212 less than the previous year. This is due to the refund of part of the stamp duty paid on the formation of the company.

NEW DEVELOPMENTS

The accounts show that at October 1, 1949, the expenditure put in hand by the Board on the company's development scheme amounted to approximately £54,000,000, and that up to that date £23,822,167 of this had been expended. The rate of engineering progress continues to be satisfactory.

Your directors have constantly under review the effect of rising prices on the estimated final cost of the development scheme. As was reported last year, the original estimate will inevitably be exceeded, and the problems arising from this are engaging your directors' attention.

FINANCE

As your board has consistently adopted the policy of buying forward dollars to cover the commitments of the company in the United States for the development scheme, the devaluation of sterling has not increased the cost of the American plant, the necessary dollars having already been acquired at the pre-devaluation rate of exchange.

The large reduction in the cash at bankers reflects the operation of our loan arrangements with the Finance Corporation for Industry, Limited, under which the company borrows money monthly as the developments proceed, whereas last year the bankers held a considerable balance of the proceeds of the 3 per cent. debenture issue.

PERSONAL

The grateful thanks of the directors are again due to all the executives, the staff and the workpeople. It has been a difficult year in many respects, and without the enthusiasm and skill of the company's employees we should not have been able to present so satisfactory an account of our stewardship.

KALIDJEROEK RUBBER COMPANY, LIMITED

RECORD REVENUE RECEIPTS

MR THOMAS TAYLOR'S REVIEW

The thirty-ninth annual general meeting of Kalidjeroek Rubber Company, Limited, was held on January 20th in London. Mr Thomas Taylor (chairman of the company) presided.

The chairman informed the meeting that the Java fiscal profits referred to in his annual review had been remitted, the amount received being £18,560, and consequently the proposed dividends would not have to be paid out of the assets in London shown in the balance sheet that had been circulated to stockholders.

The following is an extract from the chairman's review circulated with the report and accounts:—

The profit and loss account shows that the revenue from last year's crops amounted to the satisfactory total of £74,753. That is a record for this company. It will have been noted that the total revenue is the aggregate of the net proceeds of four crops—rubber, coffee, cinchona and tobacco. The first three are permanent cultivations in which this company has been engaged for many years—indeed, both rubber and coffee have been produced on Kalidjeroek Estate since the company was formed in 1910. Tobacco is a temporary crop, and is being grown on part of the estate where rubber was cut out by the Japanese; it is being cultivated for several reasons—for example, (1) to keep the land from reverting to lallang, and (2) to benefit from a temporary shortage of native-grown tobacco in Java.

PROFITABLE RESULTS FROM ALL CROPS

Results from all four crops were profitable, but it will be seen that coffee produced the largest amount of revenue and incidentally the largest amount of profit. Coffee prices everywhere are at record high levels, and in Java, where at least half the coffee-producing estates are still not restored to their owners, there is a shortage of coffee, and prices there also are at record high levels. The profit from the company's two estates on last year's working was £26,543, from which no less than £20,734 has to be deducted as reserves for taxation in Java and in this country. This leaves only £5,809, of which your directors recommend that £5,500 be distributed as a 10 per cent. dividend to the holders of both the ordinary and preference stock.

Such a recommendation implies that no part of last year's profit is being retained as a reserve. That indeed is the fact, but it will be agreed that it is not a reckless proceeding if consideration is given to the lower part of the profit and loss account, which shows that altogether £16,131 has been received as further proceeds of crops found on reoccupation of the estates, and as additional proceeds of earlier years' cinchona. The board prepared members for this in their report submitted at the annual general meeting on March 25, 1949, in which, after making reference to the £11,376 credited in the 1947-48 accounts, they stated that:

"Stocks of rubber and coffee traced as having been derived from the estates when they were out of the company's possession are the subject of claims made by the company's agents in Java, and the board expect that the company will be paid further not inconsiderable proceeds on this account."

Members will not have failed to notice from the profit and loss account that the credit balance brought in from 1947-48 was £1,732 and the balance which it is proposed to carry forward from the 1948-49 accounts is £11,039, an increase of £9,307—this after providing for the taxation on these accounts and also for the dividend which the directors recommend.

FINANCIAL POSITION SUMMARISED

Summarising the current liabilities and liquid assets in the balance sheet, I would point out that the liquid assets exceed the current liabilities (including the £7,000 "Reserve for future taxation") by £32,656, an improvement of £8,500 on last year.

With regard to the dividends of 10 per cent. which the directors recommend, these will require, after deduction of tax at 9s. in the £, a sum of £5,500. This will temporarily be paid out of our London assets, but in due course we expect to receive from Java a remittance of rather more than £18,000, which is the amount of our so-called "fiscal" profit in Java.

The report was adopted.

Quotas
Exchange
Devaluation

Quotas and exchange controls often hinder firms from taking full advantage of sterling devaluation. Information on government policies and regulations affecting payments can be provided by:

The Economist Intelligence Unit,

Investment Statistics

Company Notes

Newcastle Breweries.—After charging £101,446 (£4,295) for deferred repairs, consolidated profit declined from £555,361 to £432,102 in the year to October 31, 1949. Net group profit was £207,313 (£255,639). Net current assets at the year-end were £1,020,290 (£1,003,990).

British Lead Mills.—Consolidated trading profit increased from £140,904 to £175,307, and net profit from £61,417 to £63,533 in the year to October 31, 1949. The dividend of 32½ per cent for the year is repeated. Net current assets at October 31, 1949, were £219,823 (£174,484).

Midland Iron and Hardware (Cradley Heath).—Profit of the parent company amounted to £246,812 (£250,592) in the year to July 31, 1949. Group profit, including two new subsidiaries, was £282,327. A final dividend of 37½ per cent is recommended, making a total of 62½ per cent for the year on the capital as increased by the 3 for 1 capital bonus. This is equivalent to the 250 per cent paid on the old capital for 1947-48.

British Tyre and Rubber.—Consolidated net profit for the year to September 30, 1949, was £449,022. The amount available for appropriation has declined from £474,646 to £334,820 on the year. A total dividend of 20 per cent for the year is recommended (same).

Associated Commercial Vehicles.—Total group profit amounted to £2,093,007 (including £74,673 from non-recurring items) in the year to September 30, 1949. In 1947-48 profit was £1,230,905. The dividend of 12½ per cent, free of tax, is unchanged. Net current assets rose from £4,070,256 to £6,440,433 at September 30, 1949.

Broom and Wade.—Balance on consolidated trading account increased from £310,727 to £383,461 in the year to September 30, 1949. The dividend of 22½ per cent is repeated. Liquid funds were £442,448 (£431,135), and net current assets £1,031,857 (£907,328) at the year end.

Illingworth Morris.—Group profit increased from £438,152 to £572,474 in the year to September 30, 1949. The dividend of 15 per cent is maintained. Stocks have risen from £1,029,792 to £1,214,352, and net current assets from £1,247,953 to £1,426,703 on the year.

Finlay and Co.—Total profit declined from £307,102 to £236,559 in the year to September 30, 1949. The dividend of 15 per cent for the year is unchanged.

Colville's.—Steel output in the week to January 21st was 41,000 tons, representing an annual rate of more than 2,000,000 tons, an all-time record for the group.

William Timpson. — Consolidated net profit increased from £257,304 to £283,071 for 1949. A dividend of 27½ per cent, including 7½ per cent already paid, is recommended for the year.

Mentmore Manufacturing.—Net profit amounted to £166,392 (£170,077) in the year ended October 31, 1949. The ordinary dividend of 50 per cent is the same as for 1947-48.

Capital Issues

English Electric.—Some £30 million was offered for the issue made by Lazard Brothers and Company of £3 million 4 per cent debenture stock at £99 per cent. The offer was thus oversubscribed rather more than ten times and the general basis of acceptance, after giving consideration to applications from existing stockholders and employees of English Electric, will be about 7½ per cent. No letters of acceptance will be issued for less than £100 of the new stock.

Maconochie Foods.—Shareholders are to be offered one new 5s. ordinary share for every two shares held. Details remain to be announced. An issue of £250,000 in 4½ per cent first debenture stock, 1960-75, has been placed privately.

Boots Pure Drug.—Shareholders are to be offered one new ordinary share at 35s. per share for every five ordinary shares held.

Pearson and Foster.—Shareholders are offered one new 1s. share at 3s. 3d. for every five shares held.

Steel and Company.—A private issue is being made of £500,000 4½ per cent first mortgage debenture stock, 1965-77. Application has been made to the Stock Exchange Council for permission to deal in the new stock.

Falcon Mines.—Issued capital is to be raised to £453,902 by an offer to shareholders of 778,119 5s. shares at 7s. per share in the proportion of three new shares for every four shares held.

Newbold and Burton.—Application has been made for permission to deal on the London Stock Exchange in the issued capital of £114,200 in 5s. ordinary shares.

LANCASHIRE COUNTY COUNCIL

PLANNING ASSISTANT (RESEARCH)

Planning Assistant (Research) required in the County Offices, Preston. Commencing salary according to experience and qualifications within a maximum of £525 p.a.

Candidates should be University Honours graduates in Economics, Sociology or Geography.

Duties will include the preparation of comprehensive rural, industrial and social surveys. Candidates should have a genuine interest in the problems of the countryside and/or a sound knowledge of the practice of town and country planning.

Application forms and conditions of two referees, to be delivered to the County Officer, County Offices, Preston, by

573— [illegible] applications for permanent [illegible] Experimental Officer [illegible] filled by [illegible] Interviews will be held [illegible]ly after [illegible] application forms and [illegible] candi-

[illegible] cover a [illegible]cations.

[illegible] of age [illegible] in H.M. [illegible] science [illegible] Higher [illegible] over the age of 20.

The inclusive London salary scale (men) is £[illegible] women and for posts in the provinces are som[illegible]. Superannuation provision is made under the Superan[illegible]ct.

Further particulars and forms of application [illegible] Secretary, Civil Service Commission, Scientific Branch, [illegible]r, Trinidad House, Old Burlington Street, London, W.1, quo[illegible]2. Completed application forms should be returned as [illegible]ible and must in any case be received not later than M[illegible]50.

THE Civil Service Commissioners invite applic[illegible] appointments as Senior Scientific Officer and Scientific [illegible] be filled by competitive interview during 1950. Interviews will begin in January and will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1950, may eventually be announced. Successful candidates may be appointed immediately. The posts are in various Government Departments and cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a university degree in a scientific subject (including engineering) or in mathematics with first or second class honours, or an equivalent qualification, or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer posts taking their degrees in 1950 may be admitted to compete before the result of their degree examination is known.

Age Limits: For Senior Scientific Officers, at least 26 and under 31 on August 1, 1950; for Scientific Officers, at least 21 and under 28 (or under 31 for established civil servants of the Experimental Officer class) on August 1, 1950. Salary Scales for men in London: Senior Scientific Officers, £700 x £25—£900; Scientific Officers £400 x £25—£650. Rates for women are somewhat lower.

Further particulars from the Secretary, Civil Service Commission (Scientific Branch), 7th Floor, Trinidad House, Old Burlington Street, London, W.1, quoting No. 2887.

YOUNG Univ. graduate, good linguist, experienced imp.-exp. trade, seeks change from present position to one demanding initiative, responsibility and hard work.—Box 315.

ECONOMIST 1947 and 1948 complete. What offers?—Box 327.

HOUBLON-NORMAN FUND

The Trustees of the Houblon-Norman Fund invite applications for Fellowships or Grants in aid of research into the working of financial and business institutions in Great Britain and elsewhere and the economic conditions affecting them.

Apart from exceptional cases, awards will be confined to British-born subjects normally resident in the United Kingdom and will take effect from October 1, 1950. Fellowships will be awarded for one year, renewable for a second year, and the amount of all awards will depend upon the circumstances of the candidate and the specific expenses of his work.

Applications should be made not later than March 31st and forms of application may be obtained from the Secretary of the Fund (H. C. B. Mynors), c/o the Bank of England, London, E.C.2.

H. C. B. MYNORS, Secretary.

January, 1950.

CENTRAL OFFICE OF INFORMATION

Applications are invited for a post of Temporary Senior Information Officer, Reference Division, whose duties will be to take responsibility for the preparation of reference material and factual memoranda on a wide range of United Kingdom economic, financial and trade subjects and relationships overseas. Candidates must be qualified economists, preferably holding a University degree, with experience of the practical handling of the relevant information and statistical sources and with an appreciation of the needs of information services. Salary: Men, £820-£1,099. Women, £725-£830 per annum.

Written applications, giving date of birth, full details of qualifications and experience, including dates, should be addressed to Lieutenant Appointments Officer, Ministry of Labour and National Service, 166, Tavistock Square, London, W.C.1, quoting reference number B.J. 158. Original testimonials must not be forwarded. Only candidates selected for interview will be advised.

SUITABLE FOR COMMERCIAL USER

MAGNIFICENT VIEWS. EXCELLENT VIEWS

Four Miles Haslemere

The Hydrogen Bomb

THE hydrogen bomb is to be manufactured. After weeks of uncertainty and growing uneasiness, President Truman has dispelled at least the former by his announcement that work on all forms of atomic weapons, including the hydrogen bomb, will be continued "until a satisfactory plan for international control of atomic energy is achieved." But the uneasiness remains, and it will grow. A step may now be taken which brings closer—no one knows how much closer—the day when this planet, like other celestial bodies before it, may explode into a flaming mass of gaseous fire, a new sun of appalling light and heat, upon which all existence is instantly extinct. To shrink from such a prospect, to search for an escape from the atomic arms race that is beginning to gather momentum is simple common sense. It is not surprising that there are voices raised on both sides of the Atlantic to plead that, before any new horror is hatched, another approach be made to the Soviet Union and a new effort undertaken to secure international control of the atomic bomb.

There is, of course, everything to be said for agreeing with the Russians. It cannot be repeated too often that the fundamental aim of western diplomacy is not to defeat the Russians—certainly not to defeat them in another war—but to reach such a working agreement with them as would restore at least the necessary minimum of security to a terrified world. But because an agreement is desirable, it does not follow that the best way to get an agreement in which confidence could be reposed is to ask for it straightaway. Nor does it follow, because it is the hydrogen bomb that makes an agreement more than ever desirable, that an agreement about the bomb is what is needed. If an agreement with the Russians is to serve its proper purpose—the restoration of security—it must deal with the real issue; and that, in spite of all the frightful possibilities inherent in atomic destruction, is not the hydrogen bomb. The real issue is the risk of war. Nobody in the western world is worried about America's present possession of the atomic bomb or possible monopoly of the hydrogen bomb. Western nations know that, even if they have the gravest disagreement with the United States, the bomb will not be dropped on them. It is the risk of war, not of the atomic bomb, that must be eliminated, and the test to be applied to any agreement with Russia over the bomb is whether it increases or diminishes the risk of war.

In the political sense, therefore, the hydrogen bomb changes nothing. It makes the avoidance of war with Russia more necessary; but there is nothing in it to alter the judgments previously formed about the best way of preventing a war with Russia from coming about. If what is going on between the east and the west were a sort of bargaining match, then the prospect of this new horror would justify conceding quite a lot to get an agreement. But the western countries honestly believe that what they are insisting upon is the irreducible minimum necessary to ensure that atomic knowledge is not put to the uses of aggressive warfare. That being so, to get an agreement by making concessions might make the use of the bomb in war more

likely, not less. It is easy and understandable to be swept by emotion in a matter such as this. All the more is the necessity to keep cool heads and to ask, before action is taken, not whether its intentions are good, but what its consequences are likely to be.

Hitherto, the western nations have sought to reduce the risk of war by making it clear that they are able and ready to defend themselves. The Mutual Aid Pacts signed a week ago are the culmination of a process of building up a defence system adequate to discourage any "adventures" on the part of a potential aggressor. The atomic bomb and now the hydrogen bomb are in a sense subordinate to this wider, super-national organisation of defence. Nobody in the least supposes that this system provides the whole answer to the problem of Russian aggression. It offers no security against the tactics of infiltration or the seditious activities of the enemy within. It has not been extended to Asia and possibly could not be. Nevertheless, in the crucial Atlantic centre of the world it has provided part of the answer. When faced with force, the Russians retreated from one of their more provocative adventures—the blockade of Berlin. Since any dictatorship tends to military irresponsibility and the Russian Communists in particular are prone to "dizziness through success," it is quite reasonable to suggest that the existence in the Atlantic world of an interlocking defence system backed by American military strength has discouraged further Russian ambitions and been the means of stabilising some sort of a line in Europe.

*

This at the moment is the most effective means open to the western world to minimise the risk of war, and it is by no means certain that an agreement with the Soviet Union confined simply to the question of the atom bomb would either strengthen western defence or make the need for it less—the only two ways in which the risk of war could be reduced. Let us suppose that a limited agreement on the bomb were reached. In return for an American destruction of stock piles and an undertaking not to continue with the hydrogen bomb, the Russians might agree to put into operation the system of international inspection and control of nationally produced atomic energy, which is the maximum they have so far been prepared to concede. Let us also suppose that the Russians made further advances and agreed to transfer some atomic activities to international ownership for an experimental period, would it even then be true that the risk of war was less? Only surely if atomic agreement were matched by a general *détente* and improvement in the relations between east and west. If either side still fears aggression by the other, no agreement, however closely drafted and tightly policed, will remove the spectre of an atomic arms race. If the Soviets' world-wide pressure continued, if Communists still sabotaged arms deliveries in France, if Germans were still rearmed, if silently and unchecked the scale of Russia's land forces continued to increase, the risk of war would be no less on account of limited atomic agreement.

It is, on the contrary, possible to argue that the risk would be greater. It is not so much a question of the stock piles destroyed and the hydrogen bomb abandoned. Nothing can rob the United States of its incomparable lead in industrial techniques and scientific research. The added risk lies in the preference of the western world for an easy, non-belligerent life, for normalcy, for the pacific conduct of affairs. Even a limited agreement with Russia might be taken as the signal for a slackening of vigilance and a weakening of the defensive effort all along the line. It is one of the larger lunacies of Marxism to suppose that, because capitalist Germany was aggressive, capitalist America would prove so in the same measure. The truth is that for the Anglo-Saxon the temptations of peace are all but irresistible (as Britain learnt to its cost under Chamberlain). At the lightest excuse for optimism—and almost any agreement with Russia on atomic energy would be regarded as more than a light excuse—he will leave his gun and go fishing. There is thus every chance that an accord with Russia covering no more than the atom bomb would increase the risk of war by leaving the major aspects of Russian hostility unchanged while lulling the west into a false and lazy security. It is better that the cold war should continue until both sides are genuinely ready for a complete settlement than that any new scientific horror should lead to the disarming of one side and the consequent tempting of the other to commit aggression. The longest way round may be the shortest way home.

Does it follow, therefore, that no approach to Russia can be made? Even if no friendlier emotion ever stirs the Soviet leaders, surely the possibilities of the hydrogen bomb are horrifying enough to create a comradeship of common funk? It would certainly be a grave error to allow this or any other opportunity of approaching Russia to slip. The hydrogen bomb does appear to offer a new opening. It should be seized, not simply, however, to discuss the bomb, but to examine once again whether there is any possibility of a general *détente* between the east and west. Such a settlement could not be confined to atomic agreement; it would be dangerous if it were. It should cover all the major issues of policy—spheres of influence, the peace treaties, general disarmament, the elimination of hostile and inflammatory propaganda—which exacerbate tension and distrust in the world today. Only in such a setting of general pacification can specific agreements and concessions make a real contribution to peace. An atomic convention embedded in a larger framework of *détente* and restored confidence would give the world new hope. Without the wider accord, there is a risk that it would only weaken the western powers, confuse their defence, divide their will and thus actually increase the likelihood of future war.

Personal Incomes, 1938-1950

A series of three articles on this subject has appeared in The Economist:

Redistribution of Income	(*Jan.* 21)
Changes in Wages	(*Jan.* 28)
Salaries and Profits	(*this issue*)

These articles are being reprinted as a pamphlet which will be available on February 10th. Copies of the pamphlet (price 6d.; by post 7d.) can be obtained from

The Economist, 22 Ryder St., London, S.W.1.

Election Issues—I

Five Years of Labour

A JOURNAL that is jealous of its reputation for independence would, in any event, be foolish to compromise it by openly taking sides in a general election. Those electors who look in these columns for advice on how to cast their vote on February 23rd will look in vain. Even if we had a decided preference, we should try to conceal it. In this particular election, however, there is another and more compelling reason for perching on the fence. However much one may admire the gallantry of the Liberal fight, the effective choice of a government lies between the Labour and Conservative Parties, and their manifestos have made it clear that it is a choice of evils—which is always a difficult choice.

What can be done, however—indeed, what the voter who takes his responsibilities seriously must do—is to survey the real issues one by one and form a judgment on the merits of the parties in respect of each. It is therefore proposed in this and two succeeding articles to review the main issues of the election and to attempt to form a specific judgment on each of them—but to leave it to the reader to supply his own relative weighting of their importance in adding them up to a final choice.

*

An election looks both backwards and forwards; it is a verdict on the performance of the past five years as well as an expression of confidence in one party or the other for the next five years. This article attempts to sum up the record of the Labour Government that was put into office by the last general election. Two following articles will attempt to foresee the issues that will arise in the lifetime of the next Parliament and the attitudes that the parties can be expected to take to them.

One of the basic conventions of party politics is that the party in office can claim credit for everything good that happens during its term and can be loaded with all the blame for anything that goes wrong. But this vastly exaggerates a government's control over events. Even apart from acts of God and external pressures, governments are much more the victims than the masters of circumstances. Of what is done in their name, fully 75 per cent is determined either by the inexorable facts of life, by the momentum of past policies or by the prevailing habits of mind of the civil service. The margin that is significantly influenced by the party colour of the government is very small. Yet it is on this alone that a government should be judged. The Labour Government has had some hard knocks from circumstance. But on balance it has been lucky. The Americans have been willing to alleviate the worst of the possible disadvantages of the continuing world-wide state of inflation and shortage, while it has been able to reap all the domestic credit for the full employment that is the other side of the same medal.

But if some of the Labour Party's claims of achievement should be discounted as the mere fruits of accident, some of the criticisms that are made of its stewardship should similarly be written off. Conservatives have a natural tendency to criticise it for not doing what they would do. But it is unreasonable to criticise a Labour Government simply because it carries out Labour policies. Any party must be judged upon its own ground and the question to ask is whether it has pursued its party policies with wisdom and with benefit to the national interest.

It is in domestic, economic and social policy that Labour distinguishes itself most sharply from the other parties. External affairs, fortunately, are not a party matter in this country—it is to Mr Bevin's credit that he resisted the pressure to pursue a "Socialist foreign policy"—and it is enough for the present purpose to say that Labour's record in external policy is about average, with the forging of the Anglo-American alliance and the settlement in India on the credit side and with the Palestine fiasco and the limping obstinacy of German policy on the other side.

*

The three main heads of Labour's economic and social beliefs are in the public ownership of industry; in the conscious planning of the national economy; and in the equalisation of wealth and welfare. What can be said of its performance under each head?

Nationalisation will undoubtedly be the most discussed single topic of the election. It has often been argued in these columns that the change of ownership

ALLIANCE

FIRE · LIFE · ACCIDENT · BURGLARY · MOTOR · MARINE · ETC.

The Alliance undertakes the duties of Executor and Trustee and of Trustee for Debenture Issues.

of industry from private to public, by itself, is a matter of relatively minor importance. To say this is in itself to imply a criticism of the Labour Government for expending so much of its energy and of the time of Parliament on a secondary matter. The importance of the Iron and Steel Act, for example, does not lie in the changes that it will make in the steel industry—for it will make very few indeed for a good many years—but in the insight that the insistence on it gives into the mind of the Labour Party. After four years of nationalisation schemes, one gets the distinct impression that the party, if it ever knew why it advocated nationalisation, has long since forgotten. It nationalises as if sleep-walking or by irrational instinct. Certainly neither the nationalisation Acts themselves, nor the speeches of Ministers in proposing them, nor the actions of the boards since they have been set up, have provided many clues to the existence of a logical justification of a positive kind (there was plenty of negative justification in the case of coal) for disturbing the previously existing state of affairs.

★

This is not merely a general impression ; it is confirmed by many details. Since Ministers have never cleared their own minds about the job that they wanted the various nationalisation schemes to do, the schemes have not been designed to do any job—except the economically and socially pointless one of replacing private ownership by public. The Acts themselves were very loosely drafted, with every knotty point of practical policy left either to the unassisted decision of the boards or—more often—to the uncontrolled decision of the Minister. The appointments made to the boards—with one or two exceptions—have been of safe mediocrities. Broadly speaking, the same people, or the same sort of people, run the industries in the same way as before. Yet if no change was required, what was all the fuss about ? On the whole, the projected benefits from nationalisation as such—an improved spirit among the workers, the possibility of co-ordination of services and of a planned development programme, etc.—have turned out to be smaller than was promised, while the disadvantages—heavy overhead, cumbrous, bureaucratic methods of operation and the throwing of all labour questions into politics, at the expense of costs of production—have proved to be fully as large as was feared.

The verdict to date must be that the nationalisation schemes have certainly increased costs and made industrial structures more rigid, while the compensating advantages, if there are to be any, have not yet put in an appearance. The convinced anti-socialist, of course, never expected any other result. But many people who are neither socialist nor anti-socialist by conviction are beginning to feel bitterly disappointed. In most of the industries that have been nationalised, there was something that badly needed to be done and could have been done by state intervention, provided it was very carefully designed to achieve a defined purpose, not merely to satisfy an instinctive demand for expropriation. It would be wrong to criticise the Labour Party for nationalising, since that is what it always said it would do. It is right to criticise it for nationalising so badly.

The same impression—that the party had not really thought out even its own distinctive policies—is left on the mind by a review of what has been done to secure a truly planned economy. There is, it is true, a tremendous apparatus of control, which could have been used for carrying through a consistent plan. But that apparatus was not, in the main, created by the Labour Government so much as inherited from the wartime coalition. And there has certainly not been a plan, in the sense of a programme drawn up after careful consideration of the country's needs and designed to guide the national economy from where it is to where it ought to be. On the contrary, the Government, having inherited a state of affairs that combined full employment with high real wages, has been mainly concerned with insulating it from the possibility of any change. Even this has not been done in a planned manner, in the sense of anticipating where the strains were coming and moving betimes to relieve them. Policy has rather, as Sir Stafford Cripps confessed in a moment of candour, staggered from crisis to expedient and back to crisis. The two exceptions to this generalisation are the export campaign, which has been successful, and Sir Stafford's disinflation, which never went far enough to make a positive contribution and shines only by contrast with the economic anarchism of Dr Dalton.

In the last month or two, it is true, there have been signs that the Labour economists were beginning to evolve the outline of a deliberate plan, based on the idea that inflation and controls were not evils to be fought against, but good for their own sake. This is at least logical ; it might even work if there were no outside world ; and it might even be desirable if there were no such thing as individual liberty. But if the Labour Party is returned and begins to experiment with a plan of this nature, the results, in this crowded island, are unlikely to disturb the judgment on the planned economy that the experience of the last four and a half years would suggest. That conclusion, as with nationalisation, is that the disadvantages and the difficulties of planning have been more apparent than the benefits. And as with nationalisation, that is a pity—indeed, even more so, for the assertion by Man of some mastery over his economic environment is a far more attractive ideal than state ownership, and it will be a tragedy if it is brought into disrepute by the performance of imperfect practitioners.

The pursuit of equality is the most firmly rooted of all the policies of the Labour Party. There can be little doubt that the wage-earning class has been better off under the Labour Government than ever before—certainly in relative terms and probably in absolute terms as well. The great redistribution of incomes, however, was a product of the war ; Labour has taken it over and preserved it rather than initiated it. Most of the egalitarian legislation of the late Parliament, particularly in finishing the structure of social security, was built on foundations laid by the Coalition. The distinctive touches of its own that the Labour Government has added to the policy of greater equality are therefore mainly to be sought in administration and in attitude.

Once again, the criticism that can be levelled at it is not that it has pursued a policy of equalising wealth and welfare, but that it has been so readily content with very inferior ways of doing it. Much more passion and energy have seemed to be available for levelling down those whose wealth and welfare are above the average (whether deservedly so or not is a question that Labour does not often stop to ask) than for raising the standards of the poor. This spirit has been visible in taxation policy, where the Profits Tax, which is indefensible by any economic argument, has been invented and steadily increased for purposes almost wholly vindictive. It has been seen in the operation of the housing controls, where people who stand no chance of being allotted a council house have not been allowed to provide themselves with houses in any other way. It can perhaps be seen most clearly of all in the administration of Mr Butler's Education Act, in whose name a quite unnecessary amount of dragging down has been done—to the permanent damage of the national life. Whether intentionally or not, the Labour Party has given to millions of minds the conviction that it hates the middle classes. The reduction of the inequality of wealth and welfare is, to judge by the evidence, one of the strongest passions of the British people in this generation. To a quite remarkable extent it is shared by the comfortable, whose eyes are open to the fact that any progress towards equality must be at their expense. It would be possible to have a programme of social justice that would unite the British people. Labour has chosen—and to all appearance deliberately—to do it in a way that runs the risk of dividing the people.

These criticisms are severe. And yet they are very much less than decisive. For one thing, they are criticisms by reference to absolute standards, and by that test any government would show up badly. Mr Attlee's Government has certainly been a disappointment. As a radical reformist government it cannot hold a candle to the Liberal Government of 1906. But it would be a wild misuse of language to call it a disaster. Measured against the needs of the nation, its performance is certainly no worse than that of the governments that held office in the eight years before the war. The record of the last five years does not, by itself, dictate the choice for the next.

Prelude to Battle

(From a Special Correspondent)

The following article, the first of a series of three, presents the development of the election campaign as it can be seen, not from the national headquarters of the contesting parties, but in the constituencies themselves.

As yet, to a Londoner's eye, the election hardly exists. It is a column or two in the papers. It is surmise and head-shaking in clubs and railway carriages, it is the "phoney war," the rocket that has fizzled out since Mr Attlee put a match to it. But in the provinces it has come alive. There the local paper is already presenting "profiles" of the candidates, printing their apologies, describing the new constituencies as they have emerged from the melting pot of redistribution, estimating chances, interviewing agents. In thousands of committee rooms envelopes are being addressed, registers are being checked, coloured pins are being stuck in wall maps, charts are being marked up with names of speakers and dates of meetings. For the most part this activity is still behind closed doors—often literally, as well as figuratively, because woe betide the agent whose carelessness allows the issuance, to an over-zealous supporter, of an election leaflet which "solicits a vote" and so anticipates, for all legal purposes, the opening of the campaign. The press is, as yet, the only forum for propaganda which does not involve the dreaded accountancy of election expenses.

But it is an impressive hum. It is reminiscent of the film of *Desert Victory*, when the tanks were moving into position for the great offensive ; their batlike rustle and squeak peopled the darkness of the screen with ominous premonition of the battle to come. That is the sound that comes from pens, typewriters, duplicators and telephones, as agents move their forces into position and hope to have every propaganda gun primed ready for immediate detonation at the moment when their campaign begins. For at least one party, the Conservatives, this will be one of the best prepared election campaigns in its history. Labour's preparations run them close ; only the Liberals could use more time.

The Tories' preparedness, however, differs not only in degree ; it differs also in kind. From the typical Conservative Party headquarters, in town and country, one gets an impression of good organisation. These are well-run offices. They are bright, clean, welcoming. The switchboard is manned, the doors carry name-plates, the filing trays are filled and emptied with a brisk despatch, the confident voices answer with crisp precision. Admiral Woolton commands a fleet of well-run ships, ready to go into action whenever the signal is given. By contrast the typical Labour Party headquarters looks down at heel and (often quite unnecessarily) grimy. There is often only a caretaker to answer the telephone. No files of literature, few gleaming posters, only an old, battered typewriter fighting for space on an already over-cluttered trestle table. These are tramp steamers, in need of paint and repair, that seem to be making slow speeds in heavy weather. The Liberals are the little boats hoping to achieve the miracle of a second Dunkirk ; they defy generalisation, because they range from old pleasure steamers to a snub-nosed serviceable tug.

It is too soon to be sure how far performance will reflect appearance in these rival fleets. The Conservatives will certainly get some reward for being organised. Their case will nowhere go by default ; every voter who wishes to tread it can find the Right Road for Britain. Labour will often have difficulty in adjusting a rather rusty machine to meet an opposition at once so smooth and so fierce. The Liberals' prospects still defy their own pollsters, leave alone any one else's. But already in some constituencies, it seemed to me, the Conservatives are beginning to meet the nemesis of over-organisation. Wherever their local candidate or agent is not a seasoned political campaigner they are in danger of regarding the perfection of organisation as an end in itself, of finding too much encouragement in the contemplation of their pre-dissolution canvass, and of mistaking activity for results. There hangs over too many Conservative committee rooms the kind of technician's confidence which glowed around the steps of Governor Dewey in 1948. Where their organisation exists only for the campaign it may prove inferior to a Labour machine which has been permeating the working lives of its members every day of the year since 1945. The

committee rooms which seem so unequal to an election battle are often so because they have to serve as a trade union office and house a poor man's lawyer as well—but from that very fact they draw their strength.

It is the same with issues. The Conservatives are armed cap-à-pie. Their Speaker's Handbook and their literature contain all the answers. They can riddle their opponent's record from funnel to water line. But the old ship Full Employment may upset their battle plans by refusing to reply and by displaying a sponge-like, unsinkable indifference to the number of holes shot through her. Here, too, there is a risk that the Conservatives' propaganda may over-reach itself. They bank heavily on the belief that there is a "women's vote" and have arguments, literature and speakers addressed to wooing it. But can they enrol these crusaders of the fifties, the middle-class housewives, without alienating a corresponding number of their lower class, or lower middle class, opposite numbers? By contrast the dominant Labour conviction that the woman puts her cross in the same place as her man may prove to be the safer basis for campaigning.

It may be then that, for all the energy and ammunition that will be expended in the next three weeks, the voting allegiances of all but a slender proportion of the electorate are already determined. Agents will admit that much of their campaigning is a ritual, whose omission the gods would revenge, but whose observance they will not necessarily reward. It becomes a question of how to mobilise one's supporters and how to woo the waverers. Here three factors are dominant—the canvass, the expense limit and the weather.

The register, it is generally agreed, is good. In some constituencies absurdities persist; the dead and the blitzed have not always been eliminated. But in the main—in contrast to 1945—it is a tool on which all parties can rely. But the canvass presents difficulties. The Conservatives, I should guess, have more and more assiduous volunteer canvassers than their opponents, but they may easily rely too much on pledges too early and too easily given. Labour (and Liberals too) suffer by having fewer canvassers and by needing them at more unpleasant hours—on the dark, wet evenings when their voters are most likely to be at home. When to the growing reluctance of voters, especially the younger ones, to give any open indication of their voting intentions are added the problems presented by new constituency boundaries, few canvasses, I suspect, will be as complete by polling day as agents will pretend.

If ammunition cannot be precisely aimed, the natural disposition is to spend more of it and smother the target. An inspection of Conservative campaign literature might lead one to suppose this to be their intention. But here, as at a dozen points beside, the new limitation on election expenses steps in. Caution is the keynote everywhere, to an almost Gilbertian degree. The margin of safety is undoubtedly much smaller than national agents anticipated. Labour agents, for all their pleaded poverty, are as worried as anyone else. The adaptation of the campaign to these novel conditions will be interesting to watch.

No one is pleased about February 23rd. The rural constituencies grumble most vocally, and therein Labour most of all. It sees its cherished gains among the agricultural labourers destroyed by inability to get out the vote. Even in the towns the complaint is universal, though here it falls more evenly on all parties. Nevertheless, if it is a matter merely of mobilising one's known supporters, even here it is probably Labour which will most suffer. Apathy nibbles at the fringes of their regulars in this election to a degree which, I suspect, the Conservatives do not have to fear: their regulars may be less numerous, but for this counter-offensive they are in it to the last man and matron.

Does this fierce determination burn in Liberal breasts as well? This is the question that agitates agents, Labour and Conservatives alike, in all but the safest of constituencies. To woo them, or snub them, to hail them as splitting your opponent's vote or curse them as splitting your own—these are dilemmas which seriously worry the Liberals' opponents. Seldom have they been harder to resolve. Comparison with 1945, an election on a faulty register and with different boundaries, is seldom illuminating. All that is known is that these spoilsports exist. How many there are of them and how seriously they will interfere with the chase are still questions over which candidates, agents and election forecasters will lose a lot of sleep in the next three weeks.

Personal Incomes—III

Salaries and Profits

TWO previous articles have discussed some of the changes which have taken place in recent years in personal incomes as a whole and in wages in particular. Wages are easily the largest single source of personal income; they account for nearly half the total amount of disposable money obtained from work and property. The rest comes from a variety of sources—salaries, professional earnings, the pay of the armed forces, farming income, rents, profits and interest. What has been happening to all these non-wage incomes in the last ten years? It is difficult to add much statistical information to the movement of bald totals given in the National Income White Paper and reproduced in Table I. Changes in the size of individual incomes are not directly measurable from these figures since in most cases it is not known between how many incomes the total sums are divided. But this article—the last in the series—sheds a little more light on each of the different types of income.

Salary-earners are a very varied group. Generally, they are thought to be the black-coated workers paid by a monthly cheque as opposed to the wage-earner's weekly cash packet. But under the official description of salary-earners as administrative, technical and clerical staff the list includes such widely differing occupations as those of manager, works foreman, research worker, draughtsman, shop assistant, nurse, policeman, and any office worker from the junior office boy to the high-powered executive. For the majority of salaried posts there are no fixed scales of pay. There are, however, some exceptions to this—notably in the civil service and in the teaching profession. The salary scales for certain grades of the civil service are shown in Table II; these exclude the promised increases implementing the recommendations of the Chorley Committee. The average salary in each of the ranks shown—taken simply as the mean of the upper and lower limit—has increased over the last ten years by amounts varying between 14 and 34 per cent. In most cases, women have fared relatively better than men and the lower ranks have gained on the more senior ones.

Table III gives the scales of pay for assistant teachers and a few other occupations. The maximum salary for the university graduate with four years' training has increased by about 30 per cent since 1938; that of the certificated teacher with two years' training by about 50 per cent. The incremental rate for graduate teachers has remained unchanged at the 1938 rate of £15 a year for men and £12 a year for women, so that it takes a man graduate 17 years of normal service to reach the upper limit of £615. It should, however, be added that special allowances can increase the maximum salary in a limited number of assistant posts with special responsibilities to at the most £800 a year, excluding the London allowance.

Salaries in local government service are not laid down in the same way as for the central government. But for the school health service it is possible to make some comparisons. Table III shows that medical officers have increased their average salaries by between 30 and 40 per cent since 1938 and school dentists by rather more.

In banks, for appointments senior to clerical ones, salaries are today roughly 50 to 60 per cent above their prewar level but this covers considerable variations between branches. Bank clerks have, on the average, increased their pay by about 60 per cent for men and 80 per cent for women. Clerical salaries, mostly in manufacturing concerns, have been the object of some quite extensive surveys made by the Office Management Association in 1942, 1946 and 1948. A male clerk of some responsibility who earned about £4 10s. a week in 1942 was getting about £6 10s. in 1948. And a girl typist's pay of £2 18s. in 1942 had increased to £4 8s. a week by 1948.

The information set out about salaries, although somewhat fragmentary, confirms the view put forward in the first article of this series that the income of the salary-earner has not kept pace with the upward trend in consumption prices, which have now reached a level about twice as high as in 1938. This would be all the more true if allowance were made for changes in income tax, which have naturally made much more difference to the net incomes of salary-earners than of wage-earners. The salary-earner has less purchasing power and the wage-earner more purchasing power than before the war. Moreover, in making any such comparison, it must also be borne in mind that the wage-earner may have benefits in such matters as housing and canteens which may be denied the salary-earner. In one respect, salaries and wages show identical trends—in the lowering of the differentials between skilled and unskilled and between men and women.

This tendency towards the ironing-out of differences in pay is also seen in the adjustments which have been made in army pay. In total, Table I shows that the income of all the armed forces and auxiliary services was about three times as much in 1948 as in 1938, but their numbers had increased from 385,000 to 846,000 and the figures include retired pay and certain pensions. Some comparative scales of pay provided by the War Office are more revealing. The annual pay and allowances

TABLE I.—PERSONAL INCOME BEFORE TAX

Assistant medical officer	500–700	735–935
Senior medical officer	750–1,100	1,035–1,435
Assistant school dental officer	450–550	730–900
BANK CLERKS		
Men	70–365	157–546
Women	83–205	155–365

Prewar salary scales for teachers are for graduates in secondary grammar schools in the provinces and certificated teachers in industrial and semi-industrial areas. School dentists' salaries are averages of those advertised in the *British Dental Journal* which vary quite considerably. Bank clerks' salaries are as supplied by National Union of Bank Employees.

of a married lieutenant in general army service at age 25 and living out in London amounts to £772 today compared with £371 in 1939; a major at age 38 on the same basis receives £1,174 today as against £768 in 1939. But a field-marshal's pay which was £3,925 in 1939 is actually less today by £13.

Professional earnings, which cover the earnings of doctors, dentists, lawyers, artists, journalists and others in similar positions, increased in total by 92 per cent between 1938 and 1948. But the number of incomes contributing to the total may also have altered. Large incomes are now reported to be received by doctors and dentists in the National Health Service, but the actual professional fees generally have moved only slowly. For instance, solicitors' fees for non-contentious business were laid down by an Act of 1881; in 1925 these fees were increased by 33⅓ per cent and in 1944 by a further 12½ per cent. Solicitors' fees are today, therefore, only half as much again as they were nearly seventy years ago.

Farm incomes totalled £60 million in 1938 and £248 million in 1948. These figures measure the difference between the total value of all agricultural produce, including food consumed on farms, and the total expenses, but without making any allowance for the labour of farmers themselves and of their wives. There were 360,000 full-time farmers in each year. Simple arithmetic gives a figure of average farm income at about £150 in 1938 and £660 in 1948. This excludes the income of "spare-time" farmers, estimated in total to be about £3,000,000 in 1938 and £9,000,000 in 1948. However, the figures are gross, and taxation has absorbed an appreciable slice of the increase. There must, nevertheless, have been quite a substantial gain for the average farmer. In contrast, the average landowner has not fared so well. The rents of land and buildings—after deductions for repairs and maintenance but before income tax—brought in £430 million in 1948 compared with £395 million in 1938. After tax, and after allowance for higher prices, the real net income of the landowner must have suffered a very severe fall.

*

The last type of income to be considered is that obtained from profits, about which there is more dispute than any other. Taken as a whole, the payments of dividends and interest by companies, after deduction of tax, are estimated to have increased by 44 per cent between 1938 and 1948—appreciably less than the 80 per cent rise in consumption prices. This estimate is based on figures in the National Income White Paper; but it is biased in one direction because it excludes from the 1948 figures the amounts distributed by newly nationalised industries and in the other direction because the allowance made for the deduction of tax is almost certainly too low. Separate estimates on the profits figures of industrial companies which are analysed by *The Economist* put the total of ordinary dividends, after tax, at some 35 per cent in 1947-48 higher than in 1939-40.

The story of profits can be brought more up to date in respect of industrial profits for public companies. The main results since July, 1948, of the regular analysis of profits made by *The Economist* are given in Table IV. The first column shows the gross trading profits. The next column shows how much of these profits, together with any other current income, is left after deduction of all charges and provisions, including income tax and profits tax and debenture interest. All these charges reduce the effective trading profits to something like one-third of the total income. And by no means all of this remaining sum is distributed to shareholders, since money has to be set aside for reserves. Only after this provision has been made and preference dividends met, are ordinary dividends paid out. The figures for dividends, shown after tax, are indeed small compared with those of the gross profits and actually declined slightly in 1949 over the previous year.

One wrong conception about dividends arises from confusing gross trading profits with dividends paid out. Another comes from measuring dividends with respect to the nominal issued ordinary capital of companies instead of also including the free reserves—that is, the withheld profits of past years—so as to compare current earnings with the total assets on which they are earned. According to *The Economist's* analysis of profits, the quarterly averages in 1949 of gross dividends, before tax, varied from 13 to 17 per cent of issued capital but from 5.3 to 8.4 per cent of the actual capital employed. These latter figures are the ones which show the shareholders' return on their capital and it cannot be said that they are unduly high. The personal incomes of the ordinary shareholders of public companies are certainly not being swollen by abnormal profits. What is happening to sole traders and unincorporated businesses is more obscure.

This series of articles has attempted to give a picture of the changes in personal incomes in the last ten years. Attention should be drawn to the letter on page 258 giving some later figures on net incomes in different ranges. Although the numbers in the higher income ranges had increased between 1945-46 and 1947-48, they were still outstandingly fewer than before the war, in spite of the inflated prices. The war years saw a vast redistribution of income and the general shape of the pattern has not greatly changed since. It may be that the war only brought abruptly a change which would have come inevitably, but more gently, under the pressure of present-day social forces.

NOTES OF THE WEEK

A Political Head for OEEC

For some time past the Americans have been pressing for the appointment of a political figure of European standing to head the Organisation for European Economic Co-operation and to symbolise its weight and authority in the attempt to achieve "economic integration" in Europe. These suggestions have received very little support among the ERP countries, which, on the whole, are well satisfied with the manner in which OEEC has been administered by its present Secretary-General. Any hopes that the American proposal had been effectively buried vanished, however, when Mr Paul Hoffman, soon after his arrival in Paris, re-stated the desire of the United States Administration for a political appointment of this kind. M. Spaak, whose name has been usually mentioned in previous discussions of such an appointment, does not appear to have been considered. This is probably due in the main to the fact that M. Spaak is unwilling to give up the important position which he now holds in the Council of Europe. Apart from this, his recent speech at the University of Pennsylvania, in which he berated Britain for its lukewarmness in the cause of European co-operation, will have earned him opposition in some OEEC quarters, while even the Belgians might think twice about supporting a candidate who, as political director of the OEEC, might give Socialist advice and direction to M. Van Zeeland's Right-wing administration. The choice has therefore fallen on the Netherlands Foreign Minister, Dr Stikker, who has now to combine his present office with the new post of "political conciliator"—a feat which will call for as much mental dexterity as physical mobility.

This combination of roles may, however, provide little difficulty if one of the most important aspects of Dr Stikker's conciliation proves to be his handling of the OEEC's relationship with the United States rather than with the ERP countries in Europe. The most telling argument for appointing a political personality to head the OEEC is certainly the need of a statesman of some standing to talk on equal terms and in the name of Europe to American Senators, Congressmen and members of the American Administration. The OEEC finger of accusation and criticism should on occasion be pointed not only at European members of the Organisation but at the United States. The Council of OEEC also decided that the two vice-presidents of the Organisation—at present Dr Grueber of Austria and Mr MacBride of Eire—should join the Consultative Group of Ministers and that the President, M. Van Zeeland, and two vice-presidents, should each spend two days of every week at the seat of the Organisation. Thus there will now be no lack of people at the OEEC of sufficient status to deal with their opposite numbers in the ECA mission at Paris, and on occasion to speak for Europe in Washington.

* * *

Black and White in International Trade

The main task before the Council was the approval of the second annual report of the OEEC, which will now be submitted to the Economic Co-operation Administrator in Washington. It is meant to provide the main ammunition with which Mr Paul Hoffman will do battle in Congress to secure the dollars already requested for the third year of Marshall Aid. This report, which should be published within the next few days, recounts the achievements of the European Recovery Programme and sets down the ways and means by which Europe hopes to reach solvency in its dollar account by June, 1952.

The most controversial issues to be touched upon in the course of the Paris negotiations were the plans for liberalising intra-European trade and for setting up a European Payments Union—the more technical aspects of these schemes are discussed in notes on page 280. It is quite false to suggest, as some Washington messages have done, that Mr Hoffman has entered into detailed discussion on these matters and that deep differences of opinion have developed between him and Sir Stafford Cripps. The differences, particularly in the formulation of the new European Payments Union, were in the main those which have long divided Great Britain, with its desire to uphold the position of sterling and of the existing bilateral payments arrangements, from the group of nations led by Belgium. Their wish is to restore not only immediate multilateral inter-convertibility of European currencies but the incentives and sanctions of gold payments, once the comparatively modest margins of credit available under the new scheme have been exhausted. Mr Paul Hoffman has expressed his disappointment at the inability of European nations to agree on this scheme and has indicated that in future Marshall Aid will tend to go to those countries which adopt a really aggressive attitude in the cause of European collaboration.

The suspicion that Britain wishes to maintain a discriminatory system of international payments and regards the formulation of a new European Payments Union as a virtual attack on the sterling area system, hardened during the course of the Paris discussions. It is true that in the last stages of the discussions the Chancellor of the Exchequer made valiant attempts to remove the grounds for these doubts and may have had a partial success. Unhappily, as in so many disputes of principle, the debate between the supporters of complete convertibility and non-discrimination and the believers in careful currency control and a measure of discrimination cannot be divided between black and white and sheep and goats as each side seeks to do. Britain's support for a managed sterling area is rendered suspect by inflation at home, the undue "softness" of sterling and the uncompetitiveness of sterling goods. America's championing of free trade, non-discrimination and convertibility is weakened by tariffs, price supports, subsidies and discrimination such as has recently been apparent at Seattle. Somewhere between a measure of deflation for the sterling area and an American expansion both of imports and credits the answer for world trade undoubtedly lies. But how can such a point be reached if both sides continue their present attitude of "holier than thou"?

* * *

Completing the Atlantic Pact

When the bilateral agreements on mutual assistance between the United States and the eight west European powers were signed in Washington last week, the formal organisation of defence under the Atlantic Pact was completed. The conditions under which the United States will release, and the European nations will accept, American military equipment are now—together with the proportions to be devoted to each country—settled, and in a matter of months the material will be arriving in Europe. The agreements are severely drawn legal instruments devised to meet two main conditions; the first is to ensure that American aid will not be used to support a purely national foreign policy and will in fact be devoted to the uses for which it is intended; the second is to make the element of mutual aid something more than a mere formality while recognising that the enormous preponderance of assistance lies with the United States. Thus in the treaty with the United Kingdom the provision in the Anglo-American Economic Agreement which commits the British Government to stockpiling for the US Government is declared to be an integral part of the

agreement. Equally, under Article VII, the British Government undertakes to shoulder the sterling cost of the American administration of the scheme within the United Kingdom, and further articles deal with customs and diplomatic exemptions.

There has been some criticism in Washington about the dilatoriness of the British Government in negotiating the terms of its agreement. There seems to be little or no justification for this, and there are two special reasons why the British Government should wish to see the agreement drafted with the greatest precision. In the first place, with a defence budget which is already stretched to bursting point, no British Government—particularly on the eve of an election—would dare expose itself or its successor to imprecise financial commitments. In fact, by demanding precision on this point, the only additional cost it has incurred is £53,000 for administrative expenses in Britain in connection with the delivery of material. In the second place, the Atlantic Pact, including Western Union, is only one aspect of the defence problems of Britain and France, and it had to be made very clear in Washington that no arrangement could be entered into which would prejudice their position in south-east Asia. Britain has become the convenient whipping boy in Washington for friction between the Atlantic allies, but in fact by adopting a rather sea-lawyers' approach to the agreement the British delegation has probably averted future trouble for all the west European powers.

*

It is known that of the $1,000 million allocated to western Europe, France will receive $300 million—the largest single allocation. This is a right decision since a strong French army is the keystone of western defence: it has been chronically short of equipment since the war and until this is overcome there is no virtue in mobilising a larger force. It may be that improved equipment will do something to abate the mood of polite despair in which French public opinion views the feasibility of defending Europe. Britain does not stand to gain to an equal extent from American military aid, although it will enable the RAF to scrap some of its more useless heavy bombers in favour of 70 B29s. But it does stand to gain enormously from an increase of confidence and efficiency among its western allies.

* * *

Liberal-Conservative Battle

A follower of the British press and wireless might have been pardoned during the past week for imagining that the forthcoming election was a contest solely between Liberals and Conservatives, an election of 1900 rather than 1950, instead of a struggle of two opposition parties against a formidable opponent. The turn that the election fight has taken is due partly to the publicity which has accrued to the Liberal Party from holding their election rally in the slack time between the issue of the Labour and Conservative manifestoes and the beginning of the intense phase of the campaign. But it is due even more to the determination of Mr Churchill to attach a large part of the Liberal vote to the Conservatives. To this task he has brought both tenacity and guile. After refusing to accept Mr Clement Davies's request that the Conservatives should not join the name Liberal to their own, he delivered an adoption speech in his constituency in which he invited all men of liberal opinions to fight by his side, casting up the official Liberal party as an obscure separatist sect. This week he has managed to catch out Mr Frank Byers, the Chief Liberal Whip, in a slight error of political taste, in divulging the results of a confidential inter-party conference on the political broadcasts. There is no doubt that the Liberal Party walks a narrow path. However excellent may be the content of their manifesto, to be published next week, any impression of irresponsibility may frighten potential Liberal voters into the Conservative camp, particularly since the conduct of the campaign is in the hands of the more radical leaders of the party. On the other hand, if they fail to be trenchant and hard hitting the Liberals will go unheard among the general uproar—particularly as their manifesto, coming a fortnight after the Conservative one, must inevitably create an impression that some of its proposals are reflections of Tory policy rather than, as is really the case, the other way round.

*

Control Over Expenditure

At the end of last week two reports of the Select Committee on Estimates were published, both of them dealing with the defence estimates. Subject to an important qualification, the whole of the defence estimates have been examined in the course of a session, a procedure which the Select Committee considers should be followed in future sessions. The defence estimates account for an expenditure of about £760 million—that is, about 23 per cent of the total ordinary expenditure of the Government—and there is a widely held view, shared by people of all parties, that the country is not getting value for money. But their uneasiness is based mainly on matters of policy, and as the Select Committee on the Estimates is precluded from criticising policy, no startling revelations or proposals can be looked for in its reports.

In one of them (the seventeenth), however, it does draw attention to what seems an unnecessary extravagance even if it is assumed that present policy is soundly based. It gives two tables, one showing the increase in Service strengths since 1939-40 and the other showing the increase in headquarters staffs in the same period:

	Increase in Strengths since 1939-40		Increase in Staff since 1939-40
	%		%
Navy	15	Admiralty	202
Army	196	War Office	267
Air Force	116	Air Ministry	203

It need hardly be said that the Departments concerned have ready explanations for these disproportionate increases in headquarters staffs, but the Select Committee is not convinced by all the reasons given and recommends that the comprehensive inquiry into the organisation of the Air Ministry, the results of which should be reflected in the estimates for 1950-51, should be adopted by the other Service Departments.

Much the most important part of these two reports, however, is the Select Committee's comments on the refusal of the Minister of Defence, for security reasons, to allow them to investigate the expenditure on research and development and on works services for which no details are given in the estimates. During the war, the Select Committee on National Expenditure had access to secret information and was empowered by the House of Commons to address a memorandum to the Prime Minister instead of publishing its recommendations. The Estimates Committee is about evenly divided on whether the procedure should be applied to itself. It is worth noting that Sir Henry Tizard, chairman of the Defence Research Policy Committee, said in evidence to the Select Committee that he would welcome parliamentary criticism if it could be made consistent with the claims of security. Moreover, in evidence to the Select Committee on Procedure early in this Parliament, the Government spokesmen resisted the proposal to strengthen the Estimates Committee, saying that it already "has complete power to roam over the whole field" and "can do anything it likes within the ambit of its powers." They also affirmed that Ministers were the servants not only of the Crown, but of Parliament. In the light of these declarations, the decision of the Minister of Defence that the Select Committee should not investigate certain aspects of expenditure is very questionable. The whole matter should be raised when the new Parliament meets.

* * *

The Butchers Call It Off

The decision of the National Federation of Meat Traders' Associations to call off their revolt against the higher wholesale prices announced by the Ministry of Food for this week may have been, in part, genuinely dictated by public spirit, but it is also a tribute to the efficacy of the Ministry's threat to suspend the registration system. The butchers had, indeed, an intrinsically weak case. The fixed margin per pound on which they operate, and which constitutes their profit, was raised last March, when delays in the Argentine negotiations led to a reduced meat ration, in order to compensate them for their consequently reduced turnover and incomes. There could be no logical reason for maintaining this spread in distribution costs once the turnover had been restored, particularly in view of the burden on the taxpayer of the meat subsidy, now in the neighbourhood of £30 million a year. But the narrowing of any officially established margin inevitably evokes protest from the less favourably placed businesses. Generally speaking, Ministers have not been unduly harsh to the marginal trader. On the contrary, the public interest would have justified more severity, and the appearance of Mr Strachey as the taxpayers' watchdog is a welcome innovation.

It is true that in the meat trade with its ironclad regulations it is hard for the marginal trader, or indeed any other, when faced with a cut in aggregate profits, to find means of improving his position. He cannot exercise the retailer's specific competitive skills of buying in the best market goods corresponding as exactly as possible to his customer's requirements; price, source, quality, even the actual value of his merchandise are alike dictated. Unless he is a large multiple trader who can offer registered customers exclusive access to attractive side-lines, virtually his only way of competing for new registrations is one or another form of fiddling—a decided handicap to the scrupulous. The security from competitors, the general stability, offered by the apparatus of registration, ration and licence is certainly popular among those whom it shelters, but it is paid for by an unhealthy degree of helplessness. The Ministry of Food's sledgehammer powers have been used, this time, reasonably and in good cause; the worst of which one can accuse Mr Strachey is of a certain tactless abruptness. Those same powers, however, could be on another occasion unreasonably and tyrannously used without possibility of resistance or redress. The controversy over the butchers' surcharge raises the whole vast question of the Executive's relation to the citizen; a question on which other bodies than retail associations—trade unions, for instance—might do well to meditate.

* * *

Moscow Trades the Horse

The duration of the Russo-Chinese negotiations in Moscow, since Mao Tse-tung appeared as the guest of honour seated next to Stalin at the latter's seventieth-birthday celebrations, has naturally caused astonishment and puzzled speculation throughout the world. This has clearly been no case of top-level statesmen meeting to put the finishing touches to an agreement which has already been firmly outlined in negotiations through diplomatic channels. It certainly appears probable that either the Russians or the Chinese or both sides expected the talks to go more easily than they have, and that their duration was unexpected—for it can hardly be supposed that, if the difficulties had been foreseen, either Russia or China would have wished thus to advertise to the world the discord between them.

One factor has no doubt been the amateurishness of the Chinese Communists in diplomacy; they have not previously had any experience of relations with foreign states and may have been unduly bewildered and resentful when they found that formal and official negotiations with the Soviet Government were something very different from the informal liaison which Moscow maintained in the days when the Chinese Communists were only a rebel guerrilla faction. On the other hand, now that they have become the Government of China, recognised not only by the nations of the Russian *bloc*, but also by Britain and India, the Chinese Communists have no doubt acquired a new sense of their own dignity and importance and also of their responsibility as guardians of China's sovereign rights, which may have come as an unpleasant shock to the men in the Kremlin.

According to reports which are said to have leaked out through Soviet satellite countries Russia has been making sweeping demands on China for control of five ports on the Yellow Sea in addition to the existing control of Port Arthur and Dairen (Chingwangtao, Haichow, Chefoo, Weihaiwei and Tsingtao have been named), for increased food supplies from Manchuria, for Chinese labour contingents for work in the Soviet Union, and for rights for the Moslem and Mongol minorities in China—which appear designed to loosen these areas from China and bring them under Soviet protection. The Chinese on their side are reported to have asked the supposedly wealthy Russian uncle for financial aid to a total of some £1,000 million. If such information is correct, it is no wonder that the negotiators need time to reach an agreement. For Mao can hardly accept such Russian demands without appearing in Chinese eyes as the "running dog" of a foreign imperialism, and Mr Stalin can hardly provide China with credits on the scale requested without putting a very severe strain on the whole economy of the Societ Union and its satellites. China has hardly anything with which to make payment directly to Russia except Manchurian foodstuffs and if these are exported, how is China to relieve the serious food shortages in other parts of its own territory? Unlike such countries as Poland and Czechoslovakia which pull their weight economically, China—apart from Manchuria—is essentially, from Russia's point of view, a poor relation, whose only value to the Kremlin lies in the harm it can do to the western Powers.

* * *

Offensive Against France

In one field at least China is able to do Russia a very valuable service; it can seriously embarrass France, and thereby indirectly the whole Atlantic Pact grouping of nations, by adding fuel to the flames of war which continue to burn in Indo-China. France is now so completely committed to support of the Vietnamese Government of Bao Dai, which is willing to remain within the French Union, that it is scarcely possible for a French Government to retreat from this position without a national humiliation which might be fatal, not merely to a particular French Cabinet, but to the existing regime of the Fourth Republic. On the other hand, the Viet Minh forces led by Ho Chi-minh hold a large part of Vietnam, and prolonged military campaigns have failed to crush them decisively. Bao Dai, by making his return to Indo-China conditional on an agreement embodying most of the outstanding claims of Vietnamese nationalism, has been able to refute the charge that he is nothing but a French puppet, and recently support for him in Vietnam seems to have been growing. But there is no evidence that he could stand by himself without the assistance of French troops, nor is it intended that he should. The French point to Burma as a warning of what might happen if all their troops were withdrawn, and indeed Bao Dai might not be able to do even as well as Thakin Nu.

With a backing of French troops and with the dignity afforded by international diplomatic recognition—which is

of crucial importance for Eastern peoples emerging from colonial status to political independence—Bao Dai might in time be able to consolidate his position and extend his authority over the areas now held by his rival. Without any moral or material support from abroad, Ho Chi-minh's opposition would probably peter out in the end, though his hold on Vietnamese popular sentiment as the uncompromising champion of the national cause would not easily be eliminated. But the fate of Vietnam has now become an international issue. Both China and Russia have now recognised Ho Chi-minh's Government—which lurks in the interior of Vietnam eluding French air attack—as the *de jure* government of an independent Vietnam. This moral support will be in any case a great encouragement to the Viet Minh regime, and may be followed up with material support of arms supplied as to a "friendly" state.

The international implications of this development are serious and their significance has not been overstated in the strong note of protest which France has addressed to Moscow. As the Peking Government itself had not yet received French recognition, Sino-French diplomatic relations could not be affected, except in so far as the Chinese action gives France a weighty reason for refusing to recognise the Communist regime. But Russia is in diplomatic relations with France, and for Moscow to give diplomatic recognition to a rebel authority in a part of the French Union is the most direct and revolutionary challenge issued by Moscow to any western great power since the end of the Second World War.

* * *

Communist Strikes and French Security

The French Communist Party has shown its hand. The strikes which it has fomented against the shipment of arms to Indo-China and the arrival of war material from America are openly declared to be political, and the connection between them and any demand for wages is now acknowledged to be entirely secondary. It is therefore not surprising that the French Government have, on the direct instruction of the President of the Republic, determined on counter measures to "protect national sovereignty" and the security of the state. Troops will be used wherever strikers refuse to handle goods in the ports or on the railways, and where, as in transport, the strikers are Government employees, they will be liable to instant dismissal. Moreover, the Government intends to take action to reduce the flood of false information published by the Communist press, and, in particular, will seek to prevent Members of Parliament from acting as the directors of newspapers, in order to secure parliamentary immunity for their papers' falsifications.

The two sides are thus braced for action and the test is likely to come before many weeks are out, when really large shipments of American war material begin to arrive under the terms of the Mutual Aid Pact. It is difficult to forecast the outcome of the struggle; the Communists have in their favour the intense unpopularity of the war in Indo-China, and are seeking to make it the centre of their propaganda. On the other hand, there is fairly general acceptance of the need for the Atlantic Pact and, above all, the working class appear to be wearied of political strikes divorced from any economic objective. It seems, therefore, that the Communists' best hope is to concentrate upon the economic grievances of various strategically placed workers—longshoremen, transport workers and so forth.

Here they are on strong ground. The failure of the lower-paid workers' wages to keep pace with the rise in the cost of living is now so generally recognised that M. Bidault's government was recently compelled by the unprecedented vote of 540 to 2 in the Assembly to grant for the month of January a 3,000 franc bonus to all workers whose wage is less than 20,000 francs a month. The difficulty in passing beyond such palliatives to a genuine rise in working-class income lies in the precarious financial position of the country, and the belief, strongly held by the Radical elements in M. Bidault's coalition, that concessions to the trade unions will undermine the franc and be a signal for fresh inflation. Indeed, the French financial position remains generally precarious. The fact that M. Bidault had to use six votes of confidence to force through the final version of his budget shows how slender is the measure of agreement on future financial policy.

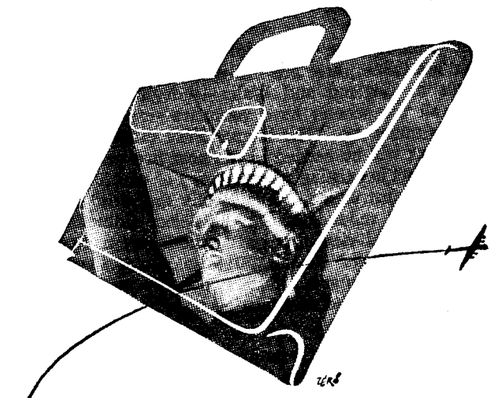
Election Gambling

It is curious that in a nation devoted to gambling as the British so little opportunity should nowadays be taken of a general election, the most sporting of all events.

Between the wars there was a considerable amount of gambling on the composition of the next parliament. At one time there were extensive dealings in "majorities" on the Stock Exchange. Conservative majorities would be quoted at, say, 70-80. If the eventual majority came out at 100, a buyer of one unit at the price of 80 would win £20, the seller losing £30. If the majority came out at 50, those who sold at a higher price would gain at the expense of buyers. There was also, at any rate in 1924, a market in straight bets against given results. Looking back, the odds seem to have been based on fantastic calculations. In 1924, 99 to 1 was reported as offered against the Conservatives getting as many as 390 seats, when in fact they got 412. In 1929, on the other hand, dealers in "majorities" finally settled on figures only forty seats different from the actual results.



In 1931 election gambling led to disaster. The market price of majorities was about 170 to 200 (for the National Government). The actual majority was 469 over Labour, the next largest party. The difference to be settled was anything up to £300 for each unit traded—after allowing for extensive hedging it is thought that £750,000 changed hands. There was a much publicised lawsuit when a trader, unable to honour his debts, pleaded the provisions of the Gaming Act. The sequel was a ban by the Council of the Stock Exchange on all such dealings, which has been reaffirmed at each subsequent election. In 1935 a big London bookmaker decided to open a book on "majorities" and did substantial business. But in 1945 there was little betting: 7 to 4 was offered on a Conservative majority of over 50, and 5 to 1 against a Labour victory. Fortunately for the bookmakers little business was done.

In the 1950 election there appears to be very little business—at least very little that can be observed above ground. Inquiries of three big bookmakers reveal that only one of them is doing any election business. His odds on a Labour victory have lengthened during the past few months from 5 to 4 on to 6 to 4 on. There is a small unofficial market for straight election betting in the City, where very short odds are being offered on either party. A great deal of the money which is placed is in the nature of insurance, and it can well be argued that in this particular election there is a definite insurable risk, which in the case of certain interests can be measured in actuarial terms. The fact that insurance methods can be brought to the aid of political strategy is shown in the most sensible arrangement made by the Liberal Party whereby members of Lloyd's have underwritten all their deposits lost between the numbers of 50 and 250 for a payment of £5,000—a demonstration that the Liberals are still the party of new ideas, and that Lloyd's underwriters believe they will not lose more than 83 deposits.

employees compared to 846,000 in 1939. A report published last week by the Local Government Manpower Committee [Cmd. 7870] makes a sincere and detailed attempt to review the methods of departmental control over local authorities and to suggest ways of reducing staff by reducing the volume of business which flows between local authority officers and Whitehall ministries. The recommendations were drawn up by a series of sub-committees composed of central and local government officers. Their task was to determine where in any particular service—housing, schools, town and country planning and the like—a line could be drawn between the responsibility of the government department concerned for the proper expenditure of public money, and the responsibility of the local authority for the execution of the service. The sub-committees were instructed to work on the principle that local authorities had responsibilities in their own right and that central control should be exercised "at key points where it can effectively discharge its responsibilities for government policy and financial administration."

The result is a number of detailed recommendations which could do much to ease the burden on both central and local government. The recommendations differ from service to service, but they have several common features. Schemes submitted for approval can be less detailed, approval in the case of housing plans can be assumed if no comments are received within 14 days, limits on expenditure without prior approval could be raised, local authorities can be empowered to go ahead with schemes which conform to agreed principles, greater reliance could be placed on the technical staffs of the local authorities themselves. All these proposals, if accepted and energetically followed up, could do much to loosen the restricting influence of central control over local government. Yet it is a matter of some regret that by approaching the issue as a method of saving manpower, the reformers should have climbed in at the window instead of knocking boldly at the front door.

* * *

Approved Schools

The most surprising fact revealed in the report on approved schools by the Select Committee on the Estimates is that the population of those in England and Wales has fallen from a peak of 11,407 children in September, 1945, to 9,230 in the same month of last year. Yet in 1948, the

latest year for which statistics are available, the number of children found guilty of indictable offences was 44,434, the highest it has ever been. It is reassuring that the increase in juvenile delinquency during and since the war (in 1939 the number of delinquents was only 30,835) has not led to overcrowding in approved schools, which would very much hinder their work.

But although the population of approved schools as a whole has fallen, there are still waiting lists for some of the schools in England and Wales—though not in Scotland where all the schools have vacancies—especially for those for boys under 15. The Home Office estimates that 1,800 new places will be needed in the next five years apart from replacements in existing schools, many of which are in urgent need of reconstruction. It is mainly the girls' schools that are becoming redundant, but the Select Committee agrees with the official view that girls' schools are not easily convertible into boys' schools. It also agrees that it is not always possible to amalgamate two half-empty schools, and that some reserve accommodation must be retained to meet unforseeable demands.

What the Select Committee does query, however, is whether it is justifiable to incur expenditure on the present increasing scale on approved schools when expenditure on the education of normal children is being restricted. The average cost per child per week, including expenditure on repairs and new equipment, is £5 4s. 9d. in England and Wales and £4 15s. in Scotland. But the high cost is not surprising in view of the high ratio of staff to children involved in the constant supervision that is needed throughout the year. There is a great deal to be said for the Select Committee's recommendation that parents' contributions towards the cost of maintaining their children in approved schools should be increased (at present it averages 3s. a week in England and Wales and under 1s. 7d. in Scotland); this should bring home to the parents their responsibility for a child—and for the actions which landed it in an approved school. But to adopt a parsimonious attitude towards the schools might well undo much of the very good work that most of them undoubtedly do.

* * *

Germany and the ECA

At the end of last year, the Federal Government of Germany submitted to the Organisation for European Economic Co-operation a memorandum outlining its programme for the last two years of the Marshall Plan. The memorandum itself was not published, but the comments made on it by the Economic Co-operation Administration have now reached the press and the two documents throw much light on the fundamental paradox of the German position. The essence of the problem is that almost every aspect of the west German economy is abnormal. The devastation of the country's industrial equipment and the wiping out of savings by war and inflation have created a tremendous need for new capital investment. The truncation of the German economy between east and west and the cutting off of the industrial areas in the Ruhr from their old natural hinterland in eastern Germany and eastern Europe have led to exceptional conditions of foreign trade. In the field of employment, the population of western Germany has been swollen by some 9,000,000 refugees from the east, and their number, even now, is being steadily augmented month by month. Thus, in three vital areas of the national economy—investment, foreign trade and employment—the German community is faced with exceptional problems which one might assume only exceptional measures could overcome.

The paradox consists, however, in the fact that, urged on by its American advisers and by its own economic principles, the Federal Government has in the last eighteen months abandoned all instruments of control through which exceptional measures might be taken. As the German memorandum points out, in the sphere of foreign trade,

> since German economic policy is, as a matter of principle, against regimentation and most controls are now withdrawn, it is no longer possible to promote the export business by priority allocations of raw materials and manpower.

Again, on the question of securing sufficient investment for the basic industries, the memorandum points out that "the funds susceptible to a central influence are not sufficient to meet even approximately the needs of" basic needs and services. In a word, the liberal policy pursued by the Government leaves it without the weapons needed to cope with the exceptional problems created by Germany's special position.

*

The results are described and strongly criticised by the officials of the ECA. In the field of foreign trade, they point out that virtually no attempt is being made to reduce the dollar deficit, and while three-quarters of Germany's dollar assistance is being spent upon imported food-stuffs, little effort is being made to increase the internal production of food and none to check such obvious waste as excessive distilling for alcohol and the use of white bread. In the field of investment, the Germans estimate that about 20 per cent of the gross national product will be the total annual figure spent on investment in the next two years. This, in the view of ECA, is quite insufficient to restore a balanced economy and, in any case, a large part of this figure represents investment in non-essential consumer goods industries, which are re-equipping and re-stocking themselves out of profits. Finally, in the sphere of unemployment, the ECA strongly attacks the Government for having virtually no plans—neither housing projects nor public works nor plans for public utilities—designed to absorb the unemployed who now number nearly 1,800,000, or 11 per cent of the labour force. The present programme, in the view of the ECA mission, will leave Germany in 1952 still in hopeless dependence upon external aid, with a drastic collapse of living standards as the only alternative. Perhaps the final paradox of the German economy is that the American advisers who, two years ago, were the keenest advocates of the liberal policies now pursued in Germany, are becoming warm supporters of the restoration of a measure of control.

* * *

The New Italian Government

Signor de Gasperi's sixth government, formed on January 27th with thirteen Christian Democrats, three Right-wing Socialists and three Republicans, appears less solid than its predecessor. It lacks the unity of anti-Communist purpose which bound the members of his last team together when they took office after the general election of April, 1948. And, in particular, it has lost the support of the Liberals, the participation of the leader of the Right-wing Socialists, Signor Saragat, and the good will of many Left-wing Christian Democrats. All this has happened at a testing time for the Government. It must reach firm conclusions on a number of vital issues of policy—over land reform, regional reform, tax reform, and above all over plans for a systematic absorption of the unemployed. Of these, the only firm project at present is a £70 million 10-year programme of agricultural rehabilitation in the South.

The thinning of the Cabinet ranks has come about largely owing to the partial failure of Signor de Gasperi's tactics—though he had very little choice in the matter. The Prime Minister thought or hoped last autumn that he could momentarily dissolve the coalition, demonstrate to each of its fragments the futility of attempting to work outside it, and then, after a few frank and chilly exchanges—involving perhaps some minor losses of support—reconstitute a basically similar administration. If he had entirely succeeded, he could have counted on a general acceptance of his own middle line on all the most controversial questions.

As it is, he has achieved this to only a limited degree, and has had to take a half-step to the Right. The Liberal loss is the least important; everyone knew all along that they detested agrarian reform, and this has become the question of the hour. What is more damaging is the loss of wholehearted backing from the Left-wing Christian Democrats. This group attempted to tie the Prime Minister's hand in his distribution of offices to the Socialists and Republicans, and when he refused to find a seat in the Cabinet for their own particular hot gospeller, Professor Dossetti, they rebelled and forced their sympathiser, Signor Fanfani, to reject the Ministry of Labour—a key post he had held with distinction for a long time. Signor Fanfani's removal makes it easier for Signor Pella at the Treasury to continue a policy of strict deflation, while in Parliament the Prime Minister is faced with potential semi-opposition from the progressive wing of his own party.

A Freebooter in Java

Ex-captain Westerling is probably no more than a flash in the pan. But, for the present, he has made quite a big flash; and it has come at a very awkward moment for the fledgling Indonesian Government. He represents nobody and nothing—except perhaps the psychological heritage of wartime commando life, combined with the fact that Indonesia is still wide open to the depredations of malcontents like the men under his command. Where the success of Westerling's recent raids on several towns in Java holds a serious threat is in the evidence it offers to rebel leaders with wider backing that tactics such as his can succeed. For this reason, one of the most disconcerting reports to come from Java in the last few days has been that, as a Moslem—his father was Dutch, his mother Turkish—Westerling may himself gravitate into the *Dar ul Islam* movement.

Dar ul Islam is the biggest and most immediate threat to stability in Indonesia during the coming months, and there can be little doubt that a good deal more will be heard of it. An extremist, religious organisation, its exact aims are hazy; but it is already in open rebellion against the new Republic of Indonesia on the ground that it is a secular state. It virtually controls a strip of territory in Western Java—an area with pretensions to autonomy—and its followers are increasing. The Government in Jakarta would be extremely unwise to let any inhibitions about invoking the assistance of the Dutch colonial army stand in the way of doing all in their power to break the military power of *Dar ul Islam*. Above all, this should be done now—before side-shows like the Westerling *condottieri* undermine even the tenuous authority which the new state as yet possesses in some parts of its territory.

Medical Research

The only item in the report of the Medical Research Council (Cmd. 7846) for the years 1945-48 to catch the headlines was the account of the research into the effect of feeding dogs, and other animals, on "improved" flour—that is, flour treated, as it has been in this country, the United States and Canada for many years, by nitrogen trichloride (the "agene" process) to improve its appearance and its baking qualities. Dogs fed on biscuits made from this flour may develop canine hysteria and other animals may develop similar symptoms. When the results of this research were first published in 1946, there was immediate speculation whether flour treated by this process could have harmful effects on man. The Medical Research Council now reports that short-term investigations on both sides of the Atlantic have not revealed any acute ill-effects on human beings. Nevertheless, it points out that toxic action of a chronic kind remains a possibility, and it is for this reason that the Ministries of Food and Health announced last week that the

agene process, which was prohibited in the United States last August, is to be replaced as soon as possible in this country by treatment with chlorine dioxide, which has so far not been shown to have any ill effects on man or beast.

Selection of this one item from the Medical Research Council's report tends to obscure, however, what a very important body it has become. Its grant-in-aid has risen from £195,000 in 1938-39 to a total of £1,135,000 (for current and non-recurrent expenditure together) in 1948-49, and to £1,618,000 in the present year. More important than this big increase in its grant is the dominant position it is gradually obtaining in medical research in this country. There are obvious reasons why, for instance, the trials of streptomycin in the treatment of tuberculosis should have been undertaken by the Medical Research Council, for it is important that trials of this sort should be carefully controlled. But it would be unfortunate if the idea were to get around that the only worth-while medical research in this country was that undertaken under the auspices of the Council. The difficulty is that individual hospital groups have too little money to devote to research; it may have to be financed solely from the "free moneys" allocated to them out of the hospitals' endowments fund.

* * *

Housing Costs

A larger survey has now confirmed the analysis of housing costs discussed in an article in *The Economist* on January 14, 1950. The survey was conducted on behalf of Political and Economic Planning by the Institute of Municipal Treasurers and Accountants and has been published in a broadsheet entitled "Economics of the Council House." The survey covered 162 local authorities with 544,000 prewar and 102,000 postwar council houses. The average costs of erection in 1949 were £1,323 per house, excluding the cost of land and site development. With these included the average cost of houses dealt with in the survey was £1,512.

The authors of the broadsheet are concerned principally with the effects of costs on rents. It is calculated that on a capital cost of £1,500 the economic rent (excluding rates) is 25s. a week, to which the statutory subsidies contribute 8s. 6d. a week, leaving a balance of 16s. 6d. In fact it was found that over two-thirds of the authorities were charging less than the economic rent for their new houses, and that the balance was coming out of additional rate subsidies or by raising the rents of prewar houses. The broadsheet avoids any but the briefest discussion of remedies. It does, however, make a case for reducing the size of some houses by cutting out the third bedroom or the parlour; it comes down strongly against economies at the expense of quality; and it cautiously skirts around the problem of subsidies. Even if it avoids attempting the answers, the document does a useful job in providing a base from which those answers can be sought.

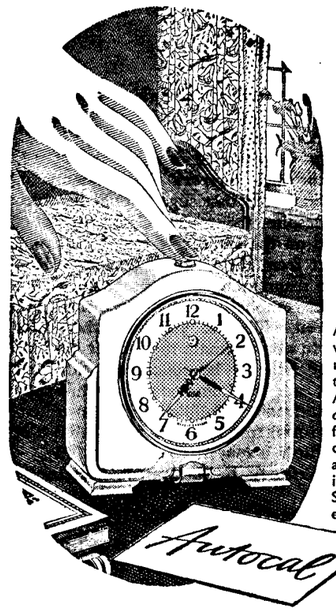
* * *

Anglo-American Exchanges

The necessity to conserve dollar expenditure is obvious and paramount, but the way in which the economies are made, especially among the smaller items of the bill, makes one wonder what sense of values obtains behind the portals of the Treasury. The Ministry of Education has recently been compelled to halve the number of teachers which it will send to the United States this year under its teacher exchange scheme. Last year 97 British teachers changed places with 97 American teachers: so successful was the result that it was intended to exchange 150 teachers in 1950 and 200 in 1951, but, according to information obtained from the Ministry of Education, the number has now been reduced to 74 for this year.

On a mathematical calculation alone this is a very curious decision. Each British teacher going to the United States received in addition to his or her regular salary an allowance of £225 from public funds to meet additional living expenses. The cost of the journey is paid from non-convertible sterling under the Fulbright scheme. On the dollar exchange the British Government gains, since it is reckoned that the American teachers spend about $1,000 more during their sojourn in England than their British counterparts are permitted to spend in the United States. Thus, since the exchange is strictly reciprocal, the Treasury, for the saving of just over £5,000, have probably lost $23,000 in dollar income by reducing the numbers below last year's figure.

On a more profound calculation Britain has lost much more. An English schoolmistress working in a small town in the United States can reach the hearts and minds of Americans who are beyond the reach of the propaganda of the British Information Services. If constant communication between individuals contributes anything to international understanding, there can be few aspects of British policy towards the United States more important than presenting Durham to Delaware and Wiltshire to Wyoming. If the bill for British expenses in the United States must be cut down, a more fruitful field could be found in the expenditure of the Foreign Office—particularly at Lake Success—than in truncating a scheme which attacks the fundamentals of the Anglo-American problem.



Back to Methuselah

IF we were asked to discard rifles and use only cross-bows—to lay aside steamboats, and be content to shove barges along by poles stuck in the mud—to reject the plough, and take to grubbing the earth with our fingers—to cast off silks and woollens, and clothe ourselves with the undressed skins of beasts, or the leaves of trees—we should at once indignantly refuse, and regard the proposer as little better than mad. But what seems so utterly absurd in all the material arts, is considered feasible, and, indeed, the only means of helping society in politics and religion. Dr Pusey and his friends have carried back the latter to the middle ages as its pure source, and have got rather more than half way towards Rome. Some persons say they have overlooked the Eternal City, and gone beyond it. So in politics a certain party would go back to restrictions, to prohibitions, to sumptuary laws, to feudalism, or even to the usages of the patriarchal ages.

As a very modest step backwards, one journal and one clique propose to re-establish guilds. With guilds there must come into use a restriction on the number of each class of tradesmen, and the necessities of society for an increase must wait for the pleasure of the guild. Guilds carry with them monopolies in favour of each guild; a subserviency of all the individuals belonging to it to the elders, and the restoration of a rigid system of apprenticeship and journeymen. Re-establishing guilds implies re-establishing the trades that composed them, and implies putting an end to the many subdivisions of trades that have now sprung from the ancient guilds. . . . Guilds, indeed! between going back to them, and going back to the very origin of society, there is no alternative. One is as feasible as the other, and when guilds are re-established, it will be proper to look out for the means of quietly suppressing all civilisation, and even society itself.

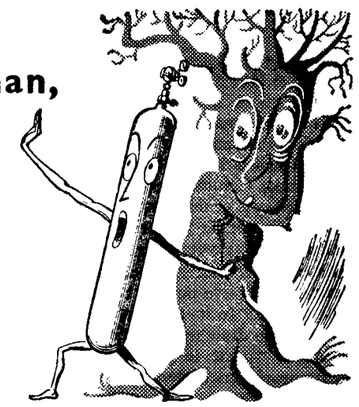
Another important reason for the speed and flexibility of Underwood Sundstrand Accounting Machines.

You're looking at the control plate of an Underwood Sundstrand Accounting Machine. This little device does virtually all the "thinking." The operator simply inserts forms and enters figures. From there, the Control Plate takes over and enables the machine to complete the work automatically. You get controlled accuracy, too. Printed evidence of accuracy is automatically furnished, on either a proof tape or an audit sheet, the instant each posting is completed. May we explain further, without obligation, in your own office?



Simplicity in Aligning Forms. Operators insert forms directly to the writing position in one fast, easy motion.

Woodman, spare that tree!

Fencing, in these days of timber shortage, is a big problem for the farmer. Solutions can be found, however. One farmer bought scrap steel tubing from an Air Ministry dump. With the help of a B.O.C welding process, this tubing was made into gates and fencing for the farm, with excellent results. When it comes to "making-do," fabrication can work wonders. The B.O.C have lots of advice to give on this subject, if you would care to get in touch with them.

Letters to the Editor

Parliament and the Law

SIR,—I think it a pity that before your article in *The Economist* of January 28th stated the conclusion: "the means by which Parliament can exercise an effective control over delegated legislation are still inadequate," it made no mention of the Select Committee on Statutory Instruments. A glance over the reports of that body will show that extra-parliamentary legislation is not (as yet, at any rate) as formidable a constitutional menace as your comments suggest.

For example, concern is often expressed at the tendency of delegated legislative powers being used to oust the jurisdiction of the Courts. In its terms of reference, the Select Committee is required to draw the attention of the House to any statutory instrument "made in pursuance of an enactment containing specific provisions excluding it from challenge in the Courts." Since its inception in 1944 the Select Committee has made no such report.

A word, too, upon your complaint that "in a whole mass of modern legislation, the aggrieved citizen . . . has no appeal but from one official to another." You make particular reference to the Agriculture Act, 1947, and I assume you have Agricultural Land Tribunals principally in mind. These tribunals, whose decisions are binding upon the Minister when he wishes to dispossess a bad farmer, certainly do not, and indeed cannot, consist of officials. The chairman must be a lawyer of seven years' standing, and of the two other members, one must represent a farming and one a landowning interest. The Minister, if he thinks fit, can add two assessors from a panel nominated by the Royal Institute of Chartered Surveyors.

I should be among the last to deny support to the libertarian spirit in which the article is written; but it is nevertheless clear to me that its case needs much more careful preparation than it usually gets.—Yours faithfully, MAURICE H. SMITH

New College, Oxford

[The necessity to review the whole field of law-making prevented a detailed examination in last week's leading article of the processes of delegated legislation. Mr Smith is undoubtedly correct in saying that the creation of a Select Committee on Statutory Instruments creates a safeguard against departmental encroachments upon the power of the Courts. He does not, however, dispose of the central objections to extra-parliamentary legislation which are (*a*) that it is not subject to amendment in Parliamentary Committees and (*b*) that there is neither the opportunity nor the obligation to give such legislation the publicity accorded to statutory legislation (a fact to which attention was drawn by Lord Justice Scott in Blackpool Corporation *versus* Locker in December, 1947.—EDITOR.]

Commonwealth Sugar Talks

SIR,—There are certain inaccuracies in the comments under the heading "Commonwealth Sugar Talks Adjourned" in *The Economist* of January 21st.

First the Colonies concerned included Fiji and East Africa.

Secondly, the Colonies have never "demanded a fixed price covering the whole period" of the proposed agreement. They have always asked for prices to be negotiated annually and His Majesty's Government in their statement of August, 1949, accepted negotiation on a basis of "reasonably remunerative prices" and later agreed that negotiations should be annual.

Thirdly, the present offer to the Colonies provides for only 1,100,000 tons to be bought by the United Kingdom at prices so negotiated. As regards the balance of 450,000 tons included in the offer to the Colonies, no guarantee whatever either as to price or outlet attached—only a pious hope was expressed.

It is here that the Colonies have their greatest complaint, and they are justified in regarding this part of the offer as a threat rather than a promise. It is not an offer of an assured market but an edict to restrict their production below an economic minimum. An offer of an "outlet" at world prices dictated by Cuba plus preference is well nigh worthless. For the Colonies will have no opportunity of absorbing losses, seeing that reasonably remunerative prices only are to be paid for the quantity carrying a price guarantee.

In August His Majesty's Government declared that it was their policy to "*maintain and improve* the economy of Colonial territories" and indicated that sugar would be given special consideration. Despite the many Commissions of Inquiry that have reported on the subject, it would seem that even now Ministers, apart from the Colonial Secretary, have no real conception of the magnitude of the problem.

Finally, it needs to be emphasised that even had His Majesty's Government been willing to guarantee the whole colonial 1,550,000 tons, there would remain the further question of whether they have any right to be concerned with their obligations to producers outside the Commonwealth while their obligations to the Colonies remain unfulfilled, with consequential mass unemployment, social unrest and a formidable dole to be provided by the British taxpayer.—Yours faithfully,

The West India Committee A. E. V. BARTON, Secretary

Redistribution of Income

SIR,—In the article on "Redistribution of Income" in *The Economist* of January 21st you state that "It is a pity that statistics giving the number of incomes in different ranges of *net* income are no longer available, since these are more revealing. The latest of that series relate to the financial year 1945-6. . . ." Although it is true that the figures for 1945-6 are the latest given in the White Papers on National Income and Expenditure, later ones, for 1947-8, presumably on a comparable basis, have been published in the Ninety-First Report of the Board of Inland Revenue (Cmd. 7738) Table 32.

I think it worth while drawing attention to these later figures for if, as I assume, they are compiled on the same basis as the 1945-6 figures, they show some substantial changes in the distribution of net income after tax, as can be seen from the following table:—

Range of Net Income	Number of Individuals		
	1938-39	1945-46	1947-48
£120-£150	...	...	2,030,000
£150-£250	4,500,000	7,950,000	8,470,000
£250-£500	1,820,000	5,225,000	8,740,000
£500-£1,000	450,000	652,000	1,378,000
£1,000-£2,000	155,000	137,500	320,000
£2,000-£4,000	56,000	34,615	58,500
£4,000-£6,000	12,000	840	3,430
Over £6,000	7,000	45	70

—Yours faithfully,

University of Manchester E. DEVONS

SIR,—Your article two weeks ago on the Redistribution of Income recalls to my mind serious doubts about the reliability and value of the statistics used on this subject. That many middle-class people are much worse off than before the war is evident, and that many wage earners are better off, is equally obvious. But, do the published statistics really tell a reliable tale?

How many profit earners are tax dodgers? How many wage earners have secondary jobs, or casual incomes never coded for PAYE? What is the extent of tax free allowances or expense accounts? To what extent are the upper- and middle-classes deliberately drawing on capital in a last attempt to meet expenses, or in the belief that if they do not spend it on themselves the state will soon spend it on somebody else?

Is *The Economist* in a position to comfort us by confirming that official statistics still have practical value?—Yours faithfully,

2 *Copthall Close, E.C.2* G. E. ROSS

[Obviously there are limitations to the accuracy of any statistics and some of the particular limitations were made clear in the article. If by "practical value" Mr Ross means that official statistics of incomes, carefully used, are a useful approximation to the truth, we will cheerfully assert faith in them. Surely it is wiser to accept them as such than to say that the truth is unattainable because it cannot be defined to three decimal places.—EDITOR

Bitter Sweet

SIR,—It may be true that controls produce vested interests but the example of the unrationed sweets is not a good one.

The desire of the chocolate and confectionery industry in this country is that as soon as is possible their businesses shall be operated within the price mechanism, for the restoration of which you are so redoubtable an advocate. It is not, however, within the power of manufacturers to create the conditions under which the price mechanism can operate; that is the province of governments and economists. What we do know is that the addition of a further supply of chocolate and confectionery to the existing ration will bring us nearer to the point when supply and demand equate. It is for this reason that we have supported the Ministry in their decision.

The various individual lines which are to be brought within the ration have yet to be examined, but it is known that the bulk are made from an imported compound of sugar and fat, which can be and is being used both by established manufacturers and the others. If the resulting goods are confectionery, then they are rationed goods.

The difficulty is not one of rationing but of price control. The imported compound is being sold at a price higher than that which would be justified if the constituent ingredients were bought in this country. To meet the difficulty, the Ministry propose for the present to exempt from price control the lines made wholly (but not partially) from the unallocated ingredients and to allow the goods to find their own level in the market. This exemption, made because of the use of an expensive ingredient, must, it seems to me, lead to other applications for exemption or relaxation. If cumulatively they hasten the day when all goods will be allowed to find their level in the market, so much the better.—Yours faithfully,

ARTHUR WHITTAKER, President

The Cocoa, Chocolate and Confectionery Alliance Ltd.

Report on Power

SIR,—May I congratulate you on your analysis of the British Electricity Authority's Report and Accounts? Further consideration of this ponderous and ill-written document, which never uses a short word where a long one will do, adds even greater force to your criticisms.

At no point does the BEA Report attempt to deal with the crucial issue either of the optimum size of the industry or of the general level of electricity prices, as opposed to the minor problem of the standardisation of tariffs. These are in fact different aspects of the same problem, though the Report gives no indication of awareness of the point. The Authority's approach to the problem of expanding generation capacity seems to be as follows. A general level of prices was inherited from the private concerns; at this average price demanded per unit of power there is now a great "shortage" of generating plant, concentrated at peak load hours; to bridge this gap a vast expansion programme is necessary; physical shortages and controls have stood in the way of the programme and have, therefore, taken the matter out of the BEA's hands. The attitude really seems as naive as this.

Now, surely the size of the industry must in the last resort be set by the economic demand for electricity. This in turn requires a rational pricing system; in its absence consumers of current may well receive a concealed subsidy from the rest of the community through an artificially low price for power and excessive diversion of resources to investment in generating stations. This is just what is happening at the moment. The average price of a unit of current has risen only 25 per cent in the last ten years, and the average price to commercial and domestic consumers has actually fallen by 9 per cent. Can technical production, efficiency or elasticity of demand, even outside peak hours, have risen to an extent even approaching

Take the finest leaf from the Golden Belt of Old Virginia and add to it (the touch of genius) a touch of the leaf that has made certain cigars world famous, and you have just the raw materials for this magic blend. Before it is worthy of your favourite briar there is the added touch of blenders whose skill is hereditary, so that finally you can weave your dreams in smoke clouds and see solutions to the insoluble through the smoke rings. For this is a tobacco that is not just a smoke but a way of living, not just another fill but another outlook, not just another brand but a bond that links you and your pipe for ever to the surname Balkan Sobranie.

Made by the makers of Balkan Sobranie at Sobranie House, London, E.C.1

the rise in the price of coal and competing sources of power, and in capital costs to an extent, therefore, justifying such a low general tariff structure? Perhaps the BEA have received a political directive from the Minister requiring prices to be held low, as during the war; if so, why does not the Report stress the fact? In any case your point of an excessive investment programme seems well proven.

One seems entitled to demand, first, what the Authority propose to do about differential time-of-day charging and whether they will continue to adopt an almost apologetic attitude for extra revenue obtained; and secondly what hard thinking Lord Citrine and his live wires have done about the general level of tariffs.—Yours faithfully, J. S. B.

Trading in Spain

SIR,—In *The Economist* of December 24th you publish under the heading "Trading in Spain" an article by a correspondent giving a picture which is at variance with my own personal experience, during a number of years of trading relationships with that country.

The Spanish Ministry of Commerce does, in fact, publish some details of import and export licences but, neither the price nor the final destination of the goods—apart from the name of the country—are published in the official trade journal. As is the case with most countries today, Spain places restrictions on the import and export of goods, and the publication of some particulars of the licences issued goes to satisfy the public that fair treatment is assured to all.

On the question of rates of exchange your correspondent says:—"Every commodity, either imported or exported, has a different rate of exchange . . . according to the firm which figures as exporter on the invoices or bill of lading." Spain has a differential exchange system but the rate of exchange is applied not to a firm but to a certain commodity, viz., mandarines, grapes, onions, etc. The case is similar where a grant of a percentage of "free sterling" is made; it is applied to a commodity and not to a firm. Thus all exporters of the same commodity were accorded similar treatment.

As an example of the "very irrational manner" in which rates of exchange are sometimes fixed, your correspondent writes:—"Nevertheless, because of the special connections which the shipper of the natural juice had at the Ministry, he succeeded in obtaining the rate of exchange of nearly 75 per cent higher than that of the shippers of juice concentrate, and in this way forced several factories to work short time because they could not stand the competition from the specially favoured firms." Having business connections with one of the largest Spanish exporters of juices I am informed by them that all exporters of natural juice received the same rate of exchange and 50 per cent free sterling whilst all exporters of concentrated juice received a higher rate of exchange without a free sterling concession. Thus, all exporters of the same commodity were accorded similar treatment.

I feel that these details should be mentioned in an endeavour to give a less harsh perspective than that of your correspondent's article and assist in the expansion of trade to the mutual interest of both countries.—Yours faithfully, W. HARWOOD.

Books and Publications

Myth of the Industrial Age

"The Theory and Practice of Communism." By R. N. Carew Hunt. Geoffrey Bles. 211 pages. 12s. 6d.

IT is a tantalising occupation to try to forecast what position will be allotted to Marx when, the rough and tumble of the industrial revolution being over, an impartial history of the present age can be written. Although no final judgment is yet possible, a reassessment of Marx's importance to the present day is overdue, and Mr Carew Hunt's book is a valuable contribution towards it. In considering the man the main task must be to distinguish between the intellectual, and the emotive, sides of his work: this Mr Carew Hunt does, showing that while the last seventy years have discredited his philosophy, his power to influence history is as strong as ever. The first part of this very readable book is devoted to a detailed exposition and refutation of nineteenth-century Communism and of Marx's thought. He is shown as taking his dialectical philosophy from the German classical philosophers, his theory of the state and revolution from the French revolutionary tradition, and his economics from the classical school of British political economy. (The author might have added that Marx read *The Economist* regularly.) In the words of Lenin he "continued and completed the main ideological currents of the nineteenth century belonging to the three most advanced countries of mankind." In refuting almost the whole system Mr Carew Hunt is careful not to fall into the common error of attributing to Marx positions never occupied by him. The attack falls naturally under two heads, and shows much original and intensive thinking. It first demolishes the claim that Marxism is "scientific" and shows that its fundamental premises require, like other dogmas, an act of faith for their acceptance. Having done this it attacks the claim that if the premises are once accepted, the whole follows by irresistible logic. So far from this being true, large areas of Marx's thought are shown to be internally contradictory, or at variance with known fact. There is, however, generous praise for his "economism" from which has grown the twentieth-century insistence that all history must be related to social history.

The second part threads its way confidently through the maze of controversy, heresy-hunts, and the relations between the disputatious socialist sects which so resemble their early Christian counterparts. The third part deals with the coming of the idea to power in Russia. This latter part is informed and clear, and can be recommended to those who have seen words like narodnist, khvostism, Zemlya i Volya, and have wanted to know more about them.

His conclusion is a plea for the enthroning of a western creed. The strength of Marxism has lain in

> its power to influence, as it certainly now does, large areas of the intelligentsia by whom it is relayed downwards. It is in the last analysis a body of ideas which has filled the vacuum created by the breakdown of organised religion as a result of the increasing secularisation of thought during the last three centuries, and it can only be combated by opposing to it a conception of life based upon wholly different principles.

That is certainly one way of combating it. Another is to do what the western powers are doing to contain it politically, and a third method is to do what Mr Carew Hunt has himself done—to expose its contradictions, and to bring nearer the day when it will require the same order of courage on the part of an intelligent man to confess oneself a Marxist as it now does to support the flat-earth theory.

The German Secret Service

"Canaris." By K. A. Abshagen. Union Deutsche Verlagsgesellschaft, Stuttgart. 403 pages. 50 D.Marks.

ALMOST five years after Hitler's elimination there is still an unabated spate of German books on the Nazi regime. The latest is about Admiral Canaris, that odd character who in 1935 became head of the *Abwehr*—the secret service of the German armed forces—and held the post for nine years. His biographer, a former major, was himself an employee of the *Abwehr*. The book contains much that is mere gossip and lacks precise information, which is understandable since Canaris's own records were destroyed before he was arrested. Yet the author gives an interesting story of internal strife during those nine years which is sure to be widely read in Germany.

Canaris was the son of a Ruhr industrialist, and joined the German Navy in 1905. In 1915 he escaped from Chile after having been interned there when the cruiser *Dresden* had been sunk by H.M.S *Glasgow*. In the last months of the first world war he commanded a U-boat in the Mediterranean, and in 1919 he witnessed the Spartacist disturbances in Berlin, where he was a member of the court-martial which tried the murderers of Karl Liebknecht and Rosa Luxemburg. His naval career was uneventful until, in 1934, on the point of retirement, he was ordered by Admiral Raeder to take charge of the *Abwehr* organisation, which came under Blomberg, the Defence Minister.

In those days the *Abwehr* was the only German organisation enjoying complete freedom from Gestapo surveillance. By 1937 Canaris had decided that Hitler and his policy would prove disastrous to Germany, and in this view he was apparently supported by his immediate subordinates, all regular officers of the armed forces. Yet far from using his unique position to further a *coup d'état*, he left such action to others, and concentrated on preventing Himmler and Heydrich—the enemies within the gates—from encroaching on his domain. By the use of guile, and with some support from the spineless Keitel, Canaris succeeded in delaying the day of reckoning for a number of years, and this was evidently his supreme achievement.

The reader is asked to believe that, once war had broken out, Canaris deliberately exaggerated his agents' reports about the strength of Germany's enemies, thereby hoping to dissuade Hitler from widening the conflict. It is thus hardly surprising that other German writers have imputed to him both treachery and sabotage. But they are wrong, for it is evident that he was without influence on Hitler's policy, and that at best he helped a number of wanted individuals to escape from the Gestapo. He may even have warned Switzerland and Spain of German aggressive intentions, for he was an ardent admirer of Franco and frequently visited Spain.

By February, 1944, Himmler had sufficient evidence of Canaris's clandestine opposition to obtain Hitler's sanction for his dismissal, whereupon the greater part of the *Abwehr* was incorporated in Kaltenbrunner's security organisation. Canaris was not implicated in the July plot, through which his former Chief of Staff, General Oster, and many others lost their lives. But after the failure of the attempt he was at once arrested, and after nine months' solitary confinement and torture, apparently borne with dignity, he was eventually hanged in April, 1945, missing salvation by only three weeks. He had played an unwise game, being neither bold enough to ensure success nor cautious enough to escape the hangman's rope.

The author's claim that Canaris built up a first-rate military intelligence system is disproved by the facts. The time, location and extent of the Allied landings in North Africa and again in Normandy came as a surprise to the German Supreme Command. The *Abwehr's* main function was to procure intelligence, and there was no co-ordination between procurement and evaluation, which latter function was performed by the staffs of the three services. The author omits to point out that a number of *Abwehr* agents are known to have used their position to escape from the country or to strike a better bargain with the Allies. Such dangers exist in the secret services of every country, but under the Nazi tyranny the risk of defection was inevitably greater.

Queen of Sciences?

"Makers of Mathematics." By Alfred Hooper. Faber and and Faber. 401 pages. 18s.

MR. HOOPER, whose school textbooks on trigonometry, algebra and arithmetic are widely used, has now written as agreeable an introduction to the history of mathematics as exists. He believes it to be high time that the dry-as-dust notion so often associated with mathematics was swept away and the student introduced to the fascination, not only of the story of mathematics and mathematicians, but of the actual mathematical processes themselves. In describing mathematics as the "Queen of the Sciences" he may have transferred a title hitherto normally given to theology; but if his book does not transform rebellious youth into loyal subjects we may despair of ever doing so.

The creation of mathematics is undoubtedly one of the most awe-inspiring productions of the human mind. It is one to which many peoples, but particularly those of Babylonia and Greece in ancient times, India and the Arabian world in the Middle Ages, and western Europe in modern days, have contributed. Mathematics and music, so much akin to each other, are the two genuinely international languages. Mr Hooper shows how our modern mathematical notation has developed. It is seldom that mankind has hit on the right notation at the start, and Mr Hooper brings out the importance of a good notation in facilitating mathematical progress. The clumsiness of the Roman notation was probably a main reason why that gifted people made no progress in mathematics; and it cannot be argued that if they were mathematically minded they would never have put up with such a notation, for the Greeks, who took so many brilliant first steps in the history of the subject, never seem to have dreamed of a notation in which the value of numerals would be indicated by position—the essence of the Indo-Arabic system in use today.

The international influences in mathematical development are also well shown by the terms used. How much more interesting mathematics could be made to boys and girls, with Mr Hooper's help, if it were explained that "arithmetic" really ought to be used for "algebra," that "algebra" means "reunion," that "sine" means "bosom," and so on. This

MIND YOUR OWN BUSINESS

What is my business? To be the objective judge between points of view. (This is election month!)

What tools do I need for the job? Facts—nothing but naked facts, as recorded in KEESING'S—leaving you free to form your own opinion.

What is KEESING'S? The one and only KEESING'S is an authentic, unbiased, concise and always up-to-date News-plus-Reference service. It is issued every week in loose-leaf supplements which record the essential data on Politics, Economics, Social Questions, etc. at home and overseas tabulated for convenient filing in a book-like Binder.

What is unique about it? Its 'living,' cumulative Index which is constantly renewed to embrace the latest items, giving immediate access to every entry.

What is my next step? Just fill in the coupon, post it today and look forward to full particulars about this useful and fascinating requisite for minding your own business efficiently, responsibly, objectively.

Name ..... Address ..... Econ.(3).

last transmogrification of a Greek idea as it passed through Indian and Arabic hands is one of the most fantastic things in the history of language.

The bulk of Mr Hooper's work is, of course, taken up with the main mathematical processes and the mathematicians who advanced the science. The selection of the processes is well made and they are lucidly described. The story is roughly carried to School Certificate standard, including calculus, but stopping short of functions of a complex variable. Those who have burst through this barrier into the clear world beyond perhaps need no persuasion of its wonders, and it is to be hoped that Mr Hooper's book may convince many that the early difficulties are worth overcoming.

There are few judgments by Mr Hooper to which exception can be taken. Perhaps it is churlish to deny Diophantus the title of "Father of Algebra," for the use in equations of an unknown quantity and the invention of a sign to describe it are immense steps forward in the subject. Incidentally that sign as given in the manuscripts is not correctly represented, as Mr Hooper has represented it, by the Greek letter *zeta*. Ptolemy's great book was not called by him *Mathematikes Suntaxis*, but *Mathematike S.*, and there can seldom have been a piece of more canine Latin than Mr Hooper's derivation of abscissa from *ab*, "from" and *sciss*—"cut."

Popular Geography

"The Far East. A Social Geography." By A. D. C. Peterson. Duckworth. 336 pages. 21s.

THE author of this book modestly declares that it "does not pretend to add anything to the world's sum of knowledge," but he also says that it "is meant to be read," and not merely used as a work of reference. It is indeed readable and provides a useful outline account of the countries and peoples "from Karachi to Kamchatka" with more politics than is usual in a geographical handbook and more geography than is common in surveys of current affairs. Mr Peterson seems to have lived in, or visited, most of the countries he describes, and particular travel experiences have coloured his account—sometimes, perhaps, to excess, as when he provides a picture of a Bengal village market with the caption: "heat, damp and crowds, not very cheerful," but finds that the Chinese "radiate practical good sense and happiness." The style varies considerably; the book as a whole seems to be designed for reading in the higher forms of schools, and is written in a chatty, conversational manner, but with lapses into literary English. Mr Peterson has an infectious enthusiasm for his subject and many illuminating and sensible things to say about it, but he is not always accurate, and his mistakes are sometimes curiously inept, as when he plots a map of the Philippines over an outline of the British Isles and then states below that the extent of the former is "roughly double" that of the latter, which the map itself shows to be untrue—the total area of the British Isles is in fact about 5,000 square miles larger than that of the Philippines.

It is open to question whether India and Pakistan should ever be included under the designation "Far East." On the other hand two things at least link India to China, Japan and south-east Asia rather than to more westerly lands—a monsoon climate and massive population. Mr Peterson has a right sense of proportion in his emphasis on the pressure of population on food supply as a factor underlying all the political issues of this part of the world, and his picture with the title "Asia's problem: hunger" would alone justify this book as a piece of intelligent, popular publicity. It may be true enough that with the resources of modern science the earth should be able to feed even more human beings than it now supports, yet multiplying peoples without either openings for emigration or sufficient export trade to buy food may continue to suffer from chronic malnutrition and even from famine.

Benelux

"Benelux." By Dr M. Weisglas. Elsevier, Amsterdam.

FROM the first days after the liberation of western Europe the economic co-operation and integration of Holland, Belgium and Luxemburg has been a point of interest. But apart from Georges de Leener's "L'Union économique Hollando-Belgo-Luxembourgoise" (which was written as far back as 1945) no complete analytical study of the subject had been made until Dr Weisglas wrote this book which covers the development of Benelux until the end of 1948. The author, who as press officer of the Dutch ministry of economic affairs and as a student of economics knows what he is talking about, traces the history of the Benelux idea. He distinguishes the present customs union and the future economic union, and shows how much "integration" of prices, subsidies, investment, finance and monetary policy is necessary to reach the last phase. Finally he places Benelux in the larger whole of the Marshall Plan. He shows that Benelux, far from hindering integration in a wider area, is "an example and a laboratory" for further European economic co-operation.

Until the book is translated, the twenty-two statistical tables will be the main attraction for foreign readers. The remainder of the book, however, is important, too, for a wider area than Holland and Belgium alone. The first point of Benelux is that Holland and Belgium increase their joint position in world politics and economic affairs; Dr Weisglas points out that the second point, that is specialisation and, as a consequence, cheaper production in the larger area, can be just as important, particularly if applied to all western Europe.

Shorter Note

"Equilibre Physique, Equilibre Biologique, Equilibre Economique." By Jacques Dumontier. (Nouvelle Bibliothèque Economique.) Presses Universitaires de France. 239 pp.

IN this exacting, elegant and stimulating book M. Dumontier endeavours to trace, isolate, analyse and develop the notion of economic equilibrium by way of an examination of the concept of equilibrium in general. He begins with the simplest equilibrium of all, the equipoise of two mechanical forces resulting in immobility; he pursues the idea through instances of growing complexity before passing to the different but related concept of equilibrium in biology. Armed with these distinctions, some broad, some extremely refined, he examines the concept of economic equilibrium as expounded by the Lausanne School, and finally outlines, in what is virtually a separate essay, his suggestions for a more complete, up-to-date, logically satisfying and fruitful definition. Economics, in his view, has suffered throughout its history from a lack of clarity in its terms, and particularly in the key term with which he is here concerned; it has argued in concealed metaphors and analogies without sufficiently close examination of their content. He does not claim, himself, to supply the whole of the specific apparatus of thought; but at the lowest estimate he opens up suggestive lines of discussion and speculation

AMERICAN SURVEY

Coal Under Pressure

(From Our American Staff)

LOOMING over the prolonged dispute between the coal companies and Mr John L. Lewis is the over-expansion of the mines, both in capital equipment and number of employees. Approximately two-thirds of the present industry, operated on a full-time basis, could supply all visible peacetime markets. The growing industrial and household demand for energy is being supplied, increasingly, by hydro-electricity, by petroleum in its various forms, and by natural gas. The large-scale water-conservation developments of recent years have made possible vast new networks of electric power; elsewhere oil and natural gas are ousting coal in the generation of electricity. The need to cut costs has led the railroads to shift from coal-burning locomotives to diesels, though, as carriers, their revenues are reduced by the declining demand for coal. The installation of new pipe lines is spreading the use of natural gas, a cheap and clean fuel.

Among householders, the desire to get away from the boiler-room is unanimous. Automatic coal stokers, though they sold well while the post-war oil shortage slowed up conversion to oil burners, provide only a partial escape. The personal touch is still required to dislodge clinkers and carry them out. Oil is cleaner and wholly automatic, while gas has the additional advantage that, if anything goes wrong, the simple dialling of a telephone number will bring the distributing company's service man running, free of charge. The development of new uses for coal, in plastics and the like, has provided only limited compensation for these trends.

Source: US Dept. of Commerce

The recent advertisement of the National Coal Association, headed "The Black Days of 1949" and showing a calendar with 110 days of the "permissible 298 working days" blacked out, "because most of the miners were called off their jobs by a UNION MONOPOLY," thus took a highly optimistic view of sales possibilities. In 1944, at the peak of the war effort, the average number of days worked was 278, and in the nineteen-thirties the highest number worked in any year was 199 in 1936.

One of the few assumptions that can safely be made about Mr Lewis's motives is that the three-day week was an effort to share the available work among all miners and among all the mines, efficient and inefficient alike, as well as a move to decrease reserves of coal and thus increase the miners' bargaining power. In this latter aim, although reinforced in the past month by "wildcat" strikes by about a quarter of the miners, it has been only moderately successful. The 435 million tons of coal produced in 1949, while considerably below the 1947 peak of 631 million tons, was more than was produced in seven out of the ten years of the nineteen-thirties. By last week, when it was agreed to resume negotiations, the National Coal Association estimated that stocks still stood at 23 million tons, or fifteen days' supply, while Dr Boyd, Director of the Bureau of Mines, put them much higher, at 32 million tons, or 28 days' supply. Dr Boyd warned the President, however, that the national welfare would be endangered unless production was immediately increased, and thus laid the foundation for the President's effort, this week, to bring pressure on both sides to conclude an agreement.

This point would have been reached sooner except for three factors. One is the phenomenally mild weather; if Mr Lewis was dreaming of a white Christmas, Santa Claus must have thought he had not been a good boy. Another was the steel strike, which eliminated one of the major sources of demand for coal and affected the requirements of related industries. Finally, the institution of a pension plan has failed, in its initial phase, to reduce the number of miners as much as was expected. In order to be eligible for a pension a man who retired before 1946 must have spent 20 years in the mines, and the desire to qualify for a pension has, to a great extent, offset retirements.

The first sign of movement out of the coal *impasse* came with the filing by Mr Robert Denham, the general counsel of the National Labour Relations Board, of a request for a court injunction against the United Mine Workers. The general charge was that the UMW was refusing to bargain in good faith and attempting to coerce the operators through the three-day week into renewing an illegal contract. The request for this injunction (which is not to be confused with the general injunction prohibiting for 80 days a strike that creates a "national emergency") went to court on Wednesday. But six days earlier Mr Lewis had taken some of the wind out of Mr Denham's sails by promptly accepting an offer of renewed negotiations from the operators. Indeed, he even offered to meet the employers at the very hour that Mr Denham was scheduled to appear in court, knowing it would be hard to prove that the miners were refusing to bargain in good faith when they were already sitting at the conference table. The operators, however, postponed the meeting until after the court hearing.

Mr Truman's intervention recognises that neither of these processes will necessarily lead to the immediate resumption of full-scale production. Therefore he proposed, if no agreement seemed to be in sight, that all miners should return to a full working week for 70 days, while a fact-finding board investigated and drew up recommendations for an equitable settlement. This is the Taft-Hartley procedure for dealing with a strike that threatens the national welfare, without the Taft-Hartley stigma, and with the additional power granted to the board of submitting recommendations. It was the device used by the President to end the steel strike.

What the operators would like, ideally, would be an unbreakable two-year contract that eliminated the clause under which the miners work only when "able and willing", provided for no increases in hours or wages, and placed the miners' welfare fund on a sound actuarial basis. Before the negotiations began, Mr Lewis preserved his usual histrionic mystery, but last summer he suggested a $15 a day minimum wage (it is now $14) and an increase in the coal royalties, which finance the welfare fund, from 20 to 35 cents a ton. He has no use for actuarial orthodoxy, regarding the welfare fund as one to be expended without thought of future commitments, and makes no secret of his hostility to the operators' nominee to the board that administers the fund.

There has been much speculation as to whether the "wildcat" strikes of the past month represent the results of careful coaching by Mr Lewis, or whether they are evidence of revolt against the union by men who compare earnings of $49.50 for a three-day week with those of $72.12 last year. But there is not the faintest sign of any alternative to Mr Lewis's leadership, and the miners' faith in his ability will die hard, though since the end of the last contract in June there has been little in the way of works to support that faith.

Small Business

[FROM OUR AMERICAN STAFF]

MR TRUMAN'S vision of the quadrupling of American production by the year 2000, set forth in his message on the State of the Union, and the shorter-run predictions of his Economic Message, rested on several major assumptions. One was that

> these gains cannot be achieved unless our business men maintain their spirit of initiative and enterprise and operate in a competitive economy. . . . As our national production increases . . . the number of independent and competing enterprises should also increase. If the number does not increase, our constantly growing economy will fall under the control of a few dominant economic groups whose powers will be so great that they will be a challenge to democratic institutions.

This belief closely parallels a little marked passage in last year's message on the State of the Union.

The President promised to amplify his views by sending to Congress a series of proposals to strengthen the anti-monopoly laws and to assist small and new businesses. These recommendations will be shaped, not only by the executive departments and agencies, but by the Congressional findings of Mr Celler's monopoly investigation and Senator O'Mahoney's investment inquiry. Reports are expected shortly on hearings held during the last half of 1949. Both Congress and public find it easier to understand and act upon the so-called "plight of small business" than to comprehend the complexities either of competitive theory or the operation of the anti-trust laws. Aids to business have been common since the days of the Founding Fathers, though government solicitude for small business dates from the depression of the thirties. Yet the existence of a small or new business "problem," as such, has never been proved to the full satisfaction of many observers.

The staff of Senator O'Mahoney's investment subcommittee, for example, has pointed out that, since 1900, the total number of firms in the country has increased more rapidly than the population, though this trend was temporarily reversed during both the depression and the war. As industrial efficiency has increased, the average amount of goods and services produced by the average firm has also increased, but this is only to say that the meaning of "small" has changed.

The dividing line between "small" and intermediate-sized business has been drawn for manufacturing plants at 100 employees or less, for wholesale establishments at $200,000 annual net sales, and for retail enterprise at receipts of $50,000. There is, of course, no hard-and-fast definition. Although no recent estimates of the number of small businesses are available, the following table shows that in 1939 about 93 per cent of all business establishments fell within the small business category. As might be expected, small business flourishes mainly in the service and retail trades, which do not require a great deal of capital.

SMALL BUSINESS IN 1939*

Industry or Trade	% of Total Establishments	% of Total Personnel	% of Total Value of Output, Sales, or Receipts
Manufacturing	91·6	29·9	30·6
Wholesaling	77·2	39·0	21·1
Retailing	91·2	56·2	42·4
Service establishments	98·7	73·8	65·5
Hotels	90·1	30·7	26·5
Construction	93·1	47·0	34·2
Places of amusement	89·8	56·6	33·3
All Industry	92·5	44·8	34·1

* Proprietors and employees are included except for manufacturing, for which the census tabulated only employees. The total output, sales, and receipts of the small businesses represented in the table was $43 billion, of which retailing and manufacturing each accounted for about 40 per cent.

Source: Censuses of Business and Manufactures, 1939.

Mortality is undoubtedly much higher among small than among large business concerns, and those which do survive and remain small suffer from more sharply fluctuating earnings than their larger competitors. Even such evidence should be taken with a grain of salt, however, since in many fields the small or new firm which succeeds becomes *ipso facto* a large firm, and is therefore automatically excluded from the statistical evidence as usually presented. Conclusions drawn from such statistics therefore apply to marginal firms rather than to small business as a whole.

Those who remain, nonetheless, convinced that a problem exists (and Mr Truman is among them, as he clearly indicated in his Economic Report) believe its chief causes to be inability to command efficient management, lack of capital, tax problems, and unfair use of power by larger competitors. As to the first, the Department of Commerce has long

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

offered an excellent programme of technical and management advisory service ; it was greatly expanded after the war to aid the many veterans who chose to become their own bosses (in many cases with no better qualifications for entrepreneurship than sheer resentment of the bark of the sergeant). The belief that the troubles of small business are due chiefly to the unscrupulous use of competitive power by larger firms has been losing ground in recent years.

The trend of current thinking is probably best summarised in the annual report of the Council of Economic Advisers to the President. It calls for a general re-examination of the climate in which the anti-trust laws operate and a new approach to the problems of business size and practices. The CEA observes that, while small business must be protected from unfair encroachment by its large neighbours, and all business must be protected against unfair competition, small business actually suffers more from general economic instability than it does from predatory practices. This diagnosis leads away from the purely negative policing of the anti-trust laws to a more affirmative approach toward business.

*

Mr Truman's chief constructive proposals concern the expansion of facilities to provide capital and tax revision. Testimony before the investment subcommittee seemed to indicate that any capital shortage that may exist is a shortage of permanent, not working, capital, since small business has adequate access to the latter through suppliers, finance companies and commercial banks. More specifically, it is a need for financing by means of equity capital as distinct from debt, although there was less agreement on this point, and many small businessmen are reluctant to share control of their enterprises with outsiders.

Several proposals for meeting the need for permanent capital through private enterprise were put forward at these hearings. The Metropolitan Life Insurance Company offered to assume 90 per cent of any otherwise acceptable small business loan made by a local bank, provided the bank retained 10 per cent. Dr Kaplan of the Brookings Institution advocated the formation of regional capital banks sponsored by commercial banks, and empowered, like the British Industrial and Commercial Finance Corporation, to invest in equity as well as debt. Investigation of this type of organisation, extended to include participation by private lenders other than banks, was recommended by the Mutual Life Insurance Company of New York. Other insurance executives advocated a relaxation of state insurance laws to permit investment in common stocks, but the small business is usually too risky to benefit from such a change. Representatives of small business itself advocated a government guaranteed system of loans similar to that provided for home mortgages. Several Bills have also been introduced in Congress which would provide government credit for small business.

It is to be hoped that the energetic efforts to protect small business will not end by killing competition because it is too competitive. Mr Wright Patman's Bill to limit the number of stores in a chain grocery unit, for example, might have precisely that effect. The extension of government aid, by a paradox, runs the danger of freezing marginal firms into the industrial structure, in the very effort to enhance its fluidity. Hard as it may be for the average layman, re-examination of the meaning of free competition must, as the Council of Economic Advisers recommends, proceed hand in hand with the development of practical measures, lest the dream of wider prosperity be destroyed by the very efforts made to realise it.

American Notes

Hot on the Acheson Trail

The refusal of the House of Representatives, by one vote, to provide $60 million for aid to Korea for the next six months will probably be reversed under the force of the Administration's dismay and of shame for the slur cast on America's reputation for reliability. This vote for the abandonment of the last American foothold on the Asiatic continent was a combined, and blind, protest against the forsaking of Formosa and the extravagance of the foreign aid programmes. The gleeful attendance danced on this bi-partisan opposition by the fellow-travelling Mr Marcantonio left no doubt that it, and not the Administration, was running with the Communist pack in the Far East.

Unfortunately Mr Acheson at once diverted attention from this confounding of his critics by his courageous but injudicious refusal to desert Mr Alger Hiss after his conviction. President Truman would not allow himself to be flushed out of cover on this issue, but Mr Acheson, putting loyalty to a personal friend before political expediency, laid a hot trail for those Republicans who were already seeking to discredit the Administration by exaggerating Mr Hiss's influence. The House Foreign Affairs Committee seems to have refrained from bringing Mr Acheson to bay this week, but the Senate Appropriations Committee has promised to do so before long. Senator Knowland and others have, of course, been at Mr Acheson's throat for some time over his refusal to continue aid to General Chiang Kai-shek. Their teeth will be sharpened by the evidence now given to them, by the Secretary of Defence and General Bradley, that the Chiefs of Staff favoured an American military mission to, although not the occupation of, Formosa.

The Secretary of State's announcement that the United States will resume full diplomatic relations with Spain, if the United Nations Assembly approves, has every indication of being an attempt to divert the hounds from his trail by throwing them a sop about which he has never been very enthusiastic. But General Franco wants hard dollars more than prestige, and his American friends will not be appeased until these are provided. Mr Acheson, probably preparing the way for eventual recognition of the Communist government in China, emphasised that the presence of an American Ambassador in Madrid should not be taken to imply approval of the Franco régime.

Nor has the presence of an American Minister in Sofia implied approval of the methods pursued by the Bulgarian Government, methods which are now driving the United States to break off diplomatic relations altogether. This rupture, which seems almost inevitable, is also designed as a protest against the treatment to which Americans, both diplomats and businessmen, have been subjected in all the eastern European countries—except, of course, in Jugoslavia. There the desire to encourage Marshal Tito's heresy has led not only to the appointment of a leading diplomat, Mr George Allen, to be the new American Minister, but also to a decision to offer military as well as economic aid should the Marshal be threatened by a crusade of orthodox Communists. He, it is thought, can be counted on to fight: General Chiang Kai-shek cannot.

* * *

Automobiles in High Gear

Hundreds of thousands of visitors crowded into General Motors' floodlit "Midcentury Motorama" last week to gape at the new models (among them a $32,000 Cadillac upholstered in leopard-skin), follow the industry's advances during the past 50 years on the "Pillar of Progress," and watch the moving exhibits of such mechanical improvements as automatic transmission, available, for the first time in a low-priced car, in the Chevrolet. This advertising extravaganza was the starting signal for a race to mop up what is left of the war and postwar backlog of demand. The automobile companies, which broke all records last year by producing over 6 million cars and lorries, are shifting into an even higher gear, undeterred by prophecies of a buyers' market in the last half of 1950. The Ford Company, for example, plans to turn out 5,000 cars a day in April, May, and June, a rate not reached since 1941.

Where these cars are to be put, and parked, with the car population already at a peak of about 42 million, is a problem that worries Detroit less than how they are to be sold, once new sales become merely a matter of replacing old cars. Comfort is drawn, however, from the fact that over half the cars on the road are of prewar vintage and it is argued that, while only seven or eight million families could afford new cars before the war, prosperity has raised this number to nearly 12 millions.

*

Certain concessions are already being made to cultivate this market ; in addition to a few price cuts, mainly in the expensive ranges, "un-de-luxed" models can now be bought, stripped of the costly accessories that used to be compulsory. It has been left to Mr Kaiser, however, to pursue the postwar dream of a really cheap car, priced to compete with second-hand Plymouths, Fords, and Chevrolets. With the aid of a government loan, hand-made models of the unnamed and so far unpriced economy car will be on view on February 18th, and production is expected to begin in June. The Nash-Kelvinator Company, despite the General Motors view that Americans do not want the kind of car that can be produced for $1,000, is toying with a similar proposal, and recently showed a single model of a two-door car designed to use foreign-made, low-horse-power engines—a feature that has aroused the interest of Marshall plan officials. But unless the response indicates a market of 100,000 a year, this project will remain in the dream stage. Another dream car, one that turned into a nightmare, was momentarily resurrected last week when Mr Preston Tucker was acquitted of fraud—too late to re-enter his "Tucker Torpedo" in the last laps of the postwar race for markets.

The only company of the automobile "big three" left at the starting post is the Chrysler Corporation, whose employees are on strike. The company offered a pension scheme similar to that accepted by the union from the Ford Company, but the automobile workers insist that Chrysler must commit itself, not merely to pay pensions of a given size, but to set aside 10 cents an hour for each employee for the pension scheme. This would safeguard the workers' gains when government social security benefits are raised ; under previous schemes, the company's liabilities would fall as federal payments rise. A similar dispute is expected when the General Motors contract expires on April 1st.

Match in the Oil Barrel

The publication in Washington of a letter from Mr Creech Jones to the Government of Kenya has produced an explosion that has blackened the face of the State Department and the Economic Co-operation Administration. The spark was Mr Creech Jones's statement that the "Americans have, as expected, not gone beyond expressing regrets" at the intention of excluding dollar oil from the sterling area. There could not have been a more unfortunate corroboration of the suspicion of the oil companies and their Congressmen that the State Department has failed to press, with sufficient vigour, for an arrangement that would permit the American companies to retain their sterling markets, even at the cost of accepting payment in pounds. Senator Connally, who is chairman of the Senate Foreign Relations Committee, blew up like one of the oil wells in his native State of Texas, denounced Britain's hostility to the American economy and referred ominously to appropriate retaliation.

The eleven large American oil companies with concessions abroad are now between the devil and the deep blue sea ; their products are wanted, in adequate volume, neither abroad nor at home, yet to restrict production, even if it did not violate their contracts, would precipitate economic unrest and political difficulties in countries that depend for their revenues on oil concessions. They had planned to increase their imports into the United States, but the independent oil concerns, whose supplies and markets are entirely domestic, have mobilised to prevent this. They point out that imports are about equal to the oil-producing capacity now kept idle because no market is available, and urge their Congressmen either to press for a higher tariff on oil imports, or an import quota, or to put pressure on Mr Truman to invoke the escape clauses in the Reciprocal Trade Agreements Act. The likelihood of restrictive legislation at this session is not very great, but the mere threat has already begun to bring the major importers to heel. They are revising their import schedules downward for the next five months, the Shell Oil Corporation to 25 per cent below its level in 1949, and Standard of New Jersey to 37 per cent below the same months last year. The pressure on the Administration to force Britain to make some concession on dollar oil is, therefore, likely to be all the heavier.

* * *

Never Normal Granary?

The "ever-normal granary" is one of the basic ideas behind the American farm price support system: the government is supposed to stabilise both supplies and prices of farm crops by buying them when output is plentiful and by selling them again when harvests fail. But in recent years the ever-normal theory has obstinately refused to strike a balance. Bad growing seasons have not been making their scheduled appearances and the farmer persists in raising his output by the latest scientific and mechanical devices. He is naturally abetted by Congress, which not only refuses to permit him to be discouraged by low farm prices, but also mitigates the effects of any agricultural controls which it can be induced to approve ; for example, it is already trying to lessen the impact of the recently imposed restrictions on the output of cotton, wheat and peanuts.

As a result, the dam of the Commodity Credit Corporation's price support system is beginning to crack under the increasing pressure of the surplus stocks piled up behind it. The CCC has been forced to ask for an increase of $2 billion in its present lending authority of $4.75 billion, in order to strengthen itself for the coming harvest ; it calculates that at the end of the current crop year nearly $4 billion of its funds will be committed. It can supposedly liquidate at least part of this investment by selling its stocks on the domestic market, but only at five per cent above the support price. This is not an economic proposition as long as market prices remain at or near support levels, where they now are.

There are, however, three channels through which small quantities of the CCC's surpluses can be drawn off. Perishable foods can be consumed at schools and other government institutions and by poor families: New York children are eating surplus apples, and Mr Lewis's striking miners surplus potatoes, under this scheme. It is financed out of customs receipts, a portion of which is also available for encouraging the export of agricultural commodities. The difference between the domestic and the internationally agreed price of wheat is being made up to exporters out of these funds, which are also being used to subsidise exports of dried fruit, dried eggs and so on, and to cultivate a taste for peanuts and concentrated orange juice abroad.

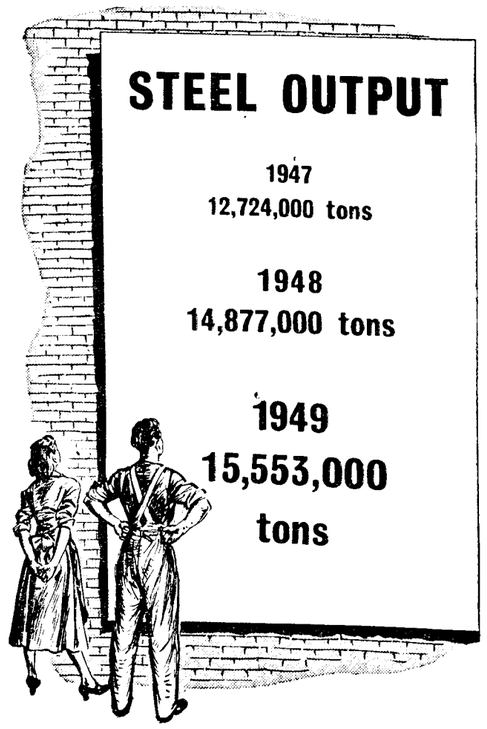
The CCC's latest attempt to get rid of its surpluses by selling them abroad at less than cost price has laid the United States open to accusations of dumping. Nor will American housewives, paying $3.50 for 100 pounds of potatoes, welcome the news that the same quantity is being sold to exporters for one cent, with a sack worth 17 cents thrown

in free. This is the most spectacular bargain in the first of the lists of export opportunities which the CCC now plans to publish regularly. Dried eggs and Mexican tinned meat are also going very cheap, but grains, flaxseed and other items on the list are at current prices and in limited quantities. The lists are intended to help exporters to negotiate sales abroad, but sales are restricted to buyers not using Marshall dollars or other American aid. It is not, therefore, expected that there will be many takers for this new scheme, and it does not include cotton and wheat which, with maize, constitute the most important part of the CCC's investment. Nevertheless, the fact that the Corporation is beginning to experiment with unorthodox methods of draining off its surplus stocks points to the possibility that it may eventually be forced to attempt something much more drastic. A large scale "give-away" operation to foreign countries has been suggested as one means of bringing the ever-normal granary home from the never-never land.

Shorter Notes

A Senate Investigations sub-committee has just reported on its inquiry into the activities of the "five percenters" who claim to be able to influence the placing of government contracts. By drawing attention to the exorbitant fees charged by these influence brokers and to their exaggerated claims to friendship with "the right people," the inquiry has done much to reduce the demand for the services of "five percenters." Government departments are combating the evil by improved methods of procurement and by better information services for business men. The report points out, however, that the "pedlars of influence" could not exist without the co-operation, or at least the toleration, of important government officials; it cites as an example the relationship between Mr John Maragon, now under indictment for perjury as a result of the inquiry, and Major-General Vaughan, the White House military aide to whom President Truman remains obstinately loyal.

★



Four years ago, at the end of the Japanese war, surplus US military property valued at over $2 billion was lying in the Philippine Islands, and the government there was guaranteed $100 million, as part of its postwar aid, to be realised by the sale of this property. It has, however, been able to realise only $45 million, and the explanation is said to lie in the wholesale thefts of this property that have gone on and that are now being inquired into both by the US Defence Department and the Senate. An oil tank farm and 35 miles of pipeline are among the more spectacular disappearances, and a hundred Quonset huts are said to have gone astray in one night.

★

The South has a rising industry based on a process discovered in 1932 for eliminating the high quantity of rosin in the Southern, or slash, pine, so that the wood can be used for newsprint. In 1940 the first big commercial newsprint mill in the South was opened at Lufkin, Texas, and this January, a new mill, built on the site of a wartime factory, began production at Coosa Pines, Alabama. The new mill is financed largely by Southern newspapermen and should produce about 100,000 tons of newsprint a year when it is in full production, some 2 per cent of total United States requirements. The United States imports about 87 per cent of its newsprint from Canadian mills.

★

Except in New York City, two-way wireless systems linking taxicabs with their home garage are becoming common. Not only does this satisfy the American taxi-driver's well-known love of conversation; it also means a great increase in business and a reduction in empty cruising.

A record that makes you think

Open competition, willing team work, skilled craftsmanship have once again given the steel industry a year of record output. Co-operation in research and development is keeping British steel supreme in quality and low in price.

THE WORLD OVERSEAS

The Modernisation of France

THE plan for modernising and equipping French industry has existed as a blueprint since 1946, and has been in full operation for over two years. It was first produced and later put into action by the *Commissariat Général du Plan de Modernisation et d'Equipement*, originally set up by General de Gaulle. Under the able direction of M. Jean Monnet this programme for the rejuvenation of French industry has not only managed to survive during a period of great political and financial uncertainty, but has also broadened its scope and gained immensely in prestige. The organisation now shows signs of becoming a permanent institution, and there is hope that the National Assembly may soon put its stamp of approval on the Plan by the passage of a law defining its objectives.

The *Commissariat* has chosen this occasion—midway between the inauguration of the Plan and the target date of 1952—to issue a progress report. Its opening chapter demonstrates how narrowly France has escaped from industrial decadence. In 1939 the real value of France's national income was about the same as that of 1913: between those years France's industrial production sank from 7.2 to 5.1 per cent of world production. Thus, in spite of bright spots such as electrified railways and the thriving new automobile industry, the capital equipment of French industry as a whole in 1939—notably coal, steel and textiles—was antique, averaging 25 years of age against 7-9 years in Great Britain and 5-7 in the United States. Agriculture and building were also gravely deficient, France then possessing only one tractor to 1,500 acres, and the average age of dwellings being 50 years in the town and a century in the country. It is this trend which the Monnet Plan has reversed.

As the current survey emphasises, the programme has never been either a rigid or a "total" plan. Its purpose is to serve as a general guide to the reinvigoration of the French economy. It does not pretend to cover every aspect of the national life after the fashion of the Five-Year Plans beyond the iron curtain. In the beginning the intention was to speed up the rate of investment and to channel this increase, so far as possible, into the six key industries which governed the rest of the economy. These were coal, electric power, steel, cement, agricultural machinery and transport.

As the plan evolved, the authors found it expedient to modify their definition and to include other branches of industry, either because they were found to be essential offshoots of the original six, or because further expansion was needed in order to balance France's external accounts. Agriculture has now been elevated to the "basic" category, and so have oil and fertilisers. Economic development in the overseas territories has been drawn into the orbit of the Plan. And special attention is also being devoted to the chemical, non-ferrous metal and rayon industries.

Since 1947 a total of 999.6 billion francs has been invested in the modernisation and equipment of these selected industries. Some idea of the magnitude of this figure is given in the report's estimate that the percentage of the gross national income devoted to the investment in these industries rose from 3.3 per cent in 1947 to 6.4 per cent in 1949.

From the following table and from details provided elsewhere in the report it can be seen where the bulk of the money has gone. The electric power industry has absorbed the largest share, with agriculture close behind. A substantial programme of equipment has also been carried out in the coal industry. In fourth place are the overseas territories, where a large proportion of the funds was spent on improving the transport network. With its three-year investment programme of 67 billion francs the steel industry has found it possible to embark on a job of renovation and at the same time to carry out a moderate expansion of capacity as well. The oil industry, too, can point to an enlarged refining capacity in addition to important overseas developments.

(a) Includes manufacture of fertilisers and agricultural machinery.
* Reconstruction expenditure. † Forecast.

For most of these industries the peak investment period is planned for the coming year, 1950. This is especially true for agriculture where the need for expansion became inescapably clear only a year ago when France and the other Marshall nations sat down in Paris and together examined their balance of payments difficulties. It is estimated that the amount invested in agriculture will increase by nearly 40 per cent between 1949 and 1950 and that 1951 will see a further increase of 20 per cent.

Although impressive, none of these figures by themselves show the tangible effect on production of this post-war effort to turn French industry into an up-to-date machine. Accordingly, the report includes a table, given below, which expresses in terms of tons and kilowatt hours the progress that has occurred in seven basic sectors.

DEVELOPMENT OF KEY INDUSTRIES

		1929	1938	1946	1949	1952–53
Coal	million tons	55	47·6	49·3	53	60
Electricity	thou. mn. kWh	14·4	20·8	23·0	29·7	43
Petrol, etc.	million tons	0	7	2·8	11·4	18·7
Steel	"	9·7	6·2	4·4	9·1	12·5
Cement	"	6·2	3·6	3·4	6·4	8
Tractors	thousands	1	1·7	1·9	17·1	40
Fertilisers	thou. tons of N_2	73	177	127	213	350

The report stresses the enormous debt which the investment plan owes to Marshall aid. Not only does Marshall aid help to bridge the trade deficit and sustain the French

economy with a steady flow of raw materials, but it also provides an important source of finance in the shape of the "counterpart fund." This is the fund in local currency which every Marshall country is obliged to set aside in an amount equal to the value of the goods received.

An analysis of the way in which the Plan was financed shows that of the total investment of 999.6 billion francs well over half—536.5 billion francs—was supplied from public funds. And of this subtotal the counterpart of Marshall aid in turn furnished over half—339 billion. Two conclusions stand out from this set of accounts. First, only a stunted version of the Monnet Plan—if that—could have been achieved without Marshall aid. And, second, if left to its own devices French industry would very probably have "slid down the slope of decadence."

These are the facts which lead the report to emphasise the urgency of France's "making good" by 1952 when Marshall aid comes to an end. By that date the programme of modernisation must bring France to the point where she can balance her trade by the products of her own labour and support investment charges out of her own savings. Should France not achieve equilibrium when that time comes, she will expose herself to "an unprecedented collapse of her standard of life and a progressive suffocation of her economy."

Future Equilibrium

According to estimates made by the *Commissariat*, France is obliged to import some $1.900 millions' worth of goods annually if she is to maintain full production and employment. During 1949 her exports totalled approximately $1,500 million. By 1952 France must, therefore, increase her exports by about $400 million annually, or 25 per cent. Unfortunately the deficit in trade is almost exclusively with the dollar area. There is the rub. It is hoped that the traditional export industries such as automobiles and textiles will be in a far stronger position to compete in the world market, although the possibility of earning dollars outside the dollar area depends to a great extent on international factors beyond the control of France. In any event, the position calls for a keen export drive to the dollar area itself.

Next there is the problem of internal finance. It is estimated that in 1950 a hole of 250 billion francs will again have to be filled by the Marshall aid counterpart fund. When that aid ceases it is believed that an enlarged national product will enable France herself to shoulder the burden. The report estimates that the gross national product must be increased by 1,000 million francs from 1949 to 1952. All the investments which have been undertaken with this objective in view are now under way, and by the end of 1950 most will be two-thirds, and some will be three-quarters, complete. If only 25 per cent of this increase is applied to investment, it will be sufficient to replace the contribution now made by the counterpart fund. "In a word, modernisation should finance itself."

The report has harsh words for those who suggest that there is a danger of over-production and over-investment. "Would not a return to the Malthusianism of pre-war France be an intolerable paradox at a time when so many essential needs remain to be satisfied—when most of the ruins have not yet been rebuilt, when not even a start has been made on the housing programme and when the living conditions of the peoples of France and the entire French Union still remain at such a mediocre level?" Nor is it true to say, the report adds, that heavy industry is being built up at the expense of light industry. (It has been suggested in some quarters that autarkic economic thinking had paid insufficient attention to more profitable export industries.)

In conclusion, the Monnet report insists that to produce enough is not the only task. The final test of the effectiveness of the Monnet Plan will come in the ability of French industry not only to produce but to produce cheaply. Productivity must be improved in order both to increase the purchasing power of the population and to enable France to withstand foreign competition. French industry has only just managed to equal the productivity of 1939. The achievements of the *Commissariat* will be consolidated only if French industrialists and workers make radical changes in their economic psychology. For until industry is prepared to stand up to the bleak winds of competition and until labour feels itself engaged in a national enterprise, much of the enrichment that France has received through the *Plan Monnet* will be wasted in selfishness and social disorder.

Tito Starts the New Year

[FROM A CORRESPONDENT IN BELGRADE]

THE New Year has found Jugoslavia with a far healthier and more hopeful outlook than it had twelve months ago. The last shred of doubt that the break with Moscow is real, deep and unbridgeable is gone. The political atmosphere has cleared considerably and stability seems assured for some time to come.

Moscow has almost abandoned its absurdly futile underground distribution of propaganda. Infiltration of agents across the well-guarded frontiers has practically stopped. The Soviet troops which paraded on the Hungarian and Rumanian frontiers in August in an attempt to frighten Uno into rejecting the Jugoslav bid for membership of the Security Council have disappeared.

The reorientation of the economy from east to west has been completed. The trade pacts with Britain and other non-communist nations will provide a flow of capital equipment and machinery for the mines and forests, which will prevent economic crisis or failure of the five year plan. The Zagreb trade fair last autumn gave clear proof that, despite staggering costs, vast improvements in industry had been recorded. In contrast to last winter's sketchy and uneven distribution, rations are now regular and consumer goods are of much better quality and in greater supply, although standards of living are still very low compared with those in the past.

Weather conditions allowed planting in the early autumn to give agriculture a good start, though this may be offset by the continued rapid pace of collectivisation. Despite the swiftness of the programme of the past year, which ended with some 200,000 peasant families and 21 per cent of the arable land in the socialist sector, the communist leadership shows no inclination towards slowing the tempo. Whether better seed, more machinery and improved planting methods in the co-operatives will offset the discontent and non-co-operation of a large segment of the population is doubtful. But food conditions should not greatly deteriorate.

Transport remains Jugoslavia's biggest economic difficulty, but the completion before the spring of the Belgrade-Zagreb "Brotherhood and Unity Highway" linking Serbia and Croatia, combined with a large number of American army trucks purchased from western Germany, will lighten the load on the obsolete and poorly maintained railway system.

The highway also contributes to the general improvement of Jugoslavia's defences; it provides a channel by which the two northern army groups can be funnelled swiftly to the mountains of Bosnia and the central Serb redoubt of Kragujevac, where the main arsenal is located. Although the army is still dependent upon an obsolete conglomeration of Russian, Italian, German and British equipment, the governmental policy of heavy investment in armaments plants should begin shortly to turn out standardised replacements in sufficient quantity. The army is completely loyal, with 92 per cent of its officers members of the Communist Party, and is by far the best force in the Balkans.

The improvement of the political, economic and military situation within Jugoslavia has resulted in the American decision to give arms if needed. To be successful, the State Department reasons, any attack upon Jugoslavia must come without warning, without any massing of troops along the borders, and must present the world with a *fait accompli*. In the days immediately following the Cominform resolution of 1948, this would have been easily possible. Now world attention is focused on Tito; his loyal army is on the alert on every frontier and he can rely upon the traditionally nationalist sentiment of the Jugoslav people, despite their overwhelming anti-Communist feelings.

How is Moscow reacting to American policy? From Belgrade it appears, to foreign and Jugoslav observers alike, that the Russians are making a desperate effort to seal off Titoism. Tito is a threat to Soviet power only as long as he is a Communist. The moment the Jugoslav leader becomes a "democrat" in the western sense of the word—and that is very unlikely indeed——Moscow can ignore him. Hence the series of Rajk and Kostov trials, with their patently ridiculous charges, designed to present the Marshal to world Communists, and those in the satellite countries particularly, as "a bloody fascist-gestapo hangman."

Communist and non-Communist Jugoslavs view the political struggle for their country with increasing wonder and more than a suspicion of disbelief. The non-party member watches in bewilderment as his farm is collectivised, his political outlets stopped, his newspapers and radio filled with endless polemics, his government constantly encroaching upon whatever freedoms he may have had and the anti-Communist nations of the west indirectly aiding the process through their support of Tito. Yet the Belgrade regime has succeeded in rallying the majority of the population on the strictly nationalistic issue of "the Russians or us." Longest in power of all Communist parties except the Bolsheviks, it has rendered all possible political opposition leaderless, voiceless and inchoate. Indeed, it is almost non-existent. The greatest transformation of the past year, particularly in recent months, has been in the Communists themselves. In turning their back on the rigid orthodoxy of the Kremlin, the Jugoslav Communists have found intellectual release. At the year's end the Jugoslav Communist Party began what its leading theoretician, Moshe Pijade, described privately as "the most important ideological development in Jugoslavia" since the Cominform resolution—the reorganisation of the educational system. The party's Central Committee decreed that, in the social sciences, textbooks prepared by Jugoslav professors will supplant Soviet ones and that in the physical sciences the accomplishments of all scientists will be treated on their merits, without regard to their nationality. In liberalising educational methods the Jugoslav concept of Marxism as opposed to the dogmatic Soviet approach will be emphasised in an effort to give greater intellectual freedom to the young.

Equally important is the decision to decentralise industry which, with education, forms the basic foundation of any Communist society. As in the Soviet Union, Jugoslav industry is organised on a basis of federal, Republican and local control. In the Soviet Union the accent has been on greater and greater central or federal control. In Jugoslavia today, the government has boldly reversed the direction. More and more factories are being turned over by Belgrade to the six Republics, and the Republics in turn are handing over greater responsibility to the *Oblasti* (counties) into which the nation was divided last summer. This programme of distributing responsibility and stimulating initiative is designed to prevent the appearance of the massive top-heavy pyramid of Soviet bureaucracy. It will apply to all light industry, to the mining and electric power industries, to part of the chemical industry and to all local transport. Together with this decentralisation,

BANK-INSURANCE UNITS

AND THE DEVALUATION OF THE £.

INVESTORS in Bank-Insurance Units secure a freely marketable investment spread over the selected shares of 50 British banks and insurance companies.

The Trust Fund is as under:

Insurance companies	36%
Canadian $ banks	15%
Other Dom., Col. & O'seas banks	15%
Home banks	22%
Discount companies	7%
Trustee securities	5%

Unit holders should benefit from the devaluation of the £. The sterling income from the 15% of the Fund invested in $ shares of Canadian banks will show an increase and should enable the recent steadily rising trend of annual distributions on the Units to be continued. The 36% of the Fund invested in the shares of insurance companies will also be strengthened, for a considerable part of their premium income is earned in $ and the sterling value of their large $ investments will greatly increase.

Units can be freely bought and sold at quoted *net* prices (and information obtained) through any Bank or Stockbroker.

Offer price 31st Jan. 20/4. Yield (conservatively calculated on net cost including commission and 2% Gov't. Stamp Duty, and subject to *reduced* rate of tax, allowing for D.I.T. relief) £3/14/0%, which may be further increased by up to ⅛%, according to the amount of the Unit holder's income for tax purposes, by his claiming additional double income tax relief. (N.B. Surtax payers obtaining this relief would be assessed for surtax on a higher income).

TRUSTEES: MIDLAND BANK EXECUTOR & TRUSTEE CO., LTD.
MANAGERS: BANK INSURANCE TRUST CORP. LTD., 30 CORNHILL, E.C.

In Australia and New Zealand

With total assets of over £300,000,000 and with over 800 branches and agencies throughout Australia, New Zealand, Fiji, Papua and New Guinea, this Bank is better equipped to facilitate trade with these countries than any other institution there.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817

(Incorporated in New South Wales with limited liability)

LONDON OFFICES:
29 Threadneedle Street, E.C.2
47 Berkeley Square, W.1

GB4906. E.

workers' councils, distinct from the trade unions, will be set up in every factory. They will share with the managers in the day-to-day operation of the enterprises.

There have been other tendencies in the same direction, as the party throws aside what some members call its "Stalinist mantle." In contrasting the direction now being taken by Jugoslavia to that of the Soviet Union, they list a flock of changes: production of consumer goods and housing are being emphasised as a result of the political situation; the inclination to create a Soviet-like gap between the top of the pyramid and the bottom has been reversed, and the party leadership is striving to follow Tito's instructions "to get closer to the masses"; nepotism and favouritism are being curbed; the role of the mass political organisations —and not merely Communists—is being increased, and recently the plenum of the Central Committee of the Communist Party of Slovenia made this the official line by passing a resolution to that effect. The first trickle of students and artists have left for foreign study, and western literature and ideas are enjoying wider popularity. Though still extremely sensitive to criticism, the government has found it has benefited tremendously from allowing western correspondents greater freedom. It has found itself able to stifle the traditional Marxist need to exorcise the "imperialists" and "capitalists" of the west. A landmark was passed on January 15th when *Politika*, the second largest newspaper here, gave a long and thoroughly objective account of the issues, personalities and ballot procedure of the forthcoming British elections.

The Jugoslavs are so pleased with themselves and their ability to survive the past eighteen months that one of their effervescent officials recently proclaimed to a press conference (which included British and French representatives) that "there are only three independent nations in the world—the United States, Russia and Jugoslavia." American diplomats who must deal with this attitude find it slightly wearing, and they are concerned lest the Jugoslav government take too much for granted. If anything, the Americans are worried lest their policy should be too successful. Since there has not been any debate in Congress on policy towards Tito and since the State Department has "made it easy" for him thus far, the Belgrade government has lost all semblance of reticence in asking favours of the Americans.

Prospects for Canadian Development

[FROM OUR OTTAWA CORRESPONDENT]

FOR the most part Canadians avoided the vulgar error of treating January 1, 1950, as the middle of the century; but some publications copied their American competitors and reviewed Canada's position as though the mid-century had in fact been reached. The outstanding feature of such a review is the growth of the last fifty years. In 1900 Canada had a population of 5,400,000 people: now it is 13.5 million. Montreal, then as now the biggest city, had 325,000 people. Now it has nearly a million and a quarter. Saskatoon, in the northern part of Saskatchewan, then had 113; now it has 46,000. Edmonton then had 4,000 people; now, the centre of the new oil industry and the gateway to the Yukon and the Northwest Territories, it has 118,000 and still grows.

Farm production has increased as might be expected. A year's wheat crop at the turn of the century was 55 million bushels. Now they run at between 300 and 400 million. But the expansion of secondary industries is more striking. In 1900 just over half the workers were in primary industries, principally agriculture and forestry. Now that figure is down to 27 per cent. Nearly three-quarters of the labour force is in secondary industries, distributive trades, professions and such like. More than three-quarters of Canada's exports are finished goods: raw materials account for only 23 per cent by value.

The United States Ambassador in Ottawa, Mr Laurence Steinhardt, is fond of saying that the peak of Britain's power is in the past, the peak of United States' power is in the present, and the peak of Canada's power is in the future. Already the oil development in the prairies promises to revolutionise much of the economy. The production now in sight could make Canada a net exporter instead of a large importer of petroleum, and oilmen are now persuaded that the pools they have tapped so far are merely seepages from a still undiscovered main deposit. The prize still to be found, they say, is immeasurably greater than anything tapped so far, rich as present discoveries are. Of almost as great importance as oil are the deposits of iron-ore on the Labrador-Quebec boundary. An initial investment of $300 millions will start opening them up in the next few years through a railway to be built down to the north shore of the St. Lawrence. As the Mesabi range of Minnesota gradually gives out—and the end of its high-grade ores, though not of its taconites, is in sight—the whole balance of North America's iron and steel industry may be tipped eastwards. This gives a quite new importance to the St. Lawrence deep waterway project. These are two examples of possible Canadian development in the coming decades. What further riches lie under the barren remoteness of the northern pre-Cambrian shield no one can guess, but the mineral wealth of the north is barely scratched as yet.

Emphasis on Immigration

The key to growth, of course, must be people as well as things, and all the optimistic prophecies postulate a large increase in population. The natural increase is running at more than 220,000 a year, and in some postwar years has been higher. A postwar wave of immigration reached its peak in 1948 when 125,000 people came to Canada. The 1949 total will show a decrease, perhaps to about 100,000. The movement from the DP camps of Europe has slowed and the flow of British people has been drastically reduced. It was 46,000 in 1948, and only 21,000 in the first eleven months of 1949. This reduction is causing concern. Immigration, which has been under a catch-all conglomeration called the Department of Mines and Resources, has just been put under a new department of "Citizenship and Immigration," whose two main functions are to look after immigration policy and Indian affairs. No disrespect is intended either to the immigrants or to the Canadian Indians.

There is no suggestion of returning to the pre-first-war policy of Sir Clifford Sifton and the Canadian Pacific Railway, when Britain and much of Europe was plastered with highly coloured posters advertising the beauties and opportunities of the Canadian prairies. That campaign, misleading as much of it was and great as was the disappointment of some homesteaders who found themselves on "dry farms," brought Canada a million new citizens in five years. But the circumstances of today are very different. It is not a case now of peopling vast empty areas—though the Peace River valley and a considerable tract of country in northern Alberta and British Columbia offer opportunities for settlement provided communications are improved. Canada is not looking primarily to the growth of new limbs, but to a general fattening-up. Such preliminary information as the government has collected indicates that Britain would still be sending a large number of emigrants if it were not for currency restrictions. The cut in emigrants' allowances to £1,000 spread over four years has made them too meagre to provide adequate capital for a man to settle himself, and devaluation has reduced the four years' annual allowance to only $760. If, on closer examination, it appears that the people who want to come to Canada want to bring £1,000 with them (and have it to bring), and if the freezing of their funds appears to be a serious factor in keeping them at home the Canadian Government will be tempted to consider very seriously whether it could help by advancing the full amount in dollars and collecting the annual instalments as transfer is permitted by the Treasury.

If any move of this sort is going to be undertaken the time to do it is probably now. There are some warning signs of the slackening of the postwar boom which has been maintained with remarkable consistency in spite of the decline in the United States economy last year. Unemployment, which reaches a seasonal peak at the beginning of March, will be higher this year than at any time since the war, and it is easy to forget that total employment has increased also. Unemployment is not likely to go much above 6 per cent of the total labour force. This is little enough as a seasonal peak considering the rate at which the labour force has been increasing; but it might be enough to start a clamour against immigration.

Increased Domestic Consumption

The prevailing view in government circles is that the postwar immigration has had more effect in increasing employment than in decreasing the number of jobs available. Certainly immigration has contributed to the increased domestic consumption which has been a tremendous asset to both farmers and manufacturers of consumer goods. But there is no way of showing how much of this increase is due to increased population and how much to release of wartime savings, higher wage rates and satisfaction of pent-up demands. Ideally, no doubt, the growth of population should keep in step with the growth of capital investment and economic activity. But this is a planner's nightmare, and in practice the decision will be largely political. It is a matter of tactics and timing rather than of principle. On the long view Canada needs millions more people.

This is not the only field in which the long-term outlook is clearer than the short-term. In the long run this must be an expanding economy. But he would be a foolhardy prophet who would promise increased activity in the next twelve months. There is no domestic reason against it, but Canada's prosperity depends so largely on exports that the domestic picture is not the determining factor. The economic developments in the United States and in Britain are vital to Canada.

It should also be added that Canada shows no sign of following the United States into deficit financing. Ottawa has a good record of balanced budgets, and Mr Douglas Abbott, the Finance Minister, is not the man to break a good habit. In the booming postwar years he collected substantial surpluses. The tax cuts he made last year were not unconnected with the June general election, but it can be argued that the situation justified at least part of them, and that they had a stimulating effect in 1949. There cannot be much of the same to follow this year. But neither is there a case any more for the anti-inflationary surplus. Government departments are being asked to cut back their estimates (national defence is included in this) to a figure which the Finance Department thinks it can provide. The prospect for 1950 is little change in tax rates, strict economy in spending and an old-fashioned balanced budget.

The Future of New Guinea

[FROM OUR CORRESPONDENT]

DURING the recent celebrations accompanying Indonesia's attainment of independence, the inhabitants of Batavia (or Jakarta, as it must now be called) reserved their chief enthusiasm for the day following the transfer of power when President Sukarno arrived from Jocjakarta to instal himself in the palace on the Konigsplein, long the official residence of the Dutch Governor-Generals of the Indies. The President made a speech from the steps of the palace. Pulling out all the weapons in his oratorical armoury (addressing his speech, for example, to "my comrades, the rickshaw-pullers"), he soon had the crowd roaring and cheering. The Indonesian people must unite; they must fight; they must continue the struggle—this was Sukarno's theme. Indonesia faces so many difficulties at the present time, such as national unity, internal security and economic rehabilitation, that most of Sukarno's listeners must have presumed that these were the aims to which they were being asked to bend their efforts. But no; what Sukarno had in mind, the next target for which the Indonesian people must unite and struggle, was the incorporation of Dutch New Guinea into the new United States of Indonesia.

It was perhaps not a very good omen for the future. On such an important occasion, when such tremendous problems lie ahead, it smacked of irresponsibility to devote so much attention to the minor issue of Dutch New Guinea. It made one wonder whether New Guinea's chief function during the next year or so will not be to divert the attention of the Indonesian people away from more pressing realities. Not for the first time foreign observers wondered whether President Sukarno, who has shown himself to be a superb demogogic leader in times of strife, has the qualities required for a period of peace and national reconstruction.

Sukarno's concentration on the New Guinea issue produced an immediate and strong reaction from an unsuspected quarter—from Australia. This took the Indonesians somewhat aback in view of the fact that Australia had been their nominee in the United Nations Committee of Good Offices. Typical of the Australian reaction was the comment of a newly elected member of the federal parliament, Colonel W. S. Kent Hughes—"Indonesia might as well claim Holland as Dutch New Guinea, as the only ground the Indonesians have for claiming the latter is that it belongs to the Dutch. If the Dutch want to give their half of New Guinea away, Australia has a far better claim to it than the

Penicillin, exclusively British in its discovery and development, is recognised throughout the world as one of the greatest scientific achievements of all time. Its discovery in 1929 and its name were due to Professor (now Sir) Alexander Fleming of St. Mary's Hospital, London. The isolation of penicillin and its development as a practical weapon in the fight against disease was due to a team of research workers in Oxford led by Dr. (now Sir) Howard Florey and Dr. E. Chain. Penicillin, product of a simple mould, possesses astonishing bacteria-killing properties. Carried by the blood to all parts of the body, it attacks bacteria wherever they are established. Unlike so many other drugs, penicillin is not poisonous. Hence, it can be used by doctors and surgeons without any fear of an overdose proving harmful to the patient.

Early research on penicillin was attended by great difficulties. At first it was only possible to produce minute quantities from the mould (Penicillium notatum) and the substance was easily destroyed by heat, acids, enzymes and air-borne bacteria. Imperial Chemical Industries Ltd. was the first industrial concern in Britain to make substantial quantities for chemical and biological investigation. The crude, unstable material then produced has since been superseded by an almost pure substance. Penicillin of I.C.I.'s manufacture is now a white crystalline product of known composition, which retains its activity for three years in all climates.

Indonesians. Neither historically nor racially has New Guinea ever been a part of Indonesia." The Dutch in the Indies, amongst whom there is no marked pro-Australian sentiment, watched these Indonesian-Australian exchanges with a good deal of amused satisfaction.

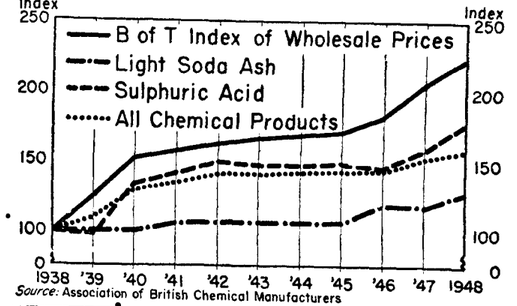
The Round Table conference at The Hague failed to reach agreement on New Guinea and decided to leave it on one side for the time being and to try to reach a settlement by peaceful means during the coming year. Observers report that almost more than any other issue it came near to wrecking the conference. It provides a good example of the way in which the Dutch, despite their reputation as hard and tenacious bargainers, are capable on occasion of being deeply moved by what they regard as a question of moral principle or sentiment. There was a lot to be said, on grounds of expediency, for getting the New Guinea issue out of the way now. It may, as foreshadowed in Sukarno's speech, impede Dutch-Indonesian co-operation in other fields. As far as is known, there are no great oil or mineral deposits in New Guinea, although some oilfields are being exploited at the western end. It is unsuitable for settlement by European or Eurasian immigrants, despite the fact that several hundred Eurasians have left other parts of Indonesia to establish communities in New Guinea, under schemes which seem foredoomed to failure.

The main consideration which prompted the Dutch Government to take up such a strong stand, a stand that almost verged on quixotry, was a sense of responsibility for the backward inhabitants of New Guinea. These Papuan natives, many of them living at an almost stone-age level of culture, have in many parts only been saved from extinction by the devoted efforts of foreign missions. The latter were able to bring considerable pressure to bear, through public opinion, on the negotiators at The Hague. Lesser considerations were a desire not to leave the Eurasians without some place to which they could go if conditions became difficult for them in the new Indonesian state, and a sentimental desire, a very natural one, to maintain some foothold, even if in an unproductive region, in a part of the world with which Holland has been closely associated for so long.

There seems to be no doubt that Indonesian control of the western half of Dutch New Guinea would mean unrestricted Indonesian immigration which would lead to the early extinction of the indigenous inhabitants. How are the interests of these inhabitants to be safeguarded until they reach a stage of political evolution, possibly not for fifty or a hundred years, when they can decide themselves what they want to do about their future? It is clearly a case where the advanced races of the world have a responsibility towards their more backward fellows. When the New Guinea issue does come to the fore again, the most hopeful approach might well be from within the framework of the United Nations, such as a continuing Dutch administration under the supervision of the Trusteeship Council. It will not be easy, however, to reconcile the conflicting claims of Dutch sentiment, Indonesian "face," Australian preoccupation with security and, last but not least, the interests of the inhabitants.

THE BUSINESS WORLD

Report on Chemicals



THE chemical industry is in the ordinary way disposed to be reticent about its affairs, and the circumstances in which it has come to publish a report on itself* are in some ways unusual. The President of the Board of Trade asked the Association of British Chemical Manufacturers in the autumn of 1948 to prepare the report, as a first step towards a "comprehensive survey" which would show the industry's long-term plans and probable development, and "the steps regarded as necessary to meet the objectives disclosed by the survey." The "complicated and diversified" character of the industry made the customary working-party technique inappropriate.

Indeed, the mere difficulty of delimiting the chemical industry, as a preliminary to surveying it, is formidable; part of the value of the report lies in the exposition of this difficulty, which is more than academic when there is any talk of nationalisation. While the report has been in preparation, the Labour Party has announced its intention of examining the industry with a view to transferring "appropriate sections" to public ownership "if it should prove necessary in order to assure vital national interests." The authors of the report have avoided any direct reaction to the threat. But the case of the spider and the fly can hardly have been totally absent from their minds.

Perhaps this explains the sensitiveness in the report to charges of monopoly. The word, it says, is now commonly used "in a sense alien to its true meaning" to describe any situation in which somebody "can exercise a predominating influence over the production and sale of an article"—though this is the definition applied in the Monopolies Act. Many chemical products are made exclusively or predominantly by a single firm; many are not protected by patents, but are "economic monopolies," and may arise from the small demand for a product or from the need for specialised plant or processes. The "monopolist" firm may even be quite small. To insist on a product being made in two or three plants when it can only be economically made in one would be absurd. The question arises where the line should be drawn—in the eyes of at least one section of the Labour Party, mere size could qualify a firm for nationalisation, and Imperial Chemical Industries were mentioned by name in *Let us Face the Future*—and, further, how the public interest can be protected. The report mentions three safeguards.

One is the Monopolies Act. Another is the fact that the user can for many purposes use alternative products. This is increasingly true as the diversity of chemicals in commercial production grows; but there are certain basic materials to which it does not apply. A third practical safeguard is that a firm, however monopolistic, that has incurred heavy capital expenditure has an interest in fostering the widest use of its product to keep its plant fully employed. This may encourage the manufacturer to fix low selling prices. The point is supported by a comparison of the price movements since 1930 of 37 chemicals "in the manufacture of which one company had a virtual monopoly," with those of 33 chemicals in a similar product group. While the average prices of the 37 "monopoly" chemicals rose by 37 per cent between 1930 and 1938, the average prices of the "non-monopoly" chemicals rose by 70 per cent. The Board of Trade index number of industrial materials and manufactures rose by 142 per cent in the same period. As the accompanying graph shows, the increases in the prices of chemicals in the last ten years have been modest compared with the general rise in prices. The key is perhaps to be found in the fact that the industry has for many years been using its plant continuously at the limit of capacity.

PRICE MOVEMENTS: CHEMICALS AND ALL PRODUCTS

Source: Association of British Chemical Manufacturers

* Report on the Chemical Industry. Association of British Chemical Manufacturers. 5s.

★

This is one advantage of a boom; and it weighs heavily in the chemical industry which uses much capital and shows especially great economies under continuous operation. There are also disadvantages of a boom—in particular, the high cost, slow pace, and general difficulty of new construction. "The cost of replacing plant constructed before the war is today almost 2½ times the original cost," and it does not vary greatly as between structural work and mechanical installations. The industry soon found out after the war the impossibility of carrying out "simultaneously and quickly" the tasks which it set itself. These tasks required not only more constructional materials and more equipment, but also more draughtsmen and experienced technologists than it could quickly command.

Unquestionably the British chemical industry is still at some disadvantage compared with the American chemical industry. Reliance on American sources for certain synthetic and other chemicals was probably unavoidable during the war, but it held the British industry back while the American industry went ahead.

Since the war, material and technical shortages have been severe enough by themselves to prevent the British industry from making up the lost ground. Indeed, it has lost more:

> There is always a gap in time between discovery and its commercial application, but this gap has been longer here than there.

The gap has been lengthened by "the preoccupation of consumers with their own similar difficulties, and their consequent inability to co-operate fully in assessing the value of a new product." A defensive mentality in industry at large can only discourage and delay new departures in industrial chemistry.

The British industry is also at a disadvantage in the cost of its materials. Coal, the most important (both as the supplier of heat and power and as the source of carbon and carbohydrates), is three times as dear in Britain as in the main industrial areas of the United States. Benzene and its derivatives are dearer in Britain. American chemists are in any case far less dependent on coal and on benzene than British, for they have abundant oil and natural gas to supply heat and power, and abundant refinery gases to supply the raw materials of organic chemical synthesis.

What is being done to overcome or offset these drawbacks? The Association of British Chemical Manufacturers is still in a better position to answer this question than is the reader of the report, which is sprinkled exasperatingly with blank spaces from which the details have been deleted as "confidential to the Board of Trade." For the most part, only the product groups are shown, and not the products themselves. Yet even this is a big advance on previous knowledge, and the accompanying table which summarises the scope and anticipated effect of the existing expansion plans gives some clear indications of the direction in which the industry is developing.

The capital investment in the chemical industry (as the report defines it) is estimated to have been £231 million at the end of 1948. But the "real capital" employed is estimated at something like £400 million. This plant had a production capacity at the end of 1948 of some £347 million a year at current prices, though the actual output in 1948 was much less—some £250 million. Some 142,000 workpeople (again at the end of 1948) were employed to utilise this capital.

The chemical industry already shows a high ratio of capital for each worker employed, but the expansion will raise it further, as these figures show:

	Capital Per Employee	Capacity Per Employee
	£	£
Existing plant	1,600	2,400
Additional plant	7,600	9,000
Existing and new plant combined	2,500	3,500

The expansion represents a new capital investment of about £191 million, and will increase production capacity by an annual value of £223 million, assuming (though the assumption is perhaps bold) no great change in the existing price levels of the products. They will, however, require no more than 25,000 additional workers to operate them. This expresses the trends towards large-scale, automatic and continuous processes and simultaneously towards the production of synthetic chemicals of high value. By the end of 1953 the industry's plans provide for an increase in capacity of 64 per cent compared with the end of 1948. Output is harder to forecast, but the report indicates that output next year (1951) should be 50 per cent higher than the output in 1946—which in turn was nearly a third greater than in 1935. Measured by capacity or output, the industry is expanding at a rapidly accelerating rate.

A general expansion of this kind inevitably requires heavy investment in plant to produce certain basic chemicals; sulphuric acid, as the almost universal reagent, comes first. The planned expenditure of £11 million in this branch of the industry is intended to raise its capacity from 1,476,000 tons a year (calculated as pure sulphuric acid) to 2,134,000 tons a year. This will create problems of raw material supply; an additional 189,000 tons of pyrites (which come mostly from Spain), 82,000 tons of spent oxide from the gasworks, and 120,000 tons of sulphur itself. A further 120,000 tons of sulphur will be needed for other purposes, and the total requirement will thus be increased to 500,000 tons a year in addition to the sulphur-bearing materials mentioned. Elementary sulphur has all to be imported.

Production of the alkalis and of chlorine is based on salt, which is available in ample quantities in Britain; the large and costly expansions in this branch seem likely to be adequate. The third group in the table, "Other inorganic acids and salts," includes calcium carbide, which was not made in this country before the war. Two plants built during the war are now able to meet the whole British requirement of carbide, and new carbide plant is among the projects now in the "tentative" stage. To be economic, carbide production needs abundant, cheap and reliable electric power (which the Norwegian producers, who formerly supplied Britain, enjoy). The report shows no confidence that those conditions are assured in Britain.

Fertilisers are another important branch to be expanded; but it is noteworthy that the bulk of the fertiliser expansion schemes are still at the tentative stage, and the report draws attention to uncertainties about the future course of world demand and the competition which may arise from expanded fertiliser production in some foreign countries. The largest schemes under consideration are in the third of the fertiliser groups, and relate to compound fertilisers (nitrogen and phosphorus or nitrogen, phosphorus and potash).

Most of the plans already mentioned are designed to expand existing branches of chemical production. For major innovations and far-reaching changes it is necessary to look at the figures for "heavy organic materials" and for "plastic materials and synthetic resins"—two groups which are closely related. The first of these two includes the new petroleum chemical plants. The United States began to manufacture isopropyl alcohol from propylene more than 20 years ago, and the American output of organic chemicals from a petroleum base is now in the region of 2,000,000 tons a year. It was accelerated by the ready availability of tail-gases from the oil refineries, but also by the great size of the American market and the comparative readiness with which American manufacturers accept new materials.

The construction of an oil refining industry in Britain, and the expansion of the British industrial market for organic chemicals, has made it feasible for British industry at last to set out to overhaul the American synthetic chemical industry in at least some products. The figure of nearly £43 million for capital expansion in this group shows that a serious effort is being made; and the estimated increase from £63 to £137 million in annual production capacity for heavy organic chemicals when the schemes are completed suggests a major shift of emphasis in the chemical industry. This should open up a far more plentiful and more varied supply of organic chemicals for British manufacturers, as well as providing a useful source of exports. Some of its consequences are seen in the projected expansion of the synthetic resins and plastics branch; it is from this expansion that the new plastics are to come, together with the polymers for the new synthetic fibres, the chemicals for an expanding rayon output, and a series of process materials for many uses. Major advances in the chemical industry can react on industry over a wide field, and can lead to general improvements in the efficiency and variety of British manufactures, as they have done in the past. Such an advance may now be on the way.

Gold from South Africa

THE announcement that South Africa is to pay gold for all future imports of essential goods from the sterling area opens a new and welcome chapter in the tangled history of the Union's financial relations with the sterling club. The main feature of the agreement is to revise the South African system of import control by the issue of "universal" import permits for essential imports. Such imports will be "buyable anywhere," and sterling suppliers will thus have the opportunity of competing for as large a share of them as they can obtain in a free market. Goods imported into South Africa under these universal licences, whether they come from hard currency countries or from the sterling area, will be paid for in gold. Other imports—not covered by universal licences—are henceforth to be allowed into South Africa only from countries accepting sterling or other soft currencies in payment; presumably, therefore, imports of almost all "inessential" goods from America will cease. By this arrangement, the amount of gold which the sterling area can earn from trade with South Africa will be determined in principle simply by the amount of "essential" goods which sterling countries can sell in competition with all other suppliers. The possibility of earning gold from such trade will no longer be contingent upon South Africa's need of sterling, and will not, therefore, be affected either by the extent of any capital outflow from this country to the Union or by sterling area purchases of South African goods.

To view the agreement in perspective it is necessary to recall the extent to which Britain has relied on South Africa as a source of gold in the past. In the last five years before the war South African mines produced some $370 million of gold each year—most of which eventually found its way into the vaults of the United States Treasury via other countries which had an export surplus with South Africa. Great Britain was the most important of these countries; its export surplus with South Africa amounted in 1938 to £25 million (equal to one quarter of the value of British imports from the United States in that year).

The war brought this system of triangular payments to a sudden stop and when the threads were picked up after 1945, they made a very different pattern. Under the Anglo-South African agreement of 1946, Britain in effect became the banker for the Union's gold output. In each of the years 1946 and 1947 South Africa was to sell a minimum of £70 million gross (about $282 million) to Britain, as custodian of the sterling area central pool, but was to draw on that pool for any hard currencies required. It was hoped that these drawings would be much smaller than the minimum gold deposit. But in

fact, as the accompanying table shows, these hopes were confounded. In 1946 South Africa sold £71 million of gold to Britain but bought through London £80 million of non-sterling currencies; in 1947 gold sales reached the bare £70 million, while currency purchases were £112 million. These purchases which, over the two years, exceeded gold sales by £50 million did not comprise only "dollar-hard" currencies. Even so, the Union's liberal—and "non-discriminatory"—import policy caused mounting concern in London. The account of the customer from whom the sterling bank had expected so much seemed likely to go into the red—if, indeed, it had not already done so. Moreover, not only was the Union attracting large amounts of private capital

from Britain—up to £175 million in 1947—but it was also becoming increasingly importunate in its requests for more liberal treatment for its exports of "inessential" goods to the rest of the sterling area.

A solution for these difficulties was sought by the Gold Loan Agreement of November, 1947. This permitted South Africa to go on drawing sterling capital from Britain (though the movement of funds was to be carefully watched) and to export to Britain up to £12 million a year of processed foods and other "inessentials." In return the Union was to reimburse Britain in gold for any purchases of non-sterling currencies from London and was to grant to Britain a three-year gold loan of £80 million (repayable, under certain conditions, in sterling on demand). The intention was plainly that, so long as the loan remained outstanding, no further gold was to be sold to Britain. The £80 million was duly transmitted to London at the beginning of 1948, and was hailed officially—and in some other quarters—as a "generous gesture." In retrospect, it seems to have the outcome of a rather toughly bargained arrangement between two parties who were both in serious straits.

Once again, however, the arrangements failed to work according to plan. During 1948 Britain's own balance of payments with the outside world improved, but South Africa's balance with the sterling area worsened—largely because of the virtual cessation of capital inflow into the Union after the election of the Malan Government. Thereafter, not only did the Union's deficit with the dollar world impose an increasing drain on its war-accumulated gold reserves, but, in addition, holdings of sterling began to fall. By June, 1949, the Reserve Bank's gold holding was down to only £37 million and its sterling holding to a mere £3,000,000, despite the fact that £50 million of the "gold" loan had already, at South Africa's request, been repaid in sterling. Belatedly, the Union clamped down import restrictions, and henceforth its imports even from the sterling area were confined to "essentials." It was already clear that, with the "gold" loan nearing exhaustion, South Africa might soon be obliged to sell gold to Britain to secure sterling to finance its imports from the sterling area—provided the capital flow to the Union was not resumed. Earlier in the year, this prospect had already led Sir Stafford Cripps to refuse to allow the Union to raise money on the London market; it also explained the growing desire in London to restrain any efflux of private capital to South Africa and, if possible, to restrict imports of South African "inessential" goods.

In this situation there were all the ingredients for a bargain. Though it has only now been made public, there is little doubt that the main outlines were hammered out during Mr Havenga's visit in July-August last. The delay in announcing it may reflect the realisation that the arrangement involves, in effect, a South African discrimination against "inessential" dollar goods. The new trade arrangements have theoretically been in operation since the beginning of the year, while other parts of the bargain—South Africa's acceptance of sterling repayment of the balance of the gold loan just before devaluation, and the floating of the £10 million South African loan on the London market last November—were put into effect before that. It is plain, however, that many of the details have still to be worked out. The most important of these is, of course, the value and the categories of the goods to which the new universal licence system for "essentials" will apply. In the Union's import restrictions last year, "essentials" mainly comprised food, capital equipment for the mining and electricity supply industries, petrol, industrial raw materials and government stores.

The upper limit on the value of these licences each year will presumably depend upon whether the South African authorities deem it wise to build up their gold reserves. If these reserves were kept constant, the maximum figure for essential imports would presumably depend on the annual value of the Union's current gold output (£144 million at the pre-devaluation rate of production and the post-devaluation rate of exchange) *plus* any additional annual gold production stimulated by the higher sterling price of gold *plus* (possibly) its hard currency earnings from wool and other products shipped to dollar countries during the year. At a very rough estimate, the ceiling might come to £175 million a year. During the first half of 1949 the sterling area supplied some 55 per cent of South Africa's total imports. Purely for the sake of indicating the theoretical magnitudes, it may be noted that if a similar proportion of South Africa's "essential" needs could be supplied, the sterling area might earn some £95 million of gold in a year. In practice the prospective earnings might be a good deal less than that sum.

At this stage, of course, it is impossible even to guess at quantitative results. It is equally impossible to estimate the prospects for British exports of less essential goods to South Africa—exports which will now presumably enjoy complete freedom from hard-currency competition. The funds to pay for these imports will mainly arise from South Africa's earnings from exports to the sterling area (which were running at an annual rate of

£74 million in the first half of 1949), its earnings from exports to non-sterling "soft" currency countries (say £30 million in the year) and the extent of the inflow of capital into the Union from Britain (other than that represented by "essential" imports on the universal list). Since the devaluation, this movement of funds has been strongly resumed; largely as a result of it the Reserve Bank's holdings of sterling have increased by more than £50 million in the last five months. Under the new agreement this capital movement will no longer threaten Britain with gold losses but it will stimulate unrequited exports of "less essential" British goods—some of which might otherwise be sold to the dollar area. Presumably, however, this is one of the limitations which Britain is bound to accept under the arrangement.

Even when fuller information is made available about the value and types of goods to be included in each South African import category, several subsidiary questions about this agreement will still have to be posed. First, it is not clear whether soft currency countries outside the sterling area (such as France and the Netherlands) are to be permitted to supply goods allowed into South Africa under the universal licence system and thus to claim payment in gold. At present South Africa is importing comparatively little from such countries; its small deficits with them have hitherto been financed by purchases of their currencies from the Bank of England against gold. Last week's Treasury announcement suggested that in future South Africa would have to pay gold only for "hard currencies" (instead of for all "non-sterling currencies") purchased from London; if this means what it appears to mean, one minor source of gold supply to the sterling area pool has now dried up.

Secondly the accounting procedure to be followed under the agreement is not at all clear. Possibly it may be found to be simpler for South Africa to pay for all its imports from the sterling area in sterling in the first instance, for it to keep accounts of the number of "universal" import licences which have been serviced from the sterling area and then to make sales of gold against sterling in the London market to clear these accounts. Yet another problem arising from the agreement is that of gauging whether it will be possible to hold out any positive incentive to British exporters to concentrate on selling goods on the "essential" list; this will be especially important in the case of those British exporters who are going to find the South African market for inessentials suddenly and profitably flung open to some lines of their products at the same time as the market for "category A" goods is flung open to other lines. The task of devising any such incentive is going to be difficult enough in any case. It is going to be almost impossible if—as has been suggested—the South Africans are not going to make public a precise list of "essential" imports but are going to hold themselves free to alter the goods in each category without notice from time to time.

But although questions of this sort still need to be posed, they should not be allowed to obscure the essential worth of the agreement. The main import of Mr Havenga's announcement is clear. For the first time since the war a real opportunity of earning South African gold is held out to the sterling area. It is all to the good that the amount to be gained will depend on the sterling area's productive efficiency and on that alone; the opportunity cannot be vitiated this time by the failure of South Africa to keep inflation in check nor can it be fostered by new trade restrictions from this side. Provided the floodgates are not flung too wide to an efflux of sterling capital to the Union, the whole agreement deserves to be welcomed. It is, perhaps, a pity that the lid has been lifted before the dish has been prepared for the table. It smells appetising, but it is not yet fully cooked.

Business Notes

OEEC Council Meeting

The two principal items on the agenda for the OEEC Council meeting in Paris this week were the trade liberalisation proposals and the Payments Scheme. Each is to be given a prominent place in the interim report which is to be published in the course of the next few days. The basis of discussion on trade liberalisation was a French proposal which went rather further than the earlier OEEC goal which was to free from quotas 50 per cent of trade transacted on private account between ERP countries. The French proposed that this percentage should be increased to 60 by next July provided the new payments agreement is in operation by then and to 75 by the end of the year. These figures were well within the scope of British intentions, but a number of other countries found them somewhat excessive, and these laggards had to be encouraged.

The exclusion of hard currency countries such as Belgium from the liberalisation proposals by others, including Britain, was again noted with sorrow and slight anger by the adversely affected parties. The usual argument was, however, again advanced that balance of payments difficulties must and will always justify discrimination. (Those who advance it never ask how far discrimination and the consequent perpetuation of high and low priced areas may themselves be responsible for balance of payments difficulties.)

The time devoted to the trade proposals was in keeping with the order of priorities that would have been set by the American ECA experts in Paris. The prevalent view among officials in Mr Averill Harriman's organisation is that the main brake to the freeing of European trade is the desire to protect vested interests and is not to be found in balance of payments difficulties. They point, by way of illustration, to France, which during the past year has built up external credits and abstained from using drawing rights to the equivalent of a total of about $300 million, mainly in order to protect French agriculture and thus, incidentally, defeating the deflationary policy of the Bank of France and the attempts of the French Administration to lower prices. They would share the view, widely held in Paris, that there is now a close enough approach to balance of payments equilibrium between European countries to free trade from all quota restrictions and allow complete interconvertibility of European currencies. If quotas are being retained, this school would argue that it is for brazenly protectionist motives.

* * *

European Payments Union

The European Payments Union proposals, though they may have taken less of the time of ministers than the trade liberalisation talks, nevertheless provided the main spectre at the conference table. This was so, not only because the differences between ERP countries again underlined the gulf that separates the "freedom" from the "planning" school in Europe, but also because the British reservations on EPU revived all the American suspicions that Britain wants commercial discrimination for its own sake and wishes to make the European economy, together with its associated territories, a vast area of permanent discrimination against the dollar world.

The final reservations made by the British delegation in the discussions on the Payments Union fell under four heads. The first was a complete refusal to allow any usurpation by the EPU of the existing bilateral payments agreements and their overdraft facilities. The second was a demand that the facilities provided by EPU through its overdrafts based on individual members' quotas should remain available for periods up to 24 months at least before being converted into a form of debt to EPU on which partial gold payments would have to be made. In technical terms, this amounts to a demand that the "swing" in the EPU mechanism should stretch not to 12 months, as had previously been proposed (on the argument that 12 months would cover all normal seasonal fluctuations), but to at least 24 months and that the possibility of gold settlements should then be pushed back to the last possible moment. Thirdly, an echo of the so-called Cripps Plan of June, 1949, reappeared in demands that debtors should be allowed to make repayments in goods and services before being compelled to pay in gold.

Finally, the British insisted on freedom for gold—losing countries to reimpose quantitative restrictions on imports from gold receiving countries, irrespective of what had been agreed under the trade liberalisation proposals. These reservations were, moreover, prefaced by a general statement stressing the inability of the British Government to shoulder any precise commitments under EPU before the General Election. Mr Paul Hoffman was thus given a report on EPU which clearly revealed the inability of the member countries to resolve their differences. His appreciation of the candour of this admission did not veil his disappointment that no agreement had been reached. The agreed general principles of the scheme, however, remain and these will duly appear in the interim report of OEEC together with some practical examples. The experts of the various countries concerned will then reassemble in the Payments Committee of OEEC and will be given the task of translating these principles into an agreed scheme.

*

The International Monetary Fund incident caused little perturbation in Paris. The omission of any mention of the IMF in earlier drafts of the EPU scheme was admitted to have been a regrettable oversight. There should, however, be no difficulty about the admission of an IMF observer at the EPU organisation. There is no reason why the two institutions should not prove wholly compatible and complementary. It is unfortunate that the IMF should have adopted so aggrieved and petulant an attitude towards a newcomer from which the IMF might ultimately hope to regain some of the prestige which it has lost since the devaluations of last September.

Trustee Borrowing Resumed

In fixing the terms of the Southern Rhodesia loan, the authorities have obviously determined to avoid the ill-fate of the South Africa and Jamaica issues. They have whetted the appetite of the stags—who have not been seen in the trustee market for many a long day—by offering £6,000,000 of 3½ per cent stock, 1967-69, at 98. It remained only for the gilt-edged market to show moderate firmness between the announcement of the issue on Wednesday and the opening of the lists on Friday to ensure a popular success—in marked contrast to the ninety per cent or so of the South Africa and Jamaica loans which had to be taken up by underwriters. The former, with two years' shorter life, was issued at 99 last November, and although its price was immediately adjusted to 98⅝ when the Southern Rhodesia terms became known, an attractive margin still remained. In the market's view, the issue price was a full point below the justifiable price.

The gilt-edged market has provided a favourable background for the Southern Rhodesian loan, for which an auspicious success will doubtless raise the prospects of the second instalment of South African borrowing. It has also reinforced the solid success of the English Electric 4 per cent debenture issue, of which the £3,000,000 offered was subscribed ten-fold. This stock, issued at 99, now stands at 101. There are any number of large borrowers, industrial and others, whose needs have become pressing, because market conditions were unfavourable after devaluation, particularly when setback in gilt-edged ensued. But these borrowers are not likely to appear before the end of the month, with the election out of the way.

By that time, some qualification may be necessary to the easy assumption which tends to be made in the City that a Conservative victory would be good for gilt-edged, and a Labour victory bad. These alternatives may measure the initial reactions to the result, but it is not confidence and sentiment which will matter in the end so much as financial policy. It is much more probable that the right financial policy would be bad for gilt-edged; the investors' main concern is whether either party would produce a Chancellor who would be both disposed and able to pursue such a policy.

closer economic co-operation between the four countries on which officials had been working for some weeks. The four countries, small enough in number and sufficiently similar in their economic make-up, offered promising scope for experiment towards freer payments long before regional economic arrangements in Europe became the fashion. If the actual achievements are limited, it is partly because Norway, being the weakest of the four, has made reservations on several points, and because Norway and Sweden are full partners in the transferable account system while Denmark is accorded administrative transferability. There were already no impediments to payments for current transactions, and the broad effect of the agreement is to free all invisible items, and trade payments, of restriction, subject only to examination by the exchange controls. There are no proposals for further liberalisation of trade (as distinct from payments) between the parties ; trade questions obviously fell more naturally into the wider area of discussion at the OEEC meetings in Paris this week.

The major change, so far as current payments are concerned, is that tourist expenditure will be unlimited in amount (except for travellers from Norway) from March 1st. Control will remain only to ensure that tourist applications are genuine. Switzerland, Belgium and France have naturally levelled accusing fingers at the agreement, on the undeniable ground that it discriminates against their tourist industries, for British tourists are limited to £50 a year for France and less for Switzerland. Tourists are not likely to be diverted in large numbers to Scandinavian resorts from cross-Channel destinations, solely on the ground that they can spend as much as they like there ; even so, Switzerland and Belgium can hardly be expected to show any sympathy for this arrangement.

Proposals for the freer grants of credits include a Swedish undertaking to continue the present extension of credits to residents of the other three countries, and a British undertaking to lengthen the term and widen the scope of credit business—opening up, it seems, the possibility of resuming ship mortgage business. The four governments will look sympathetically at proposals for productive investment in the other three countries, but their decisions will be subject to existing controls of domestic and foreign borrowing: purchases of real estate or securities, or the transfer of balances " merely for speculative purposes," will be restricted as at present. Thus the agreement stops well short of complete freeing of the exchanges, and its success will rest on the ability of the controls to prevent embarrassing accumulations of sterling from piling up in Sweden, or from leaking out to other countries. Even the provisions for the release of blocked balances and securities are tentative in character, though they seem unlikely to produce much pressure because the amounts which may be repatriated are small. Switching of sterling investments by residents of Denmark, Norway and Sweden will in future be unrestricted, but this decision is not reciprocated.

* * *

Australian Revaluation Rumours

The simmering pot of rumour about a possible revaluation of the Australian pound was brought to the boil again last week-end. Not for the first time, the headlines proved to be false prophecy, but even sober observers of the Australian scene were this time prepared to attach rather greater importance to them, if only because of the continuing inflow of sterling into Australia on both capital and current account. The main object of revaluation would be to put some check on the inflation of the price level, which is steadily pushing up Australian costs—and which is going to make internal re-adjustment there very uncomfortable when the eventual recession of export incomes sets in. The main opposition to revaluation—at any rate in the past—has come from Mr Fadden, the Federal Treasurer and leader of the Country Party, who has not been anxious to see, much less to contrive, any fall in farmers' incomes, and from some secondary industries who believe that such a setback in farmers' demand would hit their own booming domestic sales.

A whole superstructure of arguments and counter-arguments has now been built up on the framework of these two basically different points of view. It is argued that to revalue the Australian pound before the export season finishes in June would give rise to a series of appalling accounting difficulties and anomalies about stocks of farm products not yet sold abroad. On the other hand, it is pointed out that a restoration of the Australian pound to parity with sterling would leave wool producers' incomes higher than they were before Australia devalued in line with sterling last September. Moreover, an appreciation of the Australian pound—it is said—might force American and other foreign buyers to pay more (in terms of non-Australian currency) for their wool—and any extra earnings of dollars might be used for increasing Australia's petrol imports, an increase which would be very dear to Mr Fadden's heart ; this argument rides roughshod over the belief of some economists that present dollar and sterling prices of wool already overestimate the real demand for wool textiles in the world markets. The inflow of capital to Australia is reaching alarming proportions—despite repeated warnings that funds which are not remitted for genuine investment projects may not be allowed out. Meanwhile, it is worth noting that the chairmen of some of the larger Australian banks in their annual statements contrived to allow a modified note of disapproval of last September's devaluation to appear in their guarded references to the possibilities of revaluation now.

Industry and Trade

The Dollar Oil Cuts

The action of the National Petroleum Council in Washington in publishing this week the text of a letter from the British Colonial Secretary to the Government of Kenya did not reveal anything new about the sterling-dollar oil situation. When the British Government announced on December 20th its intention of restricting British imports of dollar oil in the new year, it was made clear that the new policy would be extended to the Commonwealth as and when the Commonwealth governments could be got to agree. The State Department was aware of this, and it can have been no surprise to anybody that the British Government proceeded to seek the co-operation of Colonial and Dominions governments in substituting sterling oil for some of the dollar oil that they are importing.

What is disastrous about the letter, however, is the phrase: " The Americans have, as expected, not gone beyond expressing regret." The United States Government is having enough difficulty already in maintaining a reasonably tolerant and helpful attitude towards British attempts to save dollars on American oil. But it cannot be expected actually to like policies which tend to exclude American trade, and it dislikes in particular the way in which the cuts on dollar oil imports have been devised and introduced. As Mr Acheson said on Wednesday, the State Department would prefer to work out a more durable policy which would meet the British necessity " and at the same time protect the legitimate interests of the countries and companies concerned." Perhaps this will not prove possible. Apparently, however, it has been agreed to postpone the operation of the dollar cuts on British oil imports for six weeks while the Anglo-American negotiators in Washington try to work something out ; the cuts were at first intended to start at the beginning of January.

If one thing can at this moment do more damage than another, it is the suggestion that American moderation reflects indifference or is equivalent to a green light. It is not true, and it was an ill-advised implication to be allowed to creep into even a confidential document. The American Government is under fierce pressure from its own oil trade to behave in a more intransigent manner.

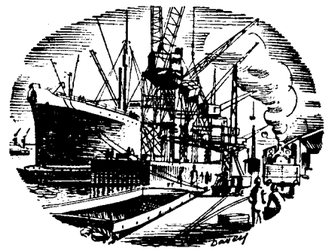
Turbo-Jet Economics

Sir Miles Thomas, chairman of BOAC, has disclosed that the first of the de Havilland turbo-jet Comets is likely to be flying on the London-Cairo-Karachi route by the end of 1951. The aircraft was not at first expected to be operating until 1952 or 1953, but since the second prototype built for the Ministry of Supply will be delivered by the summer, it is reasonable now to expect that the first of the fourteen production models ordered for BOAC will be delivered early in 1951. The cost of the aircraft has been fixed at £450,000. On the basis of the recently obtained performance figures, the makers have calculated that it will be 20 per cent cheaper to operate per ton-mile (even if capital costs are included) than a comparable piston-engined aircraft and with its greater speed will provide 50 per cent more ton-miles a year.



The detailed calculations behind these figures are being revealed only to prospective buyers, so that it is impossible to assess them. If they are sound, they go a long way to meet criticism that the aircraft's payload of 12,000 lb. over a distance of 2-3,000 miles was uneconomically low. The Comet has suffered from the general assumption that it will be used on the North Atlantic crossing, although de Havilland have never suggested that in its present form it was suitable for this route. The performance figures calculated for the Gander-Prestwick route with two stops and not for London-New York direct show that the payload cannot be much more than 8,750 lb., and on half the days of the year would be even less.

Further development of the type, and particularly of the engines, will make these performance figures and costs obsolete before the first operating aircraft are delivered, and in one or two years' time, opinions on the Comet's suitability for individual routes will need to be revised. So will the plans of manufacturers designing a possible competing aircraft. All the big American aircraft companies have produced drawings of turbo-jet airliners. Their public statements suggest that these will not be put into production without firm orders ; but, given the competitive threat of the Comet, it is hard to believe that they will adhere to this view for ever. But the rapidity with which the Comet is being developed suggests that it is now useless to design a rival aircraft merely to compete with the Comet's present performance. The earliest date on which an American turbo-jet aircraft could be used on scheduled operation is 1956. It would then have to compete with a Comet with a performance greatly improved by several years' experience in design and operation.

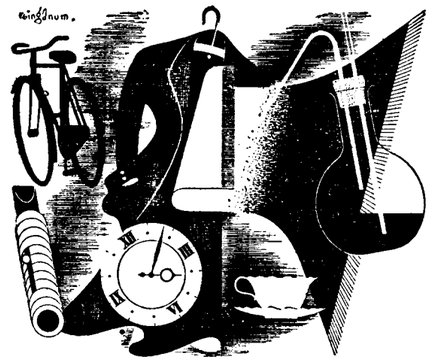
Change in Aircraft Orders



The Bristol Aeroplane Company have announced a change in plans for the 25 aircraft known as Bristol 175s which are on order for British Overseas Airways. The first version of this 60-seat aircraft was to have been powered by the company's Centaurus piston engine and later models by the Proteus turbo-prop engine which is now being developed. The piston-engined version has now been abandoned, and the company will concentrate solely on the turbo-prop powered version. This policy has certain advantages, since an aircraft designed to operate with either type of engine is inevitably less efficient than one which is intended for one type of engine only. The first of these aircraft is not due for delivery until 1954-55, and since progress with gas turbine aero engines has been so rapid, operators like BOAC will no

For Export

At the quay-side, the import-export procedure is reaching its final stages, but the earlier steps were equally important. Markets had to be found, references exchanged, restrictions complied with, payment arranged and documentation completed. At each of these steps the services of the Westminster Bank can usefully be employed. To help those who are engaged in foreign trade, the Bank has issued a booklet which may be obtained without charge at any branch. Ask for *The Foreign Business Service of the Westminster Bank*

Devaluation and the Terms of Trade

There was no doubt that devaluation would worsen Britain's terms of trade ; the only room for difference of opinion was about the extent. Now the results are becoming apparent. Import prices rose sharply between September and December by 12 per cent. The theoretical rise in the cost of imports, assuming the same pattern of trade as in mid-1949, which might be directly attributed to devaluation has been calculated at 15 per cent. Hence it might be argued that the major part of the effect of devaluation had already been reflected in Britain's trade figures by the end of the year. On the other hand, export prices have shown very little change during the last quarter or indeed during the whole year. Thus in December the terms of trade (that is the amount of imports obtained from a unit of exports) had deteriorated by 10 per cent compared with September and by 4 per cent compared with January, 1949. Between May and September, the terms of trade started to move appreciably in Britain's favour.

The rise in import prices has been by no means uniform for the separate categories of goods. Imported manufactures increased by 19 per cent in price after September, raw materials by 10 per cent and food, drink, tobacco by 8 per cent. Wholesale prices of manufactured goods (the course of which was shown in a note on January 21st) rose by

* Export price index expressed as a percentage of import price index.

only 2 per cent during an approximately equivalent period. Raw materials, however, rose to the same extent as imported raw materials—10 per cent—while the increase in the wholesale prices of food, drink and tobacco was only 5 per cent. On the export side, prices of metal goods rose slightly, while those of textiles and other manufactures tended to fall slightly.

These movements in the three price series, which differ in degree though not in direction, are explained by technical factors, such as the proportion of home-produced foods to total supply, or the period between ordering manufactured goods abroad and delivery. But the crowning feature is clearly the 10 per cent rise in the cost of raw materials since devaluation which is spreading its effect throughout the structure of industrial costs and prices. To judge from the firmness of commodities in recent weeks, further increases must be expected.

German and Japanese Shipbuilding

With the flow of new shipbuilding orders now dwindling to a trickle, British shipbuilders are watching with close interest the reappearance of competition from the ex-enemy countries. Shipowners, similarly, are preparing themselves for the inevitable return of ex-enemy competition to the world trade routes. It cannot be said that either of the maritime industries concerned has harboured illusions on the subject. They are, however, sensitive about the type of competition adopted, and anxious that some practices of the years between the wars shall not be resumed. The latest relaxation of restrictions on German shipping and shipbuilding has received much attention in this country, but it is Japanese prospects of competition that are in the more advanced stage. The original limits of 6,000 tons gross and 15 knots speed for ships built in Japan have now been altogether removed, whether for Japanese or overseas owners. In Germany the limitations still remain at 7,200 tons gross and 12 knots speed, though licences may be granted for the building of a few refrigerated ships of a higher speed, or dry-cargo or passenger vessels of a larger size, within certain strict limits.

At the end of December *Lloyd's Register* recorded that 41 vessels were being built in Japanese yards, totalling 120,416 tons gross. The American Bureau of Shipping at the beginning of December gave technical details of 15 vessels, which aggregate 103,090 tons gross and 146,950 tons deadweight, under construction in Japan. Of these, four are cargo ships for export—one of 7,600 tons gross for Panama, and three of 10,000 tons gross each for the Philippines. Of the vessels listed for Japanese owners, two are tankers—one of these (of 14,500 tons d.w.) was laid down in 1944—,there are five dry-cargo vessels of 4,000 tons and four of 6,000 tons gross. Authorisation has been given by SCAP for the expenditure of $24,000,000 of counterpart funds on a new shipbuilding programme.

For Germany no statistics are available, but nothing much larger than a coaster has been reported as laid down. But in ship repairing (on which all restrictions have been lifted) German establishments are active and have succeeded already in depriving British firms of contracts. German firms have been able to offer much faster delivery at lower cost than British firms, which have until recently been overcrowded with work. The advantage in delivery may prove temporary, but on costs the Germans can always underbid British yards. A recent German quotation to a British shipowner was 75 per cent of the lowest British tender, but when this quotation was refused it was immediately cut to about 60 per cent of the British price. The Western German Government has just announced that the cost of rebuilding the German merchant fleet is estimated at £135 million. It proposes itself to provide £50 million towards this in the form of interest-free loans, together with £12½ million from ECA counterpart funds. It has further suggested that £18½ million worth of sterling drawing rights should be used to buy foreign-built ships.

* * *

Sale of Ships Abroad

The rate at which ships already on order are being completed is now about three times the rate at which orders for new ships are coming in to British yards ; and neither British nor foreign shipowners are rushing to stop the widening breach. It may seem at first sight that their immediate needs are satisfied, since the tonnage of the merchant fleet is practically at its prewar level. But a closer examination of the age distribution of the fleet shows that there is still much room for improvement in its quality. Some 28 per cent of British foreign-going liner tonnage and about 20 per cent of tramp tonnage consists of ships 20 years old, or older. Despite this block of old tonnage, the average age of

the fleet has fallen since 1939, but this arises from the fact that about a quarter of the liners and nearly half the tramps were built to wartime standards between 1942 and 1945. "Tailor-made" ships are more efficient in competition and more in keeping with the tradition of British shipping service. Liner owners, in particular, are still anxious to improve the balance and the quality of their fleets. The replacement of this old tonnage is, therefore, an important potential source of demand for new ships in the next few years.

Sir Colin Anderson, the president of the Chamber of Shipping, drew attention last week to a deterrent to replacement that has existed since the war; this is the government restriction of the sale of "second-hand" ships abroad. Licences for such sales have been withheld in recent years by the Ministry of Transport, except for a few ships of about 30 years old, or more. Before the war shipowners were free to dispose of ships in this way, and thus add to their funds for new building. In the eleven years to 19? an average of 643,000 tons was sold abroad each year; new acquisitions were about 800,000 tons a year. The position now is that funds that might be used for building new ships are locked up in unwanted ones; and this fact may in some cases turn the scale against the decision to build. No doubt there are many foreign owners who would be willing to buy the old ships, and who are being forced to order new tonnage instead; but those orders do not necessarily go to the British shipyards.

Difficult Year for Tractors

Tractor deliveries to the home market became much easier in 1949, and farmers who in times of scarcity had placed orders with several different dealers, were obliged to take delivery of one and cancel the others. At the same time exports began to shrink. In the last quarter of 1948 they had been absorbing more than three quarters of total production; but currency difficulties closed some of the best markets, such as France and Argentina, and in spite of a trickle of exports to France these markets have not fully reopened. In other countries, buyers deliberately withheld orders in anticipation of devaluation. Since devaluation the orders which were withheld have been coming in, and orders have also come from new customers in Canada and elsewhere. It is still too early to say if these new markets will develop further, but the indications are promising.

The year's vicissitudes have had their effect on production. The two biggest producers, Ford and Ferguson, have both reduced their production rate well below that which the size of their order books would appear to justify. Ford, who are particularly anxious to avoid fluctuations in their rate of production, have reduced it very considerably from the 220 tractors a day which they were turning out at the end of 1948. Output of Ferguson tractors fell from an

average of 320 a day early in 1949 to 120 a day in the middle of the year; production is now about 200 tractors a day, and is increasing. The Nuffield tractor, which was being tested on British farms in 1949, is now tooled up for production at a rate of something over 100 a week, and this figure may be increased. The accompanying table shows the general trend of production and exports in the industry. Exports to the United States in the early part of the year were the result largely of an arrangement made by Mr Harry Ferguson to sell British-built Ferguson tractors, with American engines, through his dealers in the United States. In this way he was able to supply his American market between the termination of his agreement with the Ford Motor Company in America and the opening of his own factory in Detroit.

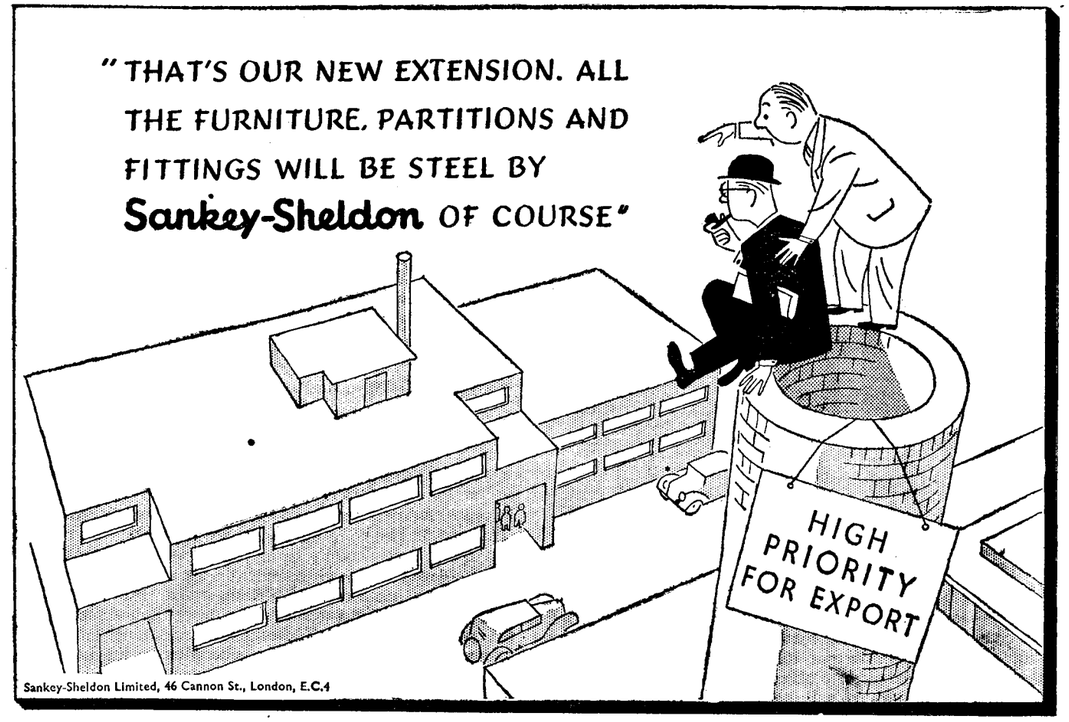
Manufacturers are confident that home and export demand are between them sufficient to absorb the present rate of production of probably well over 9,000 tractors a month. Although the number of new tractors bought since the war might suggest that replacement demand at home will be low for some years, one manufacturer still believes that as many as 100,000 tractors are due for replacement.

* * *

Steel for 1950 Motor Programme

The motor industry expects to produce about 450,000 passenger cars in 1950 and has been assured by the Ministry of Supply that there will be sufficient sheet steel to meet this volume of production. If, as is generally assumed, half a ton of sheet goes into each car, the allocation for the first quarter of the year allows for a considerably higher annual rate. This first quarter's allocation is some ten per cent higher than that for the last quarter of 1949 and is the only one yet fixed for 1950.

Sheet supplies to the industry were augmented in 1949 by the purchase of about 50,000 tons of slab from the United States for rolling in this country. All but 2,000 tons was delivered within the year, 13,000 tons within the last quarter. These imports appear to have been sufficient to enable the rolling mills to be fully employed. The British industry, however, has by now made new arrangements and can itself keep the rolling mills fully supplied with slab, and the purchases from the United States are now of motor body sheet itself. The imported sheet is about double the British price by the time it reaches this country.



The Ministry intends that only 110,000 cars shall be allocated to the home market in 1950. The loose system of allocating 75 per cent of production for export was dropped some time ago in favour of arrangements between the individual producers and the Ministry, by which the home sales are fixed and the rest of production—whatever its volume—exported. The working of this system only proved once again the impossibility of fixing rigid quotas for the two markets. Out of the 410,000 or 415,000 cars produced in 1949, 150,000 were sold on the home market and not 110,000 as was originally intended.

Rhodesian Tobacco Talks

The now customary annual talks between representatives of the Southern Rhodesia Tobacco Marketing Board and British tobacco manufacturers start in London next week. Two particular topics come up for discussion. The first is the system of co-ordinating export and import permits, a matter of administrative technique which has led to difficulties, though supplies of Rhodesian tobacco to Britain have not been affected by it.

Rhodesian tobacco production has expanded remarkably since the war. The target for the current season has been set at 90 million lb., though unofficial estimates put the crop as high as 95 million lb. In 1948-49 the harvest yielded 82 million lb. compared with 47 million lb. in 1945-46 and 27 million lb. in 1937-38. Some of this expansion has been due to a larger acreage planted, but higher yields have also contributed. In 1947-48, for example, 673 lb. of flue-cured

BAY HALL TRUST LIMITED.

Summary of Directors' Report for the year ended 31st December, 1949, and of the accompanying Statement by the Chairman, Sir Charles Hambro, K.B.E., M.C.

DIRECTORS' REPORT

The gross revenue amounted to **£153,957,** compared with **£153,886** in 1948. After charging Debenture Interest, Income Tax, Directors' Fees, Management and General Expenses, amounting to **£80,891** the net profit is **£73,066.** Adding **£137,388** brought forward, the total available for appropriation is **£210,454** and a dividend of 6 per cent., free of tax, is recommended, which will absorb **£60,828.** It is further recommended that **£10,409** be appropriated for writing down the book value of certain investments, leaving **£139,217** to be carried forward.

At market prices on December 31st, 1949 (or where no market price existed at valuations by the Directors at that date amounting to **£308,615),** the Share and Debenture Holdings and British and Foreign Government Securities had an aggregate value of **£3,230,232,** as compared with their book value of **£2,193,201.**

CHAIRMAN'S STATEMENT

The net profit of **£73,066** compares with **£68,012** for 1948, an increase of **£5,054.** Full provision has been made in the Profit and Loss Account for Income Tax and Profits Tax in respect of all income to 31st December, 1949. Double taxation relief allowable to the Company, amounting to **2s. 2d.** in the £, has been taken into account in arriving at this provision. At the end of 1949, the value of the investments showed an indicated appreciation of **£1,037,031** over book cost. Over **93** per cent. of the investments, including British Government Securities, taken at the valuations at December 31st last, are situated in the United Kingdom, South Africa and other parts of the British Commonwealth. About **85** per cent. of the investments are in Ordinary stocks and shares and the balance in fixed-interest-bearing securities.

Note: Production is expected in the following season.

Turkish type tobacco. Exports have increased with production and are now about three times their prewar size.

Rhodesia intends to expand her output to 120 million lb. by 1953—an aim which on present showing could be more than comfortably met. But tobacco growers are not willing to increase production beyond this limit in subsequent years unless Britain undertakes to absorb about two-thirds of the surplus—a matter which will provide the second topic of discussion. Britain's capacity to use more Rhodesian tobacco will depend in turn on how far American tobacco, and dollars to pay for it, are available in 1953, and at what prices. At the present time Rhodesian leaf is not much cheaper than American, despite its tariff preference.

* * *

Combating the Jute Shortage

Jute has remained very firm since devaluation, and its price is still £120 a ton compared with slightly under £100 at the beginning of September. Bumper grain crops have strengthened the demand for jute sacks and the output of jute fabric is well below requirements. From the beginning of December, the Indian mills have been working 16 hours more a month; production for that month reached 82,000 tons compared with 69,000 tons in November. But twelve months earlier, production almost touched 100,000 tons—a figure not likely to be regained unless India is prepared again to buy raw jute from Pakistan. Smuggling from Pakistan to India undoubtedly occurs, but in small quantities compared with India's import needs. Much of the demand for Indian jute goods is coming from Argentina and other South American countries.

Jute spinners in Dundee are well booked with orders and larger shipments of raw jute from Chittagong would allow them to expand their output if labour was available. The increase in the consolidated trading profit of Jute Industries from £754,863 to £864,986 in the year to September 30, 1949, and the payment of a maiden dividend of 5 per cent on the ordinary capital is an indication of their prosperity in the period prior to devaluation. The suspension of shipments of narrow width hessians from Calcutta has caused an acute shortage of such goods in Britain. The allocation of wider hessians to linoleum and carpet manufacturers has been halved and jute weavers are to use the yarn thereby saved to make narrower cloth. This expedient would in due course restrict the output of both linoleum and carpets unless suitable substitutes for hessian can be found.

The Pakistan authorities are fully aware that the present shortage of raw jute may be detrimental to the jute industry by encouraging the development of substitutes. They are trying to increase the handling capacity of Chittagong, Pakistan's only port in Eastern Bengal, and already some results can be seen. Until October shipments from Chittagong averaged 45,000 bales a month, the same as a year earlier. But in November and December shipments are reported to have increased substantially. In February, 1949, Chittagong exported over 180,000 bales of raw jute. This was an isolated example. But if this rate could be maintained, most of Pakistan's current crop could be shipped this season and Pakistan would be able to maintain its present price despite the Indian boycott.

* * *

Fisons' Future

The rapid expansion of output of fertilisers in this country since the war has been a natural corollary of Government assistance to agriculture, partly by way of subsidies on feeding-stuffs and fertilisers, but also through guaranteed prices for agricultural products. At the same time the fertiliser industry has been fairly rigidly controlled. The chairman of Fisons, in his review accompanying the 1948-49 accounts, is not unduly dismayed about the consequences for the group of the Government's decisions to remove the subsidies on fertilisers and feeding-stuffs. For while a rise in the price of these materials to the farmer appears inevitable, the farmers have the Government's assurance that such increases will be taken into consideration in the next price review of crops. Moreover, the removal of subsidies is welcomed as a first step towards decontrol of the industry.

None the less Mr F. G. C. Fison admits the possibility that crop prices may not be raised sufficiently to avoid some reduction in the funds available to farmers for buying fertilisers. At present, fertilisers represent approximately 6 per cent of a farmer's total outlay. Mr Fison considers that the first impact of a cut in demand would fall on fertilisers imported from the continent. The principal continental suppliers of manufactured fertilisers in 1949 were the Netherlands and Belgium, who between them provided nearly £700,000 of superphosphate of lime. As this was only half the amount imported from these countries in 1948, the scope for economising on imports has been narrowed.

Certainly, any reduction in demand for home-produced fertilisers might call in question the big extension to capacity at present being carried out by Fisons. The first instalment of capital to finance the scheme was raised in the form of 2,219,278 £1 ordinary shares at 21s. a share last October; a further issue of £3,000,000 unsecured loan stock is contemplated. It is somewhat disturbing to find that in the year to June 30, 1949, despite an expanding output and the continuance of subsidies, the group's profit on fertilisers was £163,000 lower than in 1947-48. Consolidated trading profit declined from £1,304,790 to £1,146,018 on the year. Moreover, it is clear from the group balance sheet at June 30, 1949, that an acute shortage of working capital remains, even after taking account of the funds from the new issue. Bank overdrafts amounting to £2,294,273 were incurred in 1948-49, while net current assets declined from £2,629,643 to £372,674 on the year. This deterioration in the group's liquid resources has largely resulted from expenditure on the development scheme in anticipation of the receipt of funds from new issues.

Finance and Taxation

Big "Above-Line" Surplus

The Exchequer returns after these past four weeks of heavy tax-gathering have greatly altered the picture presented

the year-end returns, which were discussed in *The nomist* of January 7th. For the first nine months of the rent fiscal year there was an above-line deficit of £22 lion before provisions for sinking fund. Now, only four eks later, there is instead an above-line surplus of £401 llion. It seems evident, therefore, that the original estimate the budget surplus will be realised, even though the period peak revenue inflow is now well advanced. For the full ar the Chancellor expected the above-line surplus to fall £383 million to £470 million; it has so far fallen by :29 million. This rather striking performance has been iolly attributable to the buoyancy of revenue, for expendi-re has risen rapidly. For the fiscal year to date, outgoings ibove the line" aggregate £2,625 million, or £206 million ore than in the corresponding period of 1948-49; this crease already exceeds by £50 million that expected for the ll year.

Unfortunately, the buoyancy of the revenue has been very rgely attributable to large receipts from special services. or the full year, above-line revenue was expected to fall by 229 million, and £196 million of this loss was expected to :cur under three heads—receipts from surplus stores, ading services, and miscellaneous receipts. In the year to ate, total revenue has fallen by only £23 million, while :eipts from these special sources have dropped by only 47 million. In other words, at least three-quarters of the nprovement is due to non-recurring or special credits. A irge part of the remainder arises from the unexpectedly irge yield of profits tax and EPT, and thus reflects the yield rising from trading periods in which profits were still being xpanded under the influence of inflation. It is noteworthy iat surtax, which is also assessed in arrear, already shows a ain of £14 million, or twice the amount envisaged last April.)n the other hand, income tax has so far risen by only £59 illion, or by less than half the expansion expected for the ull year.

Expenditure "below-the-line," at about £464 million net, ias already exceeded the year's estimate (£456 million),)ut this deterioration is mainly due to the abnormally heavy lemands which have been made upon the Public Works Loan Board since the disparity between its lending rates and those :urrent in the market first became pronounced. To judge rom the returns of recent weeks, this abnormal pressure has)een checked by the screening process recently imposed by Mr Bevan. In consequence, there now seems a good chance hat the year will close with an "overall" surplus; at the noment the overall deficit stands at about £63 million.

Bank Credit for Jugoslavia

The bank credit of £2,500,000, placed by the Midland Bank at the disposal of the Jugoslav National Bank, should prove of substantial assistance in ensuring a smooth flow for the greatly increased volume of exports from Britain and the sterling area envisaged under the recent Anglo-Jugoslav trade agreement. The facilities are granted in the form of a documentary sight credit, each credit line to run for six months. The final advance is repayable by June 30, 1951. The credit should thus be turned over at least three times and finance not less than £7,500,000 of sterling exports. The Export Credits Guarantee Department has underwritten the credit as to 90 per cent, the maximum risk ratio the ECGD will ever assume. The risk element in the remaining ten per cent has been eliminated by requiring the Jugoslav National Bank to put up this portion in sterling.

The Jugoslav credit is the second credit of this sort to be secured by the Midland Bank in competition with the accepting houses—and other joint stock banks—in recent months. A short time ago the bank undertook to provide the present credit facilities enjoyed by Poland, although negotiations for the renewal of this credit with the syndicate of accepting houses, who were then handling it, had reached an advanced stage. But Poland then, as Jugoslavia now, evidently found

the terms offered by the Midland Bank slightly more attractive than those eventually offered by the syndicates concerned; in both cases, therefore, the bank emerged as the successful competitor in what is becoming an increasingly competitive field.

Depreciation and Trading Profits

The further sittings of the Tucker Committee this week have considered the present basis of depreciation allowances—perhaps the most difficult and controversial part of their inquiry. Because businesses have often dealt somewhat arbitrarily with depreciation in their accounts, the system of tax allowances is laid down, in general terms, by statute. In recent years the long-standing discrimination in favour of manufacturers has been greatly increased. The Income Tax Act, 1945, which granted increased allowances, by no means disposed of all anomolies, and these, together with the discrimination against the "non-industrial" concern, have been explored very fully.

Had there been no great rise in the price level, the present system of depreciation allowances would undoubtedly have left most manufacturing concerns paying tax on something less than their true profits in some years, whilst distributors, property-owning concerns and many others would have paid on something more than true profits. Representatives of the latter classes put their case for building allowances; for instance, Viscount Buckmaster stated the property-owners' viewpoint, whilst the Hotels and Restaurants Association urged that hotels, as important dollar earners, should have such allowances. It may prove something of an embarrassment to the Committee to deal with what are clearly matters of economic policy rather than of profit measurement; but it is useful that anomolies should receive attention. The view was strongly pressed by many witnesses that all expenditure on assets with a finite life ought to be allowed over the life against the resulting revenue, whatever the nature of the business. Proposals affecting initial allowances varied from those for extension to wider fields, for speeding up the date of relief, for increases in rates, and for abolition in the interests of simplicity.

Special instances abounded, including the inadequacy of allowances to owners of dry docks, cemeteries and crematoria. These somewhat obscured the major question of principle about depreciation, whether the allowances should be adjusted to meet increased replacement cost. The FBI proposed a doubling of the annual allowances on assets acquired before 1940. In advocating this simple procedure, Mr Frank Bower justified it as reflecting the need to maintain capital in terms of physical assets. The Chamber of Shipping, on the other hand, opposed the idea of making continuing adjustments as they felt that shipbuilding costs might fall and allowances on original cost might later be more beneficial to owners. Professor W. T. Baxter put a well-reasoned case for adjustment to reflect current prices, and disagreed with earlier views about the practical difficulties.

Members of the Committee seemed uneasy about radical changes on the ground that not all firms have detailed plant records. It is to be hoped that when consideration of this subject is concluded at the next sitting on March 6th there will be support for the view that profit is the value of the fruit of a given collection of assets and does not include the increase in the money equivalent of that collection of assets arising through a fall in the value of money.

* * *

Pensions for Self-Employed

The Attorney-General's promise that the new Parliament will consider whether taxation reliefs can be granted on payments made by self-employed persons to secure

pensions is more than mere election talk. Professional men, the controlling directors of private companies, independent shopkeepers and others who are outside the scope of approved superannuation schemes are increasingly complaining of their present disadvantage compared with employed persons. An employee is in effect remunerated in two parts, if his employer runs an approved pension scheme—by an immediate salary and by a deferred pension. Such an arrangement brings considerable taxation benefit to persons in the middle and upper income brackets. The aggregate income of a working life is spread over both the years of labour and the years of retirement and earned income relief is granted during the whole period; by averaging his income over a longer period, the employee pays lower rates of surtax; and if it is a contributory scheme he gets tax relief on his contributions. A self-employed person, on the other hand, is taxed as and when his earnings arise, and he gets no earned income relief on his income from savings or from an annuity. A professional man, who starts earning comparatively late in life and who, if successful, may expect to enjoy a short period of high rewards in the later years of his career, thus suffers a particular disadvantage.

It was once reasonable for the self-employed to expect to accumulate sufficient capital during their working life to provide income for their retirement. A man who builds up a business which can be sold with a high goodwill value may still be able to do so. But the best that the majority can hope for is to save enough capital to buy a reasonable life annuity. That such an annuity should be taxed in full, without relief for the repayment of the capital content, has long been a grievance. But as Mr John Senter showed in a recent paper on the taxation of annuities to the Insurance Institute, the law, if perverse, is clear and deeply entrenched: a capital sum is surrendered; in exchange a source of income is acquired; and the whole source is subject to taxation.

Relief may appropriately be sought, not by attacking the taxability of annuities, but by securing the admissibility of their cost as a deduction in computing income. This may be in Sir Hartley's mind, and in an address, last November at the annual conference of the Association of Superannuation and Pension Funds, Mr Frank Bower supported this approach. There was, he felt, no technical difficulty.

> There is nothing unreasonable in a suggestion that self-employed persons and non-employed persons should be able to contract with assurance businesses for a non-assignable and non-commutable deferred annuity for life commencing at a given retiring age above 60 years, and have the premiums allowed to be deducted from their total income for tax purposes up to a sum equal to one-sixth of their total income for the year.

The Institute of Chartered Accountants and the Law Society broached this problem with the Chancellor in 1948 and Sir Hartley's statement no doubt follows discussions arising from this initiative. The professional bodies and other organisations may have a further opportunity of pressing their case by bringing it before the Tucker Committee on the Taxation of Trading Profits.

* * *

Wages and Prices in 1949

A superficial examination of the figures of average rates of wages in 1949, published in the *Ministry of Labour Gazette*, would suggest that the impetus towards higher wages is dying away. This impression may not prove justified. The White Paper policy on personal incomes may have held up wage increases temporarily—for a year or two, perhaps, or even merely for a matter of months. In some industries it has induced the unions to think twice before pressing a claim; in others, and particularly in the nationalised industries, it has stiffened the employer's resistance. But how long will this last? Unsatisfied wage claims are piling up, and there have lately been plain indications that the faith of some trade unions in the policy of restraint is wearing thin.

The figures, however, are striking. Average weekly rates of wages rose in 1946 by 8 per cent, in 1947 by 5 per cent, in 1948 by 4 per cent; last year the rise was only between 1½ and 2 per cent. The index of weekly rates of wages stood at 109 at the end of December (June, 1947=100); at the end of 1948 it had been 107. Some 5,200,000 workers shared in the total increase of £1,073,000 a week in wage rates in 1949. Many important industries had no increases in 1949; they included coal mining, engineering, and (except for certain rural workers) the railways. About three-fifths of the total increase went to workers in agriculture, textile manufacture, building and contracting, transport and communications, and the distributive trades.

The index of retail prices rose more sharply—from 109 to 113 (June, 1947=100). Food was by far the largest contributor to this movement. The food index rose from 108 to 120, in two main steps: in May as a consequence of the Budget policy of restricting food subsidies, and in the autumn with the advance in the price of bread which followed devaluation. Clothing rose by three points between January and July, and the reductions in traders' permitted margins for utility goods brought it down again by two points; but the index for clothing still finished the year at 117, a point higher than in January.

Unemployment remained low and showed little fluctuation; 330,000 workers were registered as unemployed at the beginning of December. This is a rate of only 1.7 per cent, and shows no important difference from the figure (327,000) of twelve months before. The working population increased further, and the numbers in civil employment rose by 230,000 from November to November; this is attributed to "the further running down of the Forces, and the continued tendency for more women to enter or stay in employment."

Shorter Notes

Although the recorded decline in net bank deposits during a January of record tax gathering amounted to just over £70 million (against £54.5 million in January, 1949), the figures in the latest monthly statement of the clearing banks are not as reassuring as might at first sight appear. The decline in net deposits is still £30 million less than in January 1948; secondly the figure given for net deposits in December was itself distorted by year-end factors. Comparison between the November and the January figures show that net deposits have risen by £27.7 million in the last two months, whereas the rise was only £2,900,000 in the same period a year earlier; the greater part of this divergence is explained by a rise of £52.5 million in advances over the two months against a rise of £30.3 million between November, 1948 and January, 1949.

*

The B.B.C. have ordered two television transmitters from Electrical and Musical Industries, Ltd., for the television stations planned for Scotland and the Bristol Channel area. The vision transmitters will be much more powerful than the one in use now at Sutton Coldfield, which is itself the most powerful transmitter yet built. It is rated at 35 kilowatts, the same as the transmitter waiting to be installed in the Holm Moss station which comes into service next year. The two new transmitters will each be of 50 kilowatts. This greater power does not necessarily mean that the range of reception will be increased, but the signals received will be stronger, and therefore reception within the range will be more reliable.

COMPANY MEETINGS

PEST CONTROL, LIMITED

TEN YEARS OF PROGRESS

SIR GUY MARSHALL ON FINANCE FOR EXPANSION

The first annual general meeting of Pest Control, Limited, was held on February 1st at the head office, Bourn, Cambridge.

Sir Guy Marshall, K.C.M.G., D.Sc., F.R.S. (chairman), presided.

The following is an extract from his circulated statement:—

We have now completed our first 10 years of business, which began in April, 1939, with a nominal capital of £2,500 That appreciable progress has been made is shown by the considerable expansion in the profit figures given below, which, with the exception of the 1949 figure, are the adjusted profits as published in the company's advertisement when application was made to the Stock Exchange for permission to deal. The 1949 figure is the profit shown in the accounts to September 30th, 1949.

	Loss or Profit
Year ended April 13, 1940 ...	£705
April 14, 1940, to September 13, 1940	£715
September 14, 1940, to September 30, 1941	£1,016
Year ended September 30, 1942	4,513
" " " " 1943	7,163
" " " " 1944	4,157
" " " " 1945	4,721
" " " " 1946	10,023
" " " " 1947	23,032
" " " " 1948	52,027
" " " " 1949	100,045

Calculated on the same basis as the above-mentioned group profit of £100,045, the comparable figure for 1948 would have been £52,829.

A large number of spraying machines and motor vehicles have been produced both for home use and export.

Other appliances cover a wide range to suit the requirements of the large and small farmer, both in this country and abroad, as well as those of the smallholder, amateur gardener and household and native growers in overseas territories.

AERONAUTICAL DEPARTMENT

We have, during the year, gained a great deal of further knowledge and experience in helicopter spraying. In April we took delivery of two new British-made Westland Sikorsky helicopters, which were fitted, in the aeronautical workshops, with a new type of spraying gear, Spraycopter Mark II. This has since proved successful, and the company has carried out the spraying of various types of crops which hitherto had not been sprayed from the air in this country.

In the Sudan, one helicopter of American origin was successfully operated for the spraying of cotton by our subsidiary, Pest Control (Sudan) Limited, since when helicopter spraying by night has been attempted for the first time and proved to be possible.

During the year the production of chemicals for home use and export has continued to expand.

In our pest control research station work has continued under our biological research manager, Dr R. M. Greenslade, on the development of new selective weedkillers and systemic insecticides. The latter have proved a valuable new weapon in our fight against pests.

In response to an increasing demand for help in the solution of pest problems overseas we have extended our overseas research services.

IMPORTANT CONTRACTS

Several important contracts for research services have been undertaken for Government departments or growers' associations. These include the following:—

(i) A contract with the Colonial Office, under which we shall test our proposed method for the prevention of swollen shoot disease of cocoa in the Gold Coast, using systemic insecticides.

(ii) A contract with the Tanganyika Sisal Board for the investigation of methods to control the sisal weevil. Preliminary experiments carried out have already shown that we have effective chemicals to deal with this pest.

(iii) A contract with important tea planting interests in Assam, to evolve a method of control of orange mite on tea, furthermore, as regards tea plantations, Dr Greenslade has just returned from touring both Ceylon and South India to study possible means of preventing the disease known as blister blight, which is becoming more and more serious.

United Kingdom and Europe.—Although this year we sprayed 25 per cent. more in acreage than last year, there is every indication that the demand for spraying is far from being satisfied, and will, therefore, keep the company fully employed throughout next season.

In July we fulfilled our first contract for spraying on the Continent, when, at the invitation of the International Committee for the Control of the Colorado Beetle, we sent two helicopters to spray potato fields in Normandy. In all, 5,155 acres were sprayed, and results were entirely successful.

In the year under review our subsidiaries in Africa, other than in the Sudan, had not reached a stage of full commercial development, but we can now look for increased profits from these sources.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the Chairman said:

The directors have completed their negotiations for the provision of the necessary new finance subject to the consent of the Treasury. Application has been made to the Capital Issues Committee, and it is hoped that the consent will not be long delayed.

The company is to create £500,000 Seven-year 5 per cent. Secured Stock, 1953-57, of which £300,000 is to be issued for cash at par. The balance of £200,000 of stock will be available for deposit as collateral security with bankers to secure banking facilities.

In addition, 800,000 ordinary shares of 5s. each are to be made available for subscription by holders of the existing ordinary shares at 7s. 6d. per share, in the proportion of four new shares for every seven existing shares.

The issue of both secured stock and ordinary shares has been underwritten by Hambros Bank, Limited.

We have felt it desirable that an opportunity should be given on this occasion to the employees of this company and Pest Control (United Kingdom), Limited, to subscribe for ordinary shares and thus acquire an interest in the business. Each employee will be entitled to subscribe not less than four of the new ordinary shares at 7s. 6d. per share, and we are making arrangements under which a proportion of the subscription monies can be advanced to employees on loan in approved cases, repayable by instalments over three months.

The report and accounts were adopted and the other formal business duly transacted.

At a subsequent extraordinary general meeting a resolution was passed increasing the capital of the company to £1,250,000 by the creation of 1,000,000 ordinary shares of 5s. each.

THE UNION BANK OF AUSTRALIA, LIMITED

FURTHER CONSIDERABLE EXPANSION

The one hundred and twelfth annual general meeting of The Union Bank of Australia Limited was held in London on January 27th.

Mr Hugh D. Flower, the chairman, in the course of his speech, said:—

I should like first to give expression to the relief and satisfaction felt by your directors at the removal of the threat of nationalisation. We may now look forward to being allowed to mind our business without undue interference and to continue its development in the general interests of the community.

The total of the balance sheet shows a further considerable increase and we have continued to maintain a thoroughly liquid position. There has been a further considerable expansion in our business which is reflected in the figure of gross profit as shown in the profit and loss account. This figure, at £2,121,343, shows an increase of some £344,000 over the previous year, an increase which is largely counteracted by the increase in expenses and taxes on the other side of the account. The result of the year's operations is a net profit of £255,066, after providing for taxes

Prices of Australia's primary products were appreciably higher in 1949 than in the previous year and total production is probably worth three times its prewar value. In volume, however, it is only slightly above the prewar figure.

Our business in New Zealand during the past year has continued its activity and expansion under conditions which have been generally favourable. The appreciation of the currency in relation to sterling, which was effected in August, 1948, does not appear to have had any serious repercussions

The report was unanimously adopted.

RADIO RENTALS, LIMITED

RECORD RESULTS

The thirteenth annual general meeting of Radio Rentals, Limited, was held in London on January 30th.

Mr H. F. Hunt, the chairman, in the course of his speech, said: This is the first year since the beginning of the war that we have been able to make or buy as many instruments as we wished, and for that reason we can consider it as the first full year of the postwar competitive radio market for which we planned.

Our trading profit and depreciation charge have both increased by approximately 50 per cent., which is an indication of the year's expansion of business. The net profit of £138,654 is after providing for all expenditure including costs of development. In our business millions of small transactions have to be handled and in order to preserve the very small profit in each the most efficient forms of mechanised accountancy must be used. The main increase of expenditure is one of approximately 22 per cent. for wages; incentive bonuses increased by some 50 per cent.

The profits tax has increased from £18,000 to £23,000 and at this figure is more than the net dividends payable to all shareholders.

This year's accounts are not materially affected by television but we now have several thousands of sets on rental and the demand for this service continues to be very heavy. The past year has also seen a major extension of our activities in the radio field and we are now operating in Glasgow, Belfast and Newcastle. Plans for the continued expansion of your company's business are progressing favourably, which leads me to believe that I shall be able to present to you another satisfactory picture in 12 months' time.

The report was adopted.

MICHAEL NAIRN AND GREENWICH

GREATER TURNOVER

The twenty-eighth annual general meeting of Michael Nairn and Greenwich, Limited, was held on January 27th at Kirkcaldy.

Sir Michael Nairn, Bt. (the chairman) said that they would observe in the net profit attributable to their group of companies a contraction of some £60,000 compared with the 1948 results. Although production and turnover had been appreciably greater, the advantages arising therefrom had been more than offset by the higher average cost of materials and by a reduction in their selling prices which was made in line with their policy to keep prices at a minimum. From the balance available to the holding company for disposal, £249,157, the board were again able to recommend the payment of a final dividend of 11½ per cent. which made a total dividend of 15 per cent. for the year ended September 30, 1949.

The board considered the results achieved by the operating companies during another difficult year to be satisfactory in view of the obstacles in the way of greater production imposed upon the industry through the operation of Government controls and restrictions on private enterprise. During the past year there had been no noticeable easing of those controls and until that occurred they would continue to be handicapped severely in their efforts to overtake the accumulated arrears of trade at home and overseas.

Despite the embargoes which various countries had placed on the import of their goods during the past year, their exports had continued to expand. A greater measure of freedom from bureaucratic control would enable them to improve upon their performance. It was in a spirit of restrained optimism that they viewed the prospects for the year ahead.

The report was adopted.

RIM (MALACCA) RUBBER ESTATES, LIMITED

DIVIDEND OF 5 PER CENT.

The thirty-ninth annual general meeting of Rim (Malacca) Rubber Estates Limited was held on January 31st in London.

Mr E. G. Estall (the chairman) presided and in the course of his speech said:—The crop of rubber harvested for the year under review was 2,455,000 lb. being 110,000 lb. short of the estimate, mainly due to tapping being affected on Mentri by floods in November, 1948, and by general labour unrest there at the commencement of the emergency period. Irrespective of this, the output was some 268,000 lb. higher than the previous year

For the year covered by the accounts the gross selling price, all grades, was 10.11d. per lb., compared with 11.50d. for the previous year, whereas, due to the general upward trend of labour rates and prices of materials, the costs of production increased by .35d. per lb.

The 40 acres of Rim Estate replanted during the year started badly owing to severe drought, but are now reported to be coming along well. The 112 acres of jungle planting on Mentri referred to last year are also progressing favourably. Provision has been made in the estimates for the current year for further replanting comprising 117 acres of Rim Estate and 43 acres of Mentri. The latter work is in progress, whereas the former has been completed already, and authority has now been given to commence on the area scheduled previously for 1950-51 a further 217 acres.

Forward sales for delivery during January-December, 1950, have been entered into. To date we have sold 360 tons at an average price of approximately 13½d. per lb. c.i.f.

The report was unanimously adopted and a dividend of 5 per cent. was declared.

NOTICES

HIS MAJESTY'S COLONIAL SERVICE

Applications are invited for the post of Agricultural Economist in the Department of Agriculture, Federation of Malaya. The officer selected will be responsible for all economic investigations and enquiries, for the editing of the Malayan Agricultural Journal, and other vernacular agricultural journals, and for the supervision of the departmental library. The post is permanent and pensionable after three years' probation. The salary scale is from $480 to $900 a month (£644 a year to £1,260 a year current sterling equivalent at one Malayan dollar to 2s. 4d.). In addition there is a pensionable expatriation allowance ranging between $90 and $165 a month (£126 and £231 a year) according to salary, and a cost of living allowance of 50 per cent. of substantive salary is payable, subject to the following maxima:

(a) Single officers—$150 a month (£210 a year).
(b) Married officers without dependent children—$300 a month (£420 a year).
(c) Married officers, or widowers, with one or more dependent children—$375 a month (£525 a year).

Government quarters, and heavy furniture, if available, are provided at rentals ranging from $17.50-$66 a month. Free first-class passages are provided for officer, his wife, and children under 10 years (not exceeding 5 persons in all) to and from Malaya, and once during each tour of service. Medical treatment is free for officer, his wife and children whilst in Malaya, but a charge is made for maintenance, should it be necessary for them to enter hospital. Applicants for pensionable employment must be 40 years of age, or under, but older applicants with particularly suitable qualifications may be considered for appointment on a contract basis. Age, experience and war service will be taken into account when determining point of entry to the salary scale. Qualifications required are a university honours degree, preferably B.Sc. (Econ.) plus training in agricultural economics. Experience of, or training in agricultural, or similar subjects, is desirable.

Application forms may be obtained by writing to the Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1.

BRADFORD EDUCATION COMMITTEE

TECHNICAL COLLEGE, BRADFORD

Applications are invited for appointment as SENIOR ASSISTANT in the College, to give general assistance to the Principal and to participate in the teaching of INDUSTRIAL ADMINISTRATION AND MANAGEMENT.

The salary, including allowances, may range from £700 to £905 per annum, according to the Burnham Scale.

Further particulars of the appointment and forms of application may be obtained from the Director of Education, Town Hall, Bradford, and completed forms should be returned to the Principal of the College within two weeks from the date of publication of this advertisement.

A. SPALDING, Director of Education.

January, 1950.

COUNTY BOROUGH OF SOUTHEND-ON-SEA EDUCATION COMMITTEE

MUNICIPAL COLLEGE

Principal: R. W. WILSON, B.Sc. (Eng.), A.C.G.I., Whit. Sch., D.I.C., A.M.I.E.E.

DEPARTMENT OF COMMERCE

Applications are invited for the post of Lecturer for Commercial Subjects. Degree and/or professional qualification essential and business experience desirable.

Salary in accordance with the Burnham Technical Scale. Forms of application and further particulars may be obtained from the undersigned and completed applications should be returned to the Principal Municipal College within two weeks of the appearance of this advertisement.

H. BOYES WATSON, M.C., M.A., Chief Education Officer.
Education Office, Warrior Square.

UNIVERSITY OF LONDON

LEON FELLOWSHIP

Applications are invited for the Leon Fellowship for Research (preferably in the fields of Economics or Education) for the Session 1950-51. The Fellowship is of the value at not less than £400 a year, and is tenable in the first instance for one year. It is not essential that candidates should be members of a University. Selected candidates will be required to attend for interview. Further particulars should be obtained from the Academic Registrar, University of London, Senate House, London, W.C.1, and applications for the Fellowship must be received not later than April 1, 1950.

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Economics tenable at the London School of Economics and Political Science (salary £1050-£1250-£1450). Applications (10 copies) must be received not later than February 25, 1950, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

BEDFORD COLLEGE FOR WOMEN

(University of London)

REGENT'S PARK, N.W.1

The Council of Bedford College invites applications for the post of Senior Research Worker to plan and direct a field study of occupational mobility, vacant as from April 20th, 1950 and open to men and women equally. Salary in the range £900-£850 per annum plus child allowances. Candidates must have experience in Social Research. Last day for receiving applications March 8th, 1950. Further particulars from the Secretary.

MINISTRY OF LABOUR AND NATIONAL SERVICE

Applications are invited from men and women for appointment as Personnel Management Adviser in the Bristol area. Candidates must have had extensive experience as Personnel Officers (whole time) in industrial undertakings. They should be able to advise firms on matters of personnel policy, on the organisation of personnel departments and the technique of personnel management. In particular, knowledge of modern employment and training methods, joint consultative procedure and industrial welfare is essential. A degree in sociology, economics or some cognate subjects, or a social science diploma is desirable. Salary ranges for this post are:—

£555 x £25—£1,021 (Men)
£410 x £25—£860 (Women)

The post does not at present carry any claim to pension.

Written applications, giving date of birth, education, full details of qualifications and experience (including a list in chronological order of posts held), together with present salary, should be addressed to BP.6, London Appointments Office, Ministry of Labour and National Service, 26 Throgmorton Square, London, W.C.1, to be received not later than 14 days after appearance of advertisement. In no circumstances should original testimonials be forwarded. Only candidates selected for interview will be advised.

ASHRIDGE.—Course 3. February 10th-13th. The Welfare State, The Individual and the Welfare State; The Citizen and the Health Services; Children; National Responsibility; The Social Services and the National Economy. Lecturers include Sir John Charles, Mrs. M. McIntosh. Inclusive Fee: £3 10s.

Course 4. February 17th-20th. The Cinema as an Aspect of National Life. The Film Actor and his Work; The Structure of the Film Industry; The Art of the Screen; Purpose and Values. Lecturers include Roger Manvell, Ernest Lindgren, Miss E. Arnot Robertson. Inclusive Fee: £3 10s.

Applications to Secretary, Ashridge, Berkhamsted, Herts. Little Gaddesden 3191.

THE CHARTERED INSTITUTE OF SECRETARIES requiring the services of CHARTERED secretarial and similar executive posts with the Secretary of the Institute House, E.C.4

Investment Statistics

Company Notes

R. A. Lister.—Including exceptional items £68,335 (£37,351) group net profit increased from £240,754 to £299,122 in the year ended September 30, 1949. A final dividend of 6½ per cent is recommended on the increased ordinary capital.

Tecalemit.—Net profit for the year to July 31, 1949, amounted to £134,263 (£139,254). A final dividend of 7 per cent is recommended on the enlarged ordinary capital.

Herron (G. R.).—Trading profit increased from £155,478 to £240,041 and net profit from £121,523 to £197,037 in the year to October 31, 1949. A final dividend of 9 per cent. is recommended, making a total of 15 per cent. for the year.

J. F. and H. Roberts.—Consolidated trading profit increased from £205,507 to £315,842 in the year ended November 30, 1949. Net profit is given at £150,211 (£85,818). The dividend and bonus for the year total 17½ per cent. Net current assets were £549,443 (£442,113) at the year-end.

William Timpson.—Consolidated trading profit amounted to £588,695 (£577,216) for the year to December 31, 1949. Net profit was £283,043 (£257,670). Net current assets declined from £1,085,388 to £1,054,982 on the year.

Henlys.—Net group profit declined from £124,573 to £114,536 in the year to August 31, 1949. Net current assets at the year-end were £439,574 (£420,685).

Fisons.—Consolidated trading profit declined from £1,304,790 to £1,146,018 in the year ending June 30, 1949. Group net profit amounted to £222,639 (£223,167). A total dividend of 12 per cent for the year is recommended on the £2,219,278 old stock and a final dividend of 2½ per cent on the £2,219,278 new stock allotted on October 6, 1949. Consolidated net current assets at June 30, 1949, amounted to £372,674 (£2,629,643) and fixed assets after depreciation to £6,156,913 (£4,216,317).

Carreras.—Trading profit of the group increased from £2,520,584 to £2,749,891 and total profit from £2,700,900 to £2,918,603 in the year to October 31, 1949. Net current assets were £8,302,235 (£8,016,873) and fixed assets £1,748,340 (£1,620,215) at the year-end; group stocks were valued at £9,282,597 (£9,089,626).

Liebig's Extract of Meat.—Group profit, including £118,302 (£138,000) not attributable to the year's trading, amounted to £1,008,808 (£1,171,751) in the year to August 31, 1949. Consolidated net profit was £385,742 (£524,381). A final dividend of 7s. per £5 stock unit is recommended, making a total of 9s. for the year (same).

Capital Issues

Southern Rhodesia Government.—Lists opened and closed on February 3rd for the issue at £98 per cent of £6,000,000 Government of Southern Rhodesia 3½ per cent stock, 1967-69.

Halfway Mark

THE Marshall Plan has run half its life—long enough, one might think, for its main achievements to be judged and an estimate of its total effect to be possible. Yet the second report on the Plan issued by the Organisation for European Economic Co-operation is not a very clear document. It contains a great deal of valuable material. There is hardly an aspect of international economic life upon which it does not touch. Yet for all this information—or perhaps because of it—it is difficult to reach a proper estimate of the Marshall Plan itself. The Report raises but does not satisfactorily answer the question of the degree of success the Marshall Plan has achieved so far and may hope for in the future.

Looking back to 1947, one can recall that there were three chief purposes behind the Plan. The first, the overriding aim, was to stave off complete economic collapse and to make good the dislocation of war. The second was to restore balance in world trade and thus make possible a return to freely convertible currencies and multilateral trading. The third aim—which was hardly made specific at all at the start, but has steadily grown in importance because of the American hope to see repeated in Europe "the miracle wrought by the Founding Fathers"—was to make the Marshall Plan into an instrument for bringing about the political and economic integration of Europe. These were the aims, and it is reasonable to judge the achievement of the Marshall Plan on the basis of the progress made towards each objective.

Of the first it can be said immediately that the Marshall Plan has proved an almost fantastic success. In four years western Europe has not only restored, but has surpassed by 15 per cent, the prewar levels of production in industry and has all but reached them in agriculture. At the same time, investment in capital goods has run at a higher level than in 1938—in the engineering industries the increase is as much as 20 per cent—and $7 billion of this investment has been earmarked for the overseas dependencies. In general, it can also be said that this high level of investment has not led, since 1947, to continued or increased inflation. The report notices a practically universal tendency towards stable prices. Nor, except in one or two cases, has the opposite danger signal of deflation and severe unemployment appeared. It can, therefore, be said with categorical emphasis that, in this respect, the Marshall Plan has succeeded beyond the expectations of even its warmest advocates.

The confusion and the question marks begin with the other aims of the Plan—the restoration of world trade and the economic integration of Europe. True, in each case, there is a measure of progress to record. But it falls short of success; and in each case the doubt is raised whether, in fact, the Marshall Plan is a practicable instrument to achieve such ends. Some of the difficulties may well arise from what amounts to an attempt to make a winch do the work of a ten-ton crane.

The essential point in the report's study of the plans for restoring balance in world trade—that is, for closing the dollar gap—is that balance will not in fact be restored by 1952. Given all the favourable assumptions —the maintenance of the present high level of business activity in the United States, a concerted and successful European export drive to America and the drawing in of third markets by competitive trade and investment—the forecast still leaves western Europe with a deficit of a billion dollars in 1952 and with no hope of using non-dollar earnings in other parts of the world to cover the gap, since all areas will still tend to be in deficit with the United States. Such a gap is, of course, quite large enough to make some measure of exchange control necessary and to complicate all attempts to remove restrictions and discrimination from international trade. The existence of a billion dollar deficit in 1952 does not imply that the European nations have made no effort. On the contrary, the $9 billion deficit of 1947 has already been reduced to $4 billion and to cut out another $3 billion will entail a further tremendous effort of adaptation. But the billion gap will remain none the less.

The fundamental reason for this prospective failure is the inadequacy of the Marshall Plan as an instrument for solving the general unbalance in world trade. A five-year plan cannot undo the work of decades. As the report points out, every economic trend in the last thirty years has tended towards the aggravation of the "dollar gap." The share of western Europe in American imports has fallen steadily. Between 1900 and 1913 it was nearly one half, in the twenties and the thirties only a quarter. Now it is little more than one tenth. American imports have also failed to keep pace with the growth of American wealth. At the beginning of the century western Europe's sales to the United States equalled 2 per cent of the American gross national product. Now the share is under 0.5 per cent. Even the steadiest source of dollar earning—the import of colonial raw materials—has been disturbed by the war. Before 1939 American imports of primary products closely followed the volume of business activity. The development of substitutes has now drastically altered the pattern, and raw material imports are far lower than the level of business would seem to warrant. At the same time, direct American sales have increased to markets formerly supplied by western Europe—a trend enormously accelerated by the war. In the vital Latin-American market, for instance, European exports, once twice as great as those of the United States, were in 1948 less than half the American share.
