Wales have echoed Mr Horner's remarks—are making the most of the manpower position as an excuse to press their demands for more pay and the fulfilment of the other outstanding conditions of the Miners' Charter.

But whatever the political motives behind this pressure, both the Board and the Government should be considering the manpower position seriously from a long-term point of view. Juvenile recruits of the right type need to be secured and the proportion of face-workers in the industry still needs to be raised. This is quite a different matter from giving in to pressure to adopt a soft labour policy: the industry cannot expect much longer to enjoy a sellers' market abroad, and cannot afford, therefore, to neglect its costs.

Commodities

Draft Agreement for Tin

The publication last week-end of the proposals for an international commodity scheme for tin, submitted by the International Tin Study Group to the United Nations, commendably follows the injunctions of the Havana charter. These proposals will be discussed at a conference to be convened later and they represent no more than a draft, subject to amendment. But they mean that stage two has arrived in the contest for a control scheme for tin. This contest has been waged for more than twelve months within the ranks of the Tin Study Group, and was narrowly decided in favour of Britain and the Netherlands last March. The opposing sides represent the producing countries, led by Britain and the Netherlands, and the consuming countries led by the United States—a division which will appear in sharp prominence when the international conference meets.

The draft differs little from the suggestions discussed and criticised in these columns during the past six months. The scheme provides for the creation of a buffer stock and for the control of exports by quotas, which would be allotted to producing countries. A small part of the total quota (5 per cent) would be reallocated each year. The buffer stock would buy in tin when the world price fell below a predetermined lower limit and sell tin when it rose above a predetermined upper limit. The scheme would be controlled by an International Tin Council consisting of representatives of producing and consuming countries, each having the same voting power. It provides for the maintenance of fair standards for labour in the tin industry, for the liquidation of "non-commercial" stocks and for the prevention of what it describes as "restrictive business practices."

The objects of the draft agreement are, of course, couched in resounding phrases. They are to prevent or alleviate widespread unemployment and under-employment in the tin industry; to prevent excessive price fluctuations; to ensure adequate supplies of tin; and to provide for economic adjustments in tin. Cynics might suggest that one of its incidental prime purposes was to maintain a profitable tin industry—but that is not mentioned among the objectives.

* * *

How Will it Help?

A buffer stock scheme could help the tin industry in two ways. It could give producers the security of a guaranteed minimum price and it could attempt to prevent excessive price fluctuations. Consumers, on the other hand, would have no guarantee of a maximum price; the proposals merely provide that when the price of tin rises above an agreed upper limit, the buffer stock will sell its accumulated supplies. If stocks were large (in other words, if the participating countries had incurred considerable investment in stocks to prevent a fall in price), prices might in fact not greatly exceed the upper limit. But there would be no guaranteed maximum price as in the international wheat agreement.

The operation of the buffer stock will be no easy matter; in particular, currency considerations will cause complications which did not arise before the war. Difficulties may arise in the provision of the different foreign currencies when tin has to be bought and in the distribution of such currencies to member countries as and when the buffer stocks are sold. Many months will be needed to convince the United States that strategic and commercial requirements can be better covered by this proposed scheme than by a series of bilateral contracts, some of which have already been concluded with the Netherlands and Belgium.

* * *

Reduced Supplies of Tea

The negotiations with the Indian and Ceylon Governments over the 1950 tea contracts have at long last been concluded. This year Britain will be permitted to buy a maximum of 275 million lb. from India (25 million lb. less than last year) at an average price of 4d. a lb. more. Unconfirmed reports suggest that Ceylon has limited the Ministry of Food's purchase to 100 million lb. (30 million lb. less than last year's total, but only 19 million lb. less than actual shipments) with an increase in price also averaging 4d. a lb. Even if prices of other supplies do not rise proportionately—an unlikely supposition—the Ministry will have to pass on something approaching 4d. a lb. to the consumer in one guise or another. If the retail price of tea were raised by this amount, the interim index of retail prices would rise by less than a quarter of a point and weekly expenditure would increase by a little over ½d. a head, at the present scale of rations. On this showing it would clearly be tempting to pass the increased cost of tea on to the consumers of tea, making allowance, as in the past, for old-age pensioners.

But the increased price—a delayed effect of devaluation—is of less significance than the reduced quantities. If Britain can buy only 375 million lb. from India and Ceylon and a further 45 million from other sources, the total import for the year will amount to only 420 million lb. compared with the scheduled import of 475 million lb. The present ration requires an annual supply of about 450 million lb., and it could therefore be maintained only if stocks were allowed to run down. Moreover, this year's contracts have been concluded so late—three to four months later than in the past—that Ceylon has already sold large quantities of high-grade teas or contracted for forward delivery to other buyers. In any case the Ministry of Food's system of purchasing tea did not encourage growers to sell the better grades to Britain, but this year the quality Britain will receive is likely to be lower than usual. In view of the reduced supplies available it would be clearly impossible to reopen the London tea market in 1951 unless the Ministry of Food were to buy additional supplies in the Colombo or Calcutta markets or to allow private merchants to do so. Neither of these courses is likely to appeal to the Ministry.

Shorter Notes

The Anglo-Argentine Trade Agreement of June, 1949, will now continue in operation at least until July, 1951; this is an automatic consequence of the fact that neither Britain nor Argentina had denounced it by the beginning of this month. The meat prices and trade schedules for the year 1950-51 have still to be fixed, but the decision not to denounce the agreement must mean that the Argentine attitude is proving sufficiently reasonable to hold out some hope that a solution of these problems will be reached. A similar conclusion may perhaps be drawn from the announcement that the Export-Import Bank of Washington has found it worthwhile to consider granting a dollar loan to Argentina; no decision on this loan is, however, expected for some time.

A committee representing ratepayers in Seattle has inquired into the recent rejection of British tenders for the supply of power station plant, and has concluded that the rejection was justified. The conclusion is based partly on the failure of the British tendering companies to undertake to meet the delivery dates laid down, and on certain other deficiencies in the British specifications relating to noise levels, impedance, and other factors which carry more weight in American than in British practice. The delivery dates in this case are stated to be of great importance, since in default of prompt delivery the power supply programme would have been held up and the Seattle authorities might have been obliged to arrange for other and more expensive sources of supply.

*

As foreshadowed in *The Economist* on April 22nd, the International Monetary Fund has turned down South Africa's proposal for an all-round increase in the official price of gold, as well as its further proposal that gold-producing countries should be allowed to sell half their output at prices above the official level. The Fund argues that, if premium sales of gold were allowed, the monetary reserves of certain countries in the Middle and Far East would be impaired, exchange transactions would take place at depreciated rates and gold-absorbing countries would be deprived of some of their current exchange receipts and reserves.

THE CUNARD STEAM-SHIP COMPANY, LIMITED

STATEMENT OF THE CHAIRMAN
FREDERIC ALAN BATES, M.C., A.F.C., D.L.

EXCESSIVE TAXATION AND REPLACEMENT COSTS

Mr F. A. Bates, chairman of the company, in a statement to stockholders for submission at the seventy-third annual meeting to be held on May 24th, says:—

"There is a tide in the affairs of men," and whether the tide be national or within our company touching each one of us, its staffs and stockholders, there are no ventures of an island people in which the ebb and flow run stronger than in the ventures of our ships. Ours is a company sprung from the tough training of a hundred years of ceaseless venture and endeavour, and if at present "the sea is full on which we float and the current serving us" we must thank the men of yesterday who set the compass of our fortunes.

Equally there is a Cunard signal of our thanks made to each and every man of today including the directors, the managers, the superintendents, the masters and their ships' companies, and the staffs of offices and branches on sea and shore of all the companies and ships which form the Cunard group and serve so well its teamwork. To all —our thanks for a year of unremitting effort to maintain the standards of our service to our shippers and passengers in every sort and class of sea transportation. In recognition of support and goodwill so widely tendered to us around the world, I would add our thanks for the help and courtesy which the Cunard White Star, Port, and Brocklebank Lines have received from agents and from officials in all the ports and cities to which our organisation offers service; it is the Cunard hope that this signal of gratitude and readiness always to serve will reach them all.

It may be recognised as something of an achievement that the consolidated accounts of our trading should be ready for the stockholders' perusal some four months after the year's end. This would not have been possible but for lively co-operation by associated companies and staffs—from London to Wellington and Sydney—from Liverpool to India, Pakistan and Colombo—from our offices in America—New York to San Francisco—and from Montreal to Halifax and Vancouver and on the Continent of Europe.

I will comment first on the consolidated accounts, because these are the accounts which have remained unaffected by internal changes in accounting. This is the third year of consolidated presentation in conformity with the pattern laid down in The Companies Act, 1948.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

It will be observed that our gross operating profit comes out at £8,862,228, which is £670,000 less than that of last year. Of this gross profit the large sum of £2,445,203 is taken up by depreciation. This sum, referring principally as it does to our ships, is calculated on actual shipyard costs when the ships were built, but large as it is, annual sums such as this are not sufficient in the aggregate to provide for replacements at present-day prices. To reduce the replacement deficiency we must, when we can, set aside additional amounts out of profits. Let it not be forgotten that moneys utilised in this way for replacement ultimately go to the shipbuilders and their subcontractors up and down the country and thence find their way to the men employed in the industry. The additional amount set aside this year out of the funds of the parent company is £1,000,000, while £1,406,215 is retained by the associated companies in the Australian, New Zealand, Indian, Pakistan and Ceylon trades. Unfortunately, additional funds set aside for rebuilding are not allowed by the Inland Revenue when our profits are assessed for taxation. The Inland Revenue do, however, permit an immediate initial capital "allowance" on the first cost of a new ship, but it is anticipatory only. It is no more in effect than an acceleration of the total depreciation to be allowed on a particular ship and results in no depreciation being permitted in its later years. The immediate effect of an initial allowance is to reduce the tax assessment but has the effect of increasing our tax liabilities in later years. Thus this year the charge for taxation although so high at £2,881,594 is less than the tax relative to the profits of the year owing to the incidence of the initial allowances on the cost of new ships recently brought into service. The total of the taxation items for the three years 1947/48/49 is £10,025,449. These amounts should be recognised as too heavy a drain on resources required for replacements of the fleet and maintenance of our industry, especially under conditions of devalued sterling.

There is a provision of £350,000 for augmentation of pension funds. In our business the planning, building, and ownership of ships, however efficient, is ineffective without the men to direct, manage, and operate them. Pension funds for those bringing so much enthusiasm to our old company and to promotion of its ideals of service should be rocks of security in future retirement, but nothing dissolves the pension rock more surely than money devaluation over which we have no control. £300,000 has been allotted to enable the directors to continue their examination of the pension funds and act as they think best in the interest of the staff. £50,000 is also allotted to become a basis for pensions in the future when requisite for directors who may or may not have executive or managerial duties. I may say I recommend this provision as reasonable when so much in the company's future depends on the work and responsibility attaching to an experienced board of directors.

I have already referred to the decline in our gross operating profit which explains why our nett profit for the year of £3,501,642 reflects a step back from the profit and loss balance of £4,246,652 in 1948. The balance carried forward to 1950, however, is increased by £241,142 to £1,200,487. One comparison which may be drawn from the figures is that the stockholders' dividends, including preference and the proposed final ordinary dividend of 7½ per cent., totalling £503,000 (nett) represent a small charge on our consolidated accounts, but that a tax computation which results in paying out £2,880,000 and neglects to provide for replacement of the ships which are earning the trading moneys is a form of improvidence which the shipping industry, from its past experience, must obviously endeavour to avoid. It seems to me that for the tax authority to exact so much for government spending with so little regard for tonnage replacement is akin to bad housekeeping, while the stockholders' £503,000 by comparison looks small in view of the country's need to encourage shipping ventures so that the housekeeper may live.

The alterations since 1948 may be described as normal to the financial movements within a large and very active transportation business. The changes arising from the exit of old ships, the advent of new, instalments on new construction and the varying factors of depreciation, result in an increase in fixed assets of a little more than £1,250,000 to £31,793,848. Investments are up to £3,754,464, the market value of which at year-end was £3,776,118. Tax reserve certificates were £3,456,000, being nearly £2,000,000 less than our holding of this type of security a year ago. Cash at £17,481,405 on December 31st was more than £4,500,000 up.

On the other side of the balance sheet the free reserves are at £23,923,481. The loans from bankers have been paid off. The remaining loans amount to £797,493 secured on properties.

The figure of creditors, open voyage accounts, etc., at £22,368,501 is liable to considerable and quick changes. It contains, for instance, voyage items such as prepaid passage and other moneys which are very variable during the seasonal movements and which we, as trustees, hold in our bank balances until our passenger and freight contracts for transportation are fulfilled.

CUNARD BALANCE SHEET

As I said last year, under The Companies Act, 1948, the production of a Cunard profit and loss account is unnecessary when a consolidated account is published in its place. The directors again gave much consideration to the matter and decided to include it on this occasion because of the exceptional changes in our accounts, though it is not comparable with previous years. If in a later year the directors consider that the parent company's profit and loss account can be advisedly dispensed with, this course may be taken.

Attention is drawn to the simplification of our accounting by bringing the Atlantic business directly into the books of The Cunard Steam-Ship Company, Limited, instead of using as intermediary our wholly owned subsidiary Cunard White Star, Limited. The two companies having arrived at the point of complete community of interest, with identical direction and management, the directors sought the best way of achieving simplification with efficiency and without disturbance to the public or to our services.

The balance shown as profit for the year, £2,094,299, is swollen by the change-over operation and should not be regarded as comparable with the £839,279 of last year.

The Cunard balance sheet receives fixed assets, reserves, cash and also, of course, liabilities of Cunard White Star, Limited—all at figures at which they formerly stood in the Cunard White Star, Limited, books. The latter company retains liquid assets in cash at banks and in gilt-edged securities of £10 million to cover the nominal value of its issued capital. Consequently, our investment in Cunard White Star now stands in our books at £10 million.

The fixed assets now stand at £15,295,337 and the shares in subsidiary companies and sundry small balances due from them figure at £14,911,441. Current assets amount to £11,584,678, which includes £6,495,689 cash at banks and £2,400,000 tax reserve certificates. The change-over arrangements were facilitated by liquidity.

On the liabilities side of the balance sheet the replacement and general reserves stand at £11,495,076 and current liabilities reserves and provisions at £16,641,341. The balance carried forward to next account is £1,200,487.

EFFECT OF DEVALUATION

The effect of this on our accounts was twofold. It at once substantially increased the sterling cost of our disbursements in hard currency areas, while it also brought into material unbalance the sterling and dollar Atlantic passenger rates, a state of affairs which the lines in the Atlantic Conference had to take immediate steps to remedy. This unfortunately caused serious increases in the fares expressed in sterling and other soft currencies, as otherwise the volume of dollars and hard currencies previously secured for H.M. Treasury would not have been maintained. To all trading companies, currency changes are unsettling and we would much prefer to have retained a definite measure of stabilisation in our charges and so avoided the hazards and difficulties which currency changes have brought into our affairs. Although for an undetermined period there may be advantages to counter disadvantages, that is only a short view with little comfort to a shipping company which can never shirk the long view problems.

In the Atlantic services we had, since January, 1949, the use of the new *Caronia*. I am glad to say that the first favourable impressions of the ship, to which I alluded last year, have been fully borne out as time went on. After spending much of the year in the North Atlantic trade, she has recently completed a successful cruise from New York around Africa, earning very necessary dollars for the British Treasury, and, what is equally important, bringing numerous letters of appreciation from the passengers themselves. At all the ports and countries at which she made her maiden call, she was admired not only as a new and lovely ship, but as one more marine adventure by which the Cunard Company seeks to increase our service and trading links with other countries.

During the year the company received also the benefit of the reconditioned *Franconia*, which became available in the middle of the year and was placed in the Liverpool-Canadian trade. Here she continues to add to that popularity which was so pleasant a feature when previously running in the company's Liverpool-New York trade.

IMPORTANCE OF SENTIMENT

There is sentiment in the Cunard Company which it is difficult to express in the figures of a balance sheet, but undoubtedly in any survey of the shipping trade it will be found that sentiment does play a very important part in the likes and dislikes of shippers and passengers, and without doubt in the minds of the seafarers themselves. I am tempted to say this because of the fact that after many years of more than usually successful operation, including through two wars, the company felt at the end of last year that they had no option but to retire from service that great favourite with the travelling public, the *Aquitania*. It is but the simple truth that for this ship everyone in the company's service felt a warm affection, probably not surpassed for any other Cunarder since the formation of the company. The same sentimental affection has been manifested by passengers whom she safely carried throughout the world.

Two new directors have joined the board during the year. They are Mr Frank Dawson, C.B.E., M.C., and Mr Frank Charlton. Both are well known in the shipping world, the latter having been a Cunard White Star director since 1934. They bring to the Cunard board expert experience in commerce generally and in shipping in particular. Mr Dawson twice visited our American offices during 1949, once accompanying myself and later making another extended tour with Brigadier John Hardy. Visits such as these are essential for the liaison and personal contact thus promoted and for the cohesion in policy and mutual understanding which encourages the smooth running of an organisation with offices and agents so widespread as those of our company.

I should like to mention that a resolution will be submitted to the annual meeting for an increase in the auditors' fees, due to the transfer of our North Atlantic business to direct operation by the Cunard company instead of Cunard White Star. The increase will be balanced by a reduction of an equivalent amount in their fees as auditors of Cunard White Star Limited, so that the total of the fees from the two companies will remain the same. The work of auditing the accounts of the companies has been a very heavy and important undertaking. Messrs Cooper Brothers' advice and assistance have been constantly available and it is a pleasure to me to express our thanks for their part in the accounting changes recorded in the statements of account.

ASSOCIATED COMPANIES

An extensive tour which I mentioned last year as then in progress by Mr William Donald, chairman of the Port Line, of the ports covered by these services, was concluded during the year and has greatly benefited the organisation. The Line carries export cargoes from Britain and U.S.A. to our kinsmen in Australia and New Zealand and brings home wool, refrigerated cargoes including meat, dairy produce, fruit and many other products so necessary and vital to the life and industry of the home country. The M.A.N.Z. Line is a service jointly operated with two other Lines to serve the trade outwards from Canada to Australia and New Zealand, and homewards to U.S.A. and Canada. It continues to be the aim of the Port Line to study the needs of their Australian and New Zealand shippers and consignees and provide a service with modern fast ships second to none.

INDIA AND PAKISTAN TRADE

There has been no slackening of the Brocklebank Line's efforts to give a service of ships in keeping with the importance of the trades of these countries. It has been a year of difficulty for the company, with many checks to trade and delays to ships resulting from the strain and unreconciled views existent between India and Pakistan. It is hoped that easing of the tension may soon be achieved, with all the benefits to the countries concerned which will follow on the heels of freer flowing and less restricted trade.

ACUTE PROBLEM OF SHIP DEPRECIATION

While we have ships we have prospects and that is as true of this island country as it is of the Cunard Company itself. But what tonnage we shall continue to have depends on annual reserves for replacements, with emphasis on the word annual. This problem is the same for all ships, but the consequences of neglecting to provide each year out of current profits for replacement of tons worn out, are particularly disrupting in the case of our passenger ships, so I will use them as an example.

These ships comprise, as it were, the buildings, houses, stores, shops, entertainment halls, kitchens, restaurants, sanitary services, hospital and power stations of quite a town. Imagine a satellite town to be moveable under its own power from Southampton to New York and back twice a month. Realise then that the walls or hull of the town, as well as all the decks and framework, are perishable steel, built to be completely replaced in a short generation. No one is going to organise so great a venture without the prospect of its continuance, by replacement out of annual profits. There is grave danger then in the present situation, where annual trading is assessed to produce taxable profit before adequate deduction is made in our accounts for replacements. Inflation o devaluation increases the danger.

I cannot think of any major industry essential in the same degree as shipping, t an island's livelihood and defence, whic has the replacement problem affecting it fixed assets in so acute and quickly recurrin a form. As I mentioned earlier in this state ment, the consolidated items under the head ing of taxation for the last three years, adc up to £10,025,449. Is it out of place t wonder if C. S. Calverley had propheti vision of the fate of the cow and gilt-eggec goose when he wrote:—

> The piper he piped on the hill-top high,
> (*Butter and eggs and a pound of cheese*)
> Till the cow said "I die," and the goose ask'd "Why?"
> And the dog said nothing, but search'd for fleas.

It would suffice our purpose and give con fidence for new building contracts which take years to complete, if we could now charge in our accounts before taxation a reserve or a basis necessary for replacement with the proviso that this reserve would be liable t be brought back into computation for taxation, unless spent in due course on ship construction. It may be recalled in the precedent of the Tonnage Replacement Agreement made by the Government with the shipowners through the War Risks Associations in the early days of the war, that arrangements were provided to ensure a percentage of the insurance moneys being used for replacement purposes and that alone

COMPETITION FROM THE AIR

A second point of danger to our long-term building plans is what may be called the dis economy of competition over the North Atlantic from the air. On level economic terms, the air should be complementary t shipping, instead of seeking by subsidies o other artificial aids and forced performance t take shipping's place. It is a competitor which, with unchecked purse, may be found feeding on the taxes the rest of us pay, bu we have to reckon on the possibility of it diseconomy remaining as a future menace t our shipping interests.

The dividends paid by a shipping company are the rewards of adventure, of courage in progress and of meeting risks. They are no in themselves a policy; rather are they the evidence or result of policy and the encouragement or the reverse to more adventure. Just as there can be storms at sea so can there be in balance sheets. Competition on the oceans is free to all and the rewards may become losses. It has often been so and directors serve well the stockholders and all employees by remembering that money paid out, whether in taxes o dividend, cannot replace the reserves necessary to buttress the future.

The year 1949 marks a culminating point in the consolidation of our finances.

The stockholders' designation in The Companies Act (1948) is "Members" and the company's thanks are due to all its members for the staunch support which has invigorated our affairs. The first members began the company's ventures more than 10 years ago and the support and financia backing of their successors, as the years go by, have carried the company safely through considerable periods of difficulty. If to some the rewards of enterprise seem now unduly restricted, I would like to suggest that t start the next chapter with a solid balance sheet and a filled purse is a reward in itself not to be despised by any commercia adventurer. Such anti-inflation restraints a may be imposed are the evidence of nationa necessity and in the interest of all of us. The cannot be lightly disregarded. If this affect our dividends, it is a disability which the Cunard company accepts with the same grac that impels us all to serve our country.

WM. FRANCE, FENWICK AND COMPANY, LIMITED

(Shipowners and Wharfingers)

A SATISFACTORY RESULT

DIFFICULTIES INCREASING

MR KENNETH R. PELLY ON THE OUTLOOK

The forty-ninth annual general meeting of Wm. France, Fenwick and Company, Limited, will be held on May 23rd at 23 Rood Lane, London, E.C.

The following is the statement of the chairman, Mr Kenneth R. Pelly, M.C., which has been circulated with the report and accounts:—

After the temporary absence last year of comparative figures caused by the many changes in the composition of our accounts to the requirements of the Companies Act, 1948, we are able to revert to the practice of giving the figures of the previous year for comparative purposes. Further, in order to minimise the amount of detail appearing in the accounts, we have this year adopted the practice of showing much of the subsidiary information in the form of notes. These are intended to form an integral part of the balance sheet and profit and loss account and should be read in conjunction therewith.

ACCOUNTS

From the figures before you, you will realise the note of caution, given in my statement last year, was fully warranted. If you turn to the profit and loss account you will see that our profit from trading, together with income from investments, shows a reduction of £39,000. After providing on a conservative basis for future surveys and charging remuneration of directors and taxation, we are able to carry to the appropriation account a figure of £105,340, compared with £142,684. At this point I would draw attention to the transfer to taxation equalisation reserve of £66,000. This represents the amount by which it is anticipated that our taxation liability will be reduced this year by the effect of initial allowances on the additions to the fleet. Your directors feel that this taxation relief should be specifically set aside.

Passing on to the appropriation account, a figure of £40,000 is transferred to general reserve—a smaller figure than the previous year by £34,000. Dividends paid and proposed are on the same basis as the previous year, making a total on the ordinary stock of 15 per cent., less tax, for the year. Finally, a balance of £35,000—some £1,000 less than last year—is carried forward to the balance sheet. Stockholders may be interested if I draw a comparison between the nominal rate of ordinary dividend and the return on the capital employed The ordinary issued capital of the company has little relation to the equity capital employed, which now amounts to some £1,981,400. On this basis the nominal dividend of 15 per cent. represents a return of approximately 5½ per cent.

BALANCE SHEET ITEMS

Referring to the balance sheet, there are a few points which I might mention. On the liabilities side capital reserves have been increased by a surplus on realisation of investments amounting to £14,313, practically the whole of which arises from the reorganisation of the capital of France Fenwick (Insurance), Limited. From this reserve we again propose to make a capital accretion distribution of 3 per cent. to the ordinary stockholders. "Surplus from liquidation of trade investment held in suspense until completion of liquidation" refers to our investment in Coastwise Colliers, Limited, to which I refer later in this statement. On the other side of the balance sheet you will notice a substantial reduction in the item "trade investments," which refers to the same matter. The increase under the heading of "interests in subsidiaries" represents mainly an investment we have made in an engineering company, which is also dealt with later in this statement

I feel sure you will agree with your board that we have again been able to place before you a sound balance sheet, and that the company is in a very satisfactory financial position, reserves having been made substantially in excess of all known liabilities.

THE FLEET

During 1949 there were considerable changes in the fleet. With the liquidation of Coastwise Colliers, Limited, three 4,000-ton colliers which had been previously in our ownership, but in 1947 were sold to that company, became available together with another 4,000-ton ship which that company had built. These four ships were acquired at a figure arrived at by an independent valuer. Although the price paid was probably at the top of the postwar second-hand market, it was nevertheless cheaper than new buildings and the deal had the advantage of carrying with it a five-year consecutive voyage charter for three of these ships.

We have also taken delivery of one of the 3,600 t.d.w. ships referred to in my statement last year, built primarily for the Baltic timber and intermediate trades. During the winter months she has been chiefly trading to the Mediterranean, but with the approach of the Baltic season, we hope that the terms and conditions of the timber trade will improve sufficiently to make this trade once more a proposition worth considering for this new ship.

The second intermediate type ship is due for delivery in the autumn of this year, in this case she will be oil fired, the first ship with oil-fired boilers ever owned by your company.

NAVIGATIONAL AIDS

During the past years, a considerable sum has been spent on navigational aids. Wireless has, for larger ships, been compulsory for many years, but in addition we have fitted direction finders, echo sounding devices, wireless telephone on the smaller ships and Decca navigators. We have commenced during the year under review to fit Decca radar throughout the whole fleet. This is very nearly now completed. Since the war we have been watching the development of radar, but the cost up to last year was prohibitive for such ships as owned by your company. The Decca Company has now produced a set at approximately half the price, and after considerable and very satisfactory tests we decided to install it throughout the fleet. We have the highest reports of this instrument from all captains, but the cost has been considerable, amounting to approximately some £1,500 per ship.

One would have hoped that with all the money spent on these navigational aids, a relief in fleet insurance premiums would be possible. The insurance market, however, does not allow any reduction in premium for such aids, but it is hoped that we shall in consequence of them run so free of claims that in time we may expect reduced premiums by reason of an exceptionally good insurance record.

COASTWISE COLLIERS

In my remarks last year, I intimated that changes might take place in Coastwise Colliers, Limited, and during the year under review this company ceased to trade and went into voluntary liquidation. Stockholders will remember that the company was formed by three leading collier owners and what was then the County of London Electricity Company, Limited, for the purpose of carrying coal supplies to the electrical undertakings of the County of London. Nationalisation of the electrical industry intervened after the company had only been in being for some two years, and we found ourselves with the British Electricity Authority as partners instead of the County of London Electricity Company. Part of the policy of the newly formed Electricity Authority was to eventually own tonnage for the carriage of a proportion of their supplies.

After due consideration by the ship-owning members, it was agreed that it was impractical to continue with an unwilling partner and the company was accordingly put into liquidation. The shipping companies interested bought some ships from Coastwise Colliers, Limited, and others afloat and building were purchased by the British Electricity Authority. The winding up of the company is now in process. The final result of the investment in Coastwise Colliers, Limited, is not yet known, but it is anticipated that it will not be detrimental to our stockholders. In the meantime, pending completion of the winding up, the surplus arising from the distributions to date has been placed to a suspense account.

TRADE

The Baltic and Scandinavian timber trade has been most unsatisfactory during the last two years. Timber for this country continues to be purchased in bulk by the Timber Control, and consequently they are practically the sole charterers for tonnage. The terms and conditions during last year were such that British tonnage could do little to participate in this trade, and it is of interest to note that of the timber shipped from the Baltic to the United Kingdom for account of the Timber Control during the nine months to September 30th last, some 81½ per cent. was carried in foreign tonnage. Not only have there been debates on this matter in the House of Commons, but the Chamber of Shipping has been active in bringing this deplorable state of affairs to the attention of the Board of Trade, with unfortunately very little, if any, success. British shipowners feel that they are being frustrated in all their endeavours to build up a fair participation of British shipping in this trade. If the position is allowed to continue it will become quite impossible for shipowners to consider further buildings and the few ships built for this specific trade will have to find their livelihood elsewhere.

We are faced today with nationalised public utility companies such as gas and electricity with a policy of owning their own fleets. There is little doubt that they will require the assistance of private enterprise for many years to come, and probably, to a certain extent, for ever. There is no doubt that the collier tonnage under construction, both for gas and electricity, far exceeds the building for private account, but at the same time the power stations are always increasing in number and size, requiring more and more tonnage to carry their supplies.

SUBSIDIARY AND ASSOCIATED COMPANIES

I am still unable to report any material progress in the settlement of compensation due to the colliery companies in which we are interested. I notice that people more qualified to speak on this matter than myself are still prophesying a further delay of two to three years. In December last, the Yorkshire Amalgamated Collieries made a return of capital of 5s. per £1 share. This is the first sign of the liquidation, which, however, is still a long way off.

Your directors have given careful consideration as to whether it would not be advisable to invest a proportion of the surplus funds of the company in a business or businesses entirely disassociated with shipping, and during the last year have investigated some three or four undertakings of various natures that have been placed before them, their object being to obtain a reasonable return on capital from a concern that is not likely to be unduly affected by times of slump and which, above all, will probably be free from any risk of nationalisation. They have now made such an investment and purchased the control of an old-established firm of agricultural engineers in Sussex. The purchase was completed during 1949, carrying with it the benefit of all profits from January 1, 1948, which, together with those of 1949, show a satisfactory yield. For the time being these profits have been ploughed back into the company, as a certain amount of expenditure on reorganisation and development is necessary to make it a truly economic unit. Really efficient management is of particular importance in a concern of this nature, and since acquiring control we have made certain appointments which we hope will be to the advantage of the company. If and when other similar opportunities occur, your directors, will give their consideration to each proposition.

THE FUTURE

You no doubt expect me to say something as to the future. This becomes more and more difficult each year. Individuality has so much passed out of our traders and we are largely in the hands of nationalised coal, electricity and gas. Political considerations tend to determine which country shall be supplied with our export coal. Further, when one reads in the press that South African coal has been bought by Denmark for the Danish State Railways and that it is cheaper in spite of the higher freightage than British coal, it is, indeed, a sorry state of affairs, and one that I cannot believe the National Coal Board is going to allow to exist with a country such as Denmark, which has bought British coal for so many years. There is every sign once more of competition of Polish coal for our export market. In days prior to the war we had to compete with Poland, and it looks as though one may have to meet the position again of competition from countries behind the Iron Curtain. These points may well affect the requirements of British tonnage of the type which you own, especially where it affects the near-Continental trade.

On the subject of costs, whether it be building prices, repairs, bunkers, port charges, wages or general expenses, there are no signs of any reduction, and in many cases increases have occurred during the year. One cannot yet feel that the top has been reached, and, indeed, if railway rates are to be increased a rise in the price of bunkers must be expected; inland coal prices will rise, which will react on steel prices, having an adverse effect on building and repair prices. Port charges in one form or another have risen in this country and in Continental ports to which we trade. The devaluation of the £ in September last, however, did not affect your company greatly, as there are few hard currency countries to which we trade, and, further, we are not oil consumers.

COST OF BUILDING

The cost of building is perhaps the matter which gives one most concern, as with a fleet the size of ours your directors have continually to bear in mind the question of replacement. At today's prices and with present prospects, few shipowners could contemplate placing new orders unless they were compelled by some very special reason. Builders no doubt have difficult times ahead, but while I am sure they wish to do everything possible to reduce prices, there is so much today outside the control of anyone except the Government.

Although I may appear to be pessimistic, I do, however, feel over the next year or two, and that is as far as anyone dare forecast today, that we may look forward to satisfactory results and, bearing in mind the sound financial position of your company, regard the future with confidence. Any such prophecy, however, must be dependent upon the position of British coal being maintained and export tonnage increased with near-Continental countries.

I cannot conclude these remarks without once more saying a word of appreciation to our staff in London and in the outports and provinces, and all those that go down to the sea in our ships. They have all, without exception, contributed to the satisfactory results, and I thank them one and all on behalf of stockholders.

ALBERT E. MALLANDAIN, LIMITED

(Paper Coaters and Converters)

RESULTS SATISFACTORY

The thirteenth annual general meeting of this company was held on April 26th in London, Mr Albert E. Mallandain (chairman and managing director) presiding.

The following is an extract from his circulated review:—

The aggregate net trading profit for the year ended December 31, 1949, amounted to £71,506, which compares with the figure of £73,930 previously. The aggregate net profits, after taxation, are £35,909 for the year under review, compared with £34,897 for the previous year. Your directors again recommend the payment of a dividend of 30 per cent., less income tax.

Following general current practice, your directors do not at this time recommend any increased dividend to the shareholders. This limitation is a voluntary gesture on the part of the company. It is not to be assumed that the board favours this as a permanent policy.

Your board considers the results achieved during the difficult year satisfactory in view of the many obstacles encountered.

Export trade competition in overseas markets has become keener during the past few months, but during the year this side of the business has been well maintained, except for some departments where markets have been closed due to certain restrictions set up overseas. As regards future prospects, it is obviously impossible to make any reliable forecasts.

I feel sure that you would wish to join with me in expressing thanks to all the staff and employees of the company for their loyal co-operation during the past difficult and strenuous year.

The report was adopted.

COW AND GATE, LIMITED

"HEALTH FOR THOUSANDS OF BABIES"

The forty-first annual general meeting of Cow and Gate, Limited, was held on April 28th at Guildford, Mr W R. Bramwell St. J. Gates, chairman and managing director, presiding.

The following is an extract from his circulated statement for the year to September 30, 1949:—

I am sure you will agree that we had every right to expect that trading conditions would become easier and that more and more regulations and restrictions would be relaxed, but this has not been so. The Ministry of Food continues to control our manufacturing programme.

INFANT FOOD COMPETITION

On the infant side we have had to face intensive competition from the highly subsidised National Dried Milk, which is sold at a very low price not only in the home market but in the British zone of Germany and in Malta. The excellence of our foods, the result of meticulous care and attention to every detail during manufacture, and the perfecting of our processes over a number of years, has meant health and happiness to thousands of babies at home and abroad. We are determined to maintain our high standards of quality in our branded infant and invalid foods. They are produced with infinite care at every stage and subject to strict laboratory control throughout.

Although our home sales have dropped, they are still considerably higher than they were before the war, but the falling birth-rate and the intensive competition may continue to affect us adversely during the coming year.

Trade in the export market is becoming more difficult. Your Canadian factories are restricted because of dollar shortages throughout the world, and I think you will agree that there must be something radically wrong in world economics when food stocks are allowed to pile up in Canada remaining unsold, whereas elsewhere, including other Empire markets, people are still suffering acute shortages.

We now have two creameries in Australia and we are equipping them as quickly as possible. By 1952 we hope they will be doing good business both in supplying the home market there and some of our markets overseas. On the retail side, the Home Counties Dairies group of companies' progress has been good, and patient development over a long period of years has now borne fruit. We can claim that in the areas served by our subsidiary companies, we sell as fine a bottle of milk as may be found on the market.

THE ACCOUNTS

It will be seen from the accounts that the group has this year had the benefit of exceptional net credits amounting to £211,800, mainly by way of adjustments for additional costs recoverable and other items relating to previous years. This amount is equivalent to a little over £100,000 after allowing for taxation. Your directors thought it proper, therefore, to appropriate £100,000 out of the surplus for the year to general reserve in addition to £20,000 to development reserve.

In conclusion I should like once again to extend to the staff both at home and abroad and to our overseas agents our very best thanks for the splendid work they have done during the past year. We believe that with their continued loyalty and co-operation we shall be able to overcome many of the problems which beset us. Our good wishes go out to them for the future.

The report was adopted.

UNITED CANNERS, LIMITED

GOVERNMENT AND THE CANNING INDUSTRY

MR J. B. DRING'S SPEECH

The eighteenth annual general meeting of United Canners, Limited, was held on April 27th at Boston.

In the course of his remarks, the chairman, Mr J. B. Dring, said: Referring to the combined accounts, the profit on trading and other sundry receipts amounted to £483,206, an increase of £118,596 over the previous year. The combined net profit, before taxation, was £259,679, which, with the amount brought forward from last year, made a total of £302,550.

After provision for taxation and the dividend of 25 per cent., and also the amount of £90,000 transferred to general reserve, there remains a balance of £39,834 to be carried forward. Current assets of the group were £737,680, against current liabilities of £517,177.

ADDITIONS TO PLANT AND MACHINERY

Some additions were made, during the year, to our buildings, plant and machinery, in the hope that the time was approaching when the British canning industry would be freed from its shackles, and would be able to obtain all the cans and sugar required for its products. We were encouraged in this hope by the fact that the canning industry in every country, except Great Britain, is already in this position.

This year, however, the British canning industry has unfortunately had to accept additional restrictions, with a reduction in sugar to 75 per cent. of last year's supply, and even on that basis, cans required for production are not now available, owing to the excessive export of tinplate.

THE EXPORT POSITION

Exports are required to pay for essential foods, but surely export should not be carried to the point where tinplate is exported to pay for imports of luxury foods which can only be purchased by people who have plenty of money. One may mention, for instance, fresh peas in the pod, imported at 3s. 6d. per pound, equal to 10s. per pound for the actual peas when shelled.

I want to make myself quite clear. Obviously, the general total of exports pays for the general total of imports. Now if imports of luxury foods for the rich should be diminished, there could be a corresponding reduction in exports, and this reduction could be made in tinplate, thus making that available for foods which can be purchased by people of limited means, such as processed peas and beans in tomato sauce, both valuable foods, rich in protein, and forming an effective supplement to the meat ration.

In this matter, it would appear that the Government is divided against itself. Specific allocations for the production of popular foods are made to canners by the Ministry of Food, each canner being informed what he may pack and what sugar will be available to cover his pack. On the other hand, the Board of Trade refuses to allow sufficient tinplate to produce the cans required to pack these specific allocations made by the Ministry of Food.

SHORTAGE OF CANS

So far as we are concerned, not only have we insufficient cans to complete the allocation of processed peas made to us by the Ministry of Food, but we have no cans whatever to pack the beans in tomato sauce also allocated to us by the Ministry of Food. In addition to that, our subsidiary company, Sandring, Limited, which operates a factory in a distressed area, will shortly have to close down because of the fact that while the Ministry of Food have allocated a pack of beans in tomato sauce which would keep the factory going for months, the Board of Trade have carried the export of tinplate to such an excess that not a single can is available for this pack.

Unemployment will therefore be created by the Board of Trade, in a distressed area, because a sufficient surplus of tinplate is to be exported in order to pay for expensive foods quite unnecessarily imported, at absurdly high prices, for the benefit of the rich.

That the shortage of cans for the canning industry is no mere accident is indicated by the reduction in sugar available for British canners to 75 per cent. of last year's supply.

It is not to be supposed that last year's supply was sufficient. At the present time, there are no canned English strawberries or raspberries left in the shops. They have long since been sold out, but while a workman who could afford to buy canned strawberries cannot get them, imported strawberries may be purchased, now, by the wealthy, at prices equal to about 20s. per pound.

Then, further, since devaluation, an acute shortage of imported canned fruits has developed, as there are no supplies from America.

GOVERNMENT'S ATTITUDE

In view of this, what steps are being taken by the Government to obtain an adequate supply of imported canned fruits? That this is regarded as a matter of negligible importance, is sufficiently indicated by the fact that we were refused permission to import 25,000 cases of canned apricots and peaches from a company in the sterling area which we ourselves established two years ago, and which could have been available for consumers in Great Britain at reasonable prices. While canned peaches, which could have been retailed at a price which would appeal to the British public, were rejected, imported fresh peaches are at the present time in the shops, costing 3s. each, for those who can afford to buy them.

In reducing the sugar for canners this summer to 75 per cent. of last year, the Government cannot claim that this is to conserve supplies of fresh fruit during the summer months for the public, as arrangements have been completed to import from the Continent ample supplies of fresh fruits during the summer months.

What will be ensured will be an acute shortage of canned English fruits next spring, when they are wanted by everybody whose means are limited, and who have to look on while those with more money can buy fresh fruits, imported during the winter and spring months, at fantastic prices.

The report and accounts were adopted.

BEYER, PEACOCK AND COMPANY, LIMITED

LARGER PROFIT

The annual general meeting of Beyer, Peacock and Company, Limited, was held on May 2nd, in London, Mr Harold Wilmot, C.B.E. (chairman and managing director) presiding.

The following is an extract from the chairman's review, circulated with the report and accounts.

The net profit for the year is £124,480, compared with £88,709 for 1948, a not unsatisfactory result in view of the trading difficulties experienced during the year. It will be noted from the consolidated profit and loss account of the company and its subsidiaries that the combined profit is £73,261 higher.

The volume of output of the company's factories during 1949 was again limited by labour shortage. With regard to the material supply position there was some measure of improvement. Apart for a small number of "bottleneck" component items the supply situation generally continues to show improvement.

ORDER BOOK

The current order book of the company includes Beyer-Garratt Locomotives for Australia, Rhodesia, West Africa, South Africa, Chile, Brazil, and engines and tenders for Australia and Peru. Locomotive contracts on our books are of a record total and ensure that the company's manufacturing facilities will be engaged for a considerable time ahead. Despite increasing international competition there is still a reasonable locomotive market including a fairly steady demand for the Beyer-Garratt type.

It is gratifying to record a substantial increase in export sales for the year. Deliveries included large Beyer-Garratt Locomotives of the now famous E.C.3. type for the East African railways and a further quantity of the 15th Class for Rhodesia. Beyer-Garratts were also shipped to Portuguese West Africa and Burma.

THE NEW COMPANY

You will note an increase in trade investments of £50,000, which represents the purchase at par of 50,000 Ordinary £1 shares in the newly-registered company "Metropolitan Vickers—Beyer Peacock, Limited." The other 50,000 Ordinary shares are owned by Messrs. Metropolitan Vickers Electrical Company, Limited, and there is a legal arrangement which provides for a continuance of equal equity partnership in the future. The new company has been formed to design, manufacture, and assemble railway locomotives other than steam. It has already secured its first order and production in a new factory near Stockton-on-Tees is about to commence. We have concluded these arrangements with confidence, and the judgment of your board is that the enterprise so started and the manner by which progress may be envisaged constitute a further step in the company's policy of broadening and advancing its basis of operation and interests.

Our subsidiary company The Richard Garrett Engineering Works, Limited, has continued production at a satisfactory level. At the same time we are tooling up for new products and have maintained our policy of research, experiment, and prototype development. Our Leiston order book is good and the prospects of this subsidiary appear to be promising.

Of the future I do not venture prediction save to remark that the company is well equipped to serve its railway friends and throughout the organisation there is a constant determination that to-day's performances shall be improved tomorrow.

The report was adopted.

COMMERCIAL UNION ASSURANCE COMPANY LIMITED

A GENERALLY GOOD YEAR

LT.-COL. JOHN LESLIE'S STATEMENT

The annual general meeting of the Commercial Union Assurance Company Limited, will be held on May 22nd, in London.

The following is an extract from the statement by the chairman, Lt.-Col. John Leslie, circulated with the report and accounts for the year to December 31, 1949:

We have experienced generally a good year. This is accounted for by the fact that, although there has been a number of large and spectacular losses, such as are usually reported in the Press as news and in which we have, of course, shared, there have been no major catastrophes such as are not infrequently experienced in some part of the world and which have a noticeable effect upon our trading results. While the outcome of this year's operations has been rather more favourable than usual, it should be borne in mind that insurance experience is subject to fluctuation from year to year and that the true measure of the results should only be gauged from the experience over a period of years.

During the year we have continued in our efforts to expand our business overseas and in this we have achieved a considerable measure of success. Our fire and accident premiums in respect of business transacted outside the borders of this country greatly exceed those of our home business.

FIRE DEPARTMENT

The premium income amounted to £17,372,933, an increase of £3,463,818 on that of the year 1948. The ratio of claims paid and outstanding was 42.92 per cent., commission absorbed 19.82 per cent., and expenses of management accounted for 22.80 per cent. After adjustment of the reserve for unexpired risks, there is an underwriting profit of £2,390,919, of which £1,850,000 has been transferred to profit and loss account. The Fire Fund now amounts to £15,340,800, or 88.30 per cent. of the premium income.

At home, the premium income has continued to expand, due in some measure to increased values, but fire damage has taken a higher toll of the national wealth and in consequence there has been a rise in our claims ratio.

In the United States, the outcome of our operations has again been satisfactory, the ratio of profit being rather better than in recent years. Fire wastage in that country, although heavy, was less than in the two preceding years, and consequently there was an improvement in our own claims experience. In the Dominions, the Colonies and elsewhere overseas, our business continued to expand and results were favourable. Although the year was free from serious catastrophes, there were many large individual fires particularly in South America.

LIFE DEPARTMENT

During 1949, 11,015 new life assurance policies were issued for sums assured of £12,687,099, of which £148,724 was reassured, leaving £12,538,375 retained at the company's own risk. The average new sum assured was £1,152. In addition, 2,609 immediate and deferred annuity policies were granted to secure £149,460 per annum.

The life assurance premium income of £3,278,249 was £102,159 in excess of the corresponding income for 1948, and during the year the life fund increased by £1,603,689 to £39,244,519. The average rate of interest earned on the fund was £3 3s. 4d. per cent. for 1949, after allowance for income tax, compared with £3 3s. 2d. per cent. net for the previous year. Commission and expenses absorbed 12.90 per cent. of the life assurance premium income, compared with 13.90 per cent. for 1948. Death claims and matured endowment assurances amounted to £665,248 and £1,528,191 respectively, while the sum of £231,603 was paid out upon the surrender of life policies. Over the whole the experienced mortality was again very favourable and well within the provision made in the valuation for such claims.

MARINE DEPARTMENT

The net premiums of this department amounted to £2,065,822, an increase of £161,314 over the previous year's total. The claims paid and outstanding, after deduction of reinsurances and salvages, amounted to £1,130,036, and out of the profit of underwriting years now closed the sum of £300,000 has been transferred to profit and loss account. The marine fund now stands at £3,344,124, or 161.88 per cent. of the premium income.

The devaluation of sterling coupled with the inevitable delay in formulating claims for damage to ships, has made it more difficult than ever to forecast the ultimate result on our 1949 hull underwriting, but we hope that it may yield some margin of profit. Cargo business has been subject to intense competition in all parts of the world; inevitably this has resulted in reduced rates.

ACCIDENT DEPARTMENT

The net premium income in this department amounted to £17,165,686, the ratio of claims paid and outstanding was 53.73 per cent., commission accounted for 18.76 per cent., and expenses of management 17.87 per cent. The underwriting surplus, therefore, was £1,656,043, and after adjustment of the reserve for unexpired risks there remained an underwriting profit of £1,854,027, or 10.80 per cent. of the premium income. After transferring £1,250,000 to the profit and loss account, the accident fund now amounts to £11,833,259, that is, 68.94 per cent. of the premium income.

At home, the repeal of the Workmen's Compensation Acts occasioned a substantial fall in the income of the employer's liability section of our business. The loss of income on this account was, however, more than made up by the expansion of business in all other sections of the department.

With regard to motor business, claims increased, but not out of proportion to the larger income, and results were not unsatisfactory. Losses by burglary and theft were again numerous, but in total were a little less burdensome than in preceding years, and in consequence there was a welcome improvement in the results from this important section of our business.

As a whole, our home accident business has made progress and given satisfactory results and, bearing in mind the loss of the Workmen's Compensation business, it is particularly gratifying that we are able to show an increase on the total premium income of the department over the previous year. In the United States we have experienced a satisfactory year.

The total dividend for the year will be 7s. 6d. per £1 stock or the same amount as last year.

GENERAL ACCIDENT

NET INCOME OVER £25,000,000

The sixty-fourth annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, will be held at Perth on May 24th.

The following is an extract from the circulated address by the chairman, Mr R. G. Simpson:—

Net income from all sources during 1949 amounted to £25,490,464. The operations resulted in a balance of £1,170,439, an increase over the previous year of £492,841. We have transferred £364,290 to staff pension funds. After appropriations and providing for the amount required to meet the final dividends recommended, the balance to be carried forward is £422,291, an increase of £38,274.

Life Department.—The net new life business shows a substantial increase over the previous year.

Accident and General Department.—This predominating account has shown further expansion and the premium income now amounts to £20,474,569 compared with the 1948 figure of £16,192,829.

Fire Department.—This department continues to expand on satisfactory lines, the net premium income being in excess of £2,000,000 for the first time.

Marine Department.—This shows a small increase in premium income which just exceeds £1,000,000.

U.S.A.—It may not be without interest were I to give you some figures. In the first year of business our net premium income was less than $250,000, while for 1949 it was no less than $47,460,575. Last year our United States branch remitted to this country $1,458,000 which yielded a sterling equivalent of £438,253. Our portfolio of investments now stands at $72,821,855.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY LIMITED

RECORD FIGURES AND RESULTS

In a statement issued with the 114th annual report and accounts of The Liverpool & London & Globe Insurance Company Limited, the chairman, Col. A. C. Tod, C.B.E., T.D., D.L., said the company's results for 1949 afforded ground for much satisfaction.

Fire, accident and marine premiums, at £21¼ million, and new life business, at £5,100,000, reached fresh high levels.

Underwriting profit, at £1,520,000, exceeded all previous records in the company's long history, and, for the first time, the million mark had been passed.

Notwithstanding world-wide increased costs, the expense ratio (apart from agency commission and overseas taxation) had been maintained at 16.4 per cent.

Fire premiums rose to £9,355,800; accident premiums advanced to £10,642,800; marine premiums were £1,503,600.

The directors recommend a final dividend of 13s. 6d., making 27s. per share, less tax, for 1949.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

The Reporting Manager,
The Economist,
22, Ryder Street,
St. James's, S.W.1.

JOHN SUMMERS AND SONS, LIMITED

RECORD INGOT PRODUCTION

MR RICHARD F. SUMMERS'S STATEMENT

The annual general meeting of John ımmers and Sons, Limited, will be held on ay 25th in London.

The following is an extract from the state- ent of the chairman, Mr Richard F. ımmers, circulated with the report and counts for the year to December 31, 1949:

We have been able to show an increased ofit. This is due to increased production ade possible by even more efficient opera- on in the works Once more I am very eased to tell you that in all departments e have broken our previous records, our roduction of ingots reaching approximately 20,000 tons. This record make of ingots, oupled with the fact that we have obtained further supply of strip mill slabs from out- de sources, has resulted in the production n the hot strip mill being increased by some 5,000 tons, but, of course, the most satis- ictory feature is that we have been enabled deliver more finished sheets and light lates to our customers than ever before in ıe whole of our history.

The net profit, after providing £360,000 or depreciation and £200,000 for special eserve for deferred taxation, amounts to 934,419, out of which dividends take 377,188, leaving £557,231 retained in the usiness.

EXPORT MARKET

In spite of the record tonnages we have ot been able to satisfy all the demands laced upon us, and once again we have only een able to export to our many customers verseas a small percentage of their require- ients. The general policy of the Govern- ient is that raw materials should only be xported if it is impossible to process these aterials into more highly finished products hich can then be exported, thereby yield- ng a greater measure of foreign exchange or the same tonnage. The great bulk of our roduction has therefore gone to manufac- urers in this country, a large proportion of hose finished products has gone to the xport markets.

We are, however, fully alive to the fact hat sooner or later we shall have to rely to considerably larger extent on direct exports, nd for this reason a number of our directors nd officials have been sent on visits to many arts of the world to keep in touch with our ustomers there, and to explain to them why ve have not been able to do more for them uring the last few years.

DEVELOPMENT SCHEME

I will now turn to our development cheme. When, at the request of the Government, the whole steel industry of Great Britain was reviewed and the large cheme of development covering some £200 illion was agreed upon, our melting shop, last furnace, and coke ovens at Shotton vere an imporant part of the plan In order o get the full benefit of the expenditure ncurred in prewar years it was necessary hat we should increase our ingot output to figure of 18,000 tons a week, and it was bundantly clear to us that such a figure ould not be safely embarked upon unless we ssured our own supplies of pig iron, which ould only be done by installing a blast urnace and coke ovens at Shotton.

When these developments are completed ve anticipate that we shall be able to increase our output of finished sheets without any erious capital expenditure on our rolling ills by about 25 to 30 per cent. on our resent figure. The whole scheme, which ve hope will be completed in about three years, we estimate will cost between £14-15 million, a substantial proportion of which we expect to be able to provide from our own resources.

POLITICAL UNCERTAINTY

From the outset of this project the whole question of finance has been overshadowed by the uncertainty of the political position, but at the various talks which we have had from time to time with our financial advisers and our bankers they have expressed the view that if it were not for these uncertainties our strong position would ensure that there would be little difficulty in raising the neces- sary additional money on favourable terms.

All along your directors have felt that no obstacle should be put in the way of your company's developments, which they feel convinced are necessary, both from the com- pany's point of view and also in the interests of the nation as a whole. Accordingly, we have been proceeding with our plans not- withstanding the fact that no concrete steps have as yet been taken to secure the neces- sary finance. Since the General Election talks have been renewed, but owing to the present impasse finance on a short-term basis may need to be arranged, leaving the final and more permanent arrangements to be made at a later date when the industry's future has been clarified.

NATIONALISATION OF THE IRON AND STEEL INDUSTRY

As I have already said, the political situa- tion is still very obscure. I think you will recollect that when the Government agreed to the amendment of the House of Lords last summer that the operation of the Steel Act should be postponed until after the general election, it was because it was felt that the electors should be given an oppor- tunity of expressing a view upon the desir- ability or otherwise of nationalising this industry; this opportunity was given last February, and a majority of about one and three-quarter million electors voted against it—you will remember it was part of the Liberal Party's manifesto that they were opposed to the nationalisation of the iron and steel industry. At the time at which the Government accepted the amendment from the House of Lords the Minister of Supply said: ". . . in an atmosphere of political tension and uncertainty it would plainly be unwise to proceed now with the selection of individuals to serve on the Corporation. Men who may well be best suited for this respon- sible task might understandably be reluctant to commit themselves to accepting such a position, and throw up their present jobs, so long as they think there is a possibility, how- ever remote, that the Corporation may not, after all, be established. . . . " If that was true at that time, surely it has greater force today, because there is a clear majority in the country against the Act, although there is still a Socialist Government, but with a negligible majority.

I have said on previous occasions that I can see no justification for interfering with an industry which has demonstrated that it is quite capable of managing its own affairs, and is fully alive to its responsibilities to the nation. The industry's achievement in 1949 of beating all previous records has merely added to my conviction that nothing but harm could come by interfering with our present set up. Many of you will have seen the slogan "Steel is serving you well." Per- sonally I believe that it is, and I think the great majority of the consumers of steel and the public as a whole share my view.

DAVIS AND TIMMINS, LIMITED

BETTER PROSPECTS

The fifty-first annual general meeting of Davis and Timmins, Limited, was held on May 2nd in London.

Mr F. Le Neve Foster, chairman and joint managing director, presided and, in the course of his speech, said: The group net profit, shown on the profit and loss account for the year, after making provision for depreciation, taxation and the other items mentioned therein, is £45,047, as against £60,082 for the previous year, which represents a moderate reduction. On the other hand, the trading profit at £110,346 shows a steep fall from the record figure for 1948 of £216,962 out of which we were able to make provision of £24,500 for deferred repairs, in addition to the provisions for taxation and depreci- ation and to include in the latter certain special writings down which we took the opportunity of making. While this retrogression in results is disappointing, the comparison is brought into better perspective when I point out that the present figures approximate those for 1946.

The directors recommend a final dividend of 30 per cent., making with the interim dividend of 10 per cent. already paid a total distribution of 40 per cent. for the year, which is the same as last year.

STRONG FINANCIAL POSITION

Your company is still in a remarkably strong financial position, and the consolidated balance sheet shows that the net tangible assets covering reserves and the issue of ordinary share capital amount to a figure of £512,627, which equals approximately 23s. per 5s. ordinary share.

It was the intention of the board, when conditions permitted, to rectify to some extent this abnormal disparity between the value of the nominal ordinary share capital and the value of the capital actually employed in the business by a free issue of bonus shares. In view, however, of the trading recession it appeared to be desirable to defer this opera- tion until the outlook was clearer. In the meantime the ban on bonus issues has unfortunately been reimposed, which makes it impossible at the present time, except to the extent of an issue up of £50,000. The board will keep the consideration of this problem before it.

SALES

In the early part of last year, it was evident that many of the trades which we supply were overbought, and severe competition, with price cutting, developed for the orders which were about. I am satisfied, however, that we obtained a satisfactory share of the orders available. The name Davis and Timmins is held in very high regard in the trade and we have proved beyond doubt that we can effectively meet a competitive market and at the same time give to our customers the high quality products which have so long been associated with our name.

Although 1949 has been rather disappoint- ing in results, I firmly believe that internally it has been a year of marked progress. Look- ing at the state of our order book and tempo of sales and production, prospects appear better today than they were when last I addressed you. Future results must, how- ever, of necessity be dependent to a large extent on external conditions over which we have no control. Nevertheless, given a fair chance by those conditions, I have every confidence that the firm will continue to give a good account of itself and still further extend its unrivalled goodwill in the trade.

The report was adopted.

KEMSLEY NEWSPAPERS LIMITED

VISCOUNT KEMSLEY'S ANNUAL REVIEW

The twenty-sixth ordinary general meet- g of Kemsley Newspapers Limited will be eld on Tuesday, May 23rd, 1950, at emsley House, London.

The following are extracts from the state- ent of the Chairman, Viscount Kemsley, rculated with the report and accounts:—

The consolidated profit and loss account r the group for the year under review ows trading profits and sundry income nounting to £1,892,440, a decrease of 398,973 on the comparable figure for 1948. uring the year there was an improvement revenue from sales of newspapers and om advertisements. This was exceeded, owever, by an increase in wages, salaries, ıe charge for newsprint and general costs.

The provision for taxation amounts to 1,004,450, compared with £1,249,224 last ar, and after leaving £52,769 in sub- diaries, against £150,707 in 1948, and inging in the balance brought forward from ıe previous year of £303,816 there is a alance available of £1,090,916, which com- ares with £1,299,316 last year, when 200,000 was included in respect of taxation rovided in previous years, but no longer quired. Dividends on the two classes of eference stock and the interim dividend of per cent., less tax, paid on the ordinary ock, absorb £349,250, and it is proposed provide £40,000 for depreciation of British overnment securities and to transfer 300,000 to general reserve, making that nd £4,000,000.

We now recommend a final dividend on ıe ordinary stock of 7 per cent., less tax, 9s., which, with the interim dividend, akes 12 per cent., less tax, for the year, ing the same as for 1948.

There then remains a balance carried for- ard in Kemsley Newspapers Limited of 305,416. The total amount of the carry rward in the consolidated balance sheet is 555,852, compared with £547,802 in 1948.

Revenue reserves, excluding the income tax serves, are up by £334,584 and now stand £5,950,934. On the other side of the alance sheet, property, plant, machinery and uipment at £4,108,480 have increased by 170,534 after writing off £231,730 for preciation, making capital expenditure dur- g the year some £400,000.

DEPRECIATION ALLOWANCES

From time to time since the war ended tention has been forcibly drawn to the un- ality of the present method of calculating preciation of plant, machinery and equip- ent for taxation purposes and of the serious ndicap placed thereby upon those busi- sses which desire to maintain themselves first-class condition at every point. The alistic view of depreciation allowances is at their purpose is to permit the creation what in effect is a reserve for replacement. his purpose is not now being achieved and oper replacement can be undertaken only y making fresh inroads into capital. Even if rect taxation is not to be reduced, the least dustry can expect is that it should be made ssible for replacement costs to be ade- uately covered by depreciation allowances. hope that the Millard Tucker Committee ill produce practical proposals to this end.

CIRCULATIONS

In general, the circulations of our news- pers have been well maintained. The in- easing demand for a Sunday newspaper of e highest quality and authority is respon- ble for the steady progress of *The Sunday Times* and for its predominance in circula- tion in its field. The *Sunday Empire News*, although published in Manchester, with its circulation of well over 2,000,000—of which a substantial proportion is in the South —can claim to rank as a newspaper of national standing. At the same time, the *Sunday Chronicle*, published in London and Manchester, continues to provide a family newspaper of popular appeal.

So far as our daily provincial newspapers are concerned, surveys give gratifying con- firmation of the completeness of the coverage they provide in their areas. Careful collabora- tion between editorial and circulation depart- ments has enabled us to extend the range of our provincial evening newspapers, and, in aggregate over the year, this group of our publications showed an encouraging increase in total circulation.

The average circulation during 1949 of our compañion papers, the *Daily Graphic* and the *Sunday Graphic*, showed an advance on the figures to which we were limited when circulation was pegged, and both these publications maintained their standing and reputation as the quality picture newspapers.

ADVERTISING

To the advertiser the quality of a news- paper's readership is of scarcely less impor- tance than its extent. The purpose of the advertiser is to sell his goods and therefore he desires to direct his appeal to those of sufficient substance to buy and to continue buying. It is because advertisements in our newspapers bring results that I am able to give a good account of our experience in 1949. Additional newsprint enabled us to offer to advertisers larger spaces and more frequent publication. This accorded well with the increased availability of goods and the return to trade generally of more com- petitive conditions than had been known since the outbreak of war.

Nevertheless, demand has been affected by the process of nationalisation. My view is that no great business which is selling to the public, whether under private enterprise or nationalisation, can succeed without a policy of steady advertising, skilfully prepared and distributed. Even monopolies ignore this truth at their peril.

"THE SUNDAY TIMES" BOOK EXHIBITION

By every reckoning the resumption of *The Sunday Times* Book Exhibition last Novem- ber was an outstanding success. During its run of thirteen days it proved the most popular exhibition of any kind ever held at Grosvenor House. More publishers took stands than at any previous exhibition, many more books were sold, and attendances at the special lectures reached the remarkable figure of 19,000—a tribute to the many famous authors who once again offered their services.

The highlight was the presentation of *The Sunday Times* £1,000 Prize for Literature to Mr. Winston Churchill, who marked the occasion with a memorable speech, in which he referred to the "very important line of guidance" given by the literary columns of *The Sunday Times*.

Before the close of the Exhibition it was known that Grosvenor House would not be similarly available in 1950. Looking to the future, we shall, of course, aim to renew the Exhibition as soon as possible, and we have the assurance of the kind and extremely effec- tive co-operation of the Publishers' Associa- tion.

INSTITUTE OF CHARTERED ACCOUNTANTS

SIR RUSSELL KETTLE'S ADDRESS

The sixty-ninth annual general meeting of The Institute of Chartered Accountants in England and Wales was held on May 3rd in London.

Sir Russell Kettle, F.C.A., in the course of his presidential address, said: The total membership increased during the year by 499 to 14,632, of whom 5,830 or 40 per cent. are in practice. My attention has been drawn to more than one published statement indi- cating that a high premium is required in order to enter into articles and that accord- ingly it is impossible to become a chartered accountant without considerable financial means. Before the last war it probably was usual for a premium to be required, but this was not so in every case. During recent years, however, the articles submitted for registration include a large proportion where no premium has been paid and many of them provide for a small graduated salary during service.

The Council has observed suggestions that admission to the Institute is being regulated by increasing the requirements for a pass. The Council has stated categorically that no such policy has been or is being contem- plated, and that there has been no alteration in the requirements for a pass in any of the examinations.

NATIONALISATION

We have experienced a considerable volume of nationalisation during the past five years. The benefits of nationalisation are a matter on which each individual holds his own views. There is, however, one respect in which we know to our cost that nationalisa- tion carries no benefit. I refer to the loss of audit work. In the case of coal nationalisa- tion, the controlling board decided against the use of independent professional account- tants to carry out local audit work—work which is technically "internal auditing," but which in practice is comparable with the auditing of subsidiary companies.

Fortunately for the profession and the public, the British Transport Commission did not follow the earlier precedent. The Commission decided to make use of the services of independent professional account- tants for local work.

In submitting a memorandum to the Tucker Committee on taxation of trading profits, the Council avoided raising specific fine points which give rise to difficulty in practice as it was felt that most of the detailed difficulties would disappear if the broad principles recommended by the Council were adopted.

I am sure you will agree that what is required today is not further complications in computing the amount to be paid by way of taxation. What is needed is to relate the taxable profits as closely and in as simple a manner as possible to those shown by the "true and fair view" required to be given in the profit and loss account. Moreover, taxation itself should be "true and fair." As the Council stated in its memorandum to the Tucker Committee, the underlying difficulty at the present time is that taxation is too high for the health of business enterprises. It is largely this fact which has resulted in the pleas made in recent years for new principles of profit ascertainment based on replacement costs.

Jointly with the Law Society the Council has made representations on this vital matter to the Chancellor of the Exchequer, and we are grateful to him for having recognised in his Budget statement that there is clear need for inquiry.

The report was adopted.

UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

ALL-TIME RECORD OF PRODUCTION AND TURNOVER

The thirty-seventh annual general meeting of The United Glass Bottle Manufacturers, Limited, will be held at the registered office, 8, Leicester Street, London, W.C., on Thursday, 25th May.

The following is an extract from the Statement by the chairman, Mr Harold St. J. Judd, which has been circulated with the report and accounts for the year ended 31st December, 1949:—

The form of presentation of the annual accounts has this year been further developed and simplified by the introduction of a consolidated profit and loss account in columnar form, incorporating the appropriation account of the holding company, in place of separate profit and loss accounts for the holding company and for the group. The group trading profit for the year 1949 amounted to £1,315,311 as compared with the adjusted amount for 1948 of £1,168,273.

Owing to complications arising out of the liquidation of subsidiary companies in 1948, it has been found necessary to amend the trading profit figure as published for 1948 from £1,216,153 to £1,168,273 and likewise on the other side of the consolidated profit and loss account, provision for income tax is adjusted from £356,887 to £310,967. These adjustments have no material effect as the net figures in the consolidated profit and loss account for 1948 remain as originally published.

PROFITS AND DIVIDEND

The group profit after taxation amounted to £468,782 compared with £451,068 in 1948; after adjustment for special items of a non-recurring nature, which in 1949 amounted to a net credit of £5,697 compared with £65,064 in 1948, the net group profit resulting is £474,479 compared with £516,132 in 1948.

The holding company profit for the year, £389,501, shows an increase over 1948 of £56,330, but it should be borne in mind that in 1948 only part of a year's trading of the factories of the liquidated subsidiary companies was reflected in the holding company's profit and loss account.

The board have considered it advisable, on account of the continuing high replacement cost of plant and equipment, to make a further substantial appropriation of £150,000 to plant replacement reserve, increasing that reserve to £250,000. They have also set aside to staff benevolent account a further sum of £30,000, increasing the balance on that account to £130,000. As to dividend, the board recommend a final dividend on the ordinary stock of 10 per cent. less income tax, to maintain the distribution for the year at 15 per cent.

The credit balance carried forward on the holding company profit and loss account shows an increase of £67,791 at £210,712; similarly the group balance is increased by £110,129 to £316,420.

The balance sheets of the holding company and the group reveal a state of increased strength and fluidity. It will be observed that a substantial portion of the company's and of the group's holding of government securities was realised during the year and that a loss was incurred on this transaction. The proceeds of their sale are the main contribution to the increase in the items cash at bankers and in hand.

The results as set forth again reflect an all-time record of production and turnover. Your company has continued to carry additional burdens by way of increased costs, but these have been offset by further improvements in mechanisation and the fruits of technical research, such as a high degree of fuel economy, which has been attained.

As I last stated the average price increase of glass containers has so far approximated 47 per cent. over prices prevailing in 1939, which, I believe, ranks with the best records of any industry in curbing price increases. There is every indication that we shall be compelled slightly to increase our selling prices in the near future, depending upon the Government decision as regards freight rates and other rising costs.

NEW DEVELOPMENT

The installation of the Stem Table Glass automatic machine unit has proved to be highly successful. A variety of stem glasses has been produced of excellent quality and attractive design. These stem glasses have been well received wherever introduced and an important quantity ear-marked for export has been sold, taking up that part of the production for the balance of this year.

Much credit is due to the St. Helens management, technical staff and operatives for the manufacturing success of this venture.

EXPANSION OF OUTPUT

Over the years you will have noted the steady expansion of your company's output. This expansion has run in cycles wherein from time to time a point has been reached of apparent peak production as related to market requirements. In due course this peak has proved to be insufficient to meet your company's ability to sell, both for home and export markets.

Notwithstanding the tendency for the sellers' market to disappear, your company now requires additional production, consequently the possible areas of expansion have been closely examined and applications for licence have been filed for additional buildings and plant at one of our main factories where the physical properties of plant, public services, technical operatives and supervision make it possible for such expansion.

Unfortunately we cannot meet the Government views as related to the distribution of industry. Existing plants in areas suitable to Government desires are not capable of taking on further expansion. Furthermore, a new factory in a development area is out of the question as trained technical skill is not available to operate such factory when split off from one of your company's existing plants.

It is therefore to be hoped that as your company can only at this time undertake a major extension at the factory, to which reference has been made, in the exceptional circumstances the Government departments concerned will grant the necessary licences.

CURRENT PROSPECTS

Your company is in the fortunate position of manufacturing a very wide range of glass containers from tiny vials to 10-gallon acid carboys, so that some falling off in sales of certain types of bottles is being made up by increased sales of other types.

Added to this feature are the activities of your group of companies engaged in the manufacture of metal and plastic closures, plastic mouldings and metallic capsules and engineering. One very important factor is the attractive range of Sherdley and Ravenhead tumblers and domestic glassware which has been so well completed by the addition of stem table glasses.

Sales are satisfactorily maintained in both home and export markets and your company look forward with confidence as to the trading during the current year, providing there is no major industrial disruption.

BRITISH ALUMINIUM COMPANY, LIMITED

PRODUCTION MAINTAINED

MR. R. W. COOPER'S REVIEW

The annual general meeting of the Britis Aluminium Company, Limited, was held May 2nd in London.

Mr R. W. Cooper, M.C., the chairma in the course of his speech, said: Our pr duction of virgin ingot during the year w approximately the same as last year and w all sold to the Ministry of Supply again an unremunerative figure. We have not y agreed a contract with the Ministry for 195 but negotiations are proceeding.

The reconstruction of our reduction wor at Kinlochleven is nearing completion, a we should shortly feel the full effect of t economies resulting from the installation new furnaces. The very much larger ta of the reconstruction of our reduction wor at Lochaber, involving very large furnac of a new type, is progressing, and we a not only at technical improvement but al at providing better working conditions a eliminating any risk of complaint w regard to the emission of fumes. Until c modernisation programme is completed 1951 we shall not derive any benefit from c efforts, since increased efficiency is at pres more than offset by the general disturbar to the process caused by reconstruction wo

MARKET CONDITIONS

On the fabrication side, production v slightly lower than in 1948. The ho market, although unsatisfactory as to ty and size of order, was fairly well maintain but there was some reduction in expo partly due to keen overseas competition fr a number of sources and also due to di culties in the Indian market, which l always been one of our main export outl brought about by the decision of the Ind Government to impose heavy restrictions the granting of import licences during second half of the year.

With regard to new plant, excellent p gress is being made with our additional st mill at Falkirk, in which we are invest approximately £1,500,000. This will st production during the second half of current year, but we will not derive a benefit from its operations until 19 Development work is proceeding actively a we have a large number of interest prospects in hand.

PERIOD OF REORIENTATION

Shareholders will appreciate that industry is going through a profound prolonged period of reorientation. T future of the great industry which we h built up over the past fifty years depends our opinion on the establishment of low-c ingot production in various parts of world. We feel that it is essential that company should take a leading part in development. We are confident that work will ultimately be rewarded.

Turning now to the accounts of the co pany, the total profit for the year amount £1,463,218 compared with £1,860,142 for previous year. We have transferred £200, to the reserve for increased cost of pl replacements, bringing it up to £450,(General reserve has been increased £2,750,000 by an allocation of £125,(We recommend a final dividend of 6 per c on the ordinary stock which, with the 4 cent. already paid, makes 10 per cent., tax, for the year.

The report and accounts were unanimo adopted.

BRUSH ELECTRICAL ENGINEERING COMPANY, LIMITED

IMPROVEMENT CONTINUED

The sixty-first annual general meeting of The Brush Electrical Engineering Company, Limited, was held in London on May 2nd, Sir Ronald W. Matthews, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:—

The accounts show a continuance of the improvement apparent for the past two years and, although earnings justify an increase in the rate of dividend, your directors, in conformity with the policy of restraint in the distribution of profits, recommend a dividend on the ordinary stock of 6 per cent., less tax, making 10 per cent., less tax, for the year, the same rate as for 1948. The group's activities can be conveniently grouped under four main headings, Brush, Mirrlees, McLarens and Petters.

VARIED ACTIVITIES

The Brush Electrical Engineering Company, Limited, Loughborough: From 1946 to 1949 the rate of receipt of orders at the Loughborough factory has risen sharply, not by reason of an exceptional demand for any particular product but as a result of progressive balanced expansion in generating sets, electrical rotating machines, switchgear, transformers, steam turbines and oil engines. To cope with the vastly increased output, the factory has been rearranged and laid out on the most up-to-date lines.

In my report to you last year I dealt at some length with the Ljungstrom Turbine which has been a prominent factor in our affairs over the last four years. During the year under review, turbines at Sunderland, York, Lincoln and Grimsby have been fitted with the new design of blading under the reconstruction programme. Results so far give your board every reason to believe that the design of the new blading has overcome the troubles and difficulties which were experienced in the past. The company also manufacture bus bodies, deliveries of which have shown a threefold increase from 1946 to 1949.

Mirrlees Bickerton and Day, Limited, Stockport: During the past year the factory has increased its production by nearly 50 per cent., and some 90 per cent. of the total output has been exported. The 1949 total is ten times the average yearly output for 1934-38. Sales for the year constitute a record and steps have been taken to increase the output by a further 50 per cent. Two new ranges of heavy engines have been designed, which it is believed will be in advance of anything in the oil-engine field.

J. and H. McLaren, Limited, Leeds: The remarkable rise in production which began in 1946 has been fully maintained and we have a full order book. The McLaren-Brush diesel-electric generating set, designed as an emergency plant to operate during power cuts, has been installed throughout the country and exported in large numbers.

Petters, Limited, Staines: The production of the Petter engine is undertaken at two factories, the small diesel and petrol engines at Staines and the larger SS engines at Loughborough. The factory at Staines is producing to the limit of its capacity and we have obtained a licence to erect additional buildings. We are arranging distribution throughout America at prices competitive with American-produced engines. It is hoped that by the middle of this year substantial orders will be forthcoming to offset the inevitable decline of orders from the sub-continent of India.

The report was adpoted.

JOHN BARKER AND COMPANY, LIMITED

INCREASED TURNOVER

The fifty-seventh ordinary general meeting of John Barker and Company, Limited, was held on April 28th in London.

Mr Trevor A. Bowen, D.L., J.P., chairman and joint managing director, in the course of his speech, said: The profit for the year, before deducting taxation, is £976,624. Of this amount, taxation absorbs £452,724, leaving a net profit of £523,900. This compares with the relative figures for the previous year as follows: Profit £992,104, less taxation £508,456. Net profit £483,648.

We have a difficult time before us. We can hardly expect our turnover to increase in the same ratio as last year, and the trend of all operating expenses is continually increasing, thus adding to our problems, but I can assure you that our organisation is flexible and strong, and with the good will of all concerned will be able to cope with emergencies as far as possible.

On a previous occasion I referred to the burden of taxation and local rates. The latter especially weighs heavily on a business owning extensive and valuable premises, and since the new rates which are now in operation show increases in many cases, we shall be faced with an additional burden during the coming year.

With regard to the profit and loss account, our gross profit is down by £62,439. Other income shows an increase of £31,553 and total expenses are down by £15,406, the final result being a profit of £976,624. Of this taxation takes £452,724 or, say, 46 per cent., a very serious toll, and, if we add to this the increasing burden of rates, you will realise how heavily handicapped modern business is.

The report was adopted.

B. MORRIS AND SONS, LIMITED

INCREASED PROFIT

The annual general meeting of B. Morris and Sons, Limited, was held on May 3rd in London.

Mr A. J. May (chairman and managing director), in the course of his speech, said: The profit for the year shows considerable increase against 1948, and this will enable us to recommend a 10 per cent. dividend, and increase the carry forward to £5,105. The stock figure shows a small decrease, but we are well placed at present as regards stocks of raw material, and are only just beginning to feel the effects of devaluation as regards the dollar countries. No doubt things will adjust themselves in due course.

The cigar side of the business is suffering very much from the importation of cigars from abroad, and in view of the unemployment amongst the operatives in that branch of the trade, it is time the powers that be gave us some protection against the imported article. Very good cigars have always been made in this country, and with a little help from the Government, there is no reason why this part of the industry should not provide full employment for the operatives. We have done everything possible to maintain this side of the business with a certain amount of success. Fortunately, we also make cigarettes and various tobaccos. Adverse factors are always operating in business today, and the only one we have not been able to get over is the excessive taxation which is taking considerably more than half of the profits.

It is extremely difficult to forecast the future, but you can rest assured that every effort will be made by all connected with the company to produce another good result for 1950.

The report was adopted.

NOTICES

THE ENGLISH ELECTRIC COMPANY LIMITED

ISSUE OF 589,789 NEW ORDINARY SHARES

Notice is hereby given that the Certificates in respect of the new Ordinary Shares provisionally allotted on January 25, 1950, will be issued from the Company's Office at Stafford in accordance with the terms of the Provisional Allotment Letter, after May 16, 1950, to the persons in whose names the Stock has been registered.

The Company is prepared to act on instructions from duly authorised persons to send these Stock Certificates to an address other than the registered address of the Stockholder concerned, provided that such instructions are received by the Company not later than the first post on Monday, May 15, 1950.

APPLICATIONS are invited for an appointment in the research organisation of a major industry, at a salary of between £1,000 and £1,400, according to experience and qualifications.

The work, which requires initiative, involves the study of economic, industrial and sociological problems.

Qualifications or experience in economics would be valuable, but the chief requirement is a capacity for critical analysis and clear thinking.

Age should preferably be between 30 and 40.

Applications, stating age, education, qualifications and full particulars of experience, should be sent to Box 416.

A COST ACCOUNTANT is required by a well-known manufacturing firm. The appointment is a responsible one and preference will be given to a Chartered Accountant. The immediate salary and conditions are good and the prospects excellent. Applications are invited from men aged about 35 years.—Full details of experience to Box 406.

OUR APPOINTMENTS BUREAU WELCOMES ENQUIRIES from Professional Men, Directors and Higher Executives who have vacancies for secretaries with a University standard of training. For interview by Employers, students are selected from among those who have completed their course with the full London College Diploma. In accordance with our established custom, no fees are charged for this service. Please write or telephone to:—
THE APPOINTMENTS DIRECTOR,
THE LONDON COLLEGE OF SECRETARIES,
170, Queen's Gate, London, S.W.7. KENsington 3228.

WANTED to purchase Manufacturing, Wholesale and Retail Grocery, Provision and Fruit and Vegetable Businesses. Must be good established running concerns. Price in accordance with Assets per Accounts. State turnover, and location, etc. Completely confidential.—Box 668, Robertson & Scott, Edinburgh, 2.

CAPITAL, £1,000 to £100,000 sought by Wholesale and Retail Food Distributors for Expansion Purposes and for additional Working Capital by old-established and thoroughly sound linked Scottish Concerns; Merchants, Banks, Trusts, and Individuals are particularly invited to apply. Terms commensurate with investment. Other Banks considered.—Box 667 Robertson & Scott, Edinburgh, 2.

COST Accountant, age 27, seeks post offering greater scope for initiative and responsibility. Experienced all departments except sales. Special reference to systematising and reorganising, budgetary control, statistics, capital expenditure, purchasing and stores organisation, wages. Capable of controlling staff. Home or abroad. Minimum salary £600.—Box 403.

S. F. GRILL & CAFE (6, Denman Street, Piccadilly Circus) now celebrating 25th Anniversary Year, looks forward to much "happy returning" by customers.

Investment Statistics

Company Notes

Imperial Chemical Industries — Group profit before taxation for the year 1949, after providing £4,500,000 (£3,500,000) central obsolescence and depreciation, amounted to £17,323,509 compared with £22,955,579 for 1948. Taxation absorbed £6,496,828 (£11,058,523); group net profit was £10,346,480 (£11,495,184), of which £554,977 (£644,770) was retained by subsidiaries. Future tax reserve takes £2,215,000 in respect of deferred liability arising from initial allowances. The dividend of 10 per cent (same) requires £3,330,697 (£3,164,162).

Royal Mail Lines.—Consolidated net profit for 1949 was £727,693 compared with £563,582 in the previous year after crediting £129,740 (£198,926) applicable to previous years. Taxation amounted to £1,028,177 (£1,060,913). The dividend of 7½ per cent is repeated.

Chloride Electrical Storage.—After depreciation and other provision, including £165,000 (£477,500) stocks reserve and £1,007,409 (£957,133) for taxation, group profit rose from £317,039 to £791,232 in 1949. A final dividend of 7½ per cent is recommended on the increased capital.

Lancashire Steel Corporation. — Consolidated net profit increased from £696,177 to £950,558 in 1949 after provision of £335,000 (£349,013) depreciation and £1,050,000 (£900,000) taxation; reserve appropriations are: taxation equalisation £65,000 (£150,000), stocks £100,000 (nil) and general £450,000 (£200,000). The dividend on the "A" and "B" ordinary stocks is 8 per cent (same) for the year.

Swan and Edgar.—Net profit amounted to £176,047 (£96,649) in the year to January 31, 1950. The dividend for the year is 10 per cent (9 per cent).

C. and J. Weir.—Group net surplus for 1949 including £52,929 profit on devaluation amounted to £385,089 (£386,932); taxation took £604,929 (£456,214) The dividend of 40 per cent is repeated.

Anglo-Newfoundland Development.—Net profit of the group declined from $6,046,380 to $2,868,585 in 1949. A dividend of $1 per share has been declared (same).

Union-Castle Mail Steamship.—Group net profit for 1949 was £2,171,012 (£1,922,689), including miscellaneous credits not attributable to the year's trading, £318,066 (£201,518), and a full year's trading profit of King Line. Taxation of £1,826,417 (£1,840,143) has been deducted. The dividend of 8 per cent is unchanged for the year.

Babcock and Wilcox.—After charging £1,203,582 (£890,750) taxation, group net profit for 1949 was £1,186,934 (£894,489). The dividend of 15 per cent has been maintained on the increased ordinary capital.

Johnson and Phillips.—Group trading profit, excluding the Scottish subsidiaries, amounted to £606,871 (£610,805) in 1949; net profit was £253,794 (£239,181). The dividend of 15 per cent on the enlarged capital absorbs £110,032 (£88,028).

Associated Electrical Industries.—Consolidated profit in 1949 amounted to £6,707,000, compared with £5,412,000 in the previous year; net profit of the group was £2,685,000 (£2,522,000). The dividend of 15 per cent is unchanged.

Pressed Steel.—After deduction of £1,095,480 (£723,453) for taxation, net profit for 1949 amounted to £860,399 (£553,538). A final dividend of 10 per cent is proposed on the higher capital.

C. A. Parsons.—Net profit for 1949, after providing £414,000 (£102,500) taxation, was £407,475 (£178,735). A total distribution of 15 per cent (12½ per cent) is recommended for the year.

Capital Issues

British Electricity Authority. — Lists opened and closed on Friday, May 5th, for the issue of £150 million 3½ per cent. guaranteed stock, 1976-79 at £99 per cent.

H. and C. Simonds.—Additional debenture capital is to be raised by the issue at £98½ per cent of £1,000,000 4 per cent. redeemable debenture stock with 1980 as final redemption date.

Stilfontein Gold Mining.—Underwriting of the £2,000,000 5½ per cent convertible unsecured loan stock, 1954-60 has been completed. Firm applications on underwriting terms have been received for £650,000 of the new stock.

Rhodesian Breweries.—Shareholders are to be offered 800,000 5s. ordinary shares at 5s. 6d. per share. Allotment to United Kingdom residents will be limited to 181,800 shares.

Statistical Summary

EXCHEQUER RETURNS

For the week ended April 29, 1950, total ordinary revenue was £81,778,000 against ordinary expenditure of £35,981,000 and issues to sinking funds £10,000. Thus, including sinking fund allocations of £474,000 the deficit accrued since April 1st is £212,000 compared with a surplus of £23,170,000 for the corresponding period a year ago.

Cold War Council

THE London meetings between the Atlantic Powers may or may not mark a turning point in their collective policies. What is certain is that the conference has come at a time when a turning point is necessary. One phase in their collaboration has come to an end. It is no longer possible to regard Europe as the sole problem in the struggle with Soviet Russia. Nor is it possible to think of a separate European effort, backed from outside by American assistance, which will come to an end in 1952. The general principles of the next phase are beginning to be more widely realised and accepted. The cold war is world-wide and indivisible. The alliance of the free nations must be based upon a pooling of policy and resources and must last a generation at least. So much is beginning to be understood. It is when these general concepts are discussed in terms of detailed policies that a feeling of uncertainty sets in.

It is still too soon to say whether the London talks will advance as far as concrete plans for the new phase in the west's defence. Only one suggestion has been made public so far—the idea of an Atlantic Council put forward by the French Prime Minister. The concept is politically important since the aim of the Council is to transform the United States—and Canada—from outside sponsors into equal partners. It could and should be an essential organ of consultation and decision. It could also serve as a rallying point for those—and there are many—who doubt the viability of western Europe working alone. Nevertheless, machinery is not policy. It is not from any shortage of institutions that the west is suffering. On the contrary, there has been a tendency in the last eighteen months to set up a new piece of machinery every time a problem becomes too difficult to solve by means of the old. If an Atlantic Council means no more than an expedient for shelving still further issues which have reached deadlock in the Council of Europe or the Brussels Pact Council or the Organisation for European Economic Co-operation, or the Anglo-American-Canadian Working Committees in Washington, a decision to set it up as a result of the London talks would not advance the west very far. The value of a new body would lie in the extent to which it could help to produce a genuine fusion of strategic and economic policies and have concrete plans in operation before the present time limit of 1952 is reached.

Western thinking on the strategy and economics of the cold war is still based on two postulates—one, already mentioned, that Europe must make its own plans and America will supplement the effort; the other, that each nation must contribute what it can to the general defence of the west without risking the prosperity and stability of its own economy. The mental revolution needed now is that the powers should cease to ask themselves what military and economic resources they can afford to devote to the cold war and ask instead what scale of effort is essential to its successful prosecution. When the order of magnitude is roughly established and agreed, they can go on to

examine how the burden can best be distributed among the various partners. It has already been argued in these columns that if, on a sober military estimate, the effective defence of Europe requires some thirty divisions, there is little point in the western allies discovering that they cannot "safely" afford more than ten. Equally in the United States, a military budget geared only to America's "capacity to pay" may not have much bearing on the only really crucial issue—whether or not enough is being done to win the cold war. The first task therefore for the new Atlantic Council might well be the drawing up of common defence estimates.

Similarly, in the closely related sphere of economic aid, there is still no joint machinery for determining what may or may not be necessary in, say, the next five years. If the western powers would co-ordinate their estimates and statistics, they could then attempt to match them by a genuine pooling of their joint resources. Detailed comparisons of performance are so complicated and invidious that probably the best available yardstick of each individual nation's effort would be a percentage of its national income. This method of distributing a common burden equitably has been used with success before and the creation of a common "cold war fund" would not only provide a valuable successor to the Marshall Plan, but would give it the solid foundation of full strategic and economic partnership.

*

Such a concept is inevitably beset with difficulties. Although the fixing of a percentage of the national income ensures a general equality of effort, it does not follow that the local effort will always be appropriate or that excessively difficult adjustments of national policy can be altogether avoided. For instance, much European thinking on the pooling of effort conceives of it in terms of an even larger contribution from the United States. Yet the United States is already spending some 7 per cent of its national income on defence and perhaps 3 per cent upon foreign aid. How many European nations could gladly and easily accept the raising of their "cold war contribution" to ten per cent of their national income? The knowledge that the American effort would not fall much below $20 billion would be a tremendous reassurance to the rest of the free world. But it would entail corresponding sacrifices in Europe.

The composition of the contribution would also still have to be determined. It is, for instance, only after months of pressure that France has succeeded in persuading the United States to accept the local struggle in Indo-China as part of the [illegible] Communism: [illegible] unspent balan[illegible] Similar difficu[illegible] forward the [illegible] releases from t[illegible] should be cou[illegible] is the United [illegible] ties. There is [illegible] contribution of [illegible] the test of the percentage of national income, is by n[illegible] means adjusted to the policy of effectively poolin[illegible] western military resources. In the last week, a group o[illegible] eminent American academic leaders have publicly ques[illegible] tioned the basic strategic thinking of the United State[illegible] Government. They criticise its over-reliance upon th[illegible] atom bomb and upon long-range strategic bombing an[illegible] argue instead that ground forces, a tactical air force fo[illegible] the close support of troops on the ground and a concerte[illegible] effort to overcome the menace of the submarine ca[illegible] contribute far more to the effective defence of Europ[illegible] and the prevention of general war than can reliance upo[illegible] a single instrument of mass destruction. Such strateg[illegible] issues as these would not be settled by the mere settin[illegible] up of a joint "cold war fund." It would be a first ste[illegible] a first gesture towards the concept of co-operation an[illegible] pooled sovereignty. More far-reaching and more painf[illegible] sacrifices would still lie beyond.

It is for this reason that the London talks cannot b[illegible] expected to achieve immediate and sensational result[illegible] It is true that the inexorable pressure of Communi[illegible] expansion is driving the nations of the west into clos[illegible] and closer co-operation; yet the more nearly th[illegible] approach the point at which a genuine sacrifice[illegible] sovereignty is necessary—for instance, the changing[illegible] a whole strategic concept in order to suit the vital interes[illegible] of other powers—the more painful and difficult the pr[illegible] cess must seem. But at least a start can be made towar[illegible] the new concepts of pooled effort and joint strategy[illegible] for it is an illusion to think that the free nations st[illegible] have the luxury of choice. In isolation, they will lo[illegible] the cold war, in unity they can still win it. These a[illegible] nothing less are the stakes at the London talks.

New Policies for Malaya

IT is a very good thing that the Secretaries of State for the Colonies and for War are to visit Malaya. Their visit, of course, is long overdue; they will find themselves catching up with, not anticipating, a critical situation. For British fortunes in Malaya have now been deteriorating for some five months, and new and possibly sweeping decisions are needed to save the day. This must be no mere Whitsun interlude in departmental routine; it should be the next step towards instilling a new sense and purpose and decision into the Cabinet's deliberations on Malaya.

What will Mr Griffiths and Mr Strachey find in Malaya? What kind of recommendations on policy are the facts likely to suggest? They will find that, after twenty-three months of effort against the Communist guerrillas, the emergency has reached an alarming four[illegible] stage. The first stage was from June to Septemb[illegible] 1948; how grave it was, few realised at the tim[illegible] Thwarted in a large-scale attempt to bring the life[illegible] Singapore to a standstill by strikes, the Malayan Co[illegible] munist Party launched its campaign of terror in t[illegible] Federation at the rate of 250 incidents a month. T[illegible] second stage, however, brought a clear defeat for t[illegible] original Communist drive; special constables had beg[illegible] to be effectively organised by December and then t[illegible] Guards Brigade arrived. The third stage ran[illegible] November, 1949; it produced a steady improvement[illegible] the situation until at least September of last year, wh[illegible] incidents were down to 30 a month. The latest s[illegible] present stage is one of failure by the British; sin[illegible]

November, the number of monthly incidents has been creeping up again towards the worst peak of nearly two years ago. In spite of a great effort by troops, police and civilians, the morale of the terrorists has considerably improved and that of the loyal population has deteriorated—a trend which can end only in disaster.

The two Ministers will learn that more now depends on the Malayan Chinese than on any other single factor. As a community they are not anti-British, but they are not prepared to be pro-British to the extent of fighting and working against terrorists most of whom are Chinese too; few, for instance, joined in the "anti-bandit month" and almost no Chinese have enrolled in the police. Yet, until they do commit themselves to the British and Malay side, it is unlikely that a victorious peace can be won. For without the active help of the Chinese there can be no consolidation of ground cleared of guerrillas. The British, having cleared up a particular area—be it a small district in Negri Sembilan or a whole state like Johore—cannot hold it against the Communists, as they come infiltrating back, so long as the local Chinese population is apathetic and frightened. Yet there can clearly be no final victory until ground gained can be held. Indeed, each time that an area is not held it becomes harder to clear it next time. As a result of these simple but inescapable facts, the two Ministers will find more and more Europeans in Malaya losing heart, not because they lack courage—many of them have shown the utmost gallantry—but because they believe Malaya is being allowed to go by default.

*

These, then, are the broad outlines of the deteriorating picture which is reflected by the almost daily news of murder, assault and terror. What should be done to stop the rot and to make a return to order and confidence possible? There is no simple or single answer; if there were, the conscientious but disappointed heads of the Malayan administration would have found it long ago. There are, however, certain fresh lines of policy which could and should be adopted urgently both by Kuala Lumpur and by Whitehall. They fall into three categories—political, military and administrative. Of these the first is the most important, although the politician can make little headway unless the soldier and the official are also successful.

The vital necessity is to persuade the Malayan Chinese—either by word or deed—that when the struggle against the guerrillas is won, they will secure a reasonable position in the new state. There are two ways of doing this. One is to make the administration in the Federation look less biased in favour of the Malays. This bias has an easily explained origin in the past history of the country; for it was only in the later nineteen thirties that Chinese women began to appear in any numbers among the immigrants from China, thus for the first time turning many of them into permanent settlers instead of transient labourers and traders. But it also has roots in the feeling of the administration that it is hard to become more sympathetic to Chinese claims—which can only be ultimately satisfied at the expense of the more loyal Malays, on whose support British rule has, hitherto, been based—just at the moment when the Malays are proving their loyalty and the Chinese are sitting firmly on the fence. But nothing less than a new policy will now have the necessary effect. The new policy should not, of course, go to the other extreme of persuading the Malays that they are to be treated as an inferior race in their own country. But it must go far enough to give the Chinese a prospect of equal rights.

The second way of dealing with the political problem is to establish in some form, and at the earliest possible moment, the proposed new Malayan citizenship. This means trying to secure sufficient agreement in the present Communities Liaison Committee—in which Malays, Chinese and Indians have been meeting under the chairmanship of Mr Malcolm MacDonald—to enable the administration to proceed with popular support. This whole topic is, of course, political dynamite; but so is the guerrilla challenge. And now that the Malay leaders admit in principle that the Chinese must be given a stake in the country, it should be possible to secure agreement. The fear of Chinese immigration is much less than it was, and so long as "Chinatown"—Singapore—continues to be excluded from the Federation, the Malay leaders would probably accept a definition of citizenship, based on birth inside Malaya, under which 95 per cent of the Malays would become Malayan citizens immediately, as well as 40 per cent of the Chinese and 60 per cent of the Indians. A dramatic gesture to the Chinese now, on this basis, with the prospect of a constantly improving percentage of citizenship in the future, would be wiser than the present hesitation.

Political conciliation alone is not enough. The Chinese have to be convinced that the British will beat the guerrillas, once for all, and that the southward expansion of Communism from China will be resisted. This is the job of the military and police, and their need is for more troops and better equipment. How to supply more

troops, while more police are being recruited and trained, will doubtless perplex Mr Strachey ; but the whole question should be re-examined in the light of recent setbacks, when the Minister returns to London. As for the inadequate supply of equipment to the troops, the facts have long been known and haggled over in the War Office. The five main types of material long ago asked for are armoured vehicles, radio sets for the police, quick-firing carbines instead of rifles, earth-moving equipment to make jeep tracks through the jungle—particularly on the appallingly inaccessible Siamese frontier—and more jeeps, or British land-rovers. It is Mr Strachey's job to see that these are made available quickly.

The Government of the Federation is, of course, wrestling with unusual and intricate difficulties and needs all the help that London can give ; but there are several ways in which its effort might be strengthened. For example, there is urgent need to improve the efficiency of the police, which consists almost entirely of Malays. Chinese recruits are required to deal with the Chinese community, but they will not even consider joining at the present rates of pay, which will have to be raised. To offset this, it should be possible to curtail expenditure for a time on routine items such as roads and in such departments as those dealing with forestry and survey. Some of these activities are going on as if all were normal in Malaya, and without useful results. If these departments were made to release staff, many jobs directly concerned with the emergency could be better done—for example, the task of administering effectively those areas cleared of terrorists by the army, so that the population feels the power of the law—both to punish and protect. There is also the vast problem—scarcely touched as yet—of bringing squatter villages, pending resettlement of their inhabitants elsewhere, within the scope of the law.

Quick and firm decisions on all these matters will require a fresh and resolute spirit in London and Kuala Lumpur. What is at stake is not only one of the west's richest sources of raw materials, but the freedom and prosperity of over five million British subjects. How they are to be protected from Communism, how they are brought up to dominion status and self-government in the face of the challenge of the rival system, will be watched all through the Commonwealth and Asia. Malaya is for Mr Attlee and his colleagues the test case in the cold war which they refused for so long to take seriously.

The London Dockers—I

Change and Tradition

THERE is no doubt that public opinion is getting very impatient with the London dockers. The strike which ended two weeks ago was the fourth major stoppage in the docks within two years. The conditions of work of the dockers have been immeasurably improved in the past decade. The curse of casual labour has been lifted from them and their average earnings have greatly increased. For these benefits to the dockers the community has paid in a greatly increased cost of moving goods through the docks. This is a most sensitive nerve of the national economy, the more so since it directly affects the terms of trade and Britain's competitive power in the world—that is, it bears immediately both on the standard of living and on the volume of employment. What has the community bought at this high price ? The record would seem to answer that it has bought lowered efficiency and a chronic tendency to stoppages. It is hardly surprising that there are voices to be heard arguing that if these are the results of trying to make the dockers happy, the community could hardly get worse work out of them, and would certainly get it more cheaply, by going back to the old unregenerate policy of letting them be unhappy.

The dockers and their leaders would do well not to ignore completely the economics of their industry. The day may not be very far off when the welfare state will have to pay its way in real earnest, and then cold facts will drive home the proposition that the docks do not exist to serve the purpose of a welfare centre, but to perform an economic function, which the national interest demands shall be performed at the lowest real cost and with the fewest interruptions that can be contrived. The basic economics of the docks will not be further pursued in this article or its intended successor, both of which are concerned with the causes of the current unrest in the docks. But considerations of the cost of operating the docks should not be wholly forgotten ; they should remain as a background to every discussion of labour relations.

Three facts emerge from an examination of the dock strikes. The first is that none of the major strikes, with the possible exception of the strike over the handling of a cargo of zinc oxide in 1948, has been for higher pay or better conditions ; they have all been strikes over what might be called dock politics. Secondly, most of the grievances and all the inter-union disputes which have caused the strikes originate in London. Dockers at other ports are for the most part contented with their wages and conditions ; on the few occasions on which they have struck work, the strike has generally been in sympathy with the London dockers rather than for any grievance of their own. The third fact is the influence of the Communists. Only a small minority of the dockers are members of the Communist party or, indeed, sympathetic towards Communism, but this minority has played a prominent part in each major strike. They provide the agitators and in some cases the unofficial strike leaders. The Communists, however, would be powerless if there were no grievances or disputes for them to exploit.

The work of discharging and loading ships in London, as in any other port, fluctuates according to the flow of shipping into and out of the docks. It is impossible to control the volume of traffic, and it is therefore an inseparable fact of dock labour that the work is casual and that the number of dockers employed varies enormously from one day to the next.

Before the introduction of the interim dock labour scheme in 1941, casual work was handled, logically enough, by casual labour. The economic hardship which was suffered by the dockers is well enough known, but it is perhaps not quite so well known that this hardship led to the growth of a number of practices on the part of the dockers designed to protect themselves against the worst effects of casual labour. Those practices have now become deeply embedded in the London dockers' way of life, and dockers cling to them with a blind, unreasoning faith, resenting bitterly any attempt to abolish them. In many cases they no longer know why the practices are carried out ; their stock answer to any question about them is: " It's history "—no other reason is given.

This would not matter were it not for the fact that a number of the traditional practices, because they were designed to deal with situations which were dominated by the fact of casual labour, militate against the decasualisation of labour and the present dock labour scheme. It is, for instance, a cardinal principle of the scheme and of the agreements which are incorporated with it that all disputes should first be submitted to a port conciliation committee or sub-committee. The committees have a very high reputation for fair and exceptionally quick settlements—most disputes are dealt with on the day they arise—and in the course of the twenty-five years or so of their existence they have earned the respect of dockers and employers alike. On the other hand, the traditional practice of the dockers is that if any group of dockers declare a strike, all dockers in that dock will immediately follow suit without question. Their boast is that they strike first and only ask why when the strike is over. It needs only a few irresponsible men to call a strike, therefore, for most of the men in that dock to come out—in spite of the scheme and in spite of the principle of conciliation which they themselves supported.

Again, it is a part of the scheme that, in order to facilitate a proper distribution of labour, dockers should " call on " at central call stands where they can make their contracts with individual employers or " prove attendance " to the Dock Labour Board officials. But in the Royal group of docks, where some 6,000 men are employed, it has long been the traditional practice of the stevedores—that is, members of the National Amalgamated Stevedores' and Dockers' Union (the terms " stevedore " and " docker " refer to the different unions to which the men belong ; there is no other real difference between them)—to call on *outside* one particular dock gate. The rest of the dockers—the majority—call on inside the dock gates, which was the obvious place for the central call stand. The stevedores, however, refused categorically to change the place of their call on. Moreover, they have also for long been accustomed to accepting their contracts for work from " pushers " ; these are experienced stevedores who engage men on behalf of the employers. The " pushers " do not fit in well with the scheme and are now more or less redundant, but the stevedores still insist on retaining them.

Yet again, the scheme provides that dockers must report for work every day—unless they are ill, on holiday or otherwise excused—if they wish to remain on the register of dockers and to draw their guaranteed minimum wage of £4 8s. a week. Some such provision was obviously essential, but most dockers prefer to work hard for four or five days on end, during which, according to the present system of piece rates, they earn enough for the week, and then to take the next two or three days off. Many of them have also developed preferences for working for particular shipping companies ; if none of the ships of that particular company is in dock, they prefer to refuse other work so as not to miss one of their ships when one does come in. The necessity, under the scheme, to prove attendance every day makes it difficult to follow either of these practices. Decasualisation, bringing with it, as it does, permanent and constant employment, has not proved the unmixed blessing it was originally thought it would be.

It can be argued that with the security, the high wages (one group of dockers at Tilbury have earned £21 a week each ; the average wage for the whole country is £8 13s. a week) and the welfare benefits that the dockers have received under the dock labour scheme there can be no excuse for retaining practices which have been outmoded. Nor, it may also be argued, can there be any good reason for discontent. There is no doubt whatsoever that the dockers are better off today than their early leaders ever dreamed of.

*

The answer to the first argument is that the practices, however wrong they may be, are traditional and cannot be changed overnight. The present dock labour scheme was imposed on the country at great speed ; much of the administrative machinery and of the policy of the National Dock Labour Board has had to be created after instead of before the scheme came into force. The scheme itself is far from perfect ; in the words of the report of the National Dock Labour Board for 1947-49: " It is often vague where precision would have been valuable . . . ; it is rigid where flexibility would have been useful . . . ; it is precise where a generalisation would have been more realistic." As amendments are made and as the dockers come to realise the responsibilities which they themselves now bear, the traditional practices will, one must hope, gradually fall into disuse.

The answer to the second argument is that what discontent there is—and it is neither so widespread nor so deep as has been made out—is largely artificial. It is chiefly the by-product of dock politics. The majority of the dockers in London—roughly 18,000 out of 27,000 men—belong to the Transport and General Workers' Union, of which they form part of the national dockers section. Some 7,000 dockers, calling themselves stevedores, belong to the National Amalgamated Stevedores' and Dockers' Union. The stevedores regard themselves as the *élite* of the dockers in London—their representation elsewhere is negligible—and they refused to follow the rest of the dockers into the embrace of the Transport and General Workers' Union. Most dockers in every port form a closed community, but the stevedores in London have closed their ranks more tightly than any other section of workers in Britain. They recruit only the sons of stevedores, and among them the adherence to tradition is almost a mania. They resent the size and power of the Transport and General Workers' Union, and during the last few years, under the leadership of a man whose political leanings are towards the extreme left, they have struggled not so much to overthrow the larger union as to assert their independence. The majority of stevedores are not Communists, nor are there any grounds for believing them to be sympathetic towards Communism, but, with chips on their shoulders and with an innate readiness to strike, they are easily persuaded by the few Communists and agitators among them to take action that helps the Communist cause.

The dockers' section of the Transport and General Workers' Union, on the other hand, has now achieved its major objects. It has no axe to grind and it is no longer a crusading force fighting for the dockers for the simple reason that it has won its battle. The union as a whole

was designed primarily to deal with employers and not to take up arms in a political cause except in the sense of opposing the politics of the employers. As far as the dockers were concerned, the introduction of the dock labour scheme and the victory of the Labour party at the polls marked an end, temporarily at least, to their struggles. The result has been that very few dockers now take an interest in union matters. Branch meetings are poorly attended and union officials experience much difficulty in persuading the men to listen to what they have to say. It is not so much that the big union is out of touch with the dockers ; it is rather that the dockers do not yet realise that they have another battle on their hands and that the union needs their active support as much as it did in the prewar years.

It would be a mistake, however, to regard the situation as a state of war between the stevedores and the Transport and General Workers' Union. The friction between them does not extend to working at the docks. There is no resentment on the part of stevedores, for instance, if dockers are chosen for a particular job in preference to the stevedores or vice versa. The stevedores are chiefly concerned with preserving their independence—which to them means their traditional practices—and friction between the two unions only breaks out when stevedores try to get support from the dockers for their illegal strikes. The task of the dockers' leaders in the big union is, in the first instance, to keep their members from following the stevedores, who have been in the vanguard of every major strike in recent years, and second, to beat the Communists on their own ground.

The need for the trade union leaders to reassert their authority and their leadership and the need for a similar assertion of authority on the part of the employers raises the question of discipline in the docks. Who, in fact, is or ought to be the boss ?

(To be continued)

Featherbed Farming ?

THE circumstances of Mr Stanley Evans's abrupt departure from the Ministry of Food have focused public attention on the costs of British agricultural production. It is an opportune moment for scrutinising this subject afresh. The Government's decision to fix the cost of the food subsidies at £410 million means that there is now a direct relation between the prices paid to British farmers and the price of food in the shops. Every rise, or fall, in the costs of agricultural production will make its mark on the cost of living. Moreover, if British agriculture expands much further and the proportion of home-produced food increases, the impact of its costs on the national economy will become correspondingly greater.

Discussion of the costs of British agriculture is apt to become confused by emotional interchanges on the question of the British farmers' " efficiency " and by misunderstandings about the operation of the food subsidies. The food subsidies are regarded by the farmers' representatives as a form of aid to the consumer, the exclusive aim of which is to keep down the cost of living. On the other hand, critics of the government's agricultural policy, such as Mr Evans, tend to talk as if their main purpose was to bolster inefficient agricultural producers. In point of fact, the food subsidies operate to assist both producers and consumers. There is no necessary relationship between the price at which the Government purchases food from the farmer and the other—and much lower—price at which it authorises the sale of the food to the consumer. The deficit on the whole transaction is simply charged to the taxpayer. The producer, however, has the benefit of fixed guaranteed prices calculated so as to allow him a " reasonable " profit (irrespective of whether or not such prices would be forthcoming on a free market); and the consumer has the benefit of a supply of food at considerably below cost price.

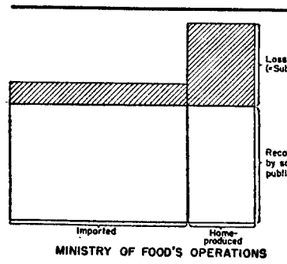
The original and the main purpose of the food subsidies has been to keep down the cost of living. Any British farmer, however, who believes that they are purely " consumer subsidies " might reflect what would happen if the subsidies were to be removed and if his produce were marketed at its cost price. The result would be a very sharp rise in the market price of home grown food. The retail price of milk, for instance (leaving out of account the operation of the welfare schemes) would rise by about 25 per cent, at which level there would certainly be a heavy decline in demand. Milk producers would then be forced either to accept a sharp cut in their prices in order to sell the same amount of milk or else to scale down their output. The Government has deliberately encouraged a high level of milk production to protect the health of the nation, and a complete reversal of this policy would be fair neither to producers nor to consumers. But the point should not be lost on British farmers, three-quarters of whom are now heavily dependent on the monthly milk cheque.

The second point to bear in mind when considering the Government's agricultural policy is that the cost of home-grown food now compares unfavourably with that of imported food. In the last financial year, about £277 million, or over 60 per cent, of the Ministry of Food's trading losses arose on home-grown food. This is a higher proportion than in previous years, although home output has also been higher. In addition, British farmers received another £26 million in direct subsidies. The pattern of expenditure in the coming year is expected to be similar. The Ministry's anticipated loss on home-produced food is put at £246 million, or 43.5 per cent of the actual cost to the Ministry of procuring that food, that on imported food at £164 million or 16.5 per cent of actual cost. (These figures—of which some more details are given in a Business Note on page 1084 are illustrated in the diagram opposite). In other words, the subsidy element is very much greater in the case of home-produced food ; indeed (when direct subsidies to farmers are added in) it approaches half the total cost of procurement.

These figures must not be used to prove too much. Retail prices can be varied at will by the Ministry of Food, and the amount of subsidy on any particular item reflects not only its cost of procurement, but official manipulations of the cost of living index. Moreover, British agriculture is incurring additional costs at the present time because of the expansion programme. British livestock producers have exceptional difficulties over the cost and quality of feeding stuffs, which partly justify the payment of a higher price. But when all these points have been conceded, it remains the case that £275 million or thereabouts is a large sum for the nation to pay, in addition to what it pays in the shops, in respect of about 30 per cent of its calories.

*

What deductions can be drawn from these figures ? Is it, in fact, the case that in the interests of high agricultural output, the government has made the farming community into an unduly protected and privileged caste ? At first sight the answer is undoubtedly that it has. The figures relating to farm income in the National Income White Paper can be regarded as no more than an intelligent guess, but for what they are worth, they suggest that " income from farming " has increased almost five-fold since before the war—from £60 million in 1938 to £283 million in 1949. There is little doubt that farmers as a group have registered much larger relative gains in their gross earnings than any other section of the community—including the farm workers, whose wages have trebled.



Against this, it is, however, argued that the return from farming before the war was unfairly small. Moreover the National Farmers' Union have pointed out that the average income per farm last year was no more than £750, representing the reward of the manual and managerial labour of the farmer and his family and the return on their capital. However, this average figure is heavily weighted downwards by the large number of small farmers, whose way of life and financial expectations are closer in many ways to those of the farm worker than of the farmer-employer. The average income of those farmers (about a quarter of the total number) whose holdings exceed 100 acres is much higher than the figure quoted above. A survey of the finances of medium and large farms in the West Country for 1948-49 showed an average profit of £1,410.

But it is impossible to say whether or not farming profits are " excessive " from a mere consideration of such statistics as are available. Good profits are quite consistent with efficient production—indeed, under competitive conditions, they are indicative of it. Certainly the present level of farming profitability would not seem unreasonable in an efficient industry with a high turnover and a low production cost per unit of output. The difficulty is to decide whether, after ten years of direct Government stimulus and protection from foreign competition, there is any relation between farming profits and farming efficiency.

As a result of the subsidies and of guaranteed markets the British farmer has lost direct contact with his customers. He no longer has to concentrate on producing what the consumer wants at a price which can be afforded. The Government, as Mr Morrison affirmed recently, will do all his planning for him. He receives a guaranteed price, settled well in advance, for almost the whole of his output, and its disposal is not his concern. In addition, he is actually in less danger than before the war of being ejected for bad farming. The power of ejection is now wielded not by his landlord, but by the county agricultural committee, which is, by comparison, an easy taskmaster.

If this is not a fair definition of feather-bedding, it is hard to see what would be. Before the war, the British farmer suffered from too much insecurity. Today his position is precisely the opposite. It is the complete absence of competition which makes it so hard to judge his efficiency. If he achieves a high output or farms good land the chances are that he will make high profits. If he prefers to work below his full efficiency, he will still be assured of a reasonable livelihood. Farming is still, of course, hard uphill work for the many who occupy poor land or possess inadequate capital, and it is the needs of this considerable group which can be used to justify the present level of farm prices. But what the nation needs is not so much more production off the marginal farm, as higher productivity —that is, lower costs per unit—all round. It is the already prosperous farm on good land which tends to offer most scope for new investment and increased output. The social aim of helping the poorer farmers should not be confused with the economic aim of getting a higher output as cheaply as possible. The confusion between these two aims is liable to cost the nation dear.

The defects of the Government's agricultural policy will become more glaring as the discrepancy between the price of home and imported food continues to grow and as the limits of consumer demand begin to appear. The gap between the price of home-grown food paid to farmers and that charged to consumers is already fantastically wide. The block accounting of the food subsidies has tended to disguise this point. When once it is realised, it may be wondered whether the predominantly urban and industrial electorate of Britain will view with complacency the prospect of paying year after year in taxes a large sum of money to induce the British farmer to grow food at costs far above the prices which the British consumer will willingly pay. There is no doubt that the British nation as a community is now paying more for its food than, as individuals, it would freely offer. It thinks it is getting its food cheap ; but it is really paying very dearly for it, and when this fact becomes apparent, the willingness to continue may vanish. It is by no means entirely the fault of the farming community that the costs of British agricultural production are so excessive. The Government must bear a large share of the blame, since it still insists upon planning production and consumption in watertight compartments—that is, in settling farm prices by reference to the production cost of individual items, and retail prices by reference to its own cost of living index. Before the whole subject of agricultural policy becomes involved in an acrimonious argument which confuses social and economic policy, the Government should consider whether it should not reshape its policy to encourage, not production at all costs, but production at low costs.

MINISTRY OF FOOD'S OPERATIONS

The total area of each column, shaded and unshaded together, is proportional to the total cost to the Ministry of acquiring imported and home-produced food respectively. The unshaded areas are proportional to the amounts recouped by sale. The shaded areas, therefore, represent the subsidy element.

NOTES OF THE WEEK

"A Bold New Policy"

For two years at least, Western Europe has had certain slogans dinned into its ears. Such phrases as "European integration," "the need to draw Germany into the community of the west," or "the transcending of national frontiers" have been done to death by journalists, politicians and public relations officers; and, since nothing apparently came of all the talk, a growing cynicism settled around the whole subject.

Now, however, the French Foreign Minister, M. Schuman, has injected the stuff of reality into the familiar clichés. In a direct gesture to the Germans he has offered to place the coal and steel industries of France with those of Germany, under a common control. The aim of the proposed authority —which would consist of independent persons appointed by governments—would be to modernise the coal and steel industries, increase their productivity, allocate supplies to both markets on an equal basis (in other words, at uniform prices) and develop the export trade. The movement of iron and steel would be freed of all import duties between the two countries, and freight rates would be equalised. Another purpose of the authority would be the creation of similar working conditions for the whole labour force. The authority would be open to the participation of other European coal and steel producers, provided they were prepared to make similar concessions. To the charge that such an organisation is perilously like the old cartels, M. Schuman would reply that it is no part of its aim to restrict output, maintain high prices or secure monopoly control of each home market.

The charge will, of course, be made. It has not escaped public attention that, since July last year, German steel output has been higher than that of France and its prices considerably lower; nor is it to be supposed that French and German industrialists have overlooked the likelihood of a steel surplus in Europe—there are already the beginnings of a coal surplus. But it is no criticism of a political proposal to say that it is based on solid economic interest. On the contrary it is only when political vision starts from a clear understanding of economic reality that a workable policy is likely to emerge. No one can deny that the French Government has shown vision in this gesture towards the Germans. M. Schuman's offer, by proposing restrictions on French sovereignty and interests, can create a genuinely new situation and break up the stalemate in western Europe; that is the meaning of the provision that the "actual application" of the agreement would be assisted by an agreed "arbitrator." The technical basis of the offer will need to be examined carefully, but there is every reason to welcome the bold political and psychological initiative which it represents.

There is no purpose in cavilling at the somewhat startling timing of M. Schuman's gesture. Within a few hours of Mr Acheson's departure from Paris and on the eve of vital talks in London, the French took an entirely separate and unexpected initiative. The Americans welcome it, but the British reaction is at the time of writing reserved. Yet the chief need is to get European opinion into a new mood and above all to put an end to the sullen discontent prevailing at Bonn. A direct and spontaneous offer such as the French have made has more power to bring about a change of mood than a carefully considered and cautiously worded communique, and a sequence of committees and clever minutes in which ideas wilt and die.

* * *

Conservatives and Liberals

The shadowy corners of the Palace of Westminster continue to produce rumours of negotiations between the Liberal and Conservative parties. Mr Churchill has made no secret of his desire to secure an agreement with the Liberals at the earliest possible moment, but secrecy surrounds the means he is employing to secure this end. Confusion has been further confounded by the fact that Lord Beaverbrook appears to have taken upon himself the role of publicity agent for the deal, with the result that the Liberals have had a blaze of publicity in the popular press which the available information by no means justifies. Mr Churchill, prompted by the outburst of speculation, issued a statement early this week affirming that there has been "no question of negotiations at the present stage," and there is no reason to doubt the accuracy of this. The committee of five which he has appointed as a "study group," under Mr R. A. Butler, has, however, all the appearance of a body standing by ready to begin negotiations if some basis for them can be established with representative Liberals.

But the committee may also have been designed to prepare the ground within the Conservative party for such an agreement. This might be a very difficult job since on this issue Mr Churchill cannot, at any rate at present, count on unanimous support from within his own party. At recent meetings of the 1922 Committee influential and outspoken members such as Mr Quintin Hogg have made it clear that they will have nothing to do with a Tory promise to undertake electoral reform which, if one can judge from Liberal speeches, would have to be an essential part of any agreement. And there are other and more influential figures within the party leadership who hold the same view. There is also a strong body of opinion within the Tory party which would base its opposition to an agreement that included any concessions on the belief that the Liberals have been brought to the edge of destruction as a party, and that one more election might see the end of them as irritable contenders for the anti-Socialist vote. This view is, not unnaturally, most strongly held by those Tory candidates whose withdrawal from marginal constituencies might be the price of an agreement with the Liberals.

*

The Conservatives would be foolish to imagine that the leaders of the Liberal party will easily consent to an electoral compact or any more comprehensive agreement with them. Quite apart from the political and ideological cleavages within the Liberal parliamentary party which such an arrangement would create, there can be few attractions for either side in a mere arrangement not to oppose each other in constituencies. In the first place, there is no certainty that, if such arrangement were concluded, the Liberal leaders could deliver the Liberal vote to the Tory candidate in constituencies where it was agreed not to run a Liberal candidate. Secondly, such an arrangement would make the Liberal party into a stepbrother of the National Liberal Party, a mere hanger-on of the Tories and dependent upon their goodwill for its continued representation in Parliament. If they are wise the Liberal leaders will enter into only one form of agreement—a promise to advise Liberals to support the Conservatives at the polls if the Tory party has given a binding promise to introduce the alternative vote as its first measure of legislation upon forming a government.

Can Wages be Planned?

The General Council of the TUC is once again considering the problem of wages stabilisation, and once again it is difficult to see that any practical conclusions will emerge from its deliberations. Most of the trade union leaders are anxious that the policy of restraining general demands should continue, since they sincerely believe in the economic necessity of the policy, and since they have pledged their personal influence to its support. For instance, the recent outburst by Mr Figgins of the National Union of Railwaymen against the policy does not represent the majority view of his fellow trade union leaders. But trade union leaders are tribunes not consuls, and they have only a very limited ability to withstand the pressure of their own rank and file.

The TUC in the person of its general secretary, Sir Vincent Tewson, has adopted one new line of approach which is to declare, Canute-like, that there is no evidence that the policy of wage stabilisation is breaking down. But the facts do not support him. The Agricultural Workers' Union must now be added to the list of unions with wage demands, since at its conference last week it decided to press for a "substantial increase" in minimum rates. Wage talks between the National Union of Mineworkers and the National Coal Board opened this week; the railwaymen's claim is still unsettled; the Confederation of Engineering and Shipbuilding Unions is at the moment issuing its ballot papers on strike action or arbitration to one and a quarter million workers; and there is unrest among teachers and civil servants. Moreover, certain rises in minimum wage rates have recently occurred, notably in the pottery and gas industries.

The silence of Transport House in face of the obvious need for a positive policy has had the effect of creating profound irritation among the Parliamentary Labour party with the massive complacency of the TUC. It is true that the Labour members who advocate the governmental planning of wage rates and a drastic overhaul of the industrial wage structure are for the most part the "intellectuals," that is to say those who do not have to seek the periodic approval of a trades union conference. It is also true that, mixed up with some intelligent heart searching as to how the demands of labour can be prevented from wrecking national recovery, there are signs of a purely totalitarian desire to use the coming crisis over wages as an opportunity for vastly extending the power of the state over the life and liberty of the individual. It is possible that the Chancellor and his political associates at the Treasury might look with favour upon a wages policy which allocated rewards upon a basis of productive contribution only (or rather upon the rough guesses of the statisticians about the contributions of different forms of labour). But Mr Isaacs, speaking more as a trade unionist than as a minister, made it clear during the adjournment debate on Monday that he would not be a party to direct government negotiation in wage fixing, and that he regarded his ministry as the provider of a common service to employers and unions —a convenient but lazy interpretation of its function in view of the doubts, the difficulties and the conflicts which are developing on all sides.

More Money for Burma

Thakin Nu, the Prime Minister of Burma, arrived in London on Tuesday to attend the memorial service in Westminster Abbey for those killed in Burma during the war. As head of the government of a state which, since then, has chosen to sever its connection with the Commonwealth, his gesture is singularly delicate and friendly. The fact, however, that the Burmese Premier is expected to stay on in London for several days afterwards has another aspect. His prolonged absence at a time when his country is still in grave trouble is a reminder that Thakin Nu's position in the political life of Burma is that of a respectable and respected figurehead, not an active leader. Since he is one of the few men in Rangoon who are at all easily accessible to the outside world, this partly explains why the Burmese Government sometimes gives the impression of being baffling and difficult to deal with.

In the House of Commons this week, the debate on Britain's share (£3,750,000) of the Commonwealth's loan of £6,000,000 to Burma—India, Pakistan, Australia and Ceylon are putting up the balance—revealed yet another aspect of Burmese affairs, about which public opinion in this country proved itself confused and disturbed. The loan is probably just worth making—although there was some doubt right up to the last moment whether the Burmese would accept aid which they originally asked for. They were very disappointed that their original hints about £20 million had been whittled down to £6,000,000. This smaller figure will nevertheless suffice to stave off for a year a crisis in the Rangoon Government's accounts. And since there is no sign of any alternative government which would strike more effectively at the Communist menace in Burma, it is on balance just preferable that Thakin Nu's struggling ministry should be helped than that it should not be. But the time is certainly coming when the Burmese will no longer be entitled to have their cake and eat it. They offer the minimum of co-operation to the British and continue to revile and harry British business firms, yet always turn instinctively and confidently to London whenever they get into difficulties. This loan should be the last of a long line of special favours granted to Burma without getting anything in return.

What has been shocking on the British side, however, has been the interminable delay. Rangoon made the first approach last October. It received no proper answer at all until March. The delay has been due partly to the cumbrous machinery for consultation in the Commonwealth, and partly to the difficulty of deciding who would participate and what their contributions should be. New Zealand (not now a participant), Pakistan and Ceylon have been the main culprits. But the Commonwealth will have to overhaul its machinery very thoroughly if, as it now increasingly and rightly proposes, it is to play an effective diplomatic part in world politics by acting as a coherent unit.

Will Formosa be Held?

The island of Hainan fell to the Chinese Communists with startling ease, and there are signs that the assault on Formosa, the last stronghold of the Nationalist government, may not be delayed much longer. The military problem of an invasion of Formosa is how to get an army across 100 miles of open sea without naval or air superiority—which has hitherto been on the side of the Nationalists. The obvious answer is for Communist China to get some suitable assistance from the power with which it recently concluded a treaty of military alliance. In view of the aid which the Soviet Union gave to the Chinese Communists when it was still in diplomatic relations with the government of Chiang Kai-shek, it can hardly be supposed that it would have scruples about intervention now that not only the Russians but also the British have given *de jure* recognition to Mao's regime.

According to information gathered by an American correspondent in Hongkong, the Russians are now building up a Chinese Communist air force to go into action against the Nationalists. By the end of April—it is reported—about thirty Russian jet aircraft had arrived in the Shanghai area; they are said to be of an up-to-date type comparable to the new American Thunderjet and far superior in performance to the old P51 Mustangs which are the best aircraft on the Nationalist side. Intensive training of Chinese Communist airmen by Russians is said to be going on in Manchuria. It is, of course, impossible to assess the value of such reports, and it may be that the Communists will prefer to rely on a deterioration of morale among Nationalist troops and some attempt at "self-liberation" by the Formosans.

If such Russian aid is in fact furnished and if the Americans do nothing more to give counter-aid to the Nationalists,

hen Formosa is doomed, for command of the air will pass o the Communist side. The possibility has to be reckoned vith that active participation by Russian aircraft on the Communist side might lead Chiang Kai-shek into declaring himself at war with the Soviet Union, which would still further complicate the Asian situation. As for the Americans, since he publication of their White Paper last year, no real support or Chiang Kai-shek can be expected from official Washington, although the American Government refuses to give diplomatic recognition to the Chinese Communists or to allow the seating of their delegates at Lake Success. So it

may be that the advocates of recognition are waiting hopefully for the fall of the last anti-Communist bastion in China, so that more blame can be heaped on Chiang Kai-shek and American public opinion can at last be persuaded that there is no alternative to recognising Mao.

Taking Stock in Peking

A speech delivered on April 29th to a meeting of Chinese Communist cadres by Mr Liu Shao-chi, the powerful Vice-Chairman of the party, was of exceptional importance. Although it was not so secret as to be withheld from broadcasting on the Peking radio, its purpose was clearly practical exhortation to party members rather than generalisation and ideological polemics. Self-congratulation was certainly not absent, but there were a number of admissions showing that the new regime is beset with serious difficulties. Even on the military side it was emphasised that the civil war was far from being over, as the "People's Liberation Army" had not only to capture Formosa and "advance into Tibet," but also to "wipe out numerous Kuomintang bandits in a number of newly liberated areas in the rear." Mr Liu frankly recognised that there was a serious economic situation and that Communist methods of administration were causing considerable discontent. The best prospect he could hold out was

> a gradual improvement in our economic situation after a short period of difficulties and a fundamental change for the better in two or three years' time.

Mr Liu admitted that many workers had become unemployed, but claimed that this was an inevitable consequence of the transition from a period of inflation to one of budgetary balance and price stabilisation. He urged employers and employed workers to contribute to an unemployment relief fund, and tried to console the unemployed with the assertion that this was the first Chinese Government to concern itself with relief. With regard to the peasants, he said that the Government had to be "very strict" in the collection of the grain tax, as China's economic recovery depended on it, and warned against a "disorderly" application of the principle of land reform; the people, he said, must not be too "impatient," but must carry it out "step by step, stage by stage and area by area." It would be soon enough if it were "generally implemented" by the end of another three years. Meanwhile, this year's food shortage would be overcome "without a scrap of relief grain from abroad"; American offers to help relieve famine would be rejected.

In the collection of taxes and the sale (at high pressure) of "victory bonds," Mr Liu said Communist officials had shown such serious shortcomings that, unless there was an improvement, the party would become "estranged from the masses." Comrades had been enforcing orders without heed to actual conditions and had shown "unwillingness to consult local people in a humble spirit." Totalitarian leaders often talk like this when they find things are going wrong, and Mr Liu is no doubt quite sincere in calling for more "humility." But a dictatorship does not breed humility in its officials, except towards their superiors.

* * *

An "Experiment in Freedom"

A relaxation of certain controls has been announced by the Minister of Town and Country Planning. In future a householder may extend his house by 10 per cent of its cubic content, up to a limit of 4,000 cubic feet, without having first to seek the permission of the planning authorities. Any enlargement within these limits is already free from development charge. The same concession is made to factory extensions, within an upper limit of 5,000 square feet of floor area. In addition, the erection of farm buildings has been freed from planning control, save in three of the proposed National Parks where the farmer must continue to inform the local authority of his building projects. This exception is somewhat illogical. The merit of the National Parks is their natural beauty. It is the more civilised parts of the English countryside which need protection against unsightly building.

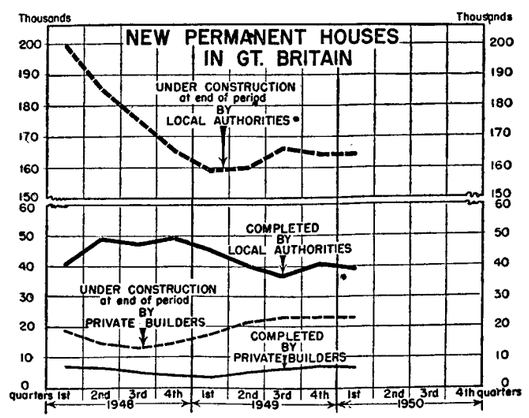
Any simplification of planning control is to be welcomed—although Dr Dalton chilled the spines of his hearers by describing these pieces of administrative commonsense as an "experiment in freedom." The ordinary citizen is tired of having his modest attempt to build a garage or store closely supervised while public bodies desolate the countryside with complete impunity. The latest example is the proposal of the Ministry of Fuel and Power to appropriate land in the Wyre forest in Worcestershire in order to reach its target for open-cast coal, while at the same time collieries are being closed in the neighbourhood for reasons of economy. The Minister has declared his intention to reduce the volume of planning controls whilst insisting that "planning should be firmly applied in important cases." It is undoubtedly the right policy; but perhaps Dr Dalton has not yet realised that nearly all the "important cases" arise from the decisions of his ministerial colleagues. His own ministry is too weak to keep the real offenders in order—which leaves it with little to do but bully the private citizen.

* * *

No Change for the Civil Service

Mr Attlee replied last week to the letter addressed to him in March by the staff side of the Civil Service National Whitley Council. He made it clear that he concedes no grounds in resisting the claims for higher salaries in the civil service. The staff side have now requested Mr Attlee to receive a deputation, but even if the Prime Minister agrees

to do so it is unlikely that it will be able to make him change his mind.



The two main contentions of the staff side are that the Government's policy of wage restraint is being applied more strictly to the civil service than elsewhere and secondly that the Arbitration Tribunal has been enjoined "not to exercise their functions impartially on the merits of the cases before them, but to reject them all automatically in obedience to Government policy." The Prime Minister's reply rejects the first on the general and somewhat dubious ground that restraint has been observed outside as well as inside the service. On the second point he reaffirms the independence of the tribunal. In the letter this is correct; in reality there can be no tribunal which has a more difficult task in combining impartiality and public duty, or is under greater direct pressure to adhere to Government policy.

It seems likely that this state of concealed warfare will continue for the time being. The senior ranks of the civil service will not presumably embark upon an open clash with their masters, although they have a stronger case than almost any other grade. Lower down the staff associations are likely to await some future external pretext before they again press their claims. The only immediate victory which the staff side has gained is the withdrawal by the Prime Minister of the statement by a Treasury official at the recent hearing before the tribunal that the Treasury were not prepared to allow any claims to be discussed which had been made after September, 1949.

Private House Building Again

In his budget speech the Chancellor announced that the annual housing target would be restored to 200,000 houses from the figure of 175,000 to which it was reduced last autumn. Last week Mr Bevan announced that licences to owner-occupiers would also return to their previous ratio of one in five. Nominally the policy has been restored to that obtaining last year. But the statement was couched in sufficiently general terms to enable a change of policy to be made in the future without creating too much atten-

tion. Mr Bevan might possibly have been hinting that he may be prepared for a change of emphasis in favour of the owner-occupier. It may be that the necessity to lessen the burden on both ratepayers and taxpayers is exerting its influence. Owner-occupiers, it must be remembered, build only at their own expense. It is to be hoped that before long Mr Bevan will be willing to go a step further in encouraging the owner-occupier. It is certain that he will be under pressure to do so from both the very rich local authorities where there is a high proportion of would-be owner-occupiers, and from the poorest ones who can no longer afford to incur an increasing bill for rate subsidies.

Meanwhile the quarterly housing returns* show that the changes in the housing target were anticipated well in advance—or that the cut imposed in the autumn was only nominal in England and Wales; there the number of houses under construction has risen markedly since September, 1949. The fact that this rise is not visible in the diagram above is due to efforts of the Scottish housing authorities to get their own programmes into balance and to increase the rate of completions by reducing the number of houses under construction. Thus 1,567 more houses were under construction in England and Wales in March than in December. In Scotland the figure was 1,578 less.

Open Door in Turkey?

Whatever the results of the general elections which are being held in Turkey tomorrow, it seems likely that the grip of the state on the country's economic life will be gradually loosened. This *étatisme* was introduced by Mustapha Kemal in 1933, when he found that the Turks themselves were unable or unwilling to supply capital to develop large-scale industrial enterprises; as a result most of the country's heavy industries and part of its light industries are now run by the state. Now, after a certain amount of American coaching, most Turks are agreed that the country's economic plans require the services of the private—particularly of the foreign—investor; and they are beginning to recognise that he requires reasonable assurances that there is a definite limit to the state's encroachments in the economic sphere.

The principal opponent of the Popular Republican party, which has been in power ever since the foundation of the Republic in 1923, is the Democratic party which is contesting all but one of the 487 seats. In 1946 it contested only one-third. This party, in which the merchants of Smyrna and Istanbul preponderate, would restrict *étatisme* to essential public services like the post office and the railways. It is a champion of both native and foreign private enterprise. In the case of the latter it would require reasonable safeguards to protect the Turk against a repetition of his experiences with capitulations and the public debt administration under the Ottoman Empire.

The electoral manifesto of the Popular Republican party

* Cmd. 7938 and 7939.

The Economist by Air

Two new Air Express Services are now in operation:

CEYLON annual subscription £5 15s. or Rs. 77

Copies reach Colombo on the day after publication. Our subscription agents are:

The Basic English Bookstall,
99 Chatham Street, Colombo, Ceylon.

BRAZIL annual subscription £7

Copies at present reach Sao Paulo on the Thursday after publication, but it is hoped to improve this service considerably in the near future. Our subscription agents are:

Orion Publicidade Ltd.,
Rua 7 de Abril 264, 13° Andar,
Salas 1316/18, Sao Paulo, Brasil.

For either service, orders originating in the U.K. may be sent to:

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W. 1

has announced the party's decision to withdraw from the Turkish constitution the statement of the six principles (symbolised in party emblems by six arrows) of nationalism, populism, *étatisme*, secularism, republicanism, and revolutionism. This would appear to be principally aimed at *étatisme*, since a constitutional amendment would also be introduced to safeguard the principle of secularism, and the other four principles have never been seriously challenged. The manifesto asserted that the party itself remained faithful to the six principles, but that it also believed that Turkish private enterprise should be given "an ever-increasing role in the economic development of the country." It promised, among other means to this end, assistance to private entrepreneurs from the newly-created Industrial Development Bank, which is the most important practical encouragement offered so far by the Government to the private investor.

The PRP manifesto also contains the statement that "our doors will be held open to foreign capital wishing to work in Turkey and willing to comply with international conditions accepted by foreign countries." Whether foreign capital will leap to get in through the door is another matter. Foreign investors who have more immediately profitable fields before them, and who remember the rigours of Turkish economic nationalism in the 'thirties, may feel disposed to caution. But they have, at any rate, been given a lead by the International Bank in Washington which has advanced half of the £T50 million capital of the new Industrial Bank.

* * *

Disagreements in Germany

American correspondents in Germany are responsible for reports—the first of which appeared some two months ago—that the British want to do away with the Allied High Commission and replace it by separate diplomatic missions in Germany. The British object, it is said, to the dominant voice of the Americans in all matters affecting Germany's ability to pay its way, and accuse Mr McCloy of interfering with the legitimate business of the German Government. The Americans are reported to resent this "torpedoing" of the High Commission by the British, whom they accuse of disloyalty.

At first sight it seems surprising that it should be the Americans who displease the British by interfering too much with German legislation. The State Department has in theory always tended to run ahead of the Foreign Office in granting liberties to the Germans. As early as 1946, Mr Byrnes declared at Stuttgart that the Germans were now democrats who could be trusted with their own affairs; and American support has consistently been given to German claims for freedom from the Potsdam limits on production. American theory and practice have, however, often diverged. In practice the Americans have made a bigger effort to transplant their own constitution, administrative concepts and political views, in Germany than have the British. General Clay, for example, found nothing too trivial for his attention. The situation has become more complicated from the British point of view owing to the fact that his successor, Mr McCloy, plays the dual role of US High Commissioner and head of the Economic Co-operation Administration in Germany. Whereas the High Commissioner might be prepared to leave the Bonn Government freedom in such matters as income tax, the guardian of ERP funds uses his weighted vote in the High Commission to intervene in German legislation. Since the High Commission was established, almost all the interventions in its name have, in fact, been made on behalf of the ECA, and have, by British standards, been unjustified. The British played the scapegoat over dismantling long after France had become the main obstacle to a clear settlement of the estion. Now they are still suspected by the Germans of ing the niggers in the woodpile.

For both British and Americans the Anglo-German trade negotiations proved an unfortunate episode. It was hard for the British—who only last autumn, at a crucial time for sterling, had been forced to pay out $7,000,000 to the Germans—that the Americans should intervene to prevent their arranging settlement in sterling. The Americans, on the other hand, oppose any move towards consolidating a sterling bloc that would cut itself off from dollar trade. This matter now waits for a solution through the European Payments Union.

The wider question of the future civil control of Germany will be discussed by the Foreign Ministers in London. It is clear that the ECA must retain at least as much right to supervise the economy of Germany as that of any other ERP country. For the sake of granting freedom to the Germans, it would be foolish to whittle away too many of the links that bind the United States, through Congress, to an active part in Europe. Furthermore it would be unwise, and unfair to the few friends of democracy in Germany, to relinquish all right to ensure that the liberties laid down in the Bonn Constitution are not infringed by the Germans themselves. These safeguards apart, the sooner the Federal Government gets its freedom the better.

* * *

French Wage Bargaining

In Paris this week the new high commission for collective bargaining began its difficult work of working out and getting agreement on a new minimum wage for French workers. Fifteen trade unionists, fifteen representatives of employers and three delegates each from the government and family organisations are starting from different estimates of what an unmarried, unskilled labourer needs to live in Paris, with the Communists choosing the highest figure and the government the lowest. Whatever the commission may decide, the final decision rests with the Minister of Labour.

The problem of employment and wages remains full of danger. It is true that the number of persons receiving unemployment compensation is only 62,000, as compared with a monthly average of 374,000 in 1928; but the figure has almost doubled since last April, and the Ministry of Labour's figure of 182,000 employed less than 40 hours per week cannot be accepted without caution. The number of work stoppages during the first three months of this year amounted to 1,240 against 358 in the corresponding period of 1949; and the strike in the Michelin factory at Clermont Ferrand, which lasted two months, was the worst since 1948. The number of working days lost during the first quarter of 1950, although they did nothing like the economic damage sustained in 1947 and 1948, is nevertheless disquieting as a token of industrial unrest.

With the nationalised railways and the *Gaz de France* in dire straits (the price of gas will have to be raised before long), there can be no question of big wage increases in the nationalised industries. If, however, the theory of the wages-front were abandoned both by the employers and the unions in favour of negotiations in the individual business, a good deal could probably be done for the workers. At present the employers are naturally as disinclined to concede a raise in an enterprise which can afford it as the unions are to accept a reduction justified by the individual enterprise's finances; for both bodies fear that a local concession may spread all along the "front."

According to the *Institut National de la Statistique*, the real wages of the single worker stood in the autumn of last year at 81 per cent of the 1938 figure and those of the worker with wife and two children at 109 per cent. This is the percentage for the whole of France; but Paris is considerably worse off than the provinces. Discontent is widespread and the situation in industry is precarious, so that public opinion will not tolerate indefinite wrangling by the collective bargainers.

Change to an

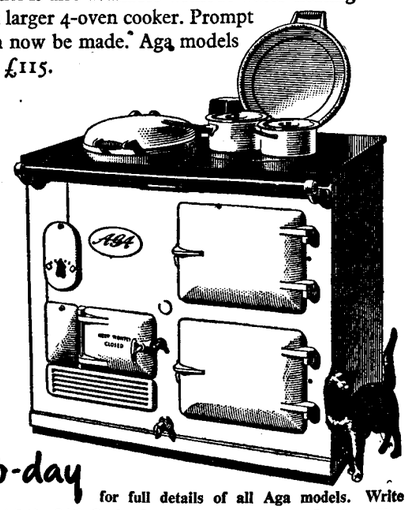
AGA Regd. Trade Mark COOKER & WATER HEATER

and enjoy

ITS CONSTANT READINESS

ITS IMMACULATE CLEANLINESS

ITS LABOUR SAVING



ITS TREMENDOUS SAVING IN FUEL...

and all the hot water you need

THERE IS A HEAVEN OF COMFORT in the house with an Aga! Its fire burns continuously without work or worry for you, yet uses only a shilling's worth of fuel a day or less—doing all your cooking and giving you enough hot water for 3 piping hot baths daily, and for all other household uses.

The Aga model CB Cooker and Water Heater shown here has a *guaranteed* maximum fuel consumption for the year of 3½ tons of COKE (in plentiful supply). This size model is also available without water-heating and there is a larger 4-oven cooker. Prompt deliveries can now be made. Aga models from £85—£115.

Hire purchase terms from £2 *a month.*

Send to-day for full details of all Aga models. Write to: Aga Heat Ltd., 34/2 Orchard House, Orchard Street, London, W.1. (*Proprietors: Allied Ironfounders Ltd.*)

THE NEW
CHAMBERS'S
ENCYCLOPÆDIA

Pre-Publication Demand

Last Autumn the publication of this great new work was fore-shadowed. Orders immediately poured in from all over the world. Sets are now on their way to every quarter of the globe. The demand is enormous.

Modern, Up-to-the-Minute

Such a demand is not surprising. No work can compare with the new Chambers's for accuracy, completeness and authority—or, indeed, for sheer value-for-money. It is the newest encyclopaedia at the lowest price for anything remotely comparable. And you must apply soon to make sure of a set of the first printing.

POST NOW

As a beginning and to give some idea of the astounding wealth of information that it will place in your hands, fill in the coupon NOW for full details.

No obligation, of course.

See the Chambers's brochure before you order any other encyclopaedia.

To: THE NEW CHAMBERS'S ENCYCLOPÆDIA (E) George Newnes Ltd., 136-137, Long Acre, London, W.C.2.

Please send me without obligation your fully descriptive brochure, containing actual colour plates from the new Chambers's Encyclopædia, and details of the various methods of payment.

Light on Delinquency

This week the Carnegie United Kingdom Trust has published* what will probably rank as one of the most important studies of delinquency to have been made in this country for many years. Its author, Mr D. H. Stott, was virtually adopted on to the staff of an approved school for four years, during which period he made an intensive study of 102 boys. He had no control group of non-delinquent boys, and his study is consequently not statistical. Nor, however, is it solely what the casual reader might think it to be—simply a collection of absorbing, fascinating case histories. The histories do indeed account for a very large part of the text; but they are woven into his arguments for illustrating his hypotheses.

Mr Stott is a psychologist. He also apparently belongs to the school of psychology which believes in the predominating influence of environment—in its widest sense—as against the influence of heredity in determining character and abnormalities of personality. It is, therefore, not surprising that in his approach to his study of the boys he should have been on the lookout for environmental stresses throughout their childhood. What is significant is his gradual abandonment of the "spoilt child syndrome" that he favoured when he began his study. Instead, he found himself faced with the fact that every boy, every one of the 102, found himself in an emotionally intolerable situation chiefly because of his failure to achieve normal human relations, particularly with his parents. The number of cases in which he found that a boy was "avoiding," that is, refusing to face an unbearable relation with his parents, particularly his mother, or the possibility of losing them, and flinging himself into restless pursuits to divert his thoughts, is too impressive to be dismissed as psychological claptrap.

Mr Stott gives a statistical summary of his 102 boys, rating them in accordance with the emotional disturbances they were subject to and the symptoms—pilfering, showing off, violence and so on—that they demonstrated. But his deliberate disregard of the statistical method will, of course, mean that his conclusions cannot be taken as valid. He himself suggests new projects of statistical research to test out his hypotheses. For instance, why does one boy, also with a bad home situation, merely become neurotic—or snap out of it altogether—while another becomes delinquent? Perhaps there is more in the genetic theory than Mr Stott, the environmentalist, allows. But the great importance of his study is to show how frequently the particular forms of bad environment that he stresses were found among his delinquent boys. The report should give a salutary jolt to those who think that delinquency needs severer punishment and the revival of birching—though Mr Stott faces the problem of how the claims of society can be reconciled with the needs of young delinquents for sympathetic treatment. Perhaps the most revealing remark in his book is his assertion that "at heart most boys were just as much worried about their getting into trouble as were their parents or the Home Secretary."

Virginibus Puerisque

The Departmental Committee on Children and the Cinema has spread its net wide. It has concerned itself with matters as diverse as the long run moral influence of the cinema, the behaviour of queues at children's film clubs, the hours of cinema going, the teaching of film appreciation, and the classification of films. On some of these questions it can only sound warnings and ask for further research. So far as the effect of the cinema on actual delinquency is concerned, the Committee (with one dissentient) gives a clean bill to the cinema, although it expresses concern about the more general and insidious inculcation of false values. The evidence is loose, the reasoning on that evidence general, and there is obvious need, before positively useful conclusions can be drawn, for expert psychological enquiry. On other matters it is strictly practical; for everyone's sake the under-fives should be excluded from children's club performances, and subject to local variations the unaccompanied under-twelves should have an eight o'clock cinema curfew.

These recommendations, while eminently sensible, are less interesting than those on the classification of films. The classification recommended by the committee would entirely exclude children from one category of films (marked X); it would designate another category as C, or the sole source of material for children's matinees and club performances; as far as the other films are concerned, the classification of the A, U, or intermediate rating would serve merely as a guide to audiences in general and parents in particular. This is refreshingly realistic and constructive. Every parent knows that the present classification is almost entirely farcical both in content and enforcement. But any classification, particularly one having legal force, will inevitably raise awkward borderline cases. One might see it argued that no impressionable adolescent should be exposed to the impact of the bedroom scene in "Hamlet"; would this, an A film which certainly deserves its label, by any deplorable chance get an X? Everything will depend on the sense, taste, or understanding of children and young people, on the part of those responsible for classification. The committee wisely recommends a special and specially qualified body, distinct from the British Board of Film Censors, to do this job among many others arising from the recommendations of its report. Here is an excellent opportunity for legislation whose fate would not depend on the current balance of the Parliamentary sick list.

Restrictionist Wrath

We are not disposed to treat altogether with contempt the anger of the farmers. We saw that tempestuous sea of vehement men which filled and overflowed the great room at the old Crown and Anchor on Tuesday. We heard fierce denunciations against a Parliament without integrity, and without sympathy for the constituencies. We heard public faith derided as impracticable, and combinations recommended not to pay the taxes. Openly was it avowed that the loyalty of the farmers had been purchased by a tax on bread, and that obedience was only to be expected from them on condition of their having permission to ravage the people. Loudly was it proclaimed that the monarchy, the aristocracy, the church, all our national institutions, rested on the Corn Law, and were all to be destroyed by wheat falling to 36s. the quarter. One speaker talked of the farmers mounting their horses, and taking the field. Another declared he was prepared to fight for the restoration of the bread tax, and more than one stalwart, red-faced, burly yeoman echoed the declaration, "Aye, we'll fight for it!" with lungs that seemed strangers to disease, while the whole assembly rose and cheered the statement as if fighting were as agreeable as fox hunting. The right of restriction was furiously demanded—the duty of confiscation advocated—and sentiments, so outrageous that no chartist assembly would dream of uttering them, were vociferously applauded, the gentlemen frequently rising and waving hats and handkerchiefs, and repeating their exclamations, as if they were at a loss for means to express their admiration of excitements to sedition and rebellion. Such proceedings are calculated to alarm the timid, and fill the courageous with regret and sorrow at the folly into which the wrath of the restrictionist farmers enables designing men to lead them.

INCREASED OUTPUT AT LESS COST

Impeller moulded in a fraction of previous machining time

A better job because of BAKELITE

This pump impeller was once machined from solid bar—a long and laborious process. By moulding it in Bakelite material, not only is it turned out much more quickly and cheaply, but the component is also resistant to corrosive liquids. At 17,000 r.p.m. it pumps 250 gallons per hour, yet it measures only 0.040" thick with a diameter of 1.65", and a pressure of 10 lb. per square inch does not affect the flange. These figures show what Bakelite materials can withstand. Perhaps some component from your factory can be more quickly and cheaply produced by moulding. Why not write, or ring SLOane 9911, and let us know your particular problem—our Technical Engineers are always at your service.

Letters to the Editor

Oxford on Keynes

SIR,—Have economists lost all capacity for surprise and indignation? Or have they, after all, no duty to comment on current events? Or was Keynes not only wrong in detail, as Heaven knows we all believe, but also in his fundamental principles?

We are presented in the United States with the standing paradox of a nation suffering from no balance of payments difficulties but 7 per cent unemployment, trying of all things to balance its budget. What lunacy is this? Is it just antediluvianism or some new theory of which we have not heard? Why is the British budget surplus, obtained in conditions of over-full employment, held up for imitation? Surely the situation is as simple as it looks: the Americans can either balance their budget or their overseas trade, but not both; they can either pay their taxes or have a secure job, but not both. But how is it that even the sanest correspondents—even your own American Survey—are not surprised, exasperated or even amused at this economic suicide? Do your American staff believe in Say's law?

Only less paradoxical—and more tragic—is the German case. To be sure they are in grave balance of payments difficulties, but they *have* several million unemployed. Is it then so absolutely certain that they must balance their budget? It is nearly impossible to teach a German banker or economist Keynesian theory, but at least when their politicians indulge in a little Keynesian practice we should think twice before intervening. In all the controversy about the income tax no mention has been made of the unemployed, who, of course, and not the American taxpayer, are the chief victims. We have held our hands over the failure of denazification and the resurgence of anti-semitism, only to strike in a purely economic quarrel where the pros and cons are very evenly balanced.

Oxford, Sir, is the home of lost causes.—Yours faithfully,

New College, Oxford P. J. D. WILES

A Defence of Laval

SIR,—I claim no other quality for writing to you than that of being for 25 years a regular reader of *The Economist*, and of having been from 1942 to 1944 Secretary-General of the government headed by Pierre Laval. I have been struck by the hostile tone to the latter of your book review of April 25th headed "The Vichy Story."

I admire General Weygand's military qualities and I am M. Bouthillier's and M. Baudouin's friend. But it is not on their evidence that a paper, whose objectivity and critical sense have made its reputation, can improvise a judgment and speak of "the ultimate depths and infamies of collaboration as practised by Laval"—no more than Mr Churchill could be taken as an impartial judge of the present Labour Government's policy or Mr Attlee of that of a future Conservative government.

England used to respect the memory of the loyal opponents of her policy—even when she had fought them bitterly during their lifetime—and Pierre Laval was not her enemy, and even less a disloyal man. My functions at Pierre Laval's side enable me to assert that he was neither pro-German nor anti-Allied. Inside the country his policy consisted in defending the French and it is on this point that he centred his defence in the notes jotted down in the prison of Fresnes for the use of the examining magistrate, and which have been published under the title "Laval parle."

As for his foreign policy—on which the hurriedness of his condemnation did not allow him to express his views—it was constantly directed against Hitler's ambitions, and there is no doubt for me that in the event of a Nazi triumph—which he dreaded as much as a Soviet victory—he would have been ruthlessly eliminated. Pierre Laval, alive to the twofold peril menacing Europe—if not the world—hoped for a negotiated peace, which would have neutralised at the same time the Nazi and the Russian imperialisms, without any of them being able to boast of final victory and impose its rule. This policy can be taxed with chimera. It can be contended that France, after her defeat, could not pretend to the role of abitrator which Laval wished to give her. It can be more simply noticed that this policy has failed. But five years after the unconditional surrender of Germany, can it be said that the Anglo-Saxon policy has achieved its war aims?—Yours faithfully,

JACQUES GUÉRARD

Madrid

Nationalisation in the Sudan

SIR,—Your correspondent's article of April 8th gives the impression that there was no point in hastening the nationalisation of the Gezira Scheme. The reasons he suggested were:—

(*a*) The tenant is not worrying about the wrongs and rights of nationalisation so long as he has sufficient money to pay for hired labour, iced beer and taxi rides.

(*b*) The aim of the decision not to renew the Syndicate's concession was to offer opportunities for Sudanisation through nationalisation.

(*c*) The tenant has a prejudice against the recruitment of Sudanese.

I should whole-heartedly accept the writer's views if only his statements were correct. But as a Sudanese agriculturist with some years of service in the White Nile Schemes referred to in the same article, I should like to comment on the above points.

(1) Supposing that the first point was correct, are we to blame for it? No. The blame should be laid at the doors of the Syndicate. It is due to the system followed which indeed was dictated by an absolutely commercial target. The system offered little or no opportunities for the development of the tenant himself. No wonder, therefore, if after forty years of tenancy under the Syndicate's system of management, the tenant has been accused of failing to spend his surplus money properly.

(2) This leads me to my second point. It explains why the tenant's enlightened and thinking brethren decided not to renew the Syndicate's concession. They intend to put the Scheme under a system which provides ample opportunities for the development of the land as well as the tenant and for saving his soil as well as his soul. No longer do they want to see him treated as a machine but as a farmer and a true participant.

(3) As regards the third point it is difficult to say how intensive and expensive that prejudice is. In the White Nile Schemes there has been a slight prejudice against Sudanese agriculturists. Your correspondent, however, has commented favourably on the result of the devolution of the junior inspectorate posts to Sudanese though he goes on to say "the real test will come when the senior inspectors are Sudanese." Let me emphasise this vital point which applies not only to junior posts but more so to senior posts particularly in the Gezira Scheme. Provided that the Government put the *right men* in these posts, which indeed is not an easy task, all I can say is "give them the tools and they will finish the job."—Yours faithfully,

MUSA ABDEL KARIM

School of Agriculture, Gordon Memorial College

SIR,—May I be allowed to comment on one or two points raised by your correspondent in his article entitled "Nationalisation in the Sudan," published in your issue of April 8th?

While your correspondent warns the Sudan Government against "fast progress on paper," he has committed the same mistake. If the Gezira tenant is as indifferent, self-centred and ruthless as your correspondent pictured him, will not consulting him be another "fast progress on paper"?

This is not the case. Indeed the tenant has not been consulted through any constitutional or formal way. But it has been clearly understood, long before the Advisory Council for the Northern Sudan recommended nationalisation in 1946, that the Sudanese were in favour of the move. In fact nationalisation of the scheme came in the first place from the Sudanese themselves. In a memorandum raised to the Sudan Government in 1942 by the Graduates General Congress, it was demanded that the concessions granted to the Syndicate should not be renewed. The matter was strongly supported by the Sudan local press, and it is generally held by the Sudanese people, who are not fond of many of the Sudan Government's decisions, that nationalisation was a wise and sound move. When I visited the Gezira in 1948 I was plainly told by the many tenants I met that they favoured nationalisation. No one of them has even showed any fear, or objected to the "changes in the field staff" as your correspondent claimed.

The picture drawn by your correspondent to illustrate the tenant as a ruthless, indifferent, weak "spiv" is not only unfair but ridiculous. Indeed the tenant employs hired labour in some parts of the Gezira. But this is not because "he does not want to demean himself with manual labour." This state of affairs is dictated on him by necessity—timing of irrigation, of picking and many other difficulties which he cannot overcome otherwise. Scheme or no scheme, the Gezira tenant has always been known for his hard work, devotion and love of the land.—Yours faithfully, BESHIR M. SAID

Electricity Capital Programme

SIR,—May I refer to your Business Note in *The Economist* of April 29th, which might be taken to imply that Lord Citrine was inconsistent in protesting against a possible further cut in the British Electricity Authority's already cut programme of 1,500 megawatts of new generating capacity per annum. You ask:

> What does such a restriction mean when the rate of installation that proves physically possible is 566 megawatts (1948), 703 megawatts (1949), or even 850 megawatts, which Lord Citrine indicated as possible for this year?

This question ignores the fact that the rising manufacturing capacity will eventually surpass the 1,500 limitation. The difficulty of providing generating plant is almost entirely confined to boilers and associated equipment, and the boilermakers are confident of their ability to expand output in the course of the next few years, so as to produce 1,500 megawatts a year, and much beyond this. Lord Citrine indicated the measures that have been taken to increase manufacturing capacity not only by the extension of existing works, but by the bringing in of additional firms.

I am sure you appreciate that the British Electricity Authority must plan several years ahead, and that a decision to cut their investment programme would mean that orders could not be placed with manufacturers to enable them to reach the output needed to overcome the deficiency in electricity supply.

You will remember the insistence of the Anglo-American Council of Productivity on a greatly increased supply of electricity and the need for every possible measure "not merely to maintain the present level of mechanisation, but also to increase the power and modern tools available to British workers." In their 1949 report the Council confirm "that there is apparently available in the United States two or three times the amount of electric power per industrial worker that is available in the United Kingdom." It is the intention of the British Electricity Authority to reduce this disparity, but to do so they must be allowed to provide the generating plant needed.—Yours faithfully,

H. F. CARPENTER

British Electricity Authority Secretary

Food Rationing

SIR,—In a Note of April 29th you stated that there appeared to be no reason why the rationing of fats should not be immediately abolished. As no one has come forward to point out the error of this statement, I am encouraged to do so.

As bakers we buy our allocation of margarine at 124s. 3d. per cwt., and cooking fat at the same price. There are varying prices, but these are the minima. The public purchase their margarine ration at 10d. per lb. and their cooking fat or lard at 1s. per lb., retailed. In addition, the margarine available to the public is of a very much higher standard than is available to bakers, and is also vitaminised. The quality supplied to bakers, on the other hand, is very similar to the 5d. per lb. margarine which was on sale at the beginning of rationing and soon withdrawn.

If fat rationing were abolished, the natural course would be for us to buy from our local grocer, as this would mean a saving to us of over 30s. per cwt. at retail prices. I am not an economist, but obviously before this can be done, either the price to the public must be increased to a level nearer the price for bulk users, or the bulk users' price must be lowered to the retail price.

I would imagine that either course is at present impossible, and until there is a radical change in the Government's policy, fat rationing will be with us for a long time.—Yours faithfully,

MODERN BANKING

By R. S. SAYERS

SECOND EDITION, 1947. 15*s. net.*

This book presents an exposition of modern banking in the light of current theory. In preparing this new edition, the author's primary concern has been to bring the factual descriptions up to date and to modify or replace arguments that derived their main interest from conditions since disappeared. But he has also taken the opportunity to make slight alterations in the theoretical analysis itself.

'A book of high quality, which is as stimulating as it is informative.' —*The Economist* reviewing the First Edition.

By the same author:—

OXFORD UNIVERSITY PRESS

Books and Publications

A European on the West

"L'Ame des Peuples." By André Siegfried. Hachette, Paris. 220 pages. 275frs.

M. ANDRÉ SIEGFRIED begins his book with the proposition that there belongs to each main branch of the human race a psychological core or "substratum" which is itself indestructible but above which a people has the possibility of adapting itself to circumstances. He inquires—chiefly in terms of ethnics, climate and economic geography—what, in the case of the principal European peoples, these "substrata" are and whether, in fact, the peoples of western Europe appear to be making adaptations to their entirely novel environment, the machine-age.

M. Siegfried, with all the visual observation of a master traveller, describes the national characteristics of Latins, French, English, Germans, Russians and Americans. In so doing he is answering by implication perhaps the most important of all topical questions: in what sense can free Europe achieve unity? On this problem M. Siegfried sheds a great deal of light. Since he is a historian he is wholly innocent of the political optimism of President Roosevelt or of the cheerful economic integrationism of Mr Hoffman. His argument proceeds in fact from an assumption directly opposite to that of those builders, sentimental-cum-material, of a European or world order who think in terms of geographical transnational *blocs*. For M. Siegfried Europe is a force which, during the past centuries, spread its intellectual and technical genius throughout the entire world, not in spite of, but because of its own critical diversity and political disharmony. Its world-power, in other words, derived from a technique which owed nothing to the political conformity of a universal state. The conclusion appears to be that, at a time when European influence is in retreat abroad and even at home before the forces of Asia, it is unreasonable to expect the western half of the old continent miraculously to unite politically and stand at bay within its own original confines. The Iron Curtain may be hanging now along an essential line of demarcation between Christendom and Barbary. But that is not to say that western Europe, because physically threatened by its Asianised Eastern half, may by political artifice be unified and rendered viable. It must indeed be physically defended, but as part of the Atlantic community. M. Siegfried seems to believe that in 1950 Europe exists, not as a *bloc*, but spiritually, as the continuing ideal source of a western civilisation of which the United States has already become the technological centre and the supreme guarantee. But at the same time he regards the American west as likely in fact ultimately to evolve a very different type of civilisation.

> "Its [America's] conditions are no longer those in which Europe was formed; Europe non-conformist, divided and rebellious, but our mother. Something new is being born there which will still be the West but no longer our West."

M. Siegfried, who represents the critical spirit of Europe, cares too much for western values to see them debased as the convenient jargon of committees and conferences. That he should acclaim the United States as the actual centre of the west is therefore more significant than all the arguments of geopoliticians.

It is possible, however, that he overrates the strength of the Asian challenge (is it, for instance, true to speak of "the immense confidence with which the Soviet people regards its future"? That is scarcely the atmosphere of contemporary Moscow). Possibly he also underrates the capacity of Latin races to evolve politically (is it inconceivable that the French may struggle out of their present political morass by seizing hold of the idea of a greater European unity within the Atlantic fold?). It is a fallacy to believe that Soviet youth is mo dynamic and French youth more decadent than their fathe Rather is the reverse the case. Nevertheless M. Siegfried l insisting that Europe should carefully examine its own cor plexity of character and tradition does much to brace the mir against the pessimism that is born of wishful thinking.

An Exasperated Ambassador

"I Saw Freedom Betrayed." By Arthur Bliss Lan Frederick Muller. 208 pages. 15s.

MR LANE was appointed as the first American Ambassador the Communist-controlled Polish Government which had bee recognised by Britain and the United States as a result of th Yalta conference; he resigned after the rigging of the promise general election in Poland in order that he might be free put on public record what he had seen during his two year tenure of the Warsaw Embassy. His book *I Saw Polan Betrayed* has now been published in a British edition with slightly modified title. It is a straightforward narrative personal experience with a number of episodes of gre interest; there is, however, a lack of the kind of politic analysis which would make the book a serious contribution contemporary history, and the publisher's method of printir documents without either recession or quotation marks ofte renders it impossible to discover whether Mr Lane is quotir from a document or giving his own comments.

His story is one of frustration and of the continued failu of the American diplomatic mission either to get the Polis Government to fulfil the pledges which it had given as th condition of recognition or to afford to American citizens Poland the protection which, under traditional conventions international intercourse, an Embassy was entitled to exten The disappearance of employees of foreign embassies, arreste without warning by the secret police, has now become commonplace of life in Communist-ruled countries, but whe Mr Lane went to Warsaw it was still an innovation and h never got accustomed to it. The perpetual lying and evasior certainly frayed his nerves, and his record shows in detail th amazing falsification of news which the Polish Communis developed into a fine art. The book is indeed an effectiv commentary on the Yalta agreement over Poland, but it leave in greater obscurity than ever the calculations of Presider Roosevelt in connection with it. According to Mr Lane, M Roosevelt told Rozmarek, president of the Polish-America Congress, that he did not trust Stalin, but in an interview wit Mr Lane on November 20, 1944, on his appointment a Ambassador, "stated that he had entire confidence in Stalin word and felt sure he would not go back on it."

Persian Resistance

"Russia and the West in Iran, 1918-1948." By Georg Lenczowski. Cornell University Press. (London Geoffrey Cumberlege.) 383 pages. $4.50 or 36s.

WHY has Russia, armed with its attractive message to land less peasantries and nascent proletariats, succeeded in Chin but failed, more than once, in Persia? Is it because of som trait in the Persian character or because some third force ha served as a deterrent? The book that could answer this riddl would be a thriller, for it would hold the key to the next te years in western Asia. Professor Lenczowski is, however, historian, not a prophet, and he limits himself therefore to prc viding the data on which conjectures can be advanced. Thi he has done dispassionately and well.

What does it add up to?

"I had three apples, one pear and a wooden wheelbarrow. My mother gave me three halfpence and some good advice. What does it all add up to?"

Simple arithmetic is not so simple when the subjects to be added confuse the mind with matter. For instance, add 50 years' experience to 53,000 skilled people in 30 factories in 20 towns; put down £1m. a year for research; enter such items as a quite remarkable apprenticeship system, and throw in flawless electrical engineering design, modern manufacturing methods and fair dealing. What does it all add up to? The order books of the Associated Electrical Industries Group could show that the answer was the making of £50m. worth of electrical equipment a year. In detail there would be mention of such matters as jet engines, infra-red equipment, radar, flat irons and coffee pots — everything electrical, from the greatest to the smallest. Or, turning from simple addition to the A.B.C., we can write the answers in three letters: A.E.I.—in which A=Associated, E=Electrical, I=Industries. Sum total — Associated Electrical Industries whose member companies make £50,000,000 worth of electrical equipment in a year.

Output per year	£50,000,000
Exports per year	£15,000,000
Highest H.P. driving motors	14,000
Giant Transformer (volts)	242,000
Number of employees	53,000
Factory floor space (sq. ft.)	10,000,000

It all adds up to **AEI**

Associated Electrical Industries

As a Polish diplomat stationed in Teheran during the war, he watched from the side-lines the three-power occupation that turned into a scramble to preach to, and feed, Persia. As a professor in an American university, which he has since become, he has had a chance to set his personal observations into the context of Soviet imperialism in Asia.

In no other book is the Persian part of the story told in such detail. Yet, through no fault of the author, it leaves an extraordinarily negative impression. Even the dynamic elements in it—the forcefulness of Reza Shah or of Russia's occasional thrusts southward—all peter out in exile or withdrawal. No participant in events is very clever. No one learns by experience. No one wins a round except on the other fellow's mistakes. Thus the Persians, when they thwarted the first Soviet attempt to dominate the north in 1921, succeeded because Russia's Persian stooges were immature and quarrelled among themselves. Similarly, the Russians, during the recent war, regained lost ground because the Allies created local confusion and mistrust by maintaining the fiction of Big Three unity long after Russia had dropped all pretence. In 1946 the Persians were able to oust the Russians from Azerbaijan because they again made all the mistakes that they had made in 1921. And in each interlude between Russian bouts of pressure, the Persian landlord politician built up a case for Communism by his refusal to sacrifice privilege in the interests of a better deal for the poor.

In the course of describing this welter of accident and *far niente*, the author contrives to leave a few firm impressions. One is that not a line of the Soviet thesis has changed and that the Russians will return to the charge. The second is that the Persians, though they have twice rebuffed Russia almost unaided, thanks either to the hold of their Shah and Mullahs or to the wiles of their politicians, are growing less and less able to do so without foreign support as knowledge spreads and more people expect a better deal. A third is that locally the West's "cold war," if it is to be conducted successfully, must become more strident and less apologetic for intrusions. Otherwise the British and Americans have to "play second fiddle to Russian propaganda, because an offensive, especially in psychological warfare, always secures better results." Unfortunately, the book closes in May, 1948, that is, after the Americans had promised material help but before they had encountered the difficulties of administering it to a touchy people. Professor Lenczowski would do a service if he would write a sequel.

War in Three Dimensions

"War in Three Dimensions." By Air Vice-Marshal E. J. Kingston-McCloughry. Jonathan Cape. 159 pages. 10s. 6d.

THE intention behind this book was excellent; a clear exposition of air warfare and of new strategic principles which the use of the "third dimension" has made necessary is much needed. Apart from Lord Tedder's lectures, there has been no authoritative work on the subject for many years, and the new developments in air warfare during and since the war, particularly the atom bomb, ought to be carefully examined to discover new, and possibly more efficient, methods of defence and attack. The author, however, does not live up to the promise implied in the introduction and the early historical chapters of his book. His analysis of the elements of air warfare, though somewhat confused by too many definitions of terms which are well enough known, is sound, but the strategic principles which he subsequently sets out to describe are not so easily intelligible. His style, too, does not make the understanding of his text any easier:

> The relative vulnerability of different classes of long-range bombardment target, and possibly, though not necessarily, the vulnerability of such targets as a whole, may be altered by an alteration in the basis of a country's economy. For example, the development of a new source of power, independent of coal, oil or water, might not only facilitate dispersion and multiplication but result in the elimination of such targets as oil refineries and power stations without of necessity creating other targets of equal importance and vulnerability.

This does not really make sense; if the country were to change over to atomic energy, then surely the atomic plants would be as important and as vulnerable as power stations.

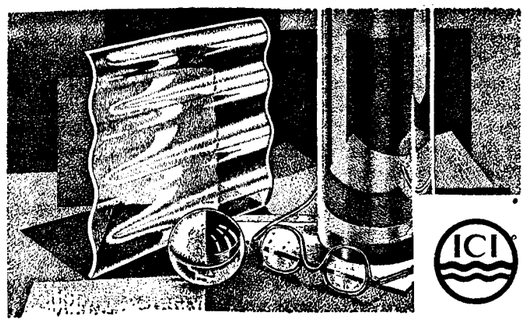
But it is unfair to the author to single out isolated passages for criticism. The book as a whole merits careful study. The invention of the atom bomb, as the author points out, makes it necessary to revise all previous ideas about defence, and all authoritative suggestions as to what changes should be made should be thoroughly examined.

Shorter Notices

"The Theory of Fluctuations in Contemporary Economic Thought." By Sidney D. Merlin. Columbia University Press. (London: Geoffrey Cumberlege.) 22s. 162 pages.

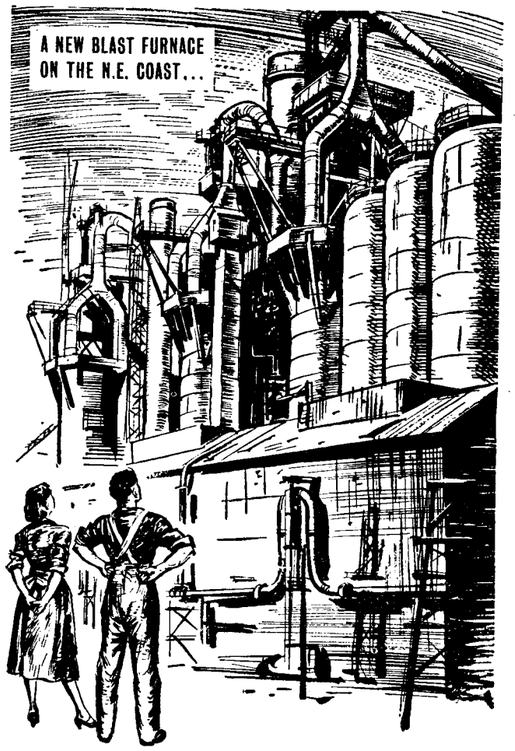
IT is often more difficult to correlate, compare, and as it were mutually to translate the theories of others than to build up a brand new theory of one's own. This is particularly true when the methods of comparative economics are applied not to the work of the classics but to that of contemporaries whose ideas are themselves in process of constant development and change. Dr Merlin's critical survey of present-day fluctuation theory attempts a job which certainly needed doing, the setting in perspective of the various approaches (e.g., those of Keynes, the Scandinavians, the econometrists, Mr Hicks, Mr Harrod) to the problem of fluctuation, and the indication of the lines on which a synthesis might be sought. The attempt does not quite come off. The various theories are summarised and criticised in scholarly and competent fashion; the author is led to formulate some shrewd generalisations; but—not surprisingly—the synthesis eludes him, as does its preliminary, the reduction to common terms of the various and variously named concepts used.

"The National Debt in War and Transition." By Henry C. Murphy. McGraw-Hill Book Company. 295 pages. 30s. $3.50.



THIS account of how the United States financed the war is written by a man who for many years directed research into public debt management in the Treasury Department, and who consequently saw, from the inside, the problems as they arose and were solved. In retrospect, the author believes that some of the increase in the public debt from $45 billion to $280 billion might have been avoided by more reliance on taxation and some use of compulsory borrowing; but he considers the finance of the war to have been the most successful in the country's history and the willing servant of the great mobilisation of human and industrial resources.

"Economic Doctrines." By Frank A. Neff. McGraw-Hill. 510 pages. 38s. 6d. or $4.50



THIS enormous elementary historical survey rouses in the reviewer's mind a keen sympathy for the American undergraduates for whom it is presumably intended. The sympathy is qualified by appreciation of the book's very real merits; its clarity of arrangement, the extent to which, in well chosen and vivid passages, the economists of the past are allowed to speak for themselves, the relation of economic theory at every stage to the main body of contemporary social thought. And if—as in an undisguised textbook one must—one is to have cross headings at virtually every paragraph, it is a great thing to have headings which do in fact exhibit, as they do here, the marrow of the argument. Nevertheless, it is hard to understand the American attachment to the combination, yet once more exhibited here, of the monumental and the superficial in textbooks; also, more specifically, to justify the proportionate attention given to the various schools and individuals, the inclusion of some and the omission of others. That no English economist should be found worthy of comment between Alfred Marshall and J. M. Keynes may be explained on the grounds that one has to stop somewhere, that one cannot start, at this level, sorting out the modern schools, and that on the other hand to leave Keynes out altogether would be unthinkable; the decision to allot two sketchy paragraphs to Stanley Jevons and fourteen pages (more than Ricardo's allowance) to the obscure amateur, Henry Carey, may have sprung from patriotic motives. But if the purpose of an educational work is to give students a connected picture of a dynamically developing subject, then this book has not fully achieved its object.

'Perspex'

'Perspex' acrylic resin is one of the most versatile and attractive of the new synthetic materials which the British chemical industry has yet produced. Since I.C.I. chemists discovered it in 1932, this crystal-clear plastic has found hundreds of uses as varied as the transparent parts of aircraft, electric light fittings, chemical plant, and corrugated sheets for roof lighting. 'Perspex' is made from acetone, of which one method of manufacture is based on molasses, a by-product of sugar manufacture. The first step in making it is to produce a water-white liquid called methyl methacrylate. The next is to polymerise this liquid—that is, to cause its molecules to join in long chains. The result is polymethyl-methacrylate which is sold under the proprietary name 'Perspex.' Although only half the weight of glass, 'Perspex' is extremely tough, and its development was a timely achievement of the British chemical industry. In 1939 it was adopted for the transparent parts of all British fighting aircraft, and today new uses are constantly being found for it.

ICI

Steel progress continues

One way the British Steel Industry keeps costs and prices down is by developing the most economical size of working unit.

To-day, 101 blast furnaces are producing one and a half million tons more pig iron than 284 furnaces did in 1920.

Where smaller units are required for making special steels progress has been just as remarkable. For instance, production of high grade steels in electric furnaces is to-day more than three times as great as before the war.

These are examples of initiative and enterprise in the iron and steel industry.

AMERICAN SURVEY

Boom Forever?

(From Our American Staff)

BEFORE the war ended in Europe five years ago this spring, a considerable number of people both in America and elsewhere were prophesying that the cessation of hostilities would soon be followed by, at best, a major recession and, at worst, a serious depression in America. Almost every day since then someone, somewhere, has proclaimed the beginning of the slump. American business men, labour leaders, farmers, economists, publicists have all hailed it in turn, with a continuous accompaniment from Moscow and a sporadic one from other foreign sources. The volume of the chorus may have varied, but it has never ceased entirely. Yet during the entire five years, production and trade, income and employment, while they have fluctuated, have remained at very high levels. There has been no depression, and there has been no serious recession. Some measurements, it is true, indicate two minor recessions —in 1946 and in 1949—but others show only insignificant declines. Generally speaking, output has been more irregular than income, the money values of production and trade have moved more than their volume, monthly and weekly figures have ranged more widely than annual totals, and detailed series than broader indices. But some such variations are occurring at all times.

Source: Council of Economic Advisers

History may tell definitely why the prophets have been so falsified. At present a number of different but interrelated factors appear to have contributed to their confusion. First, the amount of demand for goods and services deferred by individuals, businesses and governmental units during the depression and the war, and the ability to make these demands effective, was much underestimated. Second, for various reasons, a series of public actions has stimulated high —to some degree inflationary—spending. Conditions abroad have brought about large government expenditures in the interests of defence, of economic and social reconstruction. and of friendship and charity. The " welfare state " has meant heavy government expenditures at home. Private spending has been spurred by the substantial reduction in income tax made by the Eightieth Congress and the $2.8 billion in surplus funds now being distributed under the servicemen's life insurance scheme. All these have resulted not only in a level of government spending much higher than was estimated during the war, but also one that has been rising almost steadily since the sharp reduction immediately after the war. It is outrunning revenue to an increasing degree and, in consequence, there are both current and prospective budget deficits. Wage increases have been a persistent characteristic of this period as a result of labour's power, public policy, and the competition for business which made employers agree to wage demands in order to keep their place in the race. There has also been a very rapid and large rise in borrowing for the purchase of houses and consumer goods. And high consumer's incomes have given a general momentum to these more specific stimulants.

Third, the monetary situation has encouraged a high rate of expenditure. The liquid assets of the public were, and are, enormous as a result of war finance and the monetary authorities have maintained easy money in plentiful amounts and at low rates. At the slightest sign of declines in production and trade they have undertaken vigorous stimulative operations. Fourth, business has been compelled to make very large expenditures on capital account. Inventories were low at the beginning of the period and fierce competition to reach customers with the most goods first led to intensive and large purchases. Competition also made it desirable to replace as soon as possible the large proportion of plant and equipment which was obsolescent at the end of the war. Perhaps most important has been the very high rate of scientific discovery and application ; here again competition made many businessmen feel that they had no choice but to install the latest at the earliest possible moment.

Fifth, the number of marriages has been unusually great, making up for postponements during the war, and the flood of births from these and previous marriages has sent population far beyond earlier estimates. Sixth is a group of miscellaneous, but highly important, factors. Readjustments have, to a considerable degree, come in sequence, instead of concurrently ; this was mostly by chance, but strikes and shutdowns have also pulled the cycle of output considerably out of shape. Tax, labour and other developments have meant a great redistribution of income which may have had different and more buoyant results than did earlier patterns. And finally, a fairly prevalent spirit of caution, coupled with much greater information, education and experience than in the past, has doubtless checked the growth of maladjustments.

The long boom is by this time producing the historically well-known phenomenon of ebullient psychology. Some individuals and some businesses are getting involved in operations and commitments that can be justified only if these extremely favourable conditions persist. The stock market

have now pledged for weekly and monthly payments under hire-purchase plans a proportion of income so large that even a small decline would be calamitous to them.

This boom psychology is appearing also in government affairs, where programmes and commitments could prove much less reliable than they now seem. The protests that come from some domestic interests at a suggestion of just a few more imports are ominous ; a farm price support programme that is nearly swamped by surpluses of some commodities, even during an extreme boom, raises doubts ; and a plan for the nation's prosperity that is based on a 50 per cent increase in house building over the highest level of all times is imaginative, to say the least. The same psychology is visible in international affairs. Last year's readjustment, so small as to be invisible in annual figures of total outlay, gave rise to an apprehension abroad which suggests that some people must be setting standards of stability and height for the American economy that historical and functional considerations indicate cannot possibly be fulfilled. Calculations calling for imports by the United States far above the levels attained in the present great boom are surely, to put it mildly, optimistic. And some of the exhortations on " proper performance by a creditor " contain figures that must rest on assumptions, or dreams, possible only if America has really executed and buried the business cycle.

The present buoyancy of trade and sentiment does not point to any early termination of extreme prosperity ; yet evidently a number of the factors which have sustained business activity are losing force or will be doing so before long. Consequently, it is most urgent that the assumptions which business men and statesmen are making, consciously and unconsciously, should be given careful consideration. Happily, something of the sort is being done by the Twentieth Century Fund and the National Planning Association, among others, and presumably, also, by Mr Gordon Gray in his official study of the dollar gap. But public attention is focussed elsewhere—especially on the antics of Senator McCarthy, and on the President's effort to pull up his drooping public popularity by his whistle-stop tour of the country.

Primary Elections: Iowa

[FROM A CORRESPONDENT IN IOWA]

FROM April to September, all across the country, voters in various States are selecting the contestants who will wear their party colours in next November's elections. In Iowa, the lists for these primary elections closed on April 26th and on June 5th the parties vote for their candidates. In 1948, Iowan voters chose a maverick Republican for their State Governor by a majority of 120,000, a Democrat for Senator by one of 162,000, Mr Truman for President by 28,000, and conservative Republicans for Congress and for most state and county offices. So no one knows what to predict for this year, but Democrats hope to win the other Senatorship and perhaps one or two seats in the Federal House of Representatives. Liberal Republicans have little hope of anything.

Senator Bourke Hickenlooper, the Republican who is defending his seat this year, is vulnerable. The Administration would like to defeat him for attacking the Atomic Energy Commission last year and supporting Senator Joseph McCarthy against the State Department this year. His doctrinaire, stand-pat Republicanism has offended group after group of Iowans with concrete desires which can only be satisfied by federal spending and federal controls, and he has done little to endear himself to the important farm interests. Mr Hickenlooper represents the Republican right wing which took a beating in Iowa in the 1948 primary for the State Governorship. His Republican opponents in this year's primary are, however, not too formidable, though one —Mr Earl F. Wisdom of Des Moines—has some support among all three of the groups that kept the incumbent Republican Governor from re-nomination in 1948: farmers, trade unionists and school teachers. Mr Wisdom is a lawyer and executive secretary of the Iowa Rural Electric Co-operatives Association, while Mr Hickenlooper is on the side of the private power companies in the running battle between public and private electrical interests.

To fight Senator Hickenlooper, Mr Albert J. Loveland finally agreed to enter the Democratic primaries, although he was reluctant to leave his $17,500 a year job, as Under Secretary of Agriculture, for the hurly-burly of a campaign. But Democratic strategists risked hurting the feelings of the five Democrats who were already seeking the nomination for the sake of getting a strong candidate, and one who would back wholeheartedly the Administration's Brannan Plan for a new method of supporting agricultural prices. On the issue of that plan, the Democrats hope again to pull together a farmer-labour alliance. Mr Loveland calls the present farm law a " crow-bait horse," whose flexible price supports " flex in only one direction—down." His 6½ years as chairman of the Agricultural Adjustment Administration's Iowa branch (which allotted and distributed farm subsidies there) give him a ready-made local organisation in the farmers who are the paid committeemen of its successor, the Production and Marketing Administration.

Unless one of the six candidates for the Democratic nomination gets at least 35 per cent of the votes cast for the office, the primary is inconclusive and the choice is made by the

State Democratic Convention. This could happen, but only one of Mr Loveland's five opponents is considered a very serious contender. This is Mr Nelson G. Kraschel, Governor of Iowa from 1937 to 1939 and then an official of the Farm Credit Administration until 1949, when his post was abolished. Mr Kraschel was the last to enter the campaign and entered fighting the Brannan Plan: "Iowa farmers are entitled to more dependable protection against falling prices than a plan that requires annual Congressional appropriations with which to pay cash subsidies." No candidate in either party speaks for the consumers who doubt whether farmers need subsidies at all nowadays—nor for the low-income farmers who do not sell enough to gain much benefit from price supports.

*

The Governorship is conceded to the present Republican holder, Mr Beardsley, though a vigorous campaign for the Democratic nomination is being made by a man who was Public Safety Commissioner of the City of Des Moines until it abolished the office and is now responsible for a gramophone record programme on the wireless. His opponent in the Democratic primary is a former State Senator who has the same last name as the other Federal Senator, Mr Gillette, and the blessing of the Democratic organisation.

All eight of Iowa's Congressmen in the Federal House of Representatives are conservative Republicans; all must stand for re-election this year and five of the eight have no competition at all in the Republican primary. Democrats are contesting all these Congressional seats in November, but only in two districts did they come anywhere near beating the Republicans in 1948.

In one state office, Republican voters face a definite choice of principle: the Attorney-General, Mr Robert L. Larson, has been trying valiantly to stamp out gambling as a business for profit in Iowa. Gambling of all kinds has long been illegal there, but is usually tolerated. Woodbury County goes further and traditionally tolerates gambling run on commercial lines. The County Attorney, Mr Bernard A. Brown, is standing against Mr Larson and against gambling—when run by out-of-state gangsters.

But for the most part, the Republicans on the ballot in the Iowa primaries are all very much the same type of Republican, and most of the Democrats who will stand against them in November are relatively unknown in politics; several of them are liberal professors or students from the universities. Democrats complain that Republican lawmakers vote to suit the manufacturers' associations, but the only large manufacturer in Iowa's public life—Mr Fred Maytag, 39 years old and a State Senator since 1946—is not going to stand again. Candidates are usually people whose time is more nearly their own: lawyers who can fit politics into an intermittent law practice, small-town business men whose businesses will go on without them, farmers with good tenants or hired men.

Many Iowans vote for their Congressman as for their County Supervisor: because they know him, because he has done them some favour in the past or may in the future, or for some purely local reason. In some places the main consideration is whether a dying cross-roads community shall give up the ghost by abandoning its local school to a consolidation scheme. In others it is whether to approve an issue of bonds for a local project such as a hospital. Voters are people who never heard of the new Republican slogan "Liberty versus Socialism" and do not believe it is a real issue, who do not understand the Brannan Plan and are inclined to oppose it. They think the Democrats are better at preventing unemployment, at keeping the farmers prosperous, and at avoiding a depression, but that the Republicans are likely to be more successful at cutting taxes, lowering the cost of living, and dealing with subversives at home and Russia abroad.

Everything printed without attribution is prepared in London.

American Notes

Mr Truman on Tour

The Grand Coulee Dam, in the State of Washington, is most conveniently ready for dedication just as the 1950 political campaigning season opens. Equally conveniently, the three thousand miles of railway between it and the capital cross the sixteen Middle and North Western States where that campaign will be hottest. The chairman of the Republican National Committee is therefore not alone in doubting the non-political nature of the President's journey to the dedication ceremony, in the course of which he is making eight major, and about fifty minor, appearances. Mr Truman insists that he is only giving the unbiased report on his work in the White House that the people of the United States do not find in their newspapers. But he and his advisers have always attributed his unexpected success in 1948 to the similar reports, as straight from the shoulder as from the heart, made during his tours in that year. So have the Republicans, who this time have collected a chorus of their best speakers to drown the President's arguments promptly. Mr Stassen, however, has tactlessly ensured that the chorus will fall on many unsympathetic ears by damning Mr Truman as "the worst President ever to occupy the White House."

In 1948 Mr Truman could denounce the Republican Congress in the same way and did so with great effect. This year, with a nominally Democratic majority in both Houses, Congress is a liability which he is seeking to reduce by saying that it must not be judged until it has adjourned. Mr Truman certainly hopes that his present tour will inspire his listeners to spur their Congressional representatives in Washington to improve their record before adjournment. Meanwhile he maintains that Congress is "doing alright." It is hard to agree with him this week, as Southern Senators prepare for a filibuster on the Fair Employment Practices Bill, which promises to hold up indefinitely all legislation except that embarrassing to the Administration.

In his set speeches Mr Truman has been emphasising particular aspects of his Fair Deal programme in the places most interested—his farm plan in Lincoln, Nebraska, for example. But in all his speeches he is appealing for the co-operation between farmers and labour without which the Democrats cannot hope for victory in these traditionally Republican States, and he is bearding the isolationists in their strongholds. The President, believing that the danger of war is today less than it was four years ago, has no hesitation in taking credit for the improvement. If he can demonstrate that the people of the Middle West agree with him, and are prepared to go on supporting his policy of international co-operation, he will be rendering a great service to his Secretary of State as Mr Acheson urges the free world to face its crucial dangers.

Chrysler's Package

The Chrysler Corporation insists that the United Automobile Workers will find nothing in their new pension and welfare package that was not already there before the strike, which dragged on for one hundred days of unnecessary delay and unusual bitterness and lost the company and its dealers nearly one billion dollars' worth of sales. The Corporation had originally offered the union the pensions of $100 a month at the age of 65, including federal social security benefits, which the package now contains, along with various health and disability payments. But union officials maintain that its contents have been much improved by the addition of a plan for funding the pensions instead of relying, as the company wished, on its promise—and its ability—to pay. The union has also been given a voice in the allocation of payments from the fund. Some at least of the 90,000 employees, who each lost an average of $1000 during the strike, probably agree with the Corporation that they have been treated as expendable pawns by union officials, playing a number of simultaneous games against not only other automobile companies but also other labour leaders.

Mr Reuther, president of the UAW, judges a contract by its propaganda value as well as by its concrete benefits and from this point of view the Chrysler settlement is at best a stalemate. It will run for the unprecedentedly long period of three years, with the possibility of annual reopenings, and does not contain the union shop for which Mr Reuther had hoped. Moreover, the company has resolutely refused to state the cost of the pensions and other benefits in the terms of cents-an-hour which make it easy to compare these complicated arrangements with the gains won in other disputes. But this at least leaves Mr Reuther and the Chrysler officials free to agree, for once, that their package is worth as much, or more, than the 50 cents an hour which is the value of the concessions obtained by both the steel workers and the employees of the Ford Company last autumn.

The Chrysler settlement, probably by design, comes just in time to clear the board for the match against the last and biggest of the automobile industry's big three, the General Motors Corporation. The UAW is already threatening a strike when the present contract expires on May 29th, but it has left itself plenty of room to make concessions. Here, too, it is asking for a union shop and its other demands are valued at 31 cents an hour, made up of monthly pensions of $125, other welfare payments, and a wage increase of 9 cents an hour to replace the sliding scale which for the last two years has tied the wages paid by this company to the cost of living index. Unfortunately for this interesting experiment, the cost of living has been falling for over a year and General Motors' workers have had to accept three wage cuts, amounting in all to five cents an hour, during that time. The present negotiations might have opened in a more auspicious atmosphere if the Corporation had not stood so strictly by the letter of the contract at a time when its profits have been breaking all industrial records and its officers have been receiving substantial cash bonuses.

* * *

With Reference to the Files

Last week Democrats in the Senate, uniting to pin Senator McCarthy down on his charges of Communism in the State Department, nearly succeeded in forcing their writhing victim to convict himself of lying. The wildness and irresponsibility of his accusations have now been so well exposed that he is probably winning the Administration as much sympathy as he has lost it. Mr Truman, evidently thinking that the Senator is no longer a political danger, has so far ignored the McCarthy charges in his speeches while on tour. But before leaving Washington, he did concede that the investigating committee might have access to the State Department's files on the Senator's 81 cases.

Mr Truman abandoned his repeated refusal to permit this on finding that the files had already been studied by four Congressional committees (whose favourable reports on them were the source of Mr McCarthy's inspiration) two years ago, before the principle was laid down that loyalty files should never be available to Congress. No precedent is therefore established by the President's change of position; he still refuses to allow access to the files of the Federal Bureau of Investigation, on the grounds that this would smear clean reputations and hamper the future work of the Bureau. Mr McCarthy can thus protect himself by declaring that only the FBI files are trustworthy; his allegation that the State Department files are "phony" is unfortunately given some justification by the time the Department is taking to prepare them for presentation to the committee.

Other long-standing controversies over Congressional investigations of loyalty are all coming up again in the McCarthy enquiry. Two witnesses, Mr Earl Browder and Mr Field, are probably to be cited for contempt of Congress for refusing to answer the committee's questions. Mr William Remington, acquitted of disloyalty a year ago and reinstated by the Department of Commerce, has once more to appear, not indeed before the McCarthy committee, but before the Un-American Activities Committee, anxious to refocus the limelight on itself. Mr John Service, a respected employee of the State Department, is also in double jeopardy; he is once more to be investigated by the Department's loyalty board after having been cleared five years ago of charges in connection with the *Amerasia* case. But that case, which concerned the passing of secret documents to the editor of a periodical, was never satisfactorily settled and, now that Mr McCarthy has once more drawn attention to it, the mystery needs to be publicly explained.

Foreign Aid and Foreign Trade

In the end the Senate was no more severe on next year's foreign aid authorisation than the House had been: it cut only the same $250 million from the funds for the Economic Co-operation Administration, leaving it with $2,850 million (including the $150 million saved from this year); Korea is allotted $100 million and the relief of Arab refugees $27,450,000. Ten per cent of the $100 million reauthorised for aid to "the general area of China" is to be used for famine relief in China; most of the rest will, it is hoped, go to South-east Asia, some of it to Indo-China; but the military aid that Mr Acheson has now promised to that country will come out of the $75 million given to the President under the Mutual Defence Assistance Act. The sole disagreement between the Senate and the House was on aid for underdeveloped areas: the House allowed only $25 million for this, while the Senate approved the full $45 million for which the Administration asked. But this was only by one vote and the Senate, therefore, seems likely to accept any compromise that is reached in conference.

The various amendments on the isolationist fringe were well beaten, although perhaps not so soundly as they deserved, but the most reliable indication of the treatment the foreign aid programme is likely to receive, when it comes to appropriating the money which has now been authorised, is provided not by the final vote of 60 to 8, but by the tie vote of 40 to 40, which prevented a reduction of $500 million. The reduction was supported by Senator Taft and, more ominously, by Senator Ives, of New York, until now a faithful supporter of the Administration's foreign policy.

Senator Ives feels that the time has come for Congress to express by something more than words its dissatisfaction with the lack of progress western Europe has made in reducing trade barriers and integrating its economy. In the hearings now being held by the House Foreign Affairs Committee, opposition has also been expressed to the charter of the International Trade Organisation by spokesmen of organisations such as the National Foreign Trade Council and the United States Chamber of Commerce, far from protectionist in outlook. They contend that the charter pays only word service to the elimination of discriminatory trade practices and provides for so many exceptions that it might end by giving official sanction to such practices.

*

These foreign traders are concerned at recent trade returns. In March US exports, valued at $867 million, while higher than in the short month of February, were 26 per cent less than a year before and 13 per cent below the 1949 monthly average. The figures are expected to improve as the year goes on, but it now looks as if this year's dollar gap may be only about $2.5 billion, less than half as wide as last year's. For in March imports continued to rise as they have done since last July, reaching a total of $663 million, 20 per cent above last year's monthly average and higher than at any time since December, 1948. How far this is the consequence of American prosperity, how far of devaluation, cannot be assessed, but at least the abyss does not seem quite so unbridgeable as it did. Mr Hoffman has also been making it less formidable: he thinks that in 1953 Europe need sell to America goods valued at only $400 million more than now; tourist expenditures, purchases of foreign services and private investment abroad will span the rest of the $1 billion gap when Marshall aid ends. But ECA thinks the United States will have to take "extraordinary action" to absorb even this additional amount of imports. The Customs Simplification Act, now at last before Congress, represents such action, but is unlikely to progress far at this session, even though foreign traders approve it, in principle at least.

Light on the Lobbies

The Lobby Registration Act of 1946 was passed in the belief that, while lobbying is not necessarily evil and, indeed, is an essential part of representative government, Congress and the public are entitled to know who the lobbyists are and what money is being spent to influence the course of legislation. The reason the Act's haul has been disappointingly meagre was brought out recently in the trial of Mr Slaughter, a former Congressman from Missouri. Mr Slaughter was accused, and acquitted, of a charge that he had failed to register as a lobbyist. He admitted that he had received substantial sums from organisations in the grain trade for testifying before Congressional committees, and helping other witnesses to testify, in favour of a provision forbidding the Commodity Credit Corporation to lease additional storage space for surplus crops. Mr Slaughter's efforts were not in vain; but, perhaps to his dismay, the law proved an important factor in 1948 in swinging the farm vote to President Truman, another Missouri Democrat, but Mr Slaughter's bitter political enemy.

Mr Slaughter was a particularly effective spokesman for his cause since, as a former Congressman, he had friends in the House and was allowed on the floor. Yet the judge accepted his plea that he was acting, not as a lobbyist, but in a purely legal capacity, and held that it had not been proved that he exerted a direct influence on pending legislation. This decision of the court gives sanction to a whole twilight zone inhabited by lawyers, corporation officials, and public relations counsellors who have failed to register on the grounds that they are not lobbyists. It also makes very timely the House investigation into the effectiveness of the law. The chairman, Mr Buchanan, estimates that only 500 of some 1,500 lobbying groups have registered; that these registrations cover only one-fifth of the individuals who devote time and money to influencing Congressional opinion; and that they probably account for only half the money that is spent. In the three years since the law was passed the 500 who boldly accepted the lobbyist's label have collected $55 million and spent half that.

*

Mr Buchanan believes lobbying is essential to keep Congress in touch with public feeling, and evil only when it is abused; his aim is to discover how the law has worked and whether it needs strengthening. The academic experts, who were first on the stand, agreed that it does and that the present measure is full of loopholes and ambiguities, but one, at least, felt the lobbyist was a greater peril in state capitals than in sophisticated and better paid Washington. In its case studies, the committee proposes to give an impartial hearing to both sides. But impartiality, like charity, begins at home. Mr Truman probably is not displeased that the committee, despite the yearning of its Republican minority to examine the activities of federal officials and the "social lobbying" practised by the embassies, has begun by being impartial to the real estate lobby, which the President has loudly denounced as the source of Congressional hostility to his housing measures.

Shorter Note

The threatened railway strike has at last arrived, but it affects directly only four important railways, serving chiefly the south and west, and only 18,000 of the 110,000 members of the Brotherhood of Locomotive Firemen and Enginemen. The union hopes that, by limiting the strike in this way, it will avoid Government seizure of the railroad. In that case its chances of success would be poor, for two federal fact-finding boards have already rejected its demand for an extra fireman to work on Diesel engines—a demand which the companies seem justified in treating as "feather-bedding."

THE WORLD OVERSEAS

The Wafd and Britain

(From a Correspondent Recently in Egypt)

WHEN the Wafd came to power with a strong majority in Egypt, it was generally expected that Anglo-Egyptian relations would improve. British circles in Cairo seemed to think that relations between the two countries would be restored to a point where negotiations for the revision of the 1936 Treaty might be re-opened. Hopes were based on the memories of cordial relations which existed between the Wafd and the British during the war, coupled with the knowledge that a powerful section of the Egyptian commercial community, supported by the Foreign Service—in particular its members serving abroad—and by a few senior officers, really believe that it is in Egypt's interest to negotiate a new treaty with Britain as soon as possible. It was argued that the Wafd with the overwhelming support of the country could afford to take a realist line—that is, to ignore the opposition (which is always noisy on the subject of Anglo-Egyptian relations), to overrule the Palace (should this be necessary) and carry the country with them through the negotiations.

Within a week of the formation of a Wafdist Government it was only too apparent that events were not marching that way. Their attitude towards the Anglo-Egyptian sterling talks which had begun just before they took office in January was extreme and unbending. In effect, their argument ran as follows: "We, the Wafd, must obtain better terms from Britain than our predecessors. We are sorry about Britain's difficulties, but we cannot allow them to prevent Egypt gaining its 'just demands' which millions of voters throughout the country have put us into office to obtain."

Nearly five months of office have in no way modified the Government's attitude, not only towards the sterling talks but also towards the re-opening of negotiations for the revision of the 1936 Treaty. "The Wafd must obtain more generous terms than Britain offered to Sidky Pasha in 1946," is still their theme song. No allowances are made for the changed international scene since 1946. "Mr. Bevin promised that British troops would evacuate Egyptian soil by September 1, 1949. Nahas Pasha's Government must do better."

Keeping in with the Palace

Among the reasons for this intransigent attitude must be numbered disagreements inside the Cabinet. Two or three cliques are fighting for the succession. Any minister who dared to propose reasonable terms for agreement with Britain about defence, or the Sudan, would certainly be denounced by his colleagues with quite as much malice as he would receive from the political correspondents of opposition newspapers. Were Nahas Pasha still the effective leader of the Wafd, it is probable that he could have persuaded the country to accept a treaty, reasonable from the British as well as the moderate Egyptian viewpoint, had he wished to do so. But he is so often ill that others are competing to fill his shoes.

Owing to divisions inside the Cabinet, the Wafd, greatly to the surprise of all observers, have tended to cultivate the King rather than maintain their traditional policy of opposition to the Palace. The King has the power to dismiss the Prime Minister and his Government. Nahas never forgets this, and both he and the colleagues who are ambitious to succeed him are doing all in their power to keep in with the Palace. Inside the Palace the King's entourage is notoriously anti-British and xenophobic; he personally seems to have brief periods when fear of Communism drives him to adopt the reasonable view that Egypt cannot stand alone that alliance with an old friend in the west offers more to monarchs than does any other possible policy.

But Egyptians have felt for so long and so strongly that their prime desire is to see the last of British troops that their conception of a "new treaty" does not include British establishments on the Canal. They believe that the British could without danger or difficulty move their forces to Jordan or Cyrenaica. The thought that Jordan has no port and Cyrenaica no water and no labour has not occurred to them as a handicap to the defence of their area.

Has Britain Appeased?

Lastly, in the Orient as in most places, nothing succeeds like success. Britain is in Egyptian eyes not succeeding just at present. It has lost, they think, its old position as the leading great power of the Middle East. They have been encouraged in this attitude by several acts lately which look to them like appeasement, and appeasement that they interpret as a lead from weakness. Why else, they ask, have there been so many British royal visits to the King—Mountbatten, Edinburgh, Gloucester? Why has the King been made an honorary British general? Why did Britain resume the sale of arms under its treaty with them, when the embargo was lifted, without demanding the obvious *quid pro quo*, which was free passage for oil, under the terms of the Suez Canal Canvention, to the British refinery at Haifa? Why else has Mr Bevin accepted this situation with a defeatist shrug, despite the fact that it is costing the British dollar pool $50 million a year? Why does the British Embassy give its local nationals so much less backing than, for instance, the American Embassy when they seek diplomatic or consular support? There may be excellent and varying British explanations for these acts, but to an Egyptian they all point the same way. He is sufficiently conceited to think that the British army's desire to see the Egyptian army and air force participate in joint manœuvres also springs from a desire to appease.

The recent British effort to prod the Arab League towards a more realistic appraisal of the new pattern in the Middle East—a prod administered by recognising King Abdullah's title to Arab Palestine and simultaneously recognising Israel, —has gone still further to exascerbate popular feeling against *rapprochément* with Britain. Egypt will be forced to accept the *fait accompli*. Senior officials in the Ministry of Foreign Affairs fully understand this piece of British policy. Some even applaud it in private. But the cabinet will not listen to experts. Despite a nation-wide backing, they prefer playing to the mob. Their attitude towards recent events suggests that Whitehall is pursuing shadows if it thinks that it is possible simultaneously to prompt realism about Israel among Arabs and to produce in Egypt the mood for a new treaty.

May Day in Moscow

(The account of the military parade in Moscow on May Day reproduced in extracts below was broadcast on the Soviet Home Service).

06.45. (*Kremlin chimes*). Attention, this is Moscow speaking. Comrades, our microphones are placed in the Red Square in Moscow. All radio stations of the USSR are relaying us. The Red Square looks magnificent in expectation of the wonderful moment when the leaders of the Party and the Government appear and the parade begins. The ruby stars on the Kremlin towers are shining brightly. From all over Moscow columns of workers, headed by a forest of red banners, are moving towards the Red Square. Our capital is resplendent in her festive attire of flags, bunting and greenery. On this solemn day of solidarity of the workers of the world the Soviet people send their fraternal greetings to all peoples fighting for peace, democracy and socialism.

"The Soviet army. . . ." These words are known to the peoples of the whole world. They are full of profound and stirring meaning. We Soviet people utter them with great pride as the symbol of our victories and our glory. The people's democracies which the Soviet army has liberated pronounce these words with profound love and gratitude. All ordinary folk throughout the world who cherish peace and freedom see in the Soviet army the bulwark of peace. At the sound of these words all those who are hatching plans to drown the world in the blood of mankind shudder and are full of fear. . . .

A solemn hush is falling over the Red Square. . . . The troops stand motionless. Only the flag on the Kremlin palace flutters in the wind. "Stalin!" Thousands of people (*loud applause*) are now uttering this beloved name. "Stalin!" (*More applause*). Stalin and the leaders of the party and Government are on the rostrum. Stalin greets the people. . . .

The thoughts of the troops are directed towards Stalin. Young soldiers and veterans see in him the embodiment of the immortal glory which shines from our banners. Beyond our frontiers the friends of our country and the fighters for peace are filled with emotion and are inspired by Stalin. All honest people in the world know that Stalin leads the Soviet people along the path of peaceful victories. (*Speech by General Shtemenko.*)

(*The band plays the Soviet anthem, the troops cheer and the Kremlin guns fire a salute*).

(*The drums roll*). The troops have started moving. At the head of the march past are massed trumpets and drums. The cadets of the Moscow Academy of Music have marched past.

The Military Academies head the march past. This order of the parade is full of significance. Stalin's military science is our invincible weapon. The Frunze Military Academy marches past. . . .

The air parade has started, headed by the machine of Guards Lt.-Gen. of the Air Force V. I. Stalin. Gigantic machines majestically fly past in the blue sky. The sun gleams on their wings. Thousands of eyes watch this mighty armada with pride and affection.

The combined naval unit is nearing the Mausoleum. The caps of the sailors are adorned with black and orange Guards ribbons, and orders and decorations gleam on their chests. Men from battleships, destroyers, submarines, from the Baltic and Black Sea Fleets, they march past with the characteristic naval swing. . . . The fly-past continues in the meantime. Squadron after squadron appears in the sky and the people can hardly follow these swift machines with their eyes. . . .

Jet fighters are flying past, column after column. Glory to the Stalin falcons, the faithful guards of our country.

(*Poem*). "The silver aircraft are flying over Moscow while the whole people follow them with admiring eyes. In this country of work and abundance, the people are rearing their eaglets. Our hearts beat fast when these silver birds fly high up in the Moscow skies."

(*The band strikes up the cavalry march*). Cavalry units have now entered the Red Square. They are headed by the squadrons of the Budenny Academy. . . .

The rattle of wheels can now be heard. Here are the famous "tachanky." These legendary vehicles are still beloved of our people.

As we watch this parade our thoughts turn towards those whom our army has helped to win victory and to build peace. The USSR is in the front rank of the fighters of peace. A historic victory has been won by the Chinese people who have overthrown the imperialist yoke. From all our hearts, we proclaim: "Long live the Chinese People, long live the Chinese Communist party which is leading them to socialism." You will now hear Peking. (*Relay from Peking*).

(*Back in Moscow*). The glorious Soviet artillery has now entered the square headed by Lt. Gen. Ryabov. . . . For technical perfection and fire power, there is no equal to our Soviet artillery. . . . Here are the long barrels of the AA guns. They are followed by the Katyusha mortars, which opened up the way from Moscow and Stalingrad to Berlin. The stream of artillery is still moving across the Red Square, howitzers and long-range guns. Each fresh column has large calibre guns. The public turns its eyes towards the end of the square and sees the heavy long-range guns towed by tractors. (*Rumble of heavy machines*). Very powerful guns are now moving across the square. With such men and such equipment, the Soviet army is invincible. Glory to Soviet artillerymen!

The tanks have entered the square. . . .

The military parade in honour of May Day, the day of the solidarity of workers of the world, is coming to an end. This parade is yet another stern reminder to all those who are hatching plans against peace and freedom of the invincible might of the Soviet country. Every one of these soldiers is ready, at the first call from their country and from Stalin, to change into battle dress and to strike a crushing blow at any aggressor. Glory to the defenders of our country!

(*March past of massed bands*).

The May Day demonstration of the workers is now starting. The approaches to the Red Square are already filled with demonstrators, headed by a forest of red banners. Martial music introduces the start of the demonstration, which is led by prominent Stakhanovites and Stalin prizewinners of the Soviet Union.

A column of Young Pioneers marches past, carrying bouquets of flowers.

This square has seen many wonderful demonstrations and processions. But every time the onlooker is gripped by this mighty spectacle. All eyes are on the Government tribune, all hearts deeply moved by the sight of their beloved leader. Men and women, filled with enthusiasm, raise their voices in one single shout of "Glory to Stalin!" Stalin is the hope of mankind. He stands for the happiness of millions of men. The party and all Soviet people are solidly behind him.

Columns of Moscow workers continue to fill the square. Noble representatives of Soviet toil carry banners announcing the fulfilment of their labour commitments ahead of schedule. . . .

(Poem dedicated to Stalin: "In Stalin we see our future, our hope. He is the light in our hearts.")

The banners of the countries of people's democracy are now floating above the columns of workers. (China's in the lead). The portraits of the leaders of the people's democracies are borne aloft. Here are the portraits of Mao Tse-tung, Rakosi, Bierut, Gottwald, Chervenkov, Hoxha, Choibalsan, Kim Il Sung, Gheorghiu-Dej, Pieck and the President of the

fighting Democratic Republic of Vietnam, Ho Chi Minh . . . The continuator of Lenin's cause, the great Stalin, is greeting the people from the tribune. There is a profound historic significance in this great demonstration. (*Relays from Budapest and Vietnam.*)

(*Back in Red Square.*) It is bright in the sunshine, and endless streams of people continue to pass. (Poem: "Spring has come. It has come here, it has come in China, in the new streets of Warsaw, in Prague, in the gardens of Bucharest, in the villages of Bulgaria. The banner of victory flies over us. The spring of humanity is with us. It is nearing the workers' suburbs of Paris; it is marching like a master upon the piazzas of Rome. In Calcutta, Karachi and Bombay, it sings of freedom. Our Stalin, whose hand guides the spring of humanity, is leading us to victory.")

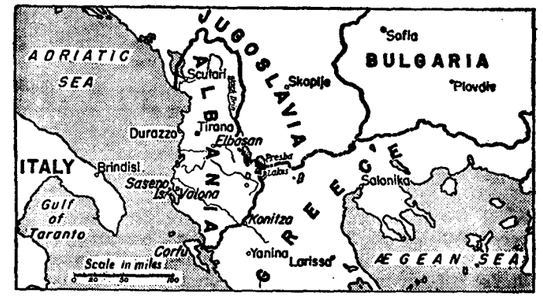
(*Relays from Paris and Berlin.*)

(*Tikhonov, chairman of the USSR peace committee, at the microphone.*) "Joyful columns are moving across the Red Square. In all towns and villages of our country the Soviet people are celebrating the day of free labour. The calm of peace lies over our country and our frontiers are firmly held. Our sentries are vigilant. Only a few days ago, they put to flight airmen who tried to violate our territory. We do not fear war. We do not want war. We want war to be outlawed, and we will win, as we won five years ago, for the sake of the future of the world."

There follows a parade of youth, and of physical training organisations, with much cheering and organised shouting of slogans. Martial music sounds in the background. Flowers are carried to form patterns and the rhythmic cheering continues in the background.

Albania in Isolation

[FROM A CORRESPONDENT]



EVER since Albania became isolated from the Soviet system as a result of the Cominform split with Jugoslavia, the hold of the Communist regime on the country has been steadily weakening. It has been the main object of Enver Hoxha, the Prime Minister, to reverse this situation; he has tried to rebuild the prestige of the regime by claiming that his Communist government enjoys the full support of the "masses" and the protection of the Soviet Union. The general election, which is due to take place on May 28th, will provide Hoxha with the opportunity of supporting his claims by the usual 99 per cent victory at the polls. The scene for the election has already been set by the trial of six Albanians charged with espionage and sabotage on behalf of Jugoslavia. Widespread publicity is being given to the sentences of death and long terms of imprisonment, which were awarded by a military tribunal on May 6th, and the electorate can be in no doubt as to the government's attitude towards Titoism.

In the 121 constituencies, each with an electorate of 10,000, the process of election will be a gay formality. At the last general election in December, 1945, official results claimed that 80 per cent of the electorate went to the polls and of these 93 per cent voted for the Democratic Front. At the elections this month the process will be repeated. There will be the usual single list of Communist candidates. The elector, anyone over the age of 17, will drop a ball into a bag after passing his clenched hand through one of two holes in a screen. Your correspondent has witnessed the pathetic embarrassment of one citizen who released his ballot ball in the hole marked "No" (signifying a vote of abstention) only to hear it drop into a tin can behind the screen.

It would be wrong to assume that a 99 per cent victory for the Democratic Front on May 28th would indicate that the hold of the Hoxha dictatorship on the country is complete. In the past Albanians opposed to the government in power in Tirana have owed much to their mountainous country, which has enabled them to maintain their source of resistance. Today, opposition to the Hoxha regime is using the mountains once again. In a speech on April 12th the Prime Minister spoke frankly of the risks with which his regime is faced. He admitted that "5,000 enemies of the people who took shelter in the mountains were closely pursued by the forces of our Defence Corps, before crossing the frontier into Jugoslavia." He also hinted that an armed rising was waiting on "salvation from abroad." Although Hoxha is himself Commander-in-Chief of the army and is popular with many of the partisans who fought with him in the mountains against the Germans and Italians during the war, he cannot count on the loyalty of his army of 60,000 men. There have been cases of desertion across the frontiers into Greece and Jugoslavia by men who have been continuously in uniform and away from their homes since 1943.

Relations with Tito

There is clearly a sharp division of opinion within the government itself about economic relations with Jugoslavia. From 1941 to the expulsion of Jugoslavia from the Cominform in June, 1948, there was complete accord between Tito and Hoxha. Friendly relations reached their peak in 1946 with the signing of a thirty-year customs and economic agreement. This agreement, which brought the economies of the two countries into line, also provided the basis of the first Albanian five-year plan. Hoxha hoped to start the industrialisation of Albania's backward economic system by exchanging minerals and oil for Jugoslav wheat, textiles, light machinery and technical assistance. For two years Albania benefited by this agreement; but when Jugoslavia was expelled from the Cominform the government decided almost overnight to transfer its allegiance and hopes for the future from Belgrade to Moscow. The agreement was torn up, the frontier with Jugoslavia was closed and Tito was denounced. A few months later, the Minister of the Interior, Koçi Xoxe, together with a number of government officials, were brought to trial for their pro-Tito sympathies, and Xoxe was executed.

Hoxha gave as the reason for this abrupt change in political alignment an attempt by Jugoslavia to absorb Albania into its federal system. This is almost certainly true, but Hoxha was also clearly taking advantage of the existing situation in south-east Europe. At that time the Greek guerrilla war was at its height, and Hoxha doubtless thought that Moscow would be only too willing to deliver economic aid to Albania, in exchange for a strategic base from which the Communist attack on Greece could be maintained and, if necessary, an offensive launched against Tito. The five-year plan with Jugoslavia was replaced by a two-year plan dependent on Soviet aid arriving by sea. For nearly a year, indeed, Albania received consumer goods and medicine, but not capital equipment, from the Russians, and ships returned to the Soviet Union with Albanian oil and minerals.

The curtailment of these Russian supplies last year after the end of the Greek civil war and their almost complete cessation in the first quarter of this year, has caused both the

government and the discontented population to realise the full extent of their insecurity and isolation. Hoxha has tried to meet the problem in two ways. Firstly, he has appealed to Moscow for assistance, while publicly telling the people that the assistance is already arriving. Secondly, he has accused members of the government responsible for economic affairs of deliberate sabotage of the state plan on orders from Jugoslavia.

Failures of the Two-Year Plan

Hoxha ended a recent speech in Tirana with the news that a new five-year plan would follow the two-year plan, when it came to an end in 1951. Again, he said, it would be based on Soviet aid, and capital equipment promised from Moscow would include a new oil refinery and machinery for factories and mines. In order to conceal the failures of the two-year plan Hoxha has employed the usual meaningless percentages to prove fulfilment of production targets in all industries with the exception of transport and oil. These are the two key industries of the two-year plan, and are largely dependent on Soviet imports. And their failure could not be hidden from the population. Hoxha decided to place responsibility directly on to the senior officials concerned. On March 9th the Director of the Oil Combine, the Minister of Industry, and the Assistant Minister of Communications were expelled from the Central Committee of the party for "Jugoslav-Trotskyite sabotage." The Assistant Minister of Communications committed suicide and the trial of the other officials is expected. It is revealing that in February Hoxha was quite satisfied with the oil output, and said that by the end of the year it would be increased by 59 per cent.

Albania's economic orientation must in the end depend on political developments, and in particular on the attitude of the Soviet Union. The attitude of its neighbours, Jugoslavia, Greece and Italy has already had a considerable effect on the internal situation. The motives of these three powers differ and are not altogether simply anti-Communist. Tito would like to remove any threat to his southern frontier by having Albania join him as a Nationalist-Communist state, and he is in a position to put on considerable pressure. Hoxha has repeatedly referred to incursions of Jugoslav armed bands into North Albania ; Jugoslavia controls the air communications between Albania and the satellites ; all aircraft crossing Jugoslav territory must report for examination at Jugoslav airports, and there have been recent cases of their being ordered to return to Tirana.

Will Moscow Come to the Rescue?

The Greek Government's attitude remains hostile to the Hoxha regime. Its claim to nearly a third of Albanian territory has not been withdrawn and Hoxha has announced that his Defence Corps have captured agents infiltrated from Greece. Italy, with a view to its future interests in the Balkans, has recently established diplomatic relations with Tirana. This move is of particular interest, since the French mission represents the only other link with the west. Italy, too, is alleged by Hoxha to have sent groups of agents by sea and parachute into Albania, whom he claims to have captured.

The efforts of all three neighbours to exploit the critical situation to their own advantage has so far failed to arouse any active response from the Albanian population. This fishing in troubled waters has tended to confuse the average citizen as to the true intentions of the western powers. On the other hand, their various activities have caused the Hoxha regime considerable alarm, and he is obviously extremely worried lest Moscow should fail to provide sufficient supplies to keep his regime in power. So far the Soviet Union has given no indication of rallying to his support, and he has not even a defence pact or membership of the Cominform to fall back on. Albania's isolation is complete.

Australian Moves Against Communists

[FROM OUR MELBOURNE CORRESPONDENT]

MR. R. G. MENZIES, the Australian Prime Minister, has dramatically fulfilled the most important—and the most contentious—of his election pledges by introducing legislation into the Commonwealth Parliament to outlaw the Communist party, dissolve it, and appoint a receiver to take over its property. In addition, the legislation provides powers to "declare" persons as Communists, to gaol "declared persons" for up to five years if they continue their activity, and to remove them from trade union office and from the Commonwealth public service.

The measures have been described as probably among the most drastic yet introduced into the Commonwealth Parliament, affecting, as they do, the individual liberty of the subject to an extent which in normal times of peace would be unthinkable. But Mr Menzies said, in introducing the Bill:

> We are not, except in a technical sense, at peace. The Soviet Union has perfected the technique of "cold war," has accompanied it by the organisation of peace demonstrations designed, not to promote true peace, but to prevent or impair defence preparations in the democracies.

Not only are members of a political party debarred from engaging in political activities to promote the cause of Communism under pain of imprisonment, but the onus of proof is placed on a "declared person" should he appeal to the High Court against his declaration. Anticipating criticism on this point, Mr Menzies said in Parliament that people of liberal mind might say that to reverse the onus of proof was wrong, but in time of a shooting war they had not criticised the executive for using its discretion, against which there had been no appeal. And a surprise provision of the legislation was that it covers anyone who was a member of the Communist party in the last two years. Sufficient evidence of this will be that a person attended a meeting of the party or a "subsidiary," advocated its objects in public or in writing, or distributed its literature.

General Election Possible

There seems little doubt that the Government will have widespread support for its action against Communism as such—Mr Menzies estimates that 80 per cent of Australians approved of the Communist Party Dissolution Bill, to give it its full title. Nevertheless, the way in which the Government proposes to carry out what is an indisputable mandate from the people at the December general elections has already aroused misgivings in some quarters. While the press has generally supported the contention that firm action must be taken to curb the pretensions of Communists, "there will be," as the Melbourne *Age* pointed out, "an earnest desire on the part of all liberal-minded people that, as the Government's programme becomes effective, the principle of full justice for the individual shall be wholly preserved."

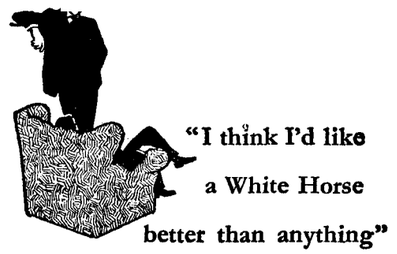
The legislation has yet only been introduced into the Commonwealth Parliament and is not law. Before it becomes law, it may have to traverse a very stormy path which could possibly involve the dissolution of both Houses of Parliament and a consequent general election. At the last general elections, the Liberal and Country Parties gained a majority of seats in the House of Representatives, but Labour still controls the Senate. It would be quite possible for Labour to reject the anti-Communist bill when it reaches the Senate, but to do this would be to court a double dissolution of Parliament, and the Government would certainly go to the country on the issue of Communism. Electors, in their present state of mind toward Communists and their ways, would almost certainly return an anti-Labour Government in both Houses.

This, indeed, is the dilemma in which the Federal Parliamentary Labour Party finds itself as a result of Mr Menzies' anti-Communist legislation. When the Labour party was in office last year, Mr Chifley took drastic and vigorous action against the Communists at the time of the general coal strike. Communist strike leaders were imprisoned and union funds frozen, and Government pronouncements at the time showed that it held no brief whatsoever for Communism. In fact, one of Mr Menzies' most powerful arguments in introducing the legislation was his quotation of Labour party advertisements published during the strike over the name of Mr Chifley.

The president of the Australasian Council of Trade Unions (Mr A. Monk) has already declared the ACTU's opposition to legislative action by an anti-Labour Government to interfere with union rights to elect whom they will to union office. This opposition was expressed shortly after Mr Menzies' Government was returned and repeated again after the introduction of the anti-Communist legislation. Mr Monk, who is generally regarded as the spokesman for organised labour in Australia, is not, however, supported by his colleagues in New South Wales, where the NSW Parliamentary Labour Party has announced outright support of the Bill in principle. And Federal Labour politicians are sharply divided in their attitude to the measure.

It does not, therefore, seem likely that the Labour Party will reject the anti-Communist Bill when it reaches the Senate. It will not risk a double dissolution of Parliament on an issue as dangerous and as unpopular as Communism.

On the other hand, Mr Chifley, the Opposition leader, has already stated in Parliament that Labour will fight to the finish the Government's legislation to restore control of the Commonwealth Bank to a board of ten in place of a Governor and advisory council responsible to the Commonwealth Treasurer.



Two days after Mr Menzies introduced his anti-Communist Bill, the Victorian Premier (Mr T. T. Hollway) released the findings of a Royal Commissioner (Mr Justice Lowe) on the activities of the Communist party in Victoria. The Royal Commissioner found that the Reds were a disruptive force aiming to overthrow the capitalist State, but he made no recommendations. The findings will undoubtedly add still more to the ferment over Communism at present sweeping Australia and it is hard to imagine that their release on the eve of a State election in Victoria is just coincidental.

Chile's Economic and Political Difficulties—II

[FROM A CORRESPONDENT]

THE roots of Chilean political difficulties of the last few years are several. First, the industrial revolution has taken hold of Chile and with it has come the disquieting growth of new ideas and new aspirations among great masses of the people. Second, the serious economic situation which was discussed in the first article in the present series, has added fuel to the natural discontent among the urban working class arising from the social and economic transformation through which Chile is now passing. Finally, the whole situation is complicated by the fact that the Communists have been able to capitalise upon this mounting unrest.

During the closing years of the Second World War there was an increasing number of strikes in Chile, most of them illegal—that is, either occurring in industries where strikes are forbidden by law or occurring before the mediation and conciliation procedures specified in the labour code had been exhausted. The government of President Juan Antonio Rios decided during the first days of 1946 to call a halt to this

spreading strike movement, and the cabinet decided to withdraw government recognition from two nitrate workers' unions which were engaging in an illegal walkout. A unanimous outburst on the part of the unions followed and a one day general strike occurred—the most effective ever seen in Chile.

The situation was brought to a head when a workers' meeting in Santiago was fired on by police, resulting in several labourers' deaths. The Government resigned as a result of this "*Plaza ulnes Massacre*" and after some time a cabinet dominated by the Socialist party was formed, which proceeded to restore recognition to the two nitrate unions. The installation of this cabinet resulted in a split in the Confederation of Workers of Chile, with the Socialist faction supporting the new regime and urging the calling off of a further general strike which had been called by the Confederation, and with the Communist faction trying to go forward with it.

Bitterly Fought Campaign

In the succeeding months political tempers rose. President Rios died and in the ensuing election on September 4, 1946, the Communists supported Gabriel Gonzalez Videla, the candidate of the Radical party. The Radicals are the traditional middle class party in Chile, and are particularly the party of the government bureaucracy. It is an interesting fact that the Radical party has seldom been out of office in the last thirty years, having had representatives in virtually all cabinets—conservative and left-wing, democratic and dictatorial.

Opposed to Gonzalez Videla were candidates of the Conservative party (Senator Eduardo Cruz Coke), and Liberal party (Senator Fernando Alessandri) and the Socialist party (Bernardo Ibanez, secretary general of the Socialist faction of the Labour Confederation, nominated only after the Acting President withdrew). In a bitterly fought campaign, Gonzalez won most votes, but not an absolute majority, which threw the decision on to a joint session of Congress, where the Liberal party—headed by ex-President Arturo Alessandri, the *eminence gris* of Chilean politics—had the balance of power. Alessandri made a deal with Gonzalez whereby the Liberals voted for him, and he agreed to invite the Liberals—a conservative-minded party of industrialists and landlords—into his cabinet.

Gonzalez Videla thus served his first six months as president, from November, 1946, to April, 1947, with a cabinet made up of members of his own Radical party, the Communist party and the Liberals. The Communists rode high during this period, acting as if they were already masters of the regime, while President Gonzalez made statements to the effect that "all those who are anti-Communist are fascists." But this honeymoon did not last very long. In April, 1947, there were nation-wide municipal elections in which the Liberals lost ground to the Conservatives, the other right-wing party which had stayed in the Opposition, and the Radicals lost ground to the Communists, their coalition partners. Therewith cries arose in both the Liberal and Radical ranks for an end to the tri-partite alliance, and Gonzalez finally dismissed the Communists.

For some time he governed with a Radical cabinet with the tolerance of the Liberals and some smaller parties, and relations became increasingly cool between the President and his former Communist allies. They launched a series of "quickie" strikes all over the country, apparently to try to show Gonzalez that if he would not govern with them, he could not govern without them.

The crisis finally came in August, 1947, when President Gonzalez used the navy to break a coal strike and arrest the principal Communist coal union leaders. Subsequently, Gonzalez asked for and received from Congress "special powers" permitting him—among other things—to deport Communist leaders to the northern nitrate port of Pisague. Subsequently, several hundred were unceremoniously dumped into that hot, dry little port town.

Once he had turned against the Communists, President Gonzalez went the whole way. He proclaimed an anti-Communist crusade, and pushed through Congress a "Law for the Defence of Democracy" which outlawed the Communist party, provided for the expunging of about sixty thousand registered Communist voters from the electoral roll, and took other stringent measures against them. He formed a "National" government, with representatives of virtually every party except the Communists. Groups as varied as the Socialists, Radicals, Democrats, Liberals and Conservatives all participated and a military man was made Prime Minister. However, rifts appeared in virtually all the parties as a result of this participation in the cabinet and differences of opinion arose concerning the wisdom of the measures outlawing the Communists. The Conservatives split (Senator Cruz Coke leading a Christian Social group which opposed collaboration with Gonzalez) as did the Socialists. The Radicals found it necessary to expel several of their leading figures who continued to be friendly with the Communists.

Unrest continued among the urban workers. Although the Gonzalez government continued the programme of economic development handed down to it by its predecessors, it was no more successful than they in dealing with the problem of inflation. Events once more came to a head late in January, 1950. The telephone and electric power workers of Santiago went out on strike for better working conditions and bonuses. Textile workers joined the walkout, as did bank and insurance employees, and on February 3rd the newspaper employees and railroad workers proclaimed a twenty-four hour general strike in sympathy with the others. On that same day a general agreement for the settlement of these strikes was reached in an all-night session in the presidential palace. In pursuance of this accord, Congress passed a law two weeks later making it mandatory for all firms in Chile to distribute 25 per cent. of their annual earnings to their workers.

Opposition Joins Government

This agreement brought about the downfall of the cabinet and President Gonzalez once again formed an interim regime made up only of members of his party. Meanwhile he invited the opposition to come into the Government. After about two weeks of negotiations a new cabinet was formed, made up of members of the Radical party and most of the former opposition parties.

President Gonzalez thus succeeded in solidifying his own position, though the new cabinet is not much more likely to be able to improve the economic situation than was its predecessor. It remains to be seen whether it will reverse the former regime's stringent measures against the Communists. Both the *Falangista* and Conservative party parliamentarians voted against the "Law for the Defence of Democracy" when it was passed, but it is rather doubtful if they will now be able to repeal it.

The entry of the Conservative party into the cabinet seems to have eliminated one of the two strongest individuals in the opposition to Gonzalez—Senator Eduardo Cruz Coke, his rival in the 1946 presidential election. Cruz Coke had been developing into the logical candidate of the anti-Gonzalez forces in the 1952 presidential election, but the entry of his party into the cabinet—although he himself has no post—will make it rather difficult for him to be the standard bearer of those elements.

The other chief figure in the opposition was General Carlos Ibanez. He has in recent years been accused of too-great friendliness for President Perón and of wishing to imitate him. Be this as it may, many Chilean democrats will be deeply perturbed if the ex-dictator once more becomes a major presidential candidate.

A BUSINESS DECISION OF THE HIGHEST IMPORTANCE

Choosing an Advertising Agency

One of our oldest clients is said to have chosen us at random, out of the telephone book. But that was twenty-five years ago and today the telephone book is a more formidable affair.

Modern conditions demand a different technique. Presenting your goods and your good name in the world's markets; interpreting your message in terms of interest to the public; working to a balanced and co-ordinated plan with management, are matters which call for a thorough assessment of the resources of the agency under examination—the extent of its services, its experience, **its talents, and above all, its people.**

Its people ! If it conforms to the best standards of agency practice it will offer you a team of people who will act in your advertising interests like a department of your own. **Yet not exactly like a department of your own,** for each member of it is also a member of some differently constituted team serving some other client. This brings a widening and deepening of experience which makes for independent thinking, a continual flow of new strength, which passes all through the agency and is made contributory to its work.

The Pritchard Wood organisation invites examination of its services, its people and its work and, as an interim measure, those interested may care to write for a copy of our new prospectus entitled "Choosing an Advertising Agency," which tells more about our outlook and the way we work.

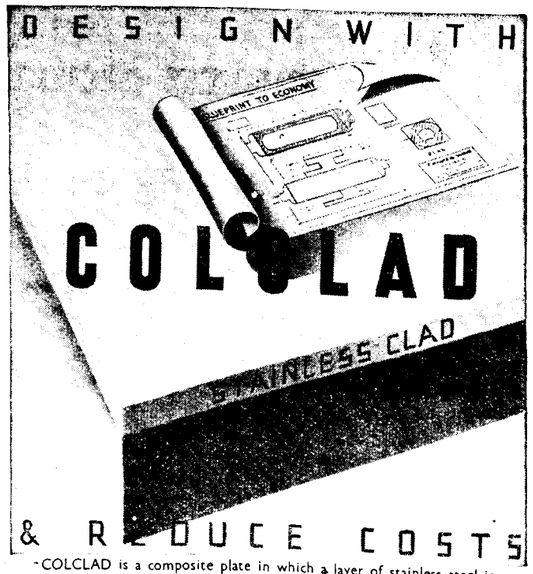
PUBLIC CONFIDENCE

Extract from the 1st Annual Report on the Royal Insurance Company's figures for **1845** :

"The accelerated progress both of the Fire and Life business may not unfairly be urged as evidence of increasing public confidence in this establishment."

Extract from the Statement by the Chairman, Col. A. C. Tod, C.B.E., T.D., D.L., accompanying the 104th Annual Report on the "Royal's" 1949 figures :



"1949 will stand in the records as a memorable year for the "Royal". Premium income, new life business and Underwriting Profits all surpass previous records, and results were favourable in all territories and in all Departments of our business.

"In a year which has seen political and financial crises abroad, and devaluation and political uncertainty at home, this result is a remarkable tribute to the stability and vigour of our business; with 70% of its premium income arising overseas the "Royal" Group of Insurance Companies is a powerful and invaluable factor in aiding Britain's recovery in these critical days."

COLCLAD is a composite plate in which a layer of stainless steel is bonded to a weldable carbon or low alloy steel. Special methods of manufacture ensure a uniform thickness of cladding. If protection is required on one side only COLCLAD offers equivalent corrosion resistance of solid stainless steel at considerable reduction in price. Easier fabrication and availability of plates in sizes larger than can be obtained in solid stainless steel, reduces production costs.
To assist YOU in adapting COLCLAD to YOUR products our technical staff is at YOUR service.

THE BUSINESS WORLD

The Sterling Balances

THAT rank nettle, the question of the sterling balances, is flourishing once more and, not for the first time, leakage of official information in Washington has encouraged its growth and sharpened its sting. The sterling balances have been under intermittent discussion by the American-British-Canadian committee which was set up in Washington after the financial discussions in September last year. In the course of these discussions the British liabilities for the sterling balances held by other countries were given considerable attention. It was recognised that many of the creditor countries are accustomed to hold all or part of their foreign exchange reserve in the form of sterling, and that the existence and availability of such holdings formed an integral feature of the multilateral use of sterling in financing a wide area of international trade. But the abnormal accumulation of sterling balances during and immediately after the war created an altogether new problem to which due recognition was given in the official communique issued after the September talks:

> In principle the whole of these balances represents a charge on the United Kingdom production of goods and services. In practice, however, a substantial proportion will continue to be held as reserves by the countries concerned. To the extent that the balances are liquidated, some proportion of the United Kingdom production of goods and services is used to discharge this liability instead of to pay for current imports of goods and services. This whole problem in its various aspects, including the necessity to provide capital goods for development, was discussed in a preliminary way on the basis of higher technical examination by the experts of the two governments. It was agreed that this was one of the subjects which concerned other countries and would require further study.

This "further study" has since been proceeding in Washington. Until recently it had taken the form of an exchange of informatory and explanatory material. But towards the end of last month a slightly more specific note was struck in a memorandum submitted by British representatives on the "ABC" Committee.

Source : Balance of Payments White Papers

This outlined certain possibilities of American action which would have the effect of lifting part of the burden of these balances from Britain. The document was no more than a working paper—a setting down of ideas which could not possibly be regarded as a series of firm proposals or requests. It ventilated suggestions which had already been repeatedly made in connection with the dovetailing of Marshall aid into President Truman's Point IV Programme. It presumably showed that, given the existing sterling area machinery, a certain part of the benefits of Marshall assistance was inevitably redistributed to members of the whole sterling area; from this it would be a logical step to suggest that if, under the Point IV Programme, direct dollar aid were given to some of the largest sterling creditors of Britain (including India, Pakistan, Egypt and other Middle East countries) it might be

Source : Economic Survey

reasonable to require of them a proportionate cancellation of their claims on the United Kingdom. The general project could be advanced as a demonstration of the link between several related problems—the sterling balances, aid to South-East Asia and the economic counter-attack against Communism. The timing of this working paper, on the eve of the Sydney Conference and of the London meeting of Foreign Ministers, was in no sense an act of opportunism; it recognised rather certain common foundations of the two series of talks.

In the distorted manner in which it found its unauthorised way to the American press, however, this memorandum was calculated to have the most unfortunate reactions. The chairman of the Senate Foreign Relations Committee immediately proclaimed the view that "the United States cannot and should not entertain the British plan"—a "plan" which Senator Connally had certainly not seen, and which could not be said to exist. To keep matters even between the two political parties, Senator Taft, chairman of the Republican Senate Policy Committee, declared that "the United Kingdom has shown extraordinary presumption in asking the United States to assume its debts". The reverberations did not end there. The principal creditors were quickly put on suspicious inquiry. India and Pakistan in particular declared that no such "proposal" to transfer Britain's sterling debt to the United States should be made without full authority of the creditors. This sensitiveness of the creditors is not altogether surprising. Some of them (India and Pakistan in particular) feel confident that they can extract aid from the United States without giving up any of their claims on the United Kingdom and they resent any suggestion that a bargain might be made on this issue behind their backs. A great deal of time and trouble has had to be expended since this latest Washington "leak" in remedying the damage and putting the material exchanged in Washington into its proper perspective.

The magnitude of the problem of the sterling balances can be gauged with somewhat greater definition than usual as a result of some careful estimates of the distribution of these balances which appear in the latest issue of *The Banker*. A résumé of *The Banker's* estimates is given in Tables III and IV below. The two preceding tables are directly derived from official information ;

TABLE III—ESTIMATED BLOCKED STERLING BALANCES AT END 1949
(£ Million)

	Fully Blocked	Maximum Working Balance
Brazil	31	6
Ceylon	40	7*
Egypt	253	69
India	680	100*
Iraq	82	3*
Israel	25	7
Pakistan	130	17*
Sweden	25	17
Uruguay	20	1
	1,286	227

* Maximum agreed releases for 1949-50. As some of these agreed releases were not transferred to free accounts before the end of 1949, the sum of the figures in column 1 above is not intended to tally with the figure for total blocked accounts shown in Table II. Moreover as some of these agreed releases were spent before the end of 1949, the sum of the figures shown in Columns 1 and 2 for each country does not necessarily tally with the corresponding estimate given in Table IV.

Source : The Banker

they show at a glance how slight is the extent to which official obscurantism on this subject has been relaxed.

It will be seen from these tables that while the total outstanding liabilities involved in these sterling balances underwent little net change over the year 1949, the categories comprised in the total fluctuated considerably. One of the most important variations is the decline from about £1,600 million to £1,350 million in the amount of blocked or restricted balances and the accompanying increase from about £1,750 million to nearly £2,000 million in the total of the balances freely usable for sterling payments. The situation has therefore changed to a greater extent, and in a more serious way, than the comparative stability of the total figures would appear to imply. The amount payable on demand has increased, and it is this total rather than the sum of the blocked or restricted balances which constitutes an immediate potential call on British resources. Since the "Economic Survey" was published, it has been stated in the House of Commons that about two-thirds of the £2,000 million of unrestricted sterling balances held at the end of 1949 belonged to sterling area countries and one-third to countries outside the sterling area. This information accords fairly closely with the estimates of the distribution of these balances reproduced in Tables III and IV. The running down of blocked balances has of course been made possible by the large releases permitted in 1948 and 1949 ; they have been officially stated to have aggregated £267 million and £218 million respectively. The greater part of these funds seem to have been released to Argentine (which has now exhausted its holdings of blocked sterling), India and Egypt.

Any reassuring conclusions which may be drawn from the study of last year's changes in the total of sterling balances depend wholly on the assumption that the countries that have increased their balances—notably Australia, South Africa and the African colonies—will at best continue their accumulations of sterling and at worst maintain the balances at their present level. There is, however, no necessary justification for this assumption. Australia, for example, regards its sterling balances as a real and effective reserve to be used in case of need. That need may arise from Australia's ambitious immigration programme—"20 million Australians in our time"—with all the capital development which it may call for ; alternatively, it may come from a sharp fall in primary commodity prices, in which contingency the sterling balances would certainly be used as a cushion to soften the impact of that blow on the Australian standard of living.

*

The importance of this volume of unused demand depends less on its size than on the time when it might be translated into effective demand. That in turn depends, to some extent, on the trust which the Sterling creditors repose in their central banker, and on the attitude of the banker towards his responsibilities. It is only exaggerating slightly to suggest that the banker has been bent on liquidating these accounts, which is not a thing that bankers do unless they are pressed by their creditors. But if the banker were to follow a more normal banking policy—in a word, to make it attractive to the depositors to maintain their accounts—the response might be surprising. If the world's confidence in sterling could be so restored (as only changes in the general policy of the British Government could restore it) that

Source : The Banker

it could be made freely transferable into all currencies (except of course into dollars), the problem of the balances might quickly become much more manageable.

To this extent, there is some ground for the argument that the Sterling balances no longer present—or at least that they no longer ought to present—a real problem,

since the big potential spenders have used their marginal sterling, leaving a basic minimum for use as working balances and monetary reserves. But the limitations of this argument must be admitted. There is no guarantee that the holders of "free" sterling would refrain from using them up in times of adversity, or even before adversity arrived. The weight of these sterling balances, and particularly of that part of them which is payable on demand, stands as a potential call on British resources that might be useful, if the world suffered an economic setback, in sustaining the demand for British exports, but which in present circumstances is more likely to present an obstacle to the progress of sterling towards true convertibility with other world currencies. It is not therefore surprising that there is still talk of international action to deal with this relic of the arbitrary and in some cases inequitable distribution of the financial burden of the war. Such action could be so ordained as to dovetail into the ebbing of Marshall aid in Europe, to promote the development of Asia and Africa and to assist the advance of sterling towards full convertibility. These are all hot issues—in America, in Britain and in many sterling countries. It may be too late to deal with them at all. It will certainly be impossible to do so and to satisfy at the same time American predilection for "open diplomacy." There can be no complaint when the open door reveals the truth. But when only part of it is seen through chinks and the rest distorted, when working papers become proposals and appear in the Washington press within forty-eight hours of being submitted in confidence to American colleagues, the way of advance does become unnecessarily complicated.

Films and the State—III

The Lions' Den

DANIEL, if he had sought friendly advice on entering the lions' den, might well have been advised to begin by getting on good terms with the lions. Much the same counsel has been offered to the British film industry on seeking a world market. To sell films in overseas markets is difficult in the teeth of hostility from the entrenched American film interests, and the advice is, therefore, excellent. British film producers can be forgiven, however, for feeling—in the absence of protection from any higher authority than the Government—that it may not be easy to get on good terms with these particular lions. Friendlier treatment from the Americans and better distribution in the American-dominated markets were among the results which were to follow (it was hoped) from the Anglo-American films agreement two years ago. But those hopes were disappointed.

Within a few weeks of the signing of the agreement, the American trade was thoroughly antagonised by the fixing of a high British first-feature quota. Whether, if this had not happened, British films would have got better treatment in the overseas markets is a matter for speculation. It is equally speculative whether, if the British industry had been able to bring its films to market on the requisite scale, the films would have proved to possess a sufficiently general appeal to be successful. The fact is that the industry has not succeeded in organising itself effectively for the worldwide distribution of its products, and only a few exceptional films have been brought before a North American public at all. Co-operation from the American industry, if it could be secured, could improve this state of things ; but the American producers have made it clear often enough that their co-operation would be conditional on the British industry accepting a modest and subordinate role—with which the British high quota policy is not consistent.

Government action has so far sought to expand British film production and guarantee British exhibition for the product. But the revenue from the British market is limited. Lacking an overseas market, the average British film has been failing to recover its costs from the British box-office. So far, therefore, the expansionist policy has been self-defeating, and film output, after being rapidly inflated, as rapidly collapsed. Its collapse has been unfortunately timed for the Government, which on Monday opens talks with the American film producers on the revision of the Anglo-American films agreement for its second two-year period. Government policy has pinned great hopes on domestic film production as a potential dollar-saver, but it has to be admitted that the hopes have not fared well.

Disappointments can, however, do good provided that their lessons are perceived. British policy towards the film industry in recent years has failed because it has sought to achieve too much at once ; it has not pursued a clear purpose, and has failed to regard the limited means available. As it exists, the industry in Britain is simply not a strong enough instrument to serve a policy of indiscriminate expansionism. It is necessary, therefore, to discriminate. What is the nature of the state's interest in the matter? Is the state interested in film production simply as a form of trading activity which it desires to encourage ? Then there are certain things that the state can do to help. But these have to be kept within the limits set by the modest trading capacity which the industry displays ; aiming too high, or travelling too fast, will do no good. There is, however, an alternative purpose and therefore another possible course of action. Is film-making to be fostered for non-commercial reasons—either to serve cultural purposes at home, or to enhance the national reputation abroad ? That is a possible aim, and one which the state might pursue. But the commercial film industry as it is at present organised in Britain is a grotesquely unsuitable instrument for carrying it out.

*

To take the first assumption first, one economic task which the British film industry is demonstrably not strong enough to shoulder is the task which was widely ascribed to it a year or two ago: to make Britain largely "self-supporting" in films within a measurable time. It is never easy to assess the usefulness of any "dollar-saving" project. The cultivation of groundnuts in East Africa is a useful dollar-saver if it produces a good crop at a reasonable cost ; but if it produces a bad crop expen-

sively it is nothing but an incubus. It may be acceptable that the cost of such a crop should be somewhat higher than the same commodity would cost in dollars, because dollars are scarce ; but how much higher ? There is no rule of thumb, no universally valid black-market rate for the dollar which the national planners can recognise. Given such a rate, the planners would know that they ought not to exceed it. Even without it, it is possible to recognise palpable absurdities when they become evident. If a dollar is worth 7s. 2d. at the official rate, it may be prudent to spend 7s. 9d. to save a dollar ; to spend £1 for the same return is the road to ruin. Domestic film production may be justifiable as a dollar-saver when it barely breaks even or, perhaps, when it makes a slight loss. But when it begins to make ruinous losses it ceases to be worth while. And since the process has now reached the point at which the losses have to be borne by the state, then the state will have to consider whether public money cannot be better used—perhaps to stimulate a dollar-earning industry instead of a dollar-saver. Alternatively, dollar-saving may have to be put on the familiar basis of self-denial by the citizen.

These considerations are worth bearing in mind in the negotiations with the American producers which open on Monday. In 1947-48 Britain was paying some $50 million a year for American films, and this is more than the British economy can "afford" at present. The American film industry agreed for the time being to accept in dollars $17 million a year plus a sum equivalent to the net dollar earnings of British films, and to leave the remainder—used or unused—in sterling. No doubt the British Government would like to bring down this rate of dollar remittance still lower, and the American film companies have let it be known that they would like to increase it. The resultant discussions may be acrimonious. But the one thing that can cloud them unnecessarily is the suggestion that supplies of American films can (because of the dollar shortage) be replaced by supplies of British films. They cannot, or only to a modest and limited degree ; if that degree is exceeded, if measures are taken which inflate British film production precipitately, the rate of loss on the average British product rises at an intolerable rate. There is, however, another course open. American film earnings could be restricted and no steps taken to find a substitute for the American product. The earning-power of the film exhibiting trade in Britain would then contract (to a level nearer that of the average European country) and dollar remittances would contract with it.

*

To outline the foregoing as a possibility is not to say that it will happen or ought to happen. The dollar shortage may be relieved in other ways. An intelligent and discriminating intervention in the film trade (on the lines, for instance, partly laid down in the Plant report) might stimulate the British film industry to improve its competitive position. The American producers might come to the conclusion that they could themselves achieve efficient production in Britain—overcoming what one of them recently called the "molasses atmosphere" in the British studios—and might spend some of their "frozen sterling" to their own satisfaction. All these things are possible. The gloomier hypothesis is merely presented in order to show that the dollar shortage does not, of necessity, justify a large domestic film output at any cost. In logic, it suggests something quite different ; it suggests less expenditure on film-going.

The attempt has been made in these articles to diagnose the state of economic health of British film production and assess its expectation of life, with or without injections of public money. They have led to the conclusion that even with the injections a big British film industry is not a good life. Some production will persist, on sheer merit. A film industry encouraged in habits of self-reliance and habituated to competitive disciplines can hope to survive, and survive usefully ; but it will only be on a modest scale of activity. This, however, is an economic calculation proceeding from strictly commercial assumptions. The state may still feel—and public opinion may support it, though this is uncertain—that film production on a more important scale is desirable on non-commercial grounds and on those grounds would justify the adventuring of public money.

To adjudicate for or against such a thesis would be out of place here. What can be said is that if this is the purpose, then its nature needs to be clearly recognised ; the idea of attaining it by a purely commercial process has to be abandoned, and other more appropriate means have to be devised. The trade as it is organised today cannot serve such a purpose, and if asked to do so will merely waste money. The producers are largely tied to the distributors, who in turn are tied to the exhibitors' assessment of public taste. The resultant standard has been neatly formulated in the United States as the "teen age rule," which lays down that a film for commercial exhibition should ideally be devised to suit the taste and match the state of mental development of the average youth and girl of nineteen.

*

No reason is apparent why the state, if it wishes to put its money into film production for reasons which are essentially not commercial at all, should accept the trade's standards as absolute. Yet this is the position into which it seems to be falling today. The National Film Finance Corporation, by the terms of its existence, injects public money into the film business through the existing trade mechanism on proposals which come from the trade ; it can initiate nothing. It cannot claim to be an arbiter of taste ; instead it has to work on standards of commercial merit which are obscure and patently unreliable. The trade is acutely suspicious of public interference, of censorship, of attempts to introduce standards of merit from outside, and this is reasonable in so far as the trade can maintain itself without state help. There should be no interference with producers who are prepared to support themselves, and there should be no attempt at monopoly.

But this is not to say that the state, if it does choose to take part in the film business, should bind itself to be a passive risk-taker. Perhaps it should participate actively—or not participate at all. Perhaps it should adopt non-commercial standards of taste and performance, and back its fancy in the same way as any other backer. Such an attempt would require the creation of new organs to train and recruit talent, to study techniques, to initiate production, and to bring the product to the market at home and overseas. It would be violently controversial. The possibility is outlined here in the hope that it may help to precipitate issues which are at present not clearly recognised.

Business Notes

Spring in Throgmorton Street

The mood in Throgmorton Street, though perhaps less fickle than the weather in this variable spring, has this week responded to the rise in temperature. The slight lifting of market oppression need not be attributed wholly, however, to the advent of spring sunshine. Rightly or wrongly, City observers regard the smooth launching of the big electricity issue as having removed an important potential source of pressure. More significant still has been the growing confidence that the difficulties which have lately overhung the Kaffir market will now be surmounted without untoward repercussions. If these two hopes are justified the City may perhaps be shaken out of its habitually morose contemplation of adverse influences—notably, of course, the burden of taxation, the pressure of rising costs and the length of the queue of claimant borrowers—and may focus instead upon the few minor blessings which this year has brought forth —the absence of new "soak-the-rich" devices in the budget and the reprieve from new threats of nationalisation.

These possibilities, however, still lie very much in the future, and certainly cannot be predicted from the minor shift of sentiment observable in the past few days. The £150 million BEA issue was officially described as fully subscribed; but the fact that applications above £250,000 received 16 per cent less than was sought did not shake the general conviction that some two-thirds of the issue has been absorbed by the "departments." The assumption that a burden has been lifted therefore looks premature, since a large part of the load will have to be shifted from the authorities to the market during the course of this year—unless official policy imprudently swings back into the bad habit of trying to keep the gilt-edged market sweet by injections of new credit. Meanwhile, the postponement of pressure has permitted a modest advance in prices. The BEA scrip opened on Monday at par—⅛ premium, dropped momentarily to a tiny discount and then rose later in the week to a premium of ⅜, now reduced to ¼. The moderate investment buying which supported this advance was at the expense of other dated and irredeemable stocks, but these later regained their slight losses and are now a little above the levels at which they stood on the eve of the loan. Short bonds have been noticeably firm.

*

At the other focal point of market concern, the week's experience pivoted about settlement day. Apprehensions that Tuesday might bring new difficulties to light provoked renewed weakness in gold shares on Monday. On Wednesday the failure was announced of a small firm of jobbers in the industrial market which had also dealt in Kaffirs ; but the general response to this unhappy incident was one of relief that nothing more serious had been encountered. Thereafter, gold shares staged a modest rally. This, perhaps, is an instance when the market idiom—"staged"—is permissible. At all events, this rally has been made the occasion for the launching of the big Stilfontein issue. The lists will open on Tuesday for an offer at par to the public of £1,350,000 of 5½ per cent Convertible Unsecured Loan Stock, 1954-60 ; a further £650,000 of the same issue has been underwritten firm. The sponsors hope that the distinctive features of this method of finance for developing mines—payment of interest during the development phase and the right to convert up to 50 per cent of the stock into equity stock as this phase gives place to production—may attract institutional funds which would not otherwise be available. The experiment will be watched with interest, for there is no doubt that novel methods will be needed if the many South African mining developments now in train are to secure all the resources needed to bring them to fruition.

Building Efficiency

The Minister of Works said in the Commons this week that action on the recommendations of the working party on building, so far as they concerned the Government, was already "on the move." One of these, no doubt, was the suggestion that "abrupt and violent changes" in the building programme should be avoided ; this was to some extent dealt with by the Chancellor in his budget statement—the house-building programme is to be 200,000 houses a year for the next three years. It is true that the Government's power to determine anything for three years ahead is at present doubtful, and it needs to be remembered also that the decision concerns house-building alone. Elsewhere on the building front, the fluctuations may be as abrupt as ever.

But, as Mr Stokes said, the majority of the working party's recommendations are directed to the industry itself and its associated professions ; and these he proposed to discuss with the National Consultative Council of the industry during the week. As a note in these columns suggested last week, many of the recommendations are in effect little more than advice to the employers and workers in the industry to make themselves more efficient. It will be tempting to pass on such good advice while leaving unsolved the central question: how to create conditions in which the employers and workers will be impelled to follow the advice.

To find any solution it will be necessary first to study the implications of the change which postwar conditions have brought about in the nature of the builder's activity. Before the war the average builder sold a commodity in the open market, and the inducements to him to keep his costs down were powerful and direct. Today most building is done under contract to an authority, and the average builder no longer sells a commodity ; he provides a service and makes a professional charge for it. The main elements in his costs—materials and labour—are in practice outside his control, and the rise and fall clauses in the contract insure him against their incidence. His remuneration is virtually on an on-cost basis. Perhaps something could be done to introduce mobility into this state of things by ordering houses in a different manner where circumstances permit. One suggestion is that where a large housing estate is to be developed a builder might be licensed to develop it within a certain capital sum, without a rigid upper limit on the number of houses he is permitted to build. He would then have some scope for ingenuity. In general, however, the builder's new status is likely to persist so long as private building enterprise is confined to a strictly subordinate role. It seems necessary, therefore, to review the whole system of contracts and charges in the light of this fact, in a more fundamental maner than the working party attempted.

Last week's note contained an error ; the statement that productive efficiency had recovered to a quarter of its prewar level by the end of 1948 should have read that it had recovered to three quarters of (or a quarter below) the prewar level.

Transport Costs Debated

Discussions on transport policy in the House of Commons are becoming more frequent and less effective. On Wednesday Sir David Maxwell Fyfe moved to annul the regulations giving effect to the one-sixth increase in railway freight charges which comes into effect on Monday. The points he made were familiar but they fastened attention on questions of costs and efficiency. Sir David suggested "a rapid inquiry by a small body of practical experts in railway running into the possibility of economies, of

increased efficiency and increased traffic." It is possible to doubt where the one or two practical experts who could tackle these enormous questions at high speed could be found. But the proposal recognises a real dilemma. All the calculations submitted by the Transport Commission in support of their application for increased freight charges rested entirely on the Commission's assertion that efficiency was being unremittingly pursued. Spokesmen for the Commission managed to convey, even if they did not intend to do so, an appearance of satisfaction about achievement towards efficiency. And the conclusion of the Transport Tribunal, having heard this evidence, was that although the estimated economies in 1950 appeared disappointingly small, it must be left to those responsible for the conduct of the Commission's activities to forecast what economies they were likely to achieve and that the Tribunal had no justification for rejecting such estimates.

Neither the Minister, nor the Opposition, nor the public can succeed, where the Transport Tribunal failed, in testing the claims about savings and efficiency put forward by the Commission. Certainly the Minister by resorting as before to the improvement of operating statistics in 1948 compared with 1947, can hardly suppose that he is touching the root of the matter. The essence is simple even though the answers are difficult. Are the increases in charges the least that are necessary to balance the Commission's books? Are the Commission and their executive agents doing all that could reasonably be expected to attain maximum efficiency? Is there enough mobility of men and ideas? Is the structure of the transport organisation too rigid? Is management too concentrated in London and too diffuse in the country? The question of efficiency is not a matter of merely trainloads and ton-miles per engine hour. It goes deep into the character of the new organisation which has been set up under the Transport Act. For this reason the small body of practical experts (if they could be found) could hardly do the job that is needed; that entails a much more fundamental study of the nature of the organisation itself and the uncovering of all the things which prevent it from working satisfactorily.

The debate on increased freight charges coincided with the opening of the inquiry into the London Area Charges Scheme. This scheme is of a more fundamental and permanent character than the application for increased freight rates which was made last November. It seeks to establish standard charges for passenger travel in the London Transport area and will clearly entail a long inquiry before the Tribunal. This week's proceedings have disclosed that the British Transport Commission estimates its deficit in 1950, after making allowance for the increased freight charges and the recent increase in fuel duty, at approximately £15 million compared with £23.3 million for 1949. An estimate for a notional full year, giving effect to railway freight increases and the additional net receipts from the London Area Scheme now proposed, would be a deficit of £1,400,000—before any allocation to write off past losses or making provision for general reserve.

* * *

Rising Costs and Steel Prices

The iron and steel industry has decided not to pass on to consumers the increase in its costs (estimated at about 10s. a ton of finished steel) which will arise from the higher rail transport charges. This is a pleasant surprise to many steel-using industries. At the same time it is a little puzzling. The new railway charges bear hardly on bulk freights such as steel and the raw materials of steel, and in the hearings before the Transport Tribunal the steel industry put up a weighty case against the increases. Further, the industry has had other heavy increases in costs to bear in the past year. The greater use of imported scrap has raised the average price paid for a ton of scrap, and devaluation made German scrap more costly than ever. Oil fuel, which is largely used nowadays in the melting shops, became 15s. 6d. a ton dearer after devaluation. The price of some imported ores also rose towards the end of 1949 for the same reason.

How can all these increases in cost be absorbed? The federation has explained that rising production has made savings in the import programme possible. These savings must refer mainly to the import of semi-finished steel for rolling. A year ago, when the steel subsidies were reduced, the industry took over from the Government the burden of the excess cost of imported over home-produced semis; steel prices were then raised to carry this and certain other charges, though the Government continued to meet the excess cost of imports of finished steel products. Reduced imports of semis will thus save money for the industry. Further, as home output grows the incidence of such subventions on a ton of home-produced steel is spread more thinly. The continuing growth of output should serve as a reminder once more—if a reminder is needed—of the fact that the steel distribution scheme has become redundant.

It is still early to say for how long the various cost-raising factors can be nullified by expanding output. Much will depend on the technical success of the industry's development programme. As the programme takes full effect it will not be enough to rely on a bigger total output alone; the operating economies and the fullest utilisation of the new or improved plants will play the crucial part. As the signs of competition from other European steel producers become plainer in the export trade, such economies become more important than ever, and the nature of the export trade makes it most urgent of all that the finishing sections of the industry should grow in efficiency.

* * *

The Miner's Stint

Ever since the disastrous attempts in 1947 to persuade Grimethorpe miners to work a longer "stint," the problem of how to achieve greater output from the individual face-worker has defied the industry's leaders. The decision of a joint committee of the Coal Board and the National Union of Mineworkers to recommend pits to adopt a system of team or individual "stints" in place of the present standard stint may thus be of great importance. Under the present system, work is allocated to men irrespective of their personal capacity or physique. The new proposal, by providing a real incentive to output, should encourage the younger and stronger men to increase their individual effort.

It will be left to the divisions to work out appropriate schemes for their collieries. Everyone will hope that their efforts will not lead to friction, but will meet with a real response. But the difficulties of persuading pitmen to change their habits are formidable. The fact is illustrated by the opposition to a scheme for time and motion study in the northern coalfield. The miners, like many industrial workers, associate the stop-watch with speed-up and the Bedaux system; they do not (they have said) want any "efficiency spies" in their coalfield. The Northern divisional board has therefore decided not to pursue the proposal. Consultation by the management with the men—and not merely with the National Union of Mineworkers—needs to be full and careful before any such scheme can hope to succeed in the existing psychological condition of the industry.

British Aircraft in America

The De Havilland Dove, a small piston-engined aircraft carrying up to a dozen passengers, may go down in aviation history as the first British aircraft to be used by American operators. Within the next week or two the Civil Aeronautics Board of the US Government is expected to grant it the American equivalent of a certificate of airworthiness. Since it was developed at the end of the war, the Dove has had a certificate of airworthiness from the British Air Registration Board, but this is not valid in the United States. Both authorities lay down stringent regulations, and an aircraft which has met the requirements of one licensing authority has also, in fact, attained the general standard of airworthiness demanded by the other. But the two sets of requirements differ in detail in such a way that an aircraft designed to satisfy one authority is unlikely to meet the requirements of the other at every point. In consequence either authority can always find grounds for refusing a certificate of airworthiness to an aircraft already approved by the other; each has, therefore, the power to prevent the use of foreign-built aircraft by its domestic air lines.

Since the war the British board has tended to accept without demur the certificates issued by the Civil Aeronautics Board to American aircraft imported for use by the British corporations, but the Dove represents the first case in the reverse direction. No aircraft of this particular size is built in the United States, and repeated attempts have been made to get its British certificate recognised there. Modifications recently made to the aircraft have brought it more closely into line with American licensing requirements, and the Civil Aeronautics Board has agreed to accept the assurance of the Air Registration Board that the Dove now meets the requirements laid down.

This unbending, limited though it is, may mean that the Civil Aeronautics Board is preparing itself for the possible import of gas turbine civil aircraft from Britain. The American aircraft industry is now appealing to Congress for a subsidy to build similar aircraft on the grounds that American airline operators will otherwise be obliged to go to British firms for their new fleets. From this distance the request does not seem reasonable, and it remains to be seen how it will be received.

*

It is not yet known what requirements the Civil Aeronautics Board is going to lay down for these aircraft. The International Civil Aviation Organisation of the United Nations has attempted to draw up a series of recommenda-

Binding Cases

Binding cases for THE ECONOMIST *and* RECORDS & STATISTICS *can now be supplied. These new cases, made by Messrs.* EASIBIND LTD., *are in stiff, dark blue cloth covers, and are gilt-lettered on the spine. The cases are of a new design and provide an extremely effective and firm binding.*

The case for THE ECONOMIST *will hold 26 issues and the half-yearly Index; that for* RECORDS & STATISTICS *will hold 52 issues. The year can be stamped on the spine.*

The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, **not** *to* THE ECONOMIST, *but to—*

EASIBIND Ltd.,

(Dept. E), Pilot House, Mallow St., E.C.1.

A binding case can be sent on approval, if required.

GEORGE II WAS KING

The private bank of Glyn, Mills & Co. was founded in 1753. It withstood the vicissitudes of the uneasy 18th century. It grew strong in the expansion of the 19th, aiding many a small enterprise to rise to international prominence. Today it is still a private bank. It still acts as financial guide and mentor to many great industrial concerns. It has large resources, and a completely modern yet personal banking service available to those firms now planning expansion in the mid-20th century.

tions as a basis for an internationally recognised certificate of airworthiness, but these recommendations are still being debated. The International Air Transport Association, to which the airlines belong, is meeting this month to draw up some recommendations of their own for gas-turbine aircraft, but these will have no official standing. Since there are no gas-turbine civil aircraft in America, the Civil Aeronautics Board has so far been asked to grant civil licences only for engines. There are grounds for expecting that it will come under strong pressure to refuse licences for foreign-built aircraft. The attitude which will be taken is of immediate importance to several British firms—to de Havilland because of the interest in the Comet, to Vickers because the Viscount already has a British Certificate of Airworthiness, and to the Avro Canada, the Canadian subsidiary of the Hawker Siddeley Group. The Avro Canada turbo-jet C 102 is a competitor of the Viscount and has been somewhat surprisingly described in the United States as "America's first jet airliner." The C 102 has been designed with possible Civil Aeronautics Board requirements in mind.

* * *

Simpler American Customs

Mr Snyder, the Secretary of the United States Treasury, recently laid before the House of Representatives the text of a proposed Customs Simplification Act. The object of the Bill is not to make changes in American tariffs, but to simplify and expedite the work of the Customs. British exporters to the United States have long complained that the procedures of the American Customs were costly, time-consuming and inequitable. No British exporter will suppose that the laying of the Administration's Bill before Congress will change these conditions overnight; much time will elapse before the Bill is enacted, and amendments are to be expected. The Bill is, nevertheless, a welcome attempt to lower the purely administrative hurdles that imports into the United States have often had difficulty in clearing.

The most important feature of the Bill from the point of view of British exporters is the proposed elimination of "foreign value" as a basis for import duty. The complications of Section 402 of the Tariff Act of 1930 (which defines what "value" means for the American tariff) are a specialised study in themselves; they were summarised in an article, "Through the American Tariff," which appeared in *The Economist* of February 18, 1950. At present the American Customs are bound to take "foreign value" or "export value," whichever is higher, for assessing *ad valorem* duties. "Foreign value" is the price at which the merchandise is freely offered for sale for home consumption in the country of origin. It is the most common basis for assessing duties, though it is often very much higher than the price at which the goods are actually sold to the American purchaser. This use of "foreign value" probably causes more trouble and irritation to British exporters than any other feature of the tariff; to work it out often involves lengthy investigation in this country and examination of the exporter's books by the United States Treasury officials. To drop "foreign value" and to substitute "export value" (that is, the price at which merchandise is freely offered to all purchasers in the usual course of trade for export to the United States) would relieve British exporters of a good deal of uncertainty and of arbitrary decisions.

As a source of trouble to British exporters, the marking regulations of the 1930 Tariff Act are only second in importance to the value provisions. The Bill would make no difference to the rule that the imports into the United States should bear an indication of the country of origin, but it does propose to abolish the special marking regulations that apply mainly to metal articles such as cutlery, clocks and watches. The proposed exemption from duty of postal parcels imported for personal use up to the value of $10 and other parcels up to $5 should be helpful; so would the exemption from formal Customs entry and consular invoicing of consignments up to $250, as against $150 as at present. Repeal of the discriminatory effect of certain internal revenue taxes on whisky should also be welcome to the distillers. American domestic spirits are almost always above "proof" (that is, 50 per cent or more alcohol) at the time tax is paid, and they are taxed on the "proof gallon." Imported potable spirits are generally under "proof" at the time of importation and are taxed by volume, on the basis of the so-called "wine gallon." In other words, the importer pays full tax on the water which has been added to the spirits. The Bill provides for the calculation of all taxes and duties on the basis of the "proof gallon."

Contradictions in Rubber

This week the rubber market has continued its remarkable advance; the London spot price is now only a farthing below 2s. a lb., though future prices have shown some slight tendency to ease. Current supplies are still well below current requirements, and some dealers are anxious about the future. The communique issued at the end of the Brussels meeting of the Rubber Study Group might have been expected to make the market bearish—but it had no such effect. World production of natural rubber in 1950 was estimated at 1,605,000 tons, an increase of 121,500 tons on 1949, while world consumption is put at 1,465,000 tons, or only 37,500 tons more than last year. These estimates certainly seem out of line with a record postwar price for rubber, but in the past the estimates of the Rubber Study Group have usually been reliable.

Their reliability is of great consequence to the rubber market. If they are likely to be fulfilled, then it must be expected that the price of rubber will show a sharp fall later this year. But on what factors are the estimates based? Malayan output this year is forecast at 685,000 tons, compared with an annual rate for the first quarter of this year of 644,000 tons. Indonesian production is put as high as 520,000 tons, whereas so far this year it has been at an annual rate of 340,000 tons. The latter figure, however, represents supplies marketed, not actual production; if the Indonesian smallholders regain confidence in their currency they will sell all they can produce and also all the supplies they have been hoarding during the past nine months. Taking Malaya and Indonesia alone, then, the group's estimate of "production" is fully 200,000 tons higher than the recent rate.

Consumption of natural rubber this year is forecast at 1,465,000 tons, of which the United States is expected to use 600,000 tons. Both of these figures are below current rates. World consumption is at present running at 1,500,000 tons a year and American consumption at 710,000 tons. If economic activity in the United States is maintained, current rates of consumption are likely to continue, though it would be dangerous to project them into the indefinite future. On synthetic rubber the Study Group was closer to current trends. American consumption was forecast at 425,000 tons, compared with 414,000 tons last year and its present annual rate of 415,000 tons. Allowance was clearly made for some switch from natural to synthetic rubber.

* * *

Warning for the Future

The estimates of production and consumption of natural rubber issued by the Study Group at least present a warning to the market. If political and economic stability is regained in south-east Asia, available supplies of rubber will expand sharply. On the other hand if, as some observers fear, the present American boom is checked towards the end of this year, consumption of rubber would then fall. The Study Group has in fact tended to take a more optimistic view of supplies and a more cautious view of demand than the market. At the moment, that view appears to be wrong, but it is perhaps as well that the Study Group had courage to show that the conditions that are causing the present high price of rubber cannot be expected to continue for all time.

Dear rubber is also likely to influence American government policy regarding synthetic rubber. General purpose synthetic sells in the United States at 18½ cents (1s. 3¼d.) a lb. and manufacturers are still using much more than the legal minimum, though between October, 1949, and March, 1950, there was a switch towards natural rubber in the manufacture of tyres and inner tubes. If the American government feels that the high price of rubber is likely to be more than a passing phase (reflecting a prolonged shortage of the natural product) it may well expand the production of synthetic rubber and increase once more the minimum quantity to be consumed in certain products. By such an act the natural rubber industry might in the end lose more than it stands to gain from the present high price.

PRODUCTION & CONSUMPTION OF RUBBER

Dearer Base Metals

Base metal prices are fully reflecting the present wave of American prosperity. Lead, which has crept up during recent weeks from 10 cents to 11¼ cents a lb., rose again this week first by ¼ cent and then by ½ cent to 12 cents (£96 a ton) and the British price was raised in conformity by £6 to £96 a ton. Zinc has risen by ½ cent to 12 cents a lb. (£96 a ton), making a rise of a cent in less than ten days and a further increase was expected as this issue went to press. In Britain the price has been raised by £4 to £103 10s. a ton. The long-awaited increase in the price of copper has also not yet been announced, but it was considered to be imminent. Even tin has benefited from this upward surge in base metal prices, being quoted ¾ cents dearer this week in New York at 77¾ cents a lb.

The pace of the market has been set almost entirely by American demand. It is true that British consumption of zinc in the first quarter of this year totalled 60,000 tons or 6,000 tons more than a year ago, while lead consumption increased by 2,000 tons to 41,000 tons. In contrast the consumption of copper in Britain fell by 7,000 tons to 128,000 tons; tin consumption was unchanged. But in the United States the record level of motor vehicle production has led to a heavy demand for copper far in excess of available supplies. The demand for zinc (particularly for brass making) and for lead has also been strong. World output

2¼% TAX PAID by the Society

a Sound and Convenient Investment

Those people who wish to invest limited capital with safety and facilities for withdrawal at par will be pleased to learn that the Portman Building Society can again accept amounts up to £5,000.

"£1 A DAY FOR LIFE—"

That's what I'll get when I'm 65"

After years of hard work you owe yourself security and comfort in your retirement. Equally, you must safeguard your family in the case of anything happening to yourself in the meantime. These considerations need not conflict: the double guarantee offered by the Imperial Life of Canada helps you protect your dependents while increasing your own retirement income. Regular deposits, on which income tax is saved up to 18%, can secure for you these advantages at the age of 65 (or earlier if you wish):—When you retire, an income of £300 a year in addition to your State Pension, payable to you for life. If you prefer, you can take instead a lump sum of over £4,000 and substantial profits.

If you do not reach pensionable age, £2,500 in cash to your wife plus £450 a year for the period arranged. Outstanding mortgage payments can also be covered. Investments can begin at any age although for higher ages the pension may start later. But why delay your well earned relaxation — secure your future by beginning *now*.

USE THIS COUPON

If I invest about £..... annually what shall I get at age ..... (55, 60 or 65?)

NAME ..... Date of Birth .....

(Mr., Mrs., or Miss)

ADDRESS .....

of each of the base metals has been maintained at a high rate and in some cases has shown an expansion, while available supplies in the United States have been augmented by appreciable shipments of copper from Japan and of lead from Jugoslavia. The strength of the market can be gauged from the fact that these additional imports have done no more than temper its bullish sentiment; six months ago they might well have caused prices to fall.

* * *

Airline Finances and Air Mail

The accounts of the two British airlines are not expected to be published until October, but Lord Douglas, the chairman of British European Airways Corporation, said this week that he expects the 1949-50 accounts of his corporation to show a deficit of £1,450,000, about half of last year's deficit. It had been hoped to bring the figure down to £1,300,000, but between September and the end of the financial year in March the effects of devaluation raised the corporation's operating costs by £180,000. In a full year these will probably increase costs by nearly £500,000; more than half of the increase will come from the higher price of fuel. Nevertheless, Lord Douglas suggests that the deficit may be reduced in 1950-1951 by another 17 per cent, *i.e.*, to £1,230,000 largely by increasing the number of hours flown. The increased petrol tax, which is not taken into account in this calculation, will be paid only on fuel consumed on flights within Britain, which form only a small proportion of the corporation's total flying.

At the same time, Lord Douglas made it clear that the corporation was not relying solely on increased loads for its greater revenue. The further reduction in the annual deficit was, he said, "dependent on our getting a fair price from the GPO" for carrying mails. A new contract is now being discussed between BEAC and the Post Office. The contracts are confidential, but evidence given to the Committee on Public Accounts last year made some of the facts public. The Post Office made a profit of £780,000 on air mails in 1947-48. Still, its payments for air carriage were equivalent to about twice the passenger rate. The Post Office spokesman is worth quoting on this point:

> I might perhaps put it this way, that the total weight of air mail is 12 per cent of the load, but for the air mail we pay 24 per cent of air revenue.

This might be regarded as a subsidy to the air lines. But the air lines contend that the rates are too low. There are many precedents for subsidising air lines through the mail rates and the American post office estimates its own payments of subsidy in this form to amount to $50 million annually on air mail. The British air corporations, however, are openly subsidised by Parliament, and in these circumstances the necessity of a second, concealed subsidy become questionable.

* * *

Apportioning the Subsidies

The Minister of Food, Mr Maurice Webb, has at least started his tour of office by giving much more detailed information on the food subsidies than his predecessor. It is now possible to compare, with some degree of accuracy, the cost of subsidising the different home produced and imported foods. The accompanying table has been built up from information given in recent weeks in answer to Parliamentary questions. The main reduction in subsidies between 1948-49 and 1949-50 was borne by imported foods; during the present financial year it is to be borne by home produced foods, chiefly through the abolition of the feeding stuffs subsidies and the reduction in the fertiliser subsidy. The implications of the subsidy policy for home agriculture are discussed in a leading article on page 1046.

The allocation of the subsidies among the different foodstuffs clearly shows the importance of milk production in the Government's agricultural programme. The subsidy on milk rose from £44 million in 1948-49 to £63 million last year, while this year it is expected to cost £74 million. In addition, the various welfare milk schemes cost £31 million a year. For three products—meat, eggs and bacon—the subsidy on home produced exceeds that on imported supplies. For three other products—flour, butter and cheese—the opposite is true. But in each instance if the cost of subsidy per unit of food consumed is calculated for home produced and imported supplies, the cost per unit of home

produced foods far exceeds that on imported foods. On flour, butter, cheese and sugar, the extra subsidy for home produced supplies is not great, but on eggs it is more than double, on bacon nearly double and on meat over twenty times. Indeed, the subsidy cost for home produced foods up to 1949-50 was even greater than these figures suggest, since allowance should be made for apportioning the subsidies on feeding stuffs and fertilisers among the various items.

The table clearly shows that the expansion of home food production is a costly operation and that the British public could feed more cheaply by relying to a greater extent on imported supplies. The problem is, of course, not so simple as that, at least not until Britain can balance its overseas payments. Secondly, the concentration on milk production, and the larger subsidy which has to be paid to dairy farmers to ensure the sale of their output, has led to higher costs—and therefore larger subsidies—in other branches of agriculture. For example, if milk were less profitable, the cost of the subsidies on home produced meat, eggs and bacon might well be much lower than it is at present.

Mr Havenga and the IMF

The South African Finance Minister had some hard things to say this week about the International Monetary Fund's rejection of his request that gold producing countries should be allowed to sell up to half their output at premium prices. Yet that rejection (which was briefly reported in *The Economist* last week) was neither unexpected nor, in the short term at least, of serious consequence. It is irksome, no doubt, to South Africa that only a very limited quantity of gold may be sold at premium prices and that the gold concerned has to go through the senseless (and expensive) stages of being processed into "industrial products" and then de-processed into gold bars before being let loose on free markets. But the fall in the premium price of gold to only $3 an ounce above the official price has now made these transactions unprofitable. If the IMF had given its blessing to less fettered premium sales, the expenses involved in processing and de-processing the gold could have been avoided; but the increase in supply would certainly have meant that the premium of the free market price over the official price would have dwindled or disappeared.

In these circumstances, Mr Havenga's indignation can only be based either on injured semi-innocence (as witnessed by his observation that since several important members of the IMF did not conform to its gold policy there was no reason why South Africa should do so either) or on the belief that the time must come when renewed disequilibrium in world exchange rates would drive the premium price of gold up again. If this does happen it will, of course, be irksome for gold producing countries that they cannot legally take full advantage of it; yet they would do well to remember that the special position of gold on world markets brings with it a responsibility which cannot be shaken off if its advantages are to be maintained. Sir Stafford Cripps revealed in the House of Commons this week that the British representative on the Executive Board of the IMF had been instructed to vote both against South Africa's proposal for wider freedom for premium sales and against its even more forlorn request for an increase in the dollar price of gold; even if it be granted that Britain's interests are on the side of the gold producers rather than on that of the gold users, this instruction was not, on a long view, necessarily unwise.

German Potash Bond Progress

A further hurdle has been taken in the protracted negotiations to secure for bondholders of the Potash Syndicate of Germany the foreign exchange proceeds from wartime potash exports. High Court approval was given last week to the agreement reached in March, 1949, between the Dutch banks and the British trustees and paying agents concerning the transfer of Fls.24,400,000 and U.S.$1,100,000 formerly blocked by the Dutch Custodian of Enemy Property. The agreement makes transfer conditional upon the payment of a small commission to the Dutch custodian and stipulates that none of the funds are to find their way into enemy hands. Now that court approval has been given, application will be made to the Dutch banks for the transfer of the funds. This will come at a somewhat inopportune moment; Holland will have to find some £2,600,000 at a time when the Netherlands Bank is employing its overdraft facilities with the Bank of England to meet current Dutch sterling liabilities.

Before the money can be paid out, it will be necessary to decide the form of the repayment. To this end, a bondholders' meeting is to be convened, under the authority of a private Bill that has already passed through the House of Lords and is now in Committee in the Commons. If, as is generally expected, payment takes the form of capital redemption, bondholders should receive the equivalent of over £40 in cash. The difference between this prospective receipt and the current market price of 74 for the 7 per cent issue may be regarded as representing the cost of an option on a further—and more problematical—40 per cent made up from the equivalent of Sws.Frcs.3,300,000 in Switzerland, $5,700,000 held by the American Custodian of Enemy Property, and a claim to future interest payments from proceeds of potash exports. Such calculations have doubtless helped to raise the price of the 7 per cent issue

WHO?

WHERE?
WHY?
HOW?

A Method That Gives You All The Answers .... At Sight—At Once—Without Searching.

WHAT DO YOU NEED?
IS IT COVERED BELOW?

MOST men have heard about machine accounting, time and motion study, and similarly efficient methods for getting better results.

But not all of them know that an unobtrusive revolution is quietly taking place in certain fundamentals of modern commercial practice.

. . . And this without the addition of any new or expensive plant and equipment.

Before the war, a "file" was a place where papers and correspondence were housed together for possible (if infrequent) reference purposes.

Today, that is all changed.

Today, the file is a compendium of information about someone or something . . . VISUAL information. Instead of a flimsy envelope or folder loaded with papers, it is a neat, suspended box-like file *showing at sight* a great deal of essential information. You can *see* at once the name of your customer, his address, telephone number, major executives—as well as the day and month when he was last called on, written to, ordered or any other such information you may require.

Each file is flat on top, colour coded to prevent misfiling, colour signalled to convey dates or facts—and fitted with a slotted-in record card for annotating special data or for transfer or cross-reference purposes.

Above you have the "a, b, c" of the shannographic system—in the same way that one can say that a Shakespeare play comprises twenty-six letters of the alphabet. But what you want to know is how shannographics can help your *specific* problem . . . on selling, advertising, export, production, accountancy, personnel and so on.

A list of shannographic plans appears below. Just tick the one(s) which interest you and attach this advertisement to your letter-heading. Then post to the address below and you will receive, by return, a detailed explanation of how this modern method operates in the special field you have indicated.

Multiple Rates in South America

The last faint rumblings of the exchange rate earthquake last September are still making themselves felt in those Latin American countries that were then unable to make up their minds to devalue. The two latest systems of rates to be officially confirmed—those of Bolivia and Chile—throw some interesting light on the present attitude of the International Monetary Fund towards multiple exchange rates. There was a time when circles close to the IMF tended to look on such rates without too much disfavour—provided they did not involve discrimination between countries of destination or origin. As late as last September, indeed, the Fund's annual report stressed the difficulties involved in fixing a single exchange rate which would serve the dual purpose of encouraging exports and restraining imports in countries where costs could not be relied upon to adjust themselves rapidly to rising prices and where the tax system was not sufficiently advanced to prevent exporters or importers from making windfall profits " arising from the establishment of a uniform rate at a time when costs and prices were still out of line ".

In its negotiations with Chile and Bolivia, however, the IMF has plainly been trying to persuade both countries to ride boldly over these difficulties. In Chile's case it has not succeeded. Before devaluation, Chile had five different rates in operation: a " government " rate of 19.47 pesos to the dollar at which the principal mineral companies had to sell part of their dollar earnings; a " preferential "—and unimportant—rate of 25.10 pesos to the dollar at which newsprint, sugar and cellulose were imported; an " official " rate of 31.10 pesos to the dollar at which some other prime necessities were imported; a " banking " rate of 43.10 pesos to the dollar which was the rate most widely in use for both import and export transactions; and a " curb " rate, which varied between 60 and 100 pesos to the dollar but which was fortunately losing most of its importance (although non-trade transactions were at one time financed at it). For the past six months the IMF has been trying to persuade Chile to cut down this fantastic edifice and establish a single rate of either 60 or 65 pesos to the dollar. In January, indeed, it seemed that the IMF had succeeded; a single Chilean rate of 60.10 pesos to the dollar was provisionally declared to be coming into operation. The most recent reports from Santiago, however, suggest that all that Chile is now willing to do is to shift part (but not all) of the transactions formerly financed at the old banking rate of 43.10 pesos to the new rate of 60.10 pesos. The Government is also contemplating the introduction of new export subsidies and a reshuffle of customs duties. In brief, after six months of talking about simplification, it has apparently decided to make the present incredible confusion even more confounded.

In contrast with this juggling, the recent revision of the Bolivian exchange rate is a fairly simple affair. Before devaluation there were three different rates in the Bolivian structure: a rate of some 42 bolivianos to the dollar which applied to specified percentages of all export proceeds and to the bulk of imports; a rate of some 56 bolivianos to the dollar which applied to given percentages of mineral export proceeds and to a limited number of imports; and a fluctuating free rate of about 100 bolivianos to the dollar (which was given official recognition only last October) applicable to non-trade transactions. The present Bolivian intention seems to be to buy and sell exchange for trade transactions at a new uniform rate of 60 bolivianos to the dollar; in view of the increase in wage costs and the fall in the dollar price of tin, however, the proceeds of mineral exports are, henceforth, to be converted at 70 bolivianos to the dollar.

Imports of Cement

The Cement Makers' Federation will import about 50,000 tons of cement and cement clinker in May and June to meet local shortages. Stocks of cement were not built up on their normal scale last winter, perhaps because of the unusually mild weather, and perhaps because capital investment went on undisturbed by the cuts announced in the autumn. Complaints of shortage of cement have lately been numerous, and it may be true that some merchants have tended to make the position worse in individual districts by buying up cement indiscriminately. The quantity now to be imported is small, perhaps a third of a week's consumption, but the cement makers hold that it should be sufficient to tide over the difficulties. Home production is expected to reach 9,600,000 tons this year. This will represent an increase of 400,000 tons, and exports are now going to be slightly lower than the 2,000,000 tons originally planned. In the circumstances it may prove possible to meet home demand without further imports this year.

Last year about 220,000 tons were imported, most of it from Germany. Lord Morrison, parliamentary secretary to the Ministry of Works, told the Lords last month that cement could be imported from several countries without licence, but would be more expensive than home-produced cement. It is estimated that cement from Belgium (the source of much of this year's imports) or Germany would sell, unsubsidised, in London at £6 10s. a ton compared with the home price of £3 10s. The federation has been buying the cement at about 85s. a ton f.o.b.—giving a delivered cost in London of about £6; the remaining 10s. would represent merchant's profit if the transaction were conducted through ordinary trade means. In fact, the federation handles the cement itself, resells it at the ruling British price, and pays the difference from funds of its own.

Shorter Notes

Exports in April declined by £34 million to £150 million, and even when allowance is made for the shorter working month owing to the Easter holidays they were still below the average for the first quarter, but £12½ million above the figure for April, 1949 (which also included the Easter holidays). Imports during the month totalled £211 million and re-exports £6,000,000. Thus the excess of imports (valued c.i.f.) over exports (valued f.o.b.) amounted to £55 million, making the total for the first four months of the year £125 million, against £107 million in the same period of 1949. Exports to Canada, adjusted for the shorter working month, continued to improve and were 13 per cent higher than in March. Shipments to the United States, however, fell sharply and were the lowest since last October.

*

The British European Airways Corporation is shortly expected to sign its long-delayed contract with Vickers-Armstrongs for a number of Viscount aircraft. The corporation's chairman, Lord Douglas, said in the United States that 25 of the aircraft will be ordered, but it is not yet known if he meant that all these would be used by British European Airways, or whether some of them were intended for the associated corporations which include Aer Lingus and Alitalia. The prototype of the Viscount 700 (the form in which the Viscount will go into production) will make its first flight this summer, but the first deliveries to the corporation will not take place until next year. It was originally intended that the Ministry of Supply would place a single order with Vickers for aircraft for BEAC and for the British West Indies branch of BOAC. British European Airways have since decided to place their own order independently. The order for BOAC has still to be negotiated and signed.

ABRIDGED PARTICULARS

PHILIP HILL & PARTNERS LIMITED

announce an issue by

STILFONTEIN GOLD MINING

COMPANY LIMITED

(*Authorised Capital* £3,500,000 *of which* £2,750,000 *is issued and fully paid*)

of

£2,000,000 5½ per Cent. CONVERTIBLE UNSECURED LOAN STOCK 1954/60 AT PAR

THE SUBSCRIPTION LIST WILL OPEN AND CLOSE ON TUESDAY, 16th MAY, 1950.

The Prospectus shows (inter alia):

(1) The Company was incorporated in the Union of South Africa on the 23rd April, 1949, for the purpose of carrying on the business of mining for gold. Mineral Rights have been acquired in the district of Klerksdorp, Western Transvaal, and borehole results have shown the existence of precious metals in payable quantities.

(2) Two Shafts are being sunk and at the 31st March, 1950, had reached a depth of 608ft. and 95ft. respectively. At the present rate of sinking, it is anticipated that the former Shaft will cut the reef towards the end of this year and that it will be possible to start reef development by the middle of 1951.

(3) In the opinion of the Directors, subject to unforeseen delays, production at the initial milling rate of 40,000 tons per month should be reached before the end of 1952.

(4) The Stock to be offered will be convertible at the option of the holder to the extent of half of its nominal value into fully paid Ordinary Shares of 5s. each of the Company, as follows:

(*a*) between 31st October, 1950, and 31st December, 1951, every complete £100 nominal amount of Stock will confer the right to convert £25 thereof into 16 Ordinary Shares;

(*b*) between 1st January, 1952, and 30th June, 1954, every complete £100 nominal amount of Stock or (where the conversion right under (*a*) above has been exercised as recorded on the certificate relating to such Stock) every complete £75 nominal amount of Stock will confer the right to convert £25 thereof into 11 Ordinary Shares.

Copies of the Prospectus, on the terms of which alone applications will be considered, and forms of application are now obtainable from:

COMPANY MEETINGS

THE PRUDENTIAL ASSURANCE COMPANY, LIMITED

ANNUAL GENERAL MEETING

SATISFACTORY RESULTS

FURTHER EXPANSION OF BUSINESS

NATIONALISATION AND MUTUALISATION PROPOSALS CRITICISED

SIR GEORGE LEWIS BARSTOW'S REVIEW

The One hundred and first Annual General Meeting of the Prudential Assurance Company, Limited, was held on May 11, 1950, at 142, Holborn Bars, London, E.C.1, Sir George Lewis Barstow, K.C.B., Chairman of the Company, presiding, in the course of his remarks, the chairman said:—

In the Ordinary branch the number of policies issued during the year was 131,000, assuring sums of £88,400,000. These figures include in respect of overseas business 38,000 policies assuring £28,800,000. The total sums assured in force, including bonuses, exceeded £616,000,000. These sums assured, together with a large number of deferred annuities, produce a premium income of £30,800,000 per annum. Of this premium income £4,800,000 arises from group life and pension business.

OVERSEAS LIFE BUSINESS

The Company's overseas life business continues to expand, and once again the volume of business written during the year is a record. Most of our overseas branches were established in the years 1927 to 1932. From the outset progress was good and by the end of 1938 the total overseas sums assured in force, including bonuses, amounted to £41,000,000. Development was retarded by the war, but recovery was rapid and by the end of 1949 the total overseas sums assured in force and bonuses had risen to £174,000,000—more than four times tne 1938 figure. The annual premium income from tnis business now exceeds £6,400,000.

INDUSTRIAL BRANCH

In the Industrial branch the number of policies issued during the year was 1,565,000, assuring sums of £75,500,000. The average sum assured per policy was thus nearly £50. The total sums assured in force, including bonuses, exceeded £906,000,000, producing a premium income of £40,000,000 per annum.

GENERAL BRANCH

The expansion of business to which I have referred in previous years was continued in 1949. The General branch premium income was £7,200,000, compared with £6,500,000 for 1948. In addition, a premium income of £1,100,000, was obtained by our American company. Thus our total premium income from fire, accident and marine business was £8,300,000, of which about £4,600,000 was derived from overseas sources.

INVESTMENTS

The year 1949 has proved a most difficult time for investors. During the year the fact was revealed that this country was experiencing such an increase in the drain on its gold and dollar reserves as to result in September last in the devaluation of sterling. Lack of confidence, both at home and overseas, in the country's economic policy led to a general decline in the prices of Stock Exchange securities over the second half of the year. There can be little doubt that, had it not been for the stabilising influence of institutional investors in general and insurance companies in particular, the fall in prices, substantial as it was, would have been even greater.

The sound investment of the funds of insurance companies is not only of vital importance to the policyholders but also, in view of the magnitude of these funds, has some influence on the financial structure of the country. It is not surprising, therefore, that the investment policy of insurance companies attracts attention. I am pleased to see that most of the comment is favourable and it would appear that the adverse criticism is largely of political origin in an attempt to justify State interference with our business. The diversity of the views expressed by the critics is worth noting. One criticism made over the last few years is that insurance companies have failed to support the gilt-edged market to an extent commensurate with the growth in their funds; another criticism asserts that undue attention has been paid to government and other fixed interest securities and insufficient interest shown in equity capital or risk-taking finance for industrial enterprises; yet again the Prudential has been subjected to the criticism that the size of its equity portfolio, far from being too small, has given it vast and socially undesirable powers of control over British industry.

CRITICISMS ANSWERED

I would like to comment briefly on these three forms of criticism. As regards the charge of failure to give adequate support to the gilt-edged market, it should not be overlooked that there has been very little new money raised over the last few years by the issue of medium or long-term government securities; such issues as have been made have certainly received substantial support from us In its extreme form this criticism accuses insurance companies of unloading government securities on the market, thus embarrassing the government and undermining overseas confidence in the United Kingdom. Anyone who has the responsibility of investing institutional funds will know only too well how important a factor is the financial stability of the country. It is ridiculous therefore to suggest that insurance companies would undermine that stability against their own interests. I feel sure that insurance companies generally can refute this charge and so far as the Prudential is concerned there is no vestige of truth in it. During the year our holdings of British Government and British Government Guaranteed Securities have increased by over £12 million, and at no period during the year did we reduce our holdings.

The second criticism, namely, that undue preference has been shown towards government and other fixed interest securities at the expense of a wider investment in ordinary shares, is contrary to the first. I must repeat what I have said on previous occasions that we invest in the policyholders' interest. Insurance companies necessarily give most careful scrutiny to equity investment, as indeed they give to all their investments: nevertheless during 1949 our holdings of ordinary shares increased by £6,750,000. The funds of insurance companies are, for the most part, built up of the small savings of the people. It is highly unlikely to-day that private individuals would invest a large proportion of their savings in equity shares. In the case of the holders of industrial assurance policies, this conclusion is, of course, all the more probable. It seems clear, therefore, that the investment of policyholders' savings by insurance companies directs more finance into equities than would be subscribed by the individuals themselves. Even more important is the fact that the total of personal savings would be all the smaller in the absence of life assurance, which is known to be the only form of regular saving for two out of three holders of industrial assurance policies.

The third criticism to which I have referred is levelled particularly at the Prudential, and in this case accuses us of having an equity portfolio of such magnitude as to give us undesirable powers of control over British industry. The truth is that it is our deliberate policy to avoid control of the companies in which we invest our funds and to abstain from taking part in the conduct of their business. We hold a majority of voting shares in only two companies operating in Great Britain. One of these is a finance company and the other is our own nominee company which exists for the purpose of holding securities on behalf of our staff pension fund and in connection with our trustee business. The charge that we exercise powers of control in British industry is thus totally unjustified. Furthermore, as it is not our practice to conceal our interests by holding stocks and shares in nominee names, the extent and nature of our interests in any company can be ascertained.

PROBLEM OF INVESTMENT OF FUNDS

Insurance companies are faced with the problem of the investment of growing funds and it is inherent in their business that they should be continually seeking remunerative investments consistent with a reasonable standard of security. Our aim is to maintain a proper balance between the different types of securities which we hold in our portfolio, but as the major part of the field for investment which is open to us lies in new capital issues, it follows that this policy must in some measure be tempered by the nature and extent of the demand for new capital which occurs from time to time. During the year 1949 we have been fortunate in obtaining a satisfactory spread of investments. Apart from the £12 million of British Government and British Government guaranteed securities and the £6,750,000 of ordinary shares to which I have already referred, we have invested £8,000,000 in properties, £8,500,000 in debentures and £5,500,000 in preference shares.

Insurance companies take a long view and are not unduly concerned with temporary fluctuations in market prices. It is necessary, however, at the end of each year to compare the market values of the assets with their book values. I am pleased to be able to tell you that, despite the fall in Stock Exchange prices, there was a surplus in each Branch at December 31st last. Nevertheless, having regard to the substantial fall in market values during the year, and to the uncertainty of the course of Stock Exchange prices in 1950, your Directors have deemed it advisable to increase the margins by making transfers from the Branch Contingency Funds to write down certain investments, chiefly British Government securities.

The geographical analysis of our assets is as follows:—

	Per cent
United Kingdom	90·1
Dominion and Colonial	7·9

In respect of Stock Exchange securities only, the distribution between the various classes is:—

	Per cent
Government and municipal	66·7
Debentures and bonds	11·2
Guaranteed and preference stocks	9·5
Ordinary stocks	12·6

LIMITATION OF DIVIDENDS

You may remember that last year I undertook that the Directors would reconsider the policy of limitation of dividends after the Labour Party's Whitsun Conference. As things have turned out and because of the continued alarms to which our business has been subject, the Directors have had this problem constantly before them throughout the year.

Limitation of dividends has been linked with restraint of wage-increases as a joint policy—agreed by all political parties—in the struggle against inflation. Since inflation undermines the foundation of all forms of thrift, its avoidance is of such fundamental concern to the business of life assurance that there is a strong claim upon any assurance company, and particularly on the Prudential as the largest, not to disregard this policy. If we did so we might well be charged with a large measure of responsibility for any collapse of the whole policy of restraint of personal incomes. We ought not to put such a weapon into the hands of our critics. After full consideration, therefore, we have decided that it would not be in the shareholders' best interests to pay an increased dividend at the present time.

NATIONALISATION AND MUTUALISATION

When I last addressed you, the Labour Party's proposal to nationalise the industrial assurance offices had been published in readiness for submission to the Party Conference at Whitsuntide.

The growth of the opposition both by policyholders and by staffs of the threatened offices became evident in the latter part of 1949 and the effect of this was seen in November, when a further statement was issued announcing that the original proposal would be "implemented on the basis of mutual ownership."

It was not, however, until towards the end of January of this year that a more detailed statement of the new proposal was published in a booklet entitled "The Future of Industrial Assurance." From this it was clear that, as we had supposed, the new proposal was merely a new method of approach to the original objective of State control and that the change of method was actuated solely by the desire to placate policyholders and staffs.

That is a brief history of recent events. I think it desirable now to devote a few minutes to an examination of the booklet "The Future of Industrial Assurance." It deals mainly with the past, starting at 1864. It repeats out-of-date criticisms and either belittles or ignores the developments and great improvements in the business during the past few decades. It recognises the need for continuing the collecting system, yet represents as evils certain features of the business which are not only inherent in that system, but which the Labour Party themselves say they intend to perpetuate.

The actual proposals for the future contain an assortment of hopes and intentions which in important respects are inconsistent. Behind the specious facade of a plan for mutual ownership there lurk all the essential features of a nationalised industry. An Industrial Assurance Board, with wide powers, would be set up. The shareholders would be bought out, though how and on what terms is not stated, and ownership of the offices would be "vested in the policyholders." At the same time the State Board would ensure that the Boards of the individual offices were "effectively manned" and would "co-operate with all the individual offices in drawing up plans for re-organisation." These plans, it is said, would, where suitable, include schemes for amalgamating individual offices. Nowhere is there any indication that the policyholders, purporting to be the new owners, would or could have any power of appointment or control over the "effectively manned" Boards of the individual offices or that they could in any way influence the decisions of the State Board.

The opposition to the original suggestion of State control of the investments of the policyholders' funds was such that any intention of "special control" has now been disclaimed. The offices, we are told, would be responsible for investing the assurance funds in such a way as to ensure the best possible return to the policyholders. This, of course, is not a new principle—it is one which has long been followed by British insurance offices, with very considerable success. Despite the reiteration of this principle, the wide powers proposed for the State-appointed directorate of the industry leave little room for doubt that investment policy would, in effect, be controlled by the State Board. And this belief surely is confirmed by the promise that the "State shall guarantee and accept complete responsibility for all existing policies," for it is inconceivable that the State would guarantee the liabilities of the offices without controlling the funds accumulating to meet those liabilities.

It is impossible to study the proposals without being forced to the conclusion that the tendency would be towards a single monopoly organisation, achieved partly by a process of forced amalgamation of offices and partly by the centralised control of the politically-appointed State Board. In any case I believe that the industry would be saddled with a costly bureaucratic control. And if, as I also believe, delays, frustrations and lack of enterprise led to the gradual decay of the business, the superimposed burdens of control would become progressively heavier as the premium income diminished.

When we consider also the certain ill-effects of nationalisation on so valuable and stable a source of small savings and the repercussions on British insurance overseas, it seems almost incredible that a proposal should have been made which holds the possibility of so little advantage and the certainty of so much harm.

The comments I have just made contain the outline of our case against interference. A more complete answer is contained in a booklet prepared by the Industrial Life Offices, giving a reasoned reply to the Labour Party's proposals. We intend to circulate copies of this booklet to shareholders, together with copies of this speech.

The feeling among the majority of policyholders is known to be against nationalisation of insurance. Moreover, it is a significant fact that our policyholders neither expressed any desire for change before the proposals were made nor greeted their advent with any sign of welcome.

As matters stand at present, the threat to our business may have receded but it has not disappeared. It is therefore incumbent upon us to remain alert and in readiness to defend the interests of policyholders, shareholders and staff should the necessity again arise.

I am sure that I am voicing the views of all of them when I express the hope that the company may be left alone to develop on the lines which for so long have been pursued to the advantage of all concerned.

The figures before you to-day in themselves exemplify the firm confidence of the general public, both at home and abroad, in the Prudential and in the men and women who maintain its high reputation for service and efficiency.

The report and accounts were adopted.

ALLIANCE ASSURANCE COMPANY, LIMITED

FURTHER EXPANSION

The annual general court of the Alliance Assurance Company, Limited, will be held in London on May 31st.

The following is an extract from the circulated review by the chairman, Mr. Anthony G. de Rothschild.

Life Department.—The net new business completed during the year amounted to £6,097,458, compared with £5,272,055 in 1948. The purchase money for immediate annuities fell from £76,756 in 1948 to £47,419, but contracts for deferred annuities, many of which are granted in respect of pension schemes, again showed an increase at £91,281 compared with £85,265 in the previous year.

At the end of the year the Alliance life and annuity funds amounted to £25,358,860, an increase of £437,281 during the year.

Fire Department.—The net premiums, amounting to £4,451,692, showed an increase of £382,932 over those of 1948. There was an increase of £90,233 in claims, which, with contributions to fire brigades, amounted to £1,532,892.

The surplus for the year, after increasing the provision for unexpired risks, amounts to £829,999 (compared with £599,807 in 1948), which has been carried to profit and loss.

In considering these figures and those of the accident department, it should be borne in mind that the company does not transact fire or casualty business in the United States of America, and consequently although our business outside this country continues to expand satisfactorily, the devaluation of the pound has not had any marked effect on the figures for the year.

Accident Department.—The net premiums amounted to £3,609,360 and show an increase of £176,886 over the figures for 1948. The result, after providing for unexpired risks, was a surplus of £381,449, which compares with £335,767 in the previous year, and this has been transferred to the profit and loss account.

Marine Department.—The net premiums amounted to £1,863,112, which is an increase of £181,914 over the premiums for 1948. The underwriting account for 1947 has now been closed with a balance of £201,885 which is £37,002 lower than that for the 1946 account. After utilising £146,741 to maintain the reserve for previous years at £425,000, an amount of £55,144 remains and this has been transferred to profit and loss.

Trustee Department.—The work of this department continues to expand and the fees for the past year, at £15,905, show an increase of just over £1,000.

Investment Department.—The year was a most difficult one for investors and in the circumstances it is pleasing to be able to report that there still remains a satisfactory favourable balance between the book and market values of our securities, after providing for the depreciation in market prices which took place particularly during the second half of the year.

Profit and Loss Account.—The following appropriations have been made: £25,000 to the Widows' and Orphans' Fund; £100,000 to the Staff Pension Funds, of which £25,000 relates to the Staff Pension Fund of a subsidiary company; £50,000 to the general reserve in the accounts of a subsidiary company; £300,000 to the additional reserve (fire account).

The directors have decided to maintain the dividend at the same rate as that declared for last year, that is to say, 20s. per share, less income tax. An interim dividend of 10s. per share, less income tax, was paid in January last and the balance will be payable in July next. Provision for this dividend has been made in the profit and loss account.

LEGAL AND GENERAL ASSURANCE SOCIETY

TOTAL FUNDS NOW £123,117,760

HON. W. B. L. BARRINGTON'S SURVEY

The 113th annual general meeting of the Legal and General Assurance Society was held, on May 10th, in London.

The Hon. W. B. L. Barrington, the chairman, in the course of his address, said:—

LIFE ASSURANCE AND ANNUITY FUND

The new life business of the society constituted yet another record. Excluding increases in the sums assured of existing group pension schemes, the net new business amounted to £33,951,964, an increase of £6,869,140. Including the additional group sums assured, the total net new business transacted was £44,500,820. In addition, deferred annuity contracts providing for the payment of £2,492,870 per annum, were issued.

Figures of this magnitude are in themselves eloquent testimony to the part which life assurance plays in the life of the community. They emphasise the fact that an ever-increasing number of people are availing themselves of the opportunity to undertake systematic saving by means of a life assurance policy. It is heartening to observe from our records that an ever-increasing number of young married men in particular are undertaking life assurance for the protection of their families. It had been thought that the contribution payable by everyone to secure the benefits of the National Insurance Scheme might have affected adversely the new business of life offices, but so far this has not proved to be the case.

We feel some degree of pride that this society has for 114 years served the public by providing the opportunity to individuals to protect themselves and their families. Steadily and constantly throughout the years have the benefits been improved and more varied contracts been made available.

The threat to nationalise a part of the insurance industry still exists. The result of the recent election has for the time being at any rate made it unlikely that the proposals can be implemented, but the danger has not been removed. I emphasise again that we do not desire to enter into the party political arena. Our policyholders include people of all parties, but we consider it to be our duty to say to the public that in our opinion the best interests of insured persons will not be served by Government interference with a business which has done so much to preserve the financial stability of the country.

The fact that insurance funds are large is not in itself a reason why the administration of insurance companies should be suspect. It cannot be repeated too often that the large funds controlled by insurance companies are administered as a trust on behalf of the policyholders. In our own case our life assurance and capital redemption funds amount to nearly £120,000,000, or 94 per cent. of our total assets.

Mortality Experience.—The death claims for 1949 were less than the amount expected under the mortality tables used.

Rate of Interest.—The net rate of interest earned by the life assurance fund, excluding the amount invested in purchased reversions, was £3 11s. 9d. per cent. compared with £3 11s. 6d. per cent. for 1948. The maintenance of an adequate rate is of the greatest importance, since it not only safeguards the interests of the policyholders but it is also one of the chief sources of profit.

Expenses of Management.—The ratio of commission and expenses of management to the premium income for 1949 was 9.47 per cent., a reduction of .62 per cent. This is a satisfactory figure, especially as it takes into account the cost of operating our large annuity business without bringing in the annuity considerations received.

Fire Insurance Account.—The net premiums amounted to £1,595,065. Claims paid and outstanding and contributions to fire brigades absorbed 43.02 per cent. of the premium income, commission and expenses of management, including overseas taxes, 45.73 per cent. After making provision for unexpired liabilities there was an underwriting surplus of £172,330. To this is added the interest on the fund amounting to £35,359, bringing the gross surplus to £207,689. United Kingdom taxation required £53,735, leaving £153,954 as the net profit. From this £39,123 has been appropriated for the staff pension fund and the balance of £114,831 added to the additional reserve, which amounts to £363,305.

Accident Insurance Account.—The total net premiums amounted to £810,573. The ratio of claims paid, together with provision for those outstanding, was 42 per cent. of the premium income. The cost of commission and expenses of management, including overseas taxes, was 42.54 per cent. The underwriting surplus, after providing for unexpired liabilities, was £94,604. Interest added amounting to £20,155 brought the surplus up to £114,759, which, after providing £31,892 for United Kingdom taxation, resulted in a net profit of £82,867. Of this, £31,253 was required for the staff pension fund, and the balance of £51,614 was added to the additional reserve, which amounts to £157,421.

Marine Account.—Premiums received in the past year amounted to £188,904. Claims paid for the 1949 account were £46,631 and expenses of management £5,108. The whole of the balance of £137,165 is retained in the fund.

Funds and Premium Income.—The total funds of the society and its subsidiaries, excluding the Gresham Life Assurance Society, increased by £13,342,385 to £123,117,760. The total premium income from all classes of business increased by £2,616,909 to £18,488,640.

Assets.—The assets of the society increased by £14,041,434 to £127,300,885.

In the case of the Stock Exchange securities which now total £77,097,617, fresh investments were made to the extent of £3,700,000.

Valuation of Investments.—Our usual valuation of securities as at December 31, 1949, has been made, and the value of the Stock Exchange and other investments was still in excess of the figures at which they appear in the balance sheet without recourse to the reserve funds.

Great Expansion of the Business.—There is every reason to be gratified with the operations of the society. The great expansion of its business has increased the assets from £50,000,000 in 1939 to £127,000,000 in 1949

We think it is right, as an institution with world-wide connections, to continue the policy of progress and expansion wherever possible. Our policy is not to acquire additional premium income merely because of a desire for size: we underwrite cautiously and accept only the best class of business.

The report and accounts were adopted.

CALEDONIAN INSURANCE COMPANY

TOTAL PREMIUM EXCEEDS £5,000,000

The one hundred and forty-fifth annual general meeting of this company was held, on May 11th, in Edinburgh.

The chairman, Mr J. F. Carnegie, C.A., in moving the adoption of the report, said:—In 1949 the net new life assurances issued amounted to £2,280,038, which compares with £2,374,826 written in 1948. Although a small decrease is recorded, we consider the result for 1949 satisfactory.

Deferred annuities for £70,768 per annum were issued, as compared with £37,901 for 1948, the increase being due to pension schemes business.

Our life premium income was £820,867, as compared with £792,078 in 1948, and the net interest income at £301,601 shows an increase of £6,381, as compared with the figure for the previous year. There was a small decrease in the net yield on the life assurance and annuity fund from £3 3s. 1d. per cent. to £3 2s. 10d. per cent.

Death claims for 1949 amounted to £275,016, as compared with £216,063 for the previous year. The figure, though higher than in recent years, is commensurate with our business.

Surrenders at £69,457 show an increase of £6,320 over the figure for 1948.

The life assurance and annuity fund has increased during the year by £213,767 to £9,853,395.

FIRE DEPARTMENT

The premium income for 1949 was £2,039,115, being the highest figure in the history of the company.

The improved experience in the United States reported last year continued, and I am in the happy position of being able to state that a satisfactory year's trading was experienced by the company in that country.

Our fire underwriting in this country and in other parts of the world was also satisfactory, and the profit of £200,991 for the department far exceeds any figure previously earned. This sum has been transferred to the profit and loss account.

ACCIDENT DEPARTMENT

The premium income for the year at £1,838,434 is again a record for the department.

The profit for the department as a whole is £74,874, and this sum has been transferred to the profit and loss account.

MARINE DEPARTMENT

The sum of £25,000 has been transferred from this account to the profit and loss account. The fund at £785,148 represents 205.9 per cent. of the premium income, which is a very satisfactory figure.

TOTAL PREMIUM INCOME

The total premium income for all departments for 1949 was £5,079,737, and it is most gratifying that the continued development of the business of the Company has brought our premium income above the £5,000,000 level.

PROFIT AND LOSS AND APPROPRIATION ACCOUNTS

The amount of interest, dividends and rents (less tax) not carried to other accounts was £79,867, which more than covers the net cost of the shareholders' dividend.

The net profit for the year carried to the appropriation account was £180,361, after providing for taxation and for bad and doubtful debts.

The report and accounts were adopted.

NORWICH UNION INSURANCE SOCIETIES

A SUCCESSFUL YEAR

The annual meetings of the Norwich Union Life Insurance Society and the Norwich Union Fire Insurance Society Limited, were held at Norwich on May 8th and 9th.

Speaking at the Life Society's meeting, the president, Sir Robert Bignold, said that the year had again been one of steady progress. The new business of more than £32 million was some £3,000,000 in excess of the 1948 figure, while the net rate of interest had increased from £3 14s. 10d. per cent. to £3 16s. 5d. per cent., and the mortality experience had been extremely favourable. The ½ per cent. increase in the overall expense ratio was largely due to the sharp rise in new business.

In South Africa and New Zealand they were able to record increased new business figures, whilst in Canada progress had been most gratifying. In Eire the society continued to maintain its outstanding position, whilst at home the results had again been eminently satisfactory.

At home once again their house purchase scheme had made a large contribution to their figures. They had advanced in 1949 over £7,000,000 under this scheme with covering policies of equivalent amount, thus helping young married people and others to buy their own homes. He would also like to draw attention to the increasing number of pension schemes arranged by the society. During the past year they had issued pension policies (over and above the ordinary life contracts) providing pensions equivalent to a cash value of some £2,500,000 at retirement.

FIRE SOCIETY

Sir Robert Bignold also presided at the Fire Society's annual meeting, and said that the accounts were representative of the society's best years. From their excellent profit substance not only could they further strengthen their financial resources for the future, but confirmation was provided of the first-class security they afforded to their many friends who were found all over the world.

At their last two annual meetings he had referred to the vital importance of the country's great insurance business being allowed to conduct its affairs with that same liberty of action which for centuries past had firmly established Britain as the largest and freest market in the world for insurance protection. Speaking for this society, he was proud of the part it had played over the generations.

The total premium income had advanced from £7,931,516 to £8,903,359, an increase of £971,843. In the Fire Department, premiums increased by £525,604 to £4,679,349, the loss ratio at 39.36 per cent. comparing with 53 per cent. in 1947 and 43 per cent. in 1948. The department's profit was £463,646, as against £192,238 in 1948.

The Accident income had increased by £349,795 to £3,575,162, the claims ratio showing a very acceptable improvement at 44.1 per cent. compared with 49.9 per cent. The profit for transfer of £413,048 compared with £246,857 in 1948.

Marine Department premiums increased to £648,848 and £50,000 had been transferred, leaving the fund at £1,185,175, or 182.6 per cent. of the premium income.

Income and other home taxes absorbed £589,633, and net dividend £145,200. £150,000 had been transferred to the pension fund, £150,000 and £50,000 as additional provision to the Fire and Accident accounts respectively, leaving a balance of £303,600. Total assets at £14,661,287 showed an increase of £3,540,524.

The reports and accounts were adopted.

ROYAL INSURANCE COMPANY, LIMITED

104TH ANNUAL RERORT

ALL PREVIOUS RECORDS SURPASSED

COL. A. C. TOD'S SURVEY

In a statement circulated with the 104th annual report and accounts of the Royal Insurance Company Limited, the chairman, Colonel A. C. Tod, C.B.E., T.D., D.L., made the following points:—

A MEMORABLE YEAR

1949 will stand in the records as a memorable year for the "Royal." Premium income, new life business, and underwriting profits all surpassed previous records, and results were favourable in all territories and in all departments of our business.

In a year which has seen political and financial crises abroad, and devaluation and political uncertainty at home, this result is a remarkable tribute to the stability and vigour of our business; with 70 per cent. of its premium income arising overseas, the "Royal" Group of Insurance Companies is a powerful and invaluable factor in aiding Britain's recovery in these critical days.

I am glad to think that the talk of nationalisation at home has receded. Companies like the "Royal" were not directly threatened, but I cannot say too plainly that Government interference, even confined to industrial life assurance, would have seriously shaken the confidence of our policyholders overseas, and done wanton damage to one of the nation's largest and most reliable earners of foreign currency.

UNITED STATES OF AMERICA

Our organisation in the United States made a handsome contribution to our profit in 1949, fire, marine and casualty business all showing up well. Conditions there have admittedly improved, but that is not all: a considerable amount of skill and hard work have been devoted to underwriting, to improving the rate structure, and to sound development: and this, combined with attention to costs and imaginative building-up of our great organisation in the United States, has produced a markedly favourable turn in our fortunes.

OTHER TERRITORIES OVERSEAS

In Canada, in Australia and New Zealand, in South Africa and India—in fact, throughout the world—1949 provided a picture of vigorous expansion for the company, with gratifying results.

FIRE DEPARTMENT

Year	Net Premiums	Profit	Percentage of Premiums
	£	£	%
1949	16,235,608	1,846,931	11.38
1948	15,020,708	1,412,947	9.41

In the Fire Department, the 1949 premium income and profit reached new high records.

Despite the increase last year in fire wastage in this country, involving over 70,000 outbreaks of fire and an estimated loss of more than £22,000,000, our home fire business has been particularly well maintained, and results have been excellent. Our centres in this country are to be congratulated on contributing their full share to this satisfactory outcome.

ACCIDENT DEPARTMENT

Year	Net Premiums	Profit	Percentage of Premiums
	£	£	%
1949	14,284,369	853,475	5.97
1948	13,373,738	607,891	4.55

The income of the accident department again touched record figures and underwriting results were favourable.

No other class has developed so extensively as motor insurance, and it is a matter of satisfaction that, despite the difficulties encountered in various parts of the world, we have been able to secure a modest profit on the business.

Some improvement has been brought about in burglary insurance, due partly to the precautionary measures that property owners have been encouraged to take, and to the freer supply of certain commodities.

LIFE DEPARTMENT

Year	New Sums Assured	New Annuities (per annum)	Claims by death	Maturing Endowment Assurances
	£	£	£	£
1949	8,294,264	206,269	883,375	1,260,745
1948	8,143,890	133,274	815,812	1,166,624

New life sums assured made a further advance on the record figures of the previous year. New annuities considerably increased mainly on account of the expansion of our deferred annuity business under staff pension schemes.

LIFE BONUS—30s. PER CENT. PER ANNUM

A quinquennial valuation of the life assurance and annuity business was made as at December 31, 1949.

The reserves have been further strengthened by the adoption of a valuation rate of interest of 2 per cent. for assurance business, as compared with 2½ per cent. five years ago.

Out of the surplus disclosed by the valuation, a reversionary bonus of 30s. per cent. per annum is being declared on with-profits assurances for the five years ending on December 31st last, this being the same rate of bonus as that declared five years ago.

At the last valuation, the amount of surplus carried forward unappropriated was £2,037,000. On this occasion, despite the strengthening of the reserves by over £700,000 (and after providing for the policyholders' bonus and for the stockholders' proportion of life profits), the unappropriated carry forward has increased to £2,216,000.

In accordance with the custom in British life assurance, the profits of our life business except for a very minor share, are applied for the benefit of the participating policyholders. The stockholders' share of life profits (£45,000 per annum for the next five years), represents only 4d. in the £ of the premiums received—a very modest return.

MARINE DEPARTMENT

Year	Net Premiums	Fund at December 31st
	£	£
1949	3,176,741	6,585,318
1948	3,189,197	6,332,287

Our 1948 marine underwriting account has been closed with a profit of £272,611.

The premiums for 1949 show a slight decrease, largely attributable to the contraction of hull and cargo business in America. The balance carried forward at the end of the year is substantially the same as a year ago, notwithstanding the loss of the "Magdalena," which was the largest hull claim we have ever had to meet.

FOREIGN EXCHANGE

The changes that occurred last year over the structure of world exchange rates call for some reference to the rates used by us.

As regards the United States and Canada, in the accounts before you we have continued to convert these currencies at approximately $4.86=£1. As the assets held in these two countries greatly exceed the liabilities, the adoption of this rate gives us a conservative basis. The maintenance of this rate facilitates

comparison with previous years and avoids violent fluctuations in results.

In dealing with our business in the general foreign field—apart from the United States and Canada—our normal practice has been again followed of converting currency figures at approximately current rates of exchange.

Actual remittances, however, from all countries have been taken at the sterling values realised. In the case of interest from the United States and Canada, the profit on remittances which has previously been shown as "Profit on Foreign Exchange," as a separate item, has been included in the accounts before you in the item "Interest and Dividends."

PROFIT AND LOSS ACCOUNT

The profits transferred from the underwriting accounts amount to £2,973,017, the largest underwriting profit the "Royal" has ever recorded.

The remaining items do not call for special reference with the exception of the transfer of £1,000,000 to supplement the additional reserve of the fire insurance fund. The premium income having greatly expanded in recent years, it has been considered desirable to strengthen the reserves allocated to the fire account.

DIVIDEND

In November last, an interim dividend of 3s. 9d. (less income tax) was declared, and the directors recommend 3s. 9d. for the final dividend, making 7s. 6d. per £1 stock for the year, the same as for 1948.

As we consider it is in the interests of everyone, including our stockholders, to avoid further inflation, we have again responded to the Chancellor of the Exchequer's appeal, and have not recommended a change in the dividend. It is not necessary for me to say that an increase would have been possible, and it is your directors' hope to be able to recommend an increase as soon as conditions allow.

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY LIMITED

FREEZING OF WAGES AND DIVIDENDS

The 140th annual general meeting of the North British and Mercantile Insurance Company Limited was held on May 11th at the North British Station Hotel, Edinburgh. The Rt. Hon. Lord Brand, C.M.G., D.C.L., (chairman of the General Court of Directors) presided.

The chairman said:—

I should like to take this opportunity of this general meeting of shareholders to add a few words to the statement I have already circulated. The figures for the year 1949 are, of course, enhanced by the devaluation of sterling. I would like to make it clear, however, that even apart from the influence of that fundamental change, the year has been a highly satisfactory one, and, had there been no devaluation, our profits figure would still have shown a considerable advance over that of 1948.

Had circumstances been normal, the General Court of Directors would have taken into serious consideration the question of increasing the dividend because of the general growth of the company's business and not for any reason connected with the results of devaluation. In deference however to the strong wishes expressed by the Chancellor of the Exchequer, the directors decided not to consider this question now, since they desired to do nothing which might be thought to weaken in any way the defences of the community against further inflation.

Nevertheless, it is obvious that the freezing of wages, salaries and dividends is not a policy, but at best a highly unsatisfactory and temporary expedient. It is not enough to create the conditions which lead to inflationary pressure and then sit on the lid. The only proper policy is to remove the underlying causes.

THE ULTIMATE RISK-TAKER

The case of dividends moreover is quite different from that of wages and salaries. The ordinary shareholder is the ultimate risk-taker. He receives good dividends in good times, lesser or, it may be, no dividends in bad times. He is the residual beneficiary or sufferer. No one will move a finger to help him, if he loses. Neither this nor any other Government will or should guarantee him in any degree against loss. He cannot complain. He has knowingly taken the risk. It is his function, in fact, in the whole economy to bear the first loss. That being so, he is entitled, when the company which he owns prospers, to receive what is reasonably his due. This is not only just to him; it is certainly desirable in the interests of the community. The distribution of profits sufficient to encourage adequate personal savings and through them the provision of adequate risk capital sufficient to keep our industry abreast of that of our competitors is of the first importance. It is the base on which our whole economy stands and which alone made possible our industrial development.

The National Income White Paper, just published, shows that in the year 1949, and notwithstanding the wage freeze, wages rose by £230 million and salaries by £110 million. On the other hand gross dividends and interest paid by all companies fell by £5,000,000, from £715 million to £710 million. Interest, of course, is in quite a different category from dividends, and it is unfortunate that these two classes of remuneration cannot be distinguished one from the other. In an article in *The Times* in February I estimated that debenture interest together with co-operative dividends amounted to £100 million. If this figure is accepted it follows that *total* company dividends, including preference dividends, received by all shareholders in the country amounted, say, to £610 million while wages and salaries together *increased* by £340 million. It seems, therefore, that the freeze as applied to wage and salary earnings has not been as biting as the freeze applied to shareholders.

The dividend receivers got roughly £600 million gross in 1949, and with freedom for dividends to rise as well as fall—nobody proposes to stop them falling—they would in a good year get somewhat more. But the increase would be negligible in relation to the total remuneration of the salaried and wage-earning classes amounting in 1949 to £6,530 million.

MISGUIDED IDEAS

I realise that, owing to misguided ideas inherited from the past, every man's hand is against the receiver of profits, though, in fact, the provision of risk-capital is, so to speak, the first social service on which all the rest depends. But, if we are to prosper, we must somehow eradicate these false notions. With the disappearance of large fortunes, those with moderate and small incomes must step into the breach to take the risk. They will certainly not do so if to do so is regarded somehow as an anti-social act which must not go unpunished.

It is essential risk-takers shall take the risk and look to no-one to help them. But the corollary of this is that they shall also reap their reward. You cannot mark both sides of their medal with the words "Heads I win, tails you lose." If that were to be so, not only would new risk-savings be inadequate, but existing capital would take every opportunity to seek a more rewarding and generous climate in other parts of the sterling area

I would, however, remind our shareholders that, with all other classes of the community, they are vitally interested in the avoidance of inflation. It is their duty and their interest to play their part, but they should not be called upon to make sacrifices unless the Government for their part take all the steps needed to render an anti-inflationary policy successful.

Finally, I must repeat that the directors will have in the future, as in the past, to continue to be guided by the shareholders' interests in the very broadest sense. They will have to consider the whole matter next year in the light of the then existing conditions.

"SOFINA"

The annual shareholders' meeting of Société Financière de Transports et d'Entreprises Industrielles (Sofina) was held on April 27th in Brussels, Vicomte Van de Vyvere, chairman of the board, presiding.

The following statements are extracted from the directors' report:

Since our last general meeting, the world economy has improved in some respects and deteriorated in others. . . . Despite America's free gifts and loans, and despite the fact that many governments sincerely desire co-operation, the world economy can hardly be said to be reviving. However, the reversal in public opinion marked in several parts of the world during the past few months, may be regarded as foreshadowing a more successful search for effective remedial measures.

The essay, which, in accordance with our custom, is appended to this report, sets out how national planning is itself a cause of the very disorder it attempts to set right. Proceeding by gradual steps, from the supervision of business undertakings to the management of them, "planning" leads inevitably to a totalitarian regime. In particular it calls for monetary policy operated without regard for the interests of other nations, so that "planning" is inconsistent, if only for this reason, with true international economic co-operation. . . .

Our company is among those which have been especially affected by the "freezing" of a large proportion of revenue earned abroad. At the same time, the operating companies of our group are in urgent need of fresh capital so as to be able to meet the growing demand for electrical energy in many parts of the world.

Each company resorts, as far as possible, to the capital market of the country in which it operates, but where money is scarce and nothing save inflation could augment the supply, the domestic means of production cannot be developed without the aid of foreign funds. Our company, among many others, is prepared to follow the lead of the International Bank as soon as favourable conditions are restored, and wherever they are established it will be happy to contribute its financial as well as its technical co-operation. . . .

The value of our investments in the United States has substantially increased, and in France we have been able to employ temporarily, or to invest, part of the compensation money received in payment for our former interests in companies that have been nationalised. We are studying new projects and we have been invited, with other Belgian groups specialising in electricity undertakings, to participate in electrification schemes in the Belgian Congo and Ruanda-Urundi. A short account of the work of our technical services during 1949 prefaces in this report the usual particulars concerning the principal companies in which our company has an interest.

In his address, Mr Dannie N. Heineman, chairman of the Standing Committee, drew attention to the implications of President Truman's "Point Four." In this, he said, the American Government was giving a highly significant lead, but its objectives could not be attained unless the governments, technicians and businessmen of other nations wholeheartedly co-operated.

In the company's balance sheet as at December 31, 1949, "holdings in public funds and participations" (B.fr.1,929,107,000) are B.fr.88,034,000 less than in the preceding balance sheet, mainly as a result of amortisations. A substantial increment in the value of the certificates delivered by the French "Caisse Autonome" in compensation for shares formerly held in French electricity companies now nationalised, has been applied to amortisations.

The recent modifications of the exchange rates of various currencies has led to a readjustment of book-values. The increase in the book-values of U.S. dollar securities and cash more than covered the depreciation of holdings in other currencies.

Cash resources (including American Government Bonds) amounted to B.fr.538,596,825.28, whereas claims against associated companies and others exceeded liabilities to third parties by B.fr.166,551,164.27. Cash resources and net claims, at B.fr.705,147,989.55, thus exceeded the corresponding total in the preceding balance sheet by B.fr.151,442,103.98.

The market value of quoted securities, on the basis of current quotations, was in the aggregate B.fr.465,035,720 higher than their book value, and unquoted securities were carried on the books for B.fr.83,100,000 less than their estimated value.

After applying to amortisations or carrying to the reserve fund the profits derived from sales of securities (B.fr.28,742,816.71) and earnings which could not be cashed in Belgian francs (B.fr.64,858,458.37) the net profit available for distribution amounted to B.fr.61,177,389.30 as against B.fr.76,592,559.13 for the preceding year. A dividend of B.fr.70—net per ordinary share (as against B.fr.80—for 1948) has been declared.

Translations of the report and of the essay above referred to ("Economic Programmes versus Planning") and of Mr D. N. Heineman's address are obtainable on application to Electric and Railway Finance Corporation, Limited, Claridge House, 32, Davies Street, London, W.1.

MANGANESE BRONZE AND BRASS COMPANY, LIMITED

A SATISFACTORY REPORT

MR J. C. COLQUHOUN'S STATEMENT

The fifty-first ordinary annual general meeting of the Manganese Bronze and Brass Company, Limited, was held on May 11th at 63, Grosvenor Street, London, W., Mr J. C. Colquhoun, M.B.E. (chairman and managing director), presiding.

The following is the statement by the chairman which had been circulated with the report and accounts and was taken as read:—

I am again pleased to be able to submit to you a satisfactory report and statement of accounts for the year ended December 31, 1949. As predicted in my statement a year ago, the volume of business fell short of the peak level reached in 1948, but as it turned out the falling off was not severe and indeed towards the end of the year there was a slight recovery. In the result the balance of profit, before providing for taxation and dividends, and after providing £15,000 additional depreciation, was £199,886, compared with £228,830 for 1948.

ALLOCATION OF PROFIT

Your directors recommend that a final dividend of 20 per cent. be paid on the ordinary shares, making 30 per cent. for the year, which is the same as for the previous year. If approved, this will mean that of £199,886 net profit, provision for taxation takes £110,589, the ordinary and preference shareholders together receive a net amount of £27,066, and the balance of £62,231 remains in the business. This last-mentioned amount will help to provide for a large part of the cost of replacements for which purpose the process of depreciation is entirely inadequate as a result of inflation. The existing method of computing tax liability shows the serious defect that sums set aside out of profits in this way to provide for replacements have to bear income-tax and profits tax.

In the balance-sheet you will see that stocks and debtors together amount to £608,124, a reduction of £76,380 over the year, which largely explains the increase in cash. The total of stocks and debtors is, of course, affected by the prices of our main raw materials, copper and zinc, but in this case reflects fairly closely the reduced scale of working at the end of the year. The fact that debtors have increased while stocks have decreased is due mostly to heavy deliveries from our works towards the end of the year, which, of course, would have this effect.

You will notice that net current assets amounting to £427,350 show a slight increase of £1,235, and net fixed assets of £251,263 show an increase of £46,074. Outstanding commitments at the end of the year in respect of capital expenditure amounted to £78,455, and this will complete the expenditure on the new "Oilite" factory buildings to which I make further reference below.

There are no other items in the accounts calling for special comment, but it may be as well to mention that the actual capital employed now amounts to £596,916 and that the issued ordinary share capital to which the rate of ordinary dividend is related is only approximately one quarter of this amount.

MARINE PROPELLERS

On the marine propeller side of your business customers have been making increasing use in recent years of our design service and in 1949 two-thirds of our total tonnage output of propellers was of our own "Scimitar" design. Recent experience has shown that where "Scimitar" design propellers have been fitted as replacements the average improvement in efficiency has been over 10 per cent. To supplement the research side of this service we have made a happy arrangement with Durham University at Newcastle-upon-Tyne to share in the work which will be carried out in their newly completed cavitation tunnel which is the largest installation of its kind in the world. A new metallurgical laboratory is also nearing completion at your Birkenhead works.

AN INTERESTING DEVELOPMENT

An interesting development in the manufacture of propellers is the use of a nickel aluminium bronze to which we have applied the trade mark "Nikalium." So far, we have made 25 propellers in this alloy which all appear to be very satisfactory, but we have not yet gone above a 3¼-ton size. Though more expensive and more difficult to manufacture than manganese bronze, it it stronger.

At your Ipswich works good progress has been made in general efficiency and on the research and metallurgical control sides. We continue here to concentrate on the special bronzes, in extruded and rolled products. The new factory buildings for the manufacture of "Oilite" self-lubricating bearings and other parts made from metal powders is nearing completion and production will be transferred to the new premises during the summer. Great attention has been given to the layout of the new factory based on our 18 years' experience in this type of business so as to get maximum efficiency and the best working conditions.

THE OUTLOOK

In regard to the outlook, I see no hope this year of returning to the 1948 level of business. I think we must be prepared for a downward trend in the shipbuilding and engineering industries on which your business is so dependent, but at the moment our order books are still very well filled. The general standing of the company today as regards equipment and facilities for production is better than it has ever been. In research and technical efficiency we can fairly claim to be progressive, and you can have confidence in the team spirit and good feeling which pervades your works. I am sure you would wish me to convey to all employees our thanks for their co-operation in a good year's work.

The report and accounts were unanimously adopted and the dividends as recommended were approved.

The retiring directors, Lt.-Col. S. J. M. Auld, O.B.E., M.C., D.Sc., and Mr. J. C. Budd, were re-elected and the proceedings then terminated.

HAMBROS BANK, LIMITED

EXPANSION OF BUSINESS

The annual general meeting of Hambros Bank, Limited, will be held on June 8th at 41, Bishopsgate, London, E.C.

The following is the statement of the Chairman, Mr. R. Olaf Hambro, circulated with the report and accounts:—

I think it will be agreed that the balance sheet figures for the year ended March 31, 1950, speak for themselves, but I would like to add a few explanatory remarks thereon and, following my custom of recent years, to comment on the business of the Bank as a whole.

Firstly will be observed the large expansion to the total of the balance-sheet. This is brought about by the increase (*a*) in deposits and (*b*) in acceptances: both these figures denote increased business, but in comparing the figure of acceptances with previous years one has to take into consideration the increased cost in pounds sterling of the merchandise financed. The same amount of goods, if financed in 1939, would probably have been carried on average by 50 per cent. of the present figure. The liquidity is again high, the total of cash and bills of exchange being £12,505,064, of which the figure given as bills of exchange consists as to 90 per cent. of Treasury bills. Loans and advances do not show any substantial increase during the year and represent 27.91 per cent. of the deposits. There has been very little change during the year in the figures of subsidiary companies which are shown in the accounts appearing on the second page, in conformity with the Companies Act.

A large percentage of our accounts relates to our business in Norway, Sweden, Denmark and Finland, which shows that the old established business of the bank with these countries is again very active, and is a gratifying proof of the value of old friends and connections, an abundance of whom it is our good fortune to possess.

Our associated company in the United States has increased its activities during the year, and since its inception has contributed to the export drive for hard currency countries a very satisfactory figure amounting to over $6,000,000.

EXCHANGE CONTROL DIFFICULTIES

Our business in Central Europe continues to be limited by the difficulties of exchange controls, the existence of which we recognise to be in some degree necessary, but the administration of which I venture to maintain

is much too rigidly interpreted. In all countries these controls are hampering trade and international good relations and are an important factor in restraining the peaceful development of the world. No friendly relations between peoples can be truly re-established until each country can freely accept the currency of its neighbour. Nothing is so resented by the inhabitants of one country as the refusal of its neighbour to accept its currency or alternatively to negotiate only in terms of deflated values. I think this is an aspect of the general situation which is insufficiently studied by economists and by those who guide our destinies.

With regard to the profit and loss account, the profits of the bank are in excess of those of previous years, but increased taxation and the ever-increasing cost of running a business such as ours create a considerable burden and have reduced our net profit to a slightly lower figure than last year.

My thanks are again sincerely extended to the management and staff for their loyal and unswerving support. It is due to them and to them only that the bank is able to handle so large a volume of business.

FORD MOTOR COMPANY LIMITED

SATISFACTORY ACHIEVEMENTS

LARGE EXPORT FIGURES

HOME SALES FURTHER RESTRICTED

LORD AIREDALE'S REVIEW

The twenty-first ordinary general meeting of the Ford Motor Company Limited, was held on May 9th at Grosvenor House, Park Lane, London, W.1, the Rt. Hon. Lord Airedale, D.S.O., M.C., the chairman, presiding.

The secretary, Mr J. M. A. Smith, A.C.A., read the notice convening the meeting and Mr. F. Pragnall, F.C.A., of Messrs. Mellors, Basden and Mellors, read the report of his firm.

The following is the chairman's statement which had been circulated with the report and accounts for the year to December 31, 1949, and which was taken as read:—

The achievements of the company in the past year have again been satisfactory, and in some respects surpass the eminently favourable results of 1948. Production amounted to 151,793 vehicles, including tractors, compared with 153,115 units in 1948, and 114,873 in 1947. Sales of parts were again a record.

Last year I indicated that more difficult times lay ahead. This prophecy has been proved correct in the event, but not quite to the extent then visualised. Profits were £2,337,689 representing 4·59 per cent. of the turnover figure, compared with 5·46 per cent. in 1948. This shows that in spite of increased turnover due to increased sales of spare parts and reconditioned engines we have not been able fully to meet rising costs. For instance, in 1939 we used 302,483 tons of coal costing £327,898. This same tonnage would now cost £901,311, an increased expenditure of over £500,000.

EXPORT MARKETS

The British motor industry, in compliance with the Government's requirements, has to devote its energies mainly to export markets. Sales of our passenger vehicles abroad were 49,977 out of a total production of 78,723. Exports also accounted for 42,973 commercial vehicles and tractors out of a total production of 73,070. In 1948 we produced 65,236 passenger vehicles and exported 50,943, and also 87,879 commercial vehicles and tractors, of which 46,356 were exported.

In considering these large export figures, it must not be forgotten that, owing to the devaluation of the £ in September, 1949, 44 per cent. more exports to hard currency areas from the United Kingdom would be necessary to earn the same amount as before September, 1949, if it were assumed that our export prices in dollars had fallen by the full devaluation percentage of 30·5 per cent. It remains to be seen whether the lower prices (expressed in hard currency) at which British goods can be sold in the hard currency areas will enable us to continue to sell a much greater volume of our goods in those markets. If the low prices are so attractive to buyers in the hard currency areas that they are willing to spend a greater quantity of dollars in buying this larger volume of our goods, then devaluation helps us—at least temporarily—unless the cost of raw materials imported goes up to such a figure as to destroy or neutralise our price advantage.

NEED TO MAINTAIN VALUE OF STERLING

The most important economic task at present is to make certain that the pound sterling buys in the future no less of the necessities of living than it does now. It is just as necessary to maintain the value of the pound sterling for us at home as it is for the importer when he spends pounds abroad to buy the raw materials which we cannot produce.

The worth of the pound is largely determined by the amount of money available for spending. If wages and other incomes were doubled, in a short time the prices of most things would double too, because production is not increased by this act. Furthermore, British products would not be competitive in the export market, which is of such vital importance to us today, to enable us to balance our imports and maintain full employment: for example, in the motor industry, exports amounted in 1949 to 57·54 per cent. of its total output and, in fact, to 10 per cent. of the total exports of the country. If wages are increased only as and when more goods are produced, prices are not affected and the pound sterling loses none of its value; indeed, it is likely to be worth more, since greater production may bring prices down through economies in manufacture. Our future as a trading nation thus depends on maintaining the worth of the pound.

The company's best export markets were Australasia (32 per cent. of total exports) and Europe and Middle East (37 per cent. of total exports). The restrictions placed by dollar-hungry nations on the imports of goods from U.S.A. have had their effect on the sales of American vehicles, and in consequence, the company's exports have benefited. The economy of fuel in running a smaller car has appealed to buyers throughout the world and I hope that the habit of buying British cars, now formed in so many countries, has come to stay. The company's exports in 1949 exceeded in unit volume total exports of all other Ford organisations in the world.

EUROPEAN COMPETITION

Last year I called attention to the efforts of European exporters in the world markets. This competition has continued throughout the year, not only from France, but also from Germany and Italy; in these countries wage levels are appreciably lower than in the United Kingdom. As is generally admitted, the proportion which wages bear to the price of the finished product is a very high one. The cost of our purchases of materials exceeded £36 million and, if traced back to the original raw materials, the cost could be proved to consist for the most part of wages. The diagram attached to this statement sets out in pictorial form how the company's income for 1949 has been used.

Export sales of parts in 1949 were approximately one-third as much again as in 1948. This is a natural and desirable consequence of the increasing number of our vehicles in use abroad. It is a trend which is likely to continue because the company's policy is to provide the necessary parts at reasonable prices, available at the premises of our associates and their dealers throughout the world. We are proud of our reputation for providing service facilities, and are continuously striving to improve our service organisation.

THE HOME MARKET

It is unfortunate that since January 1, 1950, the British Government has found it necessary still further to restrict sales of our products to buyers at home. We have domestic orders for over 275,000 passenger cars on our books, and a number of these may not mature. However, as the allocation permitted by the Government to the whole industry is only 110,000 for 1950, it is manifest how difficult it is for us to satisfy home customers, particularly as our production is still limited by certain factors over which we have no control.

The need for replacement of vehicles of all types in this country is being perilously deferred. These arrears will reach great numbers, with the result that exports will have to be curtailed when the time arrives, as it will, to meet the requirements necessary to maintain our national economy. Purchase tax is approximately 22 per cent. of the cost to the domestic buyer; for example, an "Anglia" is sold for £257, but the buyer pays £329 2s.9d. and we collect the tax of £72 2s. 9d. for the Government. I suggest that after five years of peace this country is being taxed to a standstill.

Our sales of factory-reconditioned engines continue to increase, thus showing the great contribution they make to keeping vehicles on the roads and alleviating the general shortage. Recently, reconditioned tractor engines have also been made available and welcomed enthusiastically by farmers.

DEMAND FOR TRACTORS

The farms of the United Kingdom, as a whole, are now the most highly mechanised in the world. Against the background of a prosperous farming community, a stable demand for our tractors and agricultural implements can be foreseen. Abroad, future prospects are good, as there is a great scope for development in many parts of the world, which are still far behind in agricultural mechanisation.

The emphasis placed on the need for full use of "marginal land" has been very much in the minds of your directors. The King's Speech at the opening of Parliament on March 6th was a direct reminder of the importance attached nationally to the full exploitation of the land by the most economical means, which clearly would involve further mechanisation.

Whichever political party is in power, the country's primary economic need is bound to be larger exports, if we are to maintain or improve our standard of living and feed our dense population. The company's contribution to this can be efficient production at low cost—this is our constant aim. I am glad to report that there is evidence of increasing efficiency throughout the plant, and that employment has been maintained with steady continuity throughout the year.

FACTORY RE-EQUIPMENT

Your directors have decided upon a factory re-equipment programme of considerable scope, as indicated in my statement last year. Many companies, owing to the heavy taxation, on undistributed profits, have to raise fresh capital to finance such projects. The policy of your directors in building up substantial cash reserves will enable us, we hope, to meet the cost without such recourse. The bulk of our purchases, necessary to carry out this programme, is made in the United Kingdom, but certain specialised machine-tools, which are not available in this country, will be imported from North America. The Treasury has made dollars available for these essential purchases by drawing the necessary sum from the United Kingdom E.R.P. allocation by arrangement with the E.C.A. Our present exports to North America, however, justify your directors in the belief that an equivalent amount of dollars will be earned by the company within a short period.

As indicated in the directors' report last year, a figure in excess of £10 million would be wanted for this anticipated programme. The total expenditure is now estimated at £12 million to be spent over the years 1950, 1951 and 1952. Arrangements are in progress regarding the setting up of a joint contributory sickness benefit scheme applicable to all hourly paid employees. The scheme is intended to supplement state sickness benefit, and should be welcome.

NEW MODELS

Our new models will be exhibited at the Motor Show in October, 1950. Until then I think you can scarcely expect me to disclose any details of our intentions. At the same time, the company intends to continue production of the Anglia and Prefect cars. The manufacture of spare parts for all present models will also continue.

Reference is made in the directors' report to the scheme of arrangement, including the issue of preference shares, the sale of shares in the European and Egyptian companies, and the new relationship agreements. In general terms, the result is that, following the sale of those investments, our assets will now be fully employed in this country in increasing and improving manufacturing capacity, necessitated by the wider outlet for our products throughout the world arising from the new agreements to which reference has already been made.

THE DIRECTORATE

The Viscount Portal of Hungerford, K.G., Mr Edward Corbet Woodall, O.B.E., and Mr Graeme K. Howard, vice-president foreign operations, Ford Motor Company, U.S.A., have been appointed members of the board, and your confirmation of these appointments is asked today. Lord Portal needs no introduction; he has served the country with great distinction. Mr Woodall comes of a family with long industrial experience and your directors consider he will strengthen the board. Mr Graeme Howard's experience and co-operation should prove of great value.

Mr Henry Ford II and Mr Graeme Howard have intimated to the board that, because of the dollar shortage in this country, they wish to waive their director's fees. This is a generous act, which, I am sure, you will appreciate.

As I indicated, I am retiring from the chair after this meeting. I have been happy and fortunate to occupy that position during two most successful years. The board intends to elect the deputy chairman, Sir Rowland Smith, to succeed me, and I have no doubt as to his qualifications. I am sure you will join with me in wishing him all success.

I cannot conclude without expressing my deep gratitude for the loyal support from all the members of this great organisation and recording the warm appreciation I feel for the services they have rendered in making this undertaking so successful.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring directors were re-elected, and the remuneration of the auditors was fixed.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

COLVILLES LIMITED

COMPANY'S MOST SUCCESSFUL YEAR

OUTPUT AN ALL-TIME RECORD

SIR JOHN CRAIG ON THE OUTLOOK

The nineteenth ordinary general meeting of Colvilles Limited will be held on June 2nd at the registered office of the company, 195 West George Street, Glasgow.

The following is the statement by the chairman, Sir John Craig, C.B.E., D.L., circulated with the report and accounts for the year to December 31, 1949:—

I am sure that you would desire to be associated with the directors in offering congratulations to Lord Bilsland. During the year, two great honours were conferred upon him. As the citizen who had rendered most service to the City of Glasgow during the past three years, he was deservedly awarded the St. Mungo Prize. For the splendid service he has rendered to Scottish industrial development, His Majesty the King has been pleased to confer on him the honour of a Barony. Both these honours have given great satisfaction not only to the directors but to all the staff and employees of the company and throughout industrial Scotland.

PRODUCTION

From an industrial point of view, the year was the most successful in the history of the company. The output was an all-time record. The production of ingots was 1,855,080 tons, which represented an increase of 6.83 per cent. over 1948. We acknowledge that this was only possible through the active and loyal co-operation of the managements and men at all works and their enthusiasm in utilising the improved plant placed at their disposal. We also recognise that the adequate supplies of raw materials were an essential contribution to this achievement.

As you are aware, the company has always contributed a large share of the national production in certain classes of heavy steel products, such as plates and sections for shipbuilding, structural engineering, boilermaking, locomotive and wagon building. Our development has been mainly directed to extending and improving equipment for this class of trade. For plates, sections and joists, the company's share of the national output last year was 25.3 per cent. You will see therefore the large proportion of this class of trade which is produced in Scotland by the company.

From its inception, the company has developed the production of steel boiler plates and might well be described as the pioneers in this particular business. It has been our constant endeavour to improve methods of production and maintain quality, and it is gratifying that, during the past year, our share of all the boiler plates produced in Britain was 55.2 per cent. We have always endeavoured to anticipate the changes that were taking place in the requirements of boiler makers, so that now we are able to make the larger plates they need and today we are supplying boiler plates over 20 tons in weight and up to 5 inches in thickness.

I have no doubt you will be interested in the information contained in the tables on page 16, and particularly in the comparative figures between 1939 and 1949, which show the remarkable changes that have taken place in the last decade. I would like, however, to draw your attention specially to the question of coal. Coal is an essential raw material for steel and enters very largely into the costs of production. The comparative figures were as follows—for all classes of coal, the average price was 18s. 7d. per ton in 1939, whereas in 1949 it was 54s. 9d. I need scarcely add, because I know you are familiar with the problem, that the quality has definitely deteriorated and the percentage of ash was substantially greater than it was ten years ago, so that even the price figures are not truly indicative of the increased cost.

ACCOUNTS

In reviewing the accounts, you will have noted that the charge for taxation takes a greater share of the profits than it did last year, even after the benefit of increased allowances on new expenditure has been taken into account. The benefit of the initial allowance is granted in the first year of the life of the plant, but in later years, the wear and tear allowances will be reduced, so the directors have thought it prudent to create a reserve to meet this contingency. The total provisions and reserves for taxation take nearly 70 per cent. of the profits after depreciation. This high proportion is partly explained by the difference in method of measuring taxable and commercial profits. It is to be hoped that the Tucker Committee, which at present is studying this matter, will be able to recommend some means of remedying this position.

The only other feature in the accounts that calls for comment is the decrease in the amount of the "Provisions Restored." By its nature, this item is bound to fluctuate, and the year 1948 was exceptional in that the position of the subsidiaries as regards E.P.T. was clarified.

GOVERNMENT PLANT

During the war, new plant was installed at several of our works on behalf of Government departments under agreements whereby the company had pre-emptive rights of purchase. In terms of this arrangement, we have just concluded the purchase of all the plant which we can usefully employ.

FINANCE

For six out of the past ten years, everything was sacrificed to war demands, so that nothing could be done towards developing the plans we had prepared in prewar days. However, since 1945, we have made up some of the leeway and have already spent £3,200,000 on extensions, to which there will now be added from four to five millions being spent at Clyde Iron Works and Clydebridge Steel Works, making a total expenditure of between seven and eight million pounds. So far we have met this expenditure from our own resources and will be able similarly to finance our current commitments. The time has not yet arrived when additional finance is required but you can be assured that the matter is under constant review by the directors who will take action as and when this is necessary.

RESEARCH

I have referred on previous occasions to the activities of your company in organising and promoting research work for the purpose not only of improving our manufacturing efficiency and economy but of developing entirely new steel products. It has been our aim that these new products should anticipate what our customers are likely to need in the immediate future to fulfil the ever-changing requirements of technical advances in their own spheres of activity. We are rightly proud of the success of your effort in this field of technical development.

For instance, I mentioned last year the invention of our stainless clad steel, which we sell under the name Col-Clad, and I am glad to be able to report that the reception of this steel has exceeded our expectations. Substantial tonnages have been supplied with every success and sales are developing satisfactorily.

The extensive use of welding in shipbuilding and general construction has brought its problems, as might have been anticipated, and our research department has been making a close study of them in the expectation of being able to offer some help in their solution. As a result, we are now manufacturing a new steel called Col-Tuf, which retains its toughness over an exceptionally wide range of temperature and possesses at the same time a high elastic limit. This steel has been taken up extensively by a number of overseas shipbuilders and we are informed by them that it has made a very definite contribution to solving some of the problems which have confronted them.

A department which has developed greatly during the past few years is that for welded fabrication. We are now regularly producing welded stern frames and rudders, bedplates and other fabricated work for marine and general engineering.

SUBSIDIARIES

I would like to make brief reference to some of our subsidiaries.

The Lanarkshire Steel Company achieved a record output and has had a prosperous year. When we took over these works in 1936, we inaugurated a policy of improvement and development on which we have already spent about £1,000,000. We embarked on a programme of fuel economy and recovery of waste heat. We have been successful in reducing the quantity of coal used per ton of finished steel from 24½ to 12½ cwts. In a few months' time, the cogging mill will be electrically driven with current from a central power house using mainly steam obtained from waste heat boilers at melting furnaces and soaking pits.

An additional pipe line from the River Clyde has been laid to the works to ensure an ample supply of water, not only for the Lanarkshire but for the Dalzell and Clyde alloy works as well. The new 150-ton melting furnaces have proved most satisfactory and the works are being brought up to the standard of the most modern of their type in this country. Lanarkshire works are linked by private railways to Dalzell, so that the two works can be operated in conjunction and this has proved a real advantage in their general economy.

At Clyde Alloy Steel Company, considerable extensions have taken place and there are now two modern foundries, one for light and the other for heavy castings, where the most difficult types of castings have been successfully produced. Substantial tonnages of stainless steel castings for hydro-electric and other purposes have been made and many stainless steel propellers supplied to shipbuilders in this country and abroad. This company has developed a promising trade with Continental countries and is now even supplying special steels to the United States and South America. I think it can be claimed that there is not a more modern works devoted to special steels in this country than exists at Clyde Alloy.

The works of Smith & McLean, Limited at Gartcosh, Milnwood, Mavisbank and Port Glasgow have been fully employed and have had a record year. At Gartcosh sheets of exceptional dimensions are produced, for which there is an ever-increasing demand. At Mavisbank, in addition to the manufacture of galvanised sheets, they are constantly undertaking galvanising of a most varied kind both for home and export.

One of our recent additions is Colvilles-Clugston, Limited. This company has been formed to develop commercial uses for the slag which arises from the production of pig iron. As the name implies, it is a joint venture with Clugston-Cawood, Limited, who already have successfully operated similar plants in England and whose knowledge of the subject will prove of value in our development of this new industry. Extensive plant has been laid down at Cambuslang where the material is prepared for road-making, railway and concrete work. This plant came into successful operation during the year.

We have developed other uses for blast furnace slag and have been producing quantities of granulated slag and of foam slag, both of which are now being used in house building. Our aim is to dispose of all our slag profitably and to avoid creating slag bings which, in the past, have been such a disfigurement at all blast furnace plants.

EXPORT

You would no doubt be interested in the statement embodied in the annual report showing the numerous countries to which our products have been sent during the past year. It is a striking testimony to the world-wide connection of the company that we have exported steel to 71 countries within a period of one year. Of course, the company has been exporting steel for nearly 70 years but it is encouraging today to find so many of our old customers still desiring to renew their connection with us at every opportunity.

Our exports were varied and the tonnage not as large as we would have liked since naturally, and rightly, the home consumer obtained priority. We think, however, that for certain classes of our trade, more export might well be permitted now without injury to consumers at home. Although, under the conditions of the past few years, home consumers have been able to absorb the bulk of the production, I would like to emphasise that, in normal circumstances, we must have an export market if we are to keep our plant fully occupied. It is very definitely to the interest of the home consumer that we should maintain our export trade, for only by maintaining full production can we keep our costs at the lowest level.

SCOTTISH INDUSTRIES EXHIBITION

The Scottish Council (Development and Industry) held an exhibition in Glasgow during the year, which commanded world-wide interest. We organised a stand in order that it might be recognised that no Scottish National Exhibition could be complete without steel being adequately represented, and we were well satisfied with the results of our exhibits.

TRAINING OF YOUTH

During the year, we issued a brochure entitled "The Intelligent Youth's Guide to Adventure." This was produced in order to place in the hands of youth some of the interesting features of the steel trade in the hope that many would be induced to enter it. The brochure has been very favourably commented upon, and, I am glad to say, has received special commendation from leaders of the industry in America. The personnel officer on the staff has been busily engaged on these problems, giving lectures at schools and clubs, selecting applicants for apprenticeship, and developing a system of preliminary education for selected candidates before they actually enter the works.

SOCIAL SERVICES

I think no review of the past year would be complete without making some reference to the social services at the various works because, in its own indirect way, such work contributes to the results under review.

The Mansion House at Colville Park, Motherwell, which the employees received as a gift from the Colville family, was in the hands of the public authorities during the war. It has recently been reconditioned and is now in full use as the headquarters of golf, tennis and bowling clubs, and is being increasingly used by our employees for social gatherings of all kinds.

The Memorial Home at Skelmorlie has been in constant use and has proved of very real value in the rehabilitation of employees after sickness or accident. The committee are now considering how it can be extended to meet an ever-increasing need.

NATIONALISATION

This subject has received much publicity in recent months and, as you know, there is now an Iron and Steel Act on the Statute Book, under which the nationalisation of the industry can be carried out. The creation of a Corporation in whom the ownership of the industry will vest cannot take place before October 1, 1950, and I think we must just await developments.

Having experience now of those industries which have already been nationalised, with their sluggish and over-centralised organisation, we have more reason than ever to feel convinced that the extension of such methods to the steel industry would be a disastrous blow to the economy of this country. It would react unfavourably not only on the prosperity of our own industry, but also on every one of the many industries which are dependent on steel supplies for their own success, and we are very apprehensive of its effect on our export trade.

FUTURE OUTLOOK

As regards the future, it is difficult to say anything useful. No doubt many of you have noticed that the Secretariat of the Economic Commission for Europe has been studying the future production and demand for steel and has come to the conclusion that, if all the schemes at present under way in many countries are completed, there may not be a sufficient demand to keep all the plants employed. In the White Paper, it was stated that the target output for steel in Britain should be 16 to 17 million tons, although this was later amended by the Government to an ultimate target of 18 million tons. We estimated that the share of your company in this output should be 1,900,000 tons, and you will notice that our output last year very nearly attained this figure, even without the benefit of the Clyde-bridge extensions, which will not come into operation until the latter part of this year.

From time to time, statements have been made in Government circles that this country should aim at producing still more steel, although it was obvious that it had not occurred to those who made the statements that, if the capacity for steelmaking is to be increased, it would be necessary to provide more coal and greater transport facilities. Judging from our experience, it was only with great difficulty that the National Coal Board was able to meet our coal requirements during 1949 and the railways often failed to maintain a regular supply of wagons, involving us many times in the additional expense of double-handling material.

Our production to date is actually in excess of that for the same period of 1949. We still have a good order book for our main products, but some departments are experiencing a shortage of orders. We are hoping, however, that with increased liberty to export we may be able to keep all our plant fully employed.

I cannot conclude without expressing the appreciation and thanks of the directors to the managers, the staff and all the employees for their able and loyal co-operation.

MONSANTO CHEMICALS LIMITED

EXPANSION OF ACTIVITIES

MR EDW. A. O'NEAL'S STATEMENT

The sixteenth annual general meeting of Monsanto Chemicals, Limited, was held on May 10th in London, Mr. Edw. A. O'Neal, junr. (chairman and managing director), presiding.

The following is an extract from his circulated statement:—

Turnover for the full year in 1949 fell below our expectations, though total sales were up, being 8.75 per cent. higher than in 1948. During the first half of the year we felt increasingly the pressure of American competition in our export markets and we were able to hold our foreign customers only by reducing prices while costs crept upward at home. Nevertheless, I am glad to report that direct export sales in 1949 were 31.16 per cent. of our total sales as compared with 28.75 per cent. in 1948, and the volume of our exports in 1949 increased 20.7 per cent. over the volume in 1948.

Whilst we had felt a definite upturn in sales at home and abroad before devaluation in September, this marked change in the value of the £1 sterling acted immediately as at least a temporary stimulus to trade. In fact, our turnover during the last quarter of 1949 exceeded our expectations.

This improvement, whilst gratifying, did, however, not come sufficiently early to outweigh certain other factors which affected the company's trading profit for 1949. Our manufacturing costs increased whilst we held the line on prices on the home market. At Ruabon heavy maintenance expenditure was undertaken to bring the older plants to first-class condition. At Newport delays in reaching normal production rates in those plants brought into operation in the middle of the year resulted in extremely high costs, whilst although production was at a low rate, normal depreciation was charged on all new manufacturing plants and services brought into use. This latter factor alone accounted for an increase of £85,000—or 85 per cent. in depreciation charged to cost in 1949 over 1948 without a proportionate increase in turnover.

By the end of the year most of our starting up difficulties at the Newport factory had been overcome and production was approaching design rate, whilst our overall capacity to produce had reached the estimated volume.

Additional manufacturing units brought into operation at Ruabon and Newport included facilities for the manufacture of synthetic glues, catalyst for sulphuric acid plants, sulphuric acid, synthetic detergents and maleic anhydride for the plastics industry, chemicals for the oil industry.

NEW PROJECTS

Many of those new projects for which capital was raised by the issue of additional ordinary shares in May, 1949, were completed by the end of the year—all were under construction. Of the remainder, the majority will be finished during 1950.

Expansion of our research facilities was continued by the purchase of Fulmer Hall, a property near London, towards the end of last year. Our expenditure on research during 1949 exceeded that of 1948 by 50 per cent. Further increases in expenditure on research are envisaged as they become justified by the expansion of the business of the company.

We completed negotiations for the purchase of a small manufacturing company and successfully negotiated research and development contracts with a foreign firm, which will establish a base for the development of silicon chemistry in the United Kingdom by our company.

Arrangements were completed with British Petroleum Chemicals, Limited, for the formation of a new company, Forth Chemicals, Limited, for the manufacture of Styrene Monomer and other chemicals stemming from petroleum. We have undertaken the engineering for the Styrene Monomer project for Forth Chemicals, Limited, who have successfully negotiated a contract with Monsanto Chemical Company, U.S.A., for the chemical engineering design.

Monsanto Chemicals (Australia) Limited, our Australian subsidiary, have reported good progress during the year. Jointly with Monsanto Chemical Company we were successful in the formation of Monsanto Chemicals of India, Limited. This associate will handle the sale of Monsanto products in India and provide the means for manufacture there when economically desirable.

In budgeting the company's sales and production for the year 1950 we have felt justified in anticipating an appreciable increase in turnover. We hope to bring into production by the middle of 1950 our new plant for the manufacture of Polystyrene (plastic); units for the manufacture of Pentachlorphenol and Santobrite for the wood preservative and insecticide industries, and Aroclors for the electrical industry. Commitments for products manufactured at Ruabon indicate capacity production at that location for at least the next six months.

Nevertheless, we proceed with caution for several reasons. First, we see no reason to expect any improvement in the inflexibility of national and international conditions which so hamper free trade. Secondly, we are only just beginning to feel the impact of increasing costs due to devaluation, and at this stage it is not possible to predict the scale and full effects of these for as far as a year in advance.

The income of the group for the year was £963,766, compared with £1,014,262 in 1948. After providing £233,664 for depreciation and obsolescence, £377,139 for United Kingdom and Australian taxation, £34,878 for directors' remuneration and auditors' fees, and £21,701 proportion of subsidiary company's profits attributable to minority interests, the group profit carried forward was £296,384. After providing for parent company's dividends there remains to be carried forward £487,992 for the group, as compared with £445,296 at the end of 1948.

In review, we feel we have accomplished to a large degree the task we set to expand the activities of our company in the early post-war years. Original target dates for bringing into production the new capital invested have been met within reasonable limits, and we look forward now to realisation of the tremendous effort made by all in our organisation.

The report was adopted.

BRITISH OXYGEN COMPANY, LIMITED

RECORD TURNOVER

The sixty-fourth ordinary annual general meeting of the British Oxygen Company, Limited, was held on May 10th in London.

Mr S. J. L. Hardie, D.S.O., LL.D. (the chairman), in the course of his speech, said: The turnover for the year has been a record, and the decrease in profit is mainly due to advancing costs without a commensurate increase in the selling prices. Since the war, rising costs have had to be faced in many directions, the principal items being raw materials, power, wages and transport. These increases have, up to last year, been largely taken care of by improved efficiency and expanding output.

The profit of the group for 1949 amounts to £3,264,022 compared with £3,478,332 for the previous year—or a decrease of £214,310. Deduction of overseas taxation and depreciation brings out the group trading profit at £2,032,378 compared with £2,403,174. Against this we have to meet a lower provision by £70,000 approximately at £1,025,653 for taxation and reserve for taxation rebate received on initial allowances. After taking credit for taxation reserve provided in previous years and no longer required the profit available to The British Oxygen Company, Limited, is £1,055,047 compared with £1,200,531 in 1948. The directors recommend a final dividend of 12 per cent. less income tax on the ordinary stock (making 20 per cent. for the year).

A STRONG POSITION

The consolidated balance-sheet shows the strong position of the group with its associated companies in all the main overseas countries of the Commonwealth. We now operate at home and overseas 166 works—an increase from 152 last year—102 of which are overseas. This indicates the extension of our already wide ramifications all over the world. The company maintains the policy of progression and large schemes are under construction or consideration.

The products of this company at home and overseas are a spearhead for industrial development. It has to be recognised that there are great potentialities for expansion overseas but, in the home market, we cannot look for the same spectacular increases in the volume of output, and there are indications that the rise in demand may have been halted—although it is pleasing to report that for the first quarter of 1950 output still shows an increase, and I have confidence in and am optimistic for the future of our industry at home and overseas.

Our development policy has been to equip our works and plant to meet at all times the demands for our products which are so very essential to industry. Our capital commitments to meet increased trading at home and overseas are extensive, although to a certain extent we are today adopting a policy of consolidation of our development programme in this country. The research and development department is playing an increasing part in many aspects of the company's business.

My message to industrialists in this country who have under consideration overseas expansion is that, wherever the Commonwealth flag flies and there is industrial development, our associated overseas company will be there with our technical plant and equipment, our research and development, supported by our technical and commercial experience of 60 years, to assist and to service industry with our products.

The report was adopted.

RAND MINES LIMITED

DEVALUATION IMPROVES GOLD MINES' POSITION

ALL-ROUND IMPROVEMENT IN RESULTS

COMPANY'S INVESTMENT RANGE EXTENDED

MR W. H. A. LAWRENCE'S SPEECH

The annual general meeting of Rand Mines Limited, was held in Johannesburg on May 5.

Mr. W. H. A. Lawrence, the chairman, said that the profit earned by the company during 1949 and transferred to the appropriation account had amounted to £950,062, an increase of £333,448 compared with the previous year. The main source of revenue, namely, dividends received, had increased by £315,861, interest and exchange had increased by £11,079, sundry revenue had decreased by £17,483 and administration and other expenses, after allowing for fees received, had decreased by £23,894. After making the appropriations detailed in the accounts, including £537,749 in respect of dividends declared, the sum of £181,252 had been added to the unappropriated balance which had stood at £1,413,704 at the end of the year.

RESERVES STRENGTHENED

The amount realised by the sale of investments of freehold property and ventures had exceeded their book value and amounts written off as depreciation by £400,749 ; and following the usual practice that sum had been added to the investment reserve account which had thereby been increased to £4,475,506. Claims met for dividends forfeited since September, 1939, had totalled £120,850 and the contingency reserve account created to meet those claims had been reduced to £175,800. The sum of £100,000 had been appropriated to the credit of the exploration reserve account and expenditure on ventures charged thereto had totalled £82,065, thereby increasing that reserve to £267,935.

Investments in shares and debentures had been brought into the account at a total book value of £5,426,267, being an increase of £488,728 compared with the figure for the previous year.

INVESTMENT POLICY

In its earlier years, Rand Mines investments had been almost exclusively confined to large shareholdings in certain Witwatersrand gold mining companies and precise details of those interests had been reported to shareholders annually. The range of the company's investments had, however, been steadily widened since then and it was now an essential part of its business to maintain a constant review of the portfolio of shareholdings with the object of taking due advantage of favourable opportunities for adjustment, for instance, by investment in attractive enterprises in new mining and other fields.

The directors were satisfied that in those circumstances it would be seriously disadvantageous to the company and its shareholders to continue to publish exact particulars of its portfolio, but they had included in their report a list of companies in which Rand Mines had its principal investments.

CHANGED OUTLOOK

The year 1949 had brought a considerable change in the general outlook of the South African gold mining industry, which was reflected by an all-round improvement in results achieved. The African labour position had improved materially, there had been a small increase in the number of Europeans employed and the supply position in regard to stores and materials had been easier, but working costs had continued on the upward trend as a result of the increase in the cost of stores and of the steadily rising cost of living allowances paid to European employees. In September, 1949, however, the whole economic position of the industry had been beneficially readjusted by devaluation and the resultant increase in the price of gold. The average pay limit of the industry had thereby been decreased from about 3.0 dwt to 2.1 dwt per ton.

MORE ORE AVAILABLE

That had meant that from the mining point of view considerable quantities of low-grade ore had been rendered payable and brought into the reserves ; the percentage of payability had increased ; the amount of development required to open up a given quantity of payable ore had decreased ; the percentage of dead or uneconomic ground had decreased and the quantity of working faces had increased ; and prospects of obtaining increased tonnages from the reclamation of old workings had improved.

From the financial point of view, profits had improved materially, thereby increasing the amount to be divided between shareholders and the state by way of dividends and taxation. Some indication of the magnitude of the resultant benefit to the Union's economy could be gauged from the fact that working revenue of the mines of the Witwatersrand had increased from £8,500,000 in August, 1949, to £12 million in March, 1950. Over the same period profits had increased from £2,000,000 to £4,500,000. Working costs had increased by £1,000,000, or 2s. 8d. per ton milled, and as that was equivalent to an increase of 0.2 dwt. per ton in the pay limit in the six months following devaluation, a fairly substantial proportion of the 0.9 dwt. per ton gained as the result of devaluation had already been absorbed.

GROWTH OF WORKING COSTS

The increase in working costs that had so far taken place was, however, almost entirely due to the cost of improved conditions of employment granted to employees immediately after devaluation, and it was only since March of the current year that the inflationary effects of devaluation had really become apparent. The upward movement in commodity prices, which had been aggravated by higher railage charges, was typified by the recent additions to the cost of cement, coal and foodstuffs. It was evident that the industry was already faced with further increases in working costs and much more serious efforts would have to be made if the severe inflationary spiral was to be avoided in the Union's economy.

A SATISFACTORY YEAR

Eleven producing mines on the Witwatersrand of the Central Mining/Rand Mines group had a satisfactory year compared with 13 in 1948, the general improvement recorded being largely due to devaluation but partly to the increased supply of African labour and partly to increased efficiency. Steady progress had been made with the increasing scale of operations at Blyvooruitzicht and the rate of milling had attained 80,000 tons in October. The amalgamation of City Deep and Nourse Mines from the beginning of the year had proved beneficial and progress was being made with extending the mine in depth by means of incline shafts.

At East Rand Proprietary Mines a heavy capital expenditure programme was being undertaken in order to open up deep levels by means of vertical and incline shafts. In the Eastern Transvaal, Glynns Lydenburg was nearing the end of its life as an independent producer and it was proposed to amalgamate it with Transvaal Gold Mining Estates. The latter company had gone through a critical period prior to devaluation, but was now earning satisfactory profits again.

O.F.S. MINES

In the Orange Free State, Union Free State Coal and Gold Mines had carried out further drilling in the Harmony block, which confirmed the previous indications that it was underlain by the basal reef of encouraging value and width at depths between 4,000 and 6,000 feet. A mining lease had been applied for in respect of an area of about 5,500 claims and a company would be formed to take over that lease when it was granted. Meanwhile, good progress was being made at the proposed mine ; excavations for two shafts had been started ; permanent winders had been purchased and were in the course of delivery ; temporary housing, office and workshop accommodation had been erected and some of the permanent houses were under construction ; power would shortly be provided by the Electricity Supply Commission ; and water was being drawn from boreholes pending the provision of a permanent supply from the Vaal River.

A new company, Central Mining Free State Areas Limited, had been formed during the year to take over the group's Free State mineral rights and options and interests in Union Free State Coal and Gold Mines and New Consolidated Free State Exploration Company. Since the close of the year, the group had assumed technical and administrative control of East Rand Gold, Coal and Estate Company Limited, whose principal asset was a substantial share holding in Union Free State Coal and Gold Mines.

COLLIERIES RECORD OUTPUT

South African collieries generally had had a satisfactory year, and the output had reached a record volume. The export trade had remained at a low level, but there had been some improvement following the increase in the supply of railway trucks. In the first two months of 1950 there had been a serious recession, and although some fairly substantial orders had since been booked from overseas and trade had improved, the export of coal was largely dependent on rail facilities and the amount of shipping on offer. If the shipping difficulties could be overcome and if the Government would prohibit the export of inferior grade coal which was so harmful to the reputation of South African coal abroad, there was little doubt that the Union of South Africa could build up a relatively large and stable export business which would be of considerable benefit to the country's balance of trade.

Satisfactory progress had been made at the various collieries of the group. The Raleigh Colliery had been brought to production on a small scale, and its output would be increased when the Barvoys coal preparation plant came into operation. The establishment and equipment of Van Dyks Drift Colliery was practically complete and coal of a high calorific value was being produced. The Witbank Colliery was now dependent entirely on the new Wolvekrams section which had been opened up satisfactorily and was producing high-grade coal.

INDUSTRIAL INTERESTS

The industrial interests of the group had made good progress. The Pretoria Portland Cement Company's new factory at Orkney and the Hume Steel Company's new factory at Wadeville were now in production and satisfactory progress was being made with the expansion and reconstruction programme of the Cement and Hume Pipe companies. The increased output of South African cement producers was now sufficient to meet requirements, and cement was no longer being imported.

The timber and forestry interests of the group had had a satisfactory year during 1949. The forestry undertaking of the Transvaal Gold Mining Estates Limited had been taken over by South African Forest Investments Limited on January 1, 1949, and which sold over 4,500,000 cubic feet of timber during the past year. The total plantation area at the end of 1949 had been just under 45,000 acres. The Forest Investment Company's wholly-owned subsidiary Acme Box Factory Limited had maintained its sales at a high level and continued to earn satisfactory profits. Exchange Yard Proprietary Limited had handled the timber requirements of mines of the group successfully and had recently acquired another timber property adjoining its estate in north-eastern Transvaal.

ALTERATION TO ARTICLES

In regard to the item of special business in the notice of the meeting, English Company Law had been recently altered to abolish the compulsory use of distinctive numbers in connection with shares. The South African Company Law Enquiry Commission which had reported in 1949 found that the advantage of any safeguard provided by the numbering of shares had been outweighed by the amount of clerical work involved and had recommended that the principle of English law should be adopted. In anticipation of a similar amendment to South African statutes, shareholders were being asked to pass the special resolution altering the Company's Articles of Association so as to enable the directors to dispense with the use of distinctive numbers on share certificates as soon as the law permitted.

In conclusion, he had much pleasure in recording their sincere appreciation of loyal and able work done by the staff of the company at the head office ; by the managers and staffs of the mining and other companies of the group ; and by their London secretaries, Messrs. A. Moir and Company.

The report and accounts were adopted.

CITY DEEP, LIMITED

BENEFITS FROM DEVALUATION

HIGHER PRICES FOR GOLD

MR G. V. R. RICHDALE ON YEAR'S OPERATIONS

The annual meeting of City Deep, Limited, was held in Johannesburg on May 3.

Mr G. V. R. Richdale, the chairman, said that the company had benefited considerably by devaluation of the South African currency in relation to the United States dollar, as a result of which the price received by producers for their gold had been increased from 172s. 6d. to 248s. 3d. per ounce fine, with effect from September 19, 1949. Since that date, mining operations had produced a higher revenue, and in addition it has been possible to mine profitably ore of lower content, thereby enabling the company to include an appreciable quantity of previously unpayable ore in its reserves. That meant that the life of the company's property had been extended.

In addition, the greater profits earned as a result of devaluation had enabled the Gold Producers Committee of the Transvaal Chamber of Mines to conclude agreements with representatives of the European employees in response to demands for improved conditions of employment, which had been the subject of investigation and report by the Van Eck Commission appointed by the Government in 1948. Certain increased benefits had been accordingly granted to European employees with effect from the date of devaluation. The basic wages of African employees, who had been granted a service increment earlier in the year, had also been increased.

THE NOURSE ACQUISITION

The acquisition of the entire undertaking of Nourse Mines, Limited, by the company with effect from January 1, 1949, had resulted in greater efficiency, while a number of economies in working and administration costs had been made possible. The connection between Number 20A level haulage of City Deep and Number 38 drive of Nourse Mines had been completed and equipped during the year, and ore from the lower levels of 3D section of Nourse was now being transported along that haulage to Number 5 shaft for treatment in the City Deep mill.

In addition, considerable time and expense were saved in transporting men and materials from the surface through No. 5 shaft to working places in the 3D section with a resulting improvement in efficiency and in handling costs. No. 5 compound had been enlarged to accommodate African labour which had been transferred from the Nourse Mines compound. Those employees were now lowered down No. 5 shaft and the maximum benefit was thus obtained in working the lower levels of the 3D section from the City Deep side.

LARGER PROFIT

Compared with the combined results achieved by the two companies working independently during 1948, the amalgamated property had recorded an increased profit in 1949 after due allowance had been made for the effects of devaluation in the latter months of the year. The saving in working costs had been offset during the last quarter of the year, however, by the increased cost of benefits granted to employees, and the overall costs for the year had consequently reflected a small increase compared with those for 1948.

Ore milled had totalled 1,827,000 tons, which was 72,000 tons more than the combined figure recorded for the previous year. That improvement had been partly due to the material increase in the African labour force, but that increase could not be used to full advantage owing to a continued shortage of European labour. Gold recovery had increased by 17,208 ounces to 417,194 ounces fine, and the average yield per ton milled at 4.567 dwt. had reflected an increase of 0.009 dwt.

Mainly as the result of devaluation, revenue per ton milled had increased by 6s. 4d. to 45s. 9d. and for reasons already stated working costs at 35s. 10d. per ton milled had been 2d. higher than in the previous year. Net profit for the year had been £785,864, provision for silicosis outstanding liabilities and assessment in respect of additional outstanding liabilities had accounted for £5,935, forfeited dividends refunded had totalled £18,106. provision for taxation had amounted to £254,619 and dividends had absorbed £405,366.

CAPITAL EXPENDITURE

The balance of working capital on hand had amounted to £274,722. That amount arose from the issue of shares to Nourse Mines as consideration for net current assets taken over amounting to £187,151, together with the sum of £87,571, being the excess of sales of property over expenditure on development and equipment for the year. Net capital expenditure during the year had totalled £131,914 and had been incurred mainly on extensions and renovations to main offices and workshops to facilitate centralisation; on the enlargement of No. 5 compound; on the recondition of the Nourse reduction works; on connecting the City Deep workings in the vicinity of No. 5 shaft with those in the Nourse Mines 3D incline area along No. 20A level ; on the cutting of engine chambers and on equipment for the new K1 and K2 sub-incline shafts ; and on equipment for the new K3 sub-incline shaft.

Expenditure on capital account during the current year might amount to as much as £258,000 and would be incurred mainly in connection with the three new sub-incline shafts and the construction and equipping of the new pump chamber on the 45th level of IE shaft.

AN APPLICATION GRANTED

He had informed shareholders at the last annual meeting that the company had applied to the Mining Leases Board for undermining rights of an additional 158 claims adjoining the southern boundary on Farm Elandsfontein No. 26. That application had been granted during the year and your company's mining area was now uniformly extended to the 10,000-ft. horizon. Three new sub-incline shafts would open up the western deep level portion of the property, while the existing mining area was being extended uniformly to the 45th level.

The effect of devaluation upon the financial aspect of the four-year capital programme contemplated by the exploitation of new deep level areas had been to increase the estimated cost of the scheme by approximately £250,000 to £1,500,000. Despite that increase, however, working capital on hand, together with appropriations from future profits should be sufficient to finance the whole scheme and the board did not expect that it would be necessary to raise additional funds for the purpose.

DEVELOPMENT FOOTAGE

Footage developed during the year had totalled 57,172 feet which represented an increase of 3,726 feet compared with the corresponding combined figure for 1948. Of that, 25,465 feet had been sampled, 13,500 feet being classed as payable. The average payability had been 53 per cent., compared with 45.6 per cent. in the previous year. The Main Reef Leader had again provided the bulk of tonnage developed, the value being generally satisfactory. Development on the South Reef and Main Reef horizons in the upper levels of the mine had enabled a small tonnage to be added to the ore reserves. Lowering of the pay limit had improved the future prospects of development on those reefs and it was proposed to increase the rate of development as additional labour became available.

The estimated payable ore developed had amounted to 1,100,600 tons, valued at 6.0 dwt. per ton. The available ore reserve had been re-estimated as at December 31, 1949, to be 5,977,000 tons averaging 5.9 dwt. over a stoping width of 42.0 ins. Compared with

the previous estimate for the combined area, that represented an increase of 489,000, the value and width being less by 0.1 dwt. and 0.9 inch respectively. The lowering of the pay limit consequent upon devaluation had enabled an additional 754,000 tons to be included in the available reserve.

TAXATION

The basis of gold mining taxation during 1949 had remained the same as that introduced with effect from January 1, 1948, and no alterations had been announced for the current year. Owing to the effects of devaluation, however, the ratio of profit to recovery had been higher than the statutory minimum of six per cent., and the company had thus become liable to pay taxation in respect of its gold mining profits for the year.

In the terms of the Silicosis Act No. 47 of 1946, the company's proportion of additional outstanding liabilities for the year ended March 31, 1950, had been assessed at £4,204 and a further sum of £1,731 had been provided during the year towards meeting the proportion of the outstanding liabilities of the Silicosis Compensation Fund which the company would be called upon to pay in the event of the mine being closed down. The company's assessed liability in that connection as at March 31, 1949, had been £620,534, towards which a total sum, including accrued interest, of £581,635 had been provided up to December 31, 1949. In addition, working costs had been debited with current silicosis charges totalling £76,003.

SALES AT A PREMIUM

The company benefited indirectly as the result of certain arrangements made by the Union Government in February, 1949, for the experimental sale on behalf of the gold-mining industry of 100,000 ozs. of fine gold at a premium of 17s. 6d. per ounce. The total realised had been used in reducing the silicosis levy, on scheduled mines for the last quarter of 1949. In addition, arrangements had been made by the Transvaal Chamber of Mines, with the approval of the South African Treasury and the International Monetary Fund, for the disposal at enhanced prices of a proportion of the gold output of the industry for artistic and industrial purposes as a result of which additional net revenue received by the company in respect of the period July to December had amounted to £41,027 or approximately 10d. per ton milled during that period.

A limited quantity of gold was also being sold for local manufacture of goldware and the company's proportion of the net profit realised on such sales during 1949 had amounted to £891. During the first quarter of the current year, the working profit had been £383,707, and additional revenue from sales of gold at enhanced prices had amounted to £26,604, making a total working profit of £410,311.

ALTERATION OF ARTICLES

An item of special business had been included in the notice convening the meeting. It concerned a proposal to alter the provision contained in the articles of association of the company concerning individual numbering of shares. As shareholders might be aware, legislation recently enacted in England provided for the abolition of the compulsory use of distinctive numbering of shares. There was a possibility of the company law of South Africa being amended in a similar manner, and in order to take advantage of the considerable saving in time and work connected with the transfer of shares which would result from such legislation, the directors wished to take the opportunity to propose that distinctive numbers in respect of shares might be dispensed with as soon as statutes permitted.

The report and accounts were adopted and the special resolution was passed.

CROWN MINES, LIMITED

BENEFITS FROM DEVALUATION

LARGER PROFIT RATIO

MR W. H. A. LAWRENCE'S SPEECH

The annual meeting of Crown Mines, Limited, was held in Johannesburg on May 3rd.

Mr W. H. A. Lawrence, the chairman, said that devaluation of the South African currency in relation to the United States dollar with effect from September 19, 1949, and the consequent increase in the price received for gold from 172s. 6d. to 248s. 3d. per ounce fine, materially improved the economic outlook of the gold-mining industry. In addition, arrangements had been concluded during the year whereby the industry was selling a proportion of its gold output at enhanced prices for industrial and artistic purposes.

As a result of the increased revenue assured by devaluation, the industry had been placed in a position to grant improvements in conditions of employment of both Europeans and Africans. Those improvements had included, *inter alia*, an increase in European basic salaries and wages, the establishment on a contributory basis of a pension fund for day pay employees, the payment of a lump sum of £25 to each employee, a special contribution to the employees' provident fund and an increase in basic wages of African employees.

LABOUR SHORTAGE

The company's mine, in common with most of the other mines of the industry, had suffered from the continued shortage of European labour which had prevented full advantage being taken of the satisfactory increase in the supply of African labourers in the second half of the year. The net profit was £999,784. Net expenditure on capital account had amounted to £157,856, provision in respect of silicosis outstanding liabilities had totalled £27,157, provision for taxation had accounted for £180,765, forfeited dividends refunded to shareholders had amounted to £111,905, and dividends had absorbed £612,991.

Capital expenditure during the year had totalled £186,389 and had been incurred principally in connection with ventilation at number 16 shaft and winding equipment and power supply for the incline shafts. Capital expenditure during the current year, mainly on electric power supply and installation on winding equipment for the incline shafts, was estimated at £195,000.

DEVELOPMENT RESULTS

Compared with the previous year's figure, development footage accomplished had increased by 16,783 ft. to 95,832 ft. Of that increase, 15,830 ft. represented development in country rock and consisted mainly of haulage driving, sub-incline shaft sinking and cross-cutting, all of which had been necessary to provide for a continuance of reef development at greater depths. Footage sampled on the reef at 35,445 ft. had been less by 3,995 ft.; payable development had shown a reduction of 1,645 ft., with an improvement of 0.9 dwt. over the same channel width of 16 ins.; and the percentage of payability had been virtually unchanged at 52.4 per cent.

In various deep sections of the mine, including the eastern portion of the new lease area where exploratory development had been undertaken, values disclosed on the Main Reef Leader had been approximately the same as in the previous year. Values exposed by surface trenching at numerous points on the Kimberley Reef outcrop had been generally unpayable, but disclosures in No. 15 shaft area where two winzes were being sunk had so far been encouraging. Payable ore developed at 1,357,100 tons had been 177,500 tons less than the figure for the previous year, the average value being lower by 0.2 dwt. per ton.

UNPAYABLE ORE NOW AVAILABLE

As a result of the lowering of the pay limit following devaluation, 1,245,000 tons of previously unpayable ore had been added to available reserves. At December 31, 1949, the available reserve had been estimated to be 9,535,000 tons, or only 275,000 tons more than the estimate made the previous year. But for devaluation, therefore, a steady decline in ore reserves which had been a feature of operations during the previous ten years would have continued.

That decline was to be attributed not only to the unavoidable drastic curtailment of incline shaft sinking and other off reef development during the war period, but also to a decrease in recent years in the percentage payability of the Main Reef Leader and to the deterioration of values on the South Reef. Persistent postwar labour shortages, coupled with the necessity of maintaining mill tonnages at economic levels, had prevented sufficient development being done to ensure that tonnage developed replaced tonnage mined from reserves. Present indications were that the ore reserve would continue to decline over the next two or three years and that thereafter prospects would be governed by the percentage payability of the Main Reef Leader in unexplored areas below present workings.

A NEW AREA

During the year, the company acquired from Langlaagte Estate and Gold Mining Company, Limited, 55 mining claims bordering on the north-western section of the company's mine. Most of that area had been worked out several years ago, but some blocks of the Main Reef Leader were being opened up and mined. The opening up of that area would provide additional outlets for upcast air which would in turn help to combat the rise in rock temperature encountered at increasing depths.

During the year new surface air cooling plant at No. 16 Shaft had been brought into commission. The quantity of air delivered underground by the cooling plant at No. 17 Shaft had been increased and two new fans had been installed on No. 41 level at No. 15 Shaft. Those measures had materially improved working conditions throughout the deep sections of the mine.

TAXATION

No alterations had been made in the basis of gold-mining taxation during 1949, but owing to the higher ratio of profit to recovery resulting from devaluation, the company had become liable for the formula tax and had provided a total of £180,765 for taxation in 1949, compared with £5,452 in 1948.

It should, however, be pointed out that the ratio of profit to recovery for 1949 had been 10.9 per cent., whereas the corresponding figure for the first quarter of the current financial year was 25.9 per cent., resulting in provision for taxation of £227,905 for the quarter.

During the first three months of the current year, working profit had amounted to £526,014 and additional revenue from sales of gold at enhanced prices to £36 392.

SPECIAL BUSINESS

There was an item of special business included in the notice convening the meeting. As shareholders might be aware, English company law had recently been amended to provide for the abolition of the compulsory use of distinctive numbers on shares. The South African Company Law Inquiry Commission, which had reported in 1949, found that the advantage of any safeguard provided by the numbering of shares had been outweighed by the amount of clerical work it involved, and had recommended that the principle of English law should be adopted. Shareholders would be asked to pass a special resolution altering the company's articles of association so as to enable the directors to dispense with the use of distinctive numbers on share certificates as soon as the law permitted it.

At the end of the year, Mr A. J. Walton had resigned from the board of directors. Mr Walton had been connected with the direction of the company's affairs for 30 years, first as general manager of the mine, then as consulting engineer and finally as chairman of the board of directors. The directors had a keen sense of appreciation of the excellent work performed for Crown Mines by Mr Walton and he was sure shareholders would join him in expressing to Mr Walton the company's thanks and good wishes.

The report and accounts were adopted and the special resolution was passed.

FREDERICK LAWRENCE LIMITED

GRATIFYING VOLUME OF TRADE

The twenty-second ordinary annual general meeting of Frederick Lawrence Limited was held on May 10th in London, Mr Frederick Lawrence, J.P., L.C.C., chairman and managing director, presiding.

In the course of his speech the chairman said:

There was a substantial increase in trade during the year ended January 31, 1950, and the profit on trading amounted to £83,360. Taxation totalled £41,264, and after deducting this item and adding the balance of £53,994 brought forward from last year, there remains an available balance of £86,156. The board recommends the payment of a final dividend of 20 per cent. on the issued ordinary share capital.

During the year under review a very considerable amount of business was transacted, and the profit on trading of £83,360 compares with £63,454 for the year ended January 31, 1949. The volume of trade done is very gratifying, and reflects the satisfaction of the public.

A new subsidiary company has been formed to take over the whole of the manufacturing and wholesale sides of the business of B. Maggs and Company. Your directors are confident that it will be an advantage to separate the manufacturing and wholesale business from the retail and distributing departments, and that, as a result, both sections will develop with greater efficiency.

Forecasting future trade is always a difficult task. We start, however, with the welcome knowledge that the first three months of the current year again show a marked increase of trade in every department.

The report was adopted.

NOTICES

HIS MAJESTY'S COLONIAL SERVICE—GOLD COAST

The following vacancies exist in the Statistical Branch of the Secretariat in the Gold Coast:—

(i) STATISTICAL OFFICER, responsible for the planning and analysis of statistics. The appointment is on contract, on a salary scale of £660—£1,300. Age limit 45. Candidates should possess a First or Second Class Honours Degree (or equivalent qualification) in Statistics, Mathematics, Economics or other appropriate main subjects combined with Statistics.

(ii) SUPERVISOR, CALCULATING POOL, responsible for the organisation of computing work and the training of staff. The appointment is on contract, on a salary scale of £660—£970. Age limit 45. Candidates should have had wide experience in advanced computing work.

In both cases a gratuity is payable on satisfactory completion of contract.

Further particulars of both these appointments, together with application forms, can be obtained by writing to he Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1. The closing date for completed application forms is May 30, 1950.

UNIVERSITY OF LONDON

A course of five lectures on "The Foreign Trade of Medieval Europe" will be given by Professor M. M. Postan (Cambridge) at 5 p.m. on May 19th, 23rd, 25th, 26th and 30th at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2.

ADMISSION FREE, WITHOUT TICKET.

JAMES, HENDERSON, Academic Registrar.

ANGLO-GERMAN legal qualifications and experience offered for Banking. Legal or Commercial post by British Barrister, aged 37. University graduate. Foreign Office employment terminating in July. Good knowledge of both Continental and English business conditions.—Box 409.

GENTLEMAN, public school, wide experience West African import-export trade, desires executive post East Africa. Can introduce interesting business proposition if suitable agreement made. Now employed by old-established firm dealing in general merchandise and produce. Returning U.K. June/July.—Box 413.

SENIOR Clerk (male), to take up duties in June, required by the Footwear Manufacturers' Federation which is the national trade organisation of the boot and shoe industry. Applicants should have a wide knowledge of the footwear industry, including costings and profit and price control regulations, and a practical knowledge of statistical work. Commencing salary commensurate with age and experience.—Apply, by letter only, giving full particulars, to The Director, Footwear Manufacturers' Federation, 22, Gilbert Street, London, W.1.

EAST AFRICA. Old-established Food Manufacturers in Nairobi require Senior Executive. Qualifications: first-class commercial, administrative and sales experience. Maximum age early 40s. Free passage, free house, superannuation and medical benefit scheme and home paid leave. Salary according to experience, but not less than £1,500 p.a.—Replies, in confidence, to Box "W.R.H.", c/o 95, Bishopsgate, London, E.C.2.

CENSUS OF ENGLAND AND WALES, 1931. Classification of Occupations. H.M. Stationery Office, printed in 1934 at 12s. Copy of this publication urgently needed for research work. Good price paid. Dr. Webb, Institute of Social Medicine, 10, Parks Road, Oxford.

EXECUTIVE, experienced in office management, advertising and personnel control, seeks outlet for ambition and energy. Age 37; excellent references.—Box 410.

OXFORD UNIVERSITY—NUFFIELD COLLEGE

APPLICATIONS are invited for STUDENTSHIPS from graduates (men and women) who wish to work in the field of Social Studies. Applications should be made on prescribed forms, which can be obtained from the Secretary, Nuffield College, 19, Banbury Road, Oxford, and should be returned when completed, in time to reach the College by May 27, 1950.

Election will be for one year in the first instance, starting in October, 1950, but may be renewed for a second year. A grant may be attached to the Studentships, the amount of which will be decided after consideration of the student's needs. Students will normally be expected to work for a higher degree.

NORTHAMPTON COUNTY BOROUGH EDUCATION COMMITTEE

COLLEGE OF TECHNOLOGY

Principal, O. F. BAILEY, B.Sc., A.M.I.E.E.

Required to take up duty in September next, a full-time teacher in the Commerce Department to teach general commercial subjects. Applicants should hold a degree in Commerce or Economics or a professional qualification. Salary will be in accordance with the Burnham Scale for teachers in Technical Colleges. Form of application and full particulars may be obtained from the undersigned.

H. C. PERRIN,
Chief Education Officer.

Borough Education Offices,
"Springfield," Cliftonville, Northampton.

PRODUCTION MANAGER

An ethical pharmaceutical house of repute with a factory in the north of England wishes to appoint a production manager. The person appointed will be responsible direct to the director of production for the fine chemical and pharmaceutical manufacturing departments, the finishing department and for purchasing. The position calls for a person of high executive calibre, capable of handling the production problems facing a rapidly expanding company. Applications, which will be treated with strict confidence, should give full and complete details of career to date.—Box 411.

APPLICATIONS are invited for appointment as Secretary of a nation-wide non-political Association with administrative offices in London.

Duties will be discharged in collaboration with honorary officers but the successful applicant will be expected to act as Treasurer and to edit a monthly publication distributed to members of the Association.

The Association is large and growing and offers scope for the development of initiative and organising ability.

The commencing salary will be in the region of £750 per annum.

Applicants should give fullest details of previous experience, age, etc.—Box 407.

THE POPULATION INVESTIGATION COMMITTEE invite applications for the position of Research Worker to undertake research into recent developments in French population policy. Candidates should have a fluent knowledge of French and be prepared to spend some time in France if required to do so. They should be qualified to undertake social research and be competent in the interpretation and analysis of statistical material. The appointment will be for the period of one year in the first instance and the salary offered is between £400 and £700 per annum according to qualifications and experience. Applications, with the names of two referees, should reach the Research Secretary, Population Investigation Committee, London School of Economics, Houghton Street, W.C.2, by June 1st.

ACCOUNTANT, age 40, public school, 17 years' accountancy/banking experience, widely travelled, fluent German, good French, with excellent connections and sound knowledge of present German market and trade conditions, seeks post, preferably abroad, as Travelling Auditor or as Liaison Officer between Head Office and branches overseas and/or foreign clients. Highest references.—Box 414.

Investment Statistics

Company Notes

Callaher.—Group trading profit declined from £1,687,810 to £1,445,891 and net profit from £664,103 to £569,058 in 1949. The dividend of 32½ per cent for the year is unchanged. Stocks at the year-end were valued at £9,218,907 (£8,922,317). Net current assets fell from £8,411,807 to £7,858,289 on the year.

London Brick.—Consolidated profit increased from £639,692 to £869,982 in 1949; net profit declined from £227,513 to £219,272. The dividend of 15 per cent is unchanged. Net current assets declined from £1,656,731 to £1,424,712 on the year. Stocks are up from £517,827 to £599,780.

Dunlop Rubber.—Consolidated operating profit for 1949 amounted to £9,480,850 compared with £10,768,376 in the previous year. Group net profit was £7,077,995 (£8,086,789) after taxation of £3,458,867 (£4,327,807). Profit retained by subsidiaries was £301,415 (£549,315) and net profit of the parent company £2,947,390 (£2,924,280). An EPT refund of £750,000 has been credited to profit and loss account. General reserve absorbs £2,000,000 (£1,615,176) and carry forward is increased from £1,391,020 to £1,440,562. The total distribution of 15 per cent for the year is unchanged.

Guest Keen and Nettlefolds.—Group net profit declined from £2,918,682 to £2,888,098 in 1948, after £3,610,295 (£3,651,336) taxation and £1,739,632 (£1,376,561) depreciation. The 1948 figures include results of the parent company and Midlands and South Wales Works companies for nine months only. A distribution of 12½ per cent is recommended on the £11,283,150 ordinary stock as constituted after the issue in June, 1949.

Bristol Aeroplane.—Group trading profit declined from £1,398,558 to £1,225,663 and net profit from £609,132 to £439,566 in 1949. Taxation absorbed £491,000 (£557,000). In 1948 a special credit of £60,650 was taken into account. The total distribution of 10 per cent for the year is unchanged.

Vickers.—Group trading profit increased from £7,927,184 to £10,343,714 and total profit from £8,655,353 to £10,849,648 in 1949. Depreciation took £1,834,484 (£1,367,489) and taxation £4,546,602 (£3,090,092). Stocks and work in progress amounted to £49,488,963 (£49,378,336) at the year-end. Net current assets were £38,080,104 (£34,674,989).

Home and Colonial Stores.—Group trading profit increased from £1,964,923 to £2,492,909 in 1949. Net profit of the group amounted to £522,411 (£430,638) before adjustments for previous years. Stocks at the year-end were valued at £7,524,160 (£7,496,395).

British Xylonite.—Combined trading profit rose from £489,696 to £526,519 in 1949. Net group profit was £81,577 (£88,081). The dividend for the year is 15 per cent. (20 per cent.). Net current assets at the year-end amounted to £2,754,793 (£2,861,043).

Rio Tinto.—Net return on sales of produce by the group fell from £793,997 to £722,048 in 1949. Total profit after depreciation amounted to £413,295 (£355,438). Net current assets at the year-end were £1,011,174 (£1,526,127).

De Beers Consolidated Mines.—Revenue on diamond account in 1949 was £6,717,084 (£7,164,022) and total revenue £9,309,497 (£10,029,528).

Babcock and Wilcox.—Consolidated trading profit increased from £2,108,599 to £2,631,342 in 1949. Group total profit before taxation was £2,274,523 (£1,750,444). Stocks rose from £6,457,075 to £9,143,541 and debtors from £5,643,604 to £7,587,813 on the year. Bank overdrafts have been reduced from £3,235,234 to £1,566,907.

Capital Issues

Stilfontein Gold Mining.—Lists will open and close on May 16th for the issue at par of £2,000,000 5½ per cent convertible unsecured loan stock, 1954-60. Issued share capital consists of £2,750,000 in 5s. ordinary shares. For every £100 of the loan capital stockholders may convert £25 into 16 ordinary shares between October 31, 1950 and December 31, 1951. A further 11 ordinary shares may be acquired for £25 of loan stock between January 1, 1952 and June 30, 1954.

Central Mining and Investment Corporation.—The CIC has approved the offer to ordinary and preference shareholders of 600,000 £1 ordinary shares in the proportion of one new share for every eight shares held. The existing £8 ordinary shares are to be split into eight £1 units.

South Wales Transport.—Shareholders are offered £150,000 £1 ordinary shares at par on a pro-rata basis, fractions being disregarded. The company's capital was recently increased to £750,000 by the creation of 150,000 £1 ordinary shares now the subject of this offer. The company is a subsidiary of British Electric Traction.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (n) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 14 years.

(a) Interim. (b) Final. (c) Whole year dividend 18½% after capital bonus. (d) Int. paid half-yearly. (h) Assumed (m) Final dividend on increased capital. Yield basis 35% after capital bonus. (l) To latest redemption date. † Free of tax. (n) Yield basis 26⅛%

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 6, 1950, total ordinary revenue was £100,714,000 against ordinary expenditure of £56,533,000 and issues to sinking funds £600,000. Thus, including sinking fund allocations of £1,074,000 the surplus accrued since April 1st is £43,370,000 compared with £4,743,000 for the corresponding period a year ago.

The Schuman Scheme

THE London talks mark a new phase in the affairs of the west. Defence has thrust itself to the head of the agenda. Faced with the fact of Soviet rearmament and the vast disparity in military strength that may exist between east and west by 1953, the Atlantic powers have taken the decision to give their security equal priority with economic recovery. This in itself would be enough to make the recent meetings important. But they also had before them the French Government's proposal for a wide measure of unification of control within the heavy industries of the western European countries.

There is no secret about the steps that are necessary to meet the present strategic situation. Western Europe, standing alone, cannot establish its own protection. The increasingly close association with Europe of the United States and Canada, and hence the strengthening of the machinery of the Atlantic Pact, is one condition of security. The other is to push Atlantic defence with all speed beyond the planning stage. The success of the present series of conferences will, therefore, turn on two points only: is the United States more effectively and irrevocably committed to Europe? Is European defence moving from blueprint to reality? Probably some months must pass before a complete answer can be given to either query, but at this stage there is at least room for cautious optimism. It seems likely that the structure of the Atlantic Pact will be strengthened by a permanent political committee, consisting perhaps of the Foreign Ministers' deputies and of a secretariat which would supervise and co-ordinate the committees already existing. There is also talk of the need to simplify and strengthen the structure of command under the Pact by increasing the authority of the Standing Group in Washington, composed at present of General Bradley, Lord Tedder and General Eley. Both steps increase the degree of direct American and Canadian participation in a common political and military Atlantic strategy. As such they can greatly increase the sense of security in western Europe.

Less is likely to be known of the results of the talks on the execution of defence plans, but comfort can at least be taken from the fact that the twelve Foreign Ministers are being brought at this conference face to face with the fundamental problem of financing their defence expenditure. They have before them the broad plan for western Europe approved by the Defence Ministers at The Hague. They can hardly disperse without considering how it is to be paid for, determining how the burden is to be shouldered and how the equal priority that has been given to defence and to economic and social welfare can be achieved in practice.

One might have thought that the Foreign Ministers' attention and energy would have been sufficiently taxed without the unexpected addition of M. Schuman's plan for placing French and German heavy industry under a common authority; but, in fact, the background of the Atlantic Conference has been an ideal framework

for a first consideration of France's bold initiative. The desirability of overcoming the discord in Franco-German relations and of drawing Germany into the western orbit is so great and so obvious that the first reaction of the assembled Ministers to the plan's political implications could hardly fail to be one of warm welcome, and of anxiety not to look one of the West's very few gift horses too closely in the mouth. But the strategic priorities must take precedence over everything else. Politically, the Schuman offer stands or falls on the question whether it strengthens or weakens the Atlantic link, and whether it makes easier or more difficult an effective defence plan for Europe

The Politics of the Plan

There are dangers of the political consequences of Franco-German unity being other than the enthusiasts hope. No one should under-estimate the sense of defeatism and neutrality that exists in some parts of the Continent. If only, the argument runs, the United States would stop its "cold war" against the Soviet Union and Europe could develop into an independent and neutral bloc between the two of them, how much better would be the prospects of peaceful reconstruction and economic revival in Europe. That the mood is based upon a total misconception of Russian policy need not be underlined here. The point is that the mood exists and that it is strong in France and in Germany. If, therefore, the political aims behind the integration of French and German heavy industry are to lay the economic foundations of a separate European bloc, to "withdraw Europe from the cold war" and thus remove the shield of American interest and concern from a totally undefended and "neutral" Europe, the plan should certainly be shelved without delay.

Fortunately, there is every reason to suppose that the mainspring of the Schuman offer—certainly in M. Schuman's own mind, though one cannot be so sure about its appeal to some other sections of French opinion—is the straightforward and entirely reputable desire to draw Germany into closer and more confident relations with the west and to counter the drag of the east with its promises of unity and markets. In this form, the plan certainly does nothing to exclude American interest in Europe. The prospect of European initiative and action only serves to encourage American interest and support. Nor need it render the task of building up Europe's defences more difficult. On the contrary, it may offer a solution for one of the unresolved riddles of western rearmament. The western powers have naturally set their faces against any prospect of renewed German armament making. Yet to defend Europe—and Germany—without any contribution from German industry might place a load of unproductive industrial activity upon the heavy industry of Germany's neighbours and leave the Ruhr with a very considerable competitive advantage. If, however, genuine control and integration are established in the Ruhr-Rhine-Lorraine industrial complex, a balanced solution of this problem becomes a possibility.

The United States Government has already given its support to the scheme in general terms. On political grounds, there would seem to be an immensely strong case not only for Britain's approval but for its active participation in the new authority. Britain is as concerned as France with the need to secure an equitable sharing of the burden of armaments. Britain should be far more concerned than France with preventing any experiment in exclusive "neutral" —indeed isolationist—solutions for Europe. Its presence on the new authority would ensure, as could nothing else, that the political aims of the new organisation were sound.

Economic Consequences

It is right that, in a situation highly charged with politics, the political consequences of M. Schuman's proposal should be borne in mind. But it will stand or fall by its economic implications, which are the real test of its merits.

* Coal production is for Bizone only; prewar basis for steel based on average for 1936 and 1938.
† Based on prewar average of 1937 and 1938.
‡ Including coal equivalent of brown coal and lignite.

Ever since the end of the war, European heavy industry has lived in an unrelieved sellers' market. The natural consequence of the shortage of supplies—and of the experiences of the war—has been both to stimulate the nations that already have steel industries to develop their capacity, and to encourage those that have [illegible] lacked any [illegible] dustry to s[illegible] creating their own national steel mills—all regar[illegible] cost and efficiency.

But it is already clear that the sellers' market in steel and coal is coming to an end. According to the calculations made recently by the Steel Division of the Economic Commission for Europe, present estimates of future crude steel production would bring Europe's output up to 70 million tons in 1953, but the demand for steel in that year is estimated at only 62 million tons. Similarly in the case of coal: although there is no sign of an absolute surplus, certain qualities of coal—notably of French coal—cannot now be sold at the prices proposed for them. If there should be any growth in general unemployment—even something far less than a slump—the excess of supply over demand will be greater.

There is no doubt at all about what ought, in theory, to be done in these circumstances. An excess of supply ought to be used as an opportunity to concentrate production on the lower-cost producers, to cut out the inefficient, and lower the general level of costs and prices. There is also no doubt at all that the easiest, and politically most rewarding, thing to do is to form a cartel, impose an equal proportionate restriction on all producers, and keep prices and costs up. In a world where governments are very sensitive to the emergence of any unemployment, a compromise policy is doubtless the best that can be hoped for, and it would be unrealistic to try to ban all cartel manifestations of any kind in heavy industry. But it is still very important that, in trying to succour the victims of progress, progress itself should not become the victim.

The main economic question to be asked of the Schuman proposal, therefore, is whether it would be more than a governmental facade for an old-fashioned cartel, whether or not its effect would be to increase efficiency, to lower costs and to expand Europe's export market. The plan's authors are emphatic that these are its declared purposes. Indeed, one of the most powerful arguments in their favour and the strongest point of the whole scheme is the proposal that there should be absolute free trade in the products of heavy industry, that neither coal nor iron ore nor steel should be made the subject of either customs tariffs or import quotas by any of the participating countries. Within this unified market, it is proposed that the new international authority should seek to modernise and rationalise the industries on the basis of the most efficient production, that it should determine the future pattern of investment and evolve a joint export policy. Another of its aims would be "to improve and equalise the living conditions of the workers." It is recognised that these aims cannot be achieved at once. The plan envisages a period of transition during which it may be necessary to maintain "compensating machinery to equalise prices" and a special fund to enable industry to undertake reconversion where such adjustments are necessary.

Cartel or European Authority?

Such is the outline of the scheme, and it is impossible from so general a statement to decide whether or not the proposal is an old cartel under a new title or a genuinely new departure. The statements on modernisation and rationalisation have a brave ring. On the other hand, talk of special machinery to equalise prices could lead very easily to price fixing on the old pattern and *ce n'est que le provisoire qui dure*. But, at least until there is proof to the contrary, it should be accepted that there is a genuine intention to press forward to higher productivity and that the new authority would give priority to efficiency, lowered costs and more rational production.

Each participating government, it is proposed, will choose an equal number of delegates to the council and the chairman is to be the agreed choice of the parties. Once the council is in action, its decisions "will have executive force in France and Germany" and in any other country joining the scheme. It is difficult to see how in the present state of affairs any better type of machinery could be devised, yet the proposals obviously do not exorcise the real spectre at the feast—the obstinate and ineradicable spirit of economic nationalism. If there is to be any genuine fusion of the market and any real rationalisation and modernisation of production, some enterprises will prove redundant. As the accompanying table suggests, in coal at least and possibly in steel, it is in France, where postwar expansion has been pressed to some extent irrespective of cost, that the first redundancies are likely to occur. It is true that the French steel industry would, under the scheme, gain by easy access to German coking coal; but if French pits are to be closed and French steel plans modified, is it certain that the French delegates on the council will reach agreement with their German colleagues, or that the French Government will accept the decision of an independent body on matters which directly affect the livelihood of its own electorate and the interests of the labour unions?

Claims of German Industry

There may well be equal difficulties on the German side. The estimates of future redundancy in steel made by the ECE were based upon the assumption that German production would remain at the level of not much above 11 million tons a year fixed by Allied decision. But, if an arrangement of the kind now contemplated is reached between the French and German industries, this limit will certainly not be maintained and German production, which is relatively low cost, can be expected to rise. Who, then, will accept the added cut in steel production which further German output may make necessary? And should Germany be permitted to press forward with the new strip mill, of which there has already been some talk, if the aim of rationalising production is now to be paramount? The French have installed two such mills since the war. Is

there room for another in the new Ruhr-Lorraine complex ? If not, who persuades the Germans to renounce the scheme ? A functional economic body may advise but it cannot enforce decisions. In a word, it cannot usurp the political authority which belongs to governments alone.

These national difficulties can only be accentuated by the fact that the Schuman proposals do not tackle the question of the ownership of German coal and steel. If the present trend in the affairs of the Ruhr (described in an article on page 1126) continues, the tendency of the new council to split along purely national lines will be far more marked. There might well be a far greater chance of carrying through the Schuman plan if the question of ownership in Germany could be taken up at the same time, and the attempt made to reproduce at the level of ownership the complete fusion which is aimed at both in the council and in the market at large. French shareholding in the Ruhr, German shareholding in France, the creation and inclusion of a number of publicly owned enterprises, government and *land* participation—all these are expedients for mixing together the separate national interests and reducing the risk of deadlocks, dictated purely by separate national economic interests.

These difficulties are not stressed in order to pour cold water on the scheme. Even without any disturbance of the national sovereignties of governments, an international authority sincerely dedicated to efficiency and productivity could do most valuable work. But there will only be disappointment ahead if the planners of the new scheme cherish the illusion that purely economic and industrial proposals can persuade governments to refrain from exercising their sovereignty in what they conceive to be their national interests. The problem of national sovereignty can be tackled only by a frontal assault—that is, by creating international organs with political authority, within their sphere, superior to, and capable of overriding that of national governments—not by economic by-passes. The Schuman scheme will be the more fruitful if its ambitions are adjusted to that fact.

The British Role

For economic reasons as well as political Britain should participate in the scheme. Indeed, the need to introduce economic criteria into production plans and to restore the primacy of efficiency is as great in Britain as in Europe. Provided that the new scheme can avoid the restrictive aspects of the old cartel, there is every economic reason for full British participation. At present, the British coal and steel industries are certainly competitive with their French and German opposite numbers. British steel producers stand to gain by the rationalisation of future European development, the elimination of the marginally inefficient and the curbing of excessive development plans. The Coal Board can still secure a higher price for exports than for domestic sales ; it need not fear free trade in coal. If entry into the new scheme increases the pressure to close marginal pits in this country, it will only underline—though not perhaps make politically more attractive—a policy already fully accepted in principle by the Coal Board itself. In short, the Schuman proposal is not one in which economics and politics pull in opposite directions. Solid reasons, both of general policy and of economic interest, exist that should lead the British Government to join wholeheartedly in the examination, drafting and establishment of the proposed council. Cautious hesitation has become too invariable a factor in the formulation of British policy. On this occasion, at least, no ground should be given for any accusation of "dragging the feet."

The London Docker—II

Discipline in the Docks

DISCIPLINE among the dockers is the most vexing of all dock problems today. Any attempt to enforce it is apt to be regarded, with or without prodding from the Communists, as victimisation—a word which, in dockland, is charged with more emotional content than any other. In London, the punishment of any individual docker for a breach of the dock labour scheme or for failing to carry out instructions, even when those instructions have been agreed between union representatives and employers, is becoming so difficult as to be almost not worth imposing. Early this week, for example, the Dock Labour Board suspended fourteen lightermen for seven days for refusing to obey a reasonable request to work overtime—a request which had been granted in advance by the men's representatives, who had struck a good bargain with the employer. The remaining 93 lightermen who were working in that group promptly came out on strike as a protest against the punishment of their mates, in spite of the remonstrances of their union leaders and in spite of the obvious fairness of the Dock Labour Board's action. Security, in fact, has brought with it a lack of discipline which is fast becoming intolerable.

Part of the blame must be placed on the management side of the industry. There are four separate organisations which have fingers in the pie: the National Dock Labour Board and its subsidiary local boards, the National Joint Council for the industry and its local organisations, the National Association of Port Employers, and the Government, which, though not strictly a "manager," is responsible for safeguarding the public interest.

The National Dock Labour Board and its local boards are responsible under the Dock Workers' Act of 1946 for administering the dock labour scheme. They are also to some extent the agents of the employers in that they undertake to provide labour for the employers. They are responsible for the registration of dockers, for recruitment, for dismissals and for paying, on behalf of the employers ordinary wages as well as the guaranteed minimum. They are also responsible for a number of welfare undertakings of which the most important is a special health service for the dockers. All disciplinary measures rest in their hands, but there is provision under the Act for immediate appeals from their judgments to special Appeal Tribunals.

The National Joint Council—to which the National Dock Labour Board reports—is composed equally of representatives of the employers and of the trade unions. It is the final arbiter in disputes between employers and dockers ; it may be said to be generally responsible for the efficient and smooth working of the docks throughout the country. All major agreements about dock labour and any amendments to the dock labour scheme must be submitted to, and approved by, the National Joint Council. It is not directly responsible for discipline, but because the National Dock Labour Board is in a sense its servant, it can in theory affect the Board's decisions in disciplinary matters.

The National Association of Port Employers is simply what its name implies. The employers of the dockers are the shipping companies, stevedoring firms, wharf owners and so on ; there are about 1,500 registered dock employers in London. The Association negotiates labour and wage agreements with the unions on behalf of all employers ; in practice, the day-to-day bargaining which forms so important a part of dock working is handled by its secretary—or its local secretaries—who deals direct with the secretary of the dockers' section of the appropriate trade union. The Association is, of course, concerned with discipline, but any employer who wishes disciplinary action to be taken against a docker may do no more than report the case to the Dock Labour Board. He can try to avoid employing dockers who cause trouble, but this is seldom a practical possibility and today most employers rely, not very successfully, on persuasion and personal contact with their men.

The influence of the Government is exerted by the Chief Industrial Commissioner who is the head of the industrial relations division of the Ministry of Labour. He has no authority for direct action, but all involved in any major dock dispute, save the Communists, are in the habit of consulting him and seeking his advice, particularly about points of law. Decisions to send in troops to keep the docks working can be taken only by the Cabinet ; but when this is done, it is not so much in order to bring a strike to an end—in practice the strike is usually prolonged—but merely in order to keep goods moving through the ports. The Government, however, created a precedent during the Canadian seamen's strike last July when it repudiated a statement by the National Dock Labour Board which was designed to restore order in the docks. A state of emergency had been declared at that time, but the Government's action implied that it reserved for itself the ultimate responsibility for the discipline of the dockers.

*

There is thus some confusion in London about who is the boss. The employers, with the remnants of traditional power still clinging about them, exert a little—very little—authority. The National Dock Labour Board and the local boards are the legal authorities for maintaining discipline, but their ability to act is weakened by the presence of trade union members on the boards. The Government, in spite of its apparent responsibility for discipline, refrains from positive action to enforce it. The National Joint Council, which also has a strong trade union element, is similarly averse to penal measures which might deprive a docker of all means of earning his livelihood, even though such measures may be the only way to ensure respect for law and order.

It is clear that somebody must take charge. For historical reasons, the employers are ruled out. The National Joint Council, like a coalition government, is hamstrung by the even balance between opposing forces. Government decisions, in spite of their supposed impartiality, are likely to be coloured by political considerations. The National Dock Labour Board cannot be both an executive and a judicial body. Who else could undertake the responsibility for discipline ?

There is at least one possible body, unwilling though it may be to accept the burdens involved: the port authority. London is a special problem in the dock industry, and it is only for London that this suggestion is made. The Port of London Authority is the one independent organisation which has the experience of handling dockers, the knowledge of what is required for the efficient working of the docks and experienced officially to carry out its orders. Only a handful of the few hundred dockers it employs have ever come out on strike, and it has a high reputation for fair dealing and efficiency. The Commission of Inquiry into the docks should seriously consider the possibility of the Port of London Authority becoming responsible for the registration and control of the London dockers. For the one thing about the dock troubles in London that stands out a mile is the need for a strong, independent organisation to take control.

*

So much for discipline on the job. What of discipline within the unions ? The remarkable fact about the last major strike was that it was the result of a dispute between worker and worker and not between worker and employer. This is a situation with which the normal conciliation machinery cannot deal, and which has now become as fruitful a source of stoppages as the old-fashioned disputes between the employers and the men.

The chief cause of the trouble is without doubt the activity of the Communists. By means which are familiar throughout Europe and which are becoming familiar in Britain, they have worked under the cloak of the democratic constitutions of the unions to stir up discontent and to foster factions among the dockers. In London, they have seized on the plausible suggestion that the large Transport and General Workers' Union is too big to represent the dockers properly, that it is out of touch with the needs of dockers and that it has formed an alliance with the "bosses."

None of the charges is true. The dockers are a federal part of the Transport and General Workers' Union and not a subordinate group within it ; their own leaders hold high office in the union and are in constant touch with the day-to-day working of the docks (some of them are still working dockers) ; and there never has been any question of an alliance with the employers. The insistence, however, on the part of all Labour leaders on the principle of joint consultation and the formation of joint councils in each industry has led to a blurring of the old, clear distinction between employer and trade union leader in the minds of the simpler dockers, and it is on them that the effect of Communist propaganda has been most marked.

This is necessarily a matter with which only the trade unions themselves can deal, but it must be admitted that in the past union officials have not been as energetic and as skilful as they might have been in preventing the trouble-makers from disrupting the harmony of union members. There are, however, indications that at last many dockers are beginning to realise what has been happening. The first careless rapture of decasualisation is wearing off and some signs of a new sense of

responsibility can be discerned. Mr Deakin, the General Secretary of the Transport and General Workers' Union, has been slow to don the mantle of authority of his predecessor, Mr Bevin, but the office is making the man; his strength of purpose and skilful handling of the dock strike last month were much more in line with the traditions to which he has fallen heir than his actions have been hitherto. He has made a beginning by expelling three of the more troublesome members of his union for not abiding by the agreements which the union had made; were it not for the unthinking criticism of some of those who should have been among his firmest supporters, the strike which resulted might have been over very much more quickly. As it was, the Communists suffered a serious set-back.

There is less cause for despair about the London dockers than might be imagined. The purpose of these articles has been to emphasise where the faults lie and the obstacles which hinder their correction, but it would be wrong to leave the reader with the impression that the docks are hot-beds of angry, obstinate enemies of the public. There is a great deal still to be done; the dock labour scheme needs to be carefully examined in the light of the experience of the last three years; the union leaders should repair the few cracks in their organisation; and the question of responsibility for discipline must be settled. Except for the few agitators, however, there is a willingness to be reasonable that holds out hope of a sensible solution of the complicated problems with which the docks abound.

NOTES OF THE WEEK

German Tug-of-War

There have been so many rumours recently of Allied disagreement on German policy that the three Foreign Ministers' declaration of complete agreement on their future policy towards Germany was more than timely. Its tone was notably friendly but still firm. The advance towards a review of the occupation statute goes on; the intention to admit the Federal Republic as a partner in western activities is reaffirmed, and there is a very proper emphasis on the fact that Europe's judgment of the Germans' capacity for freedom and equality will be judged by their zeal for maintaining individual rights and the integrity of justice. It was made perfectly clear that the High Commissioners will retain important powers of veto to ensure good behaviour. The Ministers have discarded all idea of a formal peace treaty which would explicitly concede full sovereignty to the Germans; instead they will gradually acquire the substance of that sovereignty by such acts as working out the Schuman Plan with the French, and resuming control of foreign affairs.

The declaration has been received with moderate content by the German Federal Government; but the Social Democrats are very critical and see in it no change at all, but on the contrary the affirmation of continued tutelage for Germany. Their attitude raises the question, which must always lurk behind Allied policy-making in Germany, whether the prospect of no peace treaty and continued occupation will play into the hands of the Russians, who offer the bribe of a peace treaty and the withdrawal of troops. It is no use denying the risk inherent in this possibility of rival bargainng between east and west—yet it can hardly be said that the Russians hold all the trumps.

*

A fortnight ago they were in trouble about the retention in Russia of an unspecified number of prisoners of war. This week a new blow has fallen. Stalin has announced that the balance of the reparations still owing from the eastern zone will be halved. Instead of paying the full $6,342 million which, according to Soviet calculations still remains from the $10,000 million demanded in 1945, the Germans will now have to meet a bill of "only" $3,171 millions—and must pay it by 1965. The Russians estimate that $3,658 million have been paid since 1945. Even if this figure were not open to the suspicion of being decidedly below the actual value of deliveries and confiscation and shares in "joint enterprises," the Germans would still be shattered by learning the extent of the Soviet slice. Comparisons with Marshall aid should become more than usually unwelcome from the Communists' standpoint.

* * *

Compromise at Sydney

The Commonwealth conference at Sydney on economic aid for South-East Asia has got down to brass tacks from the start. When Mr Spender, the Australian Foreign Minister, came out with his "plan" during the Colombo conference last January, his idea was rightly hailed as imaginative, timely and generous. But there is not and never has been a clear-cut plan; indeed, if there were, the Sydney conference would be hardly necessary. As it is, the delegates now face an extremely difficult, if not frightening, task. They are committed to working out ways of putting money and technicians into an area which is in a state of growing political confusion; and, if any effective good is to be achieved, then there will certainly be a demand for more money than is likely to be available.

No one should, therefore, be surprised that the Commonwealth delegates, sitting down at last in front of grim realities, at first disagreed among themselves. The total cost of establishing economic stability in South-East Asia during the next decade has been put at £6,000 million. Estimates of this kind are naturally open to question; but capital requirements for projects considered and recommended add up to over £400 million. In the face of these monumental estimates, the Australian suggestion that a Commonwealth pool of £3 million be established immediately looks modest and is certainly the least that should be done

PROPOSED AMERICAN AID FOR SOUTH-EAST ASIA

* Already in receipt of $100 million economic loan.

if its members want to show that they are in earnest. The important thing is, as the Australians see, to start something, if the Asian peoples are to be persuaded to put faith in the Commonwealth's efforts. The British look at it differently and see all the dangers of offering funds without any clear guarantee about their use. Their objections are reasonable, but they have created the impression that they do not fully understand the fast moving emergency which brought the conference into being. At the time of writing, however, there appears to have been a compromise between the advocates of caution and urgency, involving short-term plans for medical and technical assistance and a fund for long-term capital investment.

Meanwhile, as the accompanying table shows, the United States plans to allot immediately some $91 million for economic and military aid in the area. This is in addition to the $100 million recently lent to Indonesia. These most welcome American proposals should prompt the delegates at Sydney to see to it that action by the Commonwealth is taken quickly and firmly.

* * *

Overcrowding in Europe

In a ten-day period which has produced almost as many bright ideas as communiqués, one important suggestion of the three Foreign Ministers has escaped notice, great though its implications are for millions of human beings. They drew special attention to the "excess of population" from which several countries of western Europe, particularly Germany and Italy, are suffering. They said, too, that a systematic study of migration possibilities could help towards solving this problem, and proposed a conference of experts to review the situation.

When they meet, these experts will presumably study and appreciate the work already done by the United Nations to promote migration. The International Labour Office (ILO), in particular, has given it special attention. Last year it adopted a revised "migration for employment convention," to safeguard the rights and interests of migrants as well as of the workers in the countries receiving immigrants. This did not represent any new departure, for the ILO has in the past concentrated largely on formulating similar international standards, on which it is hoped that national legislation on labour relations will be based. But the obvious need to make easier the movement of migrant workers has led the ILO to develop new practical activities.

One of the most important is its collection every six months of detailed information on manpower surpluses and shortages; this is distributed to all interested countries. The lack of such information, which includes not only the numbers involved but also the skills and types of workers available and required, has hitherto proved a serious obstacle to the flow of migration. Since by far the greatest need everywhere is for skilled workers, the ILO has also provided practical advice on vocational training. ILO missions, for instance, have gone to a number of countries of western Europe which are anxious to organise training courses. The Preliminary Migration Conference, recently convened by the ILO in Geneva, has recommended that the ILO should intensify all such practical activities to promote migration. Moreover, it was announced at the closing session of the conference that several of the governments represented were working out means of providing the Office with additional financial resources for the development of this work. The initiative taken by the Foreign Ministers clearly therefore need not start from scratch.

* * *

We and They

The interesting debate in the House of Lords on Wednesday took place on a motion of Lord Cecil's deploring "the growing power of the Cabinet." Lord Cecil made it clear that he was chiefly concerned about the way in which a latter-day Cabinet disciplines its party followers into strict obedience and uses Parliament as a legislative rubber stamp. This complaint has become familiar, and the Lord Chancellor gave the familiar answer to it that the greatest danger of all that confronts democracy is that "we may be lost in discussion, paralysed by uncertainty and unable to take quick decisions."

There is a great deal to be said on both sides of this particular argument. But those who are not politicians at all will wonder whether the relative powers and opportunities of front-benchers and back-benchers are really the basic issue. They will wonder whether freedom and democracy are not much more directly threatened by the widening gap between the whole apparatus of government—including front-benchers, back-benchers and civil servants—on the one hand, and the people on the other, between those who understand what it is all about and those who do not, between "We" and "They." Whether or not the Cabinet adequately explains its policies to Parliament, it certainly does not do so to the public, and as a result government by the consent of the governed—which is an adequate definition of democracy—is endangered. It is true that on an issue that really engages the interest of a substantial part of the electorate, the politicians can still be forced to give way. But where a minority have a real grievance, or even where the whole people have a minor grievance (such, for example, as the continued official insistence on identity cards), there is no way at all open to them of getting it properly ventilated—since the offhand remarks of a junior Minister in an adjournment debate usually merely serve to irritate still further.

The remedy for this sort of thing does not lie in clipping the wings of the Cabinet, nor, as Lord Cecil suggested, in reforming the House of Lords. It lies in changing the assumption that has grown up in the past generation that the administrative convenience of the governmental machine must be assumed, ipso facto and without further argument, to be more important than any individual rights or desires. It lies in abolishing the belief that "the gentleman in Whitehall really does know best." The real danger to liberty does not come from the relations between any one category and another of government men—to the people they are all politicians and toffs—but from the assumption to which they are all increasingly prone, that they are the masters of the state and not its servants.

* * *

Finance Bill Debate

From the opening speeches it appeared that the second reading of the Finance Bill would be merely a rehash of the Budget debate without any of its original savour. Mr Douglas Jay's speech was for the most part a reassertion of the assumptions on which the Government's financial policy is based. Government expenditure is sacrosanct, hence the need for heavy taxation; hence, too, the need for a Budget surplus to finance the investment programe for which private saving is so manifestly inadequate. So narrow is the path that the Government's financial policy can tread that any relief of taxation must be exactly balanced by new taxation elsewhere. Thus, said Mr Jay triumphantly, anyone who opposes the increased petrol tax and the purchase tax on lorries is opposing the income tax reliefs, because the one is not possible without the other.

The Opposition's comments on "nonsense" understated the absurdity of this proposition. But Mr Jay's argument is a good illustration of how inflexible the Government's attitude has become, simply because the whole complex of the national finances is so precariously balanced that the smallest deviation may upset it. Yet even if the need for the high level of expenditure, and the consequent precariousness of the financial balance, is admitted, there are still good grounds for criticising the increased petrol tax. It will not be, as Mr Jay at one time appeared to be claiming, a tax on luxury spending—there is certainly a good case for raising the cost of private motoring by a higher price for petrol. The effects of the increased tax will, however, permeate throughout the economy; it will be bound to raise the cost of living, and will, therefore, strengthen the pressure for higher wages which is already threatening to upset the Government's equilibrium.

The Opposition's decision to oppose the higher petrol tax in committee is therefore justified. Yet once again their attack has failed, because they dare not state clearly how they would reduce the high level of expenditure which is the starting point of the Government's policy. In fact, had it not been for the relish of Mr Stanley Evans's speech, in which he repeated his criticisms of British farming that led to

his dismissal from the Ministry of Food, the debate would have been as stale as financial policy, and criticism of it, have now become because of both parties' unwillingness to commit themselves. It is significant of the present political deadlock that while much of Mr Jay's nonsense went unchallenged, most of Mr Evans's home truths, though provoking laughter, were not applauded.

* * *

No Straws in Wind?

Last week's local elections offer little help to those who are searching for signs of the swing needed to solve the present political deadlock. The Labour Party lost some seats in the boroughs and gained some in the urban and rural districts. It is hard to say how significant the changes really are; data about these and previous local elections are often contradictory and in many respects inadequate for any serious analysis of national trends. The figures issued over the week-end by the rival headquarters illustrate this sharply, while later versions still fail to resolve the contradiction.

LABOUR GAINS AND LOSSES

	Conservative Version			Labour Version		
	Gains	Losses	Net Change	Gains	Losses	Net Change
UDCs and RDCs...	153	63	+ 90	194	56	+ 138
Boroughs.....	128	207	− 79	168	221	− 53
TOTAL.....	281	270	+ 11	362	277	+ 85

The Conservatives claimed that their own candidates had made a net gain of 272 seats and, on any reckoning, they must have gained more seats than Labour lost, for, with the increasing encroachment of national politics into local elections, many councillors who were formerly Independents now accept the Conservative label. But it is impossible to assess the extent of this sort of change, and any attempt to detect trends must be confined to how Labour candidates fared in the boroughs, which contain the bulk of the electorate and where organisation along party lines is relatively far advanced. Of the 83 county boroughs in England and Wales, where party organisation is far more advanced than in the small boroughs and district councils, Labour controlled 36 councils before last week's elections. It has now lost control of Newport, Nottingham and South Shields. The decimation of many "Independents" on the smaller councils has enabled both the main parties to register electoral gains, and Labour has carried further its permeation of rural districts, many of which have been immune from party politics until recently.

A more satisfactory way of finding the trend in local elections is to study the total number of Labour victories rather than the net gains and losses. Although under the three-year rota there are different candidates each year, the number of candidates and the wards fought vary relatively little. From such figures as are available it appears that the proportion of Labour candidates who were successful has varied thus:

	Per cent		Per cent
November, 1945	62	May, 1949	41
November, 1946	44	May, 1950	39
November, 1947	32		

It would appear that Labour has indeed lost a little ground since last year—although the basis for these calculations is so uncertain that a 2 per cent difference is hardly significant.

A particular cause for uncertainty about the significance of the change lies in the fact that there was a substantial drop in the proportion of the electorate voting compared with last year. Figures are not generally available, but, to take two random examples, the percentage voting fell from 57 to 51 in Manchester and from 51 to 42 in Birmingham. It is probable that in Parliamentary elections (with 80 per cent or more of the electorate voting) an increase in the proportion favours Labour and a decrease the Conservatives. This may apply also to local elections, but unfortunately there is no reliable evidence on the subject.

It is as well to point out that, even had one party made substantial gains in seats, no clear conclusions could have been drawn about the way things would go in an immediate general election. The result in the Brighouse and Spenborough by-election, where 85 per cent voted, is probably a much more useful guide than any number of results in local contests. In this by-election there was a swing to the Conservatives of 1.7 per cent. That may have been an underestimate or an overestimate of the national change, but it suggests that there has been no revolutionary movement in public opinion since last February. However, a swing of less than 2 per cent in every constituency, either to the right or to the left, would be sufficient to produce a more or less workable Parliamentary majority.

Senator Connally and Queen Marie Antoinette

The Congress of the United States is a body that is remarkable for many other things than for consistency and for logic. But it does not often, as it did last week, contradict itself in the same breath. Ever since the end of the war the process of rebuilding an international economic community—for all the generous help that America has given—has been bedevilled by the unwillingness, or inability, of the American Government to make up its mind on the crucial issue of what it wanted other countries to do. Did it want them to stand on their own feet, to get on with no more dollars than they could earn? That is the pressure put upon other countries by many American policies, from the abrupt ending of lend-lease to the often reiterated determination to end the Marshall plan by 1952. Or did it want to ensure that American goods sold freely, throughout the world, on equal terms with the exports of any other nation? That has been the object of another set of policies, such as the steady pressure for the convertibility of currencies, the objection to preferential tariffs and the repeated insistence on non-discrimination and—in part at least—the readiness to make loans and grants.

Gradually, it has become apparent that the two policies are not only divergent, but plainly hostile to each other. Given the persistence of the dollar shortage, which is now accepted by everyone, insistence on non-discrimination means that other countries must either cut down the whole of their trade non-discriminately (refusing to import cotton from Egypt because they cannot find the dollars to buy it from America), or else they must continue permanently to run large dollar deficits. Given, again, the permanence of the dollar shortage, insistence on complete self-support means that other countries must discriminate against dollar goods or starve. What, then, are they to do? Which voice are they to regard as authoritative?

As it happens, the issue came up sharply in two amendments offered to the Foreign Aid Authorisation Bill now before Congress. Senator Connally of Texas, with his eyes on oil, proposed an amendment "declaring it the sense of Congress that no recipient government shall discriminate by licence, quotas or otherwise against United States nationals or business interests"—that is, non-discrimination even if it costs dollars. Senator Lodge, of Massachusetts, whose State is feeling the competition of the textile imports by which the European nations are trying to earn enough dollars to pay for their non-discriminating purchases of American exports, moved an amendment calling upon the European countries to reduce their dollar purchases as much as possible in order to "minimise the burden of the European recovery programme on the American taxpayer"—that is, self-support even if it means discrimination.

What did Congress do when faced with this clear choice? It calmly adopted both amendments. Senator Connally is reported to have suggested "that if the British Government wanted to cut down its dollar expenditures it should discover some means of doing it without discrimination against American products." Marie Antoinette put it much more succinctly—"let them eat cake."

Turkey Changes Leaders—

The Turks deserve great praise for the way in which they have conducted their elections. Their vote last Sunday showed, for the first time this century, that the transition from dictatorial to democratic practice can be made without violence or fuss. Yet there are grave difficulties ahead. Everyone expected the main opposition party, the Democrats, to gain seats from the Republican People's Party after its 27 years in power; but few expected such a landslide. Owing to an innovation whereby both major parties permitted 70 to 80 per cent of candidates to be nominated locally instead of from party headquarters, a large proportion of the new members of parliament have little experience outside their home provinces. Next week, therefore, management of affairs is taken over by a mass of newcomers to national and international politics. The Turks are, of course, a staunch and matter-of-fact people; but their new leaders will need both these qualities if they are to keep policy running on an even keel. Above all, they have to resist the temptation to exploit success by appointing new civil servants as well as new ministers. A two-party system, if it is to work with success, needs the backbone of continuity provided by a permanent civil service.

The state of the parties in the new and old National Assemblies stands as follows:

New		*Old*	
Democrats	427	Republican Peoples ...	403
Republican Peoples ...	51	Democrats	34
National	1	National	21
Independents	8	Independents	7

This great Republican failure had been expected in the cities—where President Inönü had incurred great personal unpopularity—but not in rural vilayets. It cannot be ascribed to poor campaigning—for many good candidates put up excellent defences of past policy—nor to striking differences between the party programmes. Indeed, on many essential points there was little to choose between them. It must be explained chiefly by the desire of an unfettered and resilient—if inexperienced—electorate to try its wings and to see what a change would bring. The Nationalist failure, with a campaign based on old-style personal invective, is a sign of the difference between politics in Turkey and in the states immediately to its south and east, where exchanges between personalities are the main stuff of so-called "democratic" politics.

* * *

—but not Foreign Policy

The new Assembly's composition raises some issues of major importance, one of which is the succession to the Presidency of the Republic. Under the present constitution the President is a member of, and is elected from, the Assembly. President Inönü, who got in for Malatia, therefore becomes the leader of the opposition and must be replaced as President by a vote next week. Many Turks feel that the election of a president standing above parties would give desirable stability to their system, but this can scarcely happen without first amending the constitution. Until now the ruling party had been in favour of this; but the other parties were against it from fear—which now turns out to have been unjustified—that President Inönü was seeking permanent power. They may change their minds during the four years term ahead.

Though the inexperience of the new government is to be feared in domestic affairs, it need cause Turkey's allies no grave anxiety so far as foreign policy is concerned. On external questions the two rival parties were already in complete agreement. Throughout the campaign both revealed their immense distrust of the Soviet Union and their intention to go on profiting by American military aid, Marshall aid and whatever other borrowing of western money and expertise would be open to them. This resolve has lately been strengthened by an article in *Red Star*—the Soviet military periodical—treating the Black Sea as a Slav preserve and asking—not for the first time—for recognition of this fact in the regulations governing the Straits. The Turks pride themselves on their just and correct management of the Straits, and to put forward such an argument is to touch them on the raw. The new government can be relied upon, therefore, to pursue the same tough line with the Russians as did its predecessor.

Housing North of the Tweed

A debate on Scottish housing, such as took place in the House of Commons last week, is a reminder of how differently housing policy is worked out north and south of the Tweed. It is also valuable to have the special needs of Scotland brought to general notice, and the debate disclosed some interesting facts. Mr McNeil, Secretary of State for Scotland, declined to follow Mr Bevan's example of increasing the ratio of houses to be built by private enterprise. The ratio is to stay at one in ten, as had been announced six weeks earlier. This difference in the treatment of private enterprise is the result of the very different record of private enterprise in Scotland between the wars; it produced only one in three of all houses built between 1919 and 1939, whereas in England and Wales the proportion was three out of four.

Scotland's share of the total housing programme has, however, been raised. Owing partly to a lack of balance in the programme, and in spite of its greater need, Scotland completed between 1945 and 1950 only 10.5 per cent of all permanent houses in Great Britain as against a population of 11.8 per cent of the whole. In the year 1949 the percentage of houses completed improved to 15 per cent, which corresponds much more closely to the relative needs of Scotland and England. Of the 71,000 permanent houses completed in Scotland since 1945, 44 per cent are of non-traditional construction compared with 19 per cent in England. This bias towards non-traditional methods was said to reduce the average period of construction from 17 to 11 months, but it has had serious effects on costs.

What the debate failed to bring out is the very marked difference in costs between Scotland and England. Last year new three-bedroomed houses in England were costing £1,500-£1,600 to build. In Scotland a brick house of four rooms was costing over £1,700, and non-traditional houses more. The English problem of how to keep costs and rents in step pales before that confronting the Scottish authorities.

Health Service Economies

In the House of Commons this week a motion was debated to annul the regulations imposing another cut, this time of 10 per cent, in the fees payable to dentists in the health service. There are two things wrong with the dental service—apart from its total cost. One is the lowering of professional standards in the general service by dentists wishing to make excessive incomes. The other is the breakdown of the priority services for children. The new cut will do nothing to correct the first evil. In fact, it will even encourage it, for it is the honest dentist who will be penalised,

while, so long as payment is made for each item of treatment, the unethical dentist will continue to find some way of making large sums for work badly done—or not done at all. The cut will, on the other hand, do something to reduce the discrepancy between the sums paid to dentists in the general service and the salaries of dentists in the priority services, but not nearly enough. The conclusion seems inescapable that the only way to restore high standards throughout the general dental service, and resuscitate the dying priority dental services for children, is to impose a charge for all dental treatment except where it is provided for a child or adolescent.

The cut in dentists' fees is not the only economy that has recently been made in the health service. In the pharmaceutical service, a reduction from 33⅓ to 16 per cent has been made in the allowance paid to chemists to cover the costs of dispensing. In the ophthalmic services, the varieties of spectacle frames that are supplied free of charge have been reduced from ten to four.

The hospitals have not been made to submit to any cut in their budgets; but they have been told that the budgets approved for 1950-51 cannot be supplemented, and an elaborate procedure has been devised for keeping a running check on expenditure. There is, therefore, some hope that this year Sir Stafford's ban on supplementary expenditure on the health service will be respected. But it is far from certain that a way has been devised of keeping the cost of the service within bounds and at the same time enabling it to take advantage of the progress of medical science. In the long run some direct contribution from the public towards its cost seems inevitable.

* * *

Germany Gains by Liberalised Trade

The spree of importing and consuming that followed the German experiment in liberalised trade last autumn seemed to provide good evidence that, in the absence of strict state controls, the risks taken were unjustified. Now, however, the advantages are becoming apparent, as the boom in imports slackens and as Germany's trading partners work off their credit balances with increased purchases. Even last December the benefits of freer trade with Holland and Denmark reached the German consumer in the form of lower trade prices for his food. In February, after urgent German requests for more reciprocity had been made with some success, the state of unbalance began to improve; and the figures of foreign trade for March show that German exports have continued to flow in greater volume through the freed channels.

Indeed, the value of German exports in March reached a postwar record of $140 million, which compares with a monthly average of only $93.6 million in 1949. Imports at $195 million were much below the figures for December and January, though greater than in February. They compared with a monthly average of $186 million last year. The gap in Germany's visible trade accounts is, therefore, narrower than at any time since the war, with the exception of one month in 1949. To the dismay of the Dutch, the greatest decrease in imports has been in foodstuffs, which have been checked by newly-imposed tariff duties. The increase in exports is chiefly due to larger sales of engineering products, including motor vehicles and precision instruments—that is to say, of Germany's traditional exports.

Sweden and Britain are the most important countries that have not yet liberalised their trade with Germany. Reports from Sweden justify German hopes that the new European Clearing Union, once it is established, will enable Germany to recover its prewar place as Sweden's biggest supplier. It is forecast in Stockholm that Sweden would divert to Germany orders at present being placed in Britain and other countries, since German prices and delivery dates for steel and engineering products compare favourably with those of their competitors.

Meanwhile, the dollar clause that has hindered the freeing of trade with the sterling area has been removed from more of the trade pacts signed recently by the German Republic. Under the latest of these—the agreement with Jugoslavia—trade will be conducted in marks and dinars at a fixed rate of exchange. The Ruhr is confident that, with the greatly increased volume of goods provided for in the new agreement, it will find a valuable market for its engineering products in Jugoslavia. To secure them it is willing to offer good credit terms.

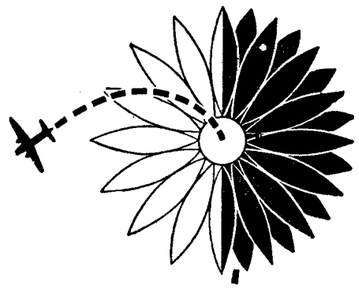
World Health Campaign

The World Health Organisation, the third annual assembly of which opened in Geneva last week, is an ambitious body that has extended its activities far beyond such obvious duties of an international health agency as the control of epidemics and the preparation of a standard pharmacopoeia. In working to promote health (defined as "a state of complete physical, mental and social well-being") it is following, and improving upon, the example set by the health organisation of the League of Nations. Its activities appear to be well and sensibly planned to make the best use of small resources.

The WHO has concentrated largely on finding ways of acting as a kind of fertilising agent on the health services of individual nations, enabling them to function more fruitfully and efficiently. Such means have been found in its own "advisory services" on which a third of its 1949 budget was spent. These services include, among their many activities, the provision of specialised information on a wide variety of medical and public health topics. During 1949, for instance, expert consultants were sent to about 15 governments to help with tuberculosis projects, to 24 to advise on the control of venereal diseases, to 16 to advise on problems of maternal and child welfare and to 15 to help with the control of malaria. Demonstration teams are also being sent all over the world to demonstrate—and give training in—the best methods of controlling such diseases as malaria and tuberculosis.

The work of these teams illustrates incidentally the encouraging extent to which various agencies of the United Nations are pooling their resources and knowledge. Five of the eight teams now working on the control of malaria in India, Pakistan, Afghanistan, Iran and Siam have been provided with supplies by the United Nations International Children's Emergency Fund (Unicef), and nutrition problems are studied in collaboration with the Food and Agriculture Organisation.



Unfortunately, the meagreness of its resources enables the WHO to do only a fraction of what needs to be done. Dr Chisholm, the Director-General, has pointed out that it receives annually a sum "not larger than that spent annually by many a large city for its own municipal health service." Moreover, owing to the failure of some states to pay their contributions, the regular budget for 1950 has had to be reduced from $7,500,000 to $6,300,000. The actual cost of the proposed programme for 1950 is about $17 million, which it is hoped to meet by a supplementary budget made up of voluntary contributions by member governments. The British Government, having inexplicably ceased contributing to the Children's Fund, might make amends by helping here.

DO DOCTORS TALK T.I.?

This has nothing to do with a National Bedside Manner. *All* doctors talk TI, whether they know it or not. For one thing, TI specialise in precision tube, which turns into useful things like waiting room chairs, hypodermic needles, operating tables, thermometer cases, delicate instruments, or intricate medical research apparatus. For another, TI supply oxygen and other gas cylinders, those versatile aluminium alloys, and special lighting and heating equipment. You probably race out for the doctor on a TI cycle, and your doctor hurries to your home in a car which is a moving catalogue of TI ingredients. Tell him when you catch your next cold. . . .

The letters TI mean Tube Investments Limited, of The Adelphi, London, W.C.2. (Trafalgar 5633). They also stand for the thirty producing companies of the co-ordinated TI group, makers of precision tubes, of bicycles and components, of wrought aluminium alloys, electrical appliances, pressure vessels, paints, road signs, metal furniture . . . and essential mechanical parts for a thousand and one things which everybody uses

TI **THE SURNAME OF A THOUSAND THINGS**

great many workers will have to move out or a great deal of capital will have to move in. But if the policy of "taking the work to the workers" cannot be pushed far enough to mop up the whole north-eastern "pocket," what are the prospects and effects of migration?

The North-East Development Association has published a paper embodying the first results of expert research financed by the Nuffield Foundation; and the considered conclusion of the experts is that large-scale migration is a highly undesirable last resort. Locally, it means in practice the draining off of the younger, fitter and able workers, leaving behind a demographically ill-balanced and largely sub-standard community with lower standards of living and a disproportionate reliance on public funds; a decline of local institutions; and a wastage of social capital. Nationally, it is likely to mean a strategically undesirable concentration in the already overcrowded midlands and south, and high social costs when new schools, hospitals, roads, and, last but not least, houses have to be provided. Some double counting is detectable here; the "waste" involved in leaving, say, a mining village derelict cannot properly be added on to the cost of expanding whatever community the migrants reach. Moreover, the lower standards of the remaining, predominantly dependent, inhabitants should surely be properly attributed to the unemployment, not to the physical absence, through migration, of the more active members. Even when allowance is made for these criticisms, however, both the social and personal costs are considerable, and pre-war experience, which the pamphlet fully analyses, shows that spontaneous and unassisted migration is a quite inadequate specific. The longer a man is unemployed, the less capable he is of moving. Migration fell to a minimum in the middle thirties when, to judge by the appalling local index of unemployment, it should have been at a maximum.

Conditions today are different. Since national employment is high, there is some point in looking for greener grass. Moreover, public funds are available to help the migrant. On the other hand the housing shortage sets up a formidable barrier which had no counterpart in the thirties. If the possibly necessary evil of heavy migration is to be faced, there must be advance assessment of its volume and direction, deliberate provision of facilities, and direct aid to the migration process itself. On this conclusion, at all events, there can be general agreement.

Migration: A Study of Movement of Population and its Effects on the North-East. Published by The North-East Development Association and the Northern Industrial Group. (9, Eldon Sq., Newcastle-upon-Tyne.) 22 pp. N/P.

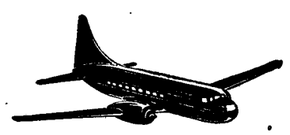
Jonah and the Red Petrol

Mr H. J. Clark, of Welwyn, must today be experiencing emotions akin to those that suffused Jonah when he realised that he had emerged from the whale's belly. He is a taxi-cab proprietor and owns five vehicles. In November, 1948, his premises and vehicles were searched and red, or commercial, petrol was found in the garage storage tank and in the tanks of the five vehicles. As a result Mr Clark was summoned under the Motor Spirit (Regulation) Act of 1948; and, since that Act lays a considerable onus on a defendant to show that he is innocent, Mr Clark must have felt that the whale's jaws had closed around him. However, he attempted to meet the charge in a somewhat old-fashioned way. He said, simply, that he did not know red petrol was being put into the tanks and that, as an honest man, he would not have allowed it had he known. On the hearing of the summonses the magistrates dismissed them on the grounds that the Act had not been complied with when the samples were taken. The prosecution appealed and the Divisional Court ordered the case to be remitted to the magistrates for reconsideration. The reconsidered it on December 23, 1949, but, despite Ac prosecutor and, to a certain extent, Divisional Court, th remained convinced that the defendant was an honest ma and dismissed the summonses again.

The prosecutor went back to the Divisional Cour The defendant's explanation, counsel said, was fantasti the magistrates' decision was clearly perverse; and he ask for a further direction to the magistrates to convict. Th court said that their decision was indeed perverse, bu it continued, a majority of the court considered th there was evidence on which the magistrates could ha come to the decision they did and therefore the appe failed. The court added, perhaps a little trustingly, th it hoped that other benches of magistrates would not tre its decision as a proposition that anyone of good charac was entitled to be believed when he said he did not kn the petrol in his tank was red.



There must be few men alive today whose hones has been so strong and so apparent that it has defeated t provisions of the Motor Spirit (Regulation) Act, 1948. less disillusioned times the story of Mr Clark and the r petrol would grow into a fable that would ring down t nurseries of the country for generations.

Down with Featherbedding

BUT if restrictions and duties be on principle injurious when imposed to subserve the policy or meet the necessities of the State, how much more injurious must they be when the reason for enacting them is to gratify the avarice or the rapacity of a class? Mr Disraeli said on Tuesday, according to the report in the *Daily News*, "that to tax *a community for the benefit of a class* was not protection—that was plunder." The restrictionists then have no principle on which to found their agitation. They cannot say that free trade is an exclusion, originating in some temporary fear and embodied in the statute book for a purpose that is at once unjust and contrary to the principles of the constitution. All that they can say, all that they do say, all that they complain of is that the price of agricultural produce is very low. But it is now higher than it was after abundant harvests under protection. They supply no proof whatever, therefore, that low price is caused by the abolition of protection. There are many reasons for believing that it is not. . . . The defeat they encountered in the House of Commons is only symptomatic of the greater defeats that await them in the country. They have only to look at their advocates in conjunction with their principles to be at once struck with despair. Of Mr Disraeli, their great man, we have already spoken. He virtually gives them up, and their chief staunch friends are Colonel Sibthorp, Mr Plumptre and Mr Grantley Berkeley. That such leaders, with the aid they receive out of doors, can reinthrone protection is as hopeless as an attempt to stop the tide. Not a single fact have they to allege in favour of their cause but distress, which has existed in a greater degree under protection—not a single argument do they bring forward but the co-existence of that distress with the change in law without showing any connection between the two. Thus, with poor advocates and a bad cause, what can await them but a succession of defeats like that of Tuesday, each succeeding one being greater than its predecessor, till annihilation engulph protection for ever?

Industrial Canteens

SIR,—As the chairman of a company operating some 600 industrial canteens, may I submit a few comments on your recent article on "Industrial Canteens."? Though the number of industrial canteens have multiplied in number after the Factory Canteens Order, 1940, it must not be forgotten that in the past the examples set by far-seeing employers were being noted and copied. The provision of good food in pleasant surroundings within or near the works was a problem and a desire exercising many minds.

The nature and urgency of the second world war involved "crude improvisation" in some directions and perhaps also "a reckless disregard of costs." But within my own knowledge and experience the "improvisation" and "disregard" were less casual than were popularly assumed. Considerable care was taken even in the exigencies to create and equip really good and efficient canteens and ensure the wise servicing of them. In such cases no sharp or severe competition came from the Civic Restaurants whose prices at the outset were comparable in general with those in the canteens though the standard of food served tended to be lower.

The comparisons taken from "The Finance of Civic Restaurants" are in my judgment not representative. A small canteen, taking night work into consideration as well as day labour, should not exceed 18s. 8d. per £1 worth of provisions at cost and a larger unit normally registers around 15s.

Your Table 1 shows figures published by the Industrial Welfare Society in 1949. The number of companies aiming to cover the cost of food, wages and salaries was 18 with only 5 succeeding in so doing. Looking at our own statistics I find that 74 per cent of the firms for whom we work more than achieve the aim and many are relieved of further costs and anxieties.

Though profit may be felt "to be out of place in a welfare service," it would seem to me that if commercial caterers are competitive in prices and can maintain or improve the quality and standard of food and service and are able to operate (including a small margin of reward for themselves) more economically for their clients, such "competition for efficiency" should be encouraged and commended.—Yours faithfully,

COTTENHAM

Peter Merchant Ltd., 5 Tilney St., London, W.1

Australia and Communists

SIR,—I appreciate that "the banning of a political party, however subversive its doctrines may be," is an unwelcome measure to many democrats. Especially the proviso of the Australian Bill, which expects the accused to prove that he is not a Communist without divulging the identity of the accuser, is literally reminiscent of the statutes of the Spanish Inquisition, and, as such, extremely disquieting.

On the other hand, I do not think that there is much cause for worry lest the "atmosphere of clandestine adventure, conspiracy and martyrdom" should be a more effective weapon for Communism than open agitation. The history of clandestine Communist organisations in Europe between the two wars does not lend much encouragement for those undercover agents, who will try to keep up the movement in Australia and South Africa after the Banning Bill has been passed.

In the East European countries, where Communism had been banned after the revolutions and counter-revolutions following the first war, the Communists were unable to stir up any serious trouble in twenty years. Nor was their resistance any more noticeable in Fascist Italy or National Socialist Germany, though they got about six million votes at an election held just a few weeks before Hitler's seizure of power.

Those who believe that illegality strengthens the appeal of Communism should compare the figures of two postwar east European elections, still conducted in a certain degree of freedom. In Czechoslovakia, where the Communists had enjoyed complete freedom during the interwar years until the German occupation, Mr Gottwald's party polled 40 per cent; in Hungary, where they had been banned for the past quarter of a century, only 17 per cent of the electorate gave their confidence to Mr Rakosi.

Thus, if the two Dominion Prime Ministers want to ban Communism, while maintaining otherwise the principles of democracy, they are more likely to encounter ideological than practical difficulties.—Yours faithfully,

GEORGE A. FLORIS

"How Green," Hever, Kent

Oxford on Keynes

SIR,—Mr Wiles should not vent quite so much "Keynesian" spleen upon American fiscal habits.

A disinflationary surplus, variously estimated at between five and eight billion—in a budget of around 40 billion and gross national product of over 250 billion—was achieved, in appropriate circumstances, for the fiscal year 1947-48. The Federal Accounts moved approximately into balance for 1948-49 and have since gone into moderate deficit—between three and five billion, perhaps, this year, and a similar result anticipated for 1950-51. What is talked and what is done in Washington are not always the same thing.

An unemployment percentage of 7 is high, but is at present decreasing. With an economy not subject to direct controls, a percentage of less than 5 may well be impossible without serious inflation and, later, collapse. In the circumstances, American fiscal policy in recent years, conducted under great political difficulty, deserves congratulations rather than brickbats from this side of the Atlantic.—Yours faithfully, J. S. FFORDE

Nuffield College, Oxford

The Nature of Incentives

SIR,—Your comments in your issue of May 6 on the nature of incentives (page 1023) was a creditable piece of work and particularly shrewd for an outside party to make. It hits the nail on the head as regards the ease with which an incompetent worker can find a fresh employer. But the real attitude of the building men is that they don't really *have* to work hard and any man who does so without necessity is very silly.

A fortnight ago I sent six men to a site twenty miles from home and as a special incentive offered £2 extra bonus per man if they finished it satisfactorily in six days. On the following week they all came in to complain that they wanted paying an extra hour for each evening for coming home in the firm's lorry.

Myself: But you were paid to sit down all the way going.
No. 1 man: Yes, but it makes a long day, y'know.
Myself: And you get standard bonus.
No. 2 man: But we work for it.
Myself: Yes, but you got an extra bonus this week.
No. 1 man: Well, you offered it, so you must have made it pay.
Myself: Very well, then, why demand more?
No. 1 man: It makes a long day.
Myself: OK, suppose it does. Don't you expect to put in extra effort for a second bonus in addition to wages *and* your travelling pay.
No. 2 man: Yes, but *you* goes out and gets these blooming jobs. *We* don't want to work from 'ome—t'aint *our* fault.
No. 1 man: Yes—it makes a long day.

Need I say more?—Yours faithfully,

Mentor at Athens

"When Greek Meets Greek." By Sir Reginald Leeper, KCMG., GBE. Chatto and Windus. 241 pages. 12s. 6d.

IN this account of his three years (1943-1946) as British Ambassador to Greece, Sir Reginald Leeper has a great advantage over most of those who compose ambassadorial memoirs. For, as the representative of the power responsible for the liberation of Greece, he was to a quite exceptional and unusual degree the guide, mentor and friend of the Government to which he was accredited. He was the confidant of everyone from King George II to the Communist leaders Messrs Porphyrogenis and Siantos, and if they would not always pay attention to his advice, they did at any rate give him an unrivalled insight into every aspect of Greek affairs.

Sir Reginald took up his mission in March, 1943, at the time when the Greek Government in exile became established in Cairo. He ended it exactly three years later, just before the first general elections to be held in liberated Greece returned a majority of the Populists and their supporters to Parliament. He gives a plain, straightforward and admirably clear account of the course of events during those years; and he contrives to delve, at times quite deeply, into the intricacies of Greek politics without ever losing sight of the fundamental issues involved. The most important of these were the constitutional problem of the monarchy, the political problem of relations with the Greek Communists and their supporters, and, after the return to Athens, the economic and financial problem of restoring some sort of stability to the disintegrated and war-damaged Greek economy.

Sir Reginald pays particular attention to the efforts of the various Greek Governments, both before and after the return to Athens, to work out some sort of *modus vivendi* with the Greek Communists. No doubt he felt all the more bound to do this since the course of events leading up to the first Communist insurrection in December, 1944, was so grossly misrepresented in most of the world's press. It has been said that the British at that time were full of principles but had no policy. This is unfair, to say the least. In the atmosphere of 1944 it would have been both extremely difficult and extremely inadvisable for the British to pour cold water on the strenuous efforts which Mr Papandreou made to keep the Communists within his Cabinet. His optimism was invincible even though it did turn out to be entirely misplaced. What was essential was that the Communists should be left in no doubt at all that the British could not stand by and allow an armed minority to impose its will on the whole country. Sir Reginald makes it clear that they were in fact fully warned. But, as he points out, the British were too thin on the ground. Only an overwhelming display of strength would have deterred the Communists and such a display could not be provided at that time for what was, militarily, only a minor sideshow.

On the whole Sir Reginald indulges sparingly in personal reminiscences, except in his vivid account of the "siege" of the British Embassy during the fighting in Athens in December, 1944. From time to time his account is enlivened by a certain quiet humour. One of the best passages in the book is his description of the signature, in February, 1945, of the Varkiza agreement between the Communists and the Greek Government. At the last minute a hitch arose, and Sir Reginald and Mr Harold Macmillan were summoned out to Varkiza to see if they could effect some compromise. He describes how they worked on into the small hours, in surroundings which grew steadily more bizarre and sordid, "waiting like two policemen until we got our bit of paper signed"; and at 4.30 a.m. their persistence was rewarded. Sir Reginald is by no means blind to the faults and failings of the Greek politicians. But he has obviously acquired such a sympathetic understanding of the way their minds work as well as of their problems that the reader of his book will regret that he has not written at greater length about some of those he came to know.

Studies on the Judiciary

"On Understanding the Supreme Court." By Paul A. Freund. Little, Brown (Boston). 128 pages. $3.00.

MR FREUND is a Harvard Professor of Law whose experience of the law has been gained in law school, in government service and in law practice. Mr Freund has argued many cases before the Supreme Court and was once a law clerk to Mr Justice Brandeis. This book consists of three lectures delivered a year ago to an audience of lawyers in the United States and it must be said that many persons, including many British lawyers, will be unfamiliar with much that Mr Freund could assume to be well known to the students and teachers in the School of Law of Northwestern University. Indeed, if it be true, as the jacket proclaims, that American laymen can follow Mr Freund's arguments easily, that judgment on the understanding of the American public is not the least remarkable thing for the English reader to note.

The first thing which strikes the cis-Atlantidean about the Supreme Court of the United States is its constitutional position, requiring it on occasions to judge the validity of acts of the legislature. To Americans, however, who take the Court's constitutional powers for granted, one of the most fascinating aspects of the Court is the clash of views and personalities which its quasi-political functions display to the public gaze. The Court has not in recent years had a reputation for harmony.

WHO'S WHO 1950

One hundred and second year of annual issue

An invaluable work of reference which gives biographical details—present position, career, recreations, clubs, etc.—of about 35,000 notable individuals in all walks of life: politics and public service, finance and commerce and industry, the Civil Service, the stage and the Services, writers, scientists, artists and lawyers.

"Yearly it grows in indispensability, for it serves as address book and telephone directory and book list as well as biographical dictionary." THE MANCHESTER GUARDIAN.

3,100 pages. Buckram 85s. net. Leather back 95s. net.

Published by ADAM & CHARLES BLACK

Mr Freund delves in his first essay into the complex which is the Court and discusses most acutely the stresses which arise out of its varied considerations of human rights and property rights. In his second essay he goes back a generation to draw a "Portrait of a liberal judge," showing in Mr Justice Brandeis a man of strong character and decided opinions in whom humanity and a judicial temperament were nicely and firmly blended. In his final essay Mr Freund is again treading ground which is strange, but strangely attractive, to practitioners from the Inns of Court, when he shows how the American legal profession, normally as conservative as any of its counterparts, has by its practices and its innovations affected the judiciary's contribution to the ceaseless process of fitting the constitution to the times.

Industrial Biography

"Through Five Generations, The History of the Butterley Company." By R. H. Mottram and Colin Coote. Faber and Faber. 181 pages. 12s. 6d.

THERE has recently been a fresh burst of company autobiographies, a form of self advertisement which makes it difficult to achieve a convincing balance between self praise and unbiased appraisal. A company is naturally interested in looking its best while the public is concerned with a good story of an honest judgment.

In this book the pitfalls of excessive self congratulation are avoided, and the reader is not antagonised. But the joint authorship has produced a composite product. It is a book about two subjects and it suffers accordingly. It is, in fact, about a great many more than two subjects, for in tracing the history of the Wright family back to Cromwellian times and in telling the story of the Butterley Company, the authors manage to range over industrial and economic history, wages theory and social history as well. As a result, many parts of the history of the Butterley Company itself are sketched rather than painted, and this does less than justice to its diverse and important achievements in engineering and mining.

The book, does, however, achieve one of its objects which is to pay tribute to the diligence and enterprise of "the Giants of the Past." The many biographic sketches of the Wright family make not only pleasant and interesting reading, but show how fully they lived up to the motto cut in stone on the parapet of the clocktower of Osmaston Manor, the family mansion—"Work while it is day." It is the more the pity that the book does not more successfully appraise the significance of that work.

Text and Reference Books

"The Export Trade." By Clive M. Schmitthoff. Stevens & Sons. 2nd Edition. 393 pages. 25s.

THE first edition of Dr Schmitthoff's concise account of the law and practice of the export trade appeared two years ago; this second edition incorporates changes made in export law and practice up to September 1, 1949. In form the book may be compared to an ably compiled student's lecture note book; Dr Schmitthoff's qualities of accuracy, assiduity and directness of style are supplemented by an intelligent—and quite indispensable—index. Where space does not permit of full explanation of any particular point, Dr Schmitthoff wisely shrugs the task off on official publications or bodies (with full names and addresses supplied). A certain over readiness to take this course may perhaps be counted the only serious blemish of the book.

"Queensland Year Book, 1948." Government Statistician's Office, Brisbane. 403 pages. 3s.

THIS is the ninth volume of the Queensland Year Book and provides information for the financial year 1946-47 or the calendar year 1947. The main information supplied presents the current statistical history of Queensland but in many cases similar information is given for other Australian States by way of comparison, or for earlier years to illustrate the State's development.

AMERICAN SURVEY

America's State of Mind

(From Our American Staff)

MR GEORGE KENNAN, whose two years' holiday from the State Department seems now an even more disturbing prospect than when it was announced in January, went to Milwaukee, in Wisconsin, on May 5th and gave an explanation of the current American malaise, an explanation which he was in a better position to give than anyone else at the moment. He comes from Wisconsin and, as the fourth generation of his family to live in that State, is undoubtedly more representative of its traditional qualities than the unpredictable Irishman, Mr McCarthy, who speaks for it in the Senate. In addition, as he said, Mr Kennan is not one of those who have been attacked by Mr McCarthy (though even his long record of anti-Communist writings could be vulnerable on Mr Budenz's theory of "special dispensation") and he is shortly leaving the government service for a time.

Mr Kennan described two recent events—"the final collapse of the power of the Chinese Government on the mainland of China and the demonstration of a Soviet atomic capability"—as having "led quite naturally to deep questions in many people's minds." He did no more than mention the second of these events which, because it destroyed forever the myth of American physical isolation, created the mood of underlying hysteria in which the credibility of the Republican charges against United States policy in China could be widely accepted.

Charitably, for one with his knowledge of international affairs, Mr Kennan admitted that he understood "the state of mind which lies behind this criticism." "It is," he said, "roughly this: China has fallen to the Communists. This is a reversal to the cause of world peace and stability. Therefore, our policy must have been wrong. Therefore there must be something wrong in the State Department." This argument may sound childish but it is not too childish for the Scripps-Howard press or the chief Washington correspondent of the *New York Herald Tribune*.

Mr Kennan went on to say that such assumptions would be plausible "if China were a sort of province of the United States and if the State Department ran it and if it were the State Department which had decided that the Communist party should be the faction which would have the best morale and discipline and pack the strongest political punch and win the civil war. But suppose none of this were so. Suppose that our representatives abroad had warned the Chinese Government earnestly and repeatedly of the probable consequences of the course on which it was embarked; suppose that when these warnings were ignored, there was nothing more that our government could really do to influence or alter the basic course of events in China; suppose that the troubles of the Chinese Government were inherent; suppose that it wasn't, in the first instance, lack of money or arms or anything that this country could give which stood between the Chinese Government and the accomplishment of its purposes in China; suppose we were given the impression that the reason that government wanted aid from us and paid people in this country to lobby for that aid was not so much that it really wanted to overcome its weaknesses, but in order that it might more easily avoid having to face them, not so much that it wanted to increase its efforts, but rather because it wanted to involve us to the point where we would take over the major burden of the responsibility and it could relax and sit back; how would things look then? These happen to have been the realities, and they can be very easily proven from the published documents."

Mr Kennan thinks that the misunderstanding and bitterness in the United States over China has been caused by the shallowness and over-simplification of the American approach to what is happening there. "I am sure that we did not analyse very effectively what was happening in Chinese political life during recent decades. I am sure that we were oblivious to signs and portents which should have put us on our guard. . . . I am sure that during the early years of the war, while the Japanese were in occupation of large portions of China, there were phenomena clearly visible which should have been recognised by us as raising serious doubt whether the Chinese Government would be able to consolidate its power in the Japanese occupied areas if and when the Japanese were to leave. . . . Had we realised this, we would not have deluded ourselves, as I think many of us did, into the hope that the defeat of Japan and the evacuation of the Japanese forces from China would mean a 'united, free and democratic China' as these terms were understood in our country."

*

Mr Kennan then discussed the reasons why the American public was not told the true state of affairs earlier. "Remember," he said, "that we could not talk about these things to our own people without being overheard in China and too much emphasis on the disturbing conclusions which had to be drawn would itself doubtless have hastened the disintegration of the power of the Chinese Government." He stressed this "because it raises a question of principle as to the extent to which our own government can interpret its own policies in a situation where its interpretations not only

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

describe the course of events but in part determine it," a question which is comparatively new in the United States whose foreign policies until recently were not of the kind which determine the course of events.

He also tried to explain why so many people in the United States—and in other western countries—consoled themselves with the delusion that Moscow's wartime association with them "would produce some basic alteration in the nature of a regime whose commitment to totalitarianism was really far more than just a state of mind." It seemed, he said, that "in the thirties we were, as a nation, not sufficiently aware of the role which power was coming to play in this world of ours, and particularly in the minds of three extremely vigorous and important peoples, all of whom were discontented in one way or another with their own cut from the settlement of World War I. These people were of course the Germans, the Russians and the Japanese. During the decade preceding our participation in the Second World War, that is from 1931-41, it was plain that these countries were all in the hands of governments which would have no respect for liberal principles . . . and would be motivated primarily by power considerations. It was also evident that these three countries in combination possessed, or soon would possess, a military potential clearly overshadowing anything that could be mobilised elsewhere on the Asiatic and European continents. . . . It was for this reason that, when war came to us, we were confronted with a sad, and perhaps for many of us humiliating, fact: namely, that it was only with the help of one totalitarian regime, still saturated with hatred for us and determined to encompass our downfall, that we could defeat those other totalitarian powers which had brought themselves into a state of hostility with us. And many of us were inclined to forget that the single totalitarian state which was on our side was there . . . not by its own choice."

*

Although he made no direct reference to Senator McCarthy or any other of the State Department's tormentors, Mr Kennan referred to the unfairness of their present attacks by saying that "in the field of foreign affairs there is generally a great time lag—as much as five or ten years on the average—between cause and effect in major developments. This is something that few people in this country are aware of. Their unawareness expresses itself in a demand for quick results, where such results often simply cannot be obtained. It also expresses itself in a tendency to lay the blame or credit for current developments on people who happen to bear public responsibility at the moment, even though the real causes of these developments may go much deeper in time and complexity."

He was not, he said, a pessimist about the cold war but "this is on the assumption that we can mobilise the best we have in human nature in this country to help us fight it and that we can give to those people the enthusiasm and the confidence and the stimulus which comes from knowing that their efforts are appreciated and supported. If we cannot do that I can give you no promising assurances. The margin of safety with which our country moves in the world today is not great enough to permit us to be reckless and wasteful with the talents and the idealism of those people we depend on for the generalship of our peacetime battles." Unfortunately, this speech has had little publicity. It is, perhaps, as useful an explanation by the professional to the amateur of the fallacies of popular thinking on foreign affairs as has been given in a long time.

American Notes

Chicago's Democratic Fair

Last weekend in Chicago the Democratic Party displayed its Fair Deal wares at a three-day Jefferson Jubilee celebration, rounding off the series of regional shows that the party has been holding in preparation for next autumn's Congressional championships. All the fun of the fair was there: fireworks, flags and film stars, brass bands and balloons, some of them complete with the $2 bills that carry Jefferson's portrait. And there were two special attractions. First, the Cabinet was put through its political paces on the stage of the Opera House, holding its weekly meeting in public for the benefit of the television cameras; the proceedings, a laudatory account of his Department's accomplishments from each member in turn, were probably as unprecedented as the place. Secondly, President Truman arrived for a frankly political finish to his non-political cross-country marathon. Luckily the railway strike did not delay him as it did many of the 3,000 Democrats who were supposed to be there.

Mr Truman, speaking to 25,000 people, laid down the basic principles which the Democratic National Committee later expanded into a restatement of the party programme designed to attract a record number of Democratic voters to the polls in November. "The two jobs this nation faces," said its President, "are to assure an increasing standard of living for our people and to achieve peace in the world." These had also been the themes of his speeches while on tour. Disagreement over the means by which the first is to be attained—"Socialism or Freedom," as the Republican slogan puts it—is, of course, the main difference between the parties; Mr Truman has found a very effective method of discrediting the slogan, by ridicule, a method which appeals especially to the simple folk who crowded round the back of his train at every stop. The President insisted that he did not regard the second job—international co-operation—as a partisan matter, but it was already the chief election issue in Illinois, where he was speaking. By bringing it to the forefront of the national campaign, Mr Truman has hardly encouraged the restoration of non-partisanship in foreign policy, although he may win votes for his party.

* * *

Election Economy

The device of merging the bulk of the year's spending measures in a single gigantic Appropriations Bill would, it was thought, have a sobering effect and induce Congress to adjust outgo to income. The new device won its first economy spurs last week, when the House approved a total of only $28.9 billion, $2 billion less than the President had requested, and nearly $150 million less than the pruned total submitted by the House Appropriations Committee. But the means employed were highly questionable, and the economies themselves may prove illusory. Until the last moment, when a majority of the Democrats present joined the Republicans to require the $600 million cut, appropriations had increased, rather than diminished, on the floor of the House. This was due in the main, however, to the additional $350 million requested for defence by a chastened Mr Johnson, and the House must be commended for its admirable restraint over the rivers and harbours section—the traditional source of federal largesse.

The savings, sponsored by Mr Taber (who once won world fame by cutting the first Marshall Plan appropriations), would be achieved by requiring most civilian agencies to reduce their salary costs by 10 per cent and travel, printing, communications and other expenses by from 5 to 20 per cent. Smaller economies would be asked of the defence department. Another amendment, whose sponsor believes it would save up to $400 million, requires that only 10 per cent of the normally occurring vacancies should be filled. Putting the whole brunt on the Federal administration in this way permits many Congressmen to pay tribute to economy in an election year without the painful necessity of paring projects dear to their constituents.

It seems probable, however, that the two amendments overlap each other, and economies already made, to such an extent that the savings they would produce are much exaggerated. Certainly they would be achieved only by gravely impairing government efficiency. Those who rushed to put themselves on the record as favouring economy may have counted upon the Senate giving the matter second thought. This in turn may mean that the appropriations to implement the Foreign Aid Bill, for which a total authorisation of $3.1 billion has now been agreed upon in conference, may feel the full force of the frustrated economy hurricane. The $2.8 billion authorised for the European Recovery Programme, the approximately $200 million for the Far East, and the $35 million compromise on Point Four, are all spending ceilings; the appropriations may well be lower.

* * *

Chipping at the Hoover Monument

While President Truman was being presented with birthday cakes on his western tour, Republicans and Southern Democrats in the Senate were stirring an unpleasant mixture for him to eat on his return to Washington. The Southerners began by collecting the ingredients for a filibuster against the Fair Employment Practices Bill, but were easily persuaded to put off serving this peculiar delicacy until they had helped the Republicans to reject the President's plans for reorganising the government along the lines recommended by the Hoover Commission. There is real danger that one or other of the Houses of Congress may disapprove nearly half of the twenty-one reorganisation plans that would have brought Mr Hoover's monument half-way to completion, if they had been allowed to come into force on May 23rd. Meanwhile, Mr Truman has sent another batch of four plans to Congress; three deal with the Reconstruction Finance Corporation and the fourth gives direct responsibility for the National Security Resources Board to the chairman, instead of dividing it among the members of the Cabinet.

The first plan to be rejected by the Senate last week was that for abolishing the office of General Counsel to the National Labour Relations Board, established by the Taft-Hartley Act, and thus ending the schism between the Board itself, exercising judicial functions, and the Counsel who is responsible for prosecuting alleged infringements of the labour laws. The Senate objected to this plan, with some justification, on the grounds that an Act which Congress passed only three years ago, and has since refused to repeal, should be altered only by a direct legislative approach, not by an executive by-pass. Mr Truman claims that his changes in the NLRB are in harmony with the general tone of the Hoover Commission's recommendations for increasing governmental efficiency by concentrating authority in the various agencies and departments. But the Commission refrained from expressing an opinion on the specific question of the General Counsel because it was a matter of political controversy.

The Commission's recommendations were, however, followed in the other plan which the Senate rejected last week, the proposals for reorganising the Treasury Department and giving it authority over the Controller of the Currency, who supervises the nation's banks. The bankers, led by the Secretary of the Treasury himself, had no difficulty in smothering support for this scheme. This is a good example of the type of pressure now piling up against the reorganisation plans. It is pressure applied by people connected with, but outside, the department concerned, on behalf of those within it who will lose their influence if the scheme goes through. Another example is the protest of the patent lawyers against the reorganisation which would give the Department of Commerce control over the Patent Office. The Citizens' Committee for the Hoover Report is already calling for a new campaign to save governmental reorganisation from being chipped away by vested interests and Mr Hoover himself may have to come to the rescue of his monument.

* * *

Split in the Keystone

Pennsylvania's Republicans, deciding at last Tuesday's primary elections on their candidates for Governor of, and Senator from, the Keystone State next November, were also perhaps deciding the future of their party. For the bitter and dirty fight that reached its climax in Pennsylvania this week was between the most diehard Republican of them all, Mr Joe Grundy, to whom the Smoot-Hawley Act was a low-tariff Act and "hand-out government" is the ultimate political sin, and the colourful, outspoken Governor, Mr James Duff, who claims to represent the "average guy" and to put human rights before property rights. This expensive philosophy is high treason to Mr Grundy and in his opinion is sinking the State in a morass of deficit spending.

The split between these two Republican factions in Pennsylvania thus epitomises the split in the national party and Mr Duff's victory is a victory for all those Republicans who believe that their party must offer positive and progressive inducements, if the voters are to be broken of their Democratic habits. This constructive attitude will have a better chance of being adopted by the party in the future than in the past if Mr Duff succeeds in consolidating his hold over Pennsylvania, a keystone not only of the party's finances but of its policy; the State sends one of the three most numerous delegations to the Republican convention.

The battle in Pennsylvania was for control of the Republican machine there, long dominated by Mr Grundy's Association of Manufacturers. That machine is oiled with the patronage dispensed by the State Governor, a patronage which helped Governor Duff to roll on to triumph. State law did not permit him to succeed himself and he therefore sought the Senatorial nomination. There was little hope of keeping this from him and, indeed, Mr Grundy is probably not averse to seeing him leave for Washington. Mr Duff's candidate for the Governorship, Judge Fine, is not particularly well qualified for this post either by reputation or proven capacity and Mr Duff's chief success has been his ability to carry Mr Fine to victory over Mr Jay Cooke, a strong and nominally independent candidate, who was supported by Mr Harold Stassen as well as by Mr Grundy.

Neither Governor Duff nor Judge Fine has, however, yet been elected and their Democratic opponents may be the chief beneficiaries of the split in the Republican Party, which has nearly a million more registered voters in the State than has the Democratic. Senator Myers, the Democratic whip in the Senate, is seeking re-election, and the Democratic candidate for Governor, Mr Richardson Dilworth, Philadelphia's city treasurer, brings clouds of glory, and the sympathy of believers in clean government, to the party ticket, for he recently exposed, and defeated, the corrupt Republican administration that had shamed Philadelphia for years.

* * *

Return of the Migrants

Hunger and distress in California's fabulously fertile San Joaquin Valley have once more called attention to the problems of the migrant farm labourer and his family. Their misery in the nineteen-thirties was made to lie heavily on the public conscience by Mr John Steinbeck's novel, "The

NICKEL AND THE LOAF

Think of everything that goes to produce the loaf and then you will realize the importance of nickel. The tractors used for ploughing the fields, the machines that reap the harvest, the vehicles that carry the grain; the vats, yeast tanks, ovens and other equipment of miller and baker—in all these nickel is present, toughening and strengthening the metals used in their construction, making them staunch against the attacks of wear, corrosion and heat. Thus nickel is contributing to the efficiency of the tools and equipment with which Britain is achieving her recovery.

THE MOND NICKEL COMPANY LTD

Sunderland House, Curzon Street, London, W.1

25/Ma/1

Grapes of Wrath." During the war, farm prosperity and the shortage of labour eased the migrants' lot, but in the past four years the number of those seeking casual agricultural work has increased by more than 40 per cent, while the available jobs have begun to contract.

The great difference between conditions now and those fifteen years ago is that today there is no wholesale exodus of bankrupt farmers from dust-bowl States seeking a new life in the west. The Joacs are now citizens of California and Arizona; they cannot be turned back at the border. Part of the distress this winter has been caused by progress; a new strain of fast maturing cotton deprived the pickers of work they had counted on to sustain them until other crops were ripe, while the introduction of mechanical pickers has been speeded up.

The problem is not confined to the west. Though less is heard about them, half the nation's 900,000 migrants are found in the south, and a quarter in the northern states. Large-scale mechanised farms, wherever they may be, create a demand for casual labour that at peak months may be ten or fifteen times as great as the normal. The need is particularly acute on vegetable and fruit farms, and in the cotton, beet-sugar, and wheat fields. The migrant's troubles are not confined to bad times; he is economically submerged throughout the business cycle, cut off from the protections of federal social insurance as well as of state unemployment compensation and insurance against accidents. His children work when they can, for in 1948 the head of a family earned only about $1,200, and the federal and state laws prohibit child labour only during school hours. Even these regulations are often honoured in the breach; the migrant's children, at best, dart in and out of half a dozen schools in a year; or at worst, get no schooling at all.

One of the first reactions to present distress has been to demand the banning of foreign labour. During the war Mexicans and British West Indians were brought in to do the "stoop" work that no American would attempt. More than 100,000 Mexicans have been legally brought in to California in the past year, but many more have slipped across the ill-guarded frontier, earning the name "wet backs" from their swimming of the Rio Grande. Officially the big land-owners frown upon the employment of wet backs, but they find them cheap additions to contract workers, for whom some guarantees of wages and employment are required. In the east, the importation of West Indians is being opposed, particularly by Puerto Rico, which has a large reservoir of unemployed American citizens. A more hopeful sign is the increased willingness of the growers' associations to accept some responsibility for providing more regular employment and better housing for the migrant.

Shorter Notes

After six months' delay Mr Leon Keyserling has been nominated to succeed Dr Edwin Nourse as chairman of the President's Council of Economic Advisers. Dr Nourse resigned in protest against two policies with which Mr Keyserling is closely associated—"deficit financing as a way of life" and "crusades" by the Council in support of its views. The appointment of Dr Roy Blough, a tax expert to the vacant seat on the three-man Council redresses the balance slightly, but he is less cautious than Dr Nourse.

*

For three days at the end of April 20,000 New York high school students besieged the City Hall in support of the teachers' campaign for higher pay. They were inspired not so much by affection for their instructors as by love of extra curricular activities—dances, games, club meetings—which since Easter the teachers have refused to supervise until their demands are met. The Board of Education last January recommended an increase of $300 a year in the average salary of $4,612, but the Mayor decided the City could not afford the $13 million which this would cost.

THE WORLD OVERSEAS

The Mood of South-east Asia—I

Nationalism in a Hurry

(From Our Special Correspondent)

IT is characteristic of the east to wait and see which way the cat is going to jump. As a result, politicians throughout South-east Asia strike the outsider as watching developments in China, the attitudes of the western powers, and the ebb and flow of the local struggle in Viet Nam with particularly anxious attention. In this the politician is naturally ahead of his people: the peasant's main interest is to be left in peace to make a living that will keep him from starvation. Nevertheless, far more of the ordinary people on these five countries—Burma, Siam, Indochina, Malaya and Indonesia—are alive to what is going on around them than at any recent time. They are very close to Communist propaganda and most are at least dimly aware that the background of their lives is changing.

The speed of the change and the intensity of awareness naturally vary from country to country, according to the events that have taken place in each one during the past five years. Siam feels the least affected, Indochina and Indonesia the most. From the politicians' point of view, however, this has not necessarily meant either less or more interest in the change; for most it has merely meant varying degrees of urgency in deciding which band-wagon is the safest to jump on. It would be easy to condemn all South-east Asian leadership for a weak-kneed attitude, if it were not for the courage of the exceptions and the fact that, left to themselves, these countries would stand no chance at all of repelling Communism. Three men who have in fact made bold decisions to commit themselves against the Communist juggernaut, trusting for a variety of motives and reasons to the power of the west to assist them, are Bao Dai in Viet Nam, Pibul Songgram in Siam and Mohamed Hatta in Indonesia. None of them was bound to adopt the line he has taken; all are abused by Moscow as running dogs of the imperialists and "lackeys of Wall Street" and stand in daily danger of assassination. And, on the spot, no one feels that the west has yet given any compelling proof of either its power or determination to preserve the framework on which these men are building their future.

Unity in Diversity

It would, therefore, be surprising if morale in South-east Asia today seemed good. During the past few months there has been time for the effect of the Communist victory in China to make a deep impression throughout this area. And, just as Marshal Lyautey spoke of the Moslem world as one great sounding board, so there is a unity of sentiment about South-east Asia which seems instinctive rather than logical. It is a unity in diversity, powerful enough to overcome the differences of religion, the considerable geographical divisions of distance, mountain, jungle and sea, and the lack of any natural political centre.

Almost the only outward relic of the Japanese wartime occupation of the area expresses this mixture of similarity and difference—it is indeed curious that the "co-prosperity sphere" has vanished so completely. All the big cities of South-east Asia have inherited from the Japanese the idea of what in Malaya is called the *trisha*, a tricycle for carrying passengers, which replaces the former rickshaw as the basic and cheapest means of transport for hire; it is also typical of today that a man should pedal a machine rather than run on his bare feet. Whereas in Singapore, however, the *trisha* is a bicycle with a sidecar, in Jakarta the *betja* has a seat in front, in Bangkok the *sam loh* has one behind and in Rangoon there is a *trisha* again, but with a different, most rakish, construction—more typical perhaps of the Burman's great capacity for self-deception, and enabling him to think it comfortable when it certainly is not.

Most of the leaders of these countries are young, in their thirties and forties, particularly in Burma, Indochina and Indonesia. This is partly because there are comparatively few older men who have had the educational and emotional background to fit them for leading movements of revolutionary nationalism; and partly because the average expectation of life is fairly low, so that there is plenty of room for the young at the top. South-east Asia, however, is not only young in outlook, but the upsurge of nationalism is inextricably linked with a youthful idealism in economic policy. No attempt, therefore, to settle the problems of the area can have much hope of succeeding that does not fully take into account the confident inexperience and touchy idealism of its leaders, as well as their respect for power and their intense desire to raise economic standards. Whether they can ever succeed in their economic aims until they have learned to avoid political irresponsibilities, like those which have ruined Burma and may yet ruin Indonesia, is another question. What is certain is that the creed of Communism could not be presented at a moment more promising of success. To counteract it will need both a military and an economic programme, put across with skilful publicity and at least a touch of glamour.

Neither military nor economic aid, however, is likely to be decisive on its own. Nor, unfortunately, does their combination on any forseeable scale appear very likely to have an immediate effect, when considered on the spot. Western aid is essentially a long-term project. Malaya is now the one example of a South-east Asian country equipped with an administration up to western standards, with relatively powerful and efficient military forces and with a long purse. But in the Chinese side streets of its towns, and in the Malay and Indian settlements on the rubber estates, there is less and less feeling of any certainty about the country's destiny. If this is true of Malaya, it is still more the case with Burma and Indochina ; there, in spite of independence having been won from the white men, the forces of nationalism have yet to settle whether the Communists are with them or against them. In Indonesia the Communists are not yet an active problem ; but the small educated class is already watching their progress on the mainland of South-east Asia with gloom, while among the people there is already confusion, if not disappointment, about the true meaning and possibilities of national independence.

It is into this atmosphere of mingled inhibition and disillusionment that foreign aid will have to be injected. And those who provide it will have to remember that although South-east Asia wants desperately to grow in stature it is often extremely suspicious of anyone who proposes to help it. In Siam, which is the most promising field for economic aid, because it is independent and stable, foreign help is widely looked on with considerable suspicion, and this is by no means exceptional. The present mood of individuals, political parties and races in South-east Asia, in fact, is one of mixed distrust, self-seeking and self-assertion. It is something which will tax the diplomacy of the western powers very severely during the coming months.

(To be continued)

The Ruhr on the Eve of the Schuman Plan

[FROM OUR SPECIAL CORRESPONDENT]

THE Schuman Plan for pooling French and German heavy industry came at a crucial point in the postwar history of the Ruhr. In March, and again in April, the daily average of crude steel production for the first time brought output above the limit of 11.1 million tons a year that had been confirmed in the Petersberg Agreement only last November. The steel industry had thus achieved its prime objective for the beginning of 1950. It then waited to see what the Allied control authorities would do about it.

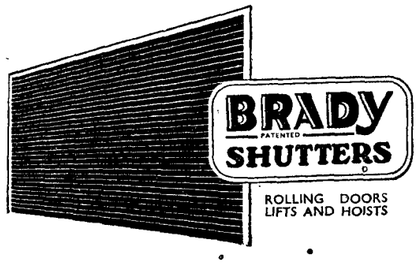
The Occupation Powers, in effect, did nothing. This month General Hodges, the American head of the Military Security Board, announced that the Board would wait until a year's production had overstepped the limit. In the meantime the High Commission has asked the German Government to take on the invidious task of allocating individual production quotas to each of the steel firms, on the basis of a total that does not exceed 11.1 million tons. There is no sign that the Government has carried out the request.

With the Ruhr already bursting its bonds, the effect of the Military Security Board's long-delayed declaration of its assignment on May 8th was not impressive. It was also overshadowed by the Foreign Ministers' conference, which every German knew would discuss, and probably modify, the Board's list of restrictions on steel and a number of other industries. The Schuman Plan has upset the whole conception of unilateral restriction of German steel output, though the French wish to maintain existing security regulations. At the very least, the plan introduces yet another element of uncertainty and confusion into the situation. In particular, it will be surprising if the Ruhr steel managers do not feel more than ever justified in holding up the task of answering the 82-page questionnaire, containing 1,200 questions, accompanied by over 100 drawings, which the Military Security Board and the Combined Steel Control asked to be returned, in 16 copies.

Back to World Markets

The Military Security Board has for many months been trying to work without knowing its own scope. Its staff has been reduced in the meantime, and it is now doubtful whether adequate technical inspection of German factories can be carried out. As far as steel is concerned, the Board has decided to limit its direct control to crude production, and to leave inspection of finished products to spot checks. It is clear that the French, who demanded a large body of technical inspectors to cover every aspect of restricted production, have lost the day.

Through all the uncertainties of the situation, one factor remains clear—that is, the determination of the Ruhr to regain its place in the sun. The French hope to build up a big steel export industry, and have been offering to sell crude steel to Germany, which has a large finishing capacity ; but the Germans, though they admit that Saar steel must keep its traditional market in South Germany, decline the offer. They intend to produce 14 to 17 million tons of steel a year and to enter the export market themselves. Until the limit on their production is raised, they are not willing to enter any international cartel ; any cuts made by international agreement must be made from a level much higher than 11.1 million tons. With this stipulation, the German industrial leaders are eager to enter an arrangement for stabilising prices and allocating markets. They are, indeed, the most cartel-minded people in the world. American efforts to force the Bonn Government to pass effective anti-trust legislation will almost certainly prove futile ; price fixing rings flourish, the old Rhine Coal Syndicate operates in exactly the same way under another name, as a semi-official body, and attempts are constantly made on the German side to reach limiting agreements with foreign competitors.



Another development is in the offing which illustrates the Ruhr's determination to meet the coming world surplus of steel as well equipped as Germany's competitors. A project will soon be presented to the steel committee of the OEEC in Paris for the erection of a wide continuous strip mill for the mass production of steel sheets. Similar plants exist or are being built with the aid of ERP funds in Britain and France, while Germany's only semi-continuous wide strip mill, at Dinslaken, has been dismantled and shipped to Russia. A full-scale project of this kind might cost as much as $100 million ; but the German steel industry suggests that it might make do with the expenditure of only DM 100 million, towards which it is hoped that the Americans would contribute.

Eyes on Eastern Europe

The efforts to raise output are being made without regard for demand. Present steel production is not justified by the order books, which show only two months' work on hand. Until such time as the uncertain Government programme for financing building and other steel-consuming works gets under way, the slack home demand remains the weak spot in the Ruhr's plans. Only the trade agreement with the Soviet Zone, calling for delivery of 210,000 tons of rolled products, saved the steel industry last autumn from having to abandon its efforts to reach the 11.1 million ton limit. The embargo placed in February on further deliveries of steel was a blow, and the Ruhr is impatient for it to be lifted. In general, the steel industry places great hopes on exports to eastern Europe—and to Latin America.

It is a strange fact that even today no one can answer the question: "Who owns the Ruhr? ", still less "Who is going to own it ? " The amazing strides in production, involving the investment from their own resources of some DM 350

It's an old-fashioned word "Service" as understood in industry has lost a lot of its old meaning — but the Brady service is still exceptional, and as famous as the Brady Shutter. The roller shutter is not a new invention but, in the Brady roller Shutter, there is a lot that is new — new patents, new materials, new finishes — which have greatly extended their usefulness. In factories, offices, hotels, houses, on commercial vehicles and aeroplanes, we can show how a Brady Shutter helps the job along, as efficiently as Brady hand and power operated lifts.

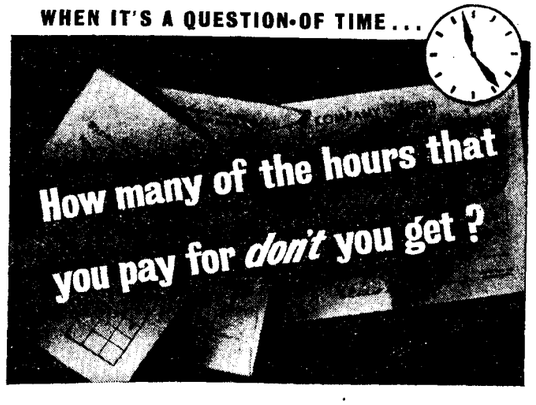
A Sensible Policy for Process Steam—10

The Air Film Handicap on Output

BY SPIRAX

One of the stagnant insulating films on the condensing surfaces of all process steam plant is a film of air. It has a remarkable ability to resist the flow of heat from the steam to the process and is a drag on production.

When steam is turned on, the steam spaces have already got air in them and more air comes forward with the steam. As a result of this dilution, the effective temperature of the steam is greatly reduced.



A far worse feature is the fact that because the air cannot condense it is deposited as a film on the condensing surfaces. Such is the insulating effect of the film that warming up is retarded, processing time is prolonged, temperatures are uneven and erratic, plant output suffers, and steam consumption is excessive.

There is only one answer to the problem : an automatic air vent which will clear initial air on starting and will release air continually during running, without permitting live steam to escape.

million by the 24 decartelised steel companies—evidence of the financial strength of old-established German firms—have been achieved in conditions of complete uncertainty about the future organisation or ownership of the industry. Law 75, which ordered the break-up of the combines and reconstitution of the industry on the lines of maximum efficiency, has still not led to any draft plan, either from the German steel trustees, the German Coal Control, or the High Commission. Since the High Commission refused to allow the Bonn Government to take responsibility for executing the law, the German trustees are still in the position of having to draft a plan under the occupation powers, and expose themselves to charges of treachery if the plan is not a success. It is harder still to envisage the Ruhr carrying out a plan imposed upon it by the High Commission. So far, the High Commission has been prevented from doing so by its differences on the question, which revolve round the size of the unit companies to be formed out of the old combines.

Is Nationalisation Likely?

Only the Americans are in favour of a drastic break-up of the combines. The British, in accord with the German trade union leaders, see that it would smooth the path to nationalisation if large units were retained. The French believe the British are under an illusion in thinking that the Ruhr will be nationalised, or that there would be any guarantee of security if it were. They maintain their objection to the preamble of Law 75, which gives the Bonn Government the right to decide the future ownership of the German heavy industry. In spite of their stand, however, the Law has been issued this week in revised, tripartite form, since the French were overruled by a majority vote.

Though the Adenauer Government will not nationalise the Ruhr, it may be forced to produce compromise proposals. It is being hard pressed by the Social-Democrats and the Trade Union Federation, which are fighting for two objectives—socialisation and trade union representation on the board of managers of all firms. Much will depend upon the outcome of the elections in the Land North Rhine-Westphalia which takes place next month. Hitherto this state, containing the Ruhr, has been governed by a Christian-Democrat coalition under a left-wing Christian-Democrat premier, Herr Arnold, and has voted in favour of socialisation. Should the Socialists lose ground in the elections, they may leave the coalition, and Herr Arnold himself may be dropped by Dr Adenauer.

In any event, it is possible that the coal industry will be socialised in a compromise form to meet Socialist demands. The coal industry differs in many ways from the steel industry, to which it was tied in a position of inferiority under the old combines. The German coal control, whose chairman, Dr Kost, is also head of Rheinpreussen, the big synthetic oil producing company, plans to base the Ruhr coal industry on coal chemistry and electric power production, instead of allowing steel to base itself on cheap coal. If production of coal by-products and electric power is intensified as an outlet for low-grade coal, the Ruhr, it is believed, can meet the coming surplus in world coal markets with better prospects. Hence the German drive to remove the ban on the Fischer-Tropsch synthetic oil production, and to develop the Ruhr electric grid.

Politically, the battle in the Ruhr is still being fought on the issue of private enterprise versus state control, familiar to all western countries. The antagonists are lined up mainly in the Social-Democrat party on the one side, and the Christian-Democrat or Liberal-Democrat party on the other. As yet there is no reason to think that the industrialists have decided to give financial support to any of the innumerable little neo-Nazi "parties" or associations that spring up, and die, like mushrooms in the political soil of postwar Germany. It is, therefore, not too late to bring them into a western European association such as is proposed by M. Schuman.

General Smuts—The South African

On May 24th, General Smuts celebrates his 80th birthday. The following tribute from a Correspondent in South Africa describes his less well-known activities in his own country.

General Smuts wears a crown which is not without its thorns and about which less is known to the outside world. It is a revealing fact, as true of the great as of the lowly, that a man can do for others what he cannot do for his own. And it does not subtract from the essential greatness of Smuts, but rather adds its paradoxical twist to his stature, that he has failed to do inside South Africa what he has done outside it. The reason is not to be sought in the biblical truth that a prophet is not without honour except in his own country—though there is substance in the converse of the proposition advanced by the Afrikaner isolationists that South Africa cannot afford an international statesman of the calibre of Smuts. Certainly so great a man would have been wasted if confined to the warring society that constitutes the Union. As it is, the very eminence of Smuts in the outer world has made his task in the smaller world almost impossible.

The world has looked at South Africa for so long in the person of General Smuts that it is sometimes difficult to appreciate that he is not its permanent Prime Minister. He has been out of office as Premier longer than he has been in office. His record as Prime Minister falls far short of that of Mr Mackenzie King. Like Mr Churchill, he is the War Minister, rather than the Peace Minister, suffering partial eclipse when wars are won. It is the price he has had to pay for being bigger than the country into which he was born. The point has been sadly disregarded by the South-African British who for 40 years have relied upon his saving abilities as "the greatest Englishman south of the Equator," a reliance so complete that they have produced no man of their own nurture to sustain his cause. Indeed, there have been occasions when the more vociferous of them in the predominantly-British province of Natal have been as ready to reject him as have been Afrikaner Republicans. "It is given to few men to know what is best for them" are the words of Mr Churchill. They might have been spoken by General Smuts of South Africa during the formative years between the wars.

Unlike Australia and New Zealand, and to a greater degree than Canada, South Africa is not an all-British British Dominion. Numerically the Afrikaners out-number the British, a fact from which emerges the fundamental issue facing South-African statesmen, an issue made more complex in the presence of subject millions. "I want one language only," Lord Milnes asserted, when discussing the future of the Boer territories. "And so do I," retorted General Hertzog. This, in essence, is the problem of Smuts in his own country—the accommodation of two proud and independent peoples in one nation. To the many roles he has played in the world—statesman and philosopher, scientist and soldier—must be added the special role in South Africa of party leader and politician. It has called from him an adjustment of his state-craft to unique local conditions, and accounts for the apparent contradictions of his international contributions and his domestic tasks.

British Imperialist and Boer Patriarch

Smuts in South Africa has always been complementary to Smuts outside South Africa. In war, in power; in peace, out of power, largely because he waged war. He sat at Kruger's side, steel-eyed, facing Milner at Vereeniging. He convinced Campbell-Bannerman of the wisdom of granting independent government to the Boer territories. He was the moving spirit of Union in 1910. He was the mind behind General Botha, the first Prime Minister of South Africa. And from 1924 to 1933, he watched his old friend but political enemy, General Hertzog, establish, as Prime Minister, the mathematical equality of British and Afrikaner interests, in language, culture and status. It was not until 1933, as a result of economic crisis, that he returned to office, and only then as Deputy-Prime Minister in a coalition, after months of selfless pleading. Then, at 70, he led the nation into battle.

Described thus, the record is not all positive, despite its final triumph. The first sight of him in office is of a young man of 28 as President Kruger's State Attorney, after a brilliant academic career at Christ's, Cambridge, and, what is more significant, after his own broodings of a united South Africa had been stirred by acquaintance with Cecil Rhodes. The British imperialist and the Boer patriarch are blended in him. His vision of a new Imperium of the Anglo-Saxon world is tempered by a philosophy deeper than Rhodes ever knew, a philosophy rooted in spiritual isolation reminiscent of Kruger. In Kruger's words, he has taken "out of the past that which is good," and if he has left the followers of Kruger behind it is because the world has left isolation behind.

In few countries are statesmen far ahead of their electorates in drive and purpose. Smuts is the rare exception. Indeed his very urgency to have his nation march in the vanguard of progress has alienated still further his isolationist opponents. When, at the inauguration of the Voortrekker Monument last year, some thousands of Afrikaners rose to go as General Smuts rose to speak, it was more than a symbol of the rejection of a Field-Marshal of the British Army or of C. J. Rhodes *redivivus*. It was a protest that Smuts in or out of power wields an influence far greater than can be attributed to his political greatness. It is the influence of the *Oubaas*, the head of the family, a feeling for which is South Africa's greatest need, and which, having known him, it may one day possess.

"What are you doing for Whitsun?"

"Going to Burgh Island, old boy, down in Devon, you know. It's a grand spot for relaxing in luxury, which always does one good, and I hear it's even more comfortable since they made the extensions to the hotel last winter. Prices are moderate and inclusive, too."

"Is the food good?"

"Excellent—so is the wine-list, *and* the service. And you'd enjoy the smugglers' inn, the 'Pilchard'. There's tennis on the Island, too, and golf courses on the mainland nearby. Oh, and a first-class resident band for dancing. Yes, Burgh Island Hotel has everything, and the scenery, of course, is superb."

"Sounds just the thing — I'll phone them this evening for reservations."

THE BUSINESS WORLD

Taxation of Trading Profits

THE Tucker Committee, having taken written and oral evidence on the method of computing trade profits for the purpose of charging them to Income Tax and Profits Tax, is now drawing up its report. This promises to be a lengthy task, for the Chancellor of the Exchequer suggested in the Commons last Tuesday that the report would not be out until the end of the year. This is not surprising, for the experience of Mr Millard Tucker and his colleagues has shown what a mass of complex detail comes to light when even a relatively small part of the fiscal machine is uncovered and what controversy is engendered by any suggestions for its improvement or simplification. The evidence, though limited to the case of business profits, has clearly shown how intricate and interdependent is the British taxing apparatus, and how an improvement of one of its branches may lead to new anomalies elsewhere.

The Tucker Committee now has the task of finding some single guiding principle that will give an equitable basis for computing the taxable profits of such diverse organisations as the Mersey Tunnel, whose chief asset is a hole in the ground, and crematoria, whose assets do not rank as industrial buildings. Without doubt, the touchstone ought to be that taxable profits should conform as closely as possible to commercial profits arrived at by using the best accounting principles with a few safeguards for the Revenue to limit the taxpayer's discretion in writing off assets, in providing for vague contingencies, or in charging expenses only remotely connected with the business. Unfortunately, there is no such test to apply, because the whole concept of "profit" is undergoing a change and there is today no unanimity on what constitute the "best accounting principles."

This has become painfully obvious during the past ten years, when inflation has become the dominant, distorting factor in the ascertainment of true profits. It was principally to give guidance on this problem of the proper measurement of profits in a phase of active inflation that the Tucker Committee was set up. In the course of his 1949 budget statement, the Chancellor explicitly recognised that the acceleration of wear and tear allowances through the initial allowances (then raised from 20 per cent to 40 per cent) was merely an expedient to help industry to pay the increased replacement costs of its fixed assets. He could hardly have been expected to say more than this, for although industrialists have long been all too conscious of the erosion of their fixed (and floating) capital through the process of inflation, they have not carried the professional accountants with them. The leading professional bodies of accountants have repeatedly asserted that profit should be determined after writing off depreciation based on historical cost, and that any additional sums set aside represent an amount appropriated out of profits, as a matter of prudent financial policy. The law charges tax on "profits and gains" and it is unrealistic to expect a definition of profits to be accepted for fiscal purposes which admits as deductions amounts which are not deducted in ordinary commercial practice. This difficulty became apparent during the Tucker Committee's hearings. Spokesmen for various industries found it difficult to explain why profits described as "true and fair" in their accounts were untrue and unfair when they came to the attention of the Inspector of Taxes. The contradiction places the Committee in something of a dilemma. There is clear need for relief since the orthodox method of determining profit does not enable a business to maintain its physical assets intact except by setting aside reserves out of taxed profits to meet increased replacement costs. On the other hand, the Committee has to keep its eye on its terms of reference; its job is to define profits, and not necessarily to recommend that certain reserves set aside for specific objects should be tax free. As Mr Millard Tucker said at one stage, "You get very near the point with companies that nothing is to be taxed except profits available for dividend."

If inflation had been more severe in this country or if it had reached such fantastic extremes that the profit on a few hours' production was sufficient, in terms of currency symbols, to write off the whole original cost of the fixed assets, there would be no debate. It would be clear that the results so arrived at represented neither commercial nor taxable profits. Similarly, if prices were stable, there would be no argument, for the orthodox accounting canons assume price stability. It is because British experience in the last ten years has strained these orthodox principles but has stopped well short of inflationary disaster that the Committee's recommendations on replacement costs are awaited with interest and anxiety. It is probably expecting too much that the Committee should save the orthodox accountants from themselves by finding that profits should be ascertained only after due provision has been made for maintaining industry's physical assets intact. But perhaps it could suggest a formula—possibly by distinguishing certain elements in profits as lacking taxable capacity—which would concede the substance of the matter without slavish pursuit of theoretical solutions. Whatever method is proposed for relief, difficulties will remain—whether the proposal be revalorisation of assets on the Belgian system, or the doubling of wear and tear allowances, or the granting of "absolute" initial allowances which are not deducted from the cost of the assets for the purpose of computing wear and tear, or by the establishment of tax free reserves. No method is likely to be at once equitable and practical, but something has to be done to stem the seepage of capital which has been going on far too long in the guise of the taxation of profits.

The question of deductions not allowed for tax purposes which should be allowed brought more representations and evidence than any other matter. The spokesman of industry should not be accused of undue rapacity on this account. It has been said that the taxpayer is more ready to pay tax on an admitted gain than the Revenue is to allow the deduction of an admitted disbursement; the official attitude is negative on the whole subject of allowable expenses. It is easy to see why this is so: the law imposes taxes on profits but does not define them; instead it sets out a list of items which are not to be deducted. Prominent on the proscribed list are disbursements not laid out wholly and exclusively for the purposes of the business and sums invested as capital in the trade. In exercising their mandate, the tax inspectors have—quite properly—seized upon these rules as the most tangible guidance they possess. Differences of opinion have been pursued in the Courts and the judges' findings—often given *obiter* and usually relating strictly to a particular set of facts—have frequently provided further ammunition. Thus in *Strong v. Woodfield* a casual remark that expenses, to be deductible, "must be made for the purpose of earning profits" has led to the doctrine of remoteness under which many items have been disallowed. Similarly the finding in the *Law Shipping* case that the very extensive repairs to a ship bought secondhand, which cost as much as the ship itself, were to be excluded on the grounds that they were of the nature of capital, has been used indiscriminately to surcharge initial expenditure of all kinds, often of comparatively minor importance.

* * *

The terms of the law, the findings of the Courts and the zeal of inspectors have combined to place an emphasis on the disallowance of many items of legitimate business expenditure in the ascertainment of taxable profits. The emphasis is largely accidental and often inappropriate. At present, the fiscal machinery is so overburdened that even now a start has hardly been made in tracing profits which escaped taxation in the war years; in these circumstances, is it justifiable that the inspectors should spend so much time in detailed negotiations about legal expenses, subscriptions, minor adaptations and alterations so that they can satisfy themselves that not a penny of capital expenditure or other disallowed expenses slips through? The Revenue exacts so large a share of the profits of industry that it is wrong to increase those profits by disallowing abortive initial expenditure on pilot plants, or the costs of obtaining capital and other items which create no asset or enduring benefit. Two reforms seem now to be needed. First, it should be recognised that money expended by businesses is not expended frivolously but for the good of the businesses, the main object of which is to earn profits. Secondly, it should be accepted that there is no clear distinction between capital and revenue expenditure. Capital expenditure, with certain exceptions, is rarely of permanent value; it should more properly be regarded as deferred revenue expenditure which takes longer to pass through the profit and loss account in the form of depreciation, amortisation, depletion or obsolescence. Whether the Committee will accept these contentions (which were put before them by the Federation of British Industries) remains to be seen. At the public hearings, at any rate, they did not show themselves unsympathetic.

When it turns from the ascertainment of the quantum of taxable profits to the chronological sequence in which they should be charged to tax, the Committee will face a number of points of technical difficulty. At present, losses can be carried forward and offset against profits earned in the six years following that in which the loss is made; they can be carried back for only one year. Industry has a right to better treatment than this: the choice of twelve months as a basis for measuring profit is purely arbitrary and there are good grounds for contending that the taxable capacity of a business should be measured by the results of its whole life. This principle was recognised for Excess Profits Tax and it is to be hoped that the Committee will at least be able to recommend that industry should be able to offset losses against the profits of the previous six years and against future profits without time limit.

The Committee was specifically charged to consider the basis period to be taken in assessing tax on trading profits. It is disappointing that there was a lack of unanimity in the evidence submitted on this point. The "preceding year" basis at present in force (under which the accounting profits of a financial period ending within a given fiscal year are "deemed" to constitute the profits of the succeeding fiscal year) is a convenient but harmless fiction. What are objectionable are the transitional provisions at the commencement and cessation which cause the profits of the opening period to be taxed more than once and the profits of the penultimate year to be left out of account. These arbitrary provisions involve the taxation, over the whole life of a business, of a total of profits which only by coincidence corresponds with profits actually earned. They are a fruitful source of confusion and complexity and often lead to hardship, particularly in partnership cases, and sometimes to avoidance. Equality, certainty, convenience and economy all call for the taxation of profits on an "actual" basis, as was the practice for Excess Profits Tax and is the practice

for Profits Tax. The main obstacle to a change is the switchover from the "previous year" to the "actual" bases which involve either a double assessment in a single fiscal year or a gap in the collection of revenue. When PAYE was introduced there was a similar problem which was surmounted by the "forgiveness" of liability which, it may be remembered, did not seem to make the Revenue any poorer or the taxpayer any richer. It would clearly ease the transitional difficulties if the change could be made in a year when total profits were likely to vary only slightly from those of the preceding year.

The Tucker Committee is not primarily concerned with simplification; it was set up to define trading profits for taxation purposes, and it may be the precursor of a more elaborate investigation into the Income Tax Acts. But its limited field is most important. If the Committee can persuade the business community and the legislature that surpluses which are the by-product of inflation are not profits at all, and if it can lead the Revenue to understand that, as a sleeping partner, it enjoys a majority share in the profits of industry and should, therefore, be more interested in commercial wellbeing than in forcing up the amount of taxable profits by meticulous and exacting applications of old rules of thumb, then it will have done its task well. But there will still be a long way to go before the tax statutes satisfy the Psalmist:

> The law must be perfect, converting the soul; the statutes must be right, rejoicing the heart; the commandment must be pure, enlightening the eyes; the judgments must be true and righteous altogether.

To that, industrialists, accountants and perhaps even Chancellors will say Amen.

Business Notes

Britain and EPU

The United Kingdom is now prepared to accept full membership of the proposed European Payments Union and on terms which will involve the automatic multilateral compensation of surpluses and deficits arising out of trade between OEEC countries. The previous British demand for special membership of EPU had met with considerable opposition, both among American experts and among Britain's colleagues in OEEC. The special problem created by the world-wide use of sterling was, however, recognised and an ingenious effort has been made by the Belgian chairman of the Payments Committee, Monsieur Ansiaux, to devise for EPU a constitution which would make full British membership possible. The essence of this plan was to give an option to creditors in the monthly compensations to hold their credits in clearing units or in sterling. This is the proposal which has broken the deadlock and which has been accepted by Britain as providing the necessary reconciliation between joint membership in an exclusively European compensation machinery and a sterling club of much wider scope and operation. Under this scheme all intra-European compensations would go through the EPU machinery, but it would be up to the creditors to decide how they held their credits. The two systems would function side by side, providing the reassurance that comes from the knowledge that if one of them falters (and it is unlikely to be the sterling system) the other will always be available to take up the burden. Under this system, however, Britain will not be a lender of last resort as British spokesmen first suggested. It will be a lender of first resort, but without sweeping up the whole of the existing sterling payments arrangements in Europe.

The problem of exceptional accumulations of sterling by certain OEEC countries which had previously aroused so much concern on the British side, is likely to be solved either by direct arrangements with each country concerned, limiting their freedom to draw on the balances, or, if they wish to put them all through the EPU machinery, by securing from ECA an undertaking that any resulting gold losses will be met out of the $600 million pool of Marshall dollars with which the EPU is to be launched. One of the developments which may have induced the British Government to adopt a warmer attitude towards the EPU plan is the abandonment of all attempt to vest the new organisation with some form of super-national authority, including powers to apply sanctions to chronic debtors or creditors. The present intention is that it shall be a purely technical agency. This fact should also reconcile the International Monetary Fund to the emergence of what might otherwise have been regarded as a European rival. A great deal of detail remains to be settled between now and July 1st, when EPU is due to take over from the second version of the Intra-European Payments Scheme.

The size and distribution of the quotas have to be fixed, the exact conditions in which dollar payments to and from EPU are made have to be defined, and, in the case of Britain, much work has to be done in dovetailing its very varied monetary and payments agreements with other OEEC countries into the new EPU machinery. These, however, are not points from which major disaster to the proposal would seem to threaten. Britain has conceded the main principle of complete transferability of currently earned currencies within Europe without discrimination and without the protection which the existing structure of bilateral payments agreements provides.

* * *

The Chancellor on Gross Savings

Sir Stafford Cripps is not often guilty of deliberate selection of statistics to support a debating point. But it is impossible to let pass his specious reply to Mr. Eden's assertion, during Tuesday's second reading of the Finance Bill, that the Government's financial policy has dried up the sources of venture capital by "almost completely liquidating the private investor." The Chancellor drew attention to the official estimates of private savings, putting his first emphasis upon gross personal savings. Before commenting on his argument it is well to recall that these were precisely the figures that were most drastically revised in the latest National Income White Paper. Twelve months ago, the statisticians estimated personal savings for 1948 at £220 million gross and £6 million net (i.e., after deducting taxes on capital); now they have struck out these figures and entered instead, for the same year, £409 million and £195 million respectively. Their only explanation of these extraordinary changes was that the estimates for savings are mere residuals derived indirectly from the estimates of other items so that "in the absence of any direct estimates all conclusions about personal savings are bound to be suspect" . . . "estimates of this item must be regarded as amongst the most precarious in this paper."

The Chancellor gave the figures without any hint of their known unreliability, emphasising that in each of the past two years gross personal savings represented the same proportion—4.8 per cent—of gross disposable income as in 1938. He omitted to say that the same series showed 5.5 per cent for 1947 and 10.5 per cent for 1946. He then went on to claim that company savings have risen "enormously" in the past two or three years, so that total private savings

have "immensely increased." But the official figures show

£mn.	1938	1946	1947	1948	1949
Gross Personal Savings	217	802	440	409	427
Undistributed Profits	170	335	495	575	530
	387	1,137	935	984	957

which scarcely justifies the Chancellor's enthusiastic description. Perhaps he meant to include not only company savings but also sums provided (at Inland Revenue rates) towards meeting depreciation. If so, the company figures, adjusted also to include changes in reserves for taxation, would be

£mn.	1938	1946	1947	1948	1949
Retained profits and provisions	540	910	1,357	1,441	1,373

and the maximum increase in total gross private savings would be from £1,657 million in 1946 to £1,855 million in 1948, followed by a fall to £1,830 million last year.

Opinions will differ about the "immensity" of this change, but there is little room for dispute that the gross figures have not, in any case, any real relevance to the point Sir Stafford hoped to prove. Gross "national" savings, being bespoken to make good the withdrawals of the spenders, are not available to finance investment. Gross company savings, after meeting the full burden of maintenance (which is far heavier than the Inland Revenue allowances), are in most instances much less than is needed to finance capital development of the businesses in which they arise. There is nothing left for "venturing" outside. The only fund available for new private enterprises and for meeting the capital deficiencies of existing businesses comes from personal savings, and a large slice of the flow of these into the market is at once abstracted by those who must sell securities to meet the Chancellor's taxation of capital—by death duties and special contribution. Here are the official estimates (also for what they are worth) of the trend of the remainder.

£mn.	1938	1946	1947	1948	1949
Net personal savings	139	658	276	195	174

The series speaks for itself, but even so it does not measure the extent of the decline in venture capital. An increasing proportion of the shrinking total arises, as Sir Stafford inconsistently admitted, in the form of small personal savings through institutions such as insurance companies and building societies; but these can provide very little risk capital of the kind that used to be furnished by the large private investor.

Reticence about Oil

The Minister of Fuel and Power, answering questions in the Commons on Monday, refused to throw any light on the progress of the Anglo-American oil negotiations. The discussions were still going on, he said, and it would be "unwise" for him to make a statement. Pressed to be more communicative, he said:

> Both the American authorities and ourselves are most anxious to reach a result. I hope that may be soon, but I am afraid I cannot make a prediction.

For ministers to refuse to discuss matters which are under negotiation is common form; all the same, it may be questioned whether the Government's complete reticence on the oil talks is well advised. These talks have been going on, though intermittently and with changes in location and personalities, for the best part of a year, and the Government's attitude for the greater part of that time has been that nothing could be said because the matter was, or might soon be, under discussion. The substitution policy was announced in December, and the contents of a British memorandum to the American oil companies were made known in February. Otherwise the British silence has been virtually unbroken, while American voices have never ceased to be raised in complaint.

The result has been to create an impression of bland intransigence on the part of Britain—an impression which has never been wholly justified and which is capable of doing a great deal of harm. The questions at issue are in reality limited; but in many American minds they have been widened into a deliberate and widespread British attack on American trade. This may be nonsense, but it is widely repeated and believed. Anglo-American relations have been unnecessarily soured, and as an incidental consequence the oil trade in many parts of the world has been disturbed by suspicions, apprehensions, and threats of retaliation which could have been avoided. The fact is that the ill effects of the disagreement have been allowed to spread until they are out of all proportion to the size of the matters in dispute.

The ICFC in a Hesitant Economy

The Industrial and Commercial Finance Corporation has now ridden out some initial squalls and taken up what its chairman evidently hopes will be the ordinary, even tenor of its existence. The corporation added some £3,270,000 to its advances and investments in the year to the end of March last, compared with £1,900,000 in the six months to the end of March, 1949; it had to set aside £190,000 as provision for doubtful items, compared with the exceptional provision of £250,000 required in the previous six months; and it made a net profit of £234,000 in the twelve months compared with a net loss of nearly £27,000 in the previous six. This year's figures, Lord Piercy believes, are not very dissimilar from those that may be expected, on the average, for future years. The nature of the business transacted in the past year showed no outstanding changes. A rather larger proportion of new loans went to development areas, the number of loans for sums less than £50,000 rose from 50 to 64 per cent of the total number, and the proportion of new investment in the form of purchases of ordinary shares rose from 3.5 per cent in the previous accounting period to 17.1 per cent in the latest accounting year. These changes, and perhaps particularly the last, were however apparently mainly chance movements. Some 63 per cent of the corporation's £15.5 million of outstanding loans and investments still comprise secured or unsecured loans (the rest being in shares); this pattern has remained remarkably constant through the four and a half years of the corporation's life.

Lord Piercy suggested that net fixed investment in manufacturing industry during this period had possibly been smaller than might have been hoped. The ICFC now finds itself operating in an increasingly hesitant economy; although applications are as high as they have ever been (and noticeably higher than in mid-1948) several applicants for loans in the past year seem to have held back at the last moment before entering into definite engagements. As a result, the proportion of applications that matured into completed contracts has declined—a tendency which has been accentuated, first, by the fact that rates charged by the corporation have moved up with rates ruling on the new issue market and, second, by increased selectivity on the part of the corporation. Most of the knocks which the corporation has suffered were due to projects approved in 1946; its close vigilance since then has kept its record virtually spotless. Perhaps because of this attitude, an increasing proportion of the corporation's resources seems to be utilised in providing working rather than fixed capital. The ICFC in short, is now performing a moderately useful function in a moderately cautious way.

Cotton Talks in Japan

The Anglo-American cotton textile mission to Japan has spent a week in talks with leaders of the Japanese cotton industry; these ended on Wednesday, and the mission is returning to the United States, where the full Anglo-American

committee of the cotton textile industries will consider the outcome of the Japanese visit. The first impressions are favourable. The mission had no power to conclude any agreements, and none have been concluded. It is reported to have been met on arrival in Tokyo by a sweeping Japanese proposal for a rough division of world markets. Clearly the mission could not make any such agreement. Perhaps, however, the Japanese representatives understood this and were merely making a gesture of co-operation.

With this plan out of the way, the mission resolved itself into three sub-committees to study production, labour conditions, and export policy in conjunction with the Japanese. The first sub-committee reported a Japanese claim that the present ceiling of 4,000,000 spindles (which is expected to be reached this year) would soon need to be raised to 6,000,000 or 8,000,000. Japan had 12,000,000 spindles before the war ; the textile machinery industry is able to put some 400,000 spindles a year into action by new production and reconditioning. Japanese exports of cotton piece goods are already not far short of British exports in quantity, but to achieve this, domestic consumption has had to be very severely rationed.

In the circumstances any such severe price-cutting policy as the Japanese exporters used to pursue before the war would be merely foolish. The export policy sub-committee in the Tokyo talks reported that foreign sales at "unnecessarily" low prices not only "created an unsympathetic attitude towards Japanese participation in world trade," but also threw away foreign exchange which the Japanese economy needs to earn. This is true. Japan has to import its raw cotton ; if a Japanese cotton industry is to exist at all —and the country has no other industry of comparable importance—it must be a big exporter. Profitable exports, instead of mass exports at cut prices, would enable the Japanese economy to let domestic consumption rise. They would also enable the Japanese industry to pay its labour better.

If the Japanese can be brought to understand this, and to improve their selling methods instead of relying universally on the cut price, there is no great reason why Lancashire and Japan should not be able to live in the same world. It is clear that Lancashire can gain less from restriction than from an intelligent and helpful co-operation with the Japanese industry. Sir Raymond Streat appeared to recognise this in his comments at the end of the talks.

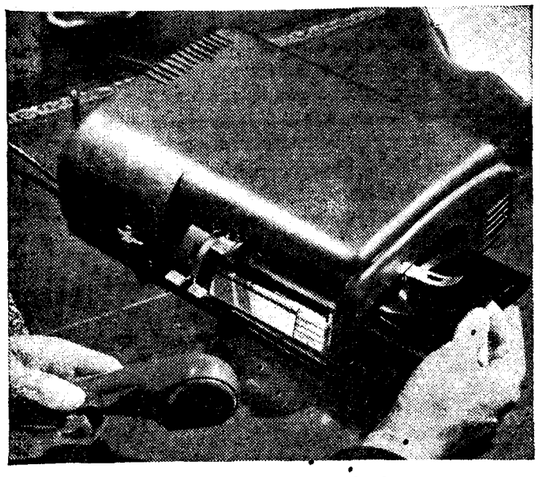
Canada's Wheat Dilemma

Mr C. D. Howe, the Canadian Minister for Trade and Commerce arrived in London this week to discuss Britain's intentions about the purchases of Canadian wheat next season. The four-year contract for Canadian wheat expires next month and the discussions turn on what arrangements are to replace the contract. Purchases of Canadian wheat by this country in each of the past two seasons have been financed by ECA funds. Twelve months ago these so-called "off-shore" purchases of Canadian wheat were suspended ; they were not resumed until ECA approval was given last September at the time of devaluation. It is now assumed that from July onwards Britain will have to pay for Canadian wheat with "free" or "earned" dollars—in other words, that Marshall dollars will not be usable for purchases from Canada, although they could be used to buy American wheat. The country that provides the dollars and has a vast surplus of wheat puts temptation in the path of Britain and fear in the heart of Canada.

Under the international wheat agreement, Canada has a guaranteed market for over 200 million bushels a year. Who is to buy this quantity if it is not Britain ? Can Britain pay for it in earned dollars ? What are the risks to the wheat growing countries that consuming countries might be constrained to escape from their obligations under the agreement by pleading difficulty in balancing their dollar accounts ? These are some of the difficult points for discussion. Even this year, the importing countries in the wheat agreement have not been ready purchasers of dollar wheat. The United States has not succeeded in selling much more than half its guaranteed total and for Canada the proportion is about the same, if sales covered by the British contract are excluded. For Canada, therefore, a new contract with Britain would mean a greater degree of security than that offered by the wheat agreement. But negotiations for such a contract would be likely to succeed only if the dollar cost was kept to the minimum.

This in turn involves the question of price. Britain has been paying Canada $2.00 a bushel this season—a figure slightly in excess of the maximum ($1.98 in Canadian currency) under the wheat agreement. This higher price was intended to offset the advantage that Britain gained in the first two years of the contract when Canadian wheat was bought at $1.55 while the world price was soaring towards $3.00 a bushel. Whether this difference is still an issue in the negotiations remains to be seen. But the limits to any possible contract between Canada and Britain have already been set, it would seem, by the international wheat agreement. It is in Canada's interest to get a contract at the maximum price under the wheat agreement while Britain's best settlement would be for a contract at the minimum price next season of $1.55 (Canadian) a bushel.

* * *



Testing the Wheat Agreement ?

There have been some recent signs that wheat is being sold under the international agreement at below the maximum price of $1.80 a bushel (US currency). Practically all the purchases have been of American grown wheat, particularly inferior qualities, and the actual price paid for these substandard wheats was lower than the margin allowed for in the agreement. It is difficult to discern any clear trend from such few facts as emerge about these dealings, and it is well to remember that American domestic wheat is still firm. Importing countries can be required to take up their full quotas only if the price is at the minimum of $1.50 a bushel. In Canada, the "free" market price for wheat has been falling recently, though it is still $2.14 a bushel (Canadian currency). At the moment this is hardly a fair test of the state of the market, since a large portion of Canada's export surplus is withheld for Britain.

The American winter wheat crop this year is forecast at 670 million bushels, compared with 902 million bushels last year—a smaller acreage planted and adverse weather account for the decline in the estimate—while the domestic price will again be supported at 90 per cent of parity. Hopes of cheaper American "free" or "non-agreement" wheat have therefore become more dim. Production in Britain and in Europe generally continues to expand and an appreciably larger harvest is expected this summer. But the main contribution to additional supplies might come from Argentina ; the wheat acreage next season is to be increased by 25 per cent, and the preparatory work is proceeding actively. If a large Argentine crop enabled importers to buy outside the agreement, the exporting members would come under pressure to reduce their prices. On present reckoning, there should be no shortage of supplies for export despite the smaller American crop. The US Commodity Credit Corporation is still holding large stocks of wheat and there is probably more than a year's supply in store in this country.

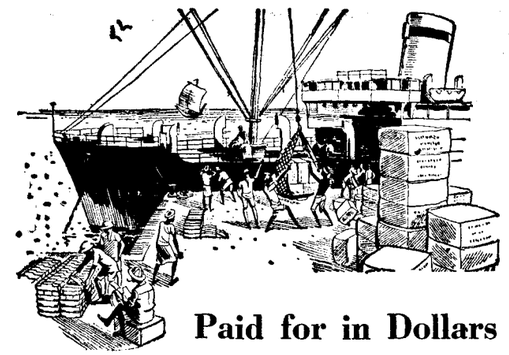
If these things come to pass, next season may prove a testing time for the international wheat agreement. Importers may attempt to cover their requirements by drawing on their own stocks or by purchasing from countries outside the agreement, rather than pay full prices to exporters inside the

The TIME-MASTER
SMALLEST-EVER DICTATING MACHINE!

Slip in a MEMOBELT, on with the switch and you're set for 15 minutes perfect recording

DICTAPHONE now brings you the latest and best in office dictating machines. It's the new TIME-MASTER, the smallest-ever machine *because it records on plastic Memobelts!* No discs, no cylinders — just expendable plastic belts that give perfect, crystal-clear recording.

Easy to use. Just think out loud — the Time-Master does the rest. You can record any notes, letters or sudden thoughts without calling for your secretary. When most convenient, she transcribes easily from the perfect recording of your words.



Memobelt — smallest, low-cost plastic medium. The plastic Memobelts slip in and out of the machine in a second. They carry on the tested Dictaphone principle of cylindrical recording ; that means constant speed, constant quality recording AND uniform back-spacing. And Memobelts are so small, they can be sent by post in a standard envelope — up to ten at a time for a 2½d. stamp.

Only the Time-Master offers all this!
1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back-spacing, rapid place finding. 4. Simple, automatic operation. 5. Mailable, filable, expendable Memobelts low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd. (Dept. O), 107 Kingsway, London, W.C.2.

British Airmanship

SOMETHING TO BE PROUD OF

The past 30 years have seen not only the development of British airlines from the first London-Paris service to a vast network covering nearly 70 countries, but also the steady maturing of something beyond machines and scientific progress. Throughout Britain and the world this has come to be known as British Airmanship and already it has earned a significance comparable with that which traditionally attaches to British Seamanship.

British Airmanship sums up the reputation for skill, enterprise and reliability which in just over a generation of air travel has become inseparably associated with British airmen — something, indeed, to be proud of.

FLY BRITISH

ISSUED BY BRITISH OVERSEAS AIRWAYS CORPORATION AND BRITISH EUROPEAN AIRWAYS

PUBLIC CONFIDENCE

Extract from the 1st Annual Report on the Royal Insurance Company's figures for **1845** :

"The accelerated progress both of the Fire and Life business may not unfairly be urged as evidence of increasing public confidence in this establishment."

Extract from the Statement by the Chairman, Col. A. C. Tod, C.B.E., T.D., D.L., accompanying the 104th Annual Report on the "Royal's" 1949 figures :

"1949 will stand in the records as a memorable year for the "Royal". Premium income, new life business and Underwriting Profits all surpass previous records, and results were favourable in all territories and in all Departments of our business.

"In a year which has seen political and financial crises abroad, and devaluation and political uncertainty at home, this result is a remarkable tribute to the stability and vigour of our business; with 70% of its premium income arising overseas the "Royal" Group of Insurance Companies is a powerful and invaluable factor in aiding Britain's recovery in these critical days."

Tea Trading Again?

The Minister of Food's statements on the reopening of the London tea market suggest that a functioning tea market in Mincing Lane next year is distinctly possible. Mr Webb has quickly discovered (what indeed has been apparent for a couple of seasons) that the system of tender contract is unsatisfactory; it does not ensure an adequate supply nor the best quality of tea. The result is a yearly squeeze which this year promises to be very painful for the Ministry and the tea drinker.

When the suppliers are so contemptuous of bulk purchase, the best decision is to restore private buying and hope for better things. Tea is, of course, a complicated case. As Mr Webb pointed out,

> We are now at work on the problem of trying to devise a new machinery by which, by reopening the London Tea Option, we can at the same time maintain price control, subsidies and rationing of this commodity.

In other words, private trade in tea might be restored, but it would be able to function only within a framework of ministerial supervision—perhaps amounting to little more than a different system of procurement, with brokers acting as the Ministry's agents.

Before the tea trade can be wholly freed, both rationing and price control would also have to be removed. The subsidy presents no great administrative difficulty, provided it is kept at a fixed level; it could be paid on shipments imported—a kind of reverse import duty—leaving the retail price to fluctuate with movements in import prices. The abolition of rationing would be far more contentious. Opinions differ about annual consumption without rationing. But, if it were of the order of 500 million lb., it could be satisfied jointly by India, Ceylon, Pakistan and East Africa. Rationing with private importation would be a hazardous marriage.

* * *

ICI and Competition

The comprehensive directors' review of the operations of Imperial Chemical Industries in 1949 issued this week provides the explanation of the decline from £29,237,348 to £25,316,047 in the group's trading profit for the year. The explanation does not, however, lie in any contraction in sales. Although there appears to have been a general falling off in sales in the first nine months of the year, a vigorous revival embracing most of the group's operating divisions occurred after devaluation; this belated recovery largely enabled the group to show a substantial increase in turnover for the whole year from £167 million to £177.5 million. Exports to dollar markets responded to the lower sterling exchange rate and the removal of uncertainty—an equally powerful influence exerted both in home and overseas trading. ICI has also been concentrating on selling export products of higher value, so that, while the volume of the group's export sales remained some 58 per cent higher than it was in 1938, the value of these exports rose last year from £37,477,000 to £38,384,000—representing approximately 45 per cent of the total exports of British chemicals in 1949. This export performance has been matched by record sales in many branches of the home market, but here, too, the effect of increasing competition has been felt.

So far ICI has been able to meet such competition. By its search for economies and higher efficiency through the installation of new equipment, more effective utilisation of old plant and incentive schemes, the group has laid its plans to counter the expected revival of German and Japanese competition. But these efforts are dogged by the upward trend in costs, particularly of raw materials and wages. In the past year, the costs of raw materials increased by no less than £11.9 million to £108 million, thus more than offsetting the rise of £10.5 million in turnover. Payments for wages and salaries at £42.8 million cost the group £2,700,000 more than in 1948. The report holds out little hope for a reduction this year in the cost of these two major items, which absorbed 86 per cent of sales proceeds in 1949. "Devaluation," it is stated, "will probably result in a substantial increase in the annual cost of raw material purchases." The wages agreements of last July and August will add £900,000 to the wages bill of the group's 100,795 employees in a full year.

The report is not as informative as it was last year on progress made with the capital expenditure programme, which entailed an outlay of £19 million in 1949, some £5,000,000 more than in the previous year. Total expenditure under this head in the past three years has been £41 million. Perhaps, at the meeting, Lord McGowan may draw together the scattered threads of information on capital projects and, indeed, amplify them. It would be interesting to have more details of the great enterprise at Wilton, which receives somewhat slight treatment in the report. Moreover, the question of financing further capital expenditure, for which £22 million of commitments were outstanding at December 31, 1949, is not referred to. The resources of ICI have been running down fast since they were replenished by the new issue in 1948. Liquid funds were reduced from £17,997,967 to £9,440,779 last year. The increase from £66.3 million to £81.6 million in the written down value of fixed assets indicates clearly where the strain is coming from.

Dunlop in 1949

In his annual statement Sir Clive Baillieu, chairman of Dunlop Rubber, filled in part of the background to the deterioration in the group's trading position in 1949 when operating profit declined from £10,768,000 to £9,481,000. As in the case of ICI, turnover has increased substantially—from £129 million to £141 million—though this rise was attributable to higher prices rather than expanding output. Production was actually lower than in 1948. The group suffered heavily from rising costs of raw materials, particularly after devaluation. Though this event had a beneficial effect on overseas sales, which accounted for 65 per cent of the group's total, it had a further withering effect on profit margins. Measured on total group turnover, these declined from 3.9 per cent to 2.7 per cent on the year. Dunlop finished the year with group stocks valued at £28,347,562, approximately £1,000,000 lower than a year earlier. Sir Clive explains that this was largely due to the uplift of sales in the final quarter of the year. In view of the rise in the price of rubber since then it is possible that stocks stand at a much higher level today. Since Dunlop is a large buyer of rubber—it is also the largest Commonwealth producer—the group will do well to absorb current high costs within its narrowed profit margins.

British Insurance Records

The leading British Insurance reports (reviewed in detail in current issues of the *Records and Statistics* Supplement) show results even better than were anticipated. New ordinary life business, which seemed at one time unlikely to reach the record total achieved in 1948, in the event exceeded it by some 4 per cent. Bonuses are still recovering from the lower wartime levels; most of the offices making valuations last year (covering periods of up to five years) declared materially

higher bonuses. Industrial new life business, however, fell back fairly sharply from the 1948 figure.

Premiums from overseas business, other than life, considerably exceed those derived from the home market, and devaluation has had important effects on insurance accounts. Business is carried on in virtually every country—one chairman mentions that premiums have been received and claims paid in more than sixty countries. Liabilities in each currency are normally fully covered by local assets, often with handsome margins, as in North America. The rates of exchange adopted govern the magnitude of the sterling amounts brought into the revenue accounts and the extent of the hidden reserves in the balance sheets. Practice last year varied widely, particularly in the conversion of United States and Canadian dollars. Some offices still retain $4.86 = £1, others $4.03 = £1, and some have employed the new parity. Others again have employed the $4.03 rate for the first three-quarters and the new parities for the last quarter. Investments have usually been retained at the old rates of exchange, thus substantially increasing hidden reserves. Because of this lack of uniformity, the results of the offices for 1949 are not properly comparable with each other. Premium income and profits have in the aggregate probably been considerably understated in terms of sterling at present rates of exchange.

Fire premiums again advanced strongly, partly because of devaluation but also through a further expansion in business. Underwriting profits were exceptionally high despite record fire wastage at home, estimated at over £22 million. Experience in the United States was better than in either 1947 or 1948. The year was also free from conflagrations and catastrophes other than from fire, but the recent fire which destroyed one-third of the Canadian town of Rimouski at an estimated loss of $20 million is a sharp reminder that a world wide business such as insurance cannot be immune from large hazards.

* * *

Accident and Marine Results

Accident results were also good. Premiums continued to rise and underwriting profits were better than in 1948, but not so markedly as in the fire department. Motor insurance, which accounts for a substantial part of the accident premium income throughout the world, yielded only slender profit. The loss of workmen's compensation business in the United Kingdom has been more than offset by the expansion of other sections of accident business.

Increasing competition is causing marine cargo rates to fall. Devaluation will increase the cost of marine claims in "hard" currencies and the prospects of profitable underwriting have lessened. The prompt settlement of the total loss of the *Magdalena* on her maiden voyage, which cost the marine market well over £2,000,000, was an impressive show of strength, as was the absorption of the share of about £3,000,000 of the insurance of the *Queen* liners, previously underwritten by the Government. Cover of over £8,000,000 is now given by the market on each vessel.

Average overseas earnings, excluding life business, of British insurance have been estimated by the British Insurance Association at £33 million per annum. There can be no doubt that this figure was considerably exceeded last year. The Labour party's proposal to nationalise industrial insurance, later changed in name if not in substance, to "mutualisation," provoked a considerable advertising campaign during last year by the industrial life offices, backed by the rest of the insurance industry. Freed from the restraint of the election period, the chairmen of the industrial cum-ordinary offices have dealt vigorously in their speeches with a proposal, which, in the words of Sir George Barstow at the Prudential meeting, "holds the possibility of so little advantage and the certainty of so much harm."

Handling in Industry

Most of the teams which have visited the United States under the arrangements made by the Anglo-American Council on Productivity have been concerned with their particular industries alone. As their reports have shown, certain factors which make for high productivity in the United States are common to many industries. The most recent of the productivity reports* is an attempt by a specialist team to isolate one of these factors, the mechanical handling of materials. The materials handling team visited a variety of industries, and its work was different in kind from the work of its predecessors. As it points out, the handling and moving of materials is a common denominator (though not, perhaps, "the" common denominator) in all factories.

The team visited some good, progressive factories, and it is not surprising that its members should have come back convinced that British industry stands to gain a great deal from a more resolute attitude towards the methods used in handling its materials. Turnover can be increased, buildings and plant more fully utilised, quality improved, fatigue and waste of effort avoided, and the costly accumulation of work in progress can be cut down. Costs, in short, can be reduced and a better return obtained for any given expenditure of money and effort. American industry has achieved immense savings by the unremitting improvement of its methods of handling.

What key will open the door to these benefits? They have not (the report emphasises) been attained in America by new devices which are unknown on the British market. The technology is open to both countries; it is the tireless search for improvement which is decisive. Clearly there are economic considerations in America which impel the manufacturer more powerfully towards improvement of this kind. Where wages are high, labour-saving devices are worth more expenditure. Where taxation falls less heavily on industrial concerns, capital for innovations can be more readily found. In the end, however, the inquiry leads back to the familiar social and psychological considerations. There is among the workers a "ready acceptance and successful operation of new productive methods." Managements are similarly on their mettle; experience is exchanged and ideas are propagated with exuberance. To explain how such attitudes of mind can be created is beyond the resources of the most eloquent productivity team, which can at best convey the impression of what it has seen; but merely to do this is useful.

* * *

Steel Foundries Seek Efficiency

Representatives of the British Steel Founders' Association and the unions met in November, studied the report of the productivity team which had visited the United States from their industry, and pledged themselves to do what they could to make their foundries more efficient and productive. At the end of April they met again to report on the progress made. In some foundries the progress appears to have been remarkably rapid. Individual firms said that their productivity was by now 50 per cent. higher than in 1945; that total man-hours per ton had been reduced by 10 per cent by devices studied in America; that a new layout should reduce man-hours per ton by 50 per cent and eventually by 75 per cent. In several instances quite small changes in technique or layout had produced remarkable results.

In this small and competitive industry (70 to 80 firms employing about 20,000 men) prices have remained steady for the past two years while output and earnings have risen. But it is admitted that the big difficulties still lie ahead. Firms which were predisposed to progressive change have been stimulated into activity. But are the remainder prepared to follow suit? The level of efficiency varies widely from one firm to another, and the factors which discourage improvement in the less efficient are by no means clear. Some, at least, of the union officials have faced the labour problems which may arise. Greater productivity has led to higher earnings, since piece rates are in use, and better conditions, but these may in the long run be obtained at the expense of some displacement of labour, and particularly of skilled craftsmen. To craft unions this is not a future which their members will find easy to accept. Mechanisation means the subdivision of processes normally done by one highly skilled man. The processes are simplified. The craftsman's skill and judgment are no longer an essential of production; or a different type of skill may be needed to work the machines. Five months' experience in working out these new techniques is too short a time to appreciate their consequences in full. The unions hope that the benefits of the new methods will speak for themselves when they have been in practice for a little longer in some undertakings, and will persuade others to follow suit.

Piped Television

The Postmaster-General's decision to allow the relaying of television programmes on lines similar to the present sound broadcast relays means a big expansion in the potential number of viewers, but the benefit will not be felt by more than a few members of the television industry. The principles are roughly the same as those of the sound relay, which picks up a service at a central receiving station and relays it by wire to individual subscribers. The distributing company, in return for a weekly payment, provides the equipment, a choice of sound programmes varying from three to six, and maintenance of the receiver. The technique of providing such a service for television is more complicated and therefore more expensive.

For the past year a test installation has been running at Northampton. It was designed by a firm jointly owned by Pye and Murphy Radio; the two firms pooled their patents for the project, and believe that the installation they have now built is sufficiently simple to overcome most of the difficulties of initial cost. Recently the City of Gloucester approved a scheme for a similar installation to cover the Gloucester region. Since the preliminary wiring has already been started the diffusion service is expected to be ready within the next six months. The plan is to provide the BBC television service, three BBC sound programmes and one other sound programme for 7s. 6d. a week. One of the reasons prompting the Gloucester authorities to facilitate the scheme is that most of the county is 70 miles from the transmitter at Sutton Coldfield, outside the range of reliable reception. One big receiving station can still receive the signals clearly and transmit them by wire to subscribers without loss of quality.

Since its first use is obviously for similar "fringe" areas where reception is poor, the existence of diffusion services may not immediately affect the sale of television receivers. Nevertheless, the high cost of receivers and the reputed high cost of replacements suggest that such services might be popular in other areas. The number of subscribers to sound relay services has risen rapidly since the war and is now a little under one million. The market for diffusion equipment is limited to those few large television manufacturers who have the technical resources necessary to develop it. Most of these firms have designed installations, though they have not promoted them until it was known that licences would be granted for the service. It is unlikely, therefore, that the Pye-Murphy lead will go long unchallenged.

contest worth comparing with the negotiations which led to the original agreement, two years ago, is taking place now. Mr Eric Johnston, whose lively conduct of the original talks made cinema-going and other conventional forms of entertainment for a time unnecessary, is once more leading the American team on behalf of the Motion Picture Association of America; a representative of the American Embassy is taking part as "observer."

The President of the Board of Trade made some conciliatory remarks about the negotiations when he addressed the annual meeting of the National Association of Kinematograph Employees during the week. Experience, Mr Wilson said, had shown what were the consequences of interference with the supply of foreign films; not only did it rob the filmgoer of the chance of seeing films he wanted to see, but

> It creates a position of insecurity and uncertainty for the industry which has serious effects on film production here.

He desired, therefore, "the freest interchange of films between our two countries."

It is precisely in securing "interchange" that the agreement has so far been a disappointment; the traffic has been one-way, and the American producers have preferred to accept relatively low dollar remittances from Britain rather than attempt to promote British films in their domestic market. They have also preferred to let sterling accumulate in the banks rather than spend it on production in Britain on any serious scale. No doubt they have reasons for this. Much of the product of the British studios has no doubt been unsuitable for world-wide showing. Several American producers have stated that the efficiency of British studios is too low to make American production in them an economic proposition. Further, employment in Hollywood itself has fallen substantially in recent years. The American Federation of Labour has shown itself apprehensive about overseas production by American companies, and has, indeed, protested at not being invited to take part in the London talks. The talks may touch on these major questions in seeking to adjust the payments arrangements, but it is hard to see how they can solve them.

Unwanted Dollars

A recent incident created a precedent in the history of the International Bank for Reconstruction and Development. A borrower, the Finance Corporation for National Reconstruction of the Netherlands, to which a $15 million loan had been granted, cancelled as unwanted $6,200,000 of this total. This loan had been granted last July for the purpose of financing imports of equipment for reconstruction and modernisation of industrial concerns in the Netherlands. The original intention was that the goods to be purchased under the loan would be procured mainly in the United States but also in the hard currency sector of western Europe.

Since the signing of the loan agreement, however, the devaluation of the Dutch guilder has made it possible for the Netherlands to finance its imports from hard-currency Europe, notably from western Germany and Belgium, without assistance from the Bank. The devaluation has also made some of the projected dollar imports unduly expensive.

As a result, part of the loan has been cancelled. This decision was made by the borrower and on the facts of the case appears reasonable and logical. It does, however, raise an important point of principle, namely that of "tying" the loans which the International Bank makes available. The Bank is bound by its articles of agreement to allow the expenditure of its loans in any currency area in the world. Adherence to that principle will be absolutely essential to the solution of the dollar problem within the context of a world of multilateral trade and convertible currencies. In fact, the Bank has closely observed the rule, and a moderate part of the US dollars which it has lent has been spent outside the United States. If it has not been larger it is because the United States has in fact been the country in which the borrowers could most cheaply and rapidly secure the equipment they needed, and for which they sought the assistance of the Bank.

West Indian Sugar

Negotiations with the West Indian sugar producers reopened in London this week—conducted on this occasion by the Colonial Office instead of the Ministry of Food, which may suggest that political considerations will receive no less weight than commercial ones. At the beginning of the year the West Indies (unlike the other Commonwealth producers) refused the Ministry of Food's offer of an eight-year contract starting in 1953. Britain was prepared to give a guarantee price for 640,000 tons of sugar a year from the West Indies at prices to be determined in relation to costs of production. In addition, this country offered to find an outlet for any additional exports of sugar from the West Indies up to a maximum of 900,000 tons but without a guaranteed price. The West Indies refused these offers and asked instead for a guaranteed price for total exports of 725,000 tons—some 85,000 tons more than the Ministry of Food was prepared to contemplate.

The disagreement is the more sharp because both sides feel that fundamental issues are involved. Until 1952 the West Indies enjoy a guaranteed price for their entire export surplus (which this year will amount to 725,000 tons). Part of that surplus has been bought by Britain and resold to Canada. In future Britain would be prepared to act only as agent for such sales to third parties, and cannot admit to any responsibilities as principal beyond the sugar needed for British consumption. Direct bargains between the West Indies and Canada would in all probable eventualities involve a severe reduction in price; even with imperial preference for West Indies sugar in the Canadian market, Cuba could sell its export surplus at lower prices.

The West Indies thus face the problem of costs. The dependence on sugar creates most serious economic and social difficulties, and its costs of sugar-growing are too high. Mechanisation and more capital would help economically, but only at the grave social cost of unemployment. The most promising policy, therefore, is great diversification of agriculture in the West Indies so as to reduce the dependence on sugar. This proposition does not find ready acceptance, for despite the relatively high cost of labour, sugar has been yielding a higher monetary return than any other crop.

For Britain to guarantee the price for sugar to be sold to a third party (such as Canada) would create a most dangerous precedent. This country cannot act as underwriter for the entire export surpluses of colonial products, and take the commercial risk on reselling the excess over its own requirements. Canada has stated that in future it will buy in the cheapest market. At the moment Cuban sugar is dearer than West Indian, but once sugar surpluses reappear—as they are expected to do after 1952—Cuba will be a serious competitor in the free market, since it enjoys the security of selling half its crop in the highly protected American market. In order to limit any price cutting by Cuba, Britain has suggested that the prewar international sugar agreement should be revived. But Cuba would be likely to join only on condition that it retained a share of the British market.

Shorter Note

Coal output last week was 4,388,300 tons, 170,600 tons more than in the preceding week. The total output for the first 19 weeks of the year is now 80,788,200 tons compared with 79,402,600 tons in the same period of 1949. During the week which ended on May 6th, there was a further net fall of 500 in the number of men on the colliery books. This brings their number down to 701,000, of whom 289,200 are face workers.

COMPANY MEETINGS

SPILLERS LIMITED

REDUCED CONSUMPTION OF FLOUR

INCREASED DEMAND FOR ANIMAL FOODS

MR ARTHUR WHITTAKER'S STATEMENT

The sixty-third annual general meeting of Spillers Limited will be held on June 9th at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, London, E.C.

The following is the statement by the chairman, Mr Arthur Whittaker, which has been circulated with the report for the year ended January 31, 1950, and the accounts for the year ended January 31, 1949:—

This year the accounts have been set out in a form which it is thought will commend itself to the stockholders as being more readily informative. The practice has been adopted of incorporating in the directors' report comments upon the more outstanding features in the accounts and matters affecting the operations of the company.

TRADING RESULTS

Profit from flour milling—our principal activity—remains virtually frozen at the prewar level under the provisions of the Control Regulations notwithstanding the marked inflation and increase in output which has taken place since 1939. There can be no doubt that the return from flour milling is not only quite inadequate under current conditions but is completely out of line with that earned by any major manufacturing industry producing at the same level. It is fortunate from the standpoint of the company that most of our other activities are not subject to the same rather harsh treatment and are able to contribute to the overall results on a basis more in keeping with normal trading ventures.

The inability to furnish stockholders with up-to-date accounts is naturally a matter of regret to the board and I recognise that you would doubtless like some forecast concerning the probable outcome of the year ended January 31, 1950. This you will readily appreciate is difficult since the major part of the results is dependent upon the adjustment of control accounts down to the end of August, 1950. But subject to the necessary reservations and in light of the information at present available to me I do not expect the profit for the year ended January 31, 1950, to be less than that for the year now before you.

VOLUME OF BUSINESS

You will have observed the reference in the directors' report to the falling off in the consumption of flour during 1949. There may be a number of factors responsible for this but I believe the principal to be the more varied diet now available and I am inclined to regard the decrease in consumption *per capita* as more or less permanent. Consumption of flour still remains at a higher level than before the war, even allowing for the increase in population which has taken place. Our own output while showing a decrease below the record level attained in 1948-9 is still substantially above that of the prewar years.

The materially increased business in animal foods is gratifying and it has given us much satisfaction to be able, as a result of the greater availability of raw materials, to meet the demand of our customers for these products. Arrangements are in hand to increase manufacturing capacity within the limits of the regulations governing these matters. I should, however, like to say that the intermittent supply of certain raw materials (over which we have no control) militates against efficient planning of large-scale production.

CAPITAL PROGRAMME

It has long been our policy to keep our capital equipment abreast of the latest developments in this country and elsewhere and to try to secure the maximum efficiency in production methods. This was circumscribed by the conditions ruling during the war and the immediate postwar years and in particular by the loss of a proportion of our manufacturing capacity which it is only now possible to begin to replace. I am sure that stockholders will welcome the news that this work is now well under way in most cases and planning is far advanced in others. It is not out of place to add that so far as construction of flour milling capacity is concerned this would not be an economic proposition judged only in the light of current conditions of high capital costs and restricted earning power. But we are satisfied that it is the right course to adopt if the company's position in the industry and its service to the public is to be maintained. We have also been influenced by the recovery of part of the cost under War Damage Claims and the belief that ultimately it ought to be possible to obtain a return from the production of flour commensurate with the capital and risk involved and the service rendered.

We are also continuing the policy of extending the company's operations throughout the field of human and animal foods in this country.

DEVELOPMENT IN RHODESIA

Considerable development has taken place and is continuing in the business of our associated company and its allied concerns in Rhodesia. The original mills and animal foods factories at Bulawayo and Salisbury have been extended and modernised and new mills and factories have been constructed or acquired in the other principal centres in Southern Rhodesia and Northern Rhodesia. Two members of the board, Sir Archibald Forbes and Mr W. D. Vernon, visited Rhodesia and the Union of South Africa last year in order to obtain first-hand knowledge of the conditions obtaining there.

All these projects at home and abroad naturally entail considerable capital outlay but it is our view that this is in the best interests of the stockholders as likely to maintain and expand the company's business and earning capacity. The conservative policy followed in the past will we believe enable us to finance the immediate programme from the existing resources of the company.

Reference has been made to the greater requirements in the way of working capital which would arise if current Government subsidies were withdrawn. The importance of this will be evident from the fact that if the price of flour were based upon the current world price of wheat the selling price would be nearly doubled. I do not know what the future trend of wheat prices may be or what policy the Government may pursue in regard to food subsidies but this is clearly a matter to be borne prominently in mind in determining the financial policy of the company.

Last year I made a reference to the possibility of bringing the issued capital of the company more into line with that employed in the business. This appears to be a desirable course and it is the board's intention to endeavour to prepare an equitable scheme for the capitalisation of some portion of the reserves and submit this to the stockholders at the first convenient opportunity when existing regulations permit.

SUPERANNUATION ARRANGEMENTS

The proposals in this respect have been set out fully in the directors' report. So far as the staff arrangements are concerned I warmly commend these to the stockholders. We are fortunate in having an outstandingly loyal and efficient staff and I am sure you would wish that their retirement benefits should be placed on a satisfactory basis and in keeping with the best industrial practice. The large special contribution to the superannuation fund may be fairly regarded as the funding of the ex gratia supplements which the company has been making for some considerable time.

The proposals relating to directors are designed to bring the existing provisions more into line with to-day's conditions and the amended benefits for the staff. It is the fact that working within the basis set up in 1934 imposes a degree of rigidity not usually present in such matters and it may be that when proposals for modernising the articles of association are submitted to the stockholders at a future date it will be considered advisable to make some further amendment in this respect. But we have thought it reasonable to ask the stockholders to consider the present proposals at this time after consulting the eminent professional firms who were responsible for the original recommendations. The issuing of proxies in this connection has only been done to conform with Stock Exchange requirements.

PERSONNEL

It was a matter of great regret to his colleagues when Sir Norman Vernon gave up office after a long association with the company in the course of which he had occupied most of the highest offices in the associations and other bodies connected with the milling industry. I am sure that our feelings will be shared by his many friends among the stockholders and throughout the industry.

I should also like to record our deep regret at the death of Mr Harold G. Brown, the former senior partner of Messrs. Linklaters & Paines, whose counsel was of such outstanding benefit to the company over many years.

This will be the last occasion on which Mr Lloyd Tanner will be present at a general meeting in his capacity of secretary of the company from which office he will retire next January after 47 years in the company's service including 34 years as secretary. Few companies can have enjoyed our good fortune in having a secretary of such unique ability, distinguished personality and devotion to duty. We have been proud of the distinctions which he has earned among the members of his own profession and in other fields. I know that I speak not only for my colleagues on the board but for the stockholders and the entire staff of the company in wishing him many happy years of leisure when he retires.

Mr Lloyd Tanner will be succeeded as secretary by Mr Cyril Harvey who has acted as assistant secretary for 18 years. Mr Harvey is well qualified for this important post and we have every confidence in his ability to maintain it at the high standard set by his predecessor.

Finally on your behalf I express to all concerned in the management and operation of the mills, factories and offices of the group our grateful appreciation of the manner in which they continue to discharge their various duties.

PHŒNIX ASSURANCE COMPANY

RECORD NET PROFIT

ALL SECTIONS CONTRIBUTE TO SATISFACTORY RESULT

MR. WILLIAM SHEARER'S STATEMENT

The annual general meeting of the Phœnix Assurance Company Limited will be held on June 7th at the head office, Phœnix House, King William Street, London, E.C.

The following is an extract from the statement by the chairman, Mr William Shearer on the directors' report and statement of accounts for the year 1949:—

We have had a good year, with premiums in the fire, accident and marine departments amounting almost to £20 million and aggregate net profits constituting a record. All sections of our business at home and overseas have made their contribution to that satisfactory result.

During October and November, 1949, accompanied by the general manager I spent three or four weeks in the United States and, under the able guidance of Mr J. M. Haines, our chief executive officer in that great country, was enabled to understand at closer range and appreciate more fully the wide ramifications of our activities there and the strength of the organisation he leads with such conspicuous success. There were many opportunities of meeting officials and agents. At our headquarters in Toronto and in Montreal—where we found Mr R. M. Sketch doing first-class work for us as Canadian manager—we had the pleasure of meeting our Canadian chairman, Mr Gordon F. Perry, and his colleagues. At every point in this busy tour there was ample evidence of the high prestige and good name which the "Phœnix" Group continues to carry in the North American Continent.

Since our last annual general meeting, Lord De L'Isle and Dudley, V.C., D.L., A.C.A., has become a director of the "Phœnix."

"MUTUALISATION"

The year 1949, the 168th of the company's existence, found us occupied with two special questions. One of these was before us a year ago and at our annual meeting I stated your board's attitude to the Socialists' proposals to nationalise industrial life assurance. Your company associated itself closely and actively with the British Insurance Association in opposition to these proposals. The fact that in December last the authors of the nationalisation scheme suddenly changed direction and found arguments for "mutualisation" did not and has not weakened our determination to resist any proposal that a form of State insurance or State-controlled insurance can be helpful to our national economy or advantageous to the policyholders or to the staffs. Benefits will not be increased, costs will certainly not be reduced, nor can overseas earnings be enhanced by any such alteration. I continue to be surprised that so little credit is given at Government level to the achievements of British insurance and to the contribution it is making to the recovery of our country.

DEVALUATION

The other special development was the decision taken by H.M. Government to devalue the pound sterling. This became effective in relation to the U.S. dollar on September 18, 1949, when the pound was reduced in U.S. dollar value from 4.03 to 2.80. Canada followed by a reduction to 3.08 and many other countries in which we operate made consequential adjustments. The complexities of handling this exchange operation and the work resulting therefrom have been considerable, and the amounts involved as affecting our published accounts are substantial. We have dealt with the devaluation as at October 1, 1949, thus in effect using throughout the year the rates of exchange current at the time. The various items of the revenue accounts therefore contain overseas figures for the first three-quarters of the year converted at the old rates and for the fourth quarter converted at the new rates. Further, in order to meet, in terms of sterling, the increased cost of our liabilities existing at October 1, 1949, we have made transfers from free reserves to the revenue accounts sufficient to cover the additional amounts required for unexpired risks, outstanding claims and so on.

The substantial exchange adjustments that became necessary have been provided through the contingencies reserve and towards the total required we have made transfers thereto from inner reserves and from profit and loss account. Although it was essential to adjust revenue transactions, the directors have maintained the same attitude with regard to investments as that adopted in the past. Thus the sterling equivalents of our investments in the U.S. and Canada still remain on our books at their previous values.

FIRE DEPARTMENT

Turning to the fire department, our premiums at £7,707,000 are the highest in the company's history, and while the devaluation of the pound has been an important contributory factor to the increase of almost £1,400,000 over 1948, there has also been a real expansion in premiums in almost every field of operation. The profit of £591,000 is the highest in our history. 7.7 per cent. has been earned after a substantial addition to the provision for unexpired risks, compared with 5.6 per cent. for the previous year.

The claims ratio of 43.7 per cent. is satisfactory. In the United Kingdom the loss to the community by fire wastage shows no signs of lessening. On the contrary, the estimated damage to propery during 1949 reached the record figure of over £22 million. Commission and Dominion and foreign taxes have increased, but the overall expense ratio at 44.6 per cent. has satisfactorily fallen by 1.1 per cent. during the year. The provision for unexpired risks calls for an additional £451,000 in 1949, and we carry forward a further £490,000, being that part of the devaluation adjustment in respect of unexpired risks which relates to 1950.

I may perhaps be permitted to mention that this year marks the centenary of the first reinsurance treaty entered into between the "Phœnix" and the "Assurances Generales" of Paris. We are now also reaching a period when a much greater number of our overseas friends can point to 75 or 100 years' unbroken representation of the company. We value the loyalty and support, often in conditions of marked difficulty, of our old and respected representatives.

ACCIDENT DEPARTMENT

In the Accident Department premiums amount to £9,669,000, an increase of £1,067,000 on the 1948 figures. Of the increase, £642,000 is due to our premiums for the last quarter of the year from dollar and other areas affected by devaluation being brought in at the new rates of exchange. The balance of £425,000 reflects the general development of our business and is well spread over the Home, United States and General Foreign Accounts. After the high loss ratios of the immediate post-war years, I am pleased to record a fall to 54.0 per cent. from the 1948 ratio of 57.8 per cent.

Commission and expenses in 1949 together represent 36.9 per cent. of premiums, a reduction of 0.5 per cent. on the 1948 ratio. Dominion and Foreign taxes are also lower at 3.1 per cent., against 3.3 per cent. There is a transfer of £377,000, or 3.9 per cent. of premiums to Profit and Loss Account. An exceptional item in this account, as in the Fire, is the United States and Canadian dollar exchange adjustment of £993,000 in respect of provision for unexpired risks as at October 1, 1949. Of this item, £210,000 has been absorbed in the account for 1949, the balance of £783,000 being carried forward to 1950.

LIFE DEPARTMENT

Life Department.—Although we did not quite attain the record of 1948, we wrote a total of over £5,800,000 in net new assurances in this department. There has been a small reduction in the commission and expenses, partly due to the fall in the amount of new business, which has had the effect of income from 15.39 per cent. to 13.85 per cent. The net rate of interest earned on the fund has increased slightly in the year and is now £3 0s. 11d. per cent.

At December 31st last, we completed the Quinquennial Valuation of the "Law Life" Fund. The surplus reported by our Actuary has been distributed in the terms of the trust deed and the proportion payable to the "Phœnix" is £19,455. After transferring this and the balance of £20,000 remaining from the "Phœnix" 1945 valuation, the Life Funds of the company now stand at the impressive total of £26,196,000, an increase during the year of £1,293,000.

MARINE DEPARTMENT

In the Marine Department the premium income in 1949 of £2,185,000 was but little less than in 1948 (£2,214,000). It seems that tendencies towards a lower premium income, owing to the reductions which have taken place in cargo rates and the effect on overseas trade of ever-increasing import controls, have been offset by rising values and, during the last quarter of the year there were also the effects of the devaluation of sterling.

The claims paid in 1949 show a welcome reduction, but, as predicted, 1947 has not proved a particularly good year for marine underwriters. The cost of our operations abroad and the taxes we have had to pay have risen but, despite these slightly adverse factors, we can transfer £100,000 this year to Profit and Loss Account and still maintain a Marine Fund of impressive strength. In Marine business it is essential to see that ample provision is made for future liabilities arising out of past transactions, and this precaution has been exercised by closing this account with a fund of £3,299,000, which is 151 per cent. of our premium income. All adjustments rendered necessary by devaluation have been included in the various items comprising the account.

PROFIT AND LOSS ACCOUNT

In the Profit and Loss Account, interest, dividends and rents earned in 1949 net of income-tax increased by £71,000 to £516,000. Part of that increase comes from the last quarter's income in the United States of America and Canada converted at the new exchange rate and the balance from the growth of our invested funds. As I have already stated, the transfers from the Revenue Accounts, aggregating £1,108,000, constitute a record for the company.

On the outgo side, there are only two items that call for special comment, shareholders being now well aware that the policy of our company is to provide fully for all taxation liability up to the close of the accounting year.

Of these two new features, the first—Dominion and Foreign Taxes, £123,000—now brings into this account the proportion of these taxes that is not specifically related to underwriting operations. With regard to the second item—viz., the transfer of £850,000 to Contingencies Reserve—I must again refer to the note on the balance-sheet dealing with rates of exchange. This note explains that the devaluation adjustments have been dealt with through Contingencies Reserve, which reserve was replenished by this transfer of £850,000 and by transfers from Inner Reserves. Bearing in mind the special "service" that the Profit and Loss Account has given this year, the resulting balance carried forward to 1950 stands very satisfactorily at £1,150,000.

BALANCE-SHEET

As a matter of interest to shareholders, I would mention that at December 31, 1949, the excess of the market value of our investments in all funds over the amounts appearing in the balance-sheet was no less than £10,365,000. Our total assets now stand at the record level of over £62 million. On the liabilities side, where changes are apparent, they are, in the main, the direct consequence of the increased business we have transacted coupled with the effect of exchange adjustments. The Contingencies Reserve now stands at just under £1,100,000.

I desire to add an assurance of the satisfaction that all the directors share with me in the presentation of such satisfactory accounts. The world-wide growth of our premium income is ample evidence of the good name and high reputation of the "Phœnix" and of the fact that we are members of a British institution of which we are all justly entitled to feel proud. British insurance is one of the real economic shock absorbers in a world that today is so much in need of stabilising influences and security, and our company, through its strength and enterprise and by its prestige built up over 168 years, is playing its full part in contributing to that high purpose.

EAGLE STAR INSURANCE

ASSETS EXCEED £55,500,000

The annual general meeting of the Eagle Star Insurance Company Limited will be held on Thursday, June 8th.

The following is an extract from the statement by the chairman and managing director, Sir Brian Mountain, Bt.

In the life department the net new sums assured exceeded £40½ million, over £2,000,000 higher than 1948 and again constituting a record.

The fire account again shows considerable expansion with profitable results both at home and overseas. A lighter loss ratio was experienced, the premium income exceeded £2,000,000 and £202,000 is transferred to profit and loss.

The accident account (including personal accident and motor) discloses an increase in premium income to nearly £4,500,000. Motor results again indicate rising claims costs and increasing accident frequency, but £253,000 (5.6 per cent. of premiums under all classes) is transferred to profit and loss.

The marine fund after transferring £100,000 to profit and loss is £1,610,945 or over 124½ per cent. of the increased premium income.

Net interest at £399,873 exceeds the dividends by over £89,300. Shareholders' profits from all departments total £564,456. After allowing for taxation which is an increasing burden, the contribution to the staff pension fund and other outgo, the profit for the year is £511,778 compared with £407,543 in 1948. The dividends require £310,532 as last year, and the profit and loss carry forward is £1,403,693.

Total assets now exceed £55½ million and reserves and undistributed profits stand at over £5,000,000.

THE LONDON ASSURANCE

PROGRESS IN ALL DEPARTMENTS

The annual general court of The London Assurance will be held in London on June 7th.

The following is an extract from the statement by the Governor, Mr R. Olaf Hambro, circulated with the report and accounts for the year 1949:—

During the past year nearly every section of our operations has yielded good results. Our activities are spread far and wide. We are able to report good profits in every department. I would emphasise the great part that insurance plays in international relations, which is admirably described in Mr Bernard Drew's book, which we have had published and sent to our friends.

In the case of the Fire department there has been good progress and satisfactory results in all territories. A large part of our Fire revenue is written in the United States and Canada, and it will be readily appreciated that the figures relating to this business as expressed in sterling have been greatly enlarged by the change in the sterling-dollar rate. We have adhered to our normal practice of converting all revenue items at current rates, which means that, broadly speaking, we have calculated eight months of the revenue at the rates of exchange prevailing immediately prior to devaluation, and the remaining four months of the revenue at the new rates.

Provision has also been made for the effects of devaluation, and the Fund now stands at £2,941,217, an increase of £1,163,000 over the figure brought in at the beginning of the year. The cost of changing from the 40 per cent. to the 50 per cent. basis, namely, £526,250, has been covered by a special transfer from the profit and loss account. Claims paid and outstanding at £2,257,783 represent the unusually low percentage of 42.9 per cent. of the premiums and commission, expenses and overseas taxation absorb a further 45.7 per cent., leaving an amount available for transfer to the profit and loss account of £338,323, or 6.4 per cent. of the premium income.

In the case of the Marine department we have been faced with similar problems, and here again we have converted only the last four months' figures at the new rates of exchange, the first eight months being taken at the old rates prevailing before devaluation. On this basis the premium income amounts to £2,626,112 and shows a small increase over the figure for the previous year.

The results achieved during the past year have been good, and the transfer to the profit and loss account of £300,000 leaves the fund substantially stronger than at the beginning of the year.

The Accident account shows a premium income for the year of £2,865,027, representing an increase of £338,000 over the previous year. After making provision for unexpired risks on the normal basis of 40 per cent. of the premiums, there is available for transfer to the consolidated profit and loss account a balance of £284,420 which is equivalent to 9.9 per cent. of the premium income.

The Life department continues to make steady progress, and the premium income at £1,399,351 represents an increase of £151,000 over the previous year. New business written during the year also constituted a new record for the corporation with total sums assured amounting to £4,750,000. The Fund amounts to £15,266,765, which shows the very satisfactory increase of £748,000 as compared with 1948.

In the balance sheet all the indemnity and other liabilities have been provided for at current rates of exchange. American investments are still shown at the sterling cost price established in our books at the time of purchase. The net profit for the year amounts to £455,821. The dividends remain unchanged.

THE MIDLAND EMPLOYERS' MUTUAL ASSURANCE

LIFE AND OTHER DEPARTMENTS DEVELOP

LOW COSTS OF MANAGEMENT

The fifty-first annual general meeting of The Midland Employers' Mutual Assurance, Limited, was held on May 16th in Birmingham, Lt.-Col. J. Beaumont Neilson, C.M.G., D.S.O., C.A. (the chairman), presiding, and in his review for 1949 reported increased business in the life, fire, accident and general accident departments.

LIFE DEPARTMENT EXPANSION

In the third year of the operations of this department, 1,002 policies were issued for sums assured totalling £1,429,313, of which amount £322,962 was reassured. Considerations for annuities granted amounted to £125,306. At the close of the year the life and annuity fund amounted to £337,490. These figures, which are in excess of those for 1948, are highly satisfactory and again reflect the support which has been received in this department, not only from our old connections, but from those engaged in the production of life assurance who are able to appreciate the services of a modern and up-to-date organisation. As in the two previous years, a substantial number of staff pensions schemes were completed, and the indications are that further expansion in this department is assured in the years to come.

INCREASE IN FIRE DEPARTMENT

The net premiums amount to £65,320, which show an increase of £18,396 over the figure for 1948. Claims, including contributions to fire brigades, amounted to £16,191, being 24.8 per cent. of premiums.

The surplus after increasing the reserve for unexpired risk by £8,278, amounts to £14,546, the corresponding figure for 1948 being £12,404. This surplus has again been left in the fund as additional reserve. It is pleasing to note that a large proportion of our original policyholders and shareholders have either placed their fire insurances with the company or have otherwise arranged for the "Midland Employers'" to be placed on their schedules.

PERSONAL ACCIDENT

The premium income of this department, which is comprised solely of personal accident and personal accident and sickness insurance, amounts to £52,809, an increase of £9,505. The company has many attractive forms of personal accident assurance the benefits of which have an increasing appeal, and the group personal accident schemes, which are available for employers of labour, provide a long-felt want in augmenting the benefits payable to injured workpeople under the National Insurance scheme.

EMPLOYERS' LIABILITY DEPARTMENT

During the year under review the number of employers' liability claims reported and the damages awarded in connection therewith, have again shown a substantial increase.

These increases are in accordance with my previous forecasts and confirm the opinion which I have expressed on many occasions, that the rates at present in operation for this particular class of insurance are inadequate, and it will undoubtedly be necessary for all insurers to make a substantial increase in their rates of premium if the business is to be conducted with a reasonable margin of profit.

I am pleased to report that during the year under review there has been a considerable increase in the number of insured in this department and employers of labour, irrespective of the size of their risk, are realising that the "Midland Employers'" policies include many attractive features unobtainable elsewhere, including a special mutual bonus scheme.

GENERAL ACCIDENT DEPARTMENT

The motor department has again proved profitable, notwithstanding the high cost of repairs and the increasing damages awarded, although these factors necessitate the utmost care in the selection and underwriting of risks in this department.

LOW MANAGEMENT EXPENSES

Increased work involved in the development of the new departments has necessitated the employment of additional staff. The overall expense ratio is 18.2 per cent. of the premium income, and it will be found that this figure compares very favourably with companies underwriting similar classes of business.

With the looked-for increase in premium income during the current year, it is hoped that this expense ratio will be further reduced.

THE BALANCE SHEET

There remains £151,869 as net surplus for the year, which, together with £97,395 brought forward from last account, makes a total of £249,264.

£50,000 has been transferred to the reserve fund, making this fund £650,000, and £100,000 has been transferred to the investment reserve.

It is proposed to pay the usual maximum dividend of 10 per cent. free of income tax. A balance on the profit and loss account of £68,860 will be carried forward to the next account.

Assets of the company amount to £7,836,651. Free reserves and surplus available again show an increased ratio over and above the usual adequate insurance funds.

The report was adopted.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

PROGRESSIVE EXPANSION

The twenty-first annual general meeting of The Agricultural Mortgage Corporation, Limited, was held in London on May 17th.

Mr E. J. Bunbury, M.C., the chairman, in the course of his speech, said: Three noteworthy features of our business during our financial year ended March 31, 1950, were the progressive increase in the amount of mortgage loans completed; within that total, a sharp rise in the amount of loans made for improvements and the adjustment of our lending rate of interest to meet the higher rate at which our new issue of debentures had to be made.

New loans of £3,521,505 were completed during the year compared with £2,746,086 in the previous year. In addition loans amounting to £1,364,995 had been sanctioned by the board and were in course of completion at the end of the year, compared with £896,962 at the end of the previous year. Applications for new loans show no signs of falling off, and therefore it is likely that we shall again be in the market towards the end of 1950 with a further issue of our debentures to the public.

A noteable and welcome feature is the sharp increase in the amount of loans specifically taken for improvements to existing and erection of new farmhouses, cottages and farm buildings, and for the modernisation of fixed equipment generally. During 1949 long-term money rates moved upwards, and it became necessary to raise our lending rate of interest for all new loans from 3½ per cent. to 4 per cent. Our borrowers, however, still retain the advantage of our fixed rate of interest on long-term loans up to sixty years.

The report was adopted.

EAST GEDULD MINES, LIMITED

MARKED INCREASE IN PROFIT

The annual general meeting of East Geduld Mines, Limited, was held at Johannesburg on May 2nd.

Mr P. M. Anderson, the chairman of the company, said:—Partly as a result of an improvement in yield, but mainly owing to the increase in the price received for gold in the latter part of the year, there was a marked increase in the working profit, enabling the dividends distributed to be increased by 2s. 6d. per share.

He stated that the ore milled at 1,754,000 tons was 23,000 tons lower than in 1948 but the yield improved by 0.17 dwt. to 5.99 dwt., so that the gold output at 525,269 ounces fine was 7,967 ounces higher than in the previous year. Working revenue at £5,161,670 was 8s. 6d. per ton milled higher but working costs at £1,802,779 increased by 1s. 1d. per ton milled. The working profit at £3,358,891 rose by 7s. 5d. per ton.

Included in the working revenue was the sum of £49,482, being the additional revenue accruing from sales of gold at enhanced prices for industrial and artistic purposes.

PROFIT EXCEEDS £3,390,000

Dividend income from the company's holdings in the Grootvlei Proprietary Mines, Limited, and the balance of sundry revenue over sundry expenditure brought the total profit for the year to £3,391,670. Provision for taxation increased by £296,120 to £1,611,353 and there remained a net profit of £1,774,356, which was £310,033 higher than in 1948. From this profit, dividends totalling £1,485,000, or 16s. 6d. per share, were declared and after providing £191,595 for capital expenditure and setting aside £83,758 for the outstanding liabilities under silicosis compensation, £37,635 for the special contribution to the Witwatersrand Gold Mines Employees Provident Fund and as explained in directors' report £186,605 for trade investments, the carry forward was reduced by £210,237 to £441,765.

Based on the new price of gold, the ore reserve, recalculated as at December 31, 1949, was 12,500,000 tons or 700,000 tons higher than in 1948. The grade at 5.4 dwt. was unaltered, but the estimated stoping width at 54 inches was 2 inches less. Development footage on main reef during the year totalled 16,699 feet of which 11,785 feet were sampled and, based on the new price of gold, 6,795 feet, or 58 per cent., proved payable with an average value of 9.1 dwt. over 27 inches. In addition, a total of 2,453 feet of development and 2,266 feet of station cutting was accomplished in the crosscut from No. 1 shaft which was being driven in the eastern portion of the mine, to the site of the proposed sub-vertical shaft, which would facilitate the extraction of ore from the main reef from the bottom of the mine.

INCREASE IN WAGES

Following devaluation, increased basic wage rates and other benefits were introduced for European employees throughout the industry and native wages were also increased.

The ore milled during the first quarter of 1950 amounted to 438,000 tons and the working profit was £1,147,781. Development work totalled 6,410 feet, of which 3,160 feet were sampled and 1,810 feet or 57 per cent. were payable with an average value of 9.7 dwt. over 25 inches.

The chairman stated that in terms of resolutions passed at an extraordinary general meeting held in April, 1950, the existing share capital of the company, amounting to £1,800,000 in £1 shares had been converted into stock transferable in amounts and multiples of 4s. 0d. Quotations for these stock units commenced on the Johannesburg exchange on the morning of the meeting and in London on the 3rd May.

The motion for the adoption of the reports and accounts was carried unanimously and the retiring directors, namely, Mr P. M. Anderson and Mr J. S. Walker, were re-elected.

GROOTVLEI PROPRIETARY MINES, LIMITED

INCREASED PRICE OF GOLD

MR P. M. ANDERSON'S ADDRESS

The annual general meeting of The Grootvlei Proprietary Mines, Limited, was held at Johannesburg on May 2nd.

Mr P. M. Anderson, the chairman of the company, said: As a result of the devaluation of the South African pound on September 19, 1949, simultaneously with the devaluation of the pound sterling, the price received for gold was increased, with effect from that date, from 172s. 6d. to 248s. 3d. per ounce fine.

This increase in the price of gold resulted in a reduction of the pay limit and permitted the profitable mining of reef material which was previously unpay. Compared with the results in 1948 there is, therefore, a reduction in the average yield of ore milled and of the grade of ore reserves, coupled with an increase in payable development footage and a substantial increase in ore reserve tonnage.

INCREASED TONNAGE MILLED

He stated that almost all of the work connected with the reduction works extensions had been completed during the year and this, combined with an improved native labour supply had made possible an increase in tonnage milled from 1,960,000 tons in 1948 to a new record of 2,061,000 tons in 1949. The yield had been reduced from 5.13 dwt. to 5.0 dwt. per ton.

Working revenue at £5,070,329 had increased by £723,887, while working costs at 22s. 8d. per ton had risen 3d. per ton, absorbing £2,333,600. Working profit had increased by £591,287, or 4s. 7d. per ton milled to £2,736,729. Included in the working revenue was the sum of £42,236 accruing from sales of gold at enhanced prices for industrial and artistic purposes.

GROWTH OF COSTS

While the company had benefited considerably from devaluation and the increased milling rate, taxation, which increased by £306,796 to £1,228,441 had absorbed over half the increase in working profit. The net profit increased by £273,939 to £1,484,240 and the amount available for disposal was £1,950,189, which had been dealt with as follows: £188,726 on capital expenditure, £45,638 for outstanding liability for silicosis compensation, £48,625 for the company's proportion of the industry's special contribution to the Witwatersrand Gold Mines Employees Provident Fund, and dividends totalling 1s. 11½d., an increase of 2½d. per unit of stock, absorbed £1,120,050, leaving £520,526 to be carried forward.

Following devaluation, increased basic wage rates and other benefits were introduced for European employees throughout the industry and native wages were also increased.

There had been a marked improvement in the native labour supply during the year, but, despite an increase in the number of Europeans employed, this supply was still insufficient.

DEVELOPMENT FOOTAGE

Development footage at 51,846 feet had increased by 4,493 feet over 1948; 35,810 feet were sampled, and, based on the new gold price, 63 per cent. was payable averaging 251 inch-dwt.

The recalculated ore reserve increased by 2,700,000 tons to 14,000,000 tons, averaging 4.7 dwt. over an estimated stoping width of 46 inches. The value was 0.5 dwt. less and the estimated stoping width one inch lower than in 1948.

Preliminary work had been started on a new haulage from No. 3 shaft, to contact with and extend the existing 45 haulage layout from No. 4 shaft. When completed this would expedite the transport of men, materials and rock in the areas north and east of No. 3 shaft and between Nos. 3 and 6 shafts.

The chairman stated that construction work on the reduction plant extensions had been completed since the year-end and full-scale production should soon be reached.

During the first quarter of 1950 the ore milled was 540,000 tons and the working profit £923,170. Development work totalled 13,386 feet and 9,935 feet were sampled, of which 5,355 feet, or 54 per cent., were payable, with an average value of 9.6 dwt. over 21 inches.

The motion for the adoption of the reports and accounts was carried unanimously and the retiring directors, Mr J. H. Crosby and Mr H. S. H. Donald, were re-elected.

LANADRON RUBBER ESTATES, LIMITED

A YEAR OF PROGRESS

The annual general meeting of Lanadron Rubber Estates, Limited, will be held on June 7, 1950, in London.

In his address which was circulated with the report and accounts the chairman, Sir Eric Macfadyen, described the year as one of progress. The output of rubber rose from 5,048,290 lb. to 5,413,820 lb., and realised £37,875 more, against which cost of production was higher by £14,470. The net profit for the year before taxation amounted to £77,374 (£54,547). Of this £38,839, or slightly more than half, was absorbed by taxation in the United Kingdom and Malaya.

After replenishing the rehabilitation reserve by £5,320 and the development and replacement reserve by £15,356 we are left with enough to pay a 5 per cent. (4 per cent.) dividend and carry forward £14,631 as compared with £12,816 brought in. A further 145 acres of new planting and 45 acres of replanting were undertaken. New and replantings of 800 acres are in hand for 1950, of which 400 acres will be planted with oil palms. 42 per cent. of the total planted area (11,065 acres) is budgrafted or clonal seed rubber. In spite of the many difficulties all field operations have been conducted methodically and economically.

Staffs and workers have carried out their daily occupations without interruption and have displayed courage and resolution in the face of hazards and uncertainties. On the situation in Malaya Sir Eric Macfadyen said: It must be made clear to the people of Malaya that H.M. Government regard the maintenance of good government in Malaya as a point of honour with them and a British commitment to be made good with all our resources.

GEDULD PROPRIETARY MINES, LIMITED

LARGER PROFIT AND DIVIDEND

The annual general meeting of Geduld Proprietary Mines, Ltd., was held at Johannesburg on May 2nd.

Mr P. M. Anderson, the chairman of the company, said:—As a result of an increase in income from investments and an enhanced price of gold due to devaluation the net profit was higher and permitted an increase of 1s. 3d. per share in dividends distributed.

The chairman stated that the increase in the price of gold had resulted in a reduction of the pay limit and permitted the profitable milling of reef material which was previously unpayable. Compared with the results in 1948 there was, therefore, a reduction in the average yield of ore milled and of the grade of ore reserves, coupled with an increase in payable development footage and in ore reserve tonnage.

HIGHER WORKING REVENUE

The ore milled was 1,257,500 tons, and the average grade 3.58 dwt., being 0.17 dwt. lower than in 1948. Working revenue was £156,245 higher at £2,203,481. Working costs totalled £1,563,919, leaving a working profit of £639,562, which was £52,047 more than in 1948. Included in the working revenue was the sum of £20,024 accruing from sales of gold at enhanced prices for industrial and artistic purposes.

Dividend income from the company's holdings in East Geduld Mines, Limited, and the Grootvlei Proprietary Mines, Limited, had increased by £87,036 to £583,054.

After providing £239,039 for taxation there remained a net profit of £968,735, which was £113,031 higher than in 1948. Dividends totalling 11s. 9d. per share were declared and absorbed £858,253, and, after providing for the other items detailed in the appropriation account, including £120,536 for capital expenditure, the carry forward was reduced from £418,738 to £343,666.

DEVELOPMENT FOOTAGE

Development footage driven on Black Reef during the year totalled 13,712 feet, and of 8,910 feet sampled, 34 per cent. was payable, averaging 4.6 dwt. over 60 inches.

The ore reserve recalculated as at December 31, 1949, increased by 500,000 tons to 4,600,000 tons. The value at 3.40 dwt. was 0.55 dwt. lower, but the estimated stoping width was unchanged at 51 inches.

Following devaluation, increased basic wage rates and other benefits were introduced for European employees throughout the industry, and it was also possible to follow the service increment granted to native employees in 1948 by a further increase in native wages.

The chairman stated that to ease its housing position the company had agreed to purchase from the Modderfontein Deep Levels, Limited (in liquidation), residential quarters at the latter company's mine, and to purchase approximately 153 acres freehold on which the buildings are situated from the New Modderfontein Gold Mining Company, Limited, at £150 per acre.

THE CURRENT YEAR

During the first quarter of 1950, the ore milled was 313,000 tons and the working profit was £202,649. Development work totalled 3,577 feet on Black Reef, 2,185 feet being sampled, of which 255 feet, or 12 per cent., was payable, averaging 5.5 dwt. over 52 inches. A feature of the quarter had been the increased number of natives offering themselves for employment.

The motion for the adoption of the reports and accounts was carried unanimously and the retiring directors, Mr M. W. Richards and Mr J. S. Walker, were re-elected.

VAN DYK CONSOLIDATED MINES, LIMITED

INCREASED WORKING REVENUE

The annual general meeting of Van Dyk Consolidated Mines, Limited, was held at Johannesburg on May 3rd.

Mr P. M. Anderson, the chairman of the company, said: The tonnage milled in 1949 at 1,199,000 tons was 4,000 tons less than in 1948 and the yield at 3.46 dwt. was 0.15 dwt. lower. The decrease in the yield was due to the grade of ore mined from reserves during the last quarter of the year being reduced to the new and lower average grade of these reserves in conformity with the lower pay limit brought about by the devaluation of the South African pound. The working revenue for the year amounted to £2,011,433 or 33s. 7d. per ton, which is 2s. 4d. per ton more than the previous year, and the working profit was £309,869, an increase of £153,393 over the previous year.

The chairman stated that included in the working revenue was the sum of £18,143 from sales of gold at enhanced prices for industrial and artistic purposes.

RESULT OF YEAR'S WORKING

The net profit for the year was £279,989. Including £43,087 brought forward from the previous year and £41,000 transferred from Renewals, Development and other provisions, £364,076 was available for disposal.

Capital expenditure, most of which was in connection with No. 5 shaft, absorbed £288,743 and after providing for the other items detailed in the appropriation account, the carry forward was reduced by £40,445 to £2,642.

Following devaluation, increased basic wage rates and other benefits were introduced for European employees throughout the industry and native wages were also increased.

DEVELOPMENT

The policy of confining development to selected areas had been continued. During the year 30,416 feet were driven on Main Reef, which was 4,455 feet less than in 1948, and of the 22,300 feet sampled, based on the new price of gold, 5,035 feet, or 23 per cent. were payable, averaging 223 inch-dwt. The ore reserve, as recalculated at the end of the year, was 2,000,000 tons, which was 400,000 tons more than in the previous year. The estimated stoping width remained unaltered at 40 inches, but the grade at 3.6 dwt. was 0.6 dwt. less.

No. 5 sub-vertical shaft was sunk 2,208 feet during the year and 1,358 feet of station work was accomplished. The shaft intersected the main reef leader on the 48th level horizon at a depth of 7,523 feet below surface on December 4, 1949. As announced in the Press at the time, the reef assayed low gold values. Sinking of the shaft was completed to its final depth of 8,139 feet below surface on April 9, 1950. The shaft was now being equipped preparatory to exploring the deep levels of the mine. It was not expected that active development from the shaft would be possible much before the end of this year.

Although the operation of sinking this two-stage shaft had been completed, as substantial expenditure remained to be incurred in equipping the shaft and in carrying out a comprehensive development programme in a large virgin area, the resumption of dividend payments was not yet in sight.

CURRENT YEAR'S FIGURES

The ore milled during the first quarter of 1950 amounted to 298,000 tons and the working profit was £85,391. Development footage on the main reef was 9,468 feet and of 5,520 feet sampled. 1,210 feet, or 22 per cent. was payable, giving an assay value of 6.1 dwt. over 17 inches.

The motion for the adoption of the reports and accounts was carried unanimously, and the retiring directors, Mr B. Elkin and Mr W. M. Frames, were re-elected.

MARIEVALE CONSOLIDATED MINES, LIMITED

RECORD TONNAGE MILLED

The annual general meeting of Marievale Consolidated Mines, Limited, was held at Johannesburg on May 3rd.

Mr P. M. Anderson, the chairman of the company, said :—The tonnage of ore milled for the year, which was a record at 675,000 tons, exceeded the 1948 figure by 63,000 tons and the working revenue rose by £326,471 to £1,899,216. This was made possible by the addition of a rod mill to the reduction plant and an improvement in the native labour supply, as well as the increase in the price of gold. On the other hand working costs per ton showed some increase, despite the increased tonnage milled, owing to the rising cost of labour and stores. The net result was an increase in the working profit of £200,556 to £659,037.

The chairman stated that included in the working revenue was the sum of £17,161, being the additional revenue from sales of gold at enhanced prices for industrial and artistic purposes.

PROFIT AND DIVIDENDS

As the company's pre-production capital expenditure had been fully amortised by the end of 1948, taxation had increased from £9 to £218,643, so that the net profit at £420,760 was a little below that of last year. Including £392,325 brought forward from the previous year, the sum of £813,085 remained to be dealt with and was allocated as follows :— £102,055 appropriated for capital expenditure, £7,624 set aside for the company's proportion of outstanding liabilities in respect of silicosis compensation, £24,025 provided for a special contribution to the Witwatersrand Gold Mines employees' provident fund and, as explained in the directors' report, £12,972 was appropriated for trade investments. Two dividends totalling 1s. 3d. per share, or an increase of 4d., absorbed £281,250, leaving £385,159 to be carried forward. Following devaluation, increased basic wage rates and other benefits were introduced for European employees throughout the industry and native wages were also increased.

Development footage totalled 28,881 feet, of which 18,378 feet were on the main reef horizon and 10,503 on the Kimberley Reef horizon. Of the Main Reef footage, 9,545 feet were on reef and sampled and, based on the new price of gold, 5,550 feet, or 58 per cent. was payable, averaging 278 inch-dwt. Of the 5,055 feet sampled on Kimberley Reef, 590 feet, or 12 per cent., was payable, averaging 163 inch-dwt.

ORE RESERVE

The ore reserve, recalculated as at December 31st last, and based on the new price of gold, increased by 300,000 tons to 2,800,000, averaging 5.8 dwt. over an estimated stoping width of 44 inches. The value was 0.2 dwt. lower and the estimated stoping width one inch more than in 1948. Included in the ore reserve tonnage for the first time was 51,000 tons from the Kimberley Reef horizon, averaging 4.2 dwt. over an estimated stoping width of 43 inches.

The surface drilling programme in the northern section of the property was completed with the drilling of one borehole which intersected Kimberley Reef at a depth of 2,035 feet, the core assaying 21.5 dwt. over a true width of 16 inches, equivalent to 344 inch-dwt. A deflection assayed 49 dwt. over a true width of 4 inches, equivalent to 196 inch-dwt.

The ore milled during the first quarter of 1950 amounted to 181,000 tons and the working profit was £238,547. During the period 5,186 feet were driven on Main Reef, of which 2,310 feet were sampled and 885 feet, or 38 per cent., were payable, averaging 12.0 dwt. over 19 inches. 3,190 feet were driven on the Kimberley Reef horizon, mainly in the No. 1 shaft area, of which 2,590 feet were on reef and sampled, disclosing 955 feet, or 37 per cent., payable, averaging 15.4 dwt. over 19 inches.

The motion for the adoption of the report and accounts was carried unanimously, and the retiring directors, Mr M. W. Richards, Mr G. V. R. Richdale and Mr T. P. Stratten were re-elected.

ASHANTI GOLDFIELDS LIMITED

OUTLOOK ENCOURAGING

MAJOR-GENERAL SIR E. L. SPEARS' REPORT

The fifty-third ordinary general meeting of Ashanti Goldfields Limited was held in London on May 12. Major-General Sir Edward L. Spears, K.B.E., C.B., M.C., the chairman, presiding said that £100,000 from the profits of the year had been put to general reserve, balances of cash in hand were increased by £76,002, bullion in transit had increased by £57,378. Profits had risen from £505,867 to £667,632. An interim dividend of 15 per cent. was paid in October, 1949. A final dividend of 25 per cent. now made 40 per cent. for the year.

Tonnage treated was the highest since 1941. The monthly rate of production had increased to 18,000 tons yielding 15,500 ounces. Production since January of this year had been at the rate of 18,500 tons for the same gold output.

Shaft Sinking and Development.—Development of new ore had more than replaced the tonnage mined from ore reserves, which showed an increase of over 100,000 tons.

They were developing the low grade deposits in the Ayeinm-Sansu area. The reopening and re-equipment of Sansu Mine had been completed in December. Their plant was practically new and since it was commissioned replacements had been comparatively light, but as time went on the need for these would increase. Their new workshops had been designed to make them as independent as possible of supplies from overseas.

Future Prospects.—Conditions in the Gold Coast Colony in recent years had not encouraged planning for the future with any great measure of confidence. At the moment the signs were more hopeful than for some time past that labour, upon which so much depended, was being attracted by the improved conditions of employment in the industry which had been made possible by the increased price of gold. The upward trend of working costs had not yet been arrested but the margin of profit should remain beter than before devaluation.

The ore reserve position at Ashanti Mine assured steady production for the next few years while additional sources of ore were developed in depth. Current development was not expected to show immediate results but the opening up of the low grade ores should allow for some expansion and it was these sources that were being counted on to provide the increased tonnage still needed to take full advantage of the capacity for treatment now available.

Following the annual general meeting an extraordinary general meeting was held and new Articles of Association were adopted.

ST. HELENA GOLD MINES, LIMITED

PROGRESS OF DEVELOPMENT

The annual general meeting of St. Helena Gold Mines, Limited, was held at Johannesburg, on May 2nd.

Mr P. M. Anderson, the chairman of the company, said : As shareholders were advised by circular dated October 21, 1949, on the recommendation of the consulting engineers, the directors decided to proceed with the installation of a reduction plant, and in order to raise the necessary funds for this and for other equipment and development work the company issued 2,500,000 of the 3,000,000 reserve shares at 37s. 6d. per share. The issued capital of the company was, therefore, now £3,750,000 in 7,500,000 shares of 10s. 0d. each, leaving 500,000 shares in reserve.

FINANCIAL POSITION

He stated that the company's total expenditure to December 31, 1949, was £3,537,672 leaving on hand a balance of cash and cash assets, less liabilities, amounting to £4,024,828, after repaying the unsecured loan of £600,000.

Development work from No. 3 incline shaft had been retarded during the year through the encountering of water-bearing fissures, but a total of 19,241 feet had been accomplished. Of this footage 7,935 feet were on basal reef and sampled and, based on the new price of gold, disclosed 3,620 feet or 46 per cent. payable, having an average assay value of 18.3 dwt. over 15 inches. These results were considered satisfactory in view of the fact that in this area results of surface drilling had not been encouraging. Only a small amount of leader reef had been exposed as work was being concentrated on the basal reef.

During the first four months of the current year total footage driven was 4,912 feet. On the basal reef 1,310 feet had been sampled and 795 feet or 61 per cent. proved payable averaging 12.5 dwt. over 24 inches.

NO. 4 SHAFT COMPLETED

Since the end of the year, No. 4 vertical shaft had been completed to its final depth of 2,938 feet. Stripping of the temporary sinking columns and cables had been completed preparatory to installing the permanent equipment. On February 10th, the first connection between the two shafts occurred when 4 level from No. 3 shaft holed through to No. 4 shaft. This connection would assist greatly ventilation of the mine and later in the year when No. 4 shaft was fully equipped the rate of development would be faster.

In March a large water-bearing fissure which had not been revealed by pilot drilling was exposed in a crosscut being driven from 2 level south to No. 4 shaft. A portion of the mine was flooded, necessitating a temporary stoppage in development work, but the position had been quickly brought under control. Some days later a methane gas explosion occurred at the end of the crosscut and the chairman announced with regret that three Europeans and twenty-six natives had been seriously injured and that subsequently eight of the natives had died. He stated that the Europeans had all been discharged from hospital and the rest of the natives were recovering. There was no reason to expect a further accident of this nature but every precaution was being taken.

REDUCTION PLANT

Work had started on the foundations for a reduction plant to treat 80,000 tons per month, and it was hoped if there were no undue delays that the plant would come into commission around the middle of 1951 at an initial milling rate of about 50,000 tons per month.

Water from the Vaal river had reached Welkom Township early in the current year and it was anticipated that it would be available to the company shortly. An extension of the railway line from Welkom had reached the company's boundary and a siding through the No. 4 shaft area was being laid.

The motion for the adoption of the reports and balance sheet was carried unanimously and the retiring directors, Sir Ernest Oppenheimer, Mr W. H. A. Lawrence and Mr J. S. Walker, were re-elected.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS

JUBILEE YEAR RECORDS

MR G. F. EARLE'S STATEMENT

The annual general meeting of Associated Portland Cement Manufacturers Limited, will be held in London on June 7th.

The following is an extract from the statement of the chairman, Mr George F. Earle, circulated with the report and accounts for 1949 :—

On July 10th the company will celebrate its 50th birthday. It is now strong and virile, and the parent of many happy and healthy children—but like most successful people, it has reached this condition the hard way. It has had its bad periods, and periods when a stern policy of saving was essential if it was to grow stronger.

It is usual to celebrate a jubilee, and we have done this in three ways. Firstly, by presenting to you accounts which with record deliveries in the home and export markets show record profits. Secondly, by starting a scheme under which any of our workpeople who are ill receive payments which should relieve their financial anxiety ; and thirdly, by giving a series of parties, to which every employee and his wife will be invited.

I am sure you are not disappointed with the year's results. In 1949 our group delivered from our works in this country over six and a quarter million tons, which means that we despatched cement at the rate of four bags a second, every hour of every day of the week, throughout the year. Our own exports were over 1,300,000 tons ; and the cement industry's contribution to the export drive was more than half as much again as that of any other building material industry.

I hope you will have cause to be pleased with the results for 1950. We have started well. Our group deliveries up to April 30th are 117,000 tons higher than in the same period in 1949, and it seems probable that our works will be kept on full output throughout the year. The prospects are good.

It is proposed to pay a final dividend of 15 per cent. on the ordinary stock, making 22½ per cent. for the year. Since the war, this country has been working under boom conditions. There is one thing we all know about booms, and that is that they do not last for ever. Prudent people, and I believe your directors are prudent, take this factor into account when making their plans, and it is for this reason, quite apart from the question of dividend limitation, that this recommendation is made to you. We also feel it is desirable to pay a dividend which can be maintained when trading conditions are not so good. We hope that the present dividend can be maintained.

PROFIT-SHARING

Last year I gave you some details of our workmen's profit-sharing scheme. A workman with 40 years' service receives this year a profit-sharing dividend on 220 notional shares—£49 10s. 0d. gross, while the average holding of our ordinary shares is 214, and the average gross dividend our stockholders receive is £48 2s. 7d. A workman with 40 years' service thus gets rather more than our average ordinary stockholder. You will, I am sure, feel satisfaction that under private enterprise, those who are doing the work in our companies are sharing in its success.

PROFITS AND DISTRIBUTION OF TURNOVER

In the A.P.C.M. and its main subsidiary the B.P.C.M., 64 per cent. of our gross profits comes from our export trade in cement and other materials, and from our home trade in goods other than cement. 17 per cent. comes from investments. Only 19 per cent. arises from our home trade in cement, though nearly 79 per cent. of our cement was sold in the home market.

The profit margin on cement is so small, that if we made no profit at all on the cement used in building a council house, the cost of that house itself would be reduced by the price of 100 Players cigarettes.

You will be interested to know how each £1 received from the sale of our own manufactures is spent :—

	£	s.	d.
Raw materials, coal, electric-power, stores, rents, rates, insurance, etc., take		8	7¼
Wages, salaries, profit-sharing schemes, and pension schemes, take		3	10
Delivery charges, take		3	3¾
		15	9
This leaves a balance of..... which is used as follows :—		4	3
Taxation (48 per cent.)	2	0¼	
Depreciation, replacements and modernisation (38 per cent.)	1	7½	
Preference div. (net) and Debenture service (7 per cent.)...	0	3½	
Ordinary div. (net), (7 per cent.)	0	3¾	
	4	3	
		20	0

During the war years, we were unable to use our depreciation and other reserves for improving our works, but since the war our group has made considerable expenditures.

GOOD OUTPUT PER MAN

We must be grateful that the output per man in our own highly-mechanised industry is good. We are producing more per man than prewar, and as much as in the U.S.A. If the price of coal and power had increased only by the same percentage as that of cement, 53 per cent., instead of 157 per cent. and 109 per cent. respectively, we should have no fear about the future of our export trade. The saving per ton of cement would amount to 7s.

Last year our group produced half a million tons more than in 1948. This year we hope to produce 900,000 tons more than in 1948, and next year, with Shoreham running, one and a quarter million tons more. We believe that we shall be able to supply our full share of the home market, and be capable of exporting very large quantities of cement.

OVERSEAS INTERESTS

Our managing director, Mr Vivian, completed a fruitful trip round the world by air last winter. He visited the U.S.A., with whose makers we keep in close touch on technical matters, and then Mexico, to see the excellent new works which the company in which we are interested have built. These works are now in production. He then went to Australia in connection with improvements and extensions now being made to the works there, and after that to New Zealand, where he practically completed the negotiations for the purchase of a majority interest in the Golden Bay Cement Company, whose works are now to be extended. He finally went to Malaya, to investigate the position.

We have decided to form a company in Malaya, in which we shall have a majority interest.

We believe that the New Zealand investment will be satisfactory.

In South Africa, the new works at Lichtenburg are now running. The initial operations have been satisfactory.

THREAT OF NATIONALISATION

During 1949, with your approval, we have tried to tell the public that the nationalisation of the cement industry would be a bad thing for our workers, for you, and for the country. I hope you are satisfied with our publicity, the cost of which, including certain advertisement expenditure, was one-sixteenth part of a penny per bag of cement.

I believe at long last the people of Britain realise that they have had more than enough of nationalisation—so let us all continue to hope and to work, so that when we meet again next year, the danger of our becoming state-owned is still smaller.

VINE PRODUCTS, LIMITED

CONTINUED PROGRESS

The twenty-fourth ordinary general meeting of Vine Products, Limited, was held on May 16th at Surbiton.

The Viscount Marchwood, K.C.V.O., the chairman, in the course of his speech, said : As a result of the increased duties levied on high strength British wines by the interim Budget of 1947 and the Budget of 1948, the price of our wines had to be increased by as much as 2s. 6d. a bottle and in consequence sales dropped considerably during the first four months of the year.

However, the Budget of April, 1949, while doing nothing for the higher strength British wines, reduced the duty on all wines of low strength, including British wines, and in view of this your directors decided to depart from previous policy and market a lower strength wine in addition to the existing marks which were re-designated V.P. Three Star Point Brand wines.

"Votrix" vermouth has had to meet the full impact of the reimportation into this country of Continental vermouths, which, as was to be expected, resulted in a temporary contraction of our sales. Since then, however, a gratifying improvement has taken place in the demand for our vermouth, due entirely to its quality.

I am pleased to tell you that our financial position is strong, and that our sales to date for this year compared with those of the corresponding period of last year are most satisfactory, and as far as one can see ahead, the outlook for the future appears bright.

The report and accounts were adopted and a final dividend of 25 per cent., together with a capital distribution of 10 per cent. on the ordinary stock, was approved.

G. AND J. WEIR, LIMITED

IMPORTANCE OF COST REDUCTION

The annual general meeting of G. and J. Weir, Limited, will be held on June 13th at Glasgow.

The following is an extract from the statement by the chairman, The Right Hon. Viscount Weir of Eastwood, circulated with the accounts for the year 1949:—

The results of the year's trading under the prevailing difficulties and restrictions are very satisfactory. The balance of the consolidated profit and loss account has risen by £160,597 to £1,168,371, and after making provision for taxation, depreciation and all other charges, the net surplus of the group is £385,089. The balance of profits retained by subsidiary companies is £106,411, and the remaining balance, viz. £278,678 (£1,343 less than last year), represents the net profit of the parent company. The dividend of 40 per cent. proposed for this year has been maintained since 1946 when the company became public.

In my statements to stockholders for the last three years I have steadily and consistently emphasised the imperative necessity in the national interest of achieving cost and price reduction, and thereby maintaining economic stability and avoiding inflation. During these three years our Government has emphasised this same vital need, but unfortunately they not only appear to take no useful steps to implement their words by helping industry to achieve this important objective, but their policies and practices definitely lead to increases in costs and prices. Even at this critical moment in our economic situation one can discern nothing but dark shadows hanging over costs and prices in spite of the efforts we, in industry, are making to achieve savings through greater technological progress and higher efficiency. As regards materials, copper, lead, zinc, and rubber have all risen in price during the last few weeks. Other impending shadows are higher rail freights, road transport charges, and a consequential increase in prices of coal, gas, and electrical energy, while, in addition to these likely new burdens, the maintenance of the Government's wage-freeze policy appears to be in considerable danger, and any departure from this policy would appear to involve serious possibilities.

EVER-GROWING BURDENS

I cannot conclude these remarks without making some reference to the overwhelming necessity for a drastic reduction in this country's production costs. To meet competition ourselves and to help our clients to do so by keeping down our prices is our constant aim. By installing the most modern plant, and by constantly endeavouring to improve our technological methods and processes our management have achieved a not inconsiderable measure of success in cost reduction, but in spite of all these efforts they find it extremely hard even to keep pace with the ever-growing burdens which are imposed upon us as a result of Governmental political policy.

The achievement of technological progress today involves new capital expenditure of an exceptionally heavy nature, but due to the incidence of dangerously high taxation we are limited in the net profit margins which can be ploughed back into the business for its maintenance and future development. Limitations of this kind strike at the very roots of all enterprise, whether national or private, and until it is realised by this Government or their successors that the national expenditure has gone far beyond all reasonable bounds, it will not be possible to create that atmosphere of encouragement essential to the achievement of the most fruitful results.

BRITISH-AMERICAN TOBACCO COMPANY, LIMITED

TRADE WELL MAINTAINED

MR T. F. WINMILL'S SPEECH

The forty-seventh annual general meeting of British-American Tobacco Company, Limited, was held on May 12th in London, Mr T. F. Winmill (the chairman) presiding.

The chairman, in the course of his speech, said: The net profits for the parent company at £5,389,000 shows an increase of some £60,000 only on the previous year.

Owing to the inflation which has occurred generally in most parts of the world, and owing to inflationary pressures which still continue widely, it is essential to build up our reserves to cover the inevitable replacement, at inflated prices, of fixed and current assets, and also to finance that expansion which is taking place in some of the territories in which your company is interested.

Were the substantial figures shown by the consolidated accounts freely transferable throughout the whole group, it might be possible, though I doubt whether it would at present be prudent, to operate with smaller reserves. Unfortunately, this is not the case. Exchange controls and other restrictions must severely handicap the free exchange of assets between members of the group, and therefore, each member must to a larger extent rely on its own reserves to take care of its probable needs. Naturally, the total of all these several funds must inevitably be larger than one central mobile fund.

EXCESSIVE TAXATION

In addition to the factors affecting reserves there is the problem of excessive taxation and more particularly double taxation, which removes much of the earnings required to maintain the real value of business assets. So far, by the exercise of financial prudence, the group has been able to maintain its real assets substantially intact and consequently has been able to finance the growth of its activities despite the exaggerated burden of taxation it has had to endure. This does not imply that the weight of this burden should be under-estimated. In the case of such an organisation as ours, the double weight becomes oppressive. Where no double taxation treaty exists, the effect of overseas income tax on the earnings of subsidiary companies, added to the overall burden of United Kingdom income tax and profits tax is such as to leave an extremely small net fraction out of the real earnings.

We therefore urge that our Government should grant full relief for overseas taxation, whether or not its action is reciprocated, so that enterprise may not be unduly discouraged and frustrated. By so doing our Government would only be following the example which has been set already by the United States of America and by Canada.

WIDESPREAD OPERATIONS

The operations of your company and its subsidiaries are widespread, and are subject to the impact of world conditions and events. This, in addition to what I have already said, will, I hope, fully explain to you why your board has felt compelled to recommend a dividend policy which may appear to err on the conservative side in view of the figures which have been presented to you.

Our American subsidiary, to which there have been many references, continues to do well in very strong competitive conditions but any increase of its business means further dollars to finance increased stocks of raw materials. As it is out of the question that further capital in dollars should be provided from this country, it may have to make suitable provision from its own earnings, which may again have an effect on the balance of earnings available for distribution as dividends.

As to the future, I see no reason to be pessimistic. China is still a cause of anxiety, and so, to a lesser degree, are other parts of the Far East. Despite difficulties in the Far East, the total trade of the group was well maintained last year and sales for the first six months of this year show a satisfactory increase over the corresponding period last year.

Owing to the increasing demand and the difficulty of providing sufficient dollars for American tobacco—a difficulty which is likely to persist for some years—there is a world shortage, outside the United States of America, of suitable leaf. This may well slow down the rate at which the industry can expand. Every effort is being made to develop alternative supplies, with some degree of success. Of the tobacco used by the group, the larger proportion is now grown in the country in which it is consumed, and we hope that continued expansion of indigenous tobacco growths will be maintained.

Finally, I would say that the company and its subsidiary companies are fully maintaining their position in the competitive field. The industry stands to benefit largely from the general rising standards of living throughout the world, and I am satisfied that we have an organisation which will assure to the company continued prosperity, subject, of course, to those political and economic vicissitudes which are beyond our control.

The report was adopted.

UNITED NEWSPAPERS, LIMITED

FURTHER PROGRESS

The thirty-first annual general meeting of United Newspapers, Limited, was held in London on May 17th.

Mr. H. C. Drayton (the chairman), who presided, said: The gross profits of the group, including dividends from associated companies, are £614,000 as against £547,000 last year. After deducting the preference dividend and the proposed ordinary dividend of 20 per cent., there is left to carry forward in this company and the company's proportion of undistributed profits of subsidiary companies, £145,000 as against £64,300 brought in.

You will appreciate that we have not been able for the past ten years to order any new machinery or take advantage of new methods in printing. Therefore, over the next five years we have to be prepared to replace a good deal of plant and machinery. As the money will be needed gradually, the directors' intention, if shareholders approve, is to make issues of 200,000 shares from time to time and they hope you will endorse the principle which they have adopted of offering a proportion of those shares to the staff at the same price as that at which they are offered to shareholders. I am convinced that this is a wise policy and gives our staff a proprietary interest in the business, which is of material benefit to all concerned, shareholders and employees alike.

When we turn to the current year's results, I can tell you that up to date our profits are running at about the same rate as last year, but we have a number of problems ahead of us. We have full confidence that we shall be able to recommend the same dividend for 1950.

The report and accounts were adopted.

DOMINION STEEL AND COAL CORPORATION

The annual meeting of Dominion Steel and Coal Corporation, Limited, was held on May 12th in Montreal.

Mr L. A. Forsyth, K.C., the president, in the course of his speech, said:—

On December 31, 1949, the closing of the corporation's accounts established that during the preceding twelve months the operational output of the corporation and its subsidiaries had reached the all-time high point of its history, while earnings for the year at $5,252,063.07, equivalent to $5.05 per share on the corporation's common class "B" stock, exceed those of the previous record year, 1948, by over $500,000.00 in the total and by nearly 60 cents per class "B" share.

The net working capital figure—$34,065,769.35 shows a gratifying increase during the year of $1,561,556.12 over that established at December 31, 1948.

Dividends on the common class "B" stock at the semi-annual rate of 25 cents per share, initiated in 1946, continued in 1947 and 1948 with two extra dividends of 25 cents each declared during 1948. From January 1, 1949, regular quarterly payments of 25 cents per share were established and with the regular dividend for the last quarter there was declared an extra dividend of $1 per share.

Overall production of ingots during 1949 reached the figure of 704,519 net tons—an increase of 8.5 per cent.

Output at the Wabana ore mines was maintained at about normal operating capacity.

The arrangements for increasing productive capacity and improving costs at Wabana, proved to be impossible to carry through due to the inability of the other interested parties to obtain the necessary authorisation from their Government for the investment of the capital funds required.

The new coke ovens at the Sydney plant are now completed and in operation. The properties of the corporation have been well maintained; but there is a real and pressing need for the replacement of outworn and obsolete equipment in certain departments of the Sydney plant and for the provision of more modern facilities in the interest of greater productive efficiency and less costly operation.

The management has had under consideration and has approved a programme of capital improvements leading to the objectives just mentioned and orders for equipment included in the initial stages of the programme have been placed. This programme contemplates a progressive schedule in which replacements and additions will be provided in order of their urgency. It has been drawn up so that, within the limits of practical possibility, expenditures can be correlated to the availability of the necessary funds for financing them without impairment of a sound working capital position.

It is, I think, fitting that I should close these remarks with a word of grateful appreciation of the continuing support extended to me by my predecessor in office, the present chairman of the board; and also that I should add a comment called forth by the resignation of Mr Arthur Cross, formerly president and latterly chairman of the board.

The retirement of Mr Cross from office in the corporation removes a notable figure in its history, to whom in no small measure the credit is due for the sound financial position which the corporation has attained and whose character and qualities have contributed greatly to the creation of the *esprit de corps* and high morale which pervade the organisation from top to bottom.

The report was adopted.

ANGLO-AMERICAN ASPHALT COMPANY LIMITED

IMPROVED POSITION

The twenty-fifth annual general meeting of the Anglo-American Asphalt Company Limited was held on May 17th in London. Mr F. Chas. Rands (chairman and managing director), in the course of his speech, said:

It is satisfactory to be able to record that last year's group profits were almost double those of the preceding year and in spite of the smaller dividend recommended I feel your business has made a definite step forward. In the absence of any new and unforeseen difficulties, I expect to see a steady improvement in your company's trading.

Profit, subject to taxation, is £20,696, compared with £11,227 the previous year. Taxation brought in from previous years amounts to £6,214, but this is more than offset by a further transfer to reserve for equalising tax allowance of £7,770. Income tax and profits tax account for £8,886, leaving £10,254. To this has to be added profit of £960 on sale of surplus plant and machinery, and carry-forward of £24,359 from last year. We have written off £150, preliminary expenses in connection with a quarry development project which was abandoned, and constructional and development expenditure of £2,762. Your directors recommend a dividend on the issued ordinary shares of 5 per cent., less tax, absorbing £3,850, and leaving £24,411 to be carried forward.

The group results for the first quarter's trading show some improvement on those for the corresponding period last year, and our sales department are now rather more optimistic.

The report was adopted.

ILLUSTRATED NEWSPAPERS, LIMITED

YEAR OF PROGRESS

The twenty-fourth annual general meeting of Illustrated Newspapers, Limited, was held in London on May 18th.

Major H. Davenport Price, M.C., the chairman, in the course of his speech, said: The profit on trading of the company and its subsidiaries amounts to £640,699, an increase over the previous year of £54,031. Your directors recommend a dividend of 3 per cent. on the ordinary shares together with a bonus of 1 per cent., the same as last year. These payments attract a 1 per cent. participating dividend on the preference shares.

The year generally has been one of progress. We have increased the number of pages of our periodicals and in some cases the size of the format, and have added more colour, while maintaining or improving on our very high standard of production. This has, of course, added considerably to our costs, but for the year under review these have been more than covered by increased sales and advertising revenue. Conditions are, of course, becoming ever more competitive, but our papers stand in a class of their own, and while we cannot expect to be quite unaffected by these conditions, we should feel them less than most. Our policy of increasing the size of our periodicals was, of course, operative for part only of the year under review, and the results of the current year will be a truer guide. I am averse to prophecies, but I may say that so far results this year are not unsatisfactory. Apart from our popular periodicals, our trade papers, *The Drapers' Record* and *Men's Wear*, have had a most successful year, and have contributed substantially to our profits.

The report was adopted.

NOTICES

CROWN AGENTS FOR THE COLONIES

ACCOUNTANT required by the Government of Tanganyika for the Accountant-General's Department. Salary according to age, qualifications and experience, in scale £550 to £1,230 a year. Outfit allowance up to £45. Free passages and liberal leave on full salary after a tour of 2 to 3 years. Candidates between 22 and 30 years of age, must be educated to Higher School Certificate standard, and have an aptitude for financial work. The appointment will be on probation for admission to the permanent and pensionable establishment. Apply at once by letter, stating age, whether married or single, and full particulars of qualifications and experience, and mentioning this paper to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M/N/25455(3C) on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

SALZBURG SEMINAR in AMERICAN STUDIES.—The Seminar at Schloss Leopoldskron, Salzburg, Austria, July 12-August 23, 1950. Scholarships offered in American Literature, History and Philosophy and Art, in Sociology, Psychology, Economics, Government and Spoken English. Candidates must have a record of achievement in one of these fields of study: preference is given to those who teach, who have entered public life or who are actively engaged in creative work, and to advanced students who are preparing for one of these careers. Apply immediately to: INTERNATIONAL STUDENT SERVICE, 59, Gloucester Place, London, W.1, from whom further information and application forms may be obtained.

THE Assistant Librarian, University College of North Wales, Bangor, wishes to obtain the following books: Gordon: The Public Corporation in Gt. Britain; Lucas: Industrial Reconstruction and the Control of Competition; Chantler: The British Gas Industry; Kalecki: Essays in the Theory of Economic Fluctuations; Von Beckerath: Modern Industrial Organisation.

BARNETT LIBRARY TRUST, OXFORD

The Trustees invite applications for the post of Librarian (man or woman).

Candidates must possess a knowledge of books in political and economic subjects.

A University degree is desirable.

Experience in Library Work will be regarded as an additional qualification.

Salary Scale £400-£500 according to age and experience. Superannuation on similar lines to F.S.S.U.

Applications (6 copies) with not more than three recent testimonials and the names of two referees should be sent not later than June 3rd to:—

The Secretary,
Barnett Library Trust,
35, Beaumont Street,
Oxford.

from whom further particulars and applications forms may be obtained.

VICTORIA UNIVERSITY COLLEGE

WELLINGTON, NEW ZEALAND

Applications are invited for the Macarthy Chair of Economics. The salary will be at the rate of £1,300 per annum (New Zealand currency). Allowances will be made for travelling expenses.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is May 31, 1950.

SPECIALIST in administration (late principal of management—consultancy organisation) will accept part-time director/consultantship with company wishing to develop along advanced lines in any field of endeavour.—Box 419.

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 13, 1950, total ordinary revenue was £62,354,000 against ordinary expenditure of £55,445,000 and issues to sinking funds £160,000. Thus, including sinking fund allocations of £1,234,000 the surplus accrued since April 1st is £50,118,000 compared with £69,251,000 for the corresponding period a year ago.

Company Notes

Imperial Chemical Industries.—Consolidated trading profit declined from £29,237,348 to £25,316,047 in 1949. Turnover increased from £167 million to £177,500,000. Stocks rose from £54,006,626 to £55,067,431 and debtors from £25,460,368 to £27,664,150 on the year. Net current assets at the year-end were £36,695,351 (£48,658,230), of which liquid funds represented £9,440,779 (£17,997,967).

Dunlop Rubber.—Group operating profit declined from £10,768,376 to £9,480,850 in 1949. Turnover increased from £129 million to £141 million. Stocks at the year-end were £28,347,562 (£29,372,865) and fixed assets £21,279,078 (£20,003,775).

C. C. Wakefield.—Group profit before taxation in 1949 was £1,301,473 (£676,788) including £120,057 (nil) profit on exchange. Net group profit increased from £318,483 to £541,404. The dividend of 37½ per cent for the year is unchanged.

British Drug Houses.—Consolidated net profit increased from £69,571 to £119,871 in 1949. Taxation deductions were £172,021 (£83,909). Profit of £13,182 (nil) arising from exchange is included in profit for the year. The proposed dividend is 6 per cent (same).

Richard Johnson & Nephew.—Group trading profit declined from £800,936 to £749,883 for the year to March 31, 1950. The total dividend for the year is 15 per cent (same).

Sheffield Twist Drill & Steel.—Profit before taxation in 1949 amounted to £398,198 (£379,121) and net profit to £84,579 (£81,371). Taxation took £318,893 (£297,750). The final dividend of 20% per cent for the year is unchanged absorbing £40,104, making 33.33 per cent for the year (same).

Trinidad Central Oilfields.—Net profit for 1949 increased from £56,849 to £86,123 including £6,858 attributable to previous year. Taxation charge was £111,117 (£38,800). Total distribution for the year is 20 per cent.

British Insulated Callender's Cables.—Consolidated trading profit increased from £6,596,476 to £6,738,264 and net profit from £2,669,734 to £2,881,797 in 1949. The dividend of 6½ per cent for the year absorbs the same amount, £338,814, as in 1948.

Selection Trust.—Revenue of the group from dividends and interest amounted to £731,742 (£654,164) in 1949-50. Profit before taxation was £864,774 (£890,355 before writing down Ultramar investment by £278,133). The dividend of 2s. net for the year is unchanged.

Clan Line Steamers.—Group profit after £1,372,000 (£1,300,000) depreciation rose from £1,430,000 to £1,451,000 in 1949. Taxation for the year was £809,000 (£786,000), leaving a net profit of £642,000 (£644,000). The dividend of 20 per cent for the year is repeated.

Rowntree.—Group trading profit increased from £1,388,616 to £1,660,739 and net profit from £640,371 to £731,703 in 1949. The dividend of 10 per cent tax free is unchanged.

Anchor Line.—Trading profit for the 15 months ending December 31, 1949, amounted to £756,304 compared with £912,706 for the previous 12 months' period. Net profit was £298,684 (£319,324). No dividend has been recommended for the year (12½ per cent). The book value of the fleet at December 31, 1949, showed a reduction from £3,285,000 to £2,941,000 on the year.

H.P. Sauce.—Consolidated profit in 1949 amounted to £768,769 (£623,266) and net profit to £323,532 (£291,602). The dividend of 1s. per stock unit is unchanged. Stocks have risen in value from £603,959 to £803,616; net current assets at the year-end were £895,210 (£815,878) excluding quoted and unquoted investments of £1,115,517 (£1,097,623).

DERBY TECHNICAL COLLEGE, NORMANTON ROAD, DERBY

Suitable students can be accepted for admission for session 1951 to:

Intermediate and Final Course for B.Com. and B.Sc.(Econ) Degree;

Intermediate Course for B.A. degree; of London University.

The session commences September 18, 1950.

Inquiries to Head of Commerce and Economics Department.

SENIOR BRANCH OF THE FOREIGN SERVICE

The Civil Service Commissioners invite applications for not more than four posts in Grade 7 (First Secretary/Consul) of the Senior Branch of the Foreign Service.

Candidates must be at least 32 and under 42 years of age on August 1, 1950. Recruitment is normally from University graduates but other candidates of good education will be considered. They will be expected to have a sound knowledge of international problems and to have experience of administrative or other work of responsible nature, which in the Commissioners' opinion renders them suitable for the Senior Branch of the Foreign Service. They must also possess a competent knowledge of at least one foreign language. Though these are not specialist posts, there is particular need of candidates with a knowledge of Chinese, Burmese, Siamese or Arabic. Candidates may be required to undergo an oral test.

Salary scale £950 x £30-£1,100 x £35-£1,250 (men); £830 x £30-£1,010 (women).

Particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 30. completed application forms must reach him by June 6, 1950.

EXECUTIVE (34, British), of a foreign associated company of internationally known motor group, in charge of sales promotion and market research, and with responsibility for distribution, advertising, and public relations seeks an interesting and profitable field of activity where hard work, initiative, and administrative ability will be encouraged and backed. Only interested in opening carrying real responsibility under clear-cut terms of reference with prospects of developing into top-rank executive. Widely travelled; good knowledge languages, experienced in negotiation with government departments and trade associations at all levels. Modern ideas and experience of selling, management, and staff. Excellent general background (including B.Sc. Econ) war service, and health. Present salary over £1,500. Write Box 429.

FEDERATION of British Industries, 21, Tothill Street, London S.W.1, requires the services of an Assistant, aged about 30. The post is pensionable; starting salary £800. Special consideration will be given to those with experience of Trade Association work. Applications to the General Secretary should be received by June 3.

Peace *versus* Peace

IF any one thing more than another could advance the cause to which the western nations are bending their efforts, it would be to stop describing it as the "cold war." The phrase is of American origin and it was invented to describe the strategy that the Soviet Union is pursuing, of war against the western powers by all means save (at present) the ultimate. But gradually and imperceptibly it has come to be used to describe the policy of resistance in the west to which Russia's "cold war" has given rise. Instead of resisting Russia's cold war, the western powers now talk of waging one of their own. Though it served a useful purpose two years ago in awakening the western peoples to a realisation of the real nature of Russian policies, its present use serves what is almost the opposite purpose of enabling the Russians to pose as the champions of peace. On the one side, the Americans and their cold war. On the other side, the Russians and Picasso's dove of peace.

It is topsy-turvy and ridiculous, but it is effective as propaganda. This absurd contrast is encouraging European faint hearts and defeatists to accuse the Americans of pursuing a warlike policy in Europe and of dragging along an unwilling Continent at their chariot wheels. When serious writers in *Le Monde* suggest that France must have the right to remain neutral in the event of a Russo-American conflict, or when Dr Adenauer supports the Schuman plan for European heavy industry as a means of creating a neutral bloc between the quarrels of the two world powers, it is clear that something has gone very much awry in European thinking. And that something is precisely the concept of a "cold war" in which America is pictured as creating a western alliance designed to carry war into the Soviet camp.

So great is the psychological disadvantage at which the western

In pursuance of a dispute with the Federation of Master Printers, the London Society of Compositors has instructed its members to refuse to work any overtime. The Society also summoned a mass meeting of its members on Thursday, the day when the work of composing *The Economist* should have been at its height. For these reasons it has been necessary to reduce the size of this issue, and even so there is reason to fear that publication may be delayed.

If we had any control whatever over these events we would offer apologies to our readers and advertisers. But we are helpless victims of the dispute. Though we shall no doubt be called upon to meet the cost of the eventual settlement, we have no means of influencing its nature or the means by which it is arrived at. Though we pay the piper, we have no control over the tune. Such are the sacred idiocies of collective bargaining.

powers have allowed themselves to be put, that it is necessary not only to drop so misleading a catchphrase but also to restate with all emphasis certain facts that ought to have been perfectly apparent all along. The first is that the present acute tensions and divisions between the Great Powers are the work of Russian, and not of American, policy. The Russians have never made any secret of the fact that, for them, there are only two kinds of state—Communist states under complete Russian control and anti-Communist states to be treated as hostile. The policy of imposing Russian control on as many states as possible and of undermining all others is not a latter-day response to American "imperialism." It dates back, in execution, to the middle of the war, and in conception to the earliest days of the Bolshevik régime. The creation of an all-Communist government for Poland began in 1943, with the breaking of diplomatic relations with General Sikorski. The rest of the process, by which even "national Communists" such as Gomulka lose their jobs for showing insufficient enthusiasm for Soviet control, has developed inexorably from that first deliberate act. Yet this first step was taken at the height of Russia's wartime alliance with the West.

Similarly, the suppression of the German Socialists in the eastern zone—which set in motion the sovietisation of eastern Germany—was undertaken in the winter of 1945-46 while four-power control of Germany was still being loyally pursued by the western powers. The process of absorption had already begun by the time of Yalta. It was in full swing during the Potsdam meetings. What followed thereafter was simply the unfolding of a policy already determined and, as the last five years have shown, in every country within the reach of Soviet arms —except Finland, which has fought, and Jugoslavia, which would fight—the "third force" elements such as National Peasants and Social Democrats, or the "neutrals" with western sympathies, such as Jan Masaryk, Benes, Petkov or Mikolajczyk, have been steadily eliminated. Their place is now taken by men who support in blind obedience the policy of creating purely Communist and Soviet-dominated governments.

So much for the Russian side. It is in striking contrast to the behaviour of the "aggressive" Americans. Their mood in 1945 and 1946 verged on isolationism. Almost total demobilisation made even the maintenance of the small American garrisons in Germany a problem. During the four-power conferences of 1946 the British representatives had on several occasions to hold their breath lest the Americans, in their overwhelming desire for agreement with the Russians, might try to achieve it at the cost of some vital British or European interest. Far from America being concerned to press its "anti-Soviet policies" on Europe, only the extreme evidence of Russian intentions and policies compelled an unwilling America to break with the tradition of generations and begin to join with the peoples of Europe to counter the Russian threat. Far from the United States "needing" Europe for its anti-Soviet plans, only Europe's desperate need finally enlisted American interest and support.

*

The second essential point that needs daily reiteration is that the policy to which the western powers are committed is not one that aims at fighting the Russian Communists and destroying their régime; it is aimed at preventing such a war from breaking out and at reaching a *modus vivendi* with the Soviets. Its object is peace, not war; agreement, not conquest. The greater is the folly of allowing it to be described in terms that invite misconception. Not only is it a policy of avoiding war, its authors believe it to be the only policy that has any chance of avoiding war. 'Communist words and Soviet actions breed the conviction that only firm resistance and obvious strength will prevent the gradual encroachments of Soviet imperialism—but the record also gives reason to believe that if the resistance and the strength are clearly there, they will not be challenged

The third point follows inexorably from this. If strength and unity provide the best chances of peace, those who preach neutrality and mediation are the real warmongers. It is vital to realise how precarious would be Europe's plight if the prophets of neutrality and third force politics were now to have their way. If the Atlantic Pact were rescinded, American troops and interests withdrawn and a "neutral" Germany and a "neutral" Europe left to face alone and unarmed their *tête-à-tête* with the Soviet Union, every evidence of recent history suggests that their fate would be no different from that of President Benes in a similar situation. The Russians would point out to, say, Dr Adenauer, who might by then be Chancellor of a united neutral Reich, that it was hardly neutral to have no Communists in his government. The next step would be to remark on the unneutral character of the Ministry of the Interior, so long as it remained "in hands hostile to the Soviet Union." Then would come the turn of the police, then of the judiciary, and without arms, without military support, without even the moral backing of a western alliance, the leaders of the threatened countries could give only one reply—the reply already given by Benes and Masaryk, the reply of capitulation. If the progressive enslavement of Europe by these means would lead to peace, there are some people in America and Britain (but by no means all) who would prefer it, horrible as it would be, to the still greater horrors of war. But if the record of history proves anything, it is that such a process of imperialist expansion would be challenged in the end. The policy of resistance offers a chance, and a good chance, of avoiding war; the policy of appeasement offers none whatever.

*

There was an account in the newspapers quite recently of the visit of a British naval vessel to Copenhagen. The local Communists greeted it with a "peace" demonstration, in which a model of a dove was very prominent. The British sailors, showing a much sounder sense of psychology than their elders and betters, responded by making a much larger model of the dove of peace and perching it on the rail of their ship.

That is the right strategy. Europe is not faced with a choice between peace—of whatever temperature—offered by the Russians and a cold war offered by the United States. The choice is between two kinds of peace—peace through strength on the western model or peace through appeasement and capitulation, which is the only peace the Soviet Union seeks or understands. To talk in this context of a "cold war" is to confuse minds and darken counsel. It is time the western peoples dropped the term entirely from their political vocabulary and used instead a phrase—peace through strength is as good as any other—that genuinely expresses their firm but pacific purposes.

Weekend at Dorking

THE political correspondents have been reporting with great confidence on the secret conclave of the chiefs of the Labour Party at Dorking last weekend. perhaps they really do know what happened there. But it does not matter very much whether they do or not, since it requires the minimum of imagination to reconstruct the general lines of the conversations. The position in which the Labour Party finds itself is known to all the world, and the course it must now take is laid down, within very narrow limits, by the compulsions of politics. The leaders of the party may wriggle—and doubtless there was a great deal of verbal wriggling last weekend—but they have no real freedom of choice. In theory, of course, they could proclaim their doctrinal purity and let their chances of continuing in office go hang. But politicians find that very difficult at any time and in any country. And if one thing has been made clear since the election, it is that the politicians of the Labour Party are not of the voluntarily retiring variety. This is not to their discredit—it is their rightful job in life to seek office—but it does tie their hands.

The results of the election in February came as a real shock to the Labour leaders. They were conscious of having provided, or at least of having maintained, for the workers conditions of employment and living better than ever before attained. Yet they were faced with the shocking fact that half of what they regarded as "the workers," even in these conditions, voted against them. Perhaps naturally, their ruminations on how to get more seats in the House of Commons at the next, and probably not very distant, general election turn into speculations on how to increase their present strength in "the working class" from the present figure of, say, 60 per cent to something more nearly 100 per cent.

Some of them argue that if the working class does not vote solidly for Labour, it must be because the party has not done enough for the workers and that the remedy, therefore, lies in pushing on even more strongly with a full-blooded socialist programme. The argument is logical; but it is also a prize example of how far wrong logic can lead an argument if it is based on a false premise. The mistake lies in the assumption that a clear majority of the British people regard themselves as belonging to anything that can be recognised as "the working class" or "the ranks of Labour." Statistics of income distribution may say they do; but their feelings and convictions tell them something different. The Gallup Poll has twice in recent years asked people what class they thought they belonged to; on one occasion the middle class total was actually larger, and on the other occasion not very much smaller, than the working class figure.

*

The fact is that Labour already polls all, and more than all, of the voters who are class-conscious "workers." If the party wants to collect more votes it must appeal to people who conceive their interests to be not merely different from those of organised labour but in many instances actually hostile. As for the argument that more socialism will bring more votes, the refutation of it is very simple indeed. The total poll in February was 84 per cent of the register; it is hardly conceivable that it can be raised significantly higher. If Labour is to poll more votes in the next election, they must be the votes of people who in February voted Conservative or Liberal (the Communist poll was negligible). Is it even faintly likely that any "worker" gave his vote to the Conservatives or the Liberals because the Labour Party was insufficiently socialist?

The effect of these facts—which, since February 23rd, are accepted as facts by all save a very few of the more wishful Labour thinkers—is to put Mr Herbert Morrison and his ideas very firmly in the saddle. This is very much better than it might have been. Mr Morrison's talent for infuriating his parliamentary opponents obscures the fact that he is really a very moderate and reasonable man. With him in charge, there is no reason to fear any wild experiments calculated to irritate moderate opinion, not even such minor examples as could be found in "Labour Believes in Britain." Further nationalisation schemes are unlikely, except perhaps for the nationalisation of water supplies, which is not very controversial and might appropriately find a place in a diluted policy. Steel is another matter, since the Act is already on the statute book, and it would take a positive Labour initiative to defer it, for which the price to be paid in party pride may be too high. But there is no doubt that Mr Morrison, who never liked the scheme at any stage, would like to find some way of keeping it out of the next election, where it can do nothing but harm to the Labour cause. It may be that M. Schuman has presented him with an excuse. Why nationalise steel when it is about to be internationalised?

Nevertheless, for all the moderation and sweet reasonableness of a Morrisonian policy, one cannot help doubting whether it can possibly do the trick. For a "moderate" policy of this kind would not consist of doing anything new, or of changing any of the things that Labour has been doing for five years past—it would consist simply of doing less of them. Such a policy might succeed to the negative extent of making fewer enemies for Labour. It might put a stop to the steady drift away to the Opposition. But is Labour likely to recruit new friends simply by slowing down to a walk?

* *

There are only two ways in which the present political deadlock can be broken. One is to wait until there is a manifest change in the general economic climate. Since employment is now full and wages high, a change could only be, in electoral terms, for the worse and would cast the incumbents of office into the wilderness. In other words, this method of breaking the deadlock holds out no hope for Labour—unless, indeed, the Conservatives are so very foolish as to manœuvre themselves into office without a majority and thus be in the dangerous position of responsibility when the change in the weather comes.

The other way of breaking the deadlock—and Labour's only chance—is for one of the major parties to offer real leadership, and to offer it to the whole nation. This latter requirement may be even more difficult for the Labour Party than the former, but it is equally necessary. They will not collect any more votes than they have already polled if their actions and their words (except on special occasions when they remember their party manners) are, or seem to be, as directly based upon spite and envy as they have been in the past five years. If they want to be a majority party, they must really make up their minds that those sections of the community who are not and never will be members of trade unions deserve to be not merely tolerated because they have votes but accepted as first-class citizens with an equal right to pursue their interests and desires.

Of what else does leadership consist? Mr Morrison is fond of using the word "progressive," by which he apparently means all those people who are, or ought to be, on his side. But the description of progressive ought to be reserved for a policy that can achieve progress, because it has faced the real continuing problems of the national life and thought out effective answers to them. Apart from nationalisation—which is a change in the outward appearance of industry rather than in its real nature, and which is now in any event to be put into cold storage—Labour's policy has been an attempt, not to reconstruct the national economy to cope with new tasks, not to change the political and economic environment in which the people live, but to keep it as nearly as possible as it was in 1945. War creates overfull employment and it shifts a large slice of the real national income into the hands of the wage-earners from those of the rentiers, the pensioners, the middle class and the rich. That was the situation that the Labour Ministers found when they took office in 1945 and their every effort has been directed to keeping these elements of the war economy—together with as many others as are inseparable from them—for as long as possible.

In this they have been highly successful, and one can share their surprise that it did not pay off better in terms of votes. But it is not a progressive policy, it is a conservative one. It is not a policy with which they can face the future, or the music. But they do not seem to have any other policy, now that nationalisation has gone. To judge by all the signs, the hearts of a clear majority of the British people are on the left; they would vote with enthusiasm for a realistic and progressive policy if they were offered one to vote for by a party that could make it effective. Dorking reveals no sign that Labour has one to offer.

Report on Europe

A NOTE of optimism has, in recent months, appeared in official comment upon the economic position of Great Britain. The effects of devaluation have made themselves felt in increased gold and dollar reserves, in the maintenance of high levels of export and in a general sense of restored confidence. Since this optimism might easily degenerate into complacency, it is as well that the Economic Commission for Europe in its "Economic Survey of Europe in 1949"—which fully maintains the excellent standard of earlier years—has pulled no punches in describing the continued precariousness of the economic position in Europe (including Great Britain) and the really serious readjustments which must be made if the ending of Marshall Aid is not to bring with it a grave crisis in European recovery.

Europe's internal record for 1949 is in many ways encouraging. Industrial production, outside Germany, was 25 per cent higher than before the war. The level of net investment showed a similar increase of 25 per cent even with the inclusion of Germany; without it the figure would be nearer 60. In spite of this large drain on national incomes for capital formation, the signs of inflation have diminished all over Europe. Intra-European trade has increased, largely as a result of increased imports by Western Germany and Great Britain, and it seems possible that devaluation has removed one of the persistent obstacles to a more freely working European payments scheme—the creditor position of Belgium. Consumption is generally back to prewar standards and in most countries (Belgium and, more doubtfully, France are exceptions) the share of the national income going to wage and salary earners has increased. Only in agriculture has there been little progress to report. Production is still 10 per cent below the prewar level.

The real causes for anxiety lie in Europe's external balance of payments. Although Europe's general deficit with the outside world fell by over $2 billion during 1949, its deficit with the United States fell hardly at all and the percentage of Europe's imports from the United States covered by its exports to the United States was actually smaller in 1949 than in 1948—21 per cent as compared with 24 per cent the year before. The plight of Western Germany was particularly acute since its total unfavourable balance actually grew from $1,018 million in 1948 to $1,115 million in 1949, and its American deficit was virtually unchanged. It is only fair to add that part of this was due to heavy German buying in the autumn of 1949, of which the counterpart in increased German exports fell into the early months of 1950, and will show up in the figures in due course.

This continuing deficit registers the European countries' failure (on balance) to earn further dollars to replace the decline—present and future—of Marshall aid. This fact does not concern Europe alone. As can be seen from the accompanying table (which is an abbreviation and partial rearrangement of one in the ECE Survey), a substantial part of the dollar trade of the whole world is being financed indirectly by way of Europe. In 1949, as in 1948, Europe's direct deficit with the United States amounted to just about $3 billion. Yet the dollars spent by Europe either out of Marshall aid or out of its own gold and dollar reserves accounted for about $5 billion. The balance of $2 billion was required by Europe to settle the dollar claims of other markets—the conversion of sterling into dollars played a particularly large part in the process. Thus the Survey provides yet more evidence that the deterioration in Europe's balance of payments has come about not so much by a vast increase in its direct dependence upon the United States—although there has been such an increase—as by the disappearance of its overseas income (a process which was taken a step further in 1948 by the British sale of the Argentine railways and the liquidation of a number of French and Dutch securities) and by the transformation of third markets from dollar earners into dollar consumers.

THE FINANCING OF EUROPE'S OVERSEAS DEFICIT

(In billions of current dollars. A plus sign indicates the receipt of funds by Europe; a minus sign indicates the payment of funds by Europe.)

It follows that not only the Marshall Plan countries, but the whole world economy will be affected by Europe's ability or failure to find alternative sources of dollars. It must be admitted that the Survey is not optimistic about the likelihood of any very marked increase. The experience of the last year tends to show that the scale of imports into the United States is determined by the level of its own domestic business activity, not by extraneous changes such as devaluation. The recent increase in imports is due far more to the revival of business confidence in America after the slight recession of early 1949 than to the lowering of prices abroad; this is especially true of primary products which are the outside world's most secure source of dollars. But it would take a very confirmed optimist to predict that the present level of American business activity will be so much greater by 1952 that the balance of Marshall aid will be covered by an increase in direct dollar earning. Scepticism is increased by the tendency of the United States to grow in self sufficiency with each new wave of economic expansion.

The causes which prevent Europe from forecasting great increases in its exports to the United States also discourage the idea that third markets will earn surplus dollars which Europe can hope to secure by way of third-party trade. About 70 per cent of the United States' imports are provided by Canada, South America, and the Philippines. At present, they all have unfavourable balances with the United States—a normal position for Canada, but in the case of Latin America representing a change from a favourable prewar balance of $200 million to an unfavourable balance of $300 million in 1949. It is not easy to expect a rapid or total reversal of this position. There remains the possibility of wiping out the $2 billion at present paid in extra-European dollar settlements by a tremendous drive to oust American exports from Latin American and sterling area markets. Devaluation has already had some effect. Between December, 1949, and February, 1950, British exports to Canada, Venezuela and Uruguay rose by 32 per cent compared with the comparable period a year earlier and American exports fell by 16 per cent. For Australia, New Zealand and Malaya the proportions were a British increase of 34 per cent and an American fall of 31 per cent; for Indonesia, Egypt, Iran, Siam, Switzerland and Belgium, a British rise of 21 per cent and an American decrease of 33 per cent. But the Survey estimates that in order to secure anything like a saving of $2 billion, European exports would have to replace 50 per cent of America's present exports to third markets, a formidable task in view of the fact that the first priority in world trade today is given to heavy capital equipment and that it is in this field that America's competitive advantage is most keenly felt. Nor is the Survey over-hopeful of Europe's ability to switch its purchases from western hemisphere supplies to alternative sources at comparable prices. One of the marked phenomena of the postwar period has been the increase in the New World's share of world production of basic raw materials. Its share of wheat production has risen from 21 per cent to 33 per cent, of maize from 66.9 per cent to 76 per cent, of rubber from 0.1 to 25.7 per cent, of tin from 21.3 to 33.6 per cent. The list could be continued at length. It shows not only America's self-sufficiency but the increasing difficulty of dispensing with the western hemisphere as a source of supply. The Survey also contains the first explicit warning of the likely impact on other European producers and importers of the return of western Germany to competitive economic activity. Before the war, 25 per cent of Germany's trade was absorbed by eastern Europe, but at present east-west trade is only a trickle. Part of the gap is filled by American financing of the

German trade deficit to the tune of a billion dollars a year. When these grants cease, Germany will become a keen competitor for dollar markets and for non-dollar sources of foodstuffs and raw materials. It is already competing with Britain for Danish agricultural supplies, but the pressure is nothing to the demands the German market will make once it has to secure the imports necessary to maintain a vast export programme designed to make good the loss of dollar grants.

One last adverse feature deserves comment. The foregoing table shows that in spite of the net of exchange control protecting Europe, the movement of capital has aggravated the problem of the European balance of payments considerably in the last three years. Part of the $800 million transferred on private account has been legitimate investment. Part, however, represents a flight of capital, driven by a loss of confidence.

From this realistic, if discouraging, report on the likely development of Europe's balance of payments, the Survey draws two conclusions. The first is that the only policy open to European governments is to prepare plans whereby their dollar exports can be tailored to match their likely dollar earnings which, in the opinion of ECE, will not much exceed $2 billion a year. Such a cut, if it were confined to dollar goods, would not ruin the European recovery ; the heavy cuts already made since 1947 have been digested, partly as a result of Europe's own increased production. But it is perfectly obvious that if these cuts had to be extended to non-dollar trade as well, the world's commerce would be ruined and many national economies would be smashed. Once again it is demonstrated that the principle of non-discrimination, however admirable it may be in theory or may have been in the practice of another age, would be calamitous if it were applied in a world dominated by a dollar shortage that has every appearance of being permanent. If there were a possibility, over and above those now visible, of a permanently higher flow of American dollars, the policy of non-discrimination would have a chance. But that is a matter which only the Americans themselves, and certainly not the Europeans, can determine.

The second conclusion is that, whatever course is adopted to bring the world's trading accounts into equilibrium—whether by discrimination against American exports or by devising a larger permanent flow of dollars —the chances of success depend entirely upon the maintenance in all countries, but most particularly in America, of a high and stable level of activity and employment. German production cannot be absorbed, nor can the present level of European sales to the United States be maintained, if there is a serious slackening in economic activity either in Europe or in the United States. The moral to be drawn from this is not simply to say that another depression in unthinkable. On the contrary, it would be wholly unrealistic to suppose that the quite unprecedented high levels of activity that have prevailed for five years of peace will go on for ever. Some downturn is quite inevitable. The urgent task is to be ready for it when it comes and, by elasticity and quick readjustments, to prevent it from developing into a serious slump.

NOTES OF THE WEEK

Atlantic Pact Cabinet ?

"When in doubt form a committee" has long been an axiom of the ministers and officials whose job it is to make a team out of the twelve governments associated with the Atlantic Pact and Western Union. The axiom is beginning to lose its usefulness ; indeed, any addition to the machinery of consultation, planning and decision must be looked at with deep misgiving—unless the latest creation shows signs of being the committee to end committees, or at least reduce them.

Perhaps that stage has now been reached. The council of twelve deputies of the foreign ministers, created last week by the Atlantic Council, will find their work intolerable if something is not done to streamline the vehicle which they are to drive. It is clear that they have the powers and opportunity to do so: their job is to co-ordinate the existing defence, defence-finance, and economic committees, to carry out policy and to formulate proposals for the Council. Moreover, they have been told to produce "tangible" results by September, when the foreign ministers meet again in the United States.

Here, in this body of deputies, is something much more like the vague shape of a super-national authority than anything yet suggested. Indeed, there is a fair prospect that its work will confirm the view (repeatedly expressed in *The Economist*) that forms of unity will be more quickly found in the course of work on defence than in any other activity of the western allies. For the deputies have not only to co-ordinate ; they have also to initiate. And if, in framing proposals for action, they can develop a common point of view, which is not subject at every stage to revision by the instructions of individual governments, then policies should emerge which cabinets will find it difficult to reject. In short, all depends on whether the deputies set out to be a body of representatives or a collection of delegates. If they become the former they will develop authority and capacity for action; if the latter they will be just another committee.

* * *

Tanks or Teeth

Three other ticklish questions were faced, if not solved, by the foreign ministers' meeting. First, they decided to bring the United States and Canada into "informal relationship" with the Organisation for European Economic Co-operation (OEEC). If that can be done effectively, then in 1952, when the Marshall Plan ends, there should be no question of the present joint economic effort of the Atlantic group coming sharply to an end, or of the OEEC itself coming under the authority of the more exclusive Council of Europe. The pattern is not precise, but the view was expressed that "the development and strengthening of the economic ties of this community may in future require formal organisational expression." This looks like a clear acceptance of the British view that it is more important to attach America and Canada, however loosely, to the continent than it is to tie up western Europe into a neat parcel.

Second, the first emphatic references have been made to "joint forces," with a concession to the British view that allowance must be made, in creating these, for "outside commitments." For some months now the opinion has been growing among the Government's service advisers that integrated European forces can be created and that Britain should make its contribution to them. And hard facts are driving advisers on finance and production to the parallel conclusion —that the Atlantic Pact bill can be met only if its members divide their tasks and combine their resources according to a thrifty and businesslike plan. Just what part the Americans would play in such arrangements is not known ; but by pressing hard for acceptance of the idea they have incurred some moral responsibility for taking part in its execution.

Third is the discomforting fact that defence plans have outrun by several laps the ideas and estimates of finance ministers. Here there has been a serious lack of foresight. To allow staff officers to work for two years on their defence plans without—in the British case—any representative of the Treasury being available to see how they made their estimates and what arguments they would use to defend them was to leave the way open for serious collision between Mr Bevin's foreign policy and Sir Stafford Cripps's budgeting —and indeed, between foreign and finance ministers in other countries. One result was that ministers seemed uncertain during the conference whether guns should now rank equally with butter, or whether butter had had too much prominence, or whether guns had had the pull over butter. Possibly guns and butter are no longer the appropriate antithesis ; perhaps it should be tanks and teeth.

Heirs of Himmler

If the public is to understand the real function of the 50,000 men of the *Bereitschaften* in the Soviet zone of Germany, it is no use calling them "alert squads." The French police has alert squads for special security duties, but they are neither armed with artillery and armoured vehicles nor put through a stiff course of political indoctrination. A more adequate description of this important body of infantry is "Communist SS," for its organisation and training can be traced directly back to Himmler's *Verfuegungstruppen* (troops for special duties).

Himmler's guards began as internal security troops and ended as the notorious and formidable armoured divisions of the *Waffen-SS*. Their Communist successors are an *élite*, chosen with care over the last three years ; about their purpose the evidence given by deserters and other sources leaves no shadow of doubt. They will be available for any job that the Communist Government of eastern Germany thinks urgent and dangerous, now or in the unpredictable future. Mr Bevin had good reason for suggesting on Wednesday that their role would be to play a decisive part in a German civil war. It is significant that their chief, Wilhelm Zaisser, is the former General Gomez of the Spanish Civil War. He is now Minister of State Security, claiming—if not exercising—jurisdiction over all Germany.

The Notes of protest sent to Moscow on Tuesday by the American, British and French governments were tardy but otherwise well-timed. Their Foreign Ministers had decided last week against the rearmament of the western Germans —not that there had ever been any formal proposal for rearmament either from the Allied or the German side—so that they are on firm ground in accusing the Russians of breaches of the Potsdam Agreement. Events will probably show, however, that the protests will have no practical effect, useful though they may be in reminding people in eastern as well as western Europe of the contrast between the protestations of the peace campaign and the practice of the Soviet Government. To dissolve the *Bereitschaften* now would be to dislocate a carefully worked-out programme for establishing the undisputed supremacy of the Grotewohl Communists by the end of this year, and so preparing for the next stage—the winning of western Germans to the "National Front."

It is worth remembering that the selection and training of these men began eighteen months before there was any discussion at all, here or in America, of the part that the Bonn Government might eventually play in the defence of western Europe ; also, that the *Bereitschaften* plus the police give Communist Germany a trained force of some 200,000 armed men.

* * *

Action from the TUC ?

The General Council of the TUC has again been in anxious conclave in an effort to determine its attitude to wage increases. The union leaders are aware of the economic necessity to maintain the policy of wage stabilisation, but they know that they themselves would be powerless to arrest a general surge of wage demands. At the same time they feel bound to resist the idea of a national wages policy, determined and enforced by the Government, which has been gaining ground in Whitehall, since such a policy would destroy the principle of collective bargaining and with it the importance of their own positions. The idea of a central arbitration as developed in Holland has been ruled out for the same reason. But, behind the façade of a verbose and meaningless statement issued on Wednesday, it appears that the General Council has conceived the idea of making itself into the arbiter on the fitness of wage claims, and that it will invite unions with claims to seek its guidance. The effect of the individual claim can then be related to general economic policy and priorities can be allotted accordingly. If the General Council has the authority and the energy to get itself accepted as a central wages council, it would be an important development. Hitherto it has been so chary of treading on the toes of the unions that it has refused to accept any suggestion for the central correlation of wage claims.

The TUC will have to work fast if it is to prevent the growth of wage demands. The awarding by the Civil Service Arbitration Tribunal of £1 a week to prison officers is significant in showing that the tribunal has not taken literally the instructions of the Treasury not to negotiate on wages in the civil service. Delegates to the annual conference of the Civil Service Clerical Association, encouraged by this apparent relaxation, have authorised their leaders to submit a new claim for increased salaries. The conference of the Union of Post Office Workers, after first endorsing the TUC's wage restraint policy, then continued with splendid illogicality to carry a resolution opposing wage restraint. The Tobacco Workers' Union are threatening to take a two year old claim for a £6 minimum out of storage. The miners and the railwaymen are searching for the best way to reopen claims for their lower paid workers, claims which, if they were to succeed, would widen the rift between the craft and the general labour unions. The TUC must speedily try to make the whole union movement realise that only by co-ordinating and sifting wage claims can a resurgence of inflation, and thereby general chaos and unpopularity for the movement, be prevented.

* * *

Shaking the Featherbed

Mr Stanley Evans has a unique capacity for stirring up hornets' nests. His renewed indictment of "featherbed farming" in Parliament last week has provoked an angry rebuttal not only from the National Farmers' Union but from the Minister of Agriculture. The NFU described some of his statements as "fantastic" and "grotesque," and Mr Williams went out of his way to second the verdict. Certainly Mr Evans may have over-embellished his case. The NFU was able to point out that the turnover of British agricultural production was £850 million and not the £591 million quoted by him, and that this represents nearer 40 per cent than 33 per cent of the nation's food supplies (although this higher figure is only obtained by giving an

undue weighting to the home content of home milk production) neither the NFU nor the Minister managed to deal with the main point in Mr Evans's argument. What is that the taxpayer and the consumer between them are paying an excessive price for the amount of food which they receive from domestic sources.

The Minister's arguments were strange in the extreme. Nobody, he suggested, grudged farm workers a 200 per cent rise over their prewar wage. Therefore, was a 350 per cent rise in farmers' incomes so unreasonable, having regard to their low prewar level and to the fact that 6s. 9d. in every £1 of profit was at present being ploughed back in order to expand output? Mr Williams spoke as if this fact showed a unique display of public spirit on the farmers' part. What it really shows is that the taxpayers' money is enabling farmers to increase their assets at a rapid rate. No doubt the nation needs more food, and perhaps [illegible] inflation of farmers' incomes [illegible] a deliberate But the high cost to [illegible] the only way to obtain it. Acceptance of public funds of getting additional output in this manner ought to be explained to the public. It is extraordinary logic to wrap up donations on the part of the taxpayer as if they were sacrifices on the part of the farmer.

In any case, arguments about whether farmers' profits are "reasonable" quite miss the point. The whole economy will speedily come to ruin (as it is likely to do) if industries are guaranteed "reasonable" profits, generously estimated, irrespective of the efficiency or lack of it they show or of what the consumer wants or can afford. The Government has interpreted the guarantee to British agriculture in such a way as to insulate it completely not only from the effects of foreign competition but also from the limitations of consumer demand. Farmers can hardly be blamed if they lie on an officially prepared featherbed, but it is improbable that it is in their own interests to do so. Mr Williams remarked that it was the aim of Government agricultural policy to avoid another tragedy like the repeal of the Corn Production Act in 1921, but his policy is likely to produce just such a result by eventually driving the predominantly urban taxpayer into revolt.

* * *

The Cost of the Kotow

Since Britain on January 6th recognised the so-called People's Government of Mao Tse-tung as the legal government of China, a representative of His Majesty's Government has been trying in Peking to obtain for Britain the priceless privilege of diplomatic intercourse with China's new rulers. He has not so far been required to perform the ceremony of the *kotow*, but he has been put publicly in the humiliating position of being rejected as a suitor for diplomatic relations. This is the result of the Foreign Office's decision not to wait for concerted action by the United States and France, and to separate itself from its principal allies on a major issue of Far Eastern policy.

Among the grievances on account of which the Chinese Communist Government has declined to enter into diplomatic relations with Britain are the British action in abstaining from voting in the Security Council and other Uno bodies on the question of Chinese representation; the detention of some seventy grounded civil aircraft in Hongkong pending litigation to decide whether they are legally Chinese or American property (the American company which claims them is appealing to the Privy Council against a Hongkong court decision); restrictions on immigration from China into Hongkong; the censorship of Chinese books and newspapers in Hongkong and Malaya, and so on.

When Britain accorded recognition it was emphasised that the act was unconditional and that no attempt was being made to impose terms. Learned authority was quoted—and promptly refuted—to show that matters of dispute should be discussed after, and not before, the opening of diplomatic relations. And it was suggested that Britain would benefit by "recognising the facts" in China. Instead, what has happened? Recognition has put new heart into the Malayan terrorists and set every Chinese wondering whether the British have started once again to appease. British merchants in China suffer crushing taxation, illegal levies and extortion, restrictive regulations and gross discourtesy. The prospects held out to them in Shanghai by the Communists have proved false, and some of those firms who believed in them face bankruptcy. American and British policies in the Far East have fallen out of step, both in the capitals and at Lake Success.

Nothing whatsoever has been gained and much has been lost by a decision which Mr Bevin took against the weight of all informed outside opinion. In the House of Commons on Wednesday he was able to place against these facts only the conviction that, in the long run, it would pay to have shown the Chinese that they would not be left to face their Russian allies alone.

Turkey's New Leaders

If proof were needed that the Turkish Democrats were surprised at their overwhelming success in the elections, it was there for all to see when their parliamentary group met to select candidates for the presidency of the Republic and other offices. No cut and dried plan was ready. Before the meeting Mr Celal Bayar, the leader of the party, was said to be reluctant to stand for the presidency, feeling that he could do more for his country as premier and leader of the party than in any other post. The candidates tipped for the presidency were either Judge Halil Ozyürük, president of the Court of Cassation, or General Ali Fuad Cebesoy, a soldier noted for his honesty and fair dealing, who had lately resigned from the Republican People's Party to stand as an independent, though with Democratic support. After debate, however, Mr Bayar was persuaded to change his mind. When the Grand National Assembly met, therefore, his party voted him into office as third President of the Turkish Republic.

For the first time, therefore, Turkey is led by a man whose formative years were spent in banking and not in the army. He was Minister of National Economy in the Republic's early years and again during the world crisis of the thirties. He is not only an administrator of repute but enjoys a good name for straightforwardness and honesty.

As always, the accession of a party to power after years in opposition called for rewards to loyal members. It was obvious that both Adnan Menderes and Fuad Koprülü would be called to high office. They become Prime Minister and Foreign Minister respectively. The former, who is 51, has solid knowledge in the field of economics and agriculture; the latter is widely known as a scholar. Both, judged by their opening statements to the Press, intend to concentrate on completing or improving work in hand before introducing changes. Above all, there is to be no change in foreign policy. A manifesto from party headquarters states that everything possible will be done to make the Opposition "feel secure under the laws of the country."

The Opposition is appreciative of this attitude, and has responded soberly with articles on the role that is open to ex-President Inönü as a model Opposition leader. "We who are in the position of the attackers," writes the leading Opposition paper, "will never shoulder the moral responsibility of disturbing the mild and courteous tone that has been established." Indeed, the whole atmosphere would be judged rather priggish, were it not a remarkable manifestation of how a people which, until 1920, was politically hidebound and backward, can grow to full stature in a single generation, by the exercise of common sense and by good leadership.

* * *

Economics of Parenthood

The fifth volume of memoranda presented to the Royal Commission on Population* is mostly concerned with the questions of parenthood as they affect not the community at large but the individual family. The conclusion to be drawn from the first memorandum, by Mr J. Hajnal and Professor A. M. Henderson, is very much what common observation would convey: that on balance economic and fiscal changes since the thirties have favoured the larger family. Apart from actual family allowances, it is the larger family which benefits most from the food subsidies and from school meals; and with higher incomes all round, many more large families than formerly benefit from income tax reliefs. Except for the very lowest income groups, however, all these ingeniously calculated factors together come nowhere near to compensating for the extra cost of each child; they cover about half of it at the standards represented by a prewar income of 60s. a week. Nor, of course, do they bear any useful relation to what in many cases is the heaviest cost of parenthood—the loss of income when the wife gives up paid employment, a cost actually increased by the income tax reform that ended the traditional anomalous penalty on married women's earnings.

Mr Harrod takes up the story where this analysis drops it, and puts up what in a society less obsessed with equality and more interested in equity would be an unanswerable case for the principle of compulsory family insurance beyond the level (taken as £250 a year) when the flat rate allowance is important. The endowment fund should be financed by payments of 1s. in the £ on incomes, and the endowments should be similarly related to income on such a scale that, given actuarial accuracy (a stiff proviso), each income group would get back exactly what it paid in—the redistribution of income being from the childless or one-child family to the larger family, not from one group to another. The results as tentatively set out by Mr Harrod are calculated to warm the heart of the family man, which, however, may well cool rapidly as he reflects that by the time (if ever) that public opinion has worked round to this scheme, and the experts have cast it into workable shape, his family will long have ceased to qualify for benefit.

* * *

Intelligence and Size of Family

The documents on the economic position of the family have a special bearing on the memoranda, published in the same volume* of papers, on the relation between intelligence and fertility. For the independent investigations of many experts, carried out over a generation, leave no room for doubt that there is a negative correlation between intelligence as measured by intelligence tests and the size of family to which the child tested belongs; in other words, that on the average the more intelligent have smaller families than the less intelligent. On this the experts, at least those whose views are given in this volume of papers, agree, and the Royal Commission on Population accepted their dictum, as well as the opinion that a large part of intelligence is inherited. Where the experts disagree is on the effect this differential fertility between the more and the less intelligent is likely to have on the future intelligence of the nation.

Some experts estimate that the effect will be serious, and Sir Cyril Burt produced to the Royal Commission a table showing that if the rate of decline in intelligence through differential fertility continued for fifty years, at the end of that time the number of children of scholarship standard (that is, of present scholarship standard) would be halved and the number of feeble-minded doubled. Experts dispute this pessimistic conclusion, partly on the ground that, as part of intelligence is influenced by environment, the improvement in environment will offset the fall in intelligence due to differential fertility, and also on the grounds that natural selection may have a more favourable effect than the pessimists predict.

Like the Royal Commission we must leave them to disagree. But it is worth noting that Sir Godfrey Thomson's recent tests on Scottish children did not show a fall in intelligence compared with those of the same age tested fifteen years earlier. On the contrary, the children's scores were higher, though the negative correlation between intelligence and size of family was again confirmed. This, of course, may well be explained by children's far greater familiarity with intelligence testing in 1947 than in 1932, quite apart from the improvement in their environment. But even if the pessimistic view on the future of national intelligence is somewhat discounted, it would appear to be plain common sense to try to remove the economic factors that at present induce the more intelligent to restrict the size of their families.

* * *

End of Points

The truncated points system did not survive very long. At the end of last week, Mr Webb announced that all goods would be removed from points rationing forthwith, thus bringing to an end a system of rationing that had been in force for about eight and a half years and had in its time served consumers very well. He is certainly to be congratulated on what in these days must be considered a bold step, which will enable his Ministry to save some 1,000 staff and eliminate some 25 million forms, besides saving the taxpayer about £300,000. One point of criticism may, however, be made. In abolishing points rationing Mr Webb has abolished only one part of the control over the foods in question. Supplies of them cannot be increased to meet any increased demand because the Ministry of Food still either allocates the raw materials, as in the case of biscuits, or else is directly responsible for imports, as in the case of dried fruits. But if supplies of a commodity cannot be increased, there are only two ways of adjusting demand to supply—rationing or allowing prices to move. The logical consequence of the end of points rationing would therefore have been the removal of price control from the rationed goods—which Mr Webb has not done. It would be a serious setback to the cause of decontrol if the trade in unrationed biscuits were to go the same way as the trade in unrationed sweets.

* * *

New Zealand Saves on Subsidies

More details are now available of the reduction of the subsidies on food and other consumer goods in New Zealand on May 5th. Mr Holland, the Prime Minister, has set out in a long statement the reasons for his Government's action. He accuses his Labour predecessors of extravagant expenditure and of setting in train inflationary tendencies which were undermining the stability of New Zealand's economy. It was imperative, therefore, that Government expenditure should be reduced if stability was to be restored. Mr Holland maintained that the subsidies, which were running at the rate of £17 million a year—that is, at about £8 10s. a head of population compared with the British figure, which until recently was about £8 16s. a head—were not justified in present circumstances; they merely served to conceal from the public the true facts about prices and costs.

The reduction in subsidies amounts to £12 million. The following table shows the resulting differences in prices of the principal items affected:

NEW ZEALAND SUBSIDIES

	Cost	New Price	Old Price	Increase
	s. d.	s. d.	s. d.	s. d.
Tea (lb)	6 1	6 1	4 4	1 9
Butter (lb)	2 4	2 0	1 6	0 6
Bread (2-lb loaf)	0 9	0 7½	0 5½	0 2
Milk (gallon)	3 1	2 8	2 4	0 4
Eggs (dozen)*	...	4 2	3 10	0 4

* Heavy grade.

The coal subsidy of £2,250,000 and the wool subsidy, which next season would have been about £1,350,000, are also to be abolished; rail freights, which were in effect subsidised to the extent of £2,350,000, are to be increased. Altogether, the Government estimates that the cost of living index will be increased by approximately 4 per cent. Wages are to be allowed to rise and several claims have already been put before the Arbitration Court. Special measures are to be taken to protect those living on pensions or on small fixed incomes.

Mr Holland has acted wisely. The subsidies amounted to roughly one-seventh of the total of government expenditure; they served to create in New Zealand, as they do in Britain, the atmosphere of a Never-Never Land in which few understood the price that was being paid to maintain their apparent standard of living. The test of Mr Holland's action, however, will be the budget which is due to be presented in July or August. If it can be balanced without recourse to such measures as those of the previous government—which, according to Mr Holland, apparently created £26 million of paper money to pay off some of its debts—then there should not be much danger of inflationary tendencies, inherent in rising prices and wages, getting under way. The reduction of subsidies, if it does nothing else, will at least inject some degree of realism into the New Zealand economy.

Shorter Notes

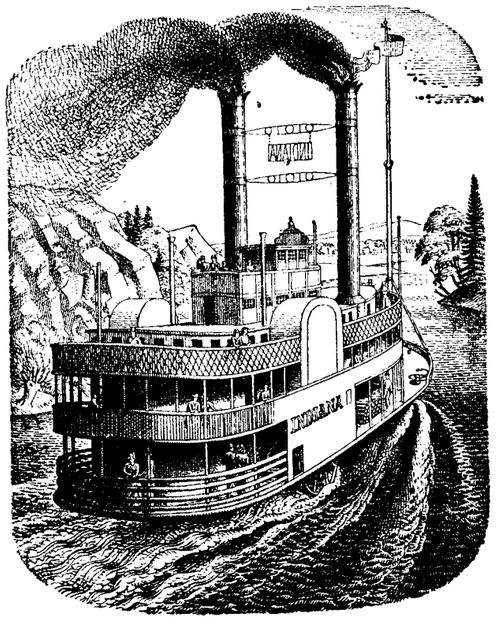
The untimely death of Hargreaves Parkinson is a sad loss to the profession of financial journalism. Parkinson was a member of the staff of *The Economist* for fifteen years and had been Associate Editor for some three years in 1938, when he resigned to become editor of the *Financial News* and later (after the merger of the two papers) of the *Financial Times*. His service to the profession—and it was a great one—was to raise comment on investment matters from the level of Throgmorton Street tipstering to that of close and reasoned analysis. He brought the art of investment and the science of economics together and his best book, "Scientific Investment," was properly named. His shrewd and kindly cheerfulness will be greatly missed by those who worked with him.

*

On Wednesday Mr Maurice Webb announced that Sir Leslie Plummer, the chairman of the Overseas Food Corporation, had been relieved of his position. It had not been expected that Sir Leslie would long survive Mr Strachey's translation from the Ministry of Food and Mr Webb has executed the *coup de grâce* which was inevitable, despite previous official statements of the Government's confidence in Sir Leslie's ability. Informed observers both in Britain and in East Africa were virtually unanimous in condemning his handling of the groundnuts scheme, and in particular his relations with the senior staff of the Overseas Food Corporation. It is to be hoped that his successor, when he is named, will prove to be a man who will revive public confidence in the validity and competence of the Overseas Food Corporation.

*

The delegates at the Commonwealth conference at Sydney on economic aid for South-east Asia have, as was expected, overcome their differences and agreed to a sensible compromise. The Australian wish for immediate action has been met by a decision to set up a scheme, costing £8,000,000, for technical help in South-east Asia within the next few months, the British plea for a more cautious approach has been satisfied by a request to all countries seeking aid to prepare and offer detailed plans by September 1st.



The final communique of the conference, which was published last Saturday, contains six recommendations for the member governments: the development of South-east Asia to be undertaken in progressive steps over six years; non-Commonwealth governments of South-east Asia to be invited into association with the Commonwealth aid plans; each country needing aid to prepare schemes by September 1st; a meeting of member governments to be called in London in September to consider the schemes; the plan for technical assistance already mentioned; and a Commonwealth bureau, to be established in Colombo, to co-ordinate the technical aid schemes.

Improvement for the People

SIR,—Your timely article on Socialism in England . . . will perhaps enlighten some of those benevolent individuals who . . . seem too apt to do permanent mischief for a temporary good. It is amazing indeed that any one should conceive there can be any social organisation from which the competitive element is attempted to be banished. This error mainly springs from the want of a clear perception that "production" (which endows us with all material wealth), can never be carried to too great an extent in *all* articles; and therefore competition, which stimulates production, is an essential good. But in exposing the fallacies in the views of those theorists who imagine that competition is an evil, *per se*, and ought therefore to be set aside, I conceive you ought to have shown how the associative principle *can* be made legitimately to conduce to the good of society, as well as how it can *not*. Do you object to the *principle* of co-operation, or is it merely to the *artificial method* of its application? . . . Are there not means and ways of our availing ourselves of the co-operative principle to effect in some degree the more equal "distribution" of wealth, while we retain competition in all its activity to stimulate the "production" of wealth? Our social organisation is ever in a transition state. . . . The law of change is a natural law, hence the transitions of our social and political life (and indeed of our economic, moral and religious life also). Our social, as well as our religious life, has its doctrines (from time to time) first questioned, then contested, and finally changed or modified. But the mistake is often made (as in this instance) of supposing that in passing through our transitions we are to *abolish* one principle in order to substitute another, whereas the fact is, we simply *modify* the action of the principle by the more extended development of some other. . . . We should . . . have practical demonstration that the two principles, competition and association (alias "christian socialism" if they will), are not antagonistic; but that, in their united action, they will give not *less* wealth to the *few*, but *more wealth* to the many. I remain, sir, your obedient servant, S. O.

Via the Mississippi

Along the waterway where once the showboat brought entertainment to Mississippi townships modern newsprint is now transported speedily and economically. It is a three thousand miles long story, beginning in the Canadian Province of Newfoundland and finishing at Nashville, Tennessee. It starts at Bowaters Corner Brook mills, where newsprint is loaded on to ships and transported up the St. Lawrence river, through the Great Lakes, to Chicago. Here the newsprint is discharged into great barge trains—one being 225 feet longer than the "Queen Mary". From here to Nashville, Tennessee the barges follow the traditional river highway to the deep south. Down the Illinois, the Mississippi, the Ohio and the Cumberland rivers newsprint journeys in the wake of the long-gone showboat—along fifteen hundred miles of water that by-passes railroads and high freight charges. An important advantage of this overland waterway transport is the lessened risk of damage to the newsprint rolls—another instance of the customer service which has become so closely associated with the Bowater Organisation.

Illustration: Courtesy of Mr. E. W. Langley and Messrs. Hooper & Co. (Coachbuilders) Ltd., London, S.W.1.

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship.' But... have you ever stopped to ask yourself

"Who are Britain's Craftsmen?"

*Introducing Ernest Langley. He started as a smith in 1899, specialising in coach building work. His hammer has shaped ironwork for undercarriages of Royal coaches and, in later years, luggage grids, seat fittings, structural ironwork and bumpers for the superb luxury cars included in Britain's impressive total of vehicles for Export.**

But... does craftsmanship mean only hand-craftsmanship? When the motor car industry adopted mass production, was craftsmanship forgotten... even though it may no longer be easy to throw the limelight on one man, or one part of the process? And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so and they follow this rule in making chemicals for a long list of British industries. With chemicals for tanning, chemicals for paints and varnish, chemicals for wood preservation, Monsanto play an important part in the great body-building firms of the Car industry.

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

Letters to the Editor

Financing Western Defence

SIR,—Although the concept of financing an international common cause on the basis of a common percentage of the national income provides a sound first step (it was a Roosevelt-Truman recommendation for sharing the money costs of World War II), considerable further refinement is needed if the approach to this subject of the Foreign Affairs Committee of the US House of Representatives is to be further pursued. In their Report No. 1265 the committee say

> The idea of the North Atlantic nations working together in a pattern of unity, each contributing in the full measure of its capability to the common defence and each receiving assistance in the measure of its need, is the pattern of policy which this Bill presents.

What is surely needed to give effect to this new partnership in the financial field is a system of joint contributory responsibility which all *citizens*, of whatever income, can recognise as fair all round. From this point of view, a common percentage of the national income leaves much to be desired, owing to wide differences in income per head, to differences in income dispersion about the national averages, and to the need for a progressive as distinct from a proportionate incidence of the levy. Immense as are the difficulties of international income comparisons, it would seem that the only acceptable approach to fair shares would be by way of the estimated national yields of an agreed progressive tax uniformly applied throughout the area.—Yours faithfully,

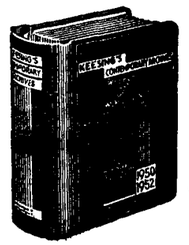
The Beeches, Gravelly Hill, Caterham J. L. GIBSON

Poverty and Socialism

SIR,—The reader who does not miss a single line of your paper is indeed well rewarded. Thus a recent quotation from *The Economist* a hundred years ago gives ample food for thought. It ends on this note: ". . . we can rely on the coming prosperity of the community to release us from all fears of socialism."

This was the opinion prevalent a hundred years ago in Liberal circles: poverty was the cause of socialism and as it receded so would socialism. Marx took it over uncritically, as he did so many other orthodox tenets, and added to it the wrong forecast that poverty would increase, and therefore socialism.

After a hundred years we find that poverty has certainly decreased; your predecessors were right in their forecast and Marx was wrong in his. But socialism has sensationally advanced; so the reasoning of both your predecessors and Marx must have been wrong. Our contemporaries who still hold the same view of a simple cause-and-effect relationship must then also be presumed wrong. This is especially the case of our American friends; their public statements on the Communist menace assume as axiomatic the belief held by *The Economist* in 1850.—Yours faithfully,



Chateau d'Anserville, Par Bornel, Oise BERTRAND DE JOUVENEL

Discipline in the Docks

SIR,—If responsibility is divided, it usually fails to be exercised, indeed it may be impossible for anyone to exercise it. Your article of last week recognises that this is happening in the docks today, but does not go far enough in suggesting the remedy.

The war did one good thing in that it made decasualisation possible by reducing the Registers, which before the war had been far beyond the needs of the ports. The employers welcomed the 1946 Act, which provided the machinery for continuing decasualisation into peace time, but the Government introduced a scheme under it against their advice, which confused the responsibility to a dangerous extent. In the old days the National Joint Council—incidentally a most effective body—controlled the industry, and if a stoppage occurred the parties had no one to blame except themselves. Both sides had, therefore, to take their responsibilities seriously and in fact only a tiny fraction of the matters in dispute failed to be settled by agreement. The introduction of the National Dock Labour Board (and its Local Boards) has removed from the employers part of their natural functions and has gravely weakened the National Joint Council—firstly by making it impossible for the employers to say "Yes" or "No" on matters which are the legal responsibility of a statutory body (the NDLB), and secondly by entangling the union in employers' functions through their membership of the National and Local Boards.

Reliable dock labour is such a vital necessity to the shipowner that many shipowners have become direct employers of dock labour, and spend much time and anxious thought on the problems which a necessarily difficult industry throws up. It need hardly be added that shipowners do not welcome stoppages, however arising, which cost them, and through them the country, very large sums in delays to ships and the consequent disruption of schedules. The shipowners and the other employers of dock labour are anxious to take their full share of responsibility for shortcomings in the docks industry, but only on the condition that they have restored to them the normal functions of an employer, subject to justifying to the union through the National Joint Council everything they do

LOOK at these years

New subscribers are now being enrolled for KEESING'S 8th Volume which starts on July 1st.

To anyone seriously interested in current affairs there is nothing to beat KEESING'S documentation of national and international Politics, Economics, Social Questions.

This unique Reference Tool records the important events, speeches, communiqués, agreements, etc., the world over and tabulates them neatly in loose-leaf supplements which are sent to subscribers every week, covered by a cumulative Index which is reborn 26 times a year.

No wonder then that a host of *Economist* readers have taken the service for many years and no doubt at all that—if you still lack KEESING'S—you, too, should at least get to know all about it.

The current and previous volumes are now available at reduced prices.

Make sure of your copy by asking for full details now.

TIME, GENTLEMEN, PLEASE!

in that capacity. The Ministry of Labour could then revert to its proper position as a conciliator, and docks work might well cease to be an annual exercise for the troops. As it is, the shipowners are gravely hampered in their conduct of the country's overseas business, which is inadequately compensated by the right to say, when things go wrong, "Please, sir, it wasn't my fault."— Yours faithfully, JOHN HOBHOUSE

Too Willingly to School

SIR,—In your interesting article in your issue of May 6th, you set out the many disadvantages of the increasingly competitive examination at eleven-plus for entry to a grammar school. You say, rightly in my opinion, that it will not be possible to substitute school records, since parents will always insist upon objective tests, and that although the "long run" solution is to wait until secondary modern schools have achieved parity with grammar schools in the public eye, this is to postpone the solution almost indefinitely. But it is curious that you did not mention the obvious solution which some authorities are adopting, namely the comprehensive school. If all children at the age of eleven go to a secondary school and spend the first two years on a general course, it will be possible for them to be allocated to more specialised courses when their abilities and aptitudes have been assessed within the school. There will be no need to settle in advance what percentage should have a grammar, and what percentage a technical school course. Conservative (in the educational sense of the term) opposition to such a solution is still so strong that only a widespread revolt by parents against the eleven-plus examination will bring it into general operation, but the increased severity of competition, which is a by-product of the abolition of fees, is beginning to have some effect.—Yours faithfully, SHENA D. Washington and British News

SIR,—The article on sterling balances in *The Economist* of May 13th, with repeated complaints of leaks and distorted reporting in the American press about the recent British memorandum, is unfair to the newspaper accounts of the matter on this side of the Atlantic.

As far as I can discover, the first story on the subject in this country was mine, published in the *Washington Post* on April 24. It took pains to point out that the document was not an actual "request" and, in your words, "could not possibly be regarded as a series of firm proposals or requests." Pertinent paragraphs read:

> Although the United Kingdom proposal presents a concrete plan, in which the United States would help pay off some of the war-incurred debt of Britain to Commonwealth countries, it appears that it was submitted without any real intention that it was to form the basis for any immediate action.
>
> Instead, it serves the purpose of illustrating the connection of Britain's debt, particularly to India and Pakistan, with the whole problem of the need for economic aid to Southeast Asia. . . .
>
> In submitting the proposal, it is believed, the British were perfectly aware that such a plan could scarcely be taken to Congress, and if it were, that Congress would not accept it.
>
> The main purpose of the paper, therefore, may be to illustrate that the sterling balance problem can be eased only as it becomes a part of a much broader design for aid to Southeast Asia.

The inference in *The Economist* account was that leaks to the American press were deliberate, conceivably malicious and certainly improper. But the author of the article in *The Economist* apparently failed to realise that an explicit story on the subject of the British memorandum appeared in the *Sunday Times* of London on April 16th, eight days before the first piece was printed in the American press. That story, in fact, was the stimulus to me to gather information for publication here.—Yours faithfully, ALFRED FRIENDLY

The "Washington Post"
Washington, D.C.

[On further consideration we believe that Mr Friendly's protest is justified.—EDITOR.]

Inflation in Brazil

SIR,—Your Rio correspondent in the article "Inflation in Brazil" is not too familiar with the coffee situation in Brazil to which, among other things, he refers.

The clearances from Brazil of coffee for the five months ending with April are 27 per cent less than for the same period in the previous year—not because Brazil lacks the coffee to ship but because consuming countries are not buying it. Consumption in the United States has dropped by 17 per cent during this period as shown by the survey of the Gillette Committee, which was recently made public. May and June shipments from Brazil are apt to be less than 50 per cent of last year and it is altogether likely that Brazil will have more surplus coffee on July 1, 1950, than it had on July 1, 1949. This was some three million bags and was considered so burdensome that they disposed of it in mid-summer for at least two special reasons (1) to get badly needed dollars (2) to relieve the market for green coffee of a bearish influence. The sale of this surplus coffee enabled Brazil to reduce its outstanding drafts representing overdue debts to the United States from about $175 million to something like $60 million at the moment, but it is doubtful if Brazil's actual balance of trade situation was improved by the operation. They have had to reduce their imports from the United States to less than half of normal and this has been one of the great contributing factors to the inflation your correspondent speaks of because it has lessened the amount of goods available. It would appear that the exchange value of the cruzeiro is not only now an open question, but devaluation is the only likely remedy Brazil can find for what is rapidly becoming for them an acute situation.—Yours faithfully,

Oklahoma City EUGENE WHITTINGTON

AMERICAN SURVEY

President's Progress

(From Our American Staff)

AS the railroad carriage named the Ferdinand Magellan rolled into the station at Washington, D.C., after its 6,400-mile round trip to Washington State, it was generally agreed that the tour had been a profitable one for the President. It had been insistently described by the Administration as non-political; Mr Truman repeatedly suggested that he was undertaking it for the noblest reasons. The Constitution requires the President to report on the State of the Union: how can it be done better than by giving the people themselves a chance to look at the man they hired in 1948 for the Chief Executive's job, and to hear at first hand what he has to say about how the job is going?

The people came. At whistle stop after whistle stop, by the dawn's early light or the twilight's last gleaming, crowds far greater than the local population were on hand; their folksy "Hiya, Harry" and "Give us a song, Margaret" were greeted with a similarly easy-going friendliness from the back platform. The railroad schedule clicked with a split-second precision not always characteristic of Presidential specials. So did the staff work, by the Department of the Interior, the Bureau of Mines, and the Department of Agriculture. They briefed the President on local conditions and enabled him to follow his opening statement that it was nice to be here, or fine to be back, with down-to-earth evidence that he knew where he was.

In Caspar, Wyoming, where Presidential visits are rare, he was greeted by the Caspar Silver Cornet band, complete with high-stepping drum majorettes. Mr Truman pronounced the majorettes good looking, and said he liked music. In tribute to the nearby Kortes Dam, he spoke on resource development and conservation, and did not fail to note that Teapot Dome, which gave its name to the great oil-lease scandal of the Harding era, was only 50 miles away. At Spokane, seat of the Jesuit Gonzaga University, he denounced atheistic communism and visited the livestock show, where he asked laughing boys and girls, members of the rural 4-H Club, if the sheep which let out a prolonged "baa" as he began to speak wasn't probably a Republican.

He was indeed in Republican territory. Of the nine States west of the Mississippi in which he made stops, all but Montana have Republican governors, and 11 of their 18 Senators are members of the opposition. But even in as solidly Republican a stronghold as North Dakota, the families celebrating Fargo's Frontier Week flocked to see him. And at Grand Coulee Dam, his entourage included a group of Republican Congressmen from the Northwest who had flown all night in order to be present at the dedication of this multi-million dollar enterprise.

Grand Coulee provides undeniable support for the President's belief, which he expressed again and again, that, to be true to its destiny, the nation must dream big dreams. Eight mammoth hydro-electric generators, two and a half of which could supply New York City, turn at capacity in a region where President Roosevelt's opponents said the only customers would be jackrabbits and coyotes. And the industrial development they are stimulating is not transferred from other regions; it is a net addition to the nation's economic strength.

But while celebrating the achievements of the recent past, Mr Truman's main theme was the future: a better America, a better world. He held out hopes of a gross national product of $350 billion within ten years, and an income of at least $4,000 for every hard-working American family—a $4,000, moreover, that would possess real purchasing power. Nothing disturbed this rural idyll. If Mr Hoover's two chickens stirred uneasily in the pot of an earlier new economic era, nobody heard them. Nowhere did the crowds heckle.

*

Mr Truman is in the happy position, for a politician, of being able to blame "the obstructionists" for not making good his promises. With a legislature that will give him approximately ten per cent of what he asks, he can use the remaining 90 per cent as campaign material. The position of his local managers is slightly different. They have to elect Congressmen, and in many cases Senators, this year. They have to appeal to voters, many of whom think that the President's programme goes too far. There were certain evidences of their sensitivity. In his farm speech at Lincoln, amid the officially solid Republicanism of Nebraska, Mr Truman himself referred only to the Secretary of Agriculture, not mentioning Mr Brannan by name; there the Brannan farm plan is highly unpopular. In Chicago, Mr Arvey, the Democratic leader, was rumoured to have questioned the desirability of seating Mr Oscar Ewing, the chief proponent of the Administration's health plan, upon the platform.

In many respects the grand climax of the President's trip, in Chicago differed from the meetings west of the Mississippi River. Most of the western crowds had assembled on a community basis; they resembled old-home week, annual stock-show, chamber-of-commerce, resource-development rallies, rather than the torchlight parades of the party organisation. But in Chicago, a frankly political gathering staged a show that attested the ward captains' zeal; every elevator boy at the Cook County Hospital had been told to be stationed along the Presidential line of march with six friends, or take the consequences.

The $10-a-plate dinners drew throngs, but few people showed an interest in issues. Attendance was sparse at the

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

televised Cabinet meeting, and even sparser at the panel meetings at which the first rank of Administration talent discussed such topics as fiscal policy and national resources. The dove-cotes were ruffled only when Mr Jonathan Daniels, of North Carolina, made it clear that a man could be a loyal Administration Democrat, having no sympathy with the rebellious southerners, and still oppose compulsory powers to prohibit discrimination against Negroes in employment.

Mr Truman's report to the people did not go unchallenged by the Republicans. On the trip, his train was shadowed by an airplane containing Mr Victor Johnston and Mr Philip Willkie, the eyes and ears of Republican headquarters. On the evening of the President's return, Senator Taft made a widely broadcast speech denouncing his evident desire for a "rubber-stamp Congress," and his "promise-everything" policy that will "wreck the United States." By coincidence, a second counter to Democratic ascendancy, and one likely to be more effective than the Senator's noble negatives, was provided that same day. In the Pennsylvania primary election, Govetnor Duff and his fellow candidates defeated the reactionary Grundy machine that has held Pennsylvania in a firm grip for over a generation. The voice of the second most powerful delegation to the Republican convention will henceforth carry a positive message.

The atmosphere of the President's trip was the balmy haze of Indian summer. Like that beguiling but sometimes deceptive season, it contained no hint of clear and present danger, no forewarning of thunder on the left. Mr Truman did indeed suggest the erection of signposts in Laramie, Wyoming, showing the air-hour distances to points on a shrinking world, but he did not emphasize that time, as well as space, may be short. No mention of Senator McCarthy's name was made the whole length of the 6,400 miles, either by the President or by a bystander. Nor did the President's popular report on the State of the Union contain any hint of the tasks facing the Foreign Ministers. The division of the resources of the promised $350 billion era between rising standards of living and military needs was not discussed. Mr Truman and his advisers seem to regard the tour, with satisfaction, as an inspired version of the famous "whistle-stop" campaign of 1948, which, to everyone's amazement, turned the tide against the complacent Republicans. Compared with that foray, the President's trip was, indeed, almost a royal progress. But this homely visitation left unfulfilled the less enjoyable task of leadership, that of placing the American present in its world setting. The Republicans may prove to have no monopoly of complacency.

Who Killed FEPC?

The Administration has failed in its attempt to have the Senate even consider its Bill to set up a Fair Employment Practices Commission. The Bill in question was the Administration draft, which would have endowed the Commission with compulsory powers to end discrimination in jobs against Negroes and other minorities, rather than the House version which relies mainly on persuasion. Last week's vote, however, was not on the Bill's merits, but on the desirability of ending debate so as to vote on a motion to take up the Bill. It failed, by 12 votes, to reach the necessary two-thirds of the Senate's full membership. The only dispute now is, who killed FEPC? The Republicans, says Mr Lucas, the Democratic leader, with their little amendment to the Senate rules. Passed last year after a filibuster far less gentlemanly than the performance that has engaged the attention of the Senate, off and on, for the past fortnight, the new closure rule, which has just had its first test, requires 64 affirmative votes to shut off debate.

In the acrimonious discussion of who fired the fatal shot, which is likely to go on until November, it is hard not to feel that the Republicans have the best of it. The sincerity of their attachment to civil rights reform might be clearer if last year, under the pretence of making closure easier, they had not actually made it harder to enforce. But the 52 votes cast for it last week were not even enough to have brought the filibuster to an end under the old rule, which, in any case, did not permit closure votes except in the debate on the Bill itself. The Republicans can also point to the figures: 33 Republicans and 19 Democrats voted for closure, six Republicans and 26 Democrats from the south and west voted against it. Furthermore, it was the Democratic Administration's decision to press forward with FEPC, which is opposed by liberal as well as conservative southerners, instead of taking up a less controversial Bill, such as the anti-lynching measure, which might have been passed. The Republicans will redouble their charges that the Democrats have no business to wave the civil rights banner. Certainly it has become rather threadbare. That will hardly prevent it from being carried in the very forefront of Democratic election parades during the coming months in the northern and western cities where the Negro vote is substantial.

* * *

In for a Penny

The House Ways and Means Committee seems to be acting on the revised adage of "in for a penny, in for a pound, it's deficits make the world go round." The President suggested that Congress might lighten the irritating

wartime excise taxes, by about $650 million, if it could dam up an equivalent amount of revenue now escaping though loop-holes in the law. The Committee has gone with enthusiasm at the congenial task of reducing the excise taxes, to the tune of $1.1 billion. It has shown considerably less zeal as a tax-gatherer; and in the last fortnight it has taken the bit in its teeth and started distributing new reliefs.

The sharpest slap at the President's programme was the tentative vote to leave untouched the present depletion allowances for oil, sulphur, and non-metallic mining companies, which Mr Truman called grossly excessive and suggested might provide a $200 million offset to tax reductions elsewhere. Not satisfied, the committee then added insult to injury by extending depletion allowances to other mining industries. It turned down the proposed increases in the estate and gift taxes, and instead, on the ground that it would stimulate business and investment, cut the capital gains tax from 25 per cent to 16 per cent, and reduced the period for which assets must be held from six to three months. The Stock Exchange is jubilant, but elsewhere there are doubts whether, with industrial shares at their highest level since 1931, business needs this shot in the arm.

The revenue increases that the committee could bring itself to approve now total $345 million, but they include a withholding tax on corporate dividends, designed to reach the secret coupon-cutter, that may be impossible to administer. Unless the committee agrees to a 2 per cent increase in the corporate income tax, the effect of its labours in the vineyard may be to reduce the federal harvest by $600 million or more. In an election year Mr Truman might turn his blind eye on some small extravagance, but he cannot afford to be as blind as all that. The committee seems to be positively courting a Presidential veto that would rule out excise relief this year. Also, the more complicated its measure, the longer the Senate hearings must be, and this year Senators will not willingly remain in Washington during August. There are both Congressmen and Senators who would have preferred to concentrate on excise relief, and let the loopholes look after themselves; that way, a Presidential veto might not have been hard to override. But by opening the Pandora's box of tax changes, the committee has probably made this impossible. The result may well be no change in taxes this year, with the new Congress, free from immediate electoral considerations, left the task of recommending broad and over-due alterations in the whole tax system.

* * *

More for the Aged

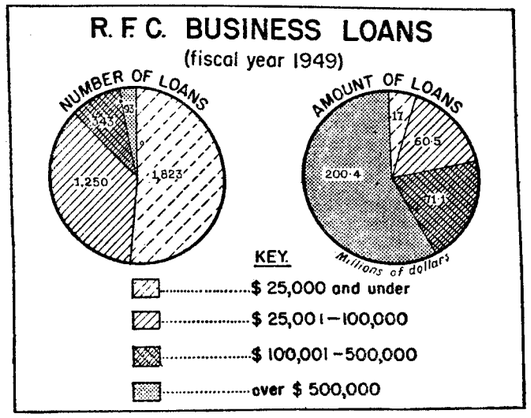
Only the aged and their dependants may expect, with some certainty, to receive a Fairer Deal from this session of Congress. Last year the House responded, by an overwhelming vote of 333 to 14, to the President's plea for an expansion of the present federal system of old age and survivors' insurance. The Senate Banking Committee will shortly bring its own version to the floor. The growth of private pension schemes, most of which call on employers to make up the difference between federal payments and the coveted $100 a month, has notably softened business hostility.

The glaring defect of the present plan is that it holds out the promise of only a pittance after 65, on the average $26 a month, and that for little more than half the working population. The result has been an alarming growth in state relief rolls, to which the federal government contributes through grants-in-aid. Washington, in times of prosperity, is spending much more on this old-age relief, originally expected to be only temporary, than the $700 million a year now being paid out in old age benefits. One of the most persuasive arguments for an expansion of federal insurance is that it would diminish this drain and the abuses that have accompanied it. In Louisiana, over 80 per cent of the aged are on relief.

Both the House and the Senate Committee Bills propose to extend the federal umbrella, the first to 11 million more people (some on a compulsory, some on a voluntary basis), the second to an additional 9.5 million. But even the House version leaves 14 million workers, chiefly farmers and farm labourers, exposed to the hazards of a dependent old age. Both Bills raise the level of benefits to compensate for the rise in the cost of living, but only the Senate version eases the restrictive eligibility requirements to enable those newly brought into the system to qualify for benefits before they retire. Both Bills fall short of Mr Truman's requests.

The additional cost will lie between the $2 billion required by the Senate Bill, and the $1.5 billion of the House measure. Apart from the new revenues from new contributors, the insurance fund, at present, can well afford to be more generous; its revenues, at $3 billion a year, far exceed outgoings, and a $12 billion reserve has been built up. The American system, drawn up in 1935, was, in fact, patterned on private insurance. It relates benefits to each worker's earnings (more or less) and, with the hope of making it nearly self-sustaining, it was expected to accumulate a vast reserve in the early years to meet the demands to be encountered later. The House, consequently, provided that contributions should be increased from the present 1½ per cent of earnings, exacted from employees and employers, to 2 per cent. But the Senate Committee, by postponing new taxes until 1956, shows signs of jettisoning the reserve scheme, either because it has listened to the doubts of the experts, who in general favour a "pay-as-you-go" plan, or, more probably, because it is reluctant to raise taxes. Two other criticisms suggest that similarly fundamental alterations may soon be required. The fantastic burden of keeping detailed records of each worker's wage history is beginning to be felt; a flat pension rate would lighten this. And doubts are growing as to whether it is sound public policy to encourage retirement at 65, when the length of life, and the number of the aged, are both increasing.

* * *



Role of the RFC

When Mr Hoover, in 1932, urged the creation of the Reconstruction Finance Corporation, he little thought that seventeen years later it would still be in existence to come under the microscope of his Commission on Government Reorganisation. He even speculated that, aside from giving businesses confidence, there might be little demand for its services. But the RFC, after bailing out banks, railroads, and business threatened with bankruptcy during the depression, played a vital part in the war effort, and today remains the government's banker to business in distress. It also controls the tin and rubber programmes and has a share of housing finance. Last year, with the recession, the number of applications for funds shot up, and in the first quarter of this year they were running at a record level. But the Hoover Commission agreed with the American Bankers' Association that, in times of peace and prosperity, direct government loans to business are undesirable and compete with private enterprise. It recommended that the RFC, now virtually independent because it is responsible only to a busy President, should be placed under the supervision of the Treasury and restricted to the guaranteeing of loans made by commercial banks.

Mr Truman's reorganisation plan for the RFC, submitted last week, would also end its independence, but by placing it in the Department of Commerce, after transferring its housing functions to the Housing and Home Finance Agency. The Commerce Department, whose mission is to aid business, presumably would use the RFC machinery more energetically than the banker-minded Treasury. The Administration's programme of aid for small business

visualises new financial institutions to provide capital, but the RFC's functions, though diminished, would not disappear. It would remain a bank of last resort for businessmen who could obtain credit nowhere else, and Mr Truman also asked Congress to liberalise the terms on which it makes loans.

It is not certain that Congress will come to the RFC's defence, useful though its facilities are to small businessmen. It no longer enjoys the standing it had when it was ran by the experienced and hard-headed Mr Jesse Jones; Mr Jones himself believes it has outlived its usefulness and should be liquidated. When the RFC charter was renewed,

Source: Annual Report of RFC

after a hard fight, in 1948, the implication was that it should be kept in stand-by condition in case of another emergency. But a number of the larger loans it has made since then have aroused Congressional suspicions of imprudence and political influence. Two large borrowers recently succumbed to bankrupcy. Senator Fulbright, who last year failed to persuade the RFC to postpone a $44 million loan to the Kaiser-Frazer Corporation, is already conducting a study of its lending policy. The cruellest testimony so far has been that of the subcommittee's accountant who estimates that, if the RFC had paid interest on its borrowings from the Treasury, its boasted $5 million profit would have been transformed into a $6 million loss.

* * *

Shipping Schizophrenia

The new Planning Board for ocean shipping, set up by the North Atlantic Council, is likely to have an early opportunity of diagnosing the schizophrenia which manifests itself in the United States whenever the merchant marine is discussed. On the one hand, the Department of Defence distrusts any co-operative scheme which makes other nations responsible for the transport of American troops and supplies in wartime. This distrust has naturally been encouraged by the shipping industry and its impresario, the Maritime Commission, since it is the justification for the subsidies which keeps the industry's head above water in peacetime. The State Department, on the other hand, has to draw a veil over these subsidies whenever the question of trade discrimination comes up at an international conference. But even if the Planning Board decides that the United States can safely rely on its allies for its seaborne military transport, it is improbable that Congress will have the courage to free the State Department from its embarrassment.

For already the prosperity of Europe's maritime industries is a depressing contrast to the penury of America's, suffering from excessive costs which the permitted subsidies are no longer adequate to cover. The numbers of vessels sailing under the American flag and being built in American yards have been declining steadily and unemployment is serious in both shipping and shipbuilding. Both Houses of Congress have been concerned about this situation for months, and they are also concerned about the strain which shipping subsidies put upon the public purse; yet no one suggests that the subsidies have failed to do their work and should be abandoned. The House, in its Appropriation Bill, has, however, limited the number of ships eligible for government aid and its Expenditures Committee has produced a blistering condemnation of the Maritime Commission, for the second time in a year, for its carelessness with public funds and its undue generosity to ship operators.

This timely blast at irregularity and extravagance probably explains the Senate's unusual readiness to accept the President's plan for reorganising the Maritime Commission. Senator Magnuson, a guardian of the nation's shipping but not of the Commission, remarked that any change would be beneficial and even the Commission's chairman agreed that reorganisation was necessary. He has been rewarded with the new post of Under Secretary of Commerce for Transportation, who is to give guidance to the new Maritime Board, which will regulate rates and services and award subsidies, and to be responsible for the Maritime Administration, which will manage the Board's programme. The shipping industry thus finds itself in the position of a reluctant prodigal returning to the old Department which it left with joy when the Commission was set up fourteen years ago, and where it thinks its interests were neglected and will be again. But, quite apart from the desirability of separating the regulatory and operating functions of the Commission and of trying to obtain more efficiency at less cost, the reorganisation scheme has the advantage of bringing America's schizophrenic tendencies under one head, at least as far as shipping and the foreign trade balance are concerned.

The Mood of South-East Asia—II

The White Man Carries On

(From Our Special Correspondent)

Many Europeans in South-East Asia are gloomy. They feel—not without justification—that it is they who have built up all the countries of the area, except Siam, into what they are today. They have founded prosperous businesses giving employment to hundreds of thousands of people. They have created whole industries, increased the yield of agriculture, laid down towns, railways, roads and telegraphs, and above all shown how administrative services should be organised on a national scale. All these things the Europeans have done over a period of several generations. Now, hard on the heels of a world war in which, having at one time lost everything, they came back as victors, they see two new forces undermining all that they have built—nationalism and Communism; indeed in Burma most of the damage is already done. Quite a few of these Europeans personally spent years in Japanese prison camps. It is not surprising, therefore, that the mood of many has become a mixture of despondency, doggedness, and often disinclination to think out the future too carefully.

The British are the most numerous Europeans in South-East Asia; on the whole they have the highest prestige, and still, through their position in Singapore and Malaya, the most power. They are also a people who, compared with other Europeans, the French and the Dutch, are the least given to rationalising their feelings. They are therefore also among the more cheerful and least pessimistic.

Three examples of British behaviour, two praiseworthy and one not, are characteristic of their present attitude. The first, on a big canvas, is the brave new educational programme in the island colony of Singapore. Under the inspiration of Mr A. W. Frisby, the Director of Education, the Singapore Government is committing itself to a ten-year project for building a mass of new schools, designed to make English the exclusive medium of instruction and to bring schooling to all. Education, Singapore feels, is the number one counter-weapon to Communism; at present, much of it is still in the hands of the Chinese, and the implications are now sinister. But ten years is a long time at the pace events are moving in Asia today. And Mr Frisby's scheme will not only cost a great deal of money, but will need a good deal of faith and the traditional belief of the British in themselves.

The other two examples are in a minor but significant key. Alongside the education scheme there continues to run the blind old-fashioned British attitude about club membership. Leading Chinese citizens feel insulted by being unable to join "The Singapore Club," with its fine rooms in the Fullerton Building looking over the outer roadstead of the harbour; three other leading clubs are also closed to them. "We would not mind," they say, "if this were openly called a British club: individual races are welcome to their own meeting grounds—indeed we have our own Chinese club. But Singapore is now more our city than their's and the British have no right to use the common name without us."

Lastly, over in what is now Jakarta, the British have been pushed by chance into learning this very lesson—so simple yet fundamental now that Asia is coming to belong to the Asians. The initials, BCC, of the British community's club, known as "the Box," used to stand for the "Batavia Cricket Club." Today, they are officially being altered to cover the frankly "British Cricket Club"—and everyone is happy.

These are public instances of British determination to carry on, whether with or without the approval of Asia itself. In private, people are more gloomy than this readiness to make the best of it suggests. Equally typically British, for instance, is the degree of depression down in the relative safety of Singapore compared with the highly strung but more determined morale up-country where the bandit attacks occur. Planters know that their tappers refer to them as red-haired white pigs as a matter of course; but they will carry on until something makes it impossible to do so.

Apart from Malaya, which is the one territory in South-East Asia still under European rule where a good deal of the European's traditional attitude to colonial life continues to be possible, the British are in the same position as other whites.

In Indonesia they form a considerable community, second in size to the Dutch; and their views about their business prospects are not basically different from those of their Dutch colleagues. Both hope rather than believe. Both find themselves with little alternative but to stay and struggle on, whatever they would prefer to do and whatever they may feel in their hearts are the chances of the new Indonesia making good. For both are now stranded, with capital and the fruit of their life's work cut off behind the iron curtain of a ruthless exchange control, against whose edicts mere foreigners no longer have any pull at all.

Nationalism and Communism—almost no European in the East today fails to realise that he is sailing between the Scylla and Charybdis of these two forces. In Indonesia the extensive foreign communities, like their Asian hosts, watch the advance of Communism on the mainland of South-East Asia with alarm. But, unlike most of the Indonesians among whom they live, these Europeans also watch, with growing despair, the threatening disintegration of Indonesia under the impulse of its own explosive nationalism. Certainly the plight of Dutch officials, for instance, whose life savings

are no longer transferable to Holland, is tragic. It would be strange indeed if the morale of these unfortunate people were good.

There are, of course, by definition no nationalists—in the local sense—and virtually no Communists among the Europeans in the East. They are inevitably thereby cut off from the spirit of the new age growing up around them. Nowhere is this more true than in Indo-China, where many of the French are going through the same emotions as the Dutch; but there, on the other side of the looking-glass, they have been faced—unlike the Dutch—with both the new forces in alliance. On the other hand, the French have not yet had to let go to the same extent as the Dutch, and some of the bigger business men at least assert that there is still a future for them in Viet Nam on the old basis. They may be right. Their attitude is anyway refreshing, since it represents a modern version of those buccaneering days when the West first came to the East. If we are cut off on our plantations, these men literally say, we will use radio for communication and will rely, as we are doing already, on aircraft for movement. Provided we can get our produce out and our stores in every now and again, either by air or in convoy, we should be able to carry on indefinitely.

The white community in Bangkok neither thinks nor talks in such desperate terms as these. It patiently assesses the probable effects on itself of the shift in South-East Asia's fortunes. It notes the rise during the last eighteen months of American activity and influence, both official and commercial. It sees its own tolerant relationships with Asia—in the form of the steady-going Siamese—as perhaps no better but certainly no worse than they have been. It hopes, if it thinks that far, that Siam may remain a Sweden or a Switzerland when the deluge comes. Indeed, that escapist hope, thinly founded on Siam's present position, is perhaps the main link between the moods of both Europeans and Asians. For, behind all that they think and say and do today, lies fear of the future—a fear which will have to be overcome throughout South-East Asia if the new policies of aid by the western powers are to be a success.

The Irish Budget

[FROM OUR DUBLIN CORRESPONDENT]

THE third Budget of the Inter-Party Government provided an innovation in Irish public finance by a formal division between capital and current expenditure. Mr McGilligan budgeted for current expenditure at £75.7 million. Taxation of all kinds is put at about 23 per cent of the national income, which was estimated as being £350 million in 1949 compared with £335 million in 1948 and £154 million in 1938. By British standards, no doubt, the proportion is low; but there are some considerations peculiar to Ireland that should be taken into account. Although the standard rate is only 6s. 6d. in the £, it bears heavily enough on a community where the average income is not high. Moreover, the burden is not yet well adjusted. The fact that only some 140,000 people pay income tax seems to suggest that many recipients of postwar increases in salaries or wages have not yet been brought into the net. On the other hand, the traditional indirect taxes are light by postwar standards and it is highly unlikely that they will be changed by the present Government. Revenue is still buoyant, and the Minister for Finance is entitled to comfort himself with the reflection that small savings were greater in 1949 than in any year since wartime shortages enforced thrift.

Interest centred on the capital budget. This new departure had been foreshadowed in a speech of the *Taoiseach*, Mr Costello, last November when he announced the Government's intention to embark on a large scheme of capital investment. The announcement aroused particular attention because it heralded a clean break with what has happened in the past. In the last fifty years the Irish community has accumulated some £450 million of foreign assets, practically all of which are held in sterling securities. They are the fruit of the high prices of the first, and the forced saving of the second, war. Between wars, their yield or realisation offset the persistent import excess in the Irish balance of payments. They have been, therefore, a useful shield against adversity. At the same time, they are also the result of a reluctance to invest at home which is best exemplified by the undercapitalised condition of Irish agriculture.

The capital budget gives the first definitive notice of the scale on which capital investment is to be made. The capital budget for 1950-51 is put at £34 million. This total is made up of £14 million for housing and £1,600,000 for complementary public health services. Schools and public buildings account for £1,100,000; and hospitals for nearly £500,000. Agricultural development will absorb £6,260,000; and there is £4,750,000 for electricity development and £1,500,000 for turf schemes. Transport takes £1,800,000 and the balance is shared by provisions for afforestation, mineral surveys, fisheries and tourism.

For this sum the Minister looks, in the first place, to the Marshall loan counterpart fund and, subject to the preservation of a reasonable liquidity, to the funds under state control. Obviously, borrowing from these sources may create a danger of inflation, but much is hoped for from small savings and from the response to a national loan which is to be floated within the year. Last year small savings came to about £5,000,000. In 1948 the report of the Central Bank stated that new capital known to have been raised from the public amounted to about £16.5 million, but this figure takes no account of reserves retained in business out of profits nor of the capital, amounting to about £2,000,000, raised by building societies. No figures are yet available for 1949. It seems reasonable, however, to suppose, that current savings will not provide the target of £34 million.

The prospect of a shift, even on a limited scale, from external to domestic investment has drawn criticism from various quarters. Objection is taken to the high proportion of social amenities contained in the programme and to the proposal to draw on the counterpart fund. It is also argued that the programme is bound to cause inflation and a worsening of the balance of payments. There is some justice in each of these criticisms. The programme rests very largely on the proposition that increased investment, particularly in agriculture, will bring increased production that can be profitably sold. It seems a legitimate proposition to make, but it will be interesting to see if the present energetic policy will in fact increase what has been in the past an almost static level of agricultural production. It seems fair to put the matter to the test. Repayment of the loan granted under the European Recovery Programme must depend, as was pointed out at the time, on sterling convertibility rather than on any efforts that can be made in Ireland. It is true, however, that the programme, in so far as it draws on counterpart moneys, mortgages the more distant to the nearer future.

But these are the sort of criticisms that can be made of most schemes of capital investment. It has to be remembered that there are arrears to be made up in Ireland, notably in the field of the building of houses and schools where the problem has been made worse by a policy of economy in the past that has been ill-rewarded by the fall in the value of the community's savings. In general, the objects of investment seem to be most suitable. The main danger is rather that an attempt should be made to do much at once. The Minister, however, made it clear that a necessary scheme of priorities would be established; and indeed the natural inertia of the Irish economy makes it probable that the gap between the rate of expenditure and the flow of savings will be narrowed. In sum, the programme seems to be an enlightened attempt to counteract the forces that have depressed the Irish economy for decades.

Industry in Italy

[FROM OUR ROME CORRESPONDENT]

Two years after the end of the first world war the *Banca di Sconto*, a big bank which had financed the sudden expansion of Italian war industry in 1915-18, closed its doors. One might see a contemporary analogy to that dramatic event in the winding up of FIM (Mechanical Industries Fund) which was decided by the Government two weeks ago. The outer forms are very different. No private depositors are victimised, as in 1921, by the abandonment of a pretence that a great bank's war industry assets had kept their value in the return to peace. It is the state which has decided to cease financing the stagnation of certain obsolete war complexes through an organ, the FIM, which had been set up so recently as 1947 to assist industry back to competitive activity. FIM had in the process expended a net sum of 43 billion lire (£25 million) on presumably unredeemable subsidies. Enterprises in the Genoa and Milan areas employing some 25,000 persons were being cared for by FIM. Its liquidation has therefore been denounced as "extremely grave" by the Engineering Workers' Union (FIOM), which announces that it will resist any attempt to close down or dismantle any of the works in question. The Minister of Defence, Signor Pacciardi, however, is reported to have said that the situation in the engineering industries will be improved by armament orders arising out of the Atlantic Pact.

The FIM, however, has not shut its doors without leaving a further winding-up unit, the ARAR-FIM, to tide over matters with a fresh Government grant of 10 billion lire. The head of this unit will be Ernesto Rossi, an economist whose courageous record as an anti-Fascist conspirator imposes respect on the Left, but who is also a stout champion of economic efficiency.

The Government's decision marks one more step in the liquidation of the deadlock in which the end of the war five years ago left north Italian industry. In the factories, where workmen's committees of a political character often wielded sole authority, there was then an almost total lack of raw materials; while the North Italian Liberation Committee, acting under powers conferred upon it by the Rome Government and more or less recognised by the Allied Occupation Authorities, had proclaimed the continued validity of the emergency laws forbidding the dismissal of any workman passed by the Fascist Republican regime in its last agony. The General Confederation of Labour (Communist controlled) has never wholeheartedly accepted the cessation of this situation. It has, year after year, reached detailed agreements with the employers for the reduction of redundant staffs, but never without reserve, which implied that the proceedings were a breach of the workers' charter of 1945. Every further step in this direction still risks the consequence of widespread strikes, and millions of workers, on their side, live in apprehension born of the knowledge that so many of them are redundant.

This apprehension has been particularly painful during the last six months in an industrial atmosphere (quite apart from such special cases as the unconverted war industry units) of semi-depression. There are some slight signs now in the engineering industries as a whole, of recovery, notably in the output and sale of cars and trucks, and in orders for heavy equipment. The demise of FIM therefore takes place in a less strained situation than that of a month or two ago, and the Government has coupled with it another announcement promising a substantial expenditure of ERP aid on heavy industrial renovations.

Brigades on the Farm

[BY A CORRESPONDENT]

THE first months of 1950 have marked the beginning of a new stage in the "Socialist development" of the satellite countries in eastern Europe, as profound and as far reaching in its consequences as the liquidation of the political opposition and all non-Communist parties and organisations. This is the "offensive" for the collectivisation of agriculture. It has started and is being pursued throughout the whole of eastern Europe with characteristic Communist singleness of purpose. In some countries (Czechoslovakia, Poland and Hungary) the drive is not as rapid or as ruthless as in Rumania and Bulgaria. But it is more than obvious that collectivisation is on everywhere, and it is perhaps significant that this new policy falls well in line with this year's gigantic campaign in Soviet Russia proper for amalgamating smaller collective farms into bigger farming units.

In this respect developments on the agrarian front in Bulgaria are of particular interest. After the Stalin-Tito split, Bulgaria became the "most advanced" of the Soviet satellite states. Since then it has been the first to introduce new Communist policies and measures, which have been followed later by the other satellites. (Such was the case with the laws suppressing religious freedom, the abolition of the ostensible multi-party popular front system, the introduction of the council (Soviet) system of local government and the official proclamation of the "dictatorship of the proletariat.")

The "glorious new Stalinist era for Bulgarian agriculture," to quote the Bulgarian Prime Minister, Valko Chervenkov, was introduced this month after much publicity and extensive purges in the Ministry of Agriculture, during which the new Minister of Agriculture himself a Politburo member—was "severely reprimanded." A "model statute" for the collective farms was unanimously accepted at a conference of party workers and peasants, and Chervenkov made a six hours' speech explaining its theory and practice.

The "model statute" gives a full and detailed picture of life and work on the farm and the new status of the peasant, based on the "great Stalinist principles of collective farming."

The farm is run by an executive council (soviet) of five or seven people, elected at an annual meeting. The President of the council has extensive rights and sweeping powers. He divides all members of the farm into "brigades," each brigade consisting of not more than 40 peasants. For agricultural work and gardening members of the brigades are, to all intents and purposes, conscripted for one year; they cannot leave their work nor change their brigades once they have been allotted to them. For work with livestock the period of conscription is two years. Each brigade has a chief, appointed by the President and personally responsible to him. Moreover, all work is on a piece-time basis for every member of the brigade and for each brigade itself. Every day the brigade chief asks for a full account of the member's activities and work. Every week the brigade chief gives the President a written account of the work of his brigade. The President organises "competitions" among the brigades for better and more productive work. The brigade chief, in his turn, organises competitions among its members.

Strict "Disciplinary Measures"

Work on the farm is estimated in "working days." If a peasant works efficiently the brigade chief may give him one and a half or even two working days for one day's work. On the other hand, if the chief is dissatisfied with the peasant's work he can "fine" him by erasing up to five working days from his account book. The value of each working day, in terms of money or food supplies, is fixed provisionally at the beginning of the year. The farm cashier may—with the approval of the President—give each peasant during the course of the year an advance of 50 per cent of the value of his working days, in money or supplies. But the final valuation of the working days takes place only at the end of the year, and that depends on the general output and productivity of the farm. Thus, the peasant has to work for a whole year without knowing the actual value of his "working days," in terms of money or supplies.

Even more drastic are the "disciplinary measures" set down in the statute. "Every negligence towards the co-operative and state property, every wrecking attitude towards the machinery or livestock of a farm is treated as treason to the common good and as help to the enemies of the people." Peasants guilty of such crimes are immediately "brought to justice, according to the laws of the republic." In practice this means that the President of the farm holds the power of life and death over every peasant; for if he himself fails to deliver the quotas to the Government he runs the risk of being punished for sabotage.

Membership of the farm is "voluntary," but what this means was well explained by Chervenkov himself. It is necessary, he said, that "all tractors and agricultural machines belonging to peasants outside the co-operative farms should be confiscated." Furthermore, in future "only peasants belonging to co-operative farms can use tractors and machines." In other words, the peasant who does not volunteer faces starvation; he would not be able, without the help of tractors and other agricultural machinery, to fulfil his Government quotas. After Chervenkov's speech "a great voluntary drive" started in all villages and in some districts the peasants are reported to have joined the co-operative farms "one hundred per cent."

The individual position of each peasant member of the farm is severely restricted. The farm, boasted Chervenkov, "completely transforms the peasant of yesterday." The individual smallholder becomes in many cases a conscript farm hand. For individual use each family in a farm is allowed one cow, not more than two pigs and not more than three sheep. But even this allocation depends on the President of the farm, who may or may not decide to allot it. The tendency is, moreover, towards the breaking up not only of the individual farm but of the individual peasant household, the backbone of peasant life. Thus, such work as cooking, laundry work, bread-making, the care of children, is done on a communal basis under the direction of "those women who are capable of leadership."

The breaking up of village family life is thus complete. Before long the peasant will become an agricultural worker, controlled in his work and every-day life as efficiently and as fully as the industrial worker in the town. This marks the end of peasant life—with its good as well as its bad points "as it has been known in eastern Europe for many centuries."

Chervenkov was careful to explain that the co-operative labour farm has "not yet" reached the theoretical level of the "fully Socialist agricultural community"—the Soviet collective farm. According to Stalin, the theory of the collective farm has six main principles, the first being that the land of the farm belongs to the state The next five deal with the common ownership of agricultural machinery, farm implements, transport facilities and warehouses, as well as the "Socialist principle" in remunerating the members of the farm—each according to his work. The co-operative labour farm, claimed Chervenkov, has all the characteristics of the Soviet collective farm, with the exception of the first: the land in eastern Europe has not yet been proclaimed state property. Theoretically, at least, it belongs to the peasants, who have "voluntarily" surrendered it to the farms. The Communist farms in eastern Europe are, in other words, "one form of Socialist agricultural enterprise," but not yet the "Soviet type" of collective farm; just as the "People's Democracies" represent politically "one form of the dictatorship of the proletariat," but are not yet "the Soviet type of power."

IT'S ONLY A DAY BY TCA

We've solved some problems in our time!

In 1945 an oil company came to us with a problem. In measuring oil and gas pressures, they told us, recording instruments were lowered into the wells. The change in temperature during descent was resulting in false pressure readings. Could we supply a battery that would preheat the recording mechanism to a temperature of 160°F, and maintain it at that heat till it reached the well bottom? There was just one little difficulty—how to get a battery of 6 volts and one ampere hour capacity *inside a diameter of* 1¼ *inches* and a length not exceeding 3 feet.

¶ We designed and produced that battery—a contrivance of three cylindrical cells wired end to end within a framework of steel rods. It fitted exactly into its allotted place amongst the delicate recording instruments housed inside the 4 inch diameter steel cylinder. And it did the job.

¶ Hundreds of thousands of Chloride, Exide and Exide-Ironclad batteries giving good service today in every branch of industry, transport and communications owe their origin to just such a demand: 'Here is a job—make us a battery for it'. We have been solving that sort of problem for over 50 years.

¶ Our battery research and development organisation is the largest and best equipped in this country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

House-Building Costs

EFFICIENCY in the building industry tends to be little considered in public except as it concerns the speed and cost of house-building. Perhaps this is inevitable. In fact, house-building is unlikely to be speedy and economical unless some tonic can be administered to the building industry as a whole; and this in turn can hardly be effectively done unless the pace of production in general can be accelerated and the costs of industry in general reduced. Three reports, and one Parliamentary debate, have been devoted to building costs and efficiency this month. The working party report on building revealed the industry's slow progress in regaining its prewar standards. A productivity report made some damaging comparisons with the pace of work and the attention given to output and organisation in the United States.

The second of the Girdwood reports, which was published this week*, fills in the dismal picture—though on one side only, the building of houses—with some precise details. The method followed in the first Girdwood report was to take the average cost of building a typical local authority house of the kind which used to be built in 1938 (a house with a floor space of 800 square feet) and add to it, first, the rise in costs which had taken place by 1947 as a result of higher rates of pay, higher costs of materials, and heavier overheads. The calculation showed that it would have cost £914 in 1947 to build the house which used to be built for £380 before the war. But, in fact, the average local authority house in 1947 had become a much more ambitious affair. Therefore £129 had to be added for the greater floor space of the house itself, £72 for the outbuilding which had become standard, and £127 for the stouter construction and the more elaborate fittings which had become customary. Thus the 1947 house cost £1,242.

The cost of an average local authority house rose further to £1,321 in 1949 in spite of some important economies. In the first place there has been a saving of as many as 404 man-hours on the site. This reflects the recovery in productivity which has already been noted in the working party report on the building industry. Man-hours taken to build a house were 45 per cent above the prewar level in 1947; last year they had been reduced to 26 per cent above the prewar level.

How is the recovery explained? The Girdwood committee points out that "generally the progress of housing contracts is no longer delayed on account of shortages of materials." Most materials are more freely available now, and many controls have been relaxed or removed. In the committee's view the overloading of the building industry, which two or three years ago "resulted in too thin a spread of labour and materials over the amount of work in progress," has been corrected. Thus the material supplies and the labour force have become adequate for the work that is put in hand. This judgment is worth bearing in mind when bold claims are made about rising productivity, whether for this or for other industries. It means no more, in effect, than that work can go on without interruption; men no longer have to waste their time hanging about until materials arrive or operations which have fallen behind schedule are finished.

While this is welcome, it represents only a partial recovery of lost ground; it has little to do with industrial progress in the more fundamental sense. Two other causes to which the committee attributes the recovery in productivity fall into the same class. "Increased experience has been gained by all concerned in house-building operations." The weather, abnormally bad in the early months of 1947, has since been better.

*

The saving in man-hours from these short-term causes can hardly be measured precisely. But an estimate of their extent, compared with the savings brought about by incentive systems of payment, should enable a judgment to be formed on the essential question of what further saving in man-hours can be expected henceforth. Of the saving of 404 man-hours which has been achieved in building the average house, the committee attributes rather less than half to incentive systems of payment, and rather more than half to the "other causes" which have been outlined. The incentives agreement was concluded between the employers and the unions in the autumn of 1947, and it has applied to about half the houses completed in the following two years. It appears to have yielded a saving of between 300 and 400 man-hours where it has been used. This is impressive, and justifies the committee in urging that incentive schemes should now be more generally applied. But, because the scheme itself adds to the earnings of each worker, the saving in cost is much less impressive than the saving in time. A simple calculation shows the net result—assuming that 350 man-hours are saved, and £35 paid in bonus:

	£	£
Wages equivalent of 350 man-hours	48	
Labour on-cost equivalent of 350 man-hours	5	
Reduction in overheads and plant charges by more rapid completion	8	
Total savings		61
Less:—		
Bonus paid	35	
Cost of administering incentive scheme	11	
Total extra cost		46
Net saving per house		15

To give better pay, save labour, and at the same time make even a modest saving in cost is worth while. But the modest size of the saving to the eventual purchaser of the house is obvious. The benefits of the incentive

* The Cost of House-Building. Second report of the committee of inquiry appointed by the Minister of Health. H.M.S.O. 1s. 3d.

scheme are largely taken up in higher earnings. The other factors which have lately tended to raise building output per man are expending themselves, and it is not easy to resist the conclusion which the committee draws:

> In such circumstances, any further saving in cost on account of improvement in productivity is likely for some time to be small.

In addition to the cost of incentive bonuses, craftsmen's wages have been raised by 4½d. an hour, and labourers' wages by 4¾d. an hour, since 1947. In total, the cost of wages and bonus in building the average house has risen from £364 to £373. There is, therefore, no net saving here to set against the rise of 14 per cent (from £699 to £798 for an identical house) which has taken place since 1947 in the cost of materials. The prices of building materials reflect for the most part the price and cost levels of commodities in general, and the committee seems to entertain no hope that they will come down. Indeed, it points out that most of the increases which it records took place before 1948, and further increases arising from devaluation can hardly be avoided.

*

A little has been done already to offset the increase in material costs by economy in the structure and equipment of the house. This has, indeed, to some extent been forced on the local housing authorities, some of whom have "become aware that total costs are reaching a level where rent, unless further subsidised from the rates, may be more than some of the applicants in most urgent housing need are able to afford." Impelled by such considerations, they have found ways of saving an average of £41 a house by such devices as simpler wall finishes, fewer electricity points, and less elaborate cupboards and fittings. Boundary walls, paths, and exterior paving have been pared. An attempt has been made to concentrate on the simpler designs. But even these economies have, in turn, been partially offset by a further increase (expressed as 21 square feet of floor space) in the average size of the house. While, therefore, the 1947 house would have cost £1,346 to build in 1949, the 1949 house with its slightly larger size and its slightly more austere standard of construction and fittings cost £1,321. Unless the standard is cut further, the price (there seems little doubt) will go on rising:

> We think it improbable that there can be any substantial reduction in the general level of house-building costs in the near future and, as far as we can judge on present information, the indications are that it may be difficult to avoid a further increase.

The Girdwood committee recommended in 1948 that policy regarding the standards of accommodation and equipment should be reviewed "in the light of present-day conditions," and it repeats the proposal now with rather more emphasis. As it recognises, there are two views about housing standards, and the Government needs to choose between them. One view is that "national standards fifty years hence may be better served by a programme, such as the present one, of building fewer and larger houses." The other is that

> it would be preferable to build more and smaller houses now in order to shorten the period of years required to provide a separate home for every family and to replace the worst of the sub-standard dwellings now existing.

The committee leaves no doubt of its own feeling that a more modest set of housing standards is needed. Quoting last year's "Economic Survey," it points out that Government policy decides the volume of housing work that can be permitted, having regard to other claims on resources; thus the rate of house-building can only be increased by building a smaller or less elaborate house.

Housing subsidies, uneconomic rents, and public borrowing at artificially low interest rates help to conceal the high cost of building from the fortunate tenants of new council houses. Except as taxpayers or ratepayers—and then in common with other people lower down on the waiting lists—they are spared much of the burden. But the burden has to be carried somewhere, and in fact it is carried largely by the less fortunate families which might have hoped for a house if more houses could have been squeezed into a capital investment programme of a given size. A perfectionist housing programme, whatever else can be said for it, is certainly not equitable.

*

All reasonable considerations suggest that the standards of subsidised housing will have to be cut. This does not mean, however, that the present high cost of the building industry or its present low efficiency ought to be accepted with complacency or resignation. They should not. The output of an average building worker is still well below his prewar output, and the productivity team which visited the United States last year formed the impression that it was only two-thirds of the output of a building worker in the United States. To bring output back to the prewar level may cost not much less, in incentive bonuses and similar payments, than the value of the man-hours saved. Still, it needs to be attempted. But, at the same time, other ways need to be explored of restraining and if possible reversing the rising curve of costs. Such an attempt will have to extend to the trades which supply fittings and materials to the builder, but it will also need to break fresh ground in examining the structure of the building trade in postwar conditions and the trading function of its members.

The Minister of Health threw some perhaps unintentional light on this subject in Monday's debate in the Commons, when he naturally enough sought to blame the building employers for all that is wrong. Private enterprise in the building industry had, he said, "failed to take advantage of its opportunities." Having "inherited the psychology of the economic jungle," it had "not yet learned how to adapt its building and conduct its economy in a society with full employment." Mr Bevan maintained that private enterprise is to blame because it is still the private enterprise builder who builds the houses—whether under contract to local authorities or under licence and on his own initiative. He added that most of the builder's work is done with public funds, and this is "one further reason why the building industry is not as efficient as it should be."

Some allowance has to be made for Mr Bevan's exuberance in debate. The state of things as he described it is not, of course, private enterprise; it is a set of arrangements which makes the builder, in effect, a professional man supplying a service to the public authority in return for a reward which is unlikely to vary greatly with his efficiency. Innovations in method are hardly likely to arise under such a system. Efficiency is likely to be largely a matter of chance. But the fact needs to be faced that if building methods continue unchanged and no further way of securing efficiency is found, then nothing can prevent building costs from continuing to rise.

Are Profits High Enough?

AFTER the Chancellor's budgeting and the forecasting in the recent "Economic Survey," a rather different question has now to be asked about profits. A year ago, it could be asked whether they were too high—to which the answer was "No." Six months ago, the question was whether profits were falling and would go on falling—to which the answer was "Possibly." The issue for 1950 is whether profits will be high enough to make a contribution to savings on the generous scale that the Chancellor evidently expects. The total sum estimated to be needed to finance the investment programme in 1950 is £2,485 million. Towards this total, the public authorities are expected to save £505 million, industry's depreciation allowances may contribute £900 million and its undistributed profits £600 million, leaving £480 million to be found from personal savings. Reasons have already been advanced in *The Economist* of April 29th for supposing that these estimates of savings are optimistic; if they are not forthcoming voluntarily, they can only be produced at the expense of further inflation.

This explains the importance of examining the estimates of savings from what the National Income White Paper calls "corporate incomes." These include the profits of companies on the one hand, and public enterprises (mainly the nationalised industries) on the other; the following table shows what is expected of them:—

CORPORATE SAVINGS

(£ Million)

	1948	1949	1950
Depreciation allowances..	675	865	900
Free reserves	766	508	620
Of which inventory gains	*400*	*75*	*100*
Added to, or taken from, tax reserves	*191*	22	*20?*
	1,250	1,395	1,500

The profits of these enterprises as a whole, it is hoped, will increase sufficiently to raise their appropriations to free reserves (after making allowance for depreciation and tax reserves) from £508 million in 1949 to say £620 million this year. This is a very considerable increase. It runs contrary to the Chancellor's own observation in his Budget speech that the progressive increase in profits that had gone on since the outbreak of war came to an end in 1948. It also runs contrary to the showing of some, though by no means all, company reports that have recently appeared. In the measurement of profits, however, time is a confusing element. The statisticians who produce the national income estimates find themselves able to put forward a figure for profits within three months after the end of the calendar year. This is a good deal faster than some sectors of industry can work out the figures for themselves. For example, the company reports that were published in the first quarter of this year related roughly to an average financial year which ended last September. It is impossible to determine from the form of annual accounts required by British law what the total profits of industry for a given calendar year may have been; all that they show is the calendar year profits for those companies whose accounting years correspond to a calendar year. Companies whose accounts close at dates other than the year end show a mixture of profits belonging to part of the calendar year and part of the preceding year.

*

There is, therefore, no accurate basis of comparison between the estimates of profits in the National Income White Paper and the analysis carried out by *The Economist*. On the question whether profits may increase to the required extent in 1950, the following table throws a little light, but the time lag between the earning of profits and their publication severely limits its application to the prospects for this year:—

MOVEMENT OF TRADING PROFITS

Quarter of Publication Ended	Approximately Corresponding Financial Year Ended	Change in Trading Profit compared with Previous Financial Year
1948	1948	Per cent
September ...	March ..	+35
December ...	June ...	+20
1949		
March ...	September ...	+17½
June ...	December ...	+15
	1949	
September ...	March ...	− 1
December ...	June ...	+ 1
1950		
March ...	September ...	+ 6½

The comparative stability of profits in the approximate financial years ended in March and June, 1949, bears out what the Chancellor said about the failure of profits to rise further in 1948. The expansion of 6½ per cent in the financial year ended last September (that is, as shown by reports published in January to March this year) marches fairly closely with the increase of about 7 per cent in retained corporate profits last year, as shown in the first table. Beyond that it is hardly possible to go in testing the estimates of company savings that have been put forward. Many recent company reports have shown considerable further increases in trading profits; but there are also important exceptions, such as Dunlop and ICI.

The official statisticians, in their national income estimates, show the trading profits of companies and public enterprises separately, and also their payments of dividends and interest on capital. But they do not give separate figures (as between companies and public enterprises) for depreciation, tax provisions, or reserves. This presents a further difficulty in comparing the official figures with our own. The trading profit of 2,550 companies (whose reports appeared in the twelve months ended last March) amounted to £891.3 million, an increase of 6 per cent over the total of £838.1 million in the preceding twelve months. These figures (set out in the table overleaf) are a mixture of 1948 and 1949 results; they were published during a twelve month, but were earned over a longer period, because some accounts are delayed longer than others. Moreover, they are struck before depreciation, whereas the White Paper figures for company profits (£1,590 million in 1949 against £1,685 million in 1948) are struck after depreciation. The companies in *The Economist* sample provided £124.5 million

for depreciation, according to their reports published in the last twelve months, against £110 million in their accounts a year earlier. Net trading profits after depreciation would thus be £766.8 million in the latest twelve months, or just under half the total shown in the White Paper. But since that document puts the joint depreciation allowance for companies and public enterprises in 1949 at £865 million whereas the amount shown in the accounts of *The Economist's* sample is £124½ million—about one-seventh of that total—the comparability of the two sets of figures is clearly suspect. The difference may be partly explained by the technical methods used by companies in accounting for the initial allowances on new capital expenditure; since these amount to 40 per cent, accounting technique may make a very great difference to the end-result in computing company profits.

The White Paper shows that dividends and interest paid by the companies last year amounted to £710 million; the comparable figure for companies in *The Economist's* sample (after adding back tax at the standard rate) was nearly £300 million—again rather less than half. Provision for taxation by companies and public enterprises (the latter could not have been very large) is put at £721 million; of this, *The Economist's* sample represents considerably more than half at £392 million. Of the corporate reserves of £508 million set down in the White Paper for 1949, about £217 million can be identified from *The Economist's* figures. The best guess—and it is no more—is that the profits and provisions of public companies account for about half of the total of corporate profits shown in the White Paper.

NOTE: Detailed analysis of the figures summarised above will be published in next week's issue of the *Record and Statistics* supplement.

All these comparisons at least justify a sceptical approach to confident estimates of profits in the recent past and even more to apparently optimistic forecasts of profits for the future. If the official estimates are to be realised, there should be clear and prompt signs from the published profits of public companies of a rising trend. So far as the statistical evidence goes, there was such a rise in the year ended in September last. There may, on balance, have been a further rise since that time. If commodity prices continue to boom, and economic activity is fully sustained, there seems no reason to doubt a further increase in profits during the course of this year. In short, the advantages of rising prices seems likely to outweigh, on the net view, the disadvantages of rising costs. This favourable conjuncture will not apply uniformly to all industries; many concerns in the consumer goods industries are feeling the chilly wind of falling demand and increased competition and are likely to go on doing so. But it does seem that the check to profits which became evident between six and nine months ago has been replaced by a further rise—and it is not fanciful to link the check with the effective phase of disinflation and the resumed rise with its waning effectiveness. Sir Stafford Cripps is counting on a rise in profits this year, despite his fears that profits are no longer expanding; much of his policy can be counted upon to produce one. What has now to be seen is whether his policies, and the forces of renewed expansion in the world economy, will produce a sufficient rise to support the tasks to which the British economy is committed.

HENRY GARDNER & CO. LTD.

(CAPITAL AND RESERVES, £1,800,000)

is associated with

The Cyprus Co. Ltd., Drew, Brown Ltd. (Canada), Sandilands Buttery & Co. Ltd. (Malaya) and C. Tennant, Sons & Co., of New York and with the organisation of The British Metal Corporation Ltd., London, Australia, Canada, India and South Africa.

The Group provides manufacturers and producers of finished articles and raw commodities with an economical method of marketing their products throughout the world. Expert knowledge in distribution and salesmanship is available through the various units of the Group.

Business Notes

Buoyancy of Gilt-Edged

The happier feeling in the gilt-edged market that allowed the launching of the big Electricity loan at the beginning of this month has since lost only a little of its first bloom. Towards the end of last week and early this week, indeed, the market almost had the appearance of enjoying a minor boomlet not unlike that which followed the issue flotation twelve months ago. Now, as then, however, any such description is justified, not by the volume of business passing but by the behaviour of prices alone. The rise that has occurred in narrow markets since the BEA issue is now quite impressive, especially in the irredeemable and longest-dated stocks. Old Consols, including a leap of ¾ last Friday, had by mid-week reached 70⅞, showing a rise of 1⅛ this month, equivalent to a fall in the flat yield from £3 12s. 11d. to £3 11s. 4d. per cent. Over the same period the longest-dated Savings Bonds have risen similarly, while gains of 1⅜ or more have been registered by the Gas and Transport stocks.

To the extent that this buoyancy derives from relief that the BEA issue is now safely "out of the way," it wears a somewhat spurious air—for reasons given in this column a fortnight ago. But there is no doubt that the market is benefiting from reinvestment of funds temporarily held idle until the electricity operation; and this demand has enabled the authorities to resell perceptible amounts of the new stock at a steadily rising premium. There is no sign, however, that they are anxious to press their sales. One reason for this is doubtless the need to make maximum use of this opportunity to shorten the queue of trustee borrowers. The first in line proved to be the East Africa High Commission, which on Thursday made its second approach to the market within two months. As before, the issue took the form of 3½ per cent Stock, 1966/68, guaranteed by the Governments of Kenya, Tanganyika and Uganda; but the amount sought was £7,100,000 (of which £2,008,000 had already been placed and £500,000 was reserved for applicants in the territories concerned), compared with £3,500,000 offered mainly for conversion last March. The issue price was raised by two points to 99½, but as the first tranche was standing at a premium of three points on the eve of the underwriting arrangements, the authorities could scarcely be accused of cutting the terms unreasonably fine.

The queue of borrowers has, now, it seems, also been joined at last by the Coal Board; the first issue of Compensation Stock, to provide merely for payments on account to those colliery companies that seek advance payment and can agree the figures with the authorities is expected in a few weeks' time. Another of the recent newcomers to the market, the 4 per cent debenture stock of H. and G. Simonds, has made an impressive debut—but the contrast with the fate of the Stilfontein issue, quoted at a substantial discount, drives home the truth that the brightening of tone is closely confined to investment stocks and that the Kaffir market has still not shaken off its malaise.

*

Meanwhile, the market for short bonds has quietened down after its phase of sustained strength. Paradoxically, the slight shading of prices this week followed indications that the tap in the new 2¼ per cent Exchequer stock was ceasing to flow. During the three months that have elapsed since the redemption of the 1¼ per cent bonds, the authorities have been able to place large lines of the new stock, at first by selling for cash and, later, mainly by sales made against purchases of the 1949/51 National War Bonds. Estimates of the total amount unloaded from official portfolios range from £150 million to £200 million. Naturally, the discount market has absorbed part of these offerings, but a substantial proportion is believed to have gone to the banks and the big industrial companies. The fact that the authorities no longer seem keen to part with stock even against purchases of the 1949/51 bonds has given rise to suggestions in some quarters that the first stage in the preparation for the redemption of the latter security may already have been completed. Most market circles, however, adhere to the view that the most likely repayment date for these bonds is February 1st next; the latest possible redemption date is August 1st next.

* * *

EPU and Britain

The British representatives on the Organisation for European Economic Co-operation have this week presented to the Payments Committee of OEEC their proposals for British membership of the EPU. The memorandum falls into two parts. The first deals with the "special" position of sterling in the context of intra-European compensation. It takes over the device first mooted in the Ansiaux plan, to offer creditors in the periodic compensation the option of taking their credits in clearing units (the unit of account of EPU) or in sterling. The option, if exercised in favour of sterling, is subject to somewhat complicated qualifications. The British Government accepts full membership of the EPU and agrees to the principle of offsetting fully European surpluses and deficits, i.e. full transferability of currently acquired European currencies.

The second part of the British memorandum develops general proposals for the granting of credits, the length of the "swings," the extent and timing of gold payments and other technicalities. This section of the paper is causing certain difficulties. The British proposals show the familiar desire to postpone gold or dollar payments to the last possible moment and to endow the proposed EPU with the widest powers of credit extension. These views have not met with unanimous support. There is an opposing school of thought, led by Belgium, which wants to restrict the credit creating potentialities of EPU and introduce the dollar or gold payment points at the earliest possible moment. A compromise between these two extremes will no doubt be achieved. But it would be unreasonable to expect it in time for the meeting of the Ministerial Council that is due to open in Paris on June 2nd. The British delegation at this meeting will be led by Mr Hugh Gaitskell. All being well, the new EPU machinery should be ready to take over from the Intra-European Payments Scheme when it closes its second annual circuit on June 30th next.

* * *

Double Taxation Relief

It is rare for a clause in the Finance Bill to be greeted with universal satisfaction. The amendment that the Chancellor has tabled on double taxation has this welcome character. Hitherto, relief from double taxation has been bilateral, in the sense that it was granted to British subjects in respect of taxation imposed by another country only if a double taxation convention had been agreed by the United Kingdom and the foreign country concerned. A large number of conventions have been signed since the war, between this country and the United States. But some gaps have remained—in Europe, South America, India, Pakistan and Ceylon.

The effect of the new clause will enable a British taxpayer to claim credit for taxes paid outside the United Kingdom (whether in countries that have entered into double taxation conventions with this country or not) up to limits of 75 per cent of the combined rates of income tax and

profits tax for Commonwealth countries and of 50 per cent of these combined rates for other overseas countries. Dominion income tax relief, as provided in the 1920 Finance Act, will disappear ; it has, of course been largely supplanted by double taxation relief provided under conventions with many Commonwealth countries. But in several cases—Ceylon is an instance—its replacement by unilateral relief under the new clause will have many advantages, including simpler administration, which Ceylon tea shares have been quick to reflect.

In a wider context, the introduction of unilateral relief will remove a major disincentive to export trade in certain markets where relief in respect of local taxation has hitherto been denied. There have been many instances of lost business in recent months that have been due to the fact that double taxation would have absorbed virtually the whole of the profit and left a wholly inadequate return for enterprise and risk taking. The benefit to British industrial concerns with widely spread markets overseas should be appreciable.

* * *

Stock Exchange and Public

Anxious thought has been given in recent months by result ock Exchange authorities to what, for want of a better comn, must be called its "public relations." Ignorant and prejudiced criticism has long been the occupational hazard of the dealer in securities, and in recent years—when the public temper has too often inclined towards writing off old institutions on the ground of their defects—there has been a real need for the public to know how the Stock Exchange functions, and how its work fits into the economic system as a whole. The need has coincided with the stress of internal changes in the character and scope of the markets, and of external changes in modes of saving and investing. These new factors strongly indicate that the Stock Exchange of the future will be a very different place from the Stock Exchange of the past.

It is much to be welcomed, therefore, that the Council is now actively exploring ways of improving the public's knowledge of Stock Exchange matters. Mr John Braithwaite, at the annual meeting of proprietors on Wednesday, indicated that three initial steps are under consideration. First, it is hoped to provide more adequate statistics relating to Stock Exchange business—not an easy matter, but one that has long called for improvement. Secondly, it may be possible to arrange for admission of the public to see the way business is carried through on the floor of the House ; there are difficulties of accommodation to be overcome, but it may be that in time the Mappin Terraces of Capel Court will serve a useful purpose in educating the public in the habits and antics of "bears" and "bulls." Thirdly, a film on the history and functions of the Stock Exchange is under consideration ; perhaps this provides the greatest opportunity for projecting, in popular terms, the part that the security markets play in the country's economic life.

Proposals such as these would have aroused horror only twenty years ago, and even today they will not be entirely free of contention. But the main point is clear. The conception of the Stock Exchange is changing from a mystery mistrusted by the average citizen into a public service, which must be understood by the public if it is to serve them efficiently. To explain itself to the public, the Stock Exchange will indeed be embarking on a lengthy and costly job. But under modern conditions it is an inescapable responsibility.

* * *

Dollars for Argentina

The long delay in resuming the Anglo-Argentine trade and financial negotiations must be related to the news that the Export-Import Bank of Washington has granted Argentina a credit of $125 million. It is evident that Argentine ministers and Government officials have had their attention so concentrated on these dollar loan negotiations as to leave no time for discussions with the British mission that has been kicking its heels in Buenos Aires since early February. Moreover, nothing was to be lost by Argentina in delaying negotiations in which the Argentine hand would be considerably strengthened if, as has now occurred, the aid of dollar credits were forthcoming. A large part of the credit from the Export-Import Bank will be required to pay off commercial debts to the United States on which Argentina had to default last year. These debts, including large amounts due on confirmed bankers' credits, amounted to between $150 million and $200 million. Arrangements were made towards the end of last year to earmark first 20 per cent and then 30 per cent of Argentina's gross dollar earnings to repay these liabilities. The amount outstanding is estimated to have fallen to just over $100 million. The Export-Import Bank credit will, therefore, suffice to repay the balance of these debts with a little to spare.

As the debts are repaid, the American banks may again loosen their purse strings. There are already suggestions that a $75 million Argentine credit has been arranged jointly by the National City Bank and the First National Bank of Boston. With more dollars at their disposal, the Argentine negotiators may be expected to adopt a somewhat "tougher" attitude towards Britain in such matters as Argentine purchases of non-essentials from sterling countries. These additional dollars, however, will be of no help in getting rid of Argentina's exportable meat. The British market for meat remains the strongest card in Britain's hand for the poker game that is being played in Buenos Aires.

* * *

Refineries and Rationing

If the scale and value of British operations in the world oil trade are considered for a moment, it seems strange that discussion of oil matters at Westminster should be so largely in terms of domestic refining and the domestic motorist's ration. Yet the fact seems to be that the larger and smaller subjects have become thoroughly intertwined in the mind of the Government and of Parliament. Conservative Members, in last week's debate in the Commons on petrol rationing, attacked the Government for having been slow with the home refinery programme. Labour Members reproached the Opposition with having "left refineries to be built in foreign territories" before the war, and maintained stoutly that "we"—meaning, apparently, the present Government—had been energetic and imaginative refinery-builders. The fact is that the oil companies did not build general refineries in Britain before the war because they did not think it would be good business to do so. Since the war, in a changed set of circumstances, they decided that it would be good business after all. The Government's part—a creditable part, but not spectacular—has consisted principally in giving out the necessary permits without unreasonable delay.

In the past year, with many of the earlier obstacles out of the way, the pace of refinery-building has been sharply accelerated. Work on the Fawley plant started late, but its progress since the autumn has been astonishingly rapid. Various considerations, mainly of a financial kind, held up until last year the final decision to go ahead with the Fawley project. So large an American investment implies substantial dollar remittances to the United States in the future, and there were misgivings on both sides about this. There was talk at one time of the Economic Co-operation Administration being asked to guarantee the investment. Finally the American parent company decided to make the entire investment from its own dollar funds, and the misgivings were overcome. These facts are common knowledge ; to recall them now would be unnecessary had not the Minister of Fuel and Power unearthed yet another explanation for the delays which are now over. "Labour was in urgent demand for reconstructing Southampton and rehousing the people," said Mr. Noel-Baker. It would really have been better to let the matter rest.

Now that the refinery programme is well under way, the men in the industries concerned who have been working hard to get the plants built may feel a little rueful on learning that the progress made has been achieved by official zeal. They may be puzzled, too, to find that the purpose has apparently been to supply that part of the British oil consumption—a relatively trifling proportion—which is held in check by petrol rationing.

* * *

Future of the Oil Talks

Mr. Noel-Baker mentioned in last week's debate a new offer from one of the American oil companies, and seemed not without hope that it might lead to some agreement. The offer is believed to refer to the British market, and the suggestions which have been heard that it may have a big effect on the domestic petrol ration may well be true. But the main hope to be placed in it is that an agreement on one matter, however limited, might break a state of deadlock that has gone on for too long. If this could be done the way might be cleared for a wider, more constructive discussion. There is every need for Anglo-American talks which would look ahead and seek a rational development of the expanding world oil trade. A year ago there seemed to be some prospect of such an approach, though the difficulties were and are formidable. Instead, a series of disputes arose about pockets of trade in the soft currency countries and finally about the trade in the sterling area itself. Over these questions the Anglo-American talks have become entangled and the negotiators themselves exhausted.

Yet the matters now in dispute are not so large that a turn of the market cannot render them irrelevant—as, for instance, the up-turn in the United States market which since the beginning of this year has converted a glut of fuel oil into almost a scarcity. In contrast there are many oil questions in which the American and the British interests are mutual, and the solution of these would bring very large advantages to both sides. How to secure an effective exploitation of Iraq oil is one such question.

A limited agreement with one company will not resolve all the present disputes. Nor will a successful conclusion of these talks—if some happy turn of events should bring it about—settle the more important questions of future development in the overseas oil-bearing regions of the world. Perhaps oil talks between Britain and the United States will have to be accepted as an enduring phenomenon. But first of all the disputes which have arisen over local markets will need to be settled, or shelved: it does not greatly matter which.

* * *

Clothing Development Council

The action by which certain firms in the clothing industry sought to have the Clothing Industry Development Council Order of last year declared void by the High Court has failed. Mr Justice Sellars gave judgment for the Board of Trade last week. The order was made under the Industrial Organisation and Development Act, 1947, and that Act requires that the Board of Trade shall first consult with both employers' and employees' organisations within the trade and that no order shall be made unless the Board is satisfied that the development council is "desired by a substantial number of the persons engaged in the industry." The plaintiffs claimed that the order was not desired by a substantial number of employers in the industry and that, in effect, the Act meant that both a substantial number of those employing as well as employed must desire the development council before the Board of Trade could validly set one up.

Mr Justice Sellars found that in fact it was impossible to say that a substantial number of persons on both sides of the industry did not desire the development council. The majority of firms inside the employers' organisation did not want it, but, in numbers, the employers' organisation spoke only for some 6,000 concerns out of 24,000 in the industry. In addition some 1,000 firms which processed clothing were in favour. On the employees' side, two trade unions did desire the council and they represented some 150,000 people out of the 474,000 working in the industry. These facts in themselves were, he said, sufficient to defeat the plaintiffs' claim. Counsel in the case had also argued a further point, one that always arises in a claim of this kind. The Attorney-General, for the Board of Trade, had argued that the Court had no jurisdiction to interfere in the exercise by a Minister of a discretion given to him by Act of Parliament, the plaintiffs the reverse. It was unnecessary, Mr Justice Sellars said, for him to determine that question.

This case establishes no legal precedent ; it has been decided on its own set of facts. At the moment the courts still act on the sensible rule that they have inherent jurisdiction to hear complaints concerning ministerial actions but that it is not for the judiciary to interfere with what are in reality political decisions ; their right to quash a ministerial order must be reserved for cases in which the Minister has either not followed the steps laid down by Parliament or has acted in a fashion completely at variance with the elementary principles of justice. It is difficult to see how this practice could be changed with advantage. Judges should not reverse political decisions ; by attempting to do so they would weaken, if not lose, their capacity to reverse decisions which are unjust or illegal.

But this judgment leaves a practical question open. Will this development council be of much use to the clothing industry while the organised employers remain in their present mood ? For moods are not reversed by statutory instrument, judicial decree, or Act of Parliament. Mr Harold Wilson has not yet won his real battle.

Cotton Doubling and the Tax System

The flow of productivity team reports continues.* The investigations made by the cotton yarn doubling team suffered in some ways from the fact that the American industry, being unacquainted with the division of cotton manufacture in Lancashire into its detached sections, regarded the spinning, doubling and weaving teams impartially as three manifestations of a Textile Productivity Team. The three processes in the United States "are normally carried out in the same mill and regarded to all intents and purposes as comprising only one industry." In the upshot the doubling team saw very little doubling.

It has, however, some useful things to say about American practice in such matters as the estimation of work loads and the application of cost, production and quality standards. The team came away persuaded that the current American methods of making a scientific work-load assessment and basing upon it a system of payment that relates reward to effort are sound and offer a pattern for the British mills to follow. It urges more attention to the training of new entrants in correct methods of working by means of the Cotton Board's "training within industry" scheme. It acknowledges the excellence of the American arrangements for testing the yarn and securing close control of quality. Conceding that American productivity is higher than British, it attaches importance to "production-consciousness," the attitude of

* Cotton Yarn Doubling. Anglo-American Council on Productivity. 3s.

mind that causes American unions to bring pressure to bear on a management that appears slow to adopt mill improvements. The team also falls into one old and interesting error.

The error arises from its observation that the piece-rate in American mills works quite well without an incentive bonus added, and that this fact "is bound up with the low rate of taxation in America." British taxation, it reasons, makes a different method necessary:—

> The incentive to higher productivity would be greatly increased if operatives were paid on the basis of a flat rate *plus* production bonus, provided that, at the same time, the method of taxation were revised to enable such bonuses to be paid free of tax.

The fact is that everybody, not only the doublers, would be delighted to work harder if they were permitted to enjoy the use of their earnings. But if the public authorities insist on taking 40 per cent of the national income or more, tax-free bonuses will not avert the consequences. If the doublers had such a bonus everyone else would want one too, and a general interest would be created in whittling away the standard, cutting down the basic day's work, and inflating the tax-free earnings at the margin. Few things could be worse than the present tax arrangements, but this would be. Heavy taxes inhibit high production; there is no way round that hard fact.

* * *

Lull in Exports

A decline in exports last month was to be expected in a short month interrupted by the Easter holidays: April, in fact, contained only 23 working days compared with the standard 26. April's total exports of £150 million were, however, £34 million lower than in March, and this was too sharp a reduction to be explained entirely by the shorter working month. The trend in exports during the past twelve months, adjusted to the standard 26 working days, is shown in the following table:

UNITED KINGDOM EXPORTS
(£ million)

May, 1949.....	151½	Sept., 1949.....	142	Jan., 1950.....	176
June, „	155	Oct., „	156	Feb., „	169
July, „	141½	Nov., „	160½	Mar., „	177½
Aug., „	137	Dec., „	160	Apr., „	169½

The rate of exports in April was about 3 per cent lower than the average for the first quarter of the year, but some 12 per cent above the average for 1949.

Exports of vehicles totalled £32.7 million, only £700,000 lower than the monthly average in the first quarter. The number of new cars exported fell from a peak of 36,608 in March to 29,056 in April, while shipments of commercial vehicles and chassis declined from 12,823 to 10,757. These reductions, however, were almost entirely offset by larger exports of ships and aircraft. Exports of machinery last month fell by 16 per cent compared with the average for the first quarter, and iron and steel goods by 10 per cent—reductions that were generally spread over the various markets. Textiles also experienced sharp falls; cotton and wool exports were each some 14 per cent smaller. These figures were redeemed by the fact that shipments of cotton and wool textiles to Canada and South Africa increased last month.

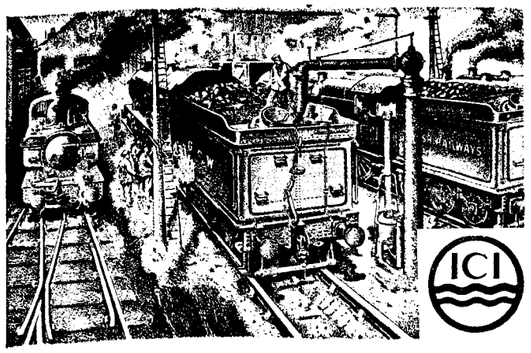
Exports to Canada have in fact maintained a steady improvement since October; in April, they were 13½ per cent higher than in March. Shipments to the United States, unhappily, declined sharply and were at the lowest rate since October. This reduction was accounted for mainly by much smaller exports of whisky and china clay: shipments of many other goods, including cotton and woollen tissues, china and earthenware and cycles increased compared with March and also with the monthly average for the first quarter.

"Two-Tier" Staffing for the Banks?

Most employers of large clerical staffs must already be aware that social changes accelerated by the war, and especially those resulting from the Education Acts of 1944 and 1945, are altering radically the accustomed patterns of their staffing problems, although the full effects may not be apparent for some years. Among the institutions likely to be most directly affected are the big banks, but so far most of them have seemed reluctant to come to grips with the task of formulating new policies. In the circumstances, Lord Balfour of Burleigh has performed a notable service—to other employers besides his fellow-bankers—by boldly bringing these difficult questions into the forum of public debate. The most pressing problem, to which he devoted the bulk of his valedictory address last week as President of the Institute of Bankers, is that diagnosed in a passage from the report of the Carr-Saunders Committee on "Education for Commerce," published at the end of 1949. This pointed out that, as young people of ability and enterprise pass in increasing numbers through the Universities, "any occupation which neglects the graduate will recruit largely from among those who are below the average in these qualities." In other words, if the banks and other similar institutions continue their tradition of taking an overwhelming proportion of their recruits direct from school, they are likely to be unable to secure the average quality of personnel to which they are accustomed, and may find themselves, in a few years' time, particularly deficient in men and women suited for higher posts.

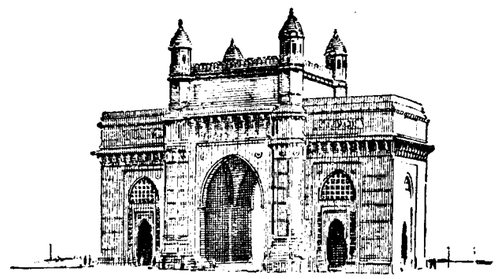
Tentative experiments made by the banks in the past in recruiting graduates by systems of so-called "special entry" have not been outstandingly successful and have served merely to create among the generality of bank staffs an abhorrence of any formal "two-tier" system, which would be against tradition. Lord Balfour believes, however, that an entirely new approach must soon be made to this problem. He points out that in practice the staffs of the banks tend inevitably to divide themselves into two broad classes—regardless of the social and educational background of the men and women concerned—corresponding to the two kinds of employment the banks have to offer. He therefore feels that new systems of special recruitment of graduates in considerable numbers ought not to be regarded as in any way objectionable—provided that "every junior" still has a "C.G.M.'s baton in his attache-case." It will be long, perhaps, before the banks as a whole alter their practice radically, though some are already making tentative moves, but Lord Balfour's thesis plainly merits full and open-minded consideration by all of them.

* * *



Shipbuilding Costs

Private shipowners and shipbuilders, who have long been complaining of continually increasing costs, will not be surprised to find from the report of the Comptroller and Auditor General on the Civil Appropriation Accounts for 1948-49 that Government departments have had much the same experience, though in exaggerated and even bizarre forms. The story of two former German vessels in the hands of the Ministry of Transport is related, although their names (presumably now *Empire Orwell* and *Empire Fowey*) are not mentioned. These ships were first converted into troopships in 1945 at a cost of £624,000, but on their first voyages serious engine defects were disclosed and they had to be withdrawn from service. In June, 1946, it was estimated that new boilers and machinery for one ship would cost £350,000, while in March, 1947, similar work for the other was estimated at £400,000. It was then proposed that the opportunity should be taken of refitting the vessels as troopships of the most modern standard, and a tentative figure of about £150,000 per vessel was suggested for this work. By January of last year the Ministry of Transport



Water Treatment

Some industrial processes can only be carried out with soft water and industries such as dyeing and bleaching first became established in those areas in which the water is naturally soft. Nowadays, the chemist can make water suitable for almost any purpose. The origin of water treatment may be traced back to a Scots doctor, Thomas Clark, who discovered in the first half of the last century that certain types of hard water could be softened by adding lime; "Clark's method" is still the basis of the lime-soda water treatment process which is widely used in industry today. Since Clark's pioneer work, many other chemicals have been produced for the treatment of water. In 1938, for example, two British chemists, Adams and Holmes, discovered the value of synthetic resins for treating water to be used in certain industrial processes—where a water of high purity, comparable with that of distilled water, is required.

One of the greatest, but least known, achievements of the British chemical industry is to treat, every day, thousands of millions of gallons of water used in textile processes, laundries and boilers—an achievement which saves the community many millions of pounds annually. British Railways treat between fifty and one hundred million gallons of water a day in order to maintain their locomotive boilers in sound condition and free from scale. The British chemical industry also provides the housewife with soda crystals and similar alkalis which form the basis of domestic bath salts and water softening compounds.

ICI

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

A comprehensive banking service is available at the Bank's branches in

INDIA PAKISTAN CEYLON BURMA KENYA ZANZIBAR UGANDA TANGANYIKA and ADEN

NATIONAL BANK OF INDIA LIMITED

Head Office: 26 Bishopsgate, London, E.C.2.

In Australia and New Zealand

With total assets of over £300,000,000 and with over 800 branches and agencies throughout Australia, New Zealand, Fiji, Papua and New Guinea, this Bank is better equipped to facilitate trade with these countries than any other institution there.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817

(Incorporated in New South Wales with limited liability)

LONDON OFFICES:
29 Threadneedle Street, E.C.2
47 Berkeley Square, W.1

GB4906. E.

reported to the Treasury that difficulties had been experienced in regard to the machinery, that there had been a persistent rise in costs, aggravated by delays (intensified by the priority given to other ships in the yards), and that the work on the two ships would cost roughly £1,560,000 for the engine work, £1,459,000 for trooping accommodation, and £1,064,000 for other work. The total cost of converting these vessels, which at last entered service this year, works out at about £4,600,000—possibly more than it would cost to build two similar ships today brand new.

Another sad experience has been with ships for carrying settlers to Australia. The seriously damaged *Monarch of Bermuda* (it can be presumed) was bought for £245,000 and the Australian Government was told that it could be converted into an excellent emigrant carrier for £1,000,000 ; this sum Australia agreed to put up. More detailed examination of the vessel, however, has shown that her conversion will cost considerably more than twice this figure. Australia then refused, naturally enough, to pay more than half. Now known as the *New Australia*, this vessel is still not in service. The cost of refitting two other ships has also to be revised "in consequence of expected increases from £542,000 to £1,500,000 and from £150,000/£200,000 to £650,000 respectively." These astonishing figures reflect more than the steadily increasing trend of shipbuilding prices in the period concerned. That trend has here undoubtedly been heavily accentuated by inexpert estimation, failure to specify requirements adequately, and delays and indecision which no private enterprise could afford. The Comptroller's report presents the taxpayer with a short course in the cost of official shipowning. Though shipbuilding costs did rise consistently during the period, it is apparent that the peak has now been reached. The chairman of the United Molasses Co., Limited (owners of tankers and of the Anchor Line) was able to record on Tuesday that tankers delivered this year cost no more than those delivered in 1949.

* * *

Private Work in Naval Dockyards

The Comptroller and Auditor General finds further scope for comment in the Navy Dockyard and Production Accounts for 1948-49—and particularly in a loss made on a commercial contract undertaken by one of the dockyards. The Admiralty undertook in 1946 to repair a badly damaged tanker for a Norwegian shipowner at a fixed price of £250,000. Work started in December, 1946, but was not finished until June, 1948. It was not until March, 1948, that the Treasury was informed that the job would probably cost about £350,000 to complete. The eventual cost proved to be £421,327, an excess of £171,327 over the contract price, although this deficit included charges amounting to £31,545 which involved no actual outlay. The loss gives some measure of the risks incurred by a private ship-repairer who quotes fixed prices, as is often the normal commercial practice. This incursion of a naval dockyard into commercial enterprise does not seem to have been a great success. Its most remarkable feature is that the price originally quoted was known at the time to be £20,000 lower than the estimated cost. It appears that in order to maintain employment in the dockyards when Admiralty requirements were declining, it was decided to accept commercial work on repayment—in other words, to compete with the private ship-repairing industry. Moreover, the Director of Dockyards had been authorised, if it should be necessary in order to get business, to quote fixed prices not more than 15 per cent below estimated costs. The unfortunate consequences of this procedure to the taxpayer are revealed in the report ; the principle involved has threatening implications, too, for the ship-repairing industry—which, it is worth while to point out, is a useful earner of foreign exchange in peace as well as a vital service in war.

New Stainless Steel Process

Much has been heard of the potential uses of oxygen as an aid to steelmaking, but evidence of its successful commercial application has so far been surprisingly scarce. The decision of the Sheffield firm of Edgar Allen and Company to make known the technique of oxygen "lancing" which it has evolved for the purification of stainless steel has, therefore, a special significance. The firm demonstrated the technique to the press last week. An electric arc furnace, charged with stainless steel scrap, was heated to about 1,700 degrees Centigrade in the ordinary manner. Oxygen was then blown into the molten alloy by means of a lance, and the temperature raised several hundred degrees further. This had the effect of burning out from the steel the greater part of the residual carbon. In the result a stainless steel of exceptionally low carbon content was produced with a considerable saving of time.

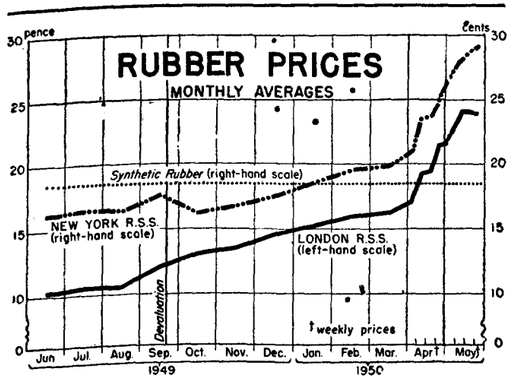
The persistence of carbon has always presented a problem in stainless steel manufacture, and the claim is made that the steel produced by this process is of superior quality and, because of its low carbon content, is more easily pressed, drawn or manipulated than normal good quality stainless steel. But the potential value of the technique is obvious in another way also. All steel manufacture produces scrap, which is usually remelted to produce more ingots. Stainless steel scrap presents a difficulty because the remelting process causes carbon from the furnace electrodes to enter into the steel ; the removal of this carbon was difficult and expensive, and also involved the removal of much valuable chromium which entered into the slag and was wasted. The oxygen process enables the carbon to be removed without a significant loss of chromium. Stainless scrap, which tended to accumulate in the works or to be sold off at very low prices, has become fully re-usable. Some 35,000 tons of stainless steel scrap arises in a normal year in Sheffield alone.

The commercial possibilities of the oxygen lancing technique hardly need, therefore, to be emphasised. Two questions arise, however, before an estimate can be made of the prospects of a substantial reduction in the price of stainless steel. The first is that the very high temperatures reached in the process must increase the wear on the furnace and frequent cooling of the furnace for relining would be costly. More experience is needed before this factor can be fully assessed. The other question concerns the price of oxygen, which is of interest to other industries which are considering oxygen processes. If a cheap and ample supply of oxygen is made available to meet the potential demand, such processes will no doubt be adopted the more readily.

* * *

Wool Reaches a New Record

Wool prices attained new record levels at last week's London wool sales, equalling or surpassing the fantastic heights of 1920. The rise was not confined to a few small lots of special quality wools, but extended to the average types which form the bulk of Bradford's raw material. The better merino wools (70's) sold at 154d. a lb, compared with 96d. in September ; the standard merinos (64's) were quoted at 148d. against 88d. at the time of devaluation, while fine crossbreds cost 116½d. a lb. against 68d. and coarse crossbreds (46's) 65d. a lb. against 36d.



The rise during the past eight months has thus been of the order of 70 per cent and the sharper rise has been shown by inferior than by superior qualities. Manufacturers are far from happy about the extent of the rise. Home demand for textiles has slackened and when this further sharp increase in raw materials emerges in final selling prices, it is feared that consumers will be further discouraged. The large export of tops in the past two or three months has overtaken most of the arrears in deliveries to overseas customers, but new orders are apparently not being received in anything like the same volume; overseas buyers are reluctant to pay present high prices, particularly for goods to be delivered at the beginning of next year.

Trends in the wool market since the war have run counter to all expectations. Wool consumption has substantially exceeded current production and the gap has been bridged by using up virtually the whole of the stocks held by the Joint Organisation. These stocks will be exhausted within six months and if the demand for wool continues at its present rate, a further rise in price is to be expected until demand is equalled to the current clip. There may well be scope for some economy in wool consumption ; although the wool textile industries of the world are using about 25 per cent more wool than they did between 1934 and 1938, their production of tissues is at present some 5 per cent less than before the war. But quite apart from the factors that govern its own supply and demand, wool is also sharing in the general commodity boom which has been developing since last November. In future, the wool market is likely to be much more sensitive to changes in economic conditions in America ; since the war the United States has become the world's largest consumer of raw wool and, with Britain, the world's largest importer.

* * *

Rubber at Two Shillings

Rubber has been close to two shillings a pound for more than a fortnight, and there are no signs of any imminent change. Consumption of natural rubber in the United States apparently continues unabated, although it is nearly 10 cents above general purpose synthetic, which costs 18½ cents a lb. As Sir John Hay points out in his address to shareholders of United Sua Betong Rubber Estates, this experience has at least shown that competition from synthetic rubber need not prevent the price of natural rubber from rising beyond some theoretically pre-determined level. Sir John's main assertion is that rubber is still not a dear commodity for American consumers. The average price last year (in American currency) was almost exactly the same as the average price for 1939. Even now the present price

is not much more than 50 per cent higher than the prewar level—though then, of course, attempts were still being made to control output.

Sir John gave some interesting figures on the rise in the cost of producing natural rubber since the war. If wages in 1939 are expressed as 100, existing rates for field workers would be 324 and for tappers 320. On the same basis, the current cost of building materials ranges from 365 to 415, nitrogen 215 and phosphates 203. Production costs have increased about threefold since 1939, quite apart from the increased cost of such services as housing, medical attention, maternity benefits, educational and recreational facilities. Yet the average price for rubber last year—in terms of local currency—was less than 25 per cent above its prewar level.

Great improvements have been made in the development and use of high yielding stock and in efficiency of management; these have absorbed part of the increase in costs. Sir John went on to plea for a stable price "which provides a fair standard of living for the workers on the rubber estate, which encourages consumption as well as production and which permits of a reasonable profit to the efficient producer." This is certainly an ideal which, if it could be achieved, would greatly improve the prospects of political stability in Malaya and South-East Asia. But it would not be easy to define such a price to the satisfaction of all parties, even for a limited period of time.

* * *

Two Impressive Results

A chain store concern, such as Marks and Spencer, trading in favourable conditions of continuing full employment, might have been expected to improve even upon its previous records. It is more remarkable that J. and P. Coats was able to achieve a further rise in profits in 1949. The experience of ICI and Dunlop, both of them companies whose activities, like those of the Coats group, are dependent to a considerable degree on external markets, was less favourable last year. Group profits of J. and P. Coats, after charging depreciation but before deducting taxation, rose from £7,890,490 to £8,282,752, compared with an increase of fully £1.4 million between 1947 and 1948. The dividend of 12½ per cent is repeated. Net profits are supplemented by a special credit of £2,250,000 arising from exchange differences. After crediting this impressive by-product of devaluation and deducting £4.3 million against £3.8 million for taxation, group net profit is £6,193,187, against £4,106,651. Doubtless J. and P. Coats contributed its full share to last year's rise of 14 per cent in cotton thread exports. Yet the fact that trading profits rose by about 5 per cent, compared with a 20 per cent rise in the previous year, when exports also rose by 14 per cent, suggests that higher raw material costs may have reduced profit margins.

Marks and Spencer's jump of fully £280,000 in net profit to £2,121,102 after increased depreciation, repairs and taxation charges is impressive. Group trading profits, after deducting interest and directors' emoluments, have risen from £5,269,883 to £5,844,661. The company is again supplementing the cash dividend of 60 per cent by a bonus share distribution, this year of one 5s. share for every 44 shares held. This requires £49,168 from reserves, and is thus within the £50,000 limit which does not require approval of the Capital Investments Committee. There is a hint here, presumably, of the resumption of annual scrip bonuses which before the war were a regular feature of Marks and Spencer finance.

Shorter Notes

The President of the Board of Trade told the cotton textile trade in March that adjustments of the ceiling prices for utility textiles would in future be made promptly to take account of changes in raw cotton and cotton waste prices. The first adjustments under this new policy were announced this week. New orders increasing the manufacturers' maximum prices for most utility cotton textiles will come into force on June 5th and 7th. The new prices are on the average about 2½ per cent higher than the existing maximum prices; they take account of price changes in raw cotton since January 5th and in cotton waste since March 2nd.

*

The Minister of Supply announced on Monday the termination of the control of distribution of steel, except for sheet and tinplate. Licences will still be needed to acquire these two relatively scarce products. Mr Strauss added that the administrative arrangements that regulate the distribution of certain types of steel tubes and pipes will continue for the time being. Other steel products, which have been in plentiful supply for some time past, can now be acquired freely, and the complicated system of allocation that has been in force with certain changes since 1940 has been brought to an end.

*

Mr A. Stuart Allen's presidential address to the Society of Incorporated Accountants and Auditors on Wednesday devoted close attention to the effect of rising prices on the problem of capital replacement. A telling example showed that the gross cost (before taxation) of maintaining assets originally costing £100,000 in 1900 and now costing three and a half times as much would have amounted to no less than £443,700 in 48 years. The replacement of the bulk of industry's assets has not, in Mr Allen's judgment, yet become imperative; but, as he pointed out, this may disguise the gravity of the problem but does not diminish its inevitability.

The "Shell" dividend disappointed the hopes of those who had inferred from the increase in the Burmah Oil dividend (raised from 12½ per cent to 15 per cent) that "Shell" might follow suit. The distribution is 1s. 6d. tax free, as in 1948. Profits of the Royal Dutch/Shell group (after provision for exploration, research, depreciation and taxation) are estimated at £35,732,000, compared with £33,227,000 in 1948 (the latter figure having been adjusted appropriately to include the group's share of profits in Venezuelan Oil Concessions, which became a fully owned subsidiary during 1949). "Shell" Transport and Trading shares fell 2s. 6d. to 65s. 7½d. on the news.

*

A return has been made to the prewar practice of charging less for house coal in summer in order to encourage householders to stock then for the winter. The reductions of between 2s. 6d. and 5s. a ton announced this week will be compensated by price increases in winter. In commenting on the scheme the Minister of Fuel and Power said that the failure of the public to buy coal in summer had been grossly unfair to coal merchants; it was of vital importance that householders who had space to stock coal should do so. It is piquant to recall that Mr Noel-Baker was asked in the Commons on March 27th to allow the full permitted quantity of house coal for the year to be delivered in summer to those householders who could accept it, but he refused. "To allow this," he said, "would imperil the principle of fair shares for all," since "many consumers have not got facilities for stocking coal."

*

The Anglo-Canadian wheat discussions ended in London this week. An understanding was reached between the two countries whereby Canada was assured of a market for a part of its crop without involving Britain in any additional dollar expenditure. An official statement on the outcome of the talks is expected next week. Meanwhile the Canadian Wheat Board has set the initial minimum price for next season's crop at $1.40 a bushel, compared with $1.75 for this season and the guaranteed minimum price of $1.54 a bushel for 1950-51 under the international wheat agreement.

SECURITY PRICES AND YIELDS

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (n) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 14 years.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (h) Assumed dividend 18⅛% after capital bonus. (j) To latest redemption date. † Free of tax. (m) Final dividend on increased capital. Yield basis 35%. (n) Yield basis 26⅛% after capital bonus.

....DICTATE IT HERE

You can take the "Recordon" into Committee or the board room; take it home for urgent work like a portable typewriter or send its paper recorded discs in an ordinary envelope safely through the post.

TYPE IT THERE....

It will work as well in your home as in your office and when on the road you, or your travellers, can use it from the car by means of a special converter which we will supply. May we send you our fully descriptive folder or better still arrange for a demonstration in your own office?

'RECORDON'

....DOES IT EVERYWHERE

"Recordon"—the first magnetic dictating unit. Use it anywhere, take it everywhere—"Recordon" is the only self-contained dictation-transcription unit of its kind.

Microphones and Receivers extra, depending on the type required. **£49.10.0.**

ABBEY NATIONAL

BUILDING SOCIETY

SAFETY-FIRST INVESTMENTS

Sums up to £5,000 are accepted for investment in shares yielding 2½ per cent. per annum, or in a deposit account bearing annual interest of 1½ per cent., income tax in each case being borne by the Society. Husband and wife are considered as one for the purpose of the £5,000 maximum.

Head Office: ABBEY HOUSE, BAKER STREET, LONDON, N.W.1.

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk—and all that it means to your dependants—*without* this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon.

PA/6

Please send me full particulars of 'General' Personal Accident Policies.

STEWARTS AND LLOYDS, LIMITED

OUTPUT AGAIN A RECORD

THE NATIONALISATION ACT

GRIEVOUS LOSS TO SHAREHOLDERS

MR A. G. STEWART'S SPEECH

The sixtieth annual general meeting of Stewarts and Lloyds, Limited, was held on May 24th in the Merchants' Hall, 30, George Square, Glasgow, Mr A. G. Stewart (the chairman) presiding.

The chairman said: Ladies and Gentlemen, the directors' report and the accounts have been in your hands for the statutory period of time. The only comment I would make on the directors' report is to emphasise the amount spent since the war on capital expenditure. At a figure of £12,059,000 it exceeds the amount of capital issued to the stockholders.

Stockholders will have noticed the new form of consolidated profit and loss account. Changes in the manner in which the accounts are set out aim at making the company's position as plain as possible to the stockholders. I think you will agree that the profit and loss account before you this year can be more easily understood, and the results of the year more readily appreciated than in previous years.

You will also have noticed that the headings and amounts shown in the preliminary dividend announcement can easily be identified with the profit and loss account. From the accounts it can be established that, whilst the deferred dividend is 12½ per cent., the gross amount of this dividend is just over 3 per cent. of the net assets employed, at balance sheet values. Taking into account the extent to which the balance sheet values are low, as described to you last year, the true percentage is under 2 per cent.

DEVELOPMENT OF THE COMPANY

It has long been the tradition of the company to recognise that it has a threefold public responsibility; to the consumer of its products; to those whom it employs, and to those who provide the necessary capital.

It may be of interest to recall certain incidents in the development of the company which, whilst referring largely to the finances of the company, a matter of direct interest to the stockholders, do bring out the almost continuous but carefully considered development of the company, a factor which is of vital concern to the company's customers and employees.

I will go no further back than 1903, when the name of Stewarts and Lloyds, Limited, was adopted, following the amalgamation of Lloyd and Lloyd, Limited, and A. and J. Stewart and Menzies, Limited. The subscribed capital of the company, including debentures, was then £1,750,000.

Expansion was practically continuous up to 1925 and regular dividends were paid. By that date the subscribed capital had grown to about £5,500,000. The year 1926 was a difficult year, particularly for those with big interests in the export trade, such as we have, and it became necessary to pay a reduced dividend for some years. Then came the acutely difficult period of 1930-1932. I would like to emphasise that whilst the stockholders received no dividend in 1931 and 1932, their capital was not reduced as happened to so many others at that time.

THE CORBY WORKS

During this period of depression, active consideration was being given to a plan to build an integrated steel works at Corby. The object was to provide steel of the right quality and in sufficient quantity to enable us to produce gas list tubes by modern mass-production methods on the same site at world competitive prices. As a preliminary and in order to provide the requisite load to enable the mass production plant to run efficiently, the business of John Russell and Company was acquired in 1929, our agreement with Tube Investments, Limited, was entered into in 1930, and the Scottish Tube Company was acquired in 1932.

The year 1932, with the capital increased to over £6,000,000, marked the end of one phase and the opening of a new phase.

The firm decision was then made to proceed with the building of the Corby works. With the background of those two lean years, the decision to proceed with this large scheme in the circumstances has been described, not inappropriately, as an act of faith.

The final event which enabled the Corby Scheme to be launched was the agreement reached with the Bankers Industrial Development Trust, whereby the necessary finance was assured. Whilst under that agreement over £3,000,000 became available, it speaks well for the company's credit that less than £500,000 was drawn from this source, as it became possible to obtain £2,500,000 from the issue of Debentures in 1934.

Rapid progress was made at Corby. The first tubes were rolled and basic Bessemer steel produced there in 1934.

Whilst the company's position rapidly improved as Corby established itself as perhaps the cheapest producer of gas list tubes in the world, the development of Corby, to the stage then contemplated, was not wholly complete when the war started in 1939. Profits during the immediate pre-war years had shown a considerable increase, and the present dividend rate of 12½ per cent. was established in 1937, but an even greater increase in profits would have been achieved but for the private trade war which the company was forced to fight against German and other government subsidised competition all over the world.

Further issues of shares were made in 1936 and 1938; and just before war broke out, the Stanton Ironworks Company, Limited was acquired—bringing the capital, including Stewarts and Lloyds and Stanton Debentures, up to approximately £15¼ million, nearly nine times what it had been in 1903 and nearly two and a-half times what it had been in 1932.

It should be remembered that by this time we had made considerable investments overseas, particularly in South Africa and Australia where tube works had been erected. I should add that the companies in both these countries have been most successful, and are being continually expanded to meet the growing demands.

THE WAR YEARS

The war, and the necessary imposition of high taxation, including EPT, marked the end of a further phase. I want to emphasise particularly that, at that stage, the company had not been able to enjoy the full advantage of Corby, nor the acquisition of the Stanton Company.

The story of the war years, and the part the company played in munition production, has been told on other occasions.

In May, 1945, stockholders were first told that the directors had formulated their immediate postwar development plans. As you are reminded in the report before you today, rapid progress has been made with these plans.

With this large programme of capital expenditure before them, the directors were bound to take a conservative view regarding the rate of dividend distribution. The first real benefits of postwar development were reported to you last year—the output of steel tubes in 1948 showing an increase of 10 per cent. on the output in 1947. For 1949 we are able to report a further increase of over 25 per cent. in the output of steel tubes on the 1948 figure.

Bearing this large increase in mind, and noting that the Corby Continuous Weld Tube Mills are producing almost four times the tonnage of gas list tubes contemplated in the original plan, and having regard also to the expenditure of £12 million on plant and buildings since the war, it is only natural that such a sharp increase in profit is now shown. In my view, the directors would be open to criticism if, under the good trading conditions prevailing in 1949, the results had been substantially otherwise.

In addition, I should point out that the profit for the year, after taxation, namely £4,274,908 is only approximately 13 per cent. of the net assets employed, at balance sheet values, and again taking into account the extent to which these values are low, the percentage is in the neighbourhood of 7 per cent. only.

I think you will agree that over this period of nearly half a century the company cannot be accused of lacking foresight, prudence or a sense of public duty.

NATIONALISATION

Each year, since 1946, in my address to the stockholders, I have dealt with the subject of Nationalisation of the iron and steel industry. The Bill, which was before the House of Lords when I spoke to you last year, has now became an Act of Parliament. It is laid down in the Act that the Minister of Supply shall appoint the members of the Iron and Steel Corporation, in which Corporation the securities of the companies specified in the Act shall later vest.

It is also laid down in the Act that the Minister shall not appoint any member of the corporation before October 1, 1950, and that the securities of the companies involved shall vest in the corporation on January 1, 1951, or such date later, but not more than twelve months later, as the Minister may, by order, substitute.

The date of the appointing of the corporation and the date of vesting were thus amended to ensure that the proposals would not be implemented until after an appeal to the country. You all know the result of the election, but by no stretch of imagination can it be considered that such a narrow majority endorses the decision to introduce such a sweeping change as the nationalisation of the industry.

It is not possible to forecast what the immediate future holds and whether or not the corporation will be appointed on October 1st, or whether the vesting date may be deferred as provided for in the Act. Unfortunately the whole question is now one of politics rather than practical consideration.

COMPENSATION INADEQUATE

Last year I dealt fully with the inadequacy of the compensation terms, and I would emphasise that the figure of compensation takes no account of the £12 million spent on capital expenditure since the war, nor of the increased volume of profit which, as I have already said, is the natural consequence. You will also be aware that under the provisions of the Act, the rate of dividend cannot be increased.

If, in spite of all, the measure were to be carried through, the loss to the stockholders of this company would be grievous.

The production record of the industry for 1949 has already received favourable comment on all sides, and so far as your company is concerned, the figures which I have already quoted to you show that we have played a very big part. I can only confirm what I said last year, that your directors are completely opposed to this measure, which can only disturb and perhaps destroy for ever the smooth and efficient working of the industry and must inevitably lead to complications outside this country and consequently endanger our export trade to an extent which few can visualise.

TRADING IN 1949

Despatches of tubes, pipes and fittings in 1949 again constituted a record in the history of the company. They much exceeded those of 1948, which was in itself a record year.

It is a satisfactory position to be able to record, since it illustrates not only that many of the schemes of development which were started in 1945 have now been completed, but also that the level of demand has in general kept pace with the increase in productive capacity. The actual tonnage of steel tubes, pipes and fittings despatched in 1949 amounted to 705,000 tons, an increase, as I have already said, of over 25 per cent. on the 1948 figure. 59 per cent. of this tonnage was delivered in the home market, and 41 per cent. exported.

Last year I referred to the high level of demand from the oil industry and to our expectation that deliveries would be substantially increased in 1949 as the result of our development schemes, and in particular to the new tube mill at Clydesdale Works. I am glad to say that these expectations have been realised, our deliveries to the oil companies in 1949 amounting to 212,000 tons, representing an increase of approximately 50 per cent. over 1948.

Perhaps the most significant factors affecting the company's trading position which have occurred since I last spoke to you are the devaluation of the pound in relation to the dollar, the enforced restriction in capital expenditure in this country, and the expansion of trade abroad by a number of countries, notably Germany and France.

It is too early as yet to estimate the full effects of devaluation. Costs of production must to some extent be increased, but the actual effect cannot as yet be foreseen. On the other hand, the company's competitive strength in the dollar markets, and in the world's markets in competition with the dollar countries, has been much enhanced. To illustrate this point I am glad to be able to tell you that it is estimated that we shall succeed in exporting to Canada in 1950 some 50,000 tons of tubes and 20,000 tons of steel strip, the value of which will exceed 7,000,000 Canadian dollars.

Whilst the restriction in capital expenditure in this country must tend to reduce the demand at home so far as 1950 is concerned no serious falling off in the volume of orders is anticipated. The position indeed is that the company's home order book, with the exception of a few minor items, is sufficient to ensure full production until the end of the year.

EXPORTS TO EUROPE

The resumption of exports on a large scale by European countries has as yet had no important bearing upon the position of your company. Although our exports in 1949 exceeded those in 1948, the demand is still greater than we can supply, having due regard to the needs of the home market. Prices quoted by European makers which until recently were greatly above our own, have, however, fallen very considerably, and it is to be anticipated that this position will be accentuated should the supply exceed the demand. We have continued our policy in the export market of moderation in prices and of only accepting orders where we felt ourselves capable of meeting the delivery required. This policy will, we feel, be of considerable benefit to us in the future.

We feel that we are now fulfilling the needs of our customers both at home and abroad on a more satisfactory basis. I do not wish to make any general prophecy as to the future, but I can say that our despatches up to the end of April, 1950, showed an increase of almost 10 per cent. on the corresponding months of 1949.

The demand on Stewarts and Lloyd's Steel Works remained heavy and the ingot production in 1949 was close on 1,000,000 tons and showed an increase of 8 per cent. over the 1948 figure.

Last year I reported to you that the Stanton Ironworks Company increased their deliveries of iron pipes and special castings by 13 per cent. as compared with 1947. In 1949 the deliveries were 18 per cent. higher than in 1948. There remains a heavy demand for Stanton products, both at home and abroad, and there was, in fact, an increase of 30 per cent. in exports during 1949 as compared with 1948.

We appreciate the difficulties which can arise from the conditions under which we have been operating since the war; but we are very much alive to the need for giving service and satisfaction to our customers; and we are developing on many lines to ensure—so far as we can—that should any recession take place, we will be in the best position to obtain a good share of the market, through efficiency and good service, both at home and abroad.

WORKS' EXTENSION PLANS

Considerable progress was made during the year with our main extension programme; and also with smaller alterations and improvements; and the efficiency of the works generally has again been improved.

The new open-hearth steel-making plant at Corby has now come into operation; and the new tube mills at Clydesdale and Corby operated very satisfactorily during the year.

As you will see from the directors' report, we spent, during 1949 £3,295,000 on development. We estimate that during the current year the expenditure will be on about the same level, and with the developments still before us, expenditure will continue at a high rate for some years.

Apart from concentrating on increasing production by additional plant, and by replacing obsolete plant, we are also developing further on the more highly finished products.

Our developments at Corby are being handicapped by the extreme shortage of houses, which prevents us from recruiting or transferring employees to Corby on the scale we require.

LABOUR AND SERVICES

Our relations with our employees, and with the Trades Unions, continue to be good; any small troubles which have occurred have been quickly settled with the co-operation of the Trades Unions.

We are continuing to extend our medical service in all our works, and are finding that it is becoming more and more appreciated by our employees. This service is regarded by management as a necessary and vital part of the organisation.

Our training and education schemes are progressing satisfactorily. There is abundant evidence that the facilities offered are appreciated by our employees and are of considerable benefit to the company. The company has also assisted the British Iron and Steel Federation in the preparation and introduction of a system of training appropriate to the young employees of the whole industry.

I have told you today something of the growth of the company since the beginning of this century, and I am sure stockholders will realise that while they owe much to those who in the past have had the energy, ability and courage to develop the company, they are equally indebted to all those who are today serving the company both at home and abroad. I know that it would be your wish that I should record your gratitude to them for their services.

The report and accounts were adopted and the dividend recommendations were approved.

The retiring directors, Mr A. G. Stewart, Sir Walter Benton Jones and Mr J. Mitchell, were re-elected, and the auditors' (Messrs. Cooper Brothers and Company) remuneration having been fixed, the proceedings terminated.

GENERAL EXPLORATION ORANGE FREE STATE

SIR GEORGE W. ALBU'S REVIEW OF OPERATIONS

The annual general meeting of General Exploration Orange Free State Limited, was held on May 9th in Johannesburg, Sir George W. Albu, Bt. (chairman), presiding. The following is an extract from the chairman's speech:

Since the year-end your company has taken up additional mineral right options in the Orange Free State covering:

(a) 1,700 morgen in the Bothaville district;
(b) A 33⅓ per cent. interest in 4,314 morgen situated to the north-west of Odendaalsrus, adjoining ground presently held by your company and ground held by Wit Extensions Limited;
(c) A 20 per cent. interest in a block of ground in extent 14,724 morgen situated to the south-west of Odendaalsrus, to the south of ground at present held by Lydenburg Platinum Limited and Eastern Rand Extensions Limited, and associated companies.

Since the year-end, due to its participation rights in the farms Bluegumhoek No. 457 and Olivine No. 249, your company has become entitled to 17,027 shares as vendor consideration and to subscribe for 84,424 shares at par in Virginia Orange Free State Gold Mining Co. Limited. It is also entitled to subscribe for £35,547 3 per cent. debentures in this issue at £1 each.

I should like to draw attention to two boreholes—namely, WN.3 and Spes Bona 1, in which Middle Witwatersrand (Western Areas) Limited, are participating, and on which drilling has recently commenced. As stockholders are aware, boreholes VDH.1, TV.2 and K.1 have indicated a strike of payable reefs in the Elsburg Series of not less than 14,000 feet. The results of boreholes WN.3, situated in the north-westerly area, and Spes Bona 1, in the south-easterly area of this strike, will add additional valuable information concerning the extent of these very important reef zones.

DRILLING

The following are brief details of the progress made since the year-end of boreholes in which your company is interested:

Borehole Spes Bona 1 on R/E of the farm Spes Bona No. 921, being drilled by your company on joint account with Middle Witwatersrand (Western Areas) Limited, had reached a depth of 20 feet in the Karroo System.

Borehole WN3 on Weltevreden 205 was in lava at a depth of 2,036 feet

Borehole GG.1 on Graspan 403 had reached a depth of 7,256 feet in sediments in its fifth deflection, which was commenced at 5,113 feet at the end of February last. Considerable trouble has been encountered in this hole due to caving in faulted sediments below the lava, and no fewer than four deflections have proved abortive on this account.

Borehole VDH.4 on Van den Heever's Rust 419 had reached a depth of 3,912 feet in lava.

Borehole "Diamant 1" on Diamant 1370 had reached a depth of 5,640 feet in sediments, having passed through the base of the lava at 5,450 feet.

Borehole "Tredenham 2" on Tredenham 1367 had reached a depth of 4,698 feet in lava.

Borehole HL.1 on Holfontein 148 had reached a depth of 6,551 feet in lava.

Borehole P.1 on Petra 157, after intersecting the "grit band" detailed in the directors' report, penetrated two conglomerate bands at 4,366 feet and 4,408 feet carrying low values. These low values were confirmed by two further deflections. These conglomerate bands are assumed to be the Leader and Basal reefs. Further drilling is being done in this area. Two further deflections were also made on the grit band I have mentioned, which assayed 5.4 dwts. over 12 inches and 8 dwts. over the same width.

Borehole UC.58 on Puntie 146 was stopped at 3,808 feet on April 19th, in beds considered to be below the Basal reef horizon.

Borehole WE.9 on Weltevreden 205 was stopped at 8,102 feet in steeply dipping sediments considered to be below the Basal reef horizon.

The report and accounts were adopted.

Copies of the full report of the proceedings may be obtained on application to the London office.

BRIXTON ESTATE, LIMITED

INCREASED REVENUE

The annual general meeting of Brixton Estate, Limited, was held on May 22nd, Mr P. Meighar-Lovett, O.B.E. (managing director), presiding in the absence through illness of the chairman, Sir Eustace Tennyson-d'Eyncourt, Bt., K.C.B., F.R.S.

The following is an extract from the statement circulated with the report and accounts:—

The net revenue, after taxation, has increased from £24,973 to £29,776. During the year the authorised share capital was increased from £180,000 to £300,000 by the creation of 480,000 new ordinary shares of 5s. each. £20,000 of the general reserve was capitalised and applied in allotting 80,000 of these shares as fully paid to existing shareholders in the proportion of one in four. After crediting the general reserve with £15,000 from the current year's income, this reserve now stands at £20,000.

It has only been possible to obtain permission for small amounts to be spent on war-damage repairs. Continuous efforts are being made to obtain licences for the reinstatement of the company's remaining war-damaged properties, but so far without success.

Further increases can be expected from a full year's income on account of the renewal of old leases at improved rentals. Our associated company is making satisfactory progress by the purchase of income-producing properties, but the development of their sites is, with one exception, still held up by the difficulty in obtaining licences. Two interim dividends amounting to 15 per cent., less tax, have already been paid, and a final dividend of 8 per cent., less tax, is now recommended on the increased capital.

The report was unanimously adopted.

THE UNITED SUA BETONG RUBBER ESTATES, LIMITED

HOPE OF CESSATION OF DISTURBANCES UNREALISED

SIR JOHN HAY ON COSTS AND PRICE

The forty-first annual general meeting of The United Sua Betong Rubber Estates, Limited was held on May 25th at 52-54, Gracechurch Street, London, E.C.

The following are extracts from the circulated statement of the chairman, Sir John Hay:—

When I addressed you last year I entertained the hope that the disturbances which then afflicted Malaya would by now have ceased and that those who serve us in the East would no longer be in danger of attack from lawless gangs. These hopes have not been realised. Raids on property and attacks on personnel have multiplied. The estate bungalow has become a fortress to be vigilantly guarded, the public highway a hazard to be travelled at one's peril and the estate a place where the ready gun must be one's constant companion. With the degree of danger varying as between one locality and another, such is the general background against which the company's operations in the East are conducted. This very brief description of existing conditions is based not on reports of others but on my own personal experience gained during a visit of some months' duration, in the course of which I visited not only the company's properties but travelled extensively throughout South and West Malaya. Notwithstanding dangers and difficulties encountered our managers and their staffs have succeeded not only in maintaining production at a high level but also in carrying out a heavy programme of improvement works, such as replanting, reorganising, where necessary, tapping, collection and processing, and at the same time in discharging the responsibility of safeguarding their labour against attacks from without and maintaining a contented spirit within by fair and considerate treatment. At any time such achievements would be very creditable: that so much should be accomplished under conditions which impose a continuous and increasing strain on our staff is high testimony to their courage, steadfastness and resourcefulness, which we do not fail to appreciate. They, in common with others who are at present employed in operating industries in dangerous areas, are not merely serving private enterprise: they are performing the vital task of protecting and preserving the economy of the country against the assaults of the Communists whose aim is its disruption and destruction.

ACCOUNTS

The comparative figures set out in the profit and loss account show the substantial extent to which our profits have been increased and your board feel justified in recommending the payment of a dividend at the rate of 17½ per cent. I should point out that this rate of dividend is calculated on the nominal issued capital, namely, £900,000. The actual capital employed in the business has been assessed at £2,236,000. On that basis, the rate of dividend which we now recommend is the equivalent of 7.04 per cent. gross or 3.87 per cent. net—a modest return indeed on an enterprise of this character which carries its own peculiar risks of which in recent years stockholders have had some rather grim experience. The following table sets out the manner in which our total profit is disposed of:—

		£	%
Profit, before charging replanting and depreciation		371,041	
To which should be added payments to Government, viz., Quit Rent, Duty and Cess		60,531	
		£431,572	
This is disposed of as follows:—			
(a) Ploughed back into the business:—			
(1) Replanting provision	51,086		
(2) Depreciation... ...	24,141		
(3) Transfer to reserve ...	50,000		
(4) Increase in carry forward	11,621		
		136,848	31.71
(b) Total taken by Government:—			
(1) Quit rent, duty and cess	60,531		
(2) Profits tax, income tax	147,568		
		208,099	48.22
(c) Dividend		86,625	20.07
		£431,572	100.00

It will be observed that whilst stockholders receive one-fifth of the profit, the Governments of Malaya and the United Kingdom take nearly half and the remainder is ploughed back into the business. But for the abnormally high expenditure incurred in 1949 on replanting, which is permitted as a charge against profits for income tax purposes, the proportion going to Governments would have been considerably more. This abnormal rate of expenditure is not likely to be repeated. Unless, therefore, there is some reduction in the rate of taxation, the proportion taken by Government in future years will be even greater

COST OF PRODUCTION

Although we succeeded in 1949 in effecting some decrease in the cost of production, I cannot promise that this will be repeated. On the contrary, we must expect costs to go up. As from the beginning of last month, wages to workers on rubber estates were increased by 12 per cent. It is indeed proper that those who work for us should be adequately paid and should participate in the better fortunes of the industry. At the same time we must not overlook the continued upward trend of the main elements in the cost of production. Taking an index of 100 as representing the rate of wages in 1939, the existing rate for field workers is 324 and for tappers 330. The cost of building materials has recently further increased and the index for current costs is from 365 to 415. Fertilisers are still costly: nitrogen is 215 and phosphates 203. In addition to cash wages, labourers receive payment in kind in the form of housing, medical attention, maternity benefits, educational and recreational facilities, and so on. The cost of all these services has increased enormously. Transport both inland and overseas is more costly. Using the same index figure, the increase in the cost of shipping rubber to the U.S.A. is from 100 to 333. As you well know, until very recently there has been no rise in the price of rubber to offset this high rate of expenditure. On the contrary, the average price of rubber for 1949, expressed in U.S.A. currency, was almost exactly the same as the average price for 1939.

PRICE OF RUBBER

Accustomed in the post-war period to a price level for rubber which contrasted strongly with the higher levels prevailing for other world commodities, the recent tardy increase

in the price of our own product seems to have come as a matter of general surprise, although the causes for that rise are not difficult to discern. In expectation of the devaluation of sterling and anticipating some recession in business, consumers during 1949 postponed purchases and drew on stocks to a dangerous extent. Although the expected devaluation of sterling proved correct, that event did nothing to add to the supplies of rubber. The anticipated recession in business did not occur: on the contrary, the demand in America for rubber products increased. Exports of crude rubber from Indonesia did not come up to expectations and the purchases to long postponed came upon a market which could not offer any surplus supplies. Whether the prevailing level of price will be maintained or increased it would be imprudent in the present state of uncertainty to hazard an opinion. It might help, however, to a more accurate assessment of the situation if I point out that the average price of rubber for the current year up to May 15th was 20.95 U.S. dollar cents—a figure which should not prove too burdensome to the consumer. That is slightly less than the average for 1947, which was then regarded as barely profitable to producers, and well below the average for 1948 which was 22.01 U.S. dollar cents. It is evident from these figures that there has been as yet no significant change in the average price of rubber in terms of U.S. dollar currency. Such rise as has occurred in the sterling average only registers the change in the value of that currency. From this factual statement, however, no wrong inference should be drawn. Those of us who are concerned with the long-term interests of the industry do not look with favour on wide fluctuations in price or on the continuance of a price level which gives that easy profitability which engenders extravagance in costs. Rather would we see a stable price which provides a fair standard of living for the worker on the rubber estate, which encourages consumption as well as production, and which permits of a reasonable profit to the efficient producer. But stability in price can only be achieved if continuous production and unimpeded export are matched by constant and even buying, whether for commercial or Governmental purposes.

The present level of price for plantation rubber would appear to confound the view so often and so confidently expressed in some quarters that the competition of synthetic rubber would act as a deterrent against any rise in the price of the natural product above a predetermined level. The fact is that as long as the use of synthetic rubber is mandatory its value in open competition can only be a matter of assertion and counter assertion. One eminent American authority, appearing before the Armed Services Committee of the House of Representatives, which is considering the subject of future legislation respecting synthetic rubber, gave evidence in the following sense: that synthetic rubber had not proved its ability to compete with natural rubber in the open market, and that the so-called "voluntary" use of synthetic was at the best a quasi-voluntary use. In some earlier speeches I have ventured to express opinions in that sense. It is a matter of special interest to me to find my views supported from a quarter which could hardly be accused of being partial to natural rubber interests.

FORWARD SALES

The only long-term forward sales outstanding are for the period July/December, 1950. The quantity sold is the equivalent of 8 per cent. of our estimated output for that period at a price of 1s. 3¾d.

RESEARCH AND PROPAGANDA

In common with other rubber producers in Malaya we have been contributing for some years to the upkeep of central research stations. Contributions are in the form of a cess levied by Government on producers' outputs. This being an easy and convenient way of raising money, no objections have been made on the grounds that progressive units in the industry, with their increasingly higher rates of output, pay proportionately more per acre than those who have continued to rely on old planting stock and consequently have a smaller rate of output. The original proposals for centralising research and financing it in the manner described were made sixteen years ago by a committee presided over by my colleague, Sir Andrew McFadyean. I was also a member of that committee. Our views on the soundness of the proposals then made, for the purposes then specified, have not altered. Our firm belief in the value of research is made evident by our voluntary action in setting up and maintaining, in conjunction with associated companies, our own research organisation which supplements the works of the central institute at Kuala Lumpur. The central institute's findings, particularly in the field of genetics, have proved valuable to the rubber producing industry. In addition to productive research carried out at the Kuala Lumpur centre, there is also conducted, mostly in this country, what is termed "consumption research." Although much diligent and patient work has been done in this field, it is difficult to ascertain whether any positive findings have yet been reached which are of practical benefit to the industry. From these two major activities other minor ones have stemmed, one operating under the all-embracing term "Development" and the other under the title "Propaganda." These combined activities are financed partly out of the cess which I have mentioned and partly out of what is known as the "Rubber Fund," which is made up of sums derived from the proceeds of rubber exported in excess of the amount permitted under the former international regulation scheme. A Government appointed committee sitting in Kuala Lumpur, the personnel of which is seldom constant, is primarily responsible for finance. In practice that responsibility is discharged by simply allocating annual sums to each of the boards directing the activities I have listed and receiving any reports that may be sent to them by any of these boards. The boards of the main research institutes, either in majority or in whole, are nominated and appointed by Government and these boards in their turn have the major say in deciding upon the constitution of the boards appointed to direct "Development" and "Propaganda." The McFadyean committee's proposals were never designed to suit such a varied assortment of activities with its system of interlocking boards and involving expenditure of money well beyond anything that was then contemplated. At the present time Malayan producers are liable to pay a cess at a rate which yields over $6,000,000 per annum. In addition to this, heavy raids, amounting to several more million dollars, are made on the Rubber Fund. The cess, only recently raised to its present figure, may be increased again to finance schemes upon which the general body of producers has not been consulted. The proceeds of the existing cess are not used exclusively for the benefit of Malayan producers. Working under the present haphazard methods, the producer who supplies all the money has no effective say in deciding on the purposes to which it shall be applied, whilst directing boards, owing in the main their appointments to some remote Government authority, cannot maintain for long a sense of accountability to the mere contributors. Rubber estate owners may read for the first time through the medium of the Press of proposals involving expenditure for years ahead to which they are to be committed, or, at other times, rubber producers may be consulted, but generally on a plea of urgency which does not permit of too close examination or consideration. We and our associated companies are substantial subscribers to these activities. We have much sympathy with most of their underlying purposes and we are happy to co-operate with other units of the industry in a common effort to advance the efficiency of the industry, but in our view the present methods are open to objection and should be so amended as to conform to sound principles of administration. It may well be argued that since no cess could be imposed except by the authority of the Government of the Federation of Malaya the initiative in this matter must rest with that Government. Nonetheless, it would be highly creditable to the industry if, without waiting on others, it took prompt measures to put its own house in order.

PARKINSON AND COWAN, LIMITED

CONTINUED PROGRESS

SIR GEORGE JESSEL'S ADDRESS

The fiftieth annual general meeting of Parkinson and Cowan, Limited, was held in London on May 19th. Sir George Jessel, Bt., M.C., the chairman, in the course of his address, said:

This is the fiftieth annual general meeting of the company and consequently an occasion when we might feel a modest pride in the progress made during the 130 years of our existence, and particularly during the last half-century, when as a public company our business has extended in size and technology so far beyond our founders' conception.

The summary of our year's operations shows that we earned a consolidated gross profit of £308,673 (£299,143 last year). After deducting depreciation, taxation and all other charges, our consolidated net profit is £80,307 (£94,186 last year).

Your directors recommend that we repeat last year's ordinary dividend at the rate of 7 per cent., and after allowing for 7 per cent. cumulative preference dividend, already paid, there is a surplus of £33,730 to be retained by the group.

Once again I have to draw your attention to an increased provision for income tax and profits tax at £96,121 (£85,538 last year), which more than absorbed our increased gross profit. We have also provided slightly larger sums for depreciation at £85,787, and we have applied £13,000 to deferred repairs (£13,789 last year).

Our fixed assets are higher at £542,228 (£521,510 last year). During the year we purchased £96,587 worth of new plant and equipment Our stocks are a little up at £826,732, and our total resources in cash and tax reserve certificates are substantially up at £250,556 (£149,410 last year).

Current assets exceed all liabilities by nearly a million pounds, and with the addition of the value of fixed assets the net assets stand at more than 1¼ million pounds, including nothing for goodwill. This covers the issued preference stock and the balance represents 28s. 4d. per £1 of ordinary stock. The ordinary dividend of 7 per cent. thus represents (other than preference capital) only about 5 per cent. on the capital employed.

SURVEY OF GROUP OPERATIONS

You will see that for a company of our size we have an unusually wide diversity of interest. We believe this diversity to be a most desirable element in commercial stability, but it brings with it problems of its own.

Our gas cookers, particularly the famous "Renown," continue very high in public esteem, and we have every reason to hope that new products which we shall be introducing in this field will still further enhance our reputation.

The demand for meters of all types has been good, although overseas markets have become intensely competitive. There are very few companies in the world which produce, as we do, gas, electricity and water meters. I think we can claim that in all three fields our products are of very advanced design, and in many cases incorporate techniques which are ahead of competitive practice.

Our leather business enjoyed a satisfactory year, and we continue to occupy a premier position in the fields we serve.

The market for gas water heaters, although slightly improved, has continued to be smitten by a savage purchase tax, and the national output of this appliance is far below pre-war level.

Our business in precision components for the instrument trade is making steady progress, and we number among our customers many world-famous makers of scientific equipment.

We continue to make great efforts in the exports field. Executives of the company are constantly visiting oversea markets, and we are maintaining our share of the business available.

THE FUTURE

We are planning to spend more than £200,000 during the next two years on plant and on improvements to buildings and services. We are continuing our policy of devoting much time and money to the recruitment and training of young engineers, for we believe that the future of our company will be largely governed by our success in the selection and training of the next generation of executives and technicians. We are steadily extending the range of our products and are entering some new fields of manufacture.

The level of business at the beginning of this year was generally similar to 1949. Unless there is any drastic curtailment of expenditure by public authorities we have reason to expect a satisfactory year ahead of us.

DIRECTORATE

Mr D. M. Henshaw did not seek re-election owing to other heavy responsibilities, and tribute was paid to his valuable services since he joined the board in 1935. During the year Mr Edward C. Woodall, O.B.E., and Mr Wilfrid H. Dimsdale, M.A., had been appointed directors and were confirmed in office.

Fitting reference was made to the late Mr W. W. Parkinson, who, when he retired in 1946, had been associated for 57 years with the management of the group.

The chairman concluded with thanks to the managing director (Mr H. P. Barker) and to the staff and workpeople.

The report and accounts were adopted.

C. & K. FOOTWEAR

FURTHER PROGRESS

The third annual general meeting of C. & K. Footwear, Limited, was held on May 23rd, in London. Mr Joseph Whiteley (chairman and joint managing director) presided.

The following is an extract from his circulated statement:—

Further progress has been made during the past year. The trading profit for the group was £113,203, compared with £111,984 for the previous year. After providing for a first and final dividend of 40 per cent., less income tax, writing off preliminary expenses, £1,495, and placing the sum of £5,000 to a contingencies reserve, the group carry forward is £37,749, compared with last year's figure of £19,067.

The consolidated balance sheet continues to reflect the sound and liquid position of

The increased production and distribution which have been achieved have enabled us to offset the reduced controlled profit margin which became operative in February, 1949, and the further reductions imposed by the Board of Trade at September last.

Orders for our "PANDA" models exceed the possible rate of production. The fine quality and finish have created an ever-increasing demand.

A national advertising campaign which has recently been launched in respect of our "CEEKAY" branded shoes is already showing satisfactory returns.

You will be pleased to know that the Board of Trade are considering the decontrol of our industry. It is to be hoped that the negotiations now in progress will have the desired result.

You will realise that the consequence of devaluation has been substantially to increase the cost of leather, the full effects of which have not yet reached the public.

In spite of the difficulties of the industry generally, I am not pessimistic of the future, knowing that we are well equipped to face the various problems which continue to arise.

The report was adopted.

CLEAVER-HUME PRESS, LIMITED

TRADING PROFIT £209,702

The fifth annual general meeting of Cleaver-Hume Press, Limited, was held on May 19th at Winchester House, Old Broad Street, London, E.C.

Mr F. Graham Maw (chairman) presided, and in the course of his speech said: A trading profit of £209,702 represents the aggregate profit of all our departments. The balance carried to the appropriation account is £170,435, against the corresponding figure last year of £148,575. Bringing in the balance of £17,012 from last year, the board had at their disposition a total sum of £187,447.

We have paid the same interim dividend and are recommending the final dividend as for the previous year, making a total of 22½ per cent., and the final result is that the balance of the profit unappropriated carried to the balance sheet is £21,134, against £17,012 last year. We have maintained our practice of transferring £10,000 to general reserve.

STRONG LIQUID POSITION

The company's balance sheet shows a stronger liquid position and instead of having an overdraft, as was the case at the end of the previous year, we had a cash credit of over £47,000 at the close of the year now under review. The capital reserve, the development and equipment reserve and the general reserve have all been substantially increased. The total capital reserves and surplus accordingly amount to £481,526, which is some £27,000 in excess of our fixed assets. Current assets exceed by some £20,000 the amount of the current liabilities.

FAVOURABLE OUTLOOK

Subject to the incidence of general trading and monetary conditions, we see no reason why the company should not continue to prosper.

The company employs some 500 staff and workpeople, and I want to pay tribute to the keenness and devotion which they give to the interests of the company.

The report and accounts were adopted.

E. POLLARD AND COMPANY

SATISFACTORY PROFITS DUE TO LARGE TURNOVER

The thirty-eighth annual general meeting of E. Pollard and Company, Limited, was held on May 23rd in London.

Mr H. Edward Pollard, the chairman, in the course of his speech, said:

The profits of the group were £235,273 and after providing for taxation there remains £108,367. This is satisfactory, but I think I should say that the actual rate of profit earned is low and that the result depended on a very large turnover.

The question of the amount of dividend on the Ordinary shares that we should recommend has given your directors considerable thought. Since 1938 wages have doubled, the value of the £ halved, and taxation has risen to crippling proportions. We therefore feel that our proposal to make the Ordinary dividend one of 10 per cent. for 1949 is justified and reasonable.

SHOPFITTING AND ENGINEERING SECTIONS

The shopfitting and display departments both benefited while licences were reasonable, and although we did not reach our maximum output, we certainly began to fill up the factories. The supply of materials is easier now, and softwoods are perhaps our only remaining shortage. On the other hand skilled labour is still short, but our permanent staff is the strength and basis of our successful production.

Shopfitting contracts included a complete new store equipped throughout in Sheffield, and many other new installations for famous businesses, and also an increased amount of export work.

On the engineering side we were particularly busy on steel shutter exports. Haskins shutters have a sound reputation in many countries and export contracts now exceed those for the home trade. In the same factory we also manufacture the Hammond and Champness electric lifts, and in spite of strong competition, we have successfully installed a number of these in various countries.

The home trade in lifts has been satisfactory, and among our many contracts we are installing a battery of 21 lifts at the Southampton Docks which will be a valuable advertisement of our products for years to come.

Our Morris Singer Company have successfully completed a school building based on their Holoform design. In addition they have developed a business they purchased during 1949 manufacturing and selling chalices and other church supplies in precious and semi-precious metals and these, together with their stained glass work, which is steadily increasing in importance, make a valuable part of their business.

On the casting side the iron foundry taken over in 1948 has been developed and has proved most helpful in every way and deliveries of other products of the company have benefited by having our iron casting in our own hands.

The non-ferrous foundry, apart from the renovation and re-design of the Trafalgar Square figures, have completed during the year several heroic size statues for export including one of General Monash for Australia.

As to the future, so many of our large cities, apart from London, have a prodigious amount of reconstruction work to be put in hand, and we shall be concerned with one product or another in most of it. A steady controlled flow of rebuilding is overdue to commence and when it does we shall be ready and able to take part in it.

The report and accounts were adopted.

TELEPHONE AND GENERAL TRUST, LIMITED

RESULTS AGAIN SATISFACTORY

SIR ALEXANDER ROGER ON THE OUTLOOK

The twenty-fourth annual general meeting of Telephone and General Trust, Limited, was held in London on May 23rd.

Sir Alexander Roger, K.C.I.E., chairman and managing director, in the course of his speech, said: The results are once again satisfactory—the profit after charging profits tax and income tax being £88,634—an increase of £10,760. Dividends, interest and sundry receipts at £250,326 were up by £36,872. We have transferred £37,500 to contingencies reserve as against £40,000 to revenue reserve last year—bringing the former up to £50,000. After providing for the usual 7 per cent. preference and 8 per cent. ordinary dividends, which require £53,163 net, £100,094 is carried forward.

Investments in our general portfolio at £1,121,636 show a reduction of £44,889, due to satisfactory sales.

VALUATION OF INVESTMENTS

The valuation of £1,368,279 for quoted investments represents an appreciation of 40.84 per cent. on the net book cost of £971,482. The directors consider the valuation of unquoted investments at their net book cost to be fair and reasonable.

Of the Trust's total investments, 34.83 per cent. are in loans and debentures, 9.15 per cent. in preference stocks, 56.02 per cent. in ordinary stocks (which includes 26.81 per cent. in subsidiaries). Geographically, 64.45 per cent. are in the British Commonwealth and 35.55 per cent. in foreign countries.

The total of the reserves, capital and revenue, of the group amounts to £836,990, an increase of £35,299 over 1948. This represents 65.5 per cent. of the total issued preference and ordinary capital, or 115 per cent. of the issued ordinary stocks.

TELEPHONE OPERATING COMPANIES—PORTUGAL

The Anglo-Portuguese Telephone Company, Limited, were the pioneers of the telephone service in Portugal, and commenced operations there in 1887. The Trust has been connected with the company for 23 years, and has a substantial interest in the undertaking by reason of its share and loan investments. The Anglo-Portuguese Telephone Company is also strongly supported through the Trust's associates in the manufacturing and technical fields.

Negotiations between the Portuguese Government and the company have now been satisfactorily concluded, and as from May 1st last the company has been authorised to charge increased tariffs for its telephone services. At the same time, the contract between the company and the Government has been amended and clarified to the mutual satisfaction of both.

VENEZUELA

The Trust's connections with Venezuela have been continuous since 1928, and it has a substantial investment interest in the telephone operating systems of Caracas and important towns through Telephone Properties, Limited, and the Nacional Telephone Company of Venezuela.

On September 20, 1949, as a result of the devaluation of sterling, the Bolivar exchange rate moved from Bs.13.51 to the pound to Bs.9.38 to the pound, which increases the value of sterling remittances to the United Kingdom. Venezuela is a strong dollar country, and one of the greatest producers of oil in the world. It also has great mineral wealth which is being explored and developed.

Nearly 5,000 stations were added to the system in 1949, bringing the total to approximately 57,500. In spite of this considerable expansion, the demand is constantly increasing, and the Nacional Company's plans are based on relieving this situation as quickly as possible. In this and other directions the Trust and its connections are closely co-operating

WEST INDIES

I intimated last year that large capital expenditure was planned for 1949 and 1950 by the telephone companies in Jamaica, Trinidad and Tobago, and Barbados, in which we are so largely interested. During 1949 nearly £600,000 was expended upon capital works by these companies, the Trust providing the necessary finance as required gradually by way of temporary loans which, in accordance with established procedure, will be replaced in due course by more permanent financing by the issue of new capital by the companies concerned.

In Jamaica, stations increased by 1,985 to a total of 12,004 in service at December 31, 1949, and during the year almost £210,000 was expended on new buildings, exchange equipment and outside plant.

Capital expenditure by the Trinidad Telephone Company amounted to some £355,000, and stations in service increased by 1,330 to 13,546.

Barbados spent some £27,000 upon development of its small but extremely efficient system and added 252 stations, making a total of 3,952 in service at the end of the year.

BENEFITS OF INTEGRATION

The telephone companies with which the Trust is actively associated operate some 180,000 telephones, and their gross telephone plant assets total over £11 million. On present-day costs, the replacement value of these assets would be considerably higher.

The Trust's association with the various companies is an outstanding example of the benefits which can accrue from the integration of the financial, technical and manufacturing requirements of an operating group such as ours.

A continuous flow of new capital is essential for the expansion of these operating companies, and they are able to plan their development programmes well ahead in the knowledge that the initial finance will be provided by the Trust in the form of temporary loans. In due course further permanent capital is raised by the companies enabling the loans to be liquidated.

The progressive supply of additional capital to meet the expansion of these companies is greatly assisted by the fact that they operate under franchises which permit satisfactory earnings. I am convinced that in the absence of any world-wide upheaval we can look forward with confidence to the continued steady development of the Trust and its associated group of companies.

The report was adopted.

BRITISH ROPES LIMITED

RECORD SALES TONNAGE

The twenty-eighth annual general meeting of British Ropes Limited, was held on May 24th in London.

Mr Herbert Smith, chairman and joint managing director, in the course of his speech, said:

In my speech last year I said that we were entering upon more difficult times, but as far as one can foresee if present conditions continue the current year ought to see your company's output maintained, though with possible changes in its sectional flow. The sales tonnage for the year 1949 surpassed that of any previous year, and the value of those sales exceeded £8,000,000. If the sales of our home and overseas subsidiary companies are taken into account the total sales output was little short of £10 million.

The consolidated profit and loss account indicates a total trading profit for the year under review of £1,162,000 as against £1,323,000 for the previous year; this reduction is in the main attributable to the exceptional maintenance expenditure on plant and machinery incurred during the year by the parent company; otherwise the trading results of the two years would have been fairly comparable.

The net dividends paid, and proposed to be paid (including 11 per cent., less tax, for one year on the Ordinary stock), account for £183,000.

Your company has harnessed itself to the great task of increasing production for export. During this last year we have made a special effort to increase our sales in hard currency areas, principal of which is the United States of America. In spite of keen competition we hope to sell increasing quantities of wire rope in that country.

The report was adopted.

UNITED MOLASSES LIMITED

RECORD PROFITS

The twenty-fourth annual general meeting of The United Molasses Company, Limited will be held on June 13th in London.

The following is an extract from the circulated statement of the chairman, Sir F. Michael K. Kielberg, K.B.E.:

The gross profits of the company and its proportion of subsidiary companies' profits for the year amounted to £2,109,543, an increase of £389,542 over the corresponding figure for the previous year, thereby attaining a new peak in the company's history.

The increase in the year's profits is largely due to a gratifying increase in the trading profits of our U.K. industrial subsidiaries, and to expanding shipping earnings.

The m.v. Athelduke, of approximately 12,800 tons deadweight, was completed in January, 1949, the m.v. Athellaird in April and the m.v. Athelcrown in July, the latter two of about 15,600 tons deadweight each.

In January of this year we took delivery of the m.v. Athelking and in April of the m.v. Athelmonarch, also of approximately 15,600 tons deadweight each.

The very severe and rapid decline in molasses values which had occurred during the winter of 1948-49, led to a temporary establishment of prices at the lowest level touched since 1939. In recent weeks a substantial recovery has taken place and the market is at present firm and the demand active both in the United States and this country.

As far as the current year is concerned trading results compare favourably with earnings for the same period last year, and present prospects for the remainder of the year look promising.

ARMY & NAVY STORES, LIMITED

REASONS FOR PROFIT REDUCTION

The seventy-eighth annual general meeting of Army & Navy Stores, Limited, was held on May 19 in London.

Major-General Guy Dawnay, C.B., C.M.G., D.S.O., M.V.O., the chairman, presided and, in the course of his speech, said:—The balance from trading account shows a falling off from last year amounting to £135,770. Manufacturing profit, miscellaneous revenue, and interest on investments are also reduced, making the total return from last year's working £144,682 less than for last year. In considering the reasons for this fall I should like you to note that whereas, in common with other retailers, our materials, linens, clothing and furniture departments all did well in turnover during the year, a great deal of our business lies in other departments, such as wines, tobacco, jewellery, hardware, and electrical goods, which have not shown such good results. The wine department in particular has suffered from the general decrease in the consumption of wines and spirits. A loss of no less than £12,000 was also incurred due to the reduction in duties on French wines in last year's Budget.

The reduced spending power of the public really only began to make itself felt during the past year, and the current year's figures only go to prove that while people still buy what they find to be absolutely necessary, there is little or nothing left over, not only for luxuries and semi-luxuries, but for what is not actually indispensable.

On top of that margins of profit are continually being cut by Government order. Our own gross profit margins have been reduced by over one-third in the last ten years, and it would appear from Ministerial statements that further cuts in retailers' profit margins may be expected.

CONTROLS AND REGULATIONS

As retailers we are at present subjected to all sorts of difficulties and pressures which are imposed upon us from outside without our having any power to mitigate them. I sometimes feel that the retailer is the chief butt of authority—the camel on which can be loaded an almost infinite variety of controls, orders and regulations, and whose back is supposed to be unbreakable, so that there is no "last straw."

In my view, the special taxation on undistributed profits is perhaps one of the most injuriously uneconomic of all the measures devised by our present injuriously uneconomic Government. It is obvious that if you believe that all that is necessary for industry, trade and commerce is to make a moderate profit year by year, and to make no provision for extension, improvement, growth, and the provision of better and more varied services, the thing would be understandable.

The whole of the profits tax so far as our business is concerned is a monstrosity, in my view. Where it is levied on distributed profits, it merely means a rise in the rate of income-tax levied on a particular body of recipients of income. Where it is levied on undistributed profits it is quite simply a deterrent to progressive commerce and trade.

We have gone far enough into the current year to realise that expectations of improvement after the General Election or after the Budget have not been fulfilled, and I do not think it is unduly pessimistic to say that the immediate future is far from bright.

The report was adopted, and the payment of a 10 per cent. dividend and a 7½ per cent. bonus was approved.

CABLE AND WIRELESS (HOLDING), LIMITED

BOARD'S INVESTMENT PLANS

The twenty-first annual general meeting of Cable and Wireless (Holding), Limited, was held on May 23rd in London.

Sir Edward Wilshaw, K.C.M.G., the chairman, in the course of his speech, said: At the meeting in April last I said: "Your directors considered that since they had received during the year 1949 the whole of the back payment of the interest on the compensation award, which, of course, is treated in the accounts as profit for that year, they were entitled to draw upon this for the benefit of ordinary stockholders." It was therefore decided to recommend a dividend of 4 per cent. on the ordinary stock for the year 1949, similar to that paid for some years past.

The current year, 1950, will also be an abnormal year because of the reconstruction scheme, but I shall be disappointed if we are not able to pay a dividend of 5 per cent., drawing a little if necessary from the unappropriated profits of earlier years. This, I hope, will prove encouraging to the stockholders who have decided to remain with the company. I should also add that all the present ordinary stockholders will, we expect, on August 15th next receive in addition a full half-year's interest on £125 3 per cent. Savings Bonds in respect of each £100 of ordinary stock held. However, it must be borne in mind that in the present year provision will have to be made for the cost of the reconstruction scheme and that the dividend on the 5½ per cent. cumulative preference stock will have to be paid for the first half of the year.

FUTURE POLICY

The reconstruction scheme for all practical purposes is behind us, and we can now settle down and concentrate on the administration of what will be the biggest investment trust company in the Empire, with an authorised capital of £47 million. With the ordinary and loan capital of approaching £20 million, provided by £5,000,000 issued ordinary stock and a further £12,249,877 loan stocks, the opportunities which lie ahead in performing a useful service to the community open a vista of the widest possibilities, carrying with them also a great responsibility to all concerned.

Dealing with the future, I went on to say: "As regards the future conduct of your company in its role of an investment trust, my colleagues and I feel strongly that, subject to the duty of your directors to earn dividends for their stockholders, the functions which our company should properly fulfil extend far beyond that of mere collectors of dividends, and that a duty is laid upon us to do our utmost to ensure that the funds at our disposal are used to the best advantage in the interests of industry in this country and in development overseas under private enterprise. In the latter sphere I believe that this company has a contribtion to make out of experience gained over a long period in this field."

It is not possible for me at this stage to forecast accurately the future earnings of the company, but I do not think that the provisional figures which I gave you at the April meeting and which were, of course, calculated before the capital of the company as reconstructed was known, will differ materially from the actual results.

I again repeat I shall be disappointed if we are unable to pay a dividend of 5 per cent. for the current year, and I believe that those of you who have retained a whole or partial interest in the reconstructed company will have no cause to regret their decision.

The report was adopted.

OLDS DISCOUNT COMPANY LIMITED

The twenty-third annual general meeting of Olds Discount Company Limited was held on May 25th in Nottingham, Mr. W. A. Olds (chairman and joint managing director) presiding. The following is an extract from his circulated statement: There has been a further increase in the volume of business and consequent larger profits. The assets of the company exceed £4,500,000.

"Restrictions are placed on hire purchase of "consumer goods" on the theory that the additional demand thus created tends to force prices up and cause inflationary trend; but the recent official attitude may indicate a slight easing of control, possibly because many classes of goods are now in plentiful supply; while there is also the important point that the need for exporting is more than ever stressed, and this cannot be done without economical bulk production, which always requires a healthy "home" market for the goods concerned. Furthermore, these restrictions seem to have the effect that the lower income groups do not obtain their fair share of these comforts and amenities, which are secured to those who can afford to pay cash. Still further, these restrictions only apply to the activities of private enterprise.

The supply of "Capital Goods" is not generally restricted. We actively seek this type of business. If wise and gradual reduction of controls may be visualised and internal conditions remain at all similar, there is ample evidence that our resources can be effectively used in the trades with which we have valuable and increasing connections and goodwill, and your board look to the future with confidence.

The report was adopted and the increased dividend distribution—interim 7½ per cent. and a final of 12½ per cent. on the increased capital—was approved.

EQUITABLE LIFE ASSURANCE SOCIETY

RECORD FIGURES

Sir William Elderton, the president, was in the chair at the one hundred and eighty-eighth annual general meeting of the Equitable Life Assurance Society held in London on May 24th. The following are extracts from his speech:—

During the year the funds increased to £21,500,000, and the premium revenue to over £1,800,000; these figures were records. The proportion of premium income absorbed by expenses was under 6 per cent. A small reduction was shown in the gross rate of interest earned on the society's funds; in 1949 the rate was £4 11s. 11d. per cent. Now that we are able to invest new money on better terms, it is to be hoped that the fall in the gross rate of interest will be checked. The net rate of interest earned for 1949 was £3 12s. 3d. per cent. The purchase of the shares of the Standard Property Investment Company has now been completed and we have advanced sums amounting to £1,150,000 to the company. Two of our subsidiary companies, the Reversionary Interest Society and University Life Assurance Society, made quinquennial valuations at the close of 1949 and both report satisfactory results.

In the year in which there was heavy depreciation in practically every class of Stock Exchange security, we have suffered a fairly sharp fall in the value of our holdings. Fortunately, a considerable part of our assets is in property and mortgages so that the fall in value is not large in relation to our total assets.

Our new life business at just under £3,800,000 was about the same level as for 1948.

The report was adopted.

LONDON AND THAMES HAVEN OIL WHARVES

INCREASED PROFIT

SIR VERNON THOMSON'S STATEMENT

The fifty-first ordinary general meeting of London and Thames Haven Oil Wharves, Limited, was held in London on May 25th, Sir F. Vernon Thomson, Bt., G.B.E., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year 1949:—

The trading profit of the company and its British subsidiaries is £234,796 (as against £229,954 for the previous year)—an increase of £4,842. The consolidated net profit is £100,682 as compared with £99,669 for the previous year.

Of the net profit of £100,682, £97,474 is attributable to London and Thames Haven Oil Wharves, Limited, and to this amount has to be added the balance of £415,839 brought forward, making a total available sum of £513,313. After transferring £27,000 to general reserve (making it £100,000) and providing £22,000 net for the dividend on the Preference shares, the directors recommend a dividend for the year on the ordinary shares at the rate of 10 per cent., and a bonus at the rate of 2 per cent., both less income tax.

CONTRACTS WITH IMPORTERS

The results for 1949 reflect the first full year's trading since the winding up of the Petroleum Board in June, 1948. Contracts have been entered into with the majority of the importers and distributors in the petroleum trade in the Thames and the volume of business handled under conditions that are still subject to restrictions and controls can be regarded as satisfactory.

The new refinery now being constructed at Thames Haven by "Shell" Refining and Marketing Company, Limited, with whom we have entered into important contracts for the future handling of their oils as reported to you last year, is due to commence operating on January 1, 1951. During the year "Shell" Refining and Marketing Company, Limited, announced that the design of the new refinery was temporarily to be modified. The new situation arising has been carefully investigated and it is not anticipated that the benefits the company expected to enjoy under these contracts will be materially affected.

To meet the future requirements of these contracts and those entered into with the remainder of the trade an extensive capital construction programme has become necessary. Tanks, pipelines, and a jetty destroyed during the war have to be replaced in a form to meet present-day and future developments. Tankage of some 110,000 tons suitable for the reception of crude oil is being constructed, and the necessary pipeline system. The jetty to be constructed will accommodate the increased size of large tankers now under construction. A substantial part of the cost of these items will be met out of war damage claims. In addition, we are increasing our operating facilities to provide the services appropriate to the changing requirements of the oil trade.

The Compagnie Industrielle Maritime, our French subsidiary, has again made substantial progress. The gross trading profit has increased from Fr.141,352,968 in 1948 to Fr.249,138,094 following a further substantial increase in the volume of business handled. It is paying its first dividend since the war—10 per cent. on the present capital.

The report was adopted.

E.N.V. ENGINEERING COMPANY

SATISFACTORY RESULTS

The annual general meeting of this company was held on May 24th in London.

Mr. C. G. Twallin, C.B.E., (chairman of the company), who presided, said:

The result of our trading during the past year, while not quite so good as that under consideration twelve months ago, is satisfactory bearing in mind conditions prevalent during the period under review. We have been fortunate in securing new contracts which have, however, necessitated much preliminary work prior to entering into production, in the meantime we have had to contend with continually rising prices. We aim to keep down our prices to customers as low as possible, to enable us to compete effectively, particularly in the export market. I am glad to be able to tell you that a large portion of our output goes abroad either by way of direct sales or as indirect sales in the shape of component parts for cars and commercial vehicles which are exported by our customers.

NEW DEVELOPMENT

For some two years we have been working in close connection with the Eaton Manufacturing Company of Cleveland, Ohio, U.S.A., on the manufacture of units for the Eaton 2-speed rear axle, and during this time considerable effort has been expended in developing the production of components. Assembly has been hampered by short and intermittent supplies of necessary material, but the situation is improving in this respect and production is increasing. There is every indication that this project will justify the confidence of your directors. This portion of our business should expand in the near future and may necessitate further capital expenditure in order to meet the rising demand; we shall not hesitate to instal equipment to enable us to reap in full the benefit of the hard work and expense occasioned in the development stages.

HEALTHY FINANCIAL CONDITION

Turning to the accounts, you will observe that our financial position is in a healthy condition. The current assets exceed the current liabilities by the sum of £687,339. We have adopted our usual practice with regard to depreciation which is continued in a generous manner. You will observe that since the conversion of the company into a public company in 1928, we have written off £848,077 in depreciation. The net profit shown in the trading account is £56,791, arrived at after due provision for taxation, to which must be added the amount brought forward from the previous year of £55,257, making a total of £112,048. An interim dividend of 7½ per cent. was paid on August 26, 1949, absorbing £10,312, leaving a balance available of £101,736. Of this we propose to add £20,000 to our general reserve, bringing this figure up to £245,000, and, subject to your approval, to pay a final dividend of 10 per cent., less tax, and a bonus of 8¾ per cent., less tax, making in all with the interim dividend a total distribution of 26¼ per cent., less tax, for the year, leaving a balance of £55,955 to be carried forward to next year.

THE CURRENT YEAR

As to the future, I am pleased to say that the value of orders on hand is in excess of the figure at this time last year, and given reasonable freedom from undue restrictions your directors feel that the current year's trading should compare favourably with the accounts now under review.

The report and accounts were adopted.

SILVRO MANUFACTURING

(Makers of BONSOIR Shirts and Pyjamas)

The fourteenth annual meeting of Silvro Manufacturing Company, Limited, was held on May 23rd in London, Mr Manley Cooper (chairman) presiding.

The following are extracts from the directors' report and the chairman's circulated statement:—

The profit for the year amounts to £66,392 compared with £52,908 for the previous year and the Directors recommend a dividend distribution on the ordinary shares of 30 per cent. for the year

Your American customers have resumed their purchases of a fair proportion of our output. While this renewal of trade was somewhat helped by devaluation, the major factor was a range of popular new designs.

The South African market has been virtually closed during the last 12 months, but the business which has been done with Canada, Scandinavia, Holland, Denmark and Australia, has partly made up the deficiency.

We have for some time now been reorganising our production methods and introducing new ones. This has led to greater productivity and enabled us largely to absorb the various increases in prices of our raw materials and other charges without passing them on to our customers. In few cases have we increased prices, certain lines have actually been reduced.

Sales for the current year to date are higher than last year and orders in hand are greater. Should this state of affairs continue the final result should be at least as satisfactory as the past year.

The report was adopted and the resolution to capitalise a portion of the reserves by issuing to ordinary shareholders 1 new share for every 3 now held was approved.

J. BERRY & SONS, LIMITED

A SUCCESSFUL YEAR

The thirteenth ordinary general meeting of J. Berry & Sons, Limited was held on May 24th in London, Mr. Leslie Berry (chairman and managing director) presiding.

The following is an extract from his circulated address for the year ended December 31, 1949:—

Your company has again had a very successful year, with a net profit of £50,149, a record for the company and one that I think you will agree is most gratifying. Your directors are recommending a final dividend of 22½ per cent., making the total for the year 37½ per cent., the same as for 1948.

As to future trends and profits, I feel that, despite the difficulties and tasks inherent in the present economic situation, and provided nothing untoward occurs, the results for the coming year should prove satisfactory.

Messrs. Leopold Farmer and Sons undertook to value the freehold property. As a result, in their opinion the value has advanced to £120,000 from the cost price as shown in the balance sheet. The balance sheet figure has accordingly been adjusted, and the excess of £91,261 has been carried to a capital reserve account by your directors. In the opinion of your directors, the other assets of the company are valued in the balance sheet at not less than their true value.

Your directors have now decided to issue out of the capital reserve accounts as part capitalisation of that account, £50,000 in 6 per cent. redeemable preference shares, and in view of this it will be necessary to set up a capital redemption reserve fund to redeem the preference shares in due course.

The report was adopted.

CONSOLIDATED ZINC CORPORATION

SATISFACTORY FIRST YEAR

The first annual meeting of The Consolidated Zinc Corporation, Limited, will be held on June 15th in London.

The following are extracts from the circulated statement of the chairman, Mr. John R. Govett:—

The Consolidated Zinc Corporation, Limited, was formed at the beginning of last year, and soon after its formation acquired the whole of the issued share capital of The Zinc Corporation, Limited. It also purchased from The Zinc Corporation, Limited, the whole of the issued ordinary capital of Imperial Smelting Corporation Limited.

The Zinc Corporation, formed in 1911 to treat accumulated mine tailing dumps at Broken Hill, New South Wales, soon became an active producer of lead, silver, and zinc ores: over the past 25 years it has developed into one of the leading mining companies in the Broken Hill field—in fact, in the world. The combined output of Zinc Corporation and New Broken Hill Consolidated today represents more than half of the total output of recoverable lead and zinc from the Broken Hill field. Imperial Smelting Corporation is the sole producer of the primary zinc metal in the United Kingdom, and has been largely built up on the treatment of the raw materials derived from the Broken Hill mines.

The company also acquired the issued share capital of Sulphide Corporation, Limited, which produces sulphuric acid, superphosphate, and cement.

In addition, through its wholly owned subsidiary, The Broken Hill Corporation Limited, The Consolidated Zinc Corporation holds many other important interests in Australia.

The profit for the year, before taxation, amounts to £3,453,429. This result is most satisfactory, but it is only prudent to point out that these profits were earned largely during a period of high metal prices, and that there is a background of increasing production costs, the full effect of which will be felt on a falling price trend.

As the shares in the subsidiary companies were not acquired until April, 1949, the profits for the first three and a half months of the year are not available for distribution. Nevertheless, the profit for the remainder of the year has been sufficient to pay dividends on ordinary shares which will give shareholders an equivalent return to that received from The Zinc Corporation, Limited, last year and to carry forward £183,303. This figure, added to £550,621 transferred to capital and revenue reserves, gives a total of £733,924 retained in the business out of the profits earned during the year.

The provision for taxation amounts to £2,077,727, which is 60 per cent. of the profit and constitutes a very heavy burden.

PRICE FLUCTUATIONS

The year 1949 was marked by violent price movements in lead and zinc both in the U.S.A. and the United Kingdom. There is a school of thought that would argue that the day-to-day fluctuations of a free market might be regarded as healthy compared with the movements that we have witnessed during this period. It is not easy to pass judgment, but it will be plain that the influence of United States stockpile buying and United Kingdom Government bulk purchasing has added a fresh speculative impetus to markets whose price levels have always been somewhat volatile. I see nothing which causes me to modify my views that we may continue to expect a level of prices which will bring a reasonable reward to all our enterprises. I cannot stress too strongly that our prosperity must still depend greatly on American economy.

We know from past results that our scale of operations at today's outputs provides an economic and well-balanced range of activities. Immediate plans for future development envisage a widening of our activities, and given reasonably stable conditions over the next few critical years, we can expect to see the gradual building up of our mining operations, harnessed to an expansion of manufacturing operations.

We have a sure foundation on which to build, and can justifiably look forward to the future with confidence.

NEW BROKEN HILL CONSOLIDATED, LIMITED

DEVELOPMENT PROGRESS

The annual general meeting of New Broken Hill Consolidated, Limited, will be held in London on June 15.

The following is an extract from the circulated statement by the chairman, Mr John R. Govett:—

Four years have elapsed since our 10-year development programme was announced in December, 1945, and in reviewing the progress achieved up to December 31, 1949, I believe we are entitled to say that great strides have already been made in establishing your company's mine as a substantial and independent producer in the Broken Hill field. The 10-year development plan contemplated that in the year 1949 production of ore from the company's own leases should total 173,000 tons; I am glad to be able to record that, in actual fact, this target figure was slightly exceeded.

Ore production from the company's leases in 1949 totalled 175,232 tons, nearly 70 per cent. higher than the previous year's figure of 103,578 tons. Under the terms of the Sale of Ore Agreement with the Zinc Corporation we purchased 48,883 tons of ore, and the total ore milled during 1949 for our account was 224,033 tons.

Crosscuts on the No. 19 level, at present our deepest development opening, had, up to April of this year, disclosed the following average values:—

	Width feet	% lead	Ounces silver,	% zinc
East Crosscut	151	17.0	3.7	9.2
West Crosscut	40	19.8	4.2	13.2

Shortage of labour remains our greatest anxiety.

MOTAPA GOLD MINING COMPANY LIMITED

INCREASED ORE RESERVES

The fourth annual general meeting of Motapa Gold Mining Company Limited, was held in Bulawayo on May 23rd.

The following is an extract from the speech of the acting chairman, Mr W. M. Barclay:

The working profit amounted to £98,028 and, after deducting £6,651, being the difference between sundry items of expenditure and revenue, there remained a net profit of £91,377. This, together with an amount of £305 unappropriated at the commencement of the year, made a total of £91,682, of which £70,000 has been transferred to general reserve, representing profits which have been "ploughed" back into the business, leaving a balance carried forward of £21,682.

During the year there was a yield of 26,806 ounces of fine gold recovered from a mill tonnage of 219,500 tons at a cost of 17s. 10.3d. per ton milled, the profit per ton milled figure being 8s. 11.2d.

The development footage advanced totalled 10,809 feet, a distance of 5,220 feet measured along the strike of the ore bodies was fully proved by crosscutting or diamond drilling and of this 2,730 feet proved payable at an average value of 3.3 dwt per ton over a width of 13.6 feet.

The ore reserve estimated at 386,000 tons averaging 3.3 dwt per ton over a stoping width of 14.3 feet, compared with the ore reserve at the end of 1948, represents an increase of 69,000 tons, the value and stoping width being lower by 0.2 dwt per ton and 2.4 feet respectively.

The report was adopted.

YORKSHIRE INSURANCE COMPANY, LIMITED

SATISFACTORY PROGRESS

The annual general meeting of this company was held on May 23rd, at York.

The Rt. Hon. Lord Middleton, M.C. (the chairman), in the course of his speech, said: I may broadly describe the year as one of satisfactory progress both at home and abroad. New life assurance business continued last year to flow in at a steadily mounting rate, the total of net new sums assured producing the record figure of nearly £6,500,000—nearly £1,500,000 more than in the previous year. The total premium income, including consideration for annuities, advanced to over £1,750,000, and the fund at the end of the year, which is over £17¼ million, represents an increase of more than £875,000.

The premium income in the fire account has risen by over £285,000 to £2,355,953. The loss ratio is 41.21 per cent., compared with 49.32 per cent. last year—a highly satisfactory result. Expenses are fractionally lower at 42.01 per cent. After making provision for unexpired risks at the new rates of exchange, we are able to carry £236,582 to the profit and loss account, compared with £141,284 in 1948.

In the accident and general account the loss of employers' liability business, consequent upon the extension of national insurance to include industrial injury insurance, has been more than made good by expansion in other directions. The profit carried to the profit and loss account is £235,808, compared with £155,826 in 1948.

Our income in the marine account continues to expand, and the fund at the close of the year, which shows an increase of £349,580 represents 155 per cent. of the 1949 premiums.

The report was adopted.

NOTICES

A COST ACCOUNTANT is required by a well-known manufacturing firm in the Birmingham Area. The appointment is a responsible one and calls for leadership and initiative. The successful applicant must have had previous experience, preferably in an engineering works. Commencing salary up to £1,200 per annum depending on experience; exceptional prospects, age limit 33-40.—Full details of qualifications and experience in confidence to Box 422.

EXPERIENCED PRIVATE TRANSLATOR undertakes commercial, literary, medical translations from French, German. French German, Spanish typing. Library research. Quick, expert, moderate. —Primrose 6537.

UNIVERSITY OF BRISTOL

DEPARTMENT OF ECONOMICS (AGRICULTURAL ECONOMICS) BRISTOL II PROVINCE

Applications are invited for the posts of Assistant Agricultural Economist. Applicants must possess a University Degree in Economics and/or Agriculture. Salary scale according to qualification and experience:—Men £295-£470 plus bonus £90; Women £230-£400 plus bonus £72. Successful applicants will be expected to work under the direction of the Provincial Agricultural Economist at Newton Abbot, Devon.

Applications which should include the names of two referees and may be accompanied by copies of not more than two testimonials should be sent to the Registrar, University of Bristol, Bristol, 8, by June 17, 1950.

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 20, 1950, total ordinary revenue was £53,878,000 against ordinary expenditure of £63,476,000 and issues to sinking funds £190,000. Thus, including sinking fund allocations of £1,424,000 the surplus accrued since April 1st is £40,329,000 compared with £54,349,000 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

Revenue	Estimate, 1950-51 £'000	Receipts into the Exchequer (£ thousand) Apr. 1, 1949 to May 21, 1949	Apr. 1, 1950 to May 20, 1950	Week ended May 21, 1949	Week ended May 20, 1950

Dash for Freedom?

AN article in *The Economist* last week examined the question whether any new economic policy was likely to have emerged from the confabulation at Dorking of the chiefs of the Labour Party, and reached the negative conclusion. This article was not in the hands of readers before Mr Noel Baker made his sensational announcement of the immediate ending of all rationing of petrol (which is fully discussed elsewhere in this issue). Coming as the culmination of quite an impressive list of relaxations of controls—including Dr Dalton's "experiment in freedom," the abolition of points rationing and the virtual ending of the allocation of steel—the liberation of petrol is a big enough event to warrant at least a re-examination of the question. Has the Labour Party, without altering its line of talk, in fact altered its course to a significant extent? Are the cartoonists right when they depict Mr Morrison running off with the Tories' clothes while they are bathing? There are some observers who profess to see quite a startling and far-reaching change since the election. For example, Mr John K. Jessup, one of the editors of the American magazine *Fortune*, reports in the May issue, after a journey of investigation to Great Britain, that

> The Socialists, who know they are licked, are no longer obstructing the businessman's recapture of a large part (not all) of his former social power. The original capitalist country is rediscovering capitalism.

This will seem to most people in this country to be a false conclusion. When analysed, it seems to be composed of an incorrect assumption of what the Labour Party's "Socialism" amounts to, combined with an exaggeration of what appear to be the current departures from it. With the exception of the dogma of nationalisation—the practical effect of which, as has often been argued in these columns, has been relatively small—there has been very little in Labour's policy over the last five years that can be clearly labelled "socialist." On the contrary, the three main objects of that policy would be equally proper to a wholly non-socialist party. The first object has been to preserve the very large shift in the distribution of the real national income that occurred as a by-product of the war. This is not a policy that would be likely to commend itself to a party that was self-consciously of the Right; but there is nothing particularly socialist about it. The second main object of Labour policy has been to complete the structure of the welfare state—or at least of the social security state—and the only differences of opinion here between socialists and non-socialists relate to pace and cost; the principle is common to both. The third main object, overshadowing both the others, has been to keep employment as high, and unemployment as low, as the war left them. In practice—however much it has been disclaimed in theory—this has meant preserving the fixity of present employment patterns, and there is no reason to suppose that a non-socialist government would have pursued a substantially different policy. These objects, and not an ideological addiction to control for control's

sake, have dictated the very stiff attitude that the Government have hitherto adopted towards all proposals for the relaxation of controls, either in domestic industry or in international trade. If they have been reluctant to withdraw their control over the free movement of prices, it has not been because of a socialist belief that they can control all prices at all times, but because of a belief that, in a free market, Labour's share of the real national income would turn out to be smaller than it is today. If they have clung to quantitative regulation as a method of controlling imports and exports, it is not because of a socialist desire to administer every industry from the Board of Trade but because of a fear lest any system that left scope for unplanned adjustments would simultaneously leave scope for unplanned unemployment.

*

How then are the relaxations of recent weeks to be explained, if not by a change of policy? The leaders of the Labour Party have always said that the restrictive controls, especially those that are unpopular, would be removed as soon as it was possible to do so without running any risk of the rationing of necessaries "by the purse" or of creating unemployment. That time, in many lines, has come. It may very well be that the Labour Party, so long as it had a secure majority, had a bias towards making these relaxations later rather than sooner. It may also be that the delicately poised parliamentary position, and the consequential need for immediate popularity, has reversed this preference, and that this explains the spate of recent weeks. But this does not alter the fact that the Government are, in substance, only doing what they always said they would do. The points rationing scheme and the steel allocation scheme were abandoned only when supply, by overtaking demand (even the inflated demand of today), had made them ineffective. Even the liberation of petrol is not nearly as big an exception as it might seem. It is true that there was an element of surrender to "rationing by the purse," but Ministers profess to believe that petrol is a luxury; and in any case the effective element was an offer of increased supplies of petrol for sterling.

Not one of these decisions represents any real change in the basic direction of Labour economic policy. So far from any deliberate decision having been taken to make a dash for freedom, it is freedom that has overtaken several departments of the government's policy. The world is gradually returning to normal; supplies everywhere, stimulated by ten years of high prices, are catching up with demands; shortages are disappearing; and at long last many of the controls imposed in wartime for the purpose of compressing demand down to the level of supply are becoming unnecessary. The Labour Government are benefiting from this process; but it is almost in spite of themselves. They have done nothing to bring it about. On the contrary, the devaluation of sterling, which has played a large part in the process, was virtually forced upon them over Sir Stafford Cripps's absent body, and the liberation of petrol, though not resisted, was the fruit not of their initiative but of the proposal of others—stimulated, in its turn, by the growing signs of a world wide buyer's market in oil. If Labour has stolen any of the Tories' clothes by the actions of the last few weeks—which is by no means certain, since most of them are clearly identified in the public mind as Tory policies, which Ministers were denouncing as irresponsible only a short time ago—it only goes to show how superficial are the differences in economic policy between the two major parties.

There is an alternative economic policy to the present accidental collection of expedients. Whether it be called capitalism or liberalism or simply back to normal, its distinguishing characteristic is that it would restore the power of money, operating through the price mechanism, as the main regulator by which the economic system is made to produce what is wanted and resources are applied where they are needed. Nobody suggests a return to a price-regulated economy in the extreme form of the nineteenth century, but the alternative to the present Government's policy is a deliberate move in that direction.

*

There are two big tests by which anyone will be able to tell when the enterprise economy is once again to be given a chance of working in Britain. Both are almost tediously familiar and need only the briefest mention here to be identified. The first test is to ask whether there is to be a sufficient disinflation of demand to permit the price mechanism to do its work. It is the essence of that mechanism that prices should be allowed to move both up and down, attracting resources to where they are needed and repelling them from where their employment is uneconomic. Obviously, the mechanism cannot work if there is so much inflation that all prices move indiscriminately upwards—or so much deflation that all move indiscriminately downwards. Obviously also, the policy of disinflation involves facing the risk of a certain degree of unemployment, since its object is to force resources, of labour as well as of capital and materials, to move, and it cannot be expected that every man thus displaced could be re-employed at once. But this unemployment need not be large. And the justification for asking the community to endure it is that it is far better to run the risk of a small volume of unemployment now than to face the virtual certainty of the mass unemployment that will follow if the British economy goes into the next bout of hard times in its present rigid condition.

The second test is whether a serious attempt is to be made to get the level of taxation down to a level that the economy can stand without perpetual inflation. This again needs no further explanation here; the only point that needs repetition is that it is a categorically imperative condition of any attempt to reinstate the price economy.

When there is a government in Britain that will risk some increase in unemployment and that will initiate a real cut in the level of government expenditure—then, and not until then, will it be time to talk of a new economic policy. Admittedly, to ask this of any politician is to ask more than he can possibly deliver at the moment. Indeed, the advocacy of the alternative policy is more uphill work at present than ever before, since for the moment all the news is good, and he who would play the role of Cassandra must content himself with warnings of what is to come, which may carry intellectual conviction to a few, but are hardly to be recommended to parliamentary candidates as a means of collecting votes. Those who believe that Britain will not be firmly on the road of economic progress until there is a sharp change of policy will have to wait until the present policy reveals its defects. They will have to be patient; and they should beware of false dawns.

Defence of the Levant

AFTER a lull of some months, the Middle East has returned to the limelight. Both Mr Bevin and Mr Acheson came to the recent talks in London well equipped with Middle Eastern advisers; but few people hoped for an outcome so clear-cut as the two statements that emerged from their discussions. The first, which they issued separately but in identical terms, covers their policy along the frontier line between east and west that is constituted by Greece, Turkey and Persia. It affirmed the Atlantic powers' "vital concern" in the integrity of these non-Atlantic countries. For the first time Persia (hitherto the most wavering of their chain of allies because it prefers, in its exposed position, to sit upon the fence), was unequivocally bracketed with countries that take western aid and like it. The second statement, which they issued jointly with the French government, is a firm effort to inject some solidity into the quivering political morass further south—that is, the states which fought the Palestine war. After assuring the Arab states and Israel that all of them will be enabled to buy arms on an equal footing, both for purposes of internal security and—a sobering thought—"to permit them to play their part in the defence of the area as a whole," the statement adds:

> The three governments, should they find that any of these states was preparing to violate frontiers or armistice lines . . . would immediately take action, both within and outside the United Nations, to prevent such violation.

At a blow, therefore, the two statements serve several purposes. The first is to demonstrate that former rivals in the area are at one on certain major points of policy, having been driven into complete unity by Russian policy in Eastern Asia. Another is to soothe Israel's understandable grievance that the British should sell arms to Arab States only. The argument that this policy was forced on the British by their treaty obligations never sounded at all fair to Tel Aviv. A third is to implant into Middle Eastern minds the conception—hitherto undreamed of in their preoccupation with more parochial issues—that regional defence may one day be necessary. Yet another is to cap and improve upon the recent British recognition that the only possible future for Arab Palestine is as part of Jordan. These four pieces of commonsense are a welcome relief from long months of Arab make-believe that Israel does not exist, and from Israeli growling about Arab intentions to start a "second round" of war. For all their talk there is not the slightest chance of this.

But the average Middle Eastern view of all such western pronouncements is not favourable. They are "dangerous." "Why must you take this subjective interest in our area? Why need we be forced into your east-west quarrel?" Egyptians, Arabs, Israelis and even Persians would prefer to be left to themselves and to be "neutral." Unfortunately for them, this attitude is, in western eyes, as head-in-sand as was Belgium's one-time neutrality. To a western mind, the present state of world affairs compels the taking of thought for the morrow in the Middle East. The western reply to Middle Eastern objections is, therefore, uncompromising and runs as follows: "Your area cannot be neutral on account of the size and desirability of its oil resources. Nor can we allow the military weakness from which, in terms of modern warfare, you suffer, in an area that adjoins our line of defence in Turkey. Nor can we ignore the risk of Russian imperialism bursting into the countries that border the one peaceful area left in the Old World—the Indian Ocean." The western aim, therefore, is to make provision firstly, for the external security and, secondly, for the internal tranquillity of the Middle Eastern world. The two statements by the Foreign Ministers go some way towards both ends.

*

In fact, there is only one point about the statements to criticise and that is the shape in which they were drafted. Their appearance as unrelated documents tends to perpetuate the notion that defence of the roof, or pie crust, of the Middle East is one question and that plans covering the political relations of the countries further south are a separate affair. This idea prevails in many Middle Eastern minds: few Egyptians or Iraquis, for instance, see any connection between building a bastion in Turkey and trying to settle Arab-Israeli and inter-Arab quarrels. The same conception is discernible even in some American thinking. All Turks and most Britons disagree. In their view, plans for strengthening the so-called roof are not worth making from bases on the distant Atlantic. Success at roof level pre-supposes some

shoring-up from directly below—that is, the existence of some bases, or potential arrangements for bases, in the Arabic-speaking world and in Israel. In short, the two London statements must be read as one.

It must be recognised from the outset, however, that few inhabitants of the Middle East, except the Turks, will make the connection. In the first place, all view the Great Powers as equally self-interested, and their attentions as unwelcome and oppressive. All, therefore, take note only of the points that directly concern themselves, and spend their time looking for the pin pricks and drawbacks that will affect them locally. In the second place, the aftermath of the Palestine war has blinded nearly all Arabs and Egyptians, not to mention a great many Israelis, to all wider issues. It has created between victor and vanquished a degree of hostility, that—at least in the Arab lands, where blood feuds are traditional—will not die quickly or easily. Even as between the vanquished Arab states it has given rise to new quarrels, as well as enhancing the old dynastic and personal feuds that have long lurked in the corners at

Arab League meetings. Thus inland Jordan which, sharing a long frontier with Israel, is immensely and adversely affected by the maintenance of war-time hatreds, is at loggerheads with Egypt and Saudi Arabia, who, being unaffected economically, are all for keeping anti-Israeli feeling at white heat. The old dynastic feuds between their respective kings, therefore, receive a new lease of life. It seems unlikely that the Arab League, bound as it is by ties of kindred and affinity, will dissolve under the strain; but it is thereby rendered useless as an instrument of regional policy, even *vis-à-vis* Israel. Likewise, Israel, obsessed as it is with the colossal problem of balancing its international payments, and with equally difficult domestic tasks, has little inclination to raise its head and look to regional issues.

It follows that—everywhere—the western powers have their work cut out to drive home their argument about the relationship between area defence and area tranquillity. Nor, looking ahead, does their task become easier with time. For, if Israel continues upon its present industrious course, causing wheels to hum and deserts to bloom, it seems that it must become to its neighbours a source not only of hatred but of fear. The scene in which the western allies are setting out to promote more harmonious relations and broader thinking cannot be said to be bright.

*

Three main courses of action are open to them as they pursue their declared policies. All three are in operation already. One is to reach military agreements with one or more of the states beneath the "roof," which would enable them harmoniously to prepare or maintain joint second line bases there. Another is to promote, by such diplomatic means as they can devise, "temporary" individual arrangements linking the Arab states which need Israel to Israel's ports and markets. A third is to press on with the economic and social advancement of the area in the form generally labelled as Point Four aid. But in all three fields they meet the same difficulty. It is that in Egypt, in most of the Arabic-speaking states and in Persia, no one dares to explain their presence to the crowd. The relationship between governors and governed, though democratic in name, is scarcely ever one of trust or confidence. Nahas Pasha, the Wafd premier, is an exception to this sweeping statement, but he has not lately used his great influence. The average relationship between government and people is one founded upon the practice of feeding the public with the slogans that it likes to hear, and of avoiding the statesman's duty of telling distasteful truths when policy demands it. It is one in which, unless statesmen pull themselves together, the crowd has the upper hand.

Agreements with the west, therefore, however sensible they may appear to sober heads conferring behind closed doors, are difficult to sell to the public. They would be greeted with acclamation were they to come as gifts of money or arms given unconditionally. But such gifts are out of fashion since the American experience in China. Whatever other form they take—whether military talks or treaties, whether encouragement to negotiate with Israel, or whether offers of economic aid entailing a share of western supervision—they are mistrusted as soon as conditions are attached. No Arab government could, at the moment, contemplate handling more than one such topic at a time.

*

It is for the west, therefore, to decide which of its goals in the area—military, political, or economic and social—shall have priority. There can be no two minds on this subject. Social development is a slow and long-term process. The calming of passions over Palestine must also await the passage of time. Only military agreement is quickly attainable. This exists, on a basis of agreement, between Britain and Jordan. It also exists, but on a basis of disagreement, between Britain and Egypt. Can the basis be improved, or ought a substitute to be sought elsewhere—in Cyprus, at Gaza, in Cyrenaica? The military view is that no substitute is possible. Nowhere but in Egypt are to be found the prime requirements of a good land base, which are good ports, good water and a good labour supply. The canal zone has the additional advantage of offering access from the sea by a back door.

A new treaty with Egypt is, therefore, an obvious western objective. Ought it not also to be an obvious objective for Egypt's present rulers? Viewed as a paper proposition, it should appeal to an aristocracy which runs a country rich in resources, weak in arms, and suffering from a scandalous disparity between the standards of rich and poor—in a word, a prime target for Russian incitement to revolution. But how many Egyptian leaders have the moral courage to confess to treaty making with the west, before a public that they have fed for so long on hatred and illusions? The answer is, unfortunately, very few.

The Fishing Industry—I

Scrambling for Fish

WHEN controls over the price of fish were removed in April, the fishing industry looked forward to a period of buoyant prices and brisk competition where the rewards for success would justify the risks of a free market. The gambling spirit which has always inspired those who handle this most perishable commodity had been suppressed for nine years during which time the trade consoled itself with rosy memories of lucky bargains and unlooked-for profits, and forgot the thin weeks that used to come between. What actually happened in April was a rude awakening for the optimists: the level of activity in the industry declined sharply and shows few signs of recovering.

There is a weary familiarity, to the layman, about reports of unsaleable fish, of trawlers laid up and fishermen idle, and he may be pardoned for concluding that the straitjacket of price control has merely been propping up a decaying industry at the consumer's expense. Because the productive side of the fishing industry is carried on in little units below the horizon, and the distributive side pursues its "business" in dreary and malodorous places, few people outside the trade can make head or tail of its chronic complaints. Economists and businessmen see penny-farthing organisation and old-fashioned methods, and judging by standards unconsciously derived from manufacturing industry, they despair of understanding its apparent backwardness. But fishing is an industry full of paradoxes, and its position can only be judged in the light of its idiosyncrasies. It is intended in this article to outline its unique external conditions and in a subsequent one to deal with the problems of internal organisation and marketing.

Two major problems confront the white fish industry and both are international—over-fishing in near waters and over-capacity for production in all the European countries. The first is not new. It was stated succinctly by an old fisherman before the Royal Commission of 1883, "if these men worked the same fishing gear as when I was a lad, they would not see anything alive." Steam vessels first enabled the catching of fish to outstrip the rate of nature's replacement and, when natural stocks began to fall, fishermen were able to go farther afield. Every few years fresh gadgets have had to be invented to make fishing pay—otter trawls to sweep a wider area, "bobbins" to ride on rougher ground, "ticklers" to stir up the fish—and each in time has defeated its own object. Radar and asdic if perfected will do the same thing. The effect of technical advance in this industry has been to make one fish swim where two swam before, and it is now no longer true that there are many more fish in the sea than ever came out of it. In 1907 the North Sea yielded to British trawlers landing in England 4.061 thousand cwt., or 17 cwt. per day's absence from port; in 1938 it yielded only 1,464 thousand cwt., or 15 cwt. per day's absence from port. Each new invention has provided a short reprieve while making the outcome even more certain. The game was almost up in the North Sea in the thirties when long-term replacement costs were not being covered at the prices then offered (85 per cent of Scottish trawlers in 1934 were over 25 years old) and since the war the fleets have made short work of the stocks replenished during the five years' rest. Before the war a hundred hours' trawling from Aberdeen yielded an average of 90 cwt of fish; when operations were resumed in 1945, the yield was 273 cwt., but free fishing has since reduced productivity to the prewar rate.

There have been some gestures of self-restraint. Parts of the Clyde and Moray Firth were reserved as spawning grounds and closed to British trawlers in 1909 although foreign ships have continued to make raids upon them. A minimum size of net and of fish to be landed were enforced in the United Kingdom in 1933 and in 1938, although an international convention since the war failed to persuade the rest of Europe to follow suit. But the poaching of the spawning grounds is only one of the difficulties. If the removal of adult fish proceeds unchecked, there will soon be no small fry to protect, and it would appear that only control of total landings, of all sizes, can save the North Sea fisheries. Great Britain met with a complete refusal to its suggestions in 1946 for all-round quantitative restriction of fishing. Only Germany had lost as many boats as Britain in the war, and every other nation was understandably eager to make the most of such a rare opportunity to sell plentiful fish to the two biggest markets in Europe. But that phase has now ended and the time has come to make another effort for international self-restraint. The nations which use the North Sea should study the striking example of the halibut fishery control on the Pacific Coast; Canada and the United States agreed in 1932 to quantitative restrictions on landings to remedy over-fishing, and in a few years they found that it took only five months to gather up the same quantity of fish that had previously taken nine months, and profits increased accordingly.

*

There are only two possible kinds of economic equilibrium in the North Sea fisheries. There is the sane balance of mutual restraint enabling a mere fraction of each country's present fleet to land a harvest ultimately bigger and in better condition than the present one, and to do so cheaply with a minimum of waste and danger. Failing this, free fishing will lead (if it has not done so already) to an uneasy oscillation between recurrent bankruptcies among fishermen and short-lived bouts of recovery among fishes, with consumers paying high prices for vessels to scrape corners of the North Sea for thin catches of undersized fish.

One outcome of the increasing unprofitableness of North Sea fishing has been the more vigorous development of the distant grounds. Iceland and the Faroes have been popular since the turn of the century, but in the twenties the Northern Atlantic beyond the Arctic circle became warmer, the ice cap retreated and rich stocks of cod were found. Instead of sending trawlers of 200 and 300 tons with crews of less than a dozen to make eight or ten day trips to spots round the British Isles where the choicer varieties of fish were to be found,

more and more owners were building 400 or 500-ton ships at costs up to £40,000 each, to carry between 24 and 30 men on voyages of a month or more. Conditions in the far north are harder—cold and darkness and long absences from home—but accommodation on the bigger ships has always been much more comfortable, and the earnings for all concerned are two to three times as big as those in the North Sea trade. This Arctic fishing, which became possible in the twenties, was the start of cheap mass production in the industry, and has grown steadily ever since. Catches may be anything from 50 to 200 tons for a trip—representing up to 600,000 domestic meals of fish. Before the war long distance skippers commonly earned about £1,000 a year which was two to three times a North Sea man's earnings. A year ago they averaged nearer £3,000 a year, against the North Sea man's £1,000.

The great drawback to these prolific Arctic fisheries, however, is that all the fish is coarse, three-quarters of it is cod, and none of it is improved by lying three weeks in a ship's hold. Packing in crushed ice slows down decay, but only freezing can stop it ; this is expensive and frozen fish is unpopular. Britain builds the grandest ships, it is said, to catch the poorest fish, and it has also created a special industry to consume it. Fried fish and chip shops are a British peculiarity—they account for one third to one half of all the fish eaten and rely almost entirely on the cheap coarse fish varieties. If the fishmonger's customers were as easy to please as those of the fish frier, no one would pay enough money for soles, plaice, halibut and turbot to make them worth seeking. Even as it is, an abundance of cheap, coarse fish drags down the price of good quality fish and makes it unprofitable to catch. There is six times as much cod landed as all the more palatable varieties put together (in 1938 it was seven times), so salvation by frying still leaves a lot of cod unredeemed.

The position of the fishing industry can be summarised by the generalisation that the near water fish are hard to catch, while the distant water fish are hard to sell. For this reason the concern of the British fishing industry at the growth of the fishing capacity of the other north European nations has a more reasonable basis than the usual complaints of an industry about the dangers of foreign competition. More and more ships are entering the Arctic fishing grounds. In 1949 five Danish ships were fishing for the first time off northern Norway, France built 27 new vessels, the United Kingdom built 40, and Germany planned to build another 50. The Icelandic and Norwegian economies are intimately concerned with the export of fish. In 1948 the food and agriculture committee of OEEC estimated that by 1952-53 there would be an increase of 43 per cent over 1938 in the fishing capacity of its member nations. But at the same time all the countries are becoming more self-sufficient, and after making the most optimistic estimates for increased consumption and the industrial uses of fish meal and oil, the committee concluded that in 1952-53 "the surplus of demersal (white) fish for which a market will have to be found has been estimated at 200,000 metric tons."

There appears to be a strong case, on economic and zoological grounds, for a fresh attempt to rationalise the fishing industries of those nations which rely upon the North Sea and the North Atlantic. Perhaps the growing willingness in Europe to accept economic co-ordination would enable a new international agreement on fishing to succeed where previous ones have failed.

NOTES OF THE WEEK

M. Schuman Sets the Pace

A lean and long-legged man may from time to time decide to take a walk with a solid and short-legged man. He then has a choice of tactics: he can have a long walk at the short man's pace or a short walk at his own pace, in the course of which his companion will certainly drag his feet before they have gone very far. That seems to be the trouble with M. Schuman and Mr Bevin over the French plan for pooling Europe's coal and steel industries under an international authority. By setting a cracking pace at the start of what was bound to be a long walk, M. Schuman has ensured that his companion lags behind and asks where they are making for, whether he has a map and whether there will be frequent halts for rest and consultation. To make matters worse for Mr Bevin, the Germans and Italians, probably also the Belgians and Luxemburgers, have gone on with M. Schuman, pretending that he knows intimately the road ahead.

M. Schuman should know his Foreign Office better by now than to imagine that the British would sign a declaration accepting "in principle" the idea of setting up for the two industries a common authority whose decisions would be binding on governments. It should have been obvious that a Labour Government—or indeed any British government—would want to know more details about ways of reaching and enforcing decisions which would affect 1¼ million British workers in basic industries. If it was not obvious at the outset, it should have become so in the conversations which M. Monnet and his assistants had with British officials during their visit to London. In fact, they left the impression that a brilliant French idea still required a great deal of working out in detail.

None the less, the misunderstanding at this juncture is unfortunate. The British cannot be excused for showing once again their lack of *flair* for the generous gesture and the eloquent phrase which keep a good idea before the public while the experts think out all the difficulties. The broad idea of the Schuman plan is of immense importance for France's policy of reconciliation with Germany, and is a first step towards German partnership in the affairs of the west ; to whittle it down, to throw shadows across the gleams of hope which flicker around it in the French and German press is to incur the responsibility of producing some better idea. And there is no sign that Mr Bevin has a better one.

* * *

French and German Hopes

Even a rough analysis of the motives behind present French and German attitudes reveals the possibility that agreement on details—perhaps even on principles—will be difficult without the mediation of some third party. The French want to produce more, cheaper and better steel by getting German coking coal at a reasonable price. To make their industry efficient and independent of subsidies is a key part of M. Monnet's reconstruction plan for France. What is more, the French have believed for two generations that equality with, or control over, German heavy industry is the key to their security. In theory they assert that the proposed

authority would be influenced by economic considerations alone when deciding where production should be encouraged and where discouraged ; in practice one cannot imagine the French agreeing to an increase in German steel production which would threaten their present margin of superiority.

As for the Germans they, too, have good political and economic reasons of self-interest for their attitude. The discussion of the plan offers them their first chance to negotiate as equals on a matter of great national importance. They see, or think they see, the Ruhr Authority and allied security measures giving place to something more acceptable. They hope that the Schuman plan would bring them more quickly and easily back into world markets. Above all, they see a startling change in French policy towards them.

So behind the ideals of French and German statesmen there lies some shrewd calculation of benefits. That should be regarded as a point for rather than against the plan ; for no international authority which does not satisfy the vital interests of those taking part is likely to survive for very long. But there does remain the question whether these interests can be reconciled ; and it is this thought which reminds the French of their weakness and gives them their passionate desire that the British should not stand aside.

Second thoughts reveal no reason for revising the view expressed in *The Economist* two weeks ago: that "solid reasons," both of general policy and of economic interest exist, that should lead the British Government to join wholeheartedly in the examination, drafting and establishment of the proposed council.

* * *

Whitsun in Berlin

The fact that the Whitsun rally of the "Free German Youth" in Berlin passed off without violence must not be allowed to obscure the significance of the demonstration. Between 400,000 and 500,000 boys and girls between the ages of 10 and 20 marched, sang, shouted and demonstrated in the style that the Nazis copied from the Russians and then developed to German purposes. It may well be that the majority of them had little understanding of the peace they were demanding or of the western society they were told to abuse; but they represented a generation which is urged by personal interest and strong emotional impulses to go on behaving in this way and to overcome, by sheer weight of organised numbers and Communist government support, any opposition that parents, teachers and churches may offer.

For such opposition there is now no focus in eastern Germany ; for the process of establishing the complete dominance of the Communist-controlled Socialist Unity Party in every branch of life now needs only the climax of elections in October. Journalists who talked to some of the demonstrators found a feeling that neutrality in the "Communist-bourgeois" struggle was neither interesting nor practicable. Those who want to complete their studies, enjoy their sports and rambles, ensure their future employment found it wise to conform and quite exciting to demonstrate.

Only six months ago the organisers of the rally were boasting how they would drive the "western pigs" out of Berlin, and were encouraged in their boasts by the quixotic decision of the western commandants to let the Free German Youth come over from the Soviet sector and have a look round. When this decision was changed, very properly, into a determination to prevent disorder by having troops and police at hand, the organisers simply declared that what might have been a *putsch* should be a peace rally. This has been another demonstration of how Mr Acheson's doctrine of "creating situations of strength" works; although those who saw the bearing of the marching *Volkspolizei*, in their Wehrmacht uniforms dyed black, wondered whether the margin of strength between the two Germanies is not getting a little narrow.

* * *

No Favour for a Wage Policy

Discussions over the future course of wages and wages policy suggest that the situation gets more confused with every week that passes. Last week the general council of the TUC issued a guarded statement which hinted that one possible way to reconcile the policy of wage stabilisation with wage demands would be if it were to adjudicate claims and allot priorities. It also stated that, unless there were some relaxation of the current wage "freeze," an intolerable strain would be placed on the system of collective bargaining. The response to this has been a series of statements by union leaders that their particular claim must have first priority, and so far from having been the signal for a fresh approach to wage problems it, appears merely to have encouraged some unions to revive dormant claims.

The National Union of Mineworkers, after many months of discussion, has formulated a claim for 2s. 6d. a shift extra for day wage workers, which, it is estimated, would add another £12-£13 million to the Coal Board's wages bill. Mr J. B. Figgins, secretary of the National Union of Railwaymen, having failed in negotiation, has tried the method of direct approach and has warned Sir Eustace Missenden, the chairman of the railway executive, of the probable effect on the railways of a continued refusal to concede his claim for the lower-paid workers.

The Associated Society of Locomotive Engineers and Firemen, whose members regard themselves as the aristocrats of railway workers and which has hitherto refused to be associated with the tactics of the NUR, has now also decided to seek increased pay. This move is significant because the ASLEF has hitherto supported the policy of wage restraint and has declared itself more interested in pensions than wages. It is also a direct challenge to the theory advanced by the leaders of some of the large unions that concessions to the lower paid workers should not lead to claims by skilled workers in order to maintain the differential.

If the ASLEF were to discuss its claim with the general council of the TUC before submitting it to the railway executive, as was suggested by the TUC last week, it is unlikely that the council would regard the claim as justifiable except perhaps as part of a comprehensive scheme of readjustment of wage rates on the railways. This will be a test case, both for the union and the TUC. No one expects individual unions to adopt with enthusiasm the idea of consulting the TUC before proceeding with a claim. Yet, if an inevitable inflationary scramble is to be avoided, and since the idea of any outside planning body or arbitration tribunal has been turned down, this would seem to be the only possible course of action.

Mr Birch's Spoke in the Wheel

Last week's High Court judgment in the case of Birch *v.* National Union of Railwaymen is one of the most important decisions affecting trade unions to be given for some time. Mr Birch, the plaintiff, is a railwayman, a member of the NUR but not a subscriber to the union's political fund. He was elected chairman of his local branch in 1946 and again in 1947. In his second year of office he was asked to sign a personal recommendation in support of an application for inclusion of a Mr William Bannard in the union's political panel. He refused and, apparently as a result, was removed from his office by the General Secretary of the union. Since the Chief Registrar of Friendly

Societies decided that this removal involved no breach of the union's rules, Mr Birch claimed relief in the High Court.

The basis of his case was that the Trade Union Act of 1913 permitted unions to set up political funds, but added the proviso that a member of a union not paying the political levy should not be placed under any disability within his union save that he should not take any part in the control or management of the political fund itself. The rules of the NUR do not clearly define the limits of the responsibility of branch chairmen with regard to the political fund. Therefore the union was able—and prepared—to argue, in effect, that no member contracting out of the political fund could become a branch chairman because as chairman he would be bound to be concerned in some way with the control or management of the political fund. As a result, Mr Birch, in his turn, was forced to argue that the rules of the NUR must be invalid in that they do not comply with the requirements of the 1913 Act. His argument has prevailed. The High Court has not only held that Mr Birch's removal from office was void. It has also declared that the rules of the NUR are in breach of the 1913 Act, because they do not give the member not paying the political levy the rights the 1913 Act intended that he should have.

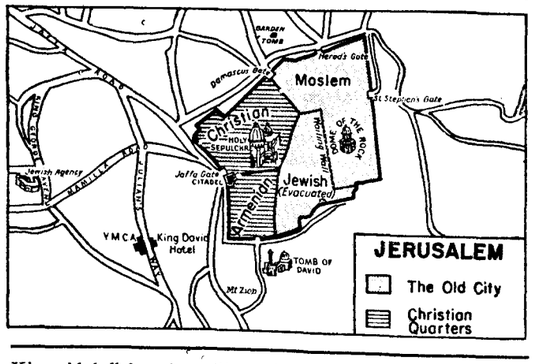
Those who believe that the emphasis in union activities must be political will regard the decision as disastrous: those who hold the opposite view will consider it to be timely. The real risk now is that some partisans will mistakenly read the decision as a blow at the principle of the political levy, which it is not. There is no doubt that the law as it stands considers that the main purpose of a union should be industrial and that its political activities should be housed, so to speak, in an annexe separated from the main building by a door that can be locked. Equally, the cause of this particular dispute lies in the fact that the NUR has failed (to put it as kindly as possible) to frame its rules with proper regard for the law as it is and as it has been since 1913. To argue that this decision requires or justifies any change in the existing law governing the political levy would be to argue that any trade unionist who failed to join the one chosen political party must be debarred from all positive trade union activity, a state of affairs which is axiomatic to the Communists but to no one else.

* * *

Reforming the Planning Act

The Royal Institution of Chartered Surveyors has proposed a number of amendments to the Town and Country Planning Act, 1947. There is general agreement that parts 6 and 7 of that Act, which deal with compensation for depreciation of land values and the making of development charges, are not working well. The principle of the Act is that the right to develop land (with certain minor exceptions) is transferred to the state, which has set aside a sum to compensate owners for the resulting "hardship." The state can sell back this right, on its own terms, to approved developers. The scale of compensation payments has been left uncertain. Development charges have been uniformly fixed, however, at 100 per cent of the increase in site value attributable to the granting of planning permission. This has created an element of uncertainty and inequity in land transactions, and has made owners reluctant to part with their land.

The Institution proposes that compensation for loss of development value should be paid in full in each individual case. It believes that the effect of "floating" and "shifting" values, which led the Government to limit compensation to the share out of a lump sum of £300 million, was exaggerated by the Uthwatt committee. At the same time, it is suggested that payment should be made only when land is actually developed or when its development is definitively prohibited by the planning authority. This procedure would both give owners some incentive to develop their land (which they now lack) and would save the Exchequer from having to make a large lump payment of an inflationary character. The chief difficulty which this proposal involves and which the Institution tries to circumvent is that planning decisions need to be made progressively as development proceeds. The owners would want premature decisions in order to get their claims paid, while the authorities would have an interest in delay.



The present procedure over development charges is condemned by the Institution. Instead of a development charge of 100 per cent, coupled with an elastic valuation technique, the Institution would prefer a variable development charge based on clear and uniform principles of valuation. In this way a financial incentive to make land available for development could be given openly instead of by secret juggling with valuation techniques. Uniformity on valuation matters would be secured by allowing an appeal against the Central Land Board's decision to the Lands Tribunal, which already arbitrates over compensation claims.

The Institution's proposals deserve serious consideration. It is admitted that they would not finally solve the tangle over compensation and betterment—indeed "a solution which is at the same time both sound and equitable in principle and simple in administration has yet to be found." But the Government's choice lies between amending the present Act and scrapping it completely to start afresh.

* * *

A Change of Curators?

Had the new Israeli plan for establishing a United Nations authority to control the Holy Places of Jerusalem been proposed months ago by one or more of the great powers, it would have had much to recommend it. Today, put forward blandly by the Israeli Government, after months of bargaining on a Uno plan which has always been adamantly opposed by both Israel and Jordan—and is in any case obviously unenforceable—it is little more than a "face-saver." It will be refused by the Arab states which supported the wider internationalisation plan; and it will not appeal to

King Abdullah, who will see in it the loss of his authority in the strategically valuable Old City and the end of the traditional custody of the Holy Places which has been well carried out by the Arabs for some centuries.

Before the British Mandate ended, and immediately afterwards, enlightened people of all creeds hoped the city would come under some form of international trusteeship. Now the only people, at any rate of those immediately concerned, who favour internationalisation seem to be the Christian Arabs; they believe they would be better off economically under an international authority than they are likely to be under the Amman government. The Christian churches established in the Old City have found that, since the fighting ended in December, 1948, the Arab Legion has maintained excellent order there and that the Jordan Government has been quite a reasonable successor to the old Government of Palestine. Even the Easter ceremonies, in the past an occasion of strife and disorder, were well organised and completed, with no more than minor hitches. Indeed, the many and varied Christian communities are probably well content with the present situation and wish for no change that might bring trouble in its wake.

Moslems have, of course, full access to their Holy Place—the Dome of the Rock—and it is only the Jews, whose Wailing Wall is barred to them, who have cause for complaint on purely religious grounds. All Arabs, even the Jordanians, will resolutely oppose the re-entry into the Old City of Israelis, in whatever guise they might come.

With the exception of the arrangements for Jews to visit the Wailing Wall, all the duties which the Israeli plan allocates to a Uno authority are being quite successfully carried out by the Jordan Government. The Jews have every right to visit the shrine hallowed by centuries of worship, and there is little doubt the custom would be resumed, subject (in the words of the Israeli text) "to the requirements of public order." If a museum keeper from Lake Success, equipped with multilingual assistants, can make the necessary arrangements and provide the required safeguards, the proposal is good. If not, then it would be better to allow the existing regime to continue, at least until Israel's relations with Jordan have developed to a point where they can devise a more suitable arrangement between themselves.

* * *

Programme for the Satellites

It will be a pity if British propaganda to eastern Europe gives too much attention to the "twenty point declaration of faith in the future of countries behind the Iron Curtain" published this week in London by the European Movement. Because it has been compiled by politicians from six different countries under so able a chairman as Mr Harold Macmillan it cannot be ignored; but because it is the work of exiles it must be examined with caution as well as sympathy. It is only rarely that exiled politicians have in the past kept their sense of proportion, faced the facts and remained capable of influencing the ideas and emotions of those who have not been able to escape from the home country. This programme shows no evidence that such able men as the Rumanian M. Gafencu, the Bulgarian Dr G. M. Dimitrov, and the Polish Count Edward Raczynski are faring any better than their predecessors.

Their programme begins with the statement of certain general principles of morality and politics generally accepted in the west and derided by the Communists. They then promise eastern Europe, "after liberation from Communist domination," European unity, a social security programme on western models, financial and technical help, and economic co-operation among the eastern peoples. The plan then tails off into a vague suggestion that "the advantages of peasant ownership" are to be combined with "the benefits of co-operative associations and the latest experience of farm mechanisation"; and there is a somewhat grudging admission that "considerable industrialisation" will be necessary.

This is really not good enough, even after only two months' discussion between representatives of countries that have found it hard to agree and help one another in the past. It takes no account either of the extent to which national economies in eastern Europe have already been given a decisive new twist, or of the efforts made by the Communists, in their own ruthless ways, to raise standards of living by close imitation of Soviet methods. A more realistic procedure would have been to study the problems—difficult enough in all conscience—of bringing back reasonable freedom and tolerance into a Communist-organised economy and society without causing chaos.

Poland's Chief Planner

Once he has blotted his copybook no amount of penitence and correctitude seems able to protect a Communist minister from obscurity or disgrace. The latest example is Mr Hilary Minc, Poland's Minister of Industry and Trade, a man with dictatorial powers who proved one of the most successful practitioners of planning in postwar Europe. Since last December he has almost disappeared from the public view, is seldom mentioned in the press and is recovering from jaundice when distinguished foreign visitors ask to see him. At the annual international fair at Poznan—his own pet project—he was supplanted at the opening ceremonies by the Prime Minister Cyrankiewicz; yet it is not so long since he was the star performer of the Bierut regime, taking precedence at party rallies even over the Prime Minister.

The reason for his eclipse is almost certainly his earlier and openly expressed opposition to the plan for forcing collective farming on the Polish peasant; it is likely, too, that he is critical of the latest plan to incorporate Polish industry into a Soviet-designed pattern for the whole of eastern Europe. If his enemies care to look farther back, they can recall how Mr Minc welcomed the Marshall plan and tried to persuade Stalin to allow Poland to take part in it. In short, his record shows him at times to have favoured links and trade pacts with the west, individual ownership of land, and—although a Moscow-trained Communist—a certain independent development for Polish industry.

Only six months ago he made what now looks like a pathetic attempt to make peace with the party. He was the chief and most bitter accuser of Gomulka when the latter was expelled by the Communist central committee in November; later he wrote for *Pravda* an article advocating collectivisation of agriculture on a scale even vaster and more rapid than had been officially proposed. Recantation has proved futile, and his powerful ministry is now being split up into ministries for home and internal economy, heavy industry, light industry and communal planning. It is true that Mr Minc is still a vice-premier, but his rival is already on the rise and has had a third vice-premiership created for him; he is Alexander Zawadski, a trusted agent of the Kremlin.

* * *

Schools and Scholarships

The *Oxford Magazine* now provides an interesting yearly record of the scholarships and exhibitions won at the men's colleges at Oxford and Cambridge, classifying them by subject and by school and analysing the types of school which provide the successful scholarship candidates. In the first place it lists the public schools which won ten or more exhibitions or scholarships this year for which the figures are given in the accompanying table. (This table does not provide a final rating of the prowess of the different schools since it includes a certain number of closed scholarships, notably in the case of Winchester.)

In the second place it shows that out of a total of 795 awards made by Oxford and Cambridge 773 were won from schools which can be classified. Of these 52.4 per cent were won by independent schools, 15.5 per cent by direct grant schools and 32.1 per cent by schools maintained or assisted by local authorities. The share going to the independent schools is larger and that going to the local authority schools is smaller than last year. These results tend to confirm the impression that the process of levelling up the standards of the local authority schools has a long way to go. The analysis shows that the high proportion of scholarships won by the independent schools can no longer be mainly attributed to their pre-eminence in classics. It is true that of the 147 classical awards won by schools, 111 were won from independent schools, but there are now considerably more scholarships and exhibitions available in both history and

in natural science than there are in classics and there is now a total of 628 non-classical awards to 167 classical ones. In

SCHOOLS WHICH WON TEN OR MORE SCHOLARSHIPS AT OXFORD AND CAMBRIDGE IN 1949-50

School	No. of Boys	Oxford	Cambridge	Total
Winchester	470	14	10	24
Manchester Grammar School	1,385	7	16	23
Eton	1,134	7	12	19
Ampleforth	409	13	2	15
Marlborough	740	7	8	15
Rugby	640	5	9	14
St. Paul's	600	3	11	14
Bristol Grammar School	970	5	6	11
Charterhouse	600	6	5	11
Christ's Hospital	830	7	4	11
Clifton	520	2	9	11
Harrow	535	4	6	10
Stowe	500	4	6	10

the non-classical subjects, the independent schools enjoy no traditional advantages and on the scientific side are often less well-equipped than the secondary grammar schools.

Healing Themselves

Few people will disagree with the main recommendations of the British Medical Association's committee set up to consider the training of a general practitioner. General practice had already been falling in prestige, in the eyes of the public as well as of the profession, long before the introduction of the national health service. But it cannot be doubted that the health service, as at present organised, is depressing the status of the general practitioner still further. Financially, the hospitals—and their staffs—the dentists, the chemists and the opticians have benefited, but not the general practitioner. Professionally, he is becoming more and more cut off from the hospital service on which most energy has been spent and to which the public is looking more and more for treatment.

It is a vicious circle. The lower the status of general practice falls, the less will the abler doctor be attracted to it, and the status will fall further. The chief merit of the British Medical Association's report is that its proposals are based on the assumption that general practice requires skills at least equal to those required by the specialties. From this assumption follow the recommendations for training. Accepting the recommendations of an earlier report by the association on the basic training of all medical students, the committee recommends that after qualifying to practise, the future general practitioner should then spend three years training for general practice. One of these should be spent under the supervision of an experienced general practitioner, and the other two in hospital—not, it is important to note, in a teaching hospital, but in an ordinary general hospital, where he will see far more of the sort of cases he will eventually have to diagnose and treat.

This is the most revolutionary of the committee's proposals. It is also unfortunately one of the least practicable at present, for it would require, among other things, an expansion of the hospitals to provide posts for all this post-registration teaching. There is, however, a great deal that could be done at once, on the lines of the other proposals, to improve general practice. First must come the reversal of the trend that is divorcing the general practitioner from the hospital and often, in consequence, from the treatment of his patients. This trend is bad on financial grounds, for hospital treatment is expensive. It will also, in the long run, be bad for medicine.

* * *

Hospital Accounts

The report of the Comptroller and Auditor-General on the accounts of hospitals and executive councils for the first nine months of the health service has now been published. What will arouse most interest is the section on the hospitals, for the civil appropriation accounts had only given their total expenditure. The present accounts break down this expenditure under various heads, roughly the same as those that appear in the estimates, and from them the following table has been compiled:—

HOSPITAL MAINTENANCE EXPENDITURE, ENGLAND AND WALES, July 5, 1948—March 31, 1949

	(£000) Original Estimate*		Actual	
	Non-teaching Hospitals	Teaching Hospitals	Non-teaching Hospitals	Teaching Hospitals
Medical salaries	8,015*	917*	10,362	2,629
Nursing salaries	15,050*	1,234*	21,137	2,562
Other salaries	25,600*	2,955*	27,993	5,084
Provisions	10,775	929	12,356	1,601
Clothing, etc., patients and staff	945	52	1,554	129
Drugs, dressings, equipment, etc.	4,450	903	7,272	1,913
Fuel, light, water, laundry	7,320	772	8,663	1,084
Maintenance and repairs	4,415	486	8,956	1,744
Administration	1,075	205	2,843	92
Miscellaneous	4,518	347	7,004	944
Total	**82,163**	**8,800**	**107,540**	**17,782**
No. of staffed beds, Mar. 31, 1949	—	—	420,663	24,915

* To estimated expenditure on salaries should be added the total estimated expenditure by employers on superannuation and national insurance contributions, *viz.*, £4,975,000 for non-teaching hospitals and £2,843,000 for teaching hospitals.

The accounts for Scotland, where the administration and finance of the teaching hospitals are not separated from those of the other hospitals, are drawn up on a different basis. Their salient figures are as follows:—

ACTUAL EXPENDITURE
July 5, 1948—March 31, 1949

	£'000
Maintenance of Patients (food, laundry, clothing, drugs, etc., travelling)	2,300
General Hospital Expenditure (including specialists' salaries)	9,962
Administration and Overheads	1,520
TOTAL	13,782
Number of beds	65,131

It will be recalled that the hospital boards and management committees have been forbidden to publish their individual accounts until after they have been presented to Parliament. But it is difficult to see what advantage the House of Commons will find in the present accounts for England and Wales. It is impossible to make from them any detailed analysis of costs or to make any estimate of comparative efficiency in the hospital service or to track down cases of extravagance. (Those for Scotland do at least distinguish patients' maintenance from staff maintenance and promise in future years a comparison of unit costs for similar hospitals.) The Government's attitude to the proposal that hospital financing would best be carried out by a system of block five-year grants on the lines of university grants seems to be that it would seriously limit Parliament's control over expenditure. It is difficult to see from these accounts just what effective control Parliament can have under the present system.

* * *

Germans in the Air Again

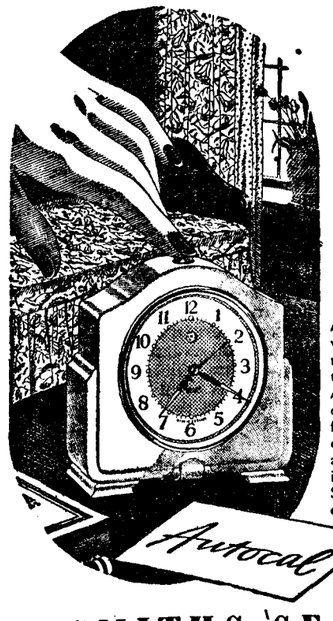
Herr Ulbricht, deputy Prime Minister of the Communist government in eastern Germany has given notice of a request to the Russians that the Germans should be allowed to fly again. It is true that he spoke in the conditional tense and referred only to "transport aviation"; but it may be assumed that there is already agreement on the form which the return to civil and para-military aviation will take in the Soviet zone. Indeed, there is good evidence that training of pilots and preparation of airfields for the Communist S

have already begun. So once again the western governments have fair warning of an important breach of the Potsdam agreement, calculated to appeal to German national pride.

In the western zones Germans are allowed no share in the control of air services and can fly only as passengers. Since the beginning of this year, however, they have been increasingly employed on ground duties, largely to save money. This concession was made grudgingly, and was strongly opposed by those who remember how the young Luftwaffe profited by the expert ground organisation that it inherited from its civil forbears. In other words, the slow slide away from the strictest interpretation of the Control Council's ban may be beginning; and the question of where it is to end already arises.

The Germans of the west now get good air services at reasonable prices without the expense of administration and maintenance. They are served—at a loss—by two American companies, British European Airways, Air France, KLM, Swissair, and the Belgian Sabena. The Germans have already made critical inquiries about the future. In April of last year, a proposal to be allowed to co-ordinate air services with rail and road traffic was rejected; and some months later the Federal Minister of Transport declared that the ban on German civil aviation was "basically unjust."

The occupying powers appear to imagine that twenty-five years can pass before German pilots and aircraft fly again. This is a quite unrealistic estimate, doomed to be upset by events. It would surely be wiser to follow M. Schuman's example, and to begin thinking now of ways in which the civil aviation companies of western Europe could come under a joint authority, in which a German air-line, using foreign aircraft, could eventually be admitted as an equal partner. Alternatively the experience of operating a joint company in Italy might be adapted to German conditions. The Russians will presumably see to it that Herr Ulbricht's civil aviation is a joint Soviet-German concern similar to what exists in China and all over eastern Europe.



* * *

Apartheid takes Shape

The Group Areas Bill, for the second reading of which the South African Government won a majority last Wednesday, is Dr Malan's first positive step to establish *apartheid*. The Bill has been thought out with extreme care, avoiding any deliberate irritation of either English-speaking South Africans or Bantu. It expresses the long-felt wish of the majority of Europeans and of a large number of the Bantu for their own inviolable territories in the Union. Nevertheless, if it is enacted, it will be an instrument which will give the government extraordinary power over the individual.

The Bill provides for the Governor-General to declare by proclamation a number of areas which will be reserved for the exclusive occupation of one or other of four main racial groups—white, native, coloured and Asiatic. With the exception of the white group, these groups may be further subdivided into smaller linguistic or ethnical sections. No one may work, live or own property in any group area other than those of his own race without special permission from the government. The non-European groups areas are to be given a certain degree of self-government, which might later be increased. The police and government inspectors are given the right of entry into any building to determine its inhabitants and the right to examine the affairs of any business to discover by whom and with whom it is being carried on. The Act will be administered by a Land Tenure Advisory Board of seven members appointed by, and responsible only to, the government.

Apart from the intolerable increase of power which the Bill confers upon the government, it also fails to deal with

the most difficult aspect of racial relations in South Africa—the mixed populations of the large cities and towns. There is nothing in the Bill to show how the racial groups on the Rand, for example, are to be separated out. Is Dr Malan contemplating genocide? Or does he intend to move a million or so detribalised Africans back to the already overcrowded native reserves? It cannot be said too often that *apartheid*, or segregation, or racial discrimination can never be a solution in those parts of South Africa, such as the Rand, where all the racial groups are so inter-dependent for their continued existence.

* * * *

Australians for Malaya

The Australians are to send a squadron of transport aircraft, with crews and ground staff, to Malaya. This is the result of the "inescapable geographic and strategic facts" to which Mr Menzies, the Australian Prime Minister, drew attention at the beginning of the week, when he said that his country has a vital interest in the situation in Malaya. The decision is very welcome. It is a gesture which, following quickly on the heels of Australian proposals for immediate economic aid to South-east Asia at the recent Sydney Conference, shows that the Australians are very much alive to the menace to themselves of Communism in South-east Asia. They may have noticed how, at the conference in Budapest last month of the World Federation of Trade Unions, Comrade Berezin from Moscow was already urging that the fight should be carried to Australia by encouraging dockers and seamen to refuse to load arms for Malaya.

It is right to mention and consider the reasons why the Australian decision has in some quarters been opposed. First, it is said that Australia is identified with the colour bar enforced in its immigration policy: how, then, may the Asian mind in Malaya react to the presence of Australians fighting against Asians? This fear is undoubtedly exaggerated. Second, it is asked whether the Australians will put themselves unreservedly under United Kingdom and Malay government command? Even on a small scale, the difficulties which arose in the Middle East during the war—fully described by Mr Churchill in his memoirs—might cause confusion in Malaya.

The answer to all these doubts is that the Commonwealth must trust and train itself to act coherently. The Australians can give very useful assistance in Malaya, and Mr Menzies is entirely right in his assessment. Now that the disproportion in size and resources between the United Kingdom and the younger Commonwealth members is fast diminishing, the burdens of defence should be shared more equitably. Indeed, such sharing is the condition of an effective British contribution to the Atlantic Pact and to Middle Eastern defence.

* * *

Crimes of Violence

The Home Secretary has now issued statistics of crimes of violence up to the end of 1949. The papers include a table, which is not normally given in the annual volumes of criminal statistics, showing how many offences of the type which could formerly be punished by flogging were committed during the postwar years. As was shown by Government statements in the recent House of Lords debate, there has been no substantial change in the total figures since the abolition of flogging in September, 1948.

The one fact which these figures reveal, however, is the alarming increase in the number of youths under the age of 17 found guilty of these particular offences. Provided that the number of persons in each age group of those found guilty is in direct proportion to the numbers in the age groups of those who escape the law—a fact which cannot be established—the figures show that in 1949 nearly twice as many young people under the age of 17 committed robbery with violence than in 1947, when the offence was punishable by flogging.

Another survey of criminal statistics was also published last week.* This lucid pamphlet sets out the few facts which can actually be deduced from the official figures of crime.

OFFENCES PUNISHABLE BY FLOGGING

	Known to the Police	Cleared Up	Persons Found Guilty						
			Under 17		Under 21		All Ages		Total
			M.	F.	M.	F.	M.	F.	
1946 ..	804	307	56	2	76	2	306	16	322
1947 ..	842	317	47	1	83	7	326	9	335
1948 ..	978	401	88	1	76	11	424	24	448
1949 ..	860	373	93	—	93	3	404	10	414

The result is half-a-dozen or so interesting generalisations: bad behaviour among men and boys in England and Wales has increased between 1938 and 1948 by 63 per cent, and in Scotland by 19 per cent; behaviour in boys deteriorates until they reach the age of 12 and 13, improves until the age of 15, falls off again at 16, and then improves once more; more women commit larceny than men, although women in general are better behaved than men.

There is nothing very remarkable about any of these facts, but the pamphlet serves a useful purpose in distinguishing between those criminal statistics which can and those which cannot be correlated. It is, as it claims to be, a rough measure of delinquency and an indication of the extent of and changes in crime.

* "Measuring Bad Behaviour," by A. M. Struthers. Published by The National Council of Social Service. 1s.

Sunday Post

The House of Commons decided on Thursday evening, by 93 to 68, to "address her Majesty, representing the *great desire which exists in all parts of the United Kingdom* for an extension of that rest on the Sabbath-day which is afforded in the London Post-office to the post offices of the provincial towns. . . ." Lord Ashley brought forward and carried this motion. There can be no doubt, however, that the measure originates with one portion of the people. It is only one of the many examples which may now be found in every part of society . . . of attempts by some to force legislative restraints on the rest of the community. . . . Now, let us ask who are the evangelical Christians thus at once made our lawgivers? Do they constitute the majority of christendom? Are they the most ancient of all the Christian sects? Is their creed universal and popular? Quite the contrary. The evangelical Christians . . . are the smallest of all the great bodies of Christians. They are also amongst the most modern. They all sprung into existence subsequent to the reformation. Their opinions of the Sabbath observance were scarcely known, and not acted on before. Many of them are of no higher antiquity than the beginning of the reign of George III. We question not their tenets or their observances; we throw no doubt on their sincerity; we are willing to admit that they may have purged away many errors with which other bodies had incumbered Christian doctrines; but we respectfully submit that their modern existence, their as yet unpopular creed, their small number in the world give them no right to assume airs of superior holiness, and impose their religious views on the whole community in the shape of restraints and restrictions. . . . In behalf of the mercantile and business community—in behalf of all men who have affections to cherish and feelings to gratify—in behalf of toleration—we protest against founding restrictive legislation for civil society on the interpretation, by one small sect, of a religious precept.

Letters to the Editor

Featherbed Farming

SIR,—In your leading article of May 13th you attempt to prove that the food subsidies are, in part at least, subsidies to the British farmer. You ask "what would happen if the subsidies were to be removed and if his (British farmer's) produce were marketed at its cost price." This is quite unrealistic; if the food subsidies were now to be removed some other instrument of redistributing incomes would have to be found in its place. The pertinent question to ask is whether, given an equivalent measure of redistribution as is now effected through the food subsidies, British farmers would still obtain prices as high as they do now. Much would depend upon the nature of the alternative ways of redistributing income and, of course, upon how long the present restricted world food supply situation (outside dollar sources) would last. There can be little doubt that in some income groups an increase in money incomes to compensate for increased food prices would not all be spent on food, but it is also true that in other groups the demand for foods, and particularly for luxury articles, is still unsatisfied. What the over-all position would be is a matter of opinion, but if it were to remain roughly as at present income redistribution would have to be of the order of 3s. 6d. per head per week and the food bill would need to rise from 18s. 2d. to 21s. 8d. in an average weekly expenditure per person of about £3 5s. This does not seem impossible.

The diagram which you include can also be very misleading to those who are not otherwise acquainted with the situation. You have calculated the rate of subsidy on Ministry of Food purchases only, and it would appear that home produced supplies constitute something like a third of all food consumed. This is not the case; both in quantity and value home production now contributes nearly a half of the total consumption. The difference is made up of foods which are not covered by the price review and for which the consumer pays a price exclusive of any subsidy element. When the rate of subsidy is calculated on the total home produced, as it should be for comparative purposes, the position is much more favourable to the home producer than your article shows. —Yours faithfully,

W. J. THOMAS, Lecturer in Agricultural Economics
University of Leeds

[The removal of the food subsidies would not necessarily mean an equivalent addition to personal incomes. Part of the saving should be used to add to the budget surplus as a buttress against inflation. Some alternative method of keeping down the cost of living for the lower-paid workers would certainly be necessary. But whatever method was chosen would be most unlikely to create a total effective demand for foodstuffs as great as that induced by a specific food subsidy of £410 million. It is true that our diagram (which specifically related to Ministry of Food operations) did not include that 25 per cent of home agricultural output which is not shielded by the Government guarantee. Even adding this in, it is not the case that home production contributes nearly 50 per cent of total consumption. The NFU has claimed no more than 40 per cent.—EDITOR.]

SIR,—I cannot help feeling that as a townsman you are not fully aware of the facts where farming is concerned. Your figures for west country farms—"holdings which exceed 100 acres"—showed an average profit of £1,410. Similar figures for Northumberland and Durham show an average profit of £656 per 100 acres for the most profitable group costed (milk and cropping farms averaging 220 acres). Other groups ranged down to £438 per 100 acres. These figures would probably show a considerably lower level of profit than £1,410. But accepting your figure, would you, sir, be able to lead a "featherbed" existence on that income? Remember that you would have to rise at six, and that all your paper-work would have to be done after your farm-men had gone to their well-earned suppers at half-past-five or six. Remember, too, that you would have paid £8-10,000 in the form of capital for the privilege of leading that existence and earning that income. Above all, remember that you would have to have the same degree and kind of skill at your job as that required by a barrister or a doctor, and a considerably more varied knowledge than either.

If you reduce the farmer's profit you will certainly reduce his output, and you will soon compel him to draw on the capital of his land-fertility. Perhaps then you will starve in the 1940 of World War III.—Yours faithfully,

NORTH-COUNTRY FARMER

British Films

SIR,—The fact is often overlooked that the British film industry is a mass-entertainment industry. If it does not entertain the mass of the people—and there is nothing ignoble in this aim—it will be run at a total loss.

From this point of view the Rank Organisation, for example, would almost certainly have done better to confine its support to the small group of intellectual producers. These producers have made "minority audience" films and made them very well, but at a heavy overall loss. When they do turn their attention to a "straight entertainment" film, it is almost always a box-office success. For they treat the contribution of the writer in dialogue and atmosphere with respect, and collaborate with him. If these producers had been led to devote 80 per cent of their production to the making of popular films, part of the profit could then have been used to finance a 20 per cent programme of "minority audience" films.

The policy followed by the Rank Organisation was to back the "intellectual producer" in the making of films which the ordinary film-goer persists in regarding as "high-brow," with a published loss to the organisation of £6,000,000. The would-be popular film was left to producers who are really a survival from the days of the silent film; for—in this epoch of sound-films and of first-class actors—they persist in an entire disregard for the contribution of the writer. The average "straight entertainment" producer will read nothing but a short synopsis, from which all dialogue, and therefore all characterisation, is absent. This fact will be borne out by the heads and staff of any film-and-dramatic agency or by the readers in the film-industry's story departments. Having chosen his subject from among skeleton-plots, the producer leaves the dialogue to a script-writer or "team of writers." The result is, of course, as though the producer of plays were to choose a subject and build a play in like manner. The "anachronistic" producers have made financially successful films, but, to do so, they have continually fallen back on the published novel, where the ability of the popular novelist to entertain by means of characterisation and atmosphere emerges as entirely superior to that of the hack script-writer.

Now, judging from the report of the National Film Finance Corporation, the intellectual producer is again being encouraged to make a type of film which it is felt that the film-going public ought to like or can be *made* to like. (Though this public has, in the past six years, made it clear—through the box-office—that what it has the bad taste to *like* is to see its favourite actors and actresses in swift-moving stories with a happy ending.) And again the "popular film" is being left to the run-of-the-mill producer with the technician's contempt for the writer.

Mr Lawrie, the managing director of the corporation, has also appealed, with the same misleading sincerity as Mr Rank, for "more good scripts," oblivious of the fact that these will not be read, except in short-synopsis form, by any "straight entertainment" producer. Yet it is on straight entertainment films that the financial stability of the industry depends. —Yours faithfully, GIOIA OWTRAM

The French Olive Branch

SIR,—It is now pertinent to disclose that in 1921 a Committee of the French Chamber of Deputies, in a secret meeting, discussed the question of whether it would be in the interest of France to bring about a common customs union with Germany. The Committee reached the conclusion that the establishment of such a union would greatly benefit the French people. It was evident that some private interests would be bound to suffer; but the country as a whole would gain immense advantages. Nobody denied that certain French industries—say the optical industry—and certain German industries—say the silk industry—would suffer; but, in both countries, industry and agriculture would flourish. However, the Committee expressed its opinion that the unpropitious political relations then prevailing between France and Germany would prevent the free exchange of redundant industrial workers and specialists, an exchange upon which the success of the scheme to some extent depended. Moreover, there was every indication that Great Britain would, at that time, have openly vetoed the scheme. For these reasons it was left in abeyance. The French, the German, and the British public were never aware that it had even been discussed.

For those who are rightly convinced that, in the long run, the only choice lies between free trade on the one hand and communism on the other, the plan now put forward by M. Schuman gives rise to great apprehensions. What is the real meaning of the economic union of French and German resources in coal and steel under a common authority? Does it mean free and competitive trade between private enterprises of the two countries? Or does it mean the nucleus of a vast state-trading organisation that will ultimately lead to a Communist economy?

It may readily be admitted that it is very difficult, if not impossible, to deal freely in two commodities, however important they may be, if the whole economy is not freed from control. So why confine the scheme to coal and steel? Why not set up a free-trading Franco-German Customs Union, with gradually diminishing barriers, for all commodities? And why not adopt a common currency as well, superseding both the franc and the mark?—Yours faithfully,

PAUL DE HEVESY

West Indian Sugar

SIR,—May I correct some misconceptions in the comment on West Indian sugar in *The Economist* of May 20th?

Today, Britain has the opportunity of giving a practical demonstration of the sincerity of her professed concern for the welfare of dependent people, whom she forces to buy British goods above world prices, by purchasing the full 725,000 tons which is the British West Indies' admitted fair share of her market on a basis of reasonable remuneration. The BWI consider her obstinacy unreasonable, bearing in mind that they have never asked nor she promised to pay reasonably remunerative prices except on condition of the maintenance of the admitted efficiency of the industry, which can always be checked.

The comment that the BWI costs of sugar growing are too high is tantamount to saying that the BWI labourer is too highly paid, since nearly 60 per cent of the costs consists of wages, and the efficiency of the industry has been acknowledged by many commissions of inquiry. The pitiable fact is that the BWI are asking nothing more than the maintenance of present minimum standards of living. If the whole BWI demand is conceded, their people will not have standards in any way comparable with those of Britain.

Crop diversification cannot provide a solution of the West Indian problem. Every possible effort to this end has been made for more than a century in these lands where sugar alone can stand up to their droughts and hurricanes. Unfortunately the BWI have no option but to pin their hopes preponderantly on sugar.—Yours faithfully, ALBERT GOMES

Chairman of the British West Indies Sugar Delegation

Taxation of Trading Profits

SIR,—Have you not been a bit hard on "orthodox accountants" in your article on the Taxation of Trading Profits on May 27th? Many of us from the beginning of the war have advised clients that part of the profit on stock and also on allowance for replacement of plant should be carried to reserve.

You say that profits which are not "true and fair" by reason of no deduction for increased replacements costs are accepted as correct by the inspector of taxes. As you point out later, however, no matter how true and fair the profit may be, the inspector of taxes strikes his own figure by elimination of charges which are not allowed by the Income Tax Acts.

The accountants' real difficulty is a legal one. A limited company has no legal obligation to do other than maintain the nominal value of the issued capital although the financial prudence of preserving "real" capital is obvious. The fact that there are difficulties in deciding how to maintain "real" capital and in ascertaining the effect of price changes in different companies has tended to obscure the measure of agreement among accountants on the principle. I think accountants have played their part in pressing the Chancellor to meet the situation and I do not agree that we have lagged behind the industrialists.—Yours faithfully,

JAMES AITKEN

COMMUNISM

First published 1947. 7/6 (8/- by post).

YOU ARE PERHAPS A FERVENT COMMUNIST OR, INSTEAD, A RABID ANTI-COMMUNIST. BUT, IN EITHER CASE, CAN YOU HONESTLY TELL WHAT COMMUNISM IS?

For a clear definition of Communism read "MONEY, MONEY and MONEY AGAIN" by Bruno Rimini. From all booksellers or direct from the publishers Bruno Rimini Ltd., 50/51, Gresham House, Old Broad St., London, E.C.2.

"... a book which has been written not so much with the idea of uncovering the "mysteries of economics," but first and foremost with the ardent desire of bringing a contribution—small as it may be—towards the attainment of that new world order for which humanity, consciously or unconsciously, is striving. An order where peace and justice for all men shall reign."

Winston Churchill's War Memoirs

Vol. III, The Grand Alliance, will be published on July 20. To ensure obtaining a copy on publication send your order now, with remittance (25/- and 11d. postage).

Vol. I, The Gathering Storm, in stock now (25/- and 11d. postage).

Dollars in Perspective

"The Balance of Payments and the Standard of Living." By R. G. Hawtrey. Royal Institute of International Affairs. 146 pages. 8s. 6d.

"THE dominant question," says Professor Hawtrey in the concluding chapter of this study, "... has been whether an adverse balance of payments can be corrected by the working of free markets, or in what conditions, by what methods and to what extent recourse must be had to controls and restrictions." This is a long-term and general question; Professor Hawtrey is looking well ahead. There is no doubt in his mind that in the realm of foreign trade a dash for freedom, in other words an unqualified reliance on "the working of free markets," would have been unmitigatedly disastrous immediately after the war and would still be disastrous now. The immediate, short-run, postwar need for re-equipment put a strain on Britain's and Europe's resources which could only be borne, even with generous foreign aid, if imports were rationed so as both to favour that re-equipment and give priority to necessities as against luxuries; the concomitant pressure of surplus money supplies, of latent inflation, made it impossible to leave the balancing of imports and exports to the exchange rate. Professor Hawtrey's analysis of these factors of the balance of payments problem is as clear, as acute and as illuminating as one would expect; but they are not his main concern. He looks further; to the end of the postwar re-equipment crisis, to the de-watering (through working-off and price rises combined) of sterling and of other European currencies, to the establishment of exchange rates corresponding to wage levels and to real differences of productivity.

The really baffling question is, what next? One big question mark concerns the industrialisation of the primary producing countries whose willingness to buy European industrial products, in return for food and raw materials, has in the past made it possible for Europe to support so many more millions than their native soil can feed and clothe. After all—the point is in a sense obvious but the scale is so enormous that it paradoxically escapes notice—America is precisely such a country. Further ahead still there lurks the Malthusian devil. With world population pressing on world food resources, will not the food-producing territories give first priority to their own inhabitants, leaving densely-peopled Europe in the cold? But Professor Hawtrey refuses to speculate on this possibility. It is rather the long-enduring, deeply-rooted weakness of Europe *vis-à-vis* a world which has changed so greatly to her disadvantage, since the days when her present standards of living and of population density were built up, which concerns him.

On the policies to be pursued Professor Hawtrey is firmly and impenitently in a minority. Devaluation was a dreadful mistake; not costs but delivery dates were the real trouble with Britain's export trade. (One would like some evidence on this; the logical support for the argument is formidable, but the facts, as exporters saw them, are not disclosed.) Its result has been actually to decrease dollar receipts for British exports. (But surely their markets are more important than Professor Hawtrey allows them to be?) A moderate price inflation should be welcomed as a means of mopping up surplus money stocks. The sterling balances should continue to be paid off as fast as possible; such payments constitute less of a strain than would the probable economic consequences of a moratorium. All along the line, the aim should be to reduce those disequilibria which make controls necessary; but it is not possible to predict when, if ever, they will be sufficiently reduced for controls (of one sort or another) to be abandoned. Professor Hawtrey writes as an analyst, not a prophet, thereby setting an example which the producers of Left or Right-minded polemics on the same subject could follow with advantage.

Fact and Fury

"Germany: What Now? Potsdam to Partition." By Basil Davidson. Frederick Muller. 268 pages. 12s. 6d.

NOTHING is so conducive to anger as an attempt to review the occupation of Germany. Mr Davidson is often very angry, and fully succeeds in transmitting his feelings to his readers. He has no difficulty in showing that recent developments in Western Germany justifiably give rise to great misgivings, that the Western occupation powers are largely to blame for this, and that at least one of the reasons is the change or changes in Anglo-American policy towards Germany.

If these were the conclusions reached on the basis of the quoted material, it would be difficult to disagree. But they are only a part of a much more precarious thesis, of which the cornerstone is the historical wickedness of the German upper and upper-middle classes. And since the connection between 1918 and 1933 is treated almost exclusively in terms of industrialists and generals, it becomes inevitable that a peace loving Germany can only exist if its heavy industries are nationalised and its big estates parcelled up, and that it will in fact exist under those circumstances. Mr Davidson equates denazification with democracy, and democracy with social revolution, and writes this equation for allied policy as expressed in the Potsdam agreement.

By refusing to examine his own assumptions, Mr Davidson imparts a twist, underlined by frequent moral judgments, to his examination of allied policy towards Germany. The Americans get the worst of it; by failing to encourage the social changes to which they are alleged to have committed themselves at Potsdam, they were forced to work for a divided Germany. American policy is summarily explained by the transformation from the Roosevelt "New Deal" policy to the "Republican dollar diplomacy" of President Truman. The French insisted on a misguided policy of reinsurance through division instead of accepting the Russian thesis of a centralised concentration of power, but in "democratic" hands, and thereby precipitated the American retreat from Potsdam. The British are pictured, not altogether incorrectly, as the faintly reluctant hangers-on of American policy. And, the least substantiated assumption of all, the Russians carried out the intention of the Potsdam agreement by initiating the necessary social changes. The solution of the German problem is in the formation of an all-German Government after the necessary social upheaval has been decreed and carried into the West.

When the five years' occupation is examined in all its details, the deciding factors of western policy will probably be found to be less clear cut, often muddle-headed instead of malevolent, inevitable instead of deliberate, idealist instead of materialist. Mr Davidson's rigid lines are not, however, imposed by a constricted philosophy. They are rather the results of confining the fermenting fury of disillusion in the mould of written argument. But, by demonstrating allied policy from a narrow conception of the German problem, supplemented by assumptions which are at least open to dispute, Mr Davidson has proportiontely lessened the effect of his telling indictment of conditions in western Germany.

The Other Island

"The History of Partition." (1912-1925) By Denis Gwynn. Dublin. Browne and Nolan. 244 pages. 12s. 6d.

MR GWYNN introduces his book as "an attempt to establish the true history of how and why the partition of Ireland was imposed in 1920 against the wishes and the convictions of all parties concerned; and to consider the prospects of a reasonable settlement by consent." The first objective is much more successfully attained than the second which Mr Gwynn would have done better to have left alone or treated more fully.

e gives the full parliamentary history of the manner in hich the present separation of the six counties came about. e also publishes for the first time the notes taken by edmond during the Buckingham Palace Conference of July,)14. These are useful additions to our knowledge of an :ceptionally complicated series of transactions.

These pages show how Irish Nationalists and Unionists alike ere driven from their original positions and forced into the resent situation. It is clear that the original insistence on ie exclusion of all Ulster was based on the calculation that Dublin government could not carry on without the nine ounties so that the Home Rule Bill would be unworkable. 'he Ulster Volunteers were immensely strengthened by their liance with the Unionist Party; and some of Mr Bonar Law's peeches make odd reading today. In the event, the Belfast :aders retreated to the line of the present six counties, the rgest area in which they could be sure of an over-all majority. earguards were sacrificed: but the retreat was successful. On ie other hand, there was now a parliament in Belfast which ney did not want; and a parliament in Dublin which they anted still less. The Nationalists had a harder fate. Having layed the parliamentary game, they found the table kicked ver as soon as they had a winning hand. They were half-)rced, half-cajoled along the path of concession. Mr Gwynn numerates some eight different proposals made by Mr Lloyd George between 1910 and 1920. It is clear enough that several f them were made to mean one thing to Carson and another o Redmond; and one promise that "whether she wills it or iot (Ulster), will not merge in the rest of Ireland" is still emembered.

To the reader, this book should go far to explain the ntransigence of Belfast and the neutrality of Dublin. One ide is unsure of itself; the other cannot take risks. No doubt, he Ireland Act of 1949 is on the Statute Book, but so was once he Act of Union. On the other hand, no leader of the najority of the nation can afford to make offers of Irish participation in war in the hope of eventual unity. The fate of Redmond is not so remote that it is not remembered; both iorth and south of the border.

Fashioning the Yardstick

"Statistics for Economists." By R. G. D. Allen. Hutchinson's University Library. 216 pages. 7s. 6d.

THIS book is written for the ordinary user of economic and ocial statistics who wants to know what sort of information s available and how to use it—or how not to use it. Professor Allen has written a book which neither frightens by having oo much mathematical notation, nor goes to the other extreme of laboriously avoiding the sort of algebraic analysis, which hose who are hoping to make real use of statistics like to see.

One useful chapter discusses the sources of British and ome general international statistics. The list does not pretend o be comprehensive, but its size and apparent scope makes quite impressive reading. (One small omission is that no nention is made of the Civil Appropriation Accounts and Civil Estimates in the section on finance and banking.) But n case the new investigator should feel that his task is likely o be too simple, it is stressed that, for one reason or another, changes have been made in many of the series which complicate comparison over any length of time. Even since this book was written there have been several further such changes —a notable instance is that it is now impossible to compare the figures of British manpower today with before the war.

Another chapter shows how to present data in graphical form, illustrating very clearly the different "do's" and "don'ts" of pictorial representation. Some elementary points on approximation are set out in Chapter IV which most statisticians could read with advantage. Far too often figures are given to a much greater degree of accuracy than they deserve, or reliance is placed on a small difference between two figures which are themselves only approximate. Government statisticians cannot hold themselves always entirely blameless in these respects.

The simple but adequate treatments of index numbers and correlation are particularly welcome. The last chapter deals with sampling and significance, and here it may be felt that the condensation leaves the reader a little breathless. It might have been better not to have touched on the mysteries of "t" and "z" distributions, but it can be said that for the reader who wants to know more about these there is plenty of standard literature to which he can turn. That is the field mainly of the scientific research worker. Professor Allen has concentrated on the needs of the economist and sociologist and succeeded in supplying them; not the least asset of this short book is that it is very readable.

Missionary Zeal

"Sam Higginbottom—Farmer." An Autobiography. Charles Scribner's Sons, New York. 232 pages. $3.00.

THIS is in one way a disappointing book. Mr Higginbottom is one of the great pioneers of Indian agriculture, and anything he says on the subject is of the utmost value. But he has put into this book only a few photographs and a few reminiscences. There is no discussion of his methods, no statistics of his results. He has not even described how he made of his Institute at Allahabad the best practical education in agriculture available in the sub-continent.

Meanwhile he has provided us with an admirable picture of the Victorian tradition at its best. All the qualities which made the Victorian age great, hard work, family loyalty, fear of God, practical goodness, came out clearly in Mr Higginbottom's life. He has no desire for money, no admiration for position. But he is also not a mystic, withdrawing himself from his fellows in order to concentrate on his own salvation. His life has been devoted to the service of others by trying to make two blades of grass grow where one grew before; for he realised that no man can think of his soul whose mind is absorbed by the hunger of his stomach. Not the least interesting part of the book is his story of the faith and courage which was required to go ahead with his Institute in the face of a lack of money which was sometimes alarming, and an opposition from the more conservative of his fellow missionaries which was always painful.

But Mr Higginbottom had been too well grounded ever to despair. His father had allowed no misfortune to daunt his optimism; when one business was ruined by an unfortunate transaction made in drink he worked until he had built up another. His mother guided her whole life and the upbringing of her children by the Bible. The atmosphere of the home was one of unity and love, and it is typical of the Higginbottom practicability that the most telling illustration given of this is the willingness of a brother to take over Sam's job of milking the cows when Sam wanted to emigrate to America. Sam took full advantage of American freedom and opportunity. He worked his way through Amherst, one of the best of American colleges, and everywhere he went there were good Presbyterians to accept and befriend him. In one such home he found his wife, who cheerfully left the ease of a wealthy home for the discomfort and the rewards of missionary life in India; her work in teaching domestic science was as valuable though less revolutionary as his in agriculture. The Higginbottoms have produced no great theories; they made no attempt to change the world through the organised power of the state yet their lives are a valuable lesson for they show what can be done without that power, by people whose only weapons are their own work and love.

Correction.—In the review of "I Saw Freedom Betrayed" in *The Economist* of May 13th the publisher was wrongly described as Frederick Muller instead of Regency Publications, Ltd.

AMERICAN SURVEY

Pensions—Public and Private

(From Our American Staff)

ON May 23rd an historic collective bargaining contract was signed by the General Motors Corporation and the United Automobile Workers. It establishes a company-financed pension plan with $100 a month to workers reaching 65 after twenty-five years of service with the company. The news came just as the Senate Finance Committee released its report on proposed reforms in the Government's old-age insurance scheme that would increase both its coverage and the size of benefits paid. As the House passed this measure last year, the way is now open for debate on the Senate floor, and the new provisions are fully expected to be adopted at this session. The two events sharpen the debate about the relative desirability of private and public sources of retirement funds, and the place of each in a system which includes both.

Pension plans have been an outstanding feature of collective bargaining between unions and corporations since the end of the war. For years, certain companies had provided pensions for their employees as a matter of policy, retaining control of the type of fund established, the amounts paid, and the conditions of benefit. Such expenditure commended itself to management as a means of reducing labour turnover, improving efficiency through the retirement of older, and the promotion of younger, men, and rewarding long service.

During the war, pension plans became easier to grant because a change in the Revenue Act allowed tax deductions for contributions to approved pension funds. In the last three years of the war the Bureau of Internal Revenue approved some 8,500 such projects. Moreover, while the War Labour Board was attempting to hold the line on wages, "fringe" issues, pensions among them, afforded a permissible means of granting additional compensation.

After the war Mr John L. Lewis set a pace that made the winning of pensions by Mr Philip Murray and Mr Walter Reuther, of the Congress of Industrial Organisations, a necessity of union politics. The plans adopted in the steel and automobile, glass and rubber industries during the past year, have raised to nearly 3,000,000 the number of workers covered by pension plans subject to collective bargaining, in a national total of approximately 15 million organised workers. The decision of the National Labour Relations Board in the Inland Steel case, which recognised pensions as deferred wages and therefore as subject to collective bargaining, has made it extremely probable that existing company-inaugurated plans will come increasingly under union review.

A recent survey in *Fortune* of employers' attitudes on pension plans indicated a wide divergence between large employers and those with relatively few workers. Of these employing 2,500 and over, only 2 per cent thought old age to be a problem solely for the individual, while 79 per cent favoured contributory, and 12 per cent non-contributory, plans. Among employers with less than 100 workers, 19 per cent thought provision for old age should be left to the individual, while 63 per cent favoured contributory and 8 per cent non-contributory plans. Interestingly enough, only 3 per cent of the large, and 8 per cent of the small, employers thought pensions should be provided entirely by the government. While the headlines feature the spectacular contracts such as those negotiated in the steel and motor industries, smaller companies, the New York bar owners, for instance, whose individual resources would not provide a very reliable basis for pensions, have been negotiating group arrangements under which all contribute to a common fund. This system has long been in operation in the garment trades, and in the building trades some 90,000 contractors having agreements with the International Brotherhood of Electrical Workers, an American Federation of Labour union, contribute to a national fund managed by a joint board under a neutral chairman. Such arrangements are now being introduced into other trades composed of small as well as large operators, such as the furniture and upholstery industry. Most of these schemes, so far, have included only firms whose contracts are with a single union; in Toledo, on the other hand, a plan is nearing completion in which all the employers in the city would participate, no matter what union they deal with.

*

In recent months employers have warmed noticeably toward increased governmental pensions. This is because in the $100-a-month plan agreed to by the big companies the larger the government pension the smaller is the management's liability. Mr Charles E. Wilson, president of General Motors, has been among those favouring an increase in government benefits; but the new enthusiasm for government insurance may prove to have been belated, at least for the stronger firms, since the new General Motors' contract specifies that, if federal benefits go up, the pension shall go up by an equivalent amount.

The chief arguments in favour of national insurance, as contrasted with company plans, are that the marginal employer cannot offer much, or offer it with certainty; that under private plans the employee receives a pension only if he has a long service record with a single firm up to retirement age; that the consequent restriction of the freedom of movement of workers from one firm or trade to another introduces undesirable rigidities into industry; and that the accumulation of private funds on the scale that more general coverage would require might create a difficult investment problem. Government benefits, on the other hand, can be earned in all jobs in the covered industries, irrespective of the resources of the employer for whom a man works or the union to which he may belong; and he does not suffer if his employer goes out of business, or if he changes jobs.

But even the provisions of the present social security law are far from perfect. It excludes many workers in uncovered occupations, and benefits are fixed by prewar wage levels.

Both of these deficiencies would be made good in large part by the Bills now being discussed. Some 35 million workers in industry and commerce are covered today; under the pending Bills—the House and Senate versions differ—at least ten million more would be brought in, including most of the non-farm self-employed, many agricultural and domestic workers, employees of non-profit organisations, public employees not covered by existing retirement systems, and so on. In addition to these new categories, the Senate Bill would include an additional 700,000 in the first year by easing the eligibility requirements. (This represents roughly a middle ground between taking in all workers over 65 regardless of previous contributions, and providing benefits only to long-term contributors.) The pressure for extending the scheme to more workers is increased by the fact that, while expenditures under the Old Age and Survivors' Insurance features of the present Act are running at some $800 million a year, about $1.1 billion is being spent by the federal government—and some $300 million more by state and local governments—for public assistance, with about three-fourths of this amount going to dependent old people. The load is particularly heavy in agricultural States, for farmers and farm workers are excluded from the federal programme.

Under the pending Bills, the average primary benefit per month would be raised from the present $26 to over $48; the amount that a pensioner could earn without disqualifying himself would be increased from $14.99 to $50; and if the Senate's version prevails, benefits would be further raised by being calculated on recent wage rates. The House, but not the Senate, Bill provides for disability insurance to take care of enforced early retirement. Another difference between the House and Senate Bills represents a difference in philosophy: how high a level of earnings should be included within the tax base? The present $3,000 is retained in the Senate version. The House would raise it to $3,600; the Advisory Council on Social Security favours $4,200. A decade ago, only 5 per cent of all steadily employed workers earned $3,000 a year; now, nearly half earn more than that. Should the pension of a man who has been earning $350 a month be more than that of one earning $250? The choice between a flat rate pension, and one adjusted to earning power, was firmly made in favour of the latter when the US system was established, in spite of the administrative difficulties entailed by keeping individual records.

The cost estimates for the new Bill contained in the Senate report, necessarily made tentative by a complex of intangibles, range from a low of $1.9 billion in 1951 and $8.5 billion in 2000, to a high of $2.2 billion in 1951 and $13.3 billion in 2000. What is certain is that the proportion of the aged in the population is increasing rapidly. When the original Social Security Act was passed in 1935 there were 7.5 million persons over 65; by 1960, estimates indicate that their number will have doubled.

Primary Elections: California

[FROM A CORRESPONDENT IN SAN FRANCISCO]

THE personalities and political ambitions of the two chief aspirants to the California Governorship next November give national interest to the primary elections in the State on June 6th, when the party candidates will be chosen.

Governor Earl Warren, who is seeking a third term—never before has a Californian Governor been re-elected twice—was the Republican Vice-Presidential candidate in 1948. Without question, if he wins in California this year by a handsome majority, he will at once be entered in the race for the Presidential nomination in 1952, and will probably be a strong runner.

His chief Democratic opponent is Mr James Roosevelt, eldest son of the late President, whose political ambitions soar far beyond his relatively meagre political experience. Neither of the other two candidates seeking the Democratic nomination for Governor has a chance of surviving the primary, but they could harm Mr Roosevelt by splitting the vote. For under California's cross-filing system, which allows candidates to put their names on the ballot papers of both parties, the election could conceivably be settled next week. The Republican, Mr Warren, appears on the Democratic ticket as well as his own, while the Democrat, Mr Roosevelt, is also on the Republican ticket—although he condemns the law that permits such a practice. In 1946, Governor Warren, for the first time, was given a majority by both parties. It will be difficult, but not impossible, to do it again.

Governor Warren's greatest strength, and also some of his weakness, arises from the non-partisan line which he has followed both in his appointments and in his political decisions. This non-partisanship has not been a pose, but a genuine policy, developed partly because he was elected by both parties, but also because he has been impelled by his personal convictions to serve all of the people in his State. Needless to say, this policy has attracted the rank and file of voters; Mr Warren has been, and still is, a popular Governor. But at the same time, it has rankled with the Old Guard Republicans, and has made enemies of some big business interests. The schism is not a wide one, however, and should not weigh too heavily against him in the coming elections.

*

It would be incorrect to label Mr Warren as a middle-of-the-roader, although ostensibly he has kept pretty closely to the middle. If anything he has tended toward liberalism—especially in his advocacy of state-managed medicine. But there again, such a programme has been popular with the mass of voters—however distasteful to the Old Guard—and Mr Warren frankly says his appeal will be to the rank and file of both parties. Personally, he is a man of great charm and winning ways. Even his enemies admit he is the closest thing they have ever seen to an honest man in politics, and this feeling of integrity is transmitted to the people, both in words and subsequent actions.

Mr Warren has other assets, tangible and intangible. He has occupied the Governor's chair during a period of prosperity: it is difficult to unseat a man who can claim to have given his constituents an enjoyable and comfortable living. The State's financial position is sound: its funds show surpluses and it is operating on a balanced budget. Tax increases have not been onerous. All in all, Governor

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Warren, in office, has displayed no great faults and has committed no serious misdeeds to bring down the anger of the people. And, because he won the last election so overwhelmingly, he has an advantage over all opponents—people usually vote for the same man they voted for previously, unless he has shown himself unfit for office.

Mr Warren's chief drawback, as far as the primary is concerned, is the late start of his personal campaign. The legislative session kept him at his desk at the State capital until he had only about a month for "stumping the State," while Mr Roosevelt has been barnstorming since February.

Mr Roosevelt's principal asset is his name, still magic for thousands of voters. That has been shown by the attention he has drawn on his campaign tours; his meetings have been well attended, and his listeners have appeared fascinated at the sight of another Roosevelt seeking office. The voting will tell whether this has been idle curiosity, or a blind faith in anyone bearing the name of Roosevelt. The enchantment of the name has also undoubtedly been a big factor in luring many Democratic politicians to support Mr Roosevelt, despite the fact that privately they were opposed or lukewarm to his candidacy.

Mr "Jimmy" Roosevelt has inherited a great deal of charm as well. Standing before an audience, he is at ease to the point of being nonchalant. He has a contagious, warming grin, and his voice on the platform is expressive, fresh and appealing. He exudes friendliness, both among rank and file voters, and toward politicians, even those hostile to him. He has also shown considerable adeptness in handling back-of-the-scenes political manœuvring. Despite the opposition of many of the firmly-entrenched managers of the local Democratic Party, and against the grudgingly given and half-hearted support of the leaders of the national party, from President Truman down (Mr Roosevelt backed General Eisenhower for the Presidential nomination in 1948), he has brazenly, and successfully, taken over the reins of the Democratic Party in California. He has not made friends among politicians, but he has gained influence over them. At various times, he has been accused by Democratic leaders of treachery, underhandedness and double-crossing. If all's fair in politics, he was justified. In any event he gained the end he sought.

*

The structure of the Democratic Party in California has been strained not only by the Roosevelt candidacy, but also by the contest for the Senate seat now held by Senator Downey. Representative Helen Gahagan Douglas, a left-of-centre Democrat, announced her candidacy against the right-of-centre Mr Downey over the objections of the party stalwarts who thought she should have waited two years and contested the seat of Mr Knowland, the Republican Senator from California. Recently, Senator Downey has had to withdraw from the race for reasons of health; but there is another Democrat in the field, Mr Manchester Boddy, publisher of the *Los Angeles Daily News*, California's largest Democratic paper, and one which, in its editorials, has disparaged Mr Roosevelt's candidacy.

In dealing with the electorate at large, one of Mr Roosevelt's biggest faults has been his attempt to please everyone. On several occasions, this has put him in hot water. He has made vague promises to labour leaders, and immediately afterwards has made contradictory commitments to industrialists opposed to the same labour groups. Whenever such contradictions have forced him into a corner, he has escaped by compromises which have made both sides feel they have been double-crossed. Moreover, he has depended too much on a few close advisers and "yes" men for advice and information, with the result that he has made blunders in public statements.

Up to now, Mr Roosevelt has taken no definite position on any matter of wide importance. It is impossible to determine the platform on which he stands, or the depth of his liberalism. He can probably be classified at present as being a little left of centre and his major opposition within his own party comes from the right-wing Democrats. Mr Roosevelt has gained the official backing of the American Federation of Labour in the State, and probably will get that of the Congress of Industrial Organisations. But many independent labour leaders, and probably a large number of rank and file trade unionists, will support Mr Warren. Even so, Governor Warren has a chance of knocking Mr Roosevelt out of the race in the primary. If Mr Roosevelt survives next week's election, Mr Warren seems almost certain to beat him in November.

American Notes

Road to Peace

The Secretary of State's report to Congress and to the nation on the conferences in Paris and London should leave America in no doubt that what has gone before—the Truman and Marshall plans, even the North Atlantic treaty itself—has been little more than a preliminary exercise. Only now is the free world ready to set out on its pilgrimage along the road to peace. Mr Acheson made it clear that this pilgrimage will be a long, difficult and expensive one and that it will not begin unless the United States is prepared to head it. His unprecedented public appearance before a joint session of Congress, and before the television cameras, to answer questions as well as to make a statement, was not only an essential attempt to improve his relations with Congress, but also the beginning of an appeal to the American people. By a speaking campaign during the next two months, Mr Acheson hopes to inspire them to undertake the arduous duty to which they are called by their present station in the world, to give that dynamic leadership towards the ideal of peace for which General Marshall called in his invigorating address on Memorial Day.

Mr Acheson's comprehensive report, on the agreements reached and the arrangements made at the conferences, was an impressive list which should go far to convince Congress that Europe is taking the journey towards peace seriously. The Schuman proposals for the coal and steel industries in Germany and France are everywhere regarded as the most striking evidence of this, and the British lack of enthusiasm for them has made it seem to many Americans that Britain is once more lagging on the road. Much will certainly be made of this by those who still refuse to agree that the United States has a continuing stake in Europe and who are already accusing Mr Acheson of giving away far more than he has been offered in return.

Mr Acheson emphasised the addition to the vital defensive strength of the free world which would result from the decision on balanced collective forces under the North Atlantic treaty. This was foreshadowed in theory by the Mutual Defence Assistance Act, but Congress may not be so satisfied with it in practice. It brings up once again the constitutional question of the Senate's right to declare war; if Europe is to rely on the United States for the strategic bombers which are an indispensable part of its defence, it becomes even more obviously illusory than before to pretend that America will not automatically be involved in any outbreak of hostilities. Such apprehensions are likely to be

played upon by those in the services who resent any loss of independence, and especially by the Army, which may be cut back severely under the scheme. Since plans for balanced forces have been under consideration for some time, they will not necessarily at once involve new expenditure. If they did, they would not appeal to a Congress mainly concerned at the moment with the financial deficit. The Administration will have an opportunity of explaining these details in the discussions, which are about to open, on next year's appropriations for military aid, for which the President has already allowed in his budget.

* * *

General Motors' New Model

The General Motors Corporation, the largest producer of automobiles in the world, last week launched a new model in the realm of collective bargaining, with the minimum of advance publicity. It signed a five year contract with the United Automobile Workers, which cannot be reopened by either side until 1955. This guarantee of uninterrupted production, and uninterrupted earnings for its 275,000 workers, was achieved by generous concessions on pensions, annual wage increases, and payments for medical and hospital care. The trend towards longer contracts is noticeable, but no other firm has been able, or willing, to sign so long an industrial truce.

The terms are substantially better than those recently won by Mr Reuther, the head of the UAW, from the Chrysler Corporation after 100 bitter days on the picket line. The old-age pensions secured will rise to $117 a month if projected increases in federal benefits are adopted, instead of being held to the $100 ceiling which so far is the rule elsewhere. The cost of living bonus will be continued; it cannot fall by more than three cents, but can rise indefinitely. An annual productivity increase of 4 cents an hour will be paid throughout the life of the contract. In addition, the company will pay disability pensions, and half the fee necessary for each worker and his family to join the voluntary Blue Cross and Blue Shield systems of pre-paid medical and hospital care.

The union estimates that its workers will benefit immediately to the tune of 19 cents an hour, and that by 1955 the sum will have risen to 35 cents an hour. The company's estimate may differ somewhat, but there is no doubt that such a long-term increase in labour costs represents a gamble on continued prosperity and continued technological progress. General Motors believes not only that the rest of the year will be a banner one for Detroit, but also that the permanent post-war market for cars will be found to be substantially higher than that before the war, because of higher levels of income, population increases, and the shift from urban to suburban living. If this is true, not only will the economic stability of the industry, and the country, be served by a long period of industrial peace, but the Corporation will find it good business. The rise of General Motors shares to the highest levels since 1929 shows that Mr Reuther is not the only enthusiast.

Other companies, and other industries, who fear that they may have the costly General Motors model thrust upon them, are less cheerful. The settlement promises a summer free from major industrial disputes, but it lays the foundations for new demands in the autumn and winter when the steel contract, for example, may be reopened. Few companies feel able to pay as high a price for industrial peace as General Motors, which last year earned more than any corporation in American history, and nearly as much as its wage and pension concessions will cost it during the next five years. Profits on this scale are almost an embarrassment in the semi-welfare state.

only AOA give you all these services

Overnight travel to New York by AOA double-deck Stratocruisers, world's largest, fastest, most luxurious airliners. Expert aircrews with a combined experience of more than 20,000 crossings. Direct connections on the same airline system to 77 cities in USA, Canada and Mexico, where there are AOA offices waiting to help you with your business arrangements. SALES AND SERVICE EVERYWHERE

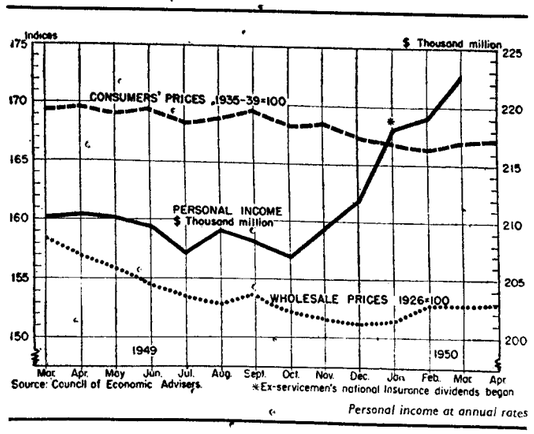
Point Four's Debut

No longer very new, and hardly very bold after sixteen months of second thoughts, Point Four had its coming-out party last week. An authorisation of $35 million was approved for a programme of technical assistance to backward countries, as one drop in the bucket of the $3.1 billion Foreign Aid Bill that has now gone to Mr Truman for his signature. The festivities were marred, however, by the absence of much enthusiasm. Some Senators had held that Point Four was not yet ready to face the world, and at the eleventh hour Senator Taft threatened to hold up the whole foreign aid authorisation because, in conference, the Senate negotiators had accepted the more glowing language of the House draft on Point Four. The mere mention of encouraging the flow of investment capital alarmed Senator Taft; he feared it might imply guarantees to private investors and perhaps involve the United States in a worldwide public works scheme.

In the end, the Bill was passed by a large majority. But Point Four's other half, the measure that authorises the Export-Import Bank to guarantee up to $250 million of private investments against inconvertibility and expropriation, will not be able to shelter behind the Marshall plan and may not be so lucky. It has been approved by both the House and Senate Banking Committees, but the House Rules Committee has refused to expedite it, and Senator Maybank, chairman of the Senate Banking Committee, now has doubts as to whether a guarantee programme, in its present form, may not discriminate against investors who have already taken the foreign plunge without government life-preservers.

The United Nations can now proceed to hold its conference on technical assistance, to fix the scope of the programme and share out the costs, twice postponed because Congress had not acted, and the United States is expected to contribute the lion's share of the money. The original UN target was put at $85 million. But of the $35 million actually approved by Congress (and which may be reduced in the Appropriations Bill) $10 million is for projects already under way, chiefly in Latin America; the United Nations cannot count on much more than $10 million of what is left.

*



The American programme has been given an immediate go-ahead signal by the loan of Mr Capus Waynick, now Ambassador to Nicaragua. But it would be only human to feel that the mountain has laboured and brought forth a mouse. For this, much of the responsibility must attach to the Administration, which could not resist the temptation to unveil the exciting new concept before even the President's advisers had agreed on what was involved. The Republicans, who were expected to embrace with enthusiasm a relatively inexpensive foreign aid programme that offered a large role to private enterprise, looked the gift-horse in the mouth, and suspected it of being of Trojan descent, as well as too personal a creation of a Democratic President. But if Point Four has made a modest debut, it should not be overlooked that its aims are being advanced under other authorisations. For example the Foreign Aid Bill empowered the Economic Co-operation Administration to spend $94 million for economic aid in the "area of China." Of this $64 million is tentatively allocated to south-east Asia, and will be spent, in the main, on the improvement of public health and agricultural techniques, that is, on the basic Point Four reforms that do not attract private capital.

Inflation Again?

Retail prices are following wholesale prices up the graphs and the sensitive commodity prices have been mounting for some time. The postwar peaks have not yet been regained, but nevertheless the fear is growing that price increases will make a mockery of the steady gain in personal incomes on which expectations of continuous prosperity are based. This gain has been temporarily exaggerated during the past four months by the repayment to ex-servicemen of surplus funds collected under the wartime national life insurance scheme, but both weekly earnings and dividend payments have also been going up. America's foot is again on the bottom step of the inflationary spiral, but at present the country does not seem likely to climb it very far, unless of course it is boosted from behind by fresh government spending on military and economic aid for the free world.

Such expenditures would certainly push prices up still further where the increase has already been most marked—among the metals. Lead and aluminium have now followed the examples of copper, zinc and steel scrap, which have been rising for many weeks. All are in more or less short supply as a result of demand springing from the high level of industrial activity, especially in the automobile, construction and steel industries. The latter has been working at over 100 per cent of theoretical capacity for the past six weeks to make up for production lost through strikes. But some steel customers now seem to be buying for inventory purposes and such purchases also account for a substantial proportion of the demand for other commodities. The first four months of the year saw a shift from the policy of inventory liquidation which followed last spring's recession to one of inventory accumulation affecting all types of business—retail, wholesale

and manufacturing—although not all to the same degree. This shift was inspired partly by rising prices, partly by optimism about the economic prospects for the rest of the year. Sooner or later, however, inventories will be back to normal and this unusual demand will end.

Sooner or later, too (from present indications it will be later than anyone thought possible a year ago), the demand for automobiles and houses will be back to normal. Indeed, the rising costs of building materials, especially lumber, already threaten to lift houses out of their market, which is now one for houses at reasonable prices, not at any price. Consumers today are more discriminating than they were and this is one of the chief deterrents to inflation. Another is that alternative sources of supply are now available. Not all industries are working to capacity and there are over three million unemployed. The shortage and the high price of natural rubber have led to demands that one of the government's standby synthetic plants should resume production. And surplus stocks of farm products set a limit to rises in agricultural prices: for example, if grain prices go up much more as the result of the poor outlook for this summer's harvest, the government will be able to release the half billion bushels of wheat which it now holds.

THE WORLD OVERSEAS

Can Defences Be Integrated?

(From Our Ottawa Correspondent)

THE powers of the North Atlantic alliance have reached that most delicate stage of defence planning, when they must allocate production and supply roles between themselves. The difficulty of the task, which touches so nearly on questions of prestige and sovereignty, is obvious enough. But if any part of the general plan should be easy, one would think it would be co-ordination between the United States and Canada.

These two countries must be complementary in production as in strategic plans. In the last war their industrial capacities were eventually dovetailed with a fair degree of success. United States forces were dependent on Canadian production for some of their vital supplies, and financial embarrassments were eliminated by the Hyde Park agreement between President Roosevelt and Mr Mackenzie King. The outflow of Canadian dollars for components and completed weapons was matched by the inflow of US dollars for military supplies which the US forces purchased here.

Canada's armed forces being comparatively small (coming from a country of only 13 million), 70 per cent of the war production of Canadian factories went either to the United States, which paid for it, or to Britain and the smaller allies which did not pay for it. The principal weakness of Canadian industry, however, is that whether for civil or military purposes, it is not self-supporting. It depends on the United States in large measure for such elementary requirements as finished steel and fuel. It depends on the United States even more for an economical supply of many of the small and highly complicated gadgets which go into every modern weapon. Some of them, as for example many of the modern electronic devices, Canada does make for itself, but to try to make them all would be completely wasteful.

Red Tape in Washington

The Canadian Government, therefore, has deliberately aimed at specialisation in arms production. But this policy is workable only on two conditions. The first, and easier, is that Canada should be able to buy its own requirements of components or weapons in the United States. The second, and the crucial one, is that the United States should be prepared to let Canada make some items for both countries—or, better still, for the Atlantic alliance as a whole. Early this year the Canadian Government tried to buy replacement parts for the Army's Sherman tanks and engines for the new F86 fighters under construction. The US Army was prepared to supply the tank parts, and the US Air Force was ready to give the necessary priority to the RCAF to buy the aircraft parts. But the Mutual Defence Assistance Act, under which arms were being given away to Europe, forbade Canada to buy these things. It contained a clause requiring that any country not receiving free aid under the Act could purchase defence equipment only on certain conditions, which included a cash payment in advance for the full cost of the article. Since Canada's public accounting system precludes the payment of cash except in return for work completed, this amounted to a complete stoppage of arms purchases.

It took months—and a lot of patience—to work out a complicated, cumbersome and unsatisfactory compromise which would satisfy the letter of the law of both countries. The compromise involved an irrevocable letter of credit from a Canadian bank, with actual cash to be advanced on certificates of work in progress. As Canadian officials remarked, it was a curious arrangement for the United States Government to accept the credit of a Canadian bank as better than the credit of the Government of Canada.

This topsy-turvy arrangement has prevented a complete stoppage of defence purchases, but it has created a preposterous amount of red tape, and it has left the more essential half of the problem untouched. This is to find means of using the important potential of Canada's industrial capacity. So long as the United States is unable to buy arms from Canada, this country is squeezed into a position of isolation. In theory it could finance out of its own resources a programme of war production which would meet the modest requirements of its own forces and leave a large surplus to give away. But the Canadian Government says this is not a practical possibility at all. Production for Canada's own forces would mean an absurdly small run of an absurdly large number of items. Production for western Europe or Britain would mean presentation of an outright gift. In principle there is nothing wrong with that; but the arms Canada could make for Europe would all involve a large US dollar content. Gifts involving such a large unrequited outlay of US dollars are out of the question.

Two Years of Argument

This leaves only the course which Canada is following. It may seem unheroic, but it is not basically unco-operative. It is to buy from the United States the very least necessary for Canada's urgent defence needs, and to keep on insisting, in season and out of season, at high level and at low level, that the defence production of the two countries has got to be treated as a unit. It was so towards the end of the last war; it will be in the case of another war. It ought to be no less so in the present cold war.

This Canada-US argument has been going on for at least two years. The Prime Minister, Mr St Laurent, has discussed it with President Truman; the Defence Minister, Mr Claxton, has discussed it with the Defence Secretary, Mr Louis Johnson; the Joint Chiefs of Staff have "sat on it"; the Permanent Joint Defence Board of the two countries has made parallel recommendations to the President and the Prime Minister. Now at long last all these discussions have led to action. Mr Louis Johnson has instructed the Secretaries of the three services to prepare lists of items which might be purchased in Canada. He has set them a total of between $15 and $25 million for the coming financial year. This will roughly match Canadian purchases in the United States. If the American list is as long as Canada would like, this country might even be able to increase its own purchases in the United States.

Mr Johnson's order makes use of a clause in the Buy American Act which has never before been used in this way. The Buy American Act is a depression measure of openly protectionist intent, enacted in 1934. It forbids Government purchases outside the United States except in two cases. One is the case where the cost of the American domestic supplies is "unreasonable." By administrative order of long standing this has been taken to mean that

the foreign goods must be at least 25 per cent cheaper. The other exception is the case in which the head of a government department certifies that it would be "inconsistent with the public interest" to buy in the United States.

This is the clause that Mr Johnson will apparently rely on. To many American officials, in the armed services and specially in the Munitions Board, it has long seemed desirable to bring the Canadian industrial potential into the joint use of both countries. Action was held up mainly because it seemed to many Americans to be politically impossible for the Secretary of Defence to invoke the "public interests" clause in the Buy American Act. It was thought that this would bring down a torrent of abuse on the Administration. In the event, however, the way was cleared by the US Chamber of Commerce deciding in favour of purchases in Canada. A resolution to that effect was carried at meetings in the spring, and it was an important indication that the Administration could rely on some support even from business in directing defence purchases to Canada. Mr Johnson has taken the plunge. In doing so he has advanced a very large step along the road towards defence co-ordination in North America. Ottawa has whole-heartedly welcomed his move.

For some time now the two governments will be occupied in working out a sensible and economical programme of American purchases in Canada. But if all goes well, and the Canadian capacity turns out to match US needs as well as is hoped, the Canadian Government still hopes eventually for further advances towards complete rationalisation. The present arrangement makes it possible to balance the dollar-defence-account at a relatively modest level. It does not approach a co-ordinated plan of industrial mobilisation. Yet nothing less than that will finally satisfy the Canadian Government. In the light of the recent Atlantic Pact decisions in London, the closest possible co-ordination of Canadian and US production seems plain common sense. Washington is apparently sympathetic, though still in a rather general way. It is doubtful whether any plan as far-reaching as Canada would like can be undertaken in peacetime without congressional approval; the Administration is naturally reluctant to ask Congress for too much too soon. But the principle of rationalisation of defence production between Canada and the United States seems to be implicit in Mr Johnson's move. If US purchases here work out satisfactorily, more far-reaching measures of integration may yet prove possible in peacetime.

How Holland Controls Wages

[FROM OUR CORRESPONDENT AT THE HAGUE]

DURING recent discussions in Britain about ways of thawing the "wage freeze" interest has been shown in the Dutch system of wage regulation. It may, therefore, be useful to describe briefly how it works and why it has been successful.

For the first four years after the liberation, prices and wages in Holland were frozen, or at least strictly regulated. Now prices have practically all been "liberalised," but wages are still controlled. The government council entrusted with this task is the *Rijksbemiddelaars* (government mediators) who before the war mediated when a strike in industry seemed imminent. The *Rijksbemiddelaar* of the industry concerned would talk the situation over with the employers and workers, and generally he succeeded in negotiating a compromise; in some cases he could try and bring both parties to agree to submit the dispute to arbitration. Anything more than persuasion, however, was not in his power; but under pre-war conditions reasonableness and his personal prestige made many a solution possible.

After the war the number of *Rijksbemiddelaars* was increased from four to six, and in October, 1945, a wider task was given them. A government decree, significantly called "special labour relations decree," allowed them to decide on wages in all branches of industry, except domestic service and government employment, and submitted all collective labour contracts to their approval. *Rijksbemiddelaars* would be subject to instructions from the Government, in particular from the Minister for Social Affairs, and would have to consult *Stichting van de Arbeid* (Institute of Labour). Both of these stipulations dominate to a large extent the policy of the mediators.

Wage policy is, of course, only part of the general government policy on wages and prices The strongly regulatory policy of the Dutch Government on both points would, if Holland were Britain, probably be hailed as a magnificent example of "muddling through." It was neither a glorious nor at all points a successful policy, but it saved the country from many other evils, particularly from the alternative dangers of over-inflation and of widespread labour unrest. Industrial peace has been widely and steadily maintained in Holland, both compared with the '20's and with other countries, and government policy has succeeded in keeping wages at slightly below, but not too much below, the rising level of prices.

Slow But Fair Results

Generally speaking, this policy gave fair results, although special groups—large families, unskilled workers and agricultural workers—got larger wage raises than others (partly as a consequence of a war-time trend). Thus a well-trained worker with years of experience, living in a large town with a small family, has great difficulty in making both ends meet. And during the last year or so the gradual abolition of rationing (with the sole exception of coffee) and the rapid—perhaps too rapid—"liberalisation" of prices have widened the "scissors" of prices and wages and heightened the tensions on the labour front.

Against this general background the *Rijksbemiddelaars* work, slowly—sometimes very slowly—plodding through the intricacies and casuistries of a centrally regulated wage system. Their very slowness is the cause of many complaints, particularly from the side of the workers. The complaining is not quite justified, because all kinds of unpleasant feelings (notoriously very important in labour relations) can be turned into attacks on the *Rijksbemiddelaars'* slowness—and cool off in the process.

The mediators are not only bound by the general government policy on wages and prices, but by the advice of the *Stichting van de Arbeid*. This Institute of Labour is one of the better fruits of war time. The three employers' associations (neutral, that is Liberal, Protestant, and Roman Catholic) and the three similarly divided trades unions' congresses formed provisional consultative committees, and in 1945 the Foundation was officially launched, with the blessings of the Government. The unique position of the new organisation, representative of all interests concerned, makes its advice a very strong influence indeed, from which neither *Rijksbemiddelaars* nor the government can easily withdraw.

Part of the goodwill of the Institute of Labour on both sides of the fence seemed to be in danger when, some time after the war, several prominent men from its management side joined the conservative "party for freedom and democracy." The nervous feeling of some people that the co-operation of management and workers in the Institute would cause the trades unions to lose their grip on the workers has, however, proved unjustified. On the contrary, all three "loyal" trades unions' congresses have seen their numbers steadily—even remarkably—increase since 1945, whilst the Communist-dominated *Eenheids-Vak-Centrale* (never included in the Institute) has lost nearly all its influence.

Taking all in all, experience with the Institute of Labour, has shown that, although not perfect, it has been rather better than was expected. The employers know it saves them an endless amount of trouble, and the workers, although dissatisfied on incidental points, have come to realise that, for the time being, no useful purpose would be served by breaking the connection.

The achievement of the *Rijksbemiddelaars* as a national wage tribunal (or, to put it more bluntly, a national wage dictatorship) has to a large extent depended on the joint backing of their policy by workers and employers in the Institute of Labour, and can hardly be judged on its own. The whole system works satisfactorily, provided that the co-operation between the two sides of industry in the institute does not break down, and provided that national wage regulation will not be considered necessary for too long a time. A return to bargaining is generally hoped for, although the present system includes, within the Institute, a good deal of bargaining, and although it will be some time yet before completely free bargaining of the employers and workers will be possible again.

Economic Aid to South-East Asia

[BY A SPECIAL CORRESPONDENT AT THE SYDNEY CONFERENCE]

PRINCIPLES rather than plans were the outcome of the British Commonwealth conference on economic aid to south and South-east Asia, which was held at Sydney two weeks ago. In order to avoid a stalemate on the political issues which arose during the discussions, the delegates compromised by confining themselves to purely technical and financial preliminaries.

The outline of agreement has already been established. There will be a technical aid fund, a capital investment fund, and a central bureau in Colombo. The central bureau will be permanently staffed by financial and economic experts drawn from all the British Commonwealth nations. It will collect information about the development plans of underdeveloped Asian nations, particularly Indo-China, Indonesia, Burma, Malaya and Siam, and will be the body to which, in the first place, these nations may apply for aid.

The delegates agreed to spend or lend up to £23 million on aid to South-east Asia within the next eighteen months, but countries outside the Commonwealth have also been invited to contribute. Australia will supply money or credit up to one-third of the above sum, which indicates that the main burden of granting economic aid will fall upon the shoulders of Great Britain, Australia, and India in that order.

The leader of the Indian delegation, Sir Ramaswami Mudaliar, said that his country could offer the services of technicians in the fields of irrigation, hydro-electricity and textile manufacturing. Indians with high qualifications would be readily available for service in countries wishing to undertake similar projects. Ceylon's minister for finance, Mr J. R. Jayawardene, said his country had a pool of experts in such fields as agriculture, irrigation and the manufacture of ceramics. The leader of the Canadian delegation, the Minister of Fisheries, Mr Robert W. Mayhew, said that Canada could send experts on grain growing, lumbering and fish canning. All delegates emphasised, however, that technical aid will be the smallest part of the general scheme for aid for South-east Asia. The ultimate usefulness of the conference will depend on the extent to which credit loans can be offered and bilateral trade agreements made.

Concrete as these proposals appear, however, it was realised that they could be carried out only by shelving the political controversy which marked the opening of the conference. Differences arose because of the egocentric attitude of the delegates, each attitude reflecting individual and not group considerations of what constituted immediate perils and urgencies. At the Colombo conference last January, the Asian members of the Commonwealth made it clear that they did not regard Communism as the greatest of political evils. In the debate on Indo-China and Commonwealth recognition, Pandit Nehru stated explicitly that "although Communism is bad, colonialism is infinitely worse."

Nehru's representative at the Sydney conference again emphasised this point when he said that the overriding consideration of any aid to Asia must be that neither its supply nor distribution should in any way infringe the sovereignty of the countries concerned. The argument used was, that although imperialism in terms of gunboats might be a dead letter, imperialism through economic infiltration now loomed in Asia as the greatest danger to be guarded against.

The Asians agreed, however, that certain unstable Asian countries where corrupt leadership still obtained could not be entrusted with unsupervised aid. In a public statement, the Ceylon delegate cited the example of China and the enormous waste of American money and material which had been granted to the Nationalist Government.

Yet even the more stable nations of Asia would object vehemently if their unsettled neighbours received foreign aid which was politically suspect. The contradiction lies in the fact that these unsettled Asian countries are the very ones in which the oppressed yet politically conscious masses are most likely to rise against their leaders and seek relief in Communism.

It is becoming clear that the complexities of the final plans for aid to Asia will not, as first believed, derive mainly from the raising of capital or the working out of involved technical details. Experts are not lacking who have had adequate experience in organising or promoting industrial enterprise in Asian countries. But, in the past, they have been able to function according to orderly western routines, untrammelled by the hypersensitive kind of nationalism which characterises the resurgent Asia of to-day. How to overcome these psychological obstacles may well prove to be the major difficulty confronting the planners of the British Commonwealth.

Europe's Improving Diet

THE progress towards general European economic recovery which is described in the Economic Commission for Europe's survey for 1949 is reflected in a steady improvement in the level of food consumption. The survey records an eight per cent increase in calorie intake and a nine per cent increase in protein consumption in 1948-49 compared with the previous year. But no Europeans are eating as much as, let alone more, than before the war. The average calorie intake is still eight per cent below pre-war, and in some countries, particularly Germany, Italy and Spain, it is as much as 10 to 15 per cent lower. The gap between food consumption in the richest and the poorest countries is now slightly wider than before the war, when the differences between countries ranged from Denmark with a calorie intake of 20 per cent above the European average, to Greece and Turkey with a calorie intake of 10 per cent below the average.

But the value of the food consumed varies far more widely. In the richest countries it is 80 to 90 per cent greater than in the poorest countries. For Europe as a whole the value of food consumption per head, in 1948-49, measured in pre-war prices, was about seven per cent higher than in 1947-48. But it was 10 to 11 per cent lower than before the war. The fact that the fall in value was greater than the fall in calorie consumption indicates a deterioration in the actual composition of the diet. This deterioration was widespread in central and eastern Europe, particularly in Germany, but in western Europe was confined to Britain and Switzerland. The most important change in dietary

habits since the war is the sharp fall in meat consumption. Only in Ireland, Czechoslovakia, Belgium and France is as much meat eaten now as before the war. In Norway, Switzerland and Britain meat consumption has fallen by 30 per cent; in Austria and the Netherlands by about 50 per cent; and in Germany by over 66 per cent. There was little or no improvement in 1948-49, but what little evidence is as yet available for 1949-50 suggests that meat consumption is beginning to increase.

More Milk and Potatoes

Most of the wealthier countries of western Europe have been able to compensate for their decreased meat consumption by drinking more milk and eating more cereals and potatoes. For example, in Britain annual consumption of milk and cheese has risen from 110 kilogrammes per person in 1934-38 to 159 kilogrammes in 1948-49; and in the Netherlands from 134 to 228 kilogrammes. The consumption of potatoes has risen everywhere in western and north-western Europe, except in Belgium and France. This compensation has not been available on the same scale to the poorer countries of southern and eastern Europe, where agricultural methods are more backward and where, on the whole, the climate is too dry for intensive potato cultivation. On the other hand meat consumption in these countries, which before the war ranged from 18 to 36 kilogrammes per person each year, was never as high as in western and north-western Europe, where it used to range from 40 to 75 kilogrammes.

This decrease in meat consumption in the richer countries of western Europe has tended to level out the large pre-war geographical differences. The same thing has happened with sugar. The very large prewar differences in annual consumption, ranging from 3 kilogrammes per person in Bulgaria to 51 in Denmark, have now been diminished; but they are still large, since in many countries sugar is still regarded as a luxury. The largest consumption in 1948-49 was in Sweden (44 kilogrammes per person); and the lowest recorded consumption was in Jugoslavia (7 kilogrammes).

With the exception of Germany dietary standards vary in accordance with differences of wealth and climate in much the same way as they did before the war. In general, the amount of meat and sugar eaten varies according to income levels, whereas milk and potatoes are affected by differences of climate. But if climatic conditions are suitable, the consumption of milk tends to be higher in the richer countries and the consumption of potatoes higher in the poorer countries. As might be expected, the consumption of fats is about twice as high in north-west Europe than in southern Europe. But on an average, the decline in fat consumption in 1948-49 was still as much as a quarter of the prewar level, and was especially large in Austria, Germany, Poland, Italy and Britain.

PRODUCTION OF MAJOR FOODSTUFFS IN EUROPE*
(Millions of Tons)

Commodity	1934-1938	1948	1949†

Less Land Under Crops

In spite of the general increase in eating, agricultural production did not increase significantly in 1949, and for Europe as a whole remained at 90 per cent of the pre-war level. Only in the Netherlands, Denmark, Sweden and Britain was output higher than before the war. The failure to regain the prewar level of cereal production does not appear to have been due to low yields, which in fact were slightly above the prewar level in 1949. It is due rather to a reduction of about 10 per cent in the area devoted to cereals, which in its turn is due to the emphasis which has been placed on the production of root crops, vegetables, fruit and animal feeding-stuffs. Intra-European trade in foodstuffs rose from 1948 to 1949 by nearly $300 million, or about 18 per cent. This increase was mainly due to more trade in animal products, such as meat, butter, cheese and eggs as well as to an increase in the exchange of fats and oils and tobacco. But there was no net expansion in the trade in cereals; although the value of trade in bread grains rose from $179 million in 1948 to $231 million in 1949, the trade in coarse grains declined from $213 million to $183 million. Intra-European trade in all foodstuffs, except sugar, cheese, fish and tobacco still remained very far below the prewar level.

The value of Europe's principal overseas food imports on the other hand remained high; it rose from $5,658 million in 1948 to $5,932 million in 1949. The large increase in imports of oils, fats and oil-seeds, from $750 million in 1948 to $1,050 million in 1949, was partly offset by smaller imports of bread grains, sugar and eggs. European food imports from the United States were valued at $1,452 million in 1949, compared with $1,149 million in 1948. Germany and Austria took nearly 50 per cent of these; and, of all European countries, Britain was the most successful in reducing drastically its dollar food imports.

"Where are you going this summer?"

"Going to my favourite haunt, old boy—the one and only Burgh Island in South Devon. It's the finest place I know for enjoying oneself in luxury at moderate prices. And I hear it's even more comfortable since they made the extensions to the hotel last winter."

"Is the food good?"

"Excellent—so is the wine-list, *and* the service. And you'd enjoy the smugglers' inn, the 'Pilchard'. There's tennis on the Island, too, and golf courses on the mainland nearby. Oh, and a first-class resident band for dancing. Yes, Burgh Island Hotel has everything, and the scenery, of course, is superb."

"Sounds just the thing — I'll phone them this evening for reservations."

THE EDITORIAL KEYNOTE

WITH the publication on 1st June of the NATIONAL AND ENGLISH REVIEW are merged the best features of "The National Review" and "The English Review Magazine".

Lord Altrincham's well-known editorial feature "Episodes of the Month" is followed by contributions on a wide selection of subjects, ranging from the Hitler-Franco meeting at Hendaye in 1940 to Paintings at the Academy in 1950, from the Colour Problem in South Africa to Milton's Poetry.

Contents include:
Episodes of the Month by the Editor

Articles
The Hendaye Tapestry:
How Franco Resisted Hitler, by Ian Colvin
The "Mutualization" of Insurance:
I. The Socialist Case, by R. H. S. Crossman, M.P.
II. The Business Answer, by Sir Frank Morgan
Colour Bar and Commonwealth, by Laurence Gandar
The Future of Jerusalem, by Sir William Fitzgerald
Paintings at the Academy (illustrated), by Michael Jaffé

Book Reviews
Mr. D. C. Somervell's "British Politics since 1900," by Christopher Sykes
Rex Warner on Milton, by Peter Russell
"The Autobiography of Henry L. Stimson," by Jules Menken, etc., etc.

THE NEW IDEA IN FILING

A System which Gives At-Sight Identification and Error-Proof Certainty

SHANNOGRAPH FOR SPLIT-SECOND FILING — AND FILING

IF your filing system were just a place to keep letters, you might as well use a waste paper basket.

It's the FINDING that matters.

Plus, of course, speed in operation.

Here are the facts about Shannograph :—

First, it is flat-topped. That is, the top of each file is flat right across. That gives you a lot of space to use—name, address, telephone (and many other things, as you will see). And there are not tabs and the like to catch in the cabinet, wear out, or THUMB-FUMBLE through. Your EYE spots any file at one glance.

Then there's charting. Briefly, each letter of the alphabet is charted so that a "B" in an "A" section stands out like a sore thumb. For that matter, so does an "Ab" in an "Aa" section.

Then there's "suspension." Shannograph is not the ordinary suspension system. *Every single folder is separately hung by metal hangers on a metal frame.* The folders don't touch the cabinet. That means less wear and tear. More speed. Longer life. Less cost.

Last . . . you can signal Shannograph—like you would a Shannon Visible System. Why not ? Shannograph *is* a VISIBLE system of filing-finding. So signal it—to show when a reply ought to be expected. Or what degree of importance each firm has. Or any other item(s) of information you may want.

Let's sum up Shannograph. It's fool-proof. You can't make an error and hide it. It's faster—the eye's quicker than the thumb. It's stronger. The folders last and last—and can be used and re-used for any purpose or firm.

Shannograph will go in your existing cabinet—or desk drawer —or on your desk-top, or on a side table, counter or shelf. And it's moderate in first-cost and next-door-to-nothing in upkeep cost.

. . . Having said all this, there's still a great deal more to be told. And you really should know about Shannograph —because there just isn't anything else like it made.

To save time just tear out this advertisement, pin to your letter-heading and send to the address below. Full details will be sent by return, without obligation.

SIMON ENGINEERING GROUP

It would be hard to name industries and public utilities more important than those for which the Simon companies build capital equipment. Simon-Carves coal cleaning and coking plants, power stations and sulphuric acid plants aid the production of coal, iron and steel, gas, electricity and heavy chemicals. Grain handling plants and granaries by Simon Handling Engineers and flour and provender mills by Henry Simon help to produce food for man and beast. In serving these industries Simon machinery and plant earn dollars, pesos, cruzieros, escudos, kronor, guilders, francs, and many other currencies.

New Hope for the Oil Talks

WHEN petrol rationing was so suddenly discarded last weekend nobody was sorry, but a good many people were quite reasonably perplexed. Hardly any control had entrenched itself in the British system of government with a greater appearance of being immovable. None had been upheld by Government spokesmen with a more unyielding set of arguments. Petrol was a "luxury" which it would be wrong to import at the expense of imports of "essential" goods. It cost dollars and could not, therefore, be "afforded." Alternatively, it was capable of being used to earn or to save dollars ; therefore its consumption must be restricted even when supplies became plentiful. To suggest anything else was "irresponsible," and even the use of the price mechanism as an alternative method of restricting consumption would cause "hardship" and was therefore abhorrent.

Such systems of argument, hard as they are, prove brittle. The initiative to break this one came from the Standard Oil Company (New Jersey), more familiarly known as the Jersey Standard, which offered to take sterling in payment for its share of the additional imports which would be needed if rationing were removed, and to spend all the extra sterling so earned on the purchase of sterling goods and services. Jersey Standard supplies some 28 per cent of the British market, or four-fifths of the dollar part of the trade ; and the other American company concerned (Caltex) agreed to do the same for its part also. The purpose is not difficult to see. The trade of the American companies is threatened by the Government's substitution policy. But an expansion of the total market will allow them to hold a larger trade than they would otherwise have held in the interim period until the Fawley refinery, and other American arrangements for supplying oil to the sterling area at sterling cost, can take effect. Further, the Jersey Standard representatives were no doubt anxious to devise some way of relieving the hitherto unbroken failure of the Anglo-American oil talks and creating a better atmosphere in which the talks might proceed more hopefully. Their offer was astute as well as imaginative, and one that a hard-pressed Government would not find it easy to turn down.

It left the Government with some decisions to make. The American companies wanted to be able to spend some of their extra sterling on tankers—a capital expenditure which the British "incentive" proposals put forward in February would not permit. This (from Mr Noel-Baker's announcement on Friday) will be a permitted use for the extra sterling earned in consequence of the derationing. Granted this point, and granted that the dollar cost of consuming more dollar oil was for the time being satisfactorily covered, the Government had still to decide whether the national economy could "afford" a general expansion of the oil trade in Britain. Thus, the products of the sterling companies, which supply some 65 per cent of the market, themselves contain a substantial element of dollar cost, and no increase of this cost can be transferred to other shoulders. And what of the future, when the Fawley refinery comes into operation and the present Standard offer comes (presumably) to an end ? Fawley will handle sterling crude from Iran and Iraq, and the refinery costs will be in sterling. But its profits will be (quite legitimately) remittable in dollars, and the crude oil which feeds it will (like any other sterling oil) have cost something in dollars.

Reasoning as it reasoned a year or even four months ago, the Government would have turned the Jersey proposal down. But in fact it accepted the proposal and moved with startling speed ; and, though it had to throw overboard some arguments which it had harboured for a long time, it was probably right to do so. Still, it is permissible to say that if the change had been less rapid, the end of petrol rationing might have had less of the character of a leap in the dark. How much will this additional consumption be ? The trade expects an increase of about 750,000 tons a year in petrol, with perhaps an additional 75,000 tons of diesel fuel, but really nobody knows. Assuming this increase in consumption, what share of its dollar cost will have to be borne by the British economy? Is the present price of 3s. 0¾d. a gallon the right price to keep petrol consumption within reasonable bounds ?

*

Only experience will show whether the arrangements now arrived at with the American companies are fully workable, what is the "right" price for petrol in postwar Britain, and what is likely to be the level of demand in the coming years. One thing alone is reasonably certain ; no government is likely to contemplate re-imposing the rationing system except under pressure of extreme crisis. Rationing has gone, but the dollar shortage remains, the substitution policy remains, and the Anglo-American oil talks are still with us. Everyone concerned must feel the hope that, now that one agreement at least has been reached on one subject, the talks will begin to go better. It is necessary to remember that the oil talks are not primarily concerned with British rationing at all. They began last year, some months before the American share in the British market was brought into question, because the American companies were apprehensive about the damaging effect on their world-wide trade of what they regarded as "discrimination" against them by Britain. The chairman of Jersey Standard put his company's view in a recent letter to stockholders:

> Beyond the challenge of normal business competition, Jersey Standard and other American oil companies are facing measures by the British Government which give British companies great advantages in the world oil market.

Mr Holman listed a variety of such measures: bilateral

trade agreements, currency exchange restrictions that "prevent American companies from selling oil for sterling to countries which are outside the sterling area but which have sterling to spend"; and, as the latest development, the substitution of sterling for dollar oil in the markets of the sterling area itself.

This is probably the order of importance in which the American companies regard their grievances. The last, substitution, is formally unaffected by the end of rationing, but a curious situation has arisen. Additional petrol or road diesel oil consumed in the sterling area this year and next—as things now stand—will not cost dollars if it is dollar oil, but if it is sterling oil it will cost some dollars. This being so, the Americans can at least consider themselves safe against any British hankering after still more substitution. No doubt they will persist in their efforts to get the substitution policy withdrawn altogether; to this end they have put forward various schemes designed to reduce the dollar content of their oil by spending more money in the sterling area, or alternatively to prove that it is already no higher than the dollar content of the "marginal" sterling oil.

*

It is on schemes of this kind that the oil talks have lately been concentrated; the Jersey offer which led to the end of rationing in Britain and the Commonwealth is one such proposal. The other schemes, put up by more than one company, are designed to get round the substitution policy and to keep the American foothold in those currency areas which are neither dollar nor sterling, but which have sterling and no dollars to offer. In those areas the British have suspected the Americans of wanting Britain to underwrite the ill-effects on American trade of other countries' dollar shortages; while the Americans suspect Britain of plotting to stifle American trade.

It is always reasonable to point out that Britain is not responsible for the dollar shortages of the non-sterling countries, and that the United States, if it desires to go on selling to those countries, could ease matters by greater willingness to accept their goods in return. At the same time, there is little point in denying that the distinction between sterling and dollar oil, though it is sometimes real, is often artificial and difficult to follow. American and British companies have many investments in common, and for simple economic reasons they exchange their products among themselves in many parts of the world on a considerable scale. A sharp distinction between sterling and dollar oil tends, therefore, to hamper and distort the trade. Of all trades, the oil trade is the hardest to divide into currency areas.

The purpose of oil policy must therefore be to relax and not to harden this division; and this is a common interest of British and Americans alike, for both countries stand to make immense gains by the smooth running and uninterrupted expansion of the world-wide trade. Oil-field development in recent years has been successful on a huge scale, and in many countries economic recovery is reaching a point at which these expanding supplies can be readily consumed. This world trade is fairly evenly divided between the American interests and the British and British-Dutch interests. No invincible reason exists why the common trade cannot be expanded on a scale which will render disputes over local markets irrelevant. The oil trade is international in character, and the British interest in it is of a kind that can only flourish so long as the trade is left to work reasonably free of national demarcations.

*

The disputes that have arisen have by now become exacerbated into an international difference, a serious impediment to good Anglo-American relations, and are doing an amount of damage within and outside the boundaries of the oil trade that is out of proportion to the actual matters at issue. Within the trade, it is necessary always to remember that oil companies which operate on a world-wide scale are vulnerable to pressure at many points of the globe; they are exposed to threats of retaliation which they cannot afford to take lightly. Further, the state of mind that has been generated makes concerted action between the British and Americans in oil development difficult. Thus it can only thwart the general expansion of the trade that otherwise is within their grasp and in their common interest.

After too long a period of unbroken dissension, the agreement of last weekend surprised both sides in the talks by proving that the desire to agree existed; where trade can expand, interests can be reconciled. It leaves still unsettled the greater part of the area of difference, and there is as yet no certainty that dissension will end. But the atmosphere has at last been freshened by a success, and this can prove to be the turning-point if it is followed up with imagination. If the two sides bargain too hard over the details or stand pat on statements of principle, the opportunity can still slip away; and both sides will be losers.

Britain's EPU Proposals

WITH the arrival in Paris of Mr Hugh Gaitskell, the British representative at the Ministerial Council of the Organisation for European Economic Co-operation, the stage is now set for the concluding—and, it is to be hoped, successful—phase of the long negotiations for the formation of a European Payments Union. EPU has been under continuous discussion by the Payments Committee of OEEC for some weeks past. Some of the difficulties that had stood in the way of final agreement have already been removed as a result of the latest proposals submitted on Britain's behalf. The others are confidently expected to be resolved within the next few days. To put these difficult matters in simple terms is scarcely possible. The experts now assembled in Paris have themselves been hard put to keep pace with the changing metaphysics and techniques that they have been discussing. The objects of the Payments Union are fundamental and simple; they are to encourage European trade by getting rid of some of the impediments that have prevented—or have been held to prevent—payments from one European country to another. But this self-evidently desirable objective has been hard to discern amid the complexities of technique, which frequent references in these columns have sought to explain in recent months.

This subject is hard on the reader, but it is hard, too, on the financial journalist and the government official. Perhaps the most helpful attempt at understanding what is afoot, should begin from January of this year, when the Chancellor of the Exchequer, at a meeting of the OEEC Council, drew attention to certain British reservations about the proposed Payments Union. These reservations, which must be read in the light of the general agreement on EPU principles voiced in the second report of the OEEC, arose on four distinct points. The first was that Britain could not accept the suggestion that the EPU should be the sole lender in financing intra-European surpluses and deficits; it did not agree that all existing credit margins under bilateral agreements and all existing sterling balances accumulated by members should be swept into the new EPU machinery. Any such arrangement, Britain feared, would impair the position of sterling as an international currency—that is as a currency in which many non-sterling countries maintain working balances and hold part of their external monetary reserves.

Secondly, the British Government objected to the proposal that any debt by a member to the EPU that had been outstanding for more than a year should thereupon become payable in gold. To Britain, this proposal was far too reminiscent of the rigid gold standard of former times; it would have brought about a contraction and not an expansion of intra-European trade. Thirdly, the British Government wished to reserve the right to apply discrimination in import restrictions against any country to which gold was being lost under the EPU mechanism. Finally, Britain objected to the vesting in the management of the EPU of powers that would, in effect, have enabled it to intervene in the domestic affairs of member countries. As a result, Britain suggested that sterling should be given a special position in the proposed Union. The idea was that Britain, while accepting the general obligation to extend credit facilities to the EPU, would not take such facilities from it—provided that, as a *quid pro quo*, Britain would be able to maintain intact its existing structure of bilateral payments and monetary agreements with non-sterling countries.

Of these four British reservations, the fourth—that protesting against the vesting of special powers in the management of the EPU—was accepted by continental countries without demur. The others, however—and particularly, the request for "special" membership—raised such a storm of protest that the negotiations threatened to relapse into deadlock. This deadlock has now been broken by a new set of British proposals, the upshot of which is to promise full British membership of the EPU by an acceptance of the principle that all surpluses and deficits between member countries shall be submitted for compensation by the EPU. Britain, in other words, is now prepared to waive its previous objections to the functioning of the EPU as the channel through which all intra-European surpluses and deficits are compensated and through which the resulting net creditor or debtor positions are financed.

*

Although the new United Kingdom proposals no longer call for special membership of the EPU, they do, nevertheless, envisage certain measures to deal with the special position of sterling. The United Kingdom, they suggest, should be allowed to make agreements with other members of the EPU laying down both the extent to which these members should have the right—or shall even undertake—to hold their surpluses in sterling and the extent to which they will be allowed to cover their deficits out of their existing sterling balances. Subject to this overriding agreement by the whole OEEC group—now, apparently, already assured on this point—Britain hopes to negotiate bilateral arrangements to ensure that any country that is a net creditor in the periodic compensations (of all intra-European debits and credits) will hold in sterling such part of its credit as has been earned in sterling—but only that part. This limitation is of considerable importance. It will make it impossible for a country that is a net creditor in the monthly compensations, but is not a creditor of the sterling area, to accumulate its claims in sterling; it cannot, under this provision, force the United Kingdom to accept additional claims on the EPU in return for credits in sterling. Some publicity has been given this week to this alleged threat to sterling, but it can be said that these fears are based on a complete misconception of the British proposals.

Similarly, Britain intends to make bilateral arrangements with participating countries permitting them to use any sterling balances accumulated up to July 1, 1950 (when EPU is due to come into operation), to meet any net deficits with which they may be saddled at the periodic EPU compensations. If such countries have no accumulated sterling resources, they will be entitled to use any credit margins available to them under their bilateral agreements with Britain to meet their deficits—if any—with the sterling area. Thus the British proposal is that sterling balances of the participating countries

should be available to meet the overall deficits of debtor countries, but that the overdraft facilities exchanged between the United Kingdom and participating countries under bilateral agreements should be available to meet only those deficits arising with the sterling area.

These proposals, which would keep the sterling mechanism functioning side by side with that of EPU, do not involve a separation of the two systems in so far as the allocation of credit margins is concerned. The proposal is that surplus countries should not lose their right to gold receipts by agreeing to take sterling rather than clearing units. In calculating the points at which gold payments to creditors will come into operation it will be immaterial whether the creditors' surpluses are held with the EPU or in sterling. Conversely, in calculating the gold payments due to the EPU by debtor countries, the credit margins used under their agreements with Britain will be given the same weight as their overdrafts at the EPU. These provisions, and the attempt to mesh the existing sterling mechanism into the EPU, may therefore require a renegotiation of Britain's bilateral payments agreements with participating countries. It would, for example, be impossible to reconcile a payments agreement allowing unlimited overdrafts (such as the Anglo-Italian and Anglo-Swedish agreements) with the strictly defined overdraft arrangements made under the EPU plan.

*

These British proposals about the position of sterling in the Payments Union have been accepted by the OEEC Payments Committee, but the section of the British memorandum that deals with Britain's views on the proper width for credit margins is still under discussion. These sections may still give rise to last minute difficulties. Britain is still asking for reasonably liberal EPU credit margins before gold payments become due, and also still insists, as it did at the time of the Chancellor's January memorandum, on some mechanism to correct the disequilibrium of chronic debtors or creditors. The British proposals would relate the credit margins to a "basic turnover" calculated for each member by adding its visible and invisible trade with all other participants in the year 1949. It is proposed that each member should have the right to borrow up to 10 per cent of its basic turnover without any obligation to pay gold and without time limit. On this formula, Britain's basic turnover would amount to about £1,000 million and the gold-free borrowing quota would therefore be £100 million or, since the figures will be expressed in dollars, $280 million. After this 10 per cent quota had been exhausted, the debtor would then have a further borrowing right equal to 5 per cent of its basic turnover, but any utilisation of this additional 5 per cent would be linked with gold payments. These gold payments would be arranged on a sliding scale so that at first a comparatively small amount of gold would be due in respect of a given utilisation of credit. The sliding scale, however, would be so constructed that by the time the borrower had used up the additional 5 per cent credit allowance, he would also have paid a further 5 per cent in gold to EPU. Thus if Britain ran up a deficit of $560 million with other OEEC countries, it could finance $420 million of this by borrowing rights but would have to pay for $140 million of it in gold. Britain also proposes that as soon as a debtor had used up his gold-free quota of 10 per cent, his position would be discussed by EPU; and that as soon as he had used up his additional 5 per cent quota as well, the other members should be allowed to discriminate in his favour in their import policy, so as to help to restore his solvency with the Payments Union.

*

The British proposals for the allocation of lending rights are in interesting contradistinction to those just described for the allocation of borrowing rights. The suggestion is that each member should have a gold-free lending obligation of only 5 per cent of his basic turnover (compared with the 10 per cent gold-free borrowing right). In addition to this initial 5 per cent lending obligation, each member would have a further lending obligation amounting to 10 per cent of his basic turnover; while yielding this extra 10 per cent of credit he would get $1 worth of gold for each $2 worth of extra credit extended. If, therefore, a creditor had made available his two lines of credits, he would have run an accumulated surplus equal to 20 per cent of his basic turnover, of which 5 per cent would have been covered by his gold-free lending obligations, 10 per cent by the second line of credit linked with gold payments, and 5 per cent by actual gold receipts. The British proposals would both bring pressure to bear on the creditor and provide him with means of self-defence, by providing that after his cumulative surplus had reached 10 per cent of his basic quota, his position would be discussed by EPU. After it had reached 15 per cent, other members would be entitled to discriminate against him; and after it had reached 20 per cent a creditor (who in the new EPU language will become known as a "structural creditor") would be entitled to leave the club.

It will be seen that, if the lending and borrowing rights as proposed by Britain were used to the full, the gold payments made to and by EPU ought to balance. But, as progress was made towards full utilisation of these credit facilities, there would be a tendency for EPU to pay out more gold than it received—because the gold-free borrowing rights would be greater than the gold-free lending obligations. The pool of ECA dollars with which EPU is to be endowed would play its part in filling this gap. The British memorandum recognises that after this endowment, the EPU may become either excessively full or excessively empty of gold or dollars; it therefore suggests that its proposed ratios between credit facilities and gold should remain adjustable. Finally, the memorandum suggests that the credits established and used in connection with EPU should remain outstanding until June, 1952, when, on the cessation of Marshall Aid, the whole problem of future European payments machinery will inevitably come under review.

Provided agreement can be reached, both on the proposals for dealing with the position of sterling and on the place of gold and credit facilities in the EPU, on the lines suggested in the British memorandum, the United Kingdom undertakes to cease all discrimination against member countries. This presumably means that in these circumstances Britain will lift the present exceptions applied against Belgium, western Germany and Switzerland in its trade liberalisation measures. It also implies that in such matters as tourist travel allowances and emigrant remittances, all participating countries will be treated alike by Britain.

The British proposals have as yet been put forward only as a basis for discussion. They constitute, however, an ingenious attempt to reconcile the differences that have arisen in the recent debates on this tangled, but extremely important, question of European monetary union. They preserve the sterling mechanism; they avoid the blot on European unity that would have been caused if a special membership of the EPU had to be earmarked for Britain; they go some way towards meeting the demands of prospective creditor countries—among which, incidentally, Britain itself is likely to be ranked—and finally they embody in their provisions for conditional discrimination some sort of corrective and equilibrating mechanism. They should go a long way to remove the suspicion that Britain is still determined to seek protection behind its structure of bilateral monetary payments agreements, since these agreements are to be made part of the compensating mechanism to which the rules of EPU will apply. Finally, and most important of all, Britain accepts the principle and the implications of full transferability of western European currencies within western Europe and turns its back on those remnants of commercial discrimination that have caused such an unhappy undercurrent of European complaint against this country.

Business Notes

Sunshine in the Markets

The sunshine that has poured through the dome of the Stock Exchange this week has added its own touch of splendour to the market scene. In the space of a week, the atmosphere has become cheerful—and by comparison with recent months, positively gay. Business has bucked up. The *Financial Times* ordinary share index has broken through its post-devaluation peak and thus gives the schoolmen whose lives are governed by charts and the Hatch system new opportunities for argument and hope. Kaffir shares have risen for four consecutive days, having fallen for as many months. Gilt-edged, if not so buoyant as they were before the Whitsun break, have been active and firm.

Is all this due to taking petrol off the ration? Hardly, it would seem, although that event has a symbolic force no less important than its direct economic effects. When the Government abandons a series of controls one after the other, and suddenly finds it possible to jettison one that seemed more firmly established than any, it becomes possible to talk without too much exaggeration of a dash for freedom, and this is certainly what the market thinks it would like. But, viewed against the broad economic background, these recent steps towards a freer economy in this country are primarily of domestic importance. They are significant and may become more important still if they mark a decisive turn of British economic policy. But until the evidence is clearer on this point, the main emphasis in investment policy ought to be on what is happening outside the country—high economic activity in the United States, rising prices for many primary products, and rising incomes to buy more British exports.

The condition of near-boom in which the world now finds itself is not pure gain for the British economy or the British shareholder. There are many directions in which rising costs will be a distinct embarrassment to industry if, indeed, a dash for freedom is about to take place. There are, on the other hand, the possibilities of renewed inflationary pressure at home if the dash were allowed to become an uncontrolled rush. Just as cost factors might temper the larger benefits of a freer and more competitive economy, so greater economic freedom without the necessary restraints of monetary and fiscal policy might produce inflationary conditions, the benefits of which to equity investors would be spurious and short lived. Suggestions for a reduction in purchase tax may fall into this latter category of questionable policies. On these issues, the market has not begun to make up its mind, and it is probably wise to wait until the signals are rather clearer. The dependence of primary prices on the American economy was never more direct, and there is some touch of excitement in recent American buying which could subside rather suddenly, as it has done in the past. Yet investors may conclude that they face a more promising summer than they have known in recent years. That is not saying much, for the last three summers have not been gracious. But there is more promise of fair weather for a month or two than seemed possible only a few weeks ago.

The Film Talks

The Anglo-American film talks ended last weekend, and the principal American negotiator, Mr Eric Johnston, has since returned to New York, taking the final British proposals with him. Apparently the two sides had said everything they had to say, but they did not reach any agreement; the next move is with the American producers, who will have to consider whether to accept the British proposals or not.

The purpose of the talks was to review the films agreement of two years ago and settle the terms on which it is to work for the next two years—the remainder of the agreement's life. Discussion turned substantially on two points. The Americans wanted the limit on their remittances from London to New York ($17 million a year, *plus* the amount of the net dollar earnings of British films) to be removed altogether. They put forward two reasons in support: the British balance of payments had improved (they said) since the agreement was made, and devaluation had reduced the dollar equivalent of their British earnings. Thus, if they were earning £12½ million a year net when the agreement came into force, this would be worth $50 million then but only $35 million today. But the British Government not only refused to entertain this proposal; they suggested that it ought to be cut severely. American bargaining has been able to do no more than induce the Government to concede that the present rate of remittance shall be maintained—and this only on conditions.

The British conditions refer mainly to American film production in Britain, and there are indications that an "incentive" plan not wholly dissimilar to the oil incentive plan has been outlined in an attempt to encourage the Americans to spend their sterling in British studios. Clearly the Americans are not anxious to go very far in this direction; they like to be free to produce in the places they find most expedient, and they have reason to be apprehensive of the anger of the American trade unions if they transfer any more production out of California. The fact that Mr Johnston has since been conferring in Dublin with Mr Walsh, of the American International Alliance of Theatrical Stage Employees, and with Mr O'Brien of the British theatre and cinema workers' union, confirms that unemployment in the American and British film industries has played an important part in the talks. But the root of the disagreement can no doubt be expressed in the remark of a member of the American film trade: "They want to get our films for nothing."

* * * *

Canadian and Russian Wheat

Details of the understanding reached between Britain and Canada on next season's wheat purchases—the outcome of last week's talks—were released on Wednesday. Both governments stated that the existence of an international wheat agreement obviated the need for a new Anglo-Canadian contract to replace the existing contract, which expires next month. Britain is expected to buy between 100 and 120

million bushels from Canada in 1950-51 (compared with 140 million under the present contract) and 300,000 tons of flour. The actual size of the purchase will depend on prices and quality.

Under the international wheat agreement, Britain has guaranteed to buy 180 million bushels in any season at the minimum price, which for 1950-51 will be $1.40 (US) a bushel. Of this quantity, some 60 million bushels are likely to come from Australia, and the remaining 120 million bushels from either the United States or Canada. If the allocation of ECA funds to Britain was made conditional upon British purchases of American wheat, a smaller quantity would presumably be purchased from Canada. But it is unlikely that Britain would buy all the 120 million bushels from the United States.

A new development in the grain trade, however, now emerges in the form of a Russian offer to consider joining a European grain agreement. Reports have suggested for many months that Soviet ports have been equipped to handle large shipments of grain, and British experience of coarse grain deliveries from Russia under the two separate contracts has been favourable. The Soviet Union could, if it were so minded, become a main source of grain for Europe. But there would obviously have to be some *quid pro quo*, in the form of machinery and possibly strategic raw materials. The existence of Russia as an alternative source of wheat would not be a serious threat to the wheat agreement, though it would be a powerful influence in forcing the world price down to the minimum level, particularly if Russia were willing to accept payment in importers' currencies. The latest Soviet offer, however, is of a very general character and is presumably not inspired by commercial considerations alone.

* * *

The Cost of Imports

Imports have risen so sharply this year that the benefits from the achievements of the export drive have been much diluted. In April, imports totalled £211 million—only £10 million less than in March, although April had 23 working days compared with 26 in March. Exports, however, fell by nearly 20 per cent, to £150 million. Part of the rise in the cost of imports is to be attributed to larger arrivals; for example, both crude petroleum and unrefined whale oil reached record levels in April. A more important cause, however, is the sharp rise in commodity prices during recent months.

It is idle to try to measure how far this rise has been due to devaluation and how far to America's boom. But it is the fact that in seven months from September to April the Board of Trade's index of import prices (1947 = 100) has risen by 21 points to 131, or by 19 per cent. The index has been carried upwards by raw materials, for which the index has risen by 30 points, or 25 per cent. Food, drink, and tobacco import prices were 14 per cent higher and manufactured goods 17 per cent higher. Practically the whole rise in manufactures occurred in October and November, immediately after devaluation. A further rise in import prices and in the total cost of imports is to be expected, for world prices of primary commodities (as a note elsewhere shows) are still rising. Export prices, on the other hand, have increased by only 4 per cent since September. Thus the terms of trade (that is, the quantity of imports that can be obtained for a unit of exports) have swung violently against Britain since sterling was devalued. Since September, the deterioration has amounted to 12 per cent; in the previous five months there had been an improvement of 6 per cent. Thus devaluation has had the effect of making British exports relatively cheap to dollar buyers, and the American boom has made British imports relatively dear. A given bundle of exports now secures only 88 per cent of the amount of imports that it would have bought last September.

IMPORT AND EXPORT PRICES

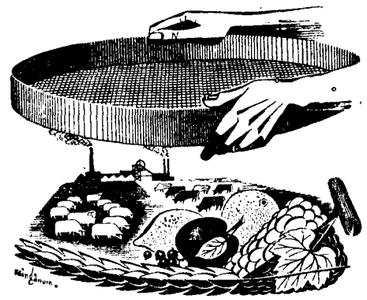
Guesses at the Surplus



The rising cost of imports is bound to affect the outcome of the balance of payments this year. In their estimates in the "Economic Survey" the official statisticians wrote in a surplus of £50 million, but this figure was "assumed" and was in no sense a hard and fast calculation. Indeed, there were grounds two or three months ago for supposing that it might err on the side of modesty—in which case the nation's task of financing its investment programme at home and a larger surplus abroad would have involved correspondingly greater efforts of saving or correspondingly greater risks of inflation.

How do these estimates and assumptions stand now? For the first four months of the year, the excess of imports (valued c.i.f.) over exports (valued f.o.b.) amounted to £125 million, compared with £107 million in the first four months of 1949. But the excess of imports over exports calculated in this way is not a satisfactory guide to the real trend of visible trade. The value of imports has to be corrected to an f.o.b. basis, and allowance has to be made for the fact that the balance of payments is literally concerned with actual payments, which do not coincide with the arrival of goods. During the last half of 1949 the cost of imports was some 13½ per cent lower than the recorded value of imports. If this same correction is applied to the value of imports between January and April of this year (£814 million) the net result is £704 million. Similarly, total exports have to be converted to receipts rather than shipments. The exact factor to apply is doubtful, but assuming that it is 2 per cent, this would reduce the figure of £689 million for the first four months of 1950 to £675 million. Thus, up to the end of April, the adverse balance on account of visible trade might have been of the order of £30 million.

The next stage is to introduce a guess about the trend of invisible items. No data are available about their movement except in the balance of payments white paper. This showed that the deficit with dollar countries in the first half of 1949 (£22 million) was converted to a surplus (£8,000,000) in the second half of the year, and this improvement has almost certainly continued. Britain had a surplus with the non-dollar world last year which amounted to approximately £60 million in each half. It is possible that increased earnings by British oil companies have more than offset their increased expenditure overseas (not excluding Persia which did not devalue), while receipts from shipping should also have increased. Adverse factors to be taken into account include the political situation in South-east Asia and the Far East which has increased the level of military expenditure and probably reduced the earnings of British companies operating in those areas. On balance, it is plausible to suppose that Britain's surplus or invisible account with the non-dollar world this year is at least equal to the rate achieved in 1949.

If this guess is anywhere near the mark, the overall surplus on invisible items should be running at, say, £10-15 million

Not all the gold is in Kalgoorlie

The many opportunities open to business men in Australia and New Zealand are far richer than the famous "Golden Mile" of Kalgoorlie, Western Australia gold mining centre.

The Bank of Australasia offers up-to-date information on prevailing market conditions to business men interested in trade in Australia or New Zealand. Write for our booklet "The Answers To Your Questions" which may be obtained from the Bank on request. It contains not only information concerning the commercial world but also more personal details about life in these two Dominions.

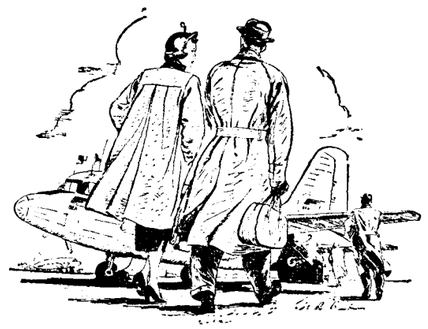
INDUSTRIAL AND COMMERCIAL
I. C. F. C.
FINANCE CORPORATION LTD.

I.C.F.C. was set up in 1945 by the English and Scottish Banks, with resources of £45,000,000, to supplement existing facilities by providing an accessible source of share capital and long term funds for well conducted businesses of small or medium size. It applies to all proposals the usual canons of sound finance and is not averse from supplying risk capital. I.C.F.C. so far has made available over £19,000,000 for British Industry, divided among more than 290 concerns of many kinds.



Full particulars of the facilities offered may be obtained from the General Manager,
7, Drapers Gardens, E.C.2.

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners—there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

month, and the total for the first four months of the year ould then be £40-60 million. After deducting £30 million r the visible deficit, the overall surplus on current account ight thus lie between £10-30 million—say, an annual rate £60 million. The vital factor in the coming months will early be the trend of import prices. If this were to continue iarply upwards, without any compensating reduction in ie volume of import or without any corresponding increase i either the value or volume of exports, then the "assumed" irplus of £50 million might indeed be hard to attain.

Iechanisation in the Docks

The report of the working party on mechanisation in ie docks is a statement of general principles rather than a etailed examination of the many special problems which eed to be solved. It could hardly be anything else. Facilies and practices in each port differ widely; a detailed :heme for Middlesbrough, for example, would not necesirily work in Aberdeen, and it is the general principles, ither than the detailed plans, that are wanted at this stage.

On the technical side the working party sets out the basic ict that mechanisation, to be fully effective, must extend 'om the packaging department of the factory to the hold of ie ship. There is not much point in having large numbers f fork lift trucks and conveyor belts if the cargoes are so acked that they cannot be handled by them, or if the wareouses are so designed that the trucks cannot move freely. hips, quays, warehouses, railway wagons, lorries and actories all need to be adapted if there is to be any large ncrease in efficiency. The cost will be high; it is also lear that the change-over from man-handling to mechanical ietbods must be a gradual process and that separate schemes iust be worked out for each majof port.

On the labour side, the working party recommends that mployers should be more careful in consulting the dockers efore introducing mechanical methods, that a national urvey should be undertaken to estimate the effect on the ock labour force of more mechanisation—it is not expected o be as drastic as the dockers' fear—and that the separate chemes for each port should be worked out by local joint ommittees of employers, dockers and engineers. They oint out that there are at present 5,085 registered dockers ver the age of 65 and 1,697 over the age of 70; the retirement of these elderly dockers on pension might well compensate for any redundancy caused by increased mechanisaion. The restrictive practices of the dockers will also have o be overcome, but this may well prove a less difficult undertaking than the report appears to assume.

The one weakness in this otherwise admirable report is hat it does not deal adequately with the question of costs which is the most important question of all. No attempt is nade to show how the cost of handling cargo is likely to ie affected by increased mechanisation. The dockers will expect higher earnings as the result of mechanisation, and the employers will expect some return for the capital outlay involved. Beyond what point, or in what conditions, will the increase in efficiency which more mechanisation should bring about be outweighed by the increase in costs? This question is not answered.

* * *

Passengers by Helicopter

The Liverpool to Cardiff helicopter service which was started by British European Airways this week will be the first passenger service of its kind in the world. Helicopter development is in its early stages, and much has to be done to bring the machines to the pitch of mechanical reliability that passenger schedules demand. The present BEA venture is really an extension of the mail-carrying experiments which have been going on during the winter. The air services on this route have been losing money, but for social reasons some form of air transport is considered essential to supplement the inadequate land connections. The helicopter service will also lose money, but this loss can reasonably be regarded as cost of research. The mail-carrying experiments were not economic, and the Post Office and the Ministry of Supply each bore a proportion of the loss.

If this summer's experience in passenger-carrying is successful, further development of helicopter transport will depend on the rate of progress that the manufacturers can attain. BEA is not prepared to use the present single-engined type for services between city centres. The consequences of single-engine failure are not so serious as they are with fixed wing aircraft: if the helicopter has sufficient height, the rotor blades can be used to prevent an unpleasantly heavy drop to the ground. Nevertheless, the possibilities of such a forced landing in a built-up area might be serious and it is right not to risk them. The Liverpool-Cardiff service, and any future services with single-engined helicopters, will take off and alight on the outskirts of the towns.

Multi-engined helicopters are being developed. The Bristol Aeroplane Company is building a 10-seat twin-engined machine which is expected to be in service within three or four years. The Cierva Company has already flown a three-engined prototype of the Air Horse which has a three-ton payload, and is doing a design study for the Ministry of Supply for an even larger machine. BEA envisages services with 35-seat helicopters within eight to ten years. Westland Aircraft, whose Sikorsky, built under licence from America, is being used for the Welsh service, and the Fairey Aviation Company, as well as the two companies mentioned earlier, build smaller helicopters carrying up to four passengers. All use as power plant the Leonides engine made by the Alvis Company, the only one available in this country.

ESTABLISHED 1867

52, CORNHILL, LONDON, E.C.3

All the larger and several of the smaller prototypes are being built for the Ministry of Supply; hence, a proportion of the development charges is being met by the Government. Prices, however, are high; while a four-seater fixed wing aircraft can be bought for £2,000, a helicopter of similar capacity costs roughly £25,000. The different character of the machine justifies some difference in price, but the prices of American helicopter manufacturers, with their larger output, are well below British prices. High capital cost has hampered the wider use of helicopters in Britain. They have some military uses, and are valuable for some types of crop spraying and for survey work. But few firms can afford so heavy a capital charge, particularly since the insurance premiums—upwards of 17½ per cent—are much heavier than those for fixed wing aircraft.

Shipping Chairmen on Taxation

The short and long term effects of initial allowances on shipping company finance have received prominence in this week's speeches from shipping company chairmen. Sir William Currie, at the P & O meeting, conceded that initial allowances had been most helpful in assisting the liquid position of the group in the past two years. P & O have had heavy commitments for financing new tonnage at a high level of shipbuilding costs. At the end of 1948 the group's surplus liquid funds over its capital commitments amounted to £5,600,000, and this surplus had been increased to £7,800,000 by December 31, 1949. Sir William put the contribution of initial allowances towards this surplus at about £5,000,000 since they first became effective three years ago. Funds for ship replacement were supplemented by normal allowances which raised the total contribution to liquid funds to just over £6,000,000 in 1949 and by £1,684,000 set aside from taxed profit as "additional" depreciation. But although the "relief" afforded by initial allowances is considerable, Sir William considers it a mixed blessing:

> The taxation relief which is derived from initial allowances must tend to become part of the permanent finances of a company just as are its capital and its reserves. The tax relief is not held in cash, but is used in acquiring plant and ships. Having been so applied, the tax relief cannot be withdrawn from industry without weakening its financial structure. This would certainly be the effect while prices remain at their present high level, and, in my view, would remain true to a large extent even if prices were to fall.

Sir William criticised the imposition of balancing charges on the loss of a ship whether by marine or war risks. The crucial point is that this form of taxation puts a further strain on the company's funds required for the replacement of lost ships. The same point was also stressed by Mr Walter C. Warwick, chairman of Royal Mail Lines, which incurred a considerable tax liability for balancing charges following the loss of the *Magdalena* and the *Lochmonar*. Mr Warwick stated that

> no exception could be taken to these taxation charges if the balances recovered were in excess of the capital required to replace lost ships; but inasmuch as these recoveries are far below the heavy cost of replacements, these taxation liabilities can only be regarded as a very serious additional drain on the company's resources.

These arguments have been fully represented to the Tucker Committee, whose findings must be awaited before any redress can be expected.

Canada's Exchange Position

The annual report of the Canadian Foreign Exchange Control Board shows that Canada's gold and US dollar reserve increased by US $119 million in 1949. This increase was US $377 million lower than in 1948. In terms of Canadian dollars, the current account deficit with the United States deteriorated from $393 million in 1948 to $594 million in 1949; simultaneously, the current account surplus with the sterling area declined from $615 million to $578 million and that with "other countries" from $230 million to $196 million. The report, however, is obviously not inclined to take this series of deteriorations too tragically. The increase in Canada's deficit with the United States in 1949, it points out, was largely due to the removal of restrictions on Canadian spending across the border. The decline in the surpluses with other countries was largely due to import restrictions imposed by the dollar-hungry section of the world. For this reason, the report gives a general welcome to the world-wide exchange rate adjustments of last September. "Since the likelihood of our being able to continue to sell a reasonably large volume of goods to sterling area and western European countries depends to a great extent on their ability to export more to this country," it says, "we must welcome a step which should enable them to increase these exports."

This is an eminently sensible long-term argument, but it is one that Canada may have to strain itself to remember in the difficult months that may be ahead. For the evidence is accumulating that Canada has been more hard hit by the short-term effects of devaluation than, perhaps, any other major trading country. One example of these effects is contained in the report: Canadian dollar balances held by sterling area governments were stated to be abnormally high at the end of 1949 (they apparently ran up by nearly $65 million in the year). In at least some months since then, it is believed, the United Kingdom's traditional visible deficit with Canada has turned to a surplus. The blunt truth is that Canada can hardly avoid some painful adjustments in its internal economy now that dollars, in which it pays for most of its imports, are no longer undervalued in relation to sterling, with which most of its exports are bought.

Industrial Gas Turbines

In a talk on industrial gas turbines given recently to the Institute of Metals, Dr Roxbee Cox, formerly head of the National Gas Turbine Establishment and now head of the scientific department of the Ministry of Fuel, described the possibilities of using gas turbines for electricity generation, traction, and various industrial processes. Naturally, Dr Cox gave a good deal of time to describing the means by which it was hoped to replace by cheaper fuels the expensive distillate oils now burnt. As possibilities he mentioned residual fuel oil, coal, peat and various gases. Residual oil is now a feasible alternative to the distillates; the Swiss gas turbine locomotive now in service in this country runs on such fuel. The use of coal is necessary if gas turbines are to be used for base load electricity generation, and work is proceeding on three different techniques of coal burning. It is a more difficult problem than that posed by residual oil; so is the use of peat, which in any case has only limited geographical possibilities. More practical and more immediate is the use of gas—not only natural gas in oil-bearing regions, blast-furnace gas, gas from petroleum cracking, and methane, but also the supplies of gas which may be derived by underground gasification from coal.

There is an urgent need to get some gas turbine plants actually working to provide operating data against which theoretical calculations may be checked. Only one British-built plant is in productive operation, a Ruston and Hornsby 750 kw generator. Too many projects have been "under construction" for too long, and their completion is often postponed while new developments are incorporated in the design. The design of industrial gas turbine plants presents so many new problems that it would be unfair to criticise the firms concerned for the rate of progress, but the lack of any apparent sense of urgency, or of an appreciation that Britain has not the same lead in this field that it has in gas turbine aero engines, is somewhat marked. It may be true that commercially the gas turbine is not yet very attractive, and the chief designers' talents can be more profitably employed on the other products of many of the firms concerned. This tends to slow down development.

Engineering difficulties apart, there are two other obstacles to the rapid development of industrial gas turbines. One, which was mentioned by Dr Cox, is that the available materials cannot stand up to operating temperatures of more than 700 deg. to 800 deg. C., while the gas turbine cycle would operate more efficiently at higher temperatures. Some metallurgists, however, hold that the available materials are not being used to their best advantage. The other obstacle is the dearth of good gas turbine engineers. Gas turbine technology is a field of engineering on its own, virtually unexplored before the aero engines went into production towards the end of the war. Training on aero engines does not necessarily give the experience needed to design an industrial plant, nor does steam turbine engineering necessarily develop talents in gas turbine design. The difficulties occur as much in management as the drawing office; not all the firms interested in this technology have a clear grasp of its possibilities.

Fall in Bank Deposits

The latest clearing bank statement, dated May 17th, goes far to redress the adverse impression conveyed by its predecessor. Between mid-March and mid-April, it will be recalled, there was a more than seasonal expansion in net deposits, which rose by some £30 million more than in the similar period of 1949. In contrast, the latest statement shows a decline by £14½ million, whereas in April-May, 1949, there was an expansion by £23.9 million. This difference is partially attributable to the effects of the recent big BEA issue, but the main explanation of it seems to lie in a rather abrupt reduction in official requirements for bank finance. The banks' statement was made up before last week's first call on the BEA stock, so that the month's repayments of electricity advances out of the proceeds of the issue cannot have exceeded the £15 million payable on application; and as some two-thirds of this sum had presumably to be found by the "departments" (thereby involving the authorities in corresponding borrowings from the banking system), the whole operation cannot have accounted for more than about £5,000,000 of the month's decline in deposits.

The effect on the advances item has, of course, been more pronounced; the total has risen on the month by only £7,500,000. Even after allowing for the effects of the repayments, this is the smallest movement for some months. In the corresponding month last year the advances total actually declined by nearly £8,000,000, but this movement was wholly attributable to a repayment of roughly £30 million of advances out of the proceeds of an issue of gas stock. It will be seen, therefore, that if allowance is made for these special influences, the rate of growth of advances now seems to have slackened down to about the same level as that of early 1949.

Despite their heavy take-up of BEA stock, the authorities appear to have reduced their net indebtedness to the banking system by some £22 million, whereas in the previous month and in the corresponding month last year they made substantial net new demands for credit. A roughly similar change is also observable in the Exchequer return. In the four weeks to May 20th, there was an above-line surplus of roughly £90 million, or about £25 million more than in the corresponding period last year; at the same time, there

ADMINISTERS NATIONAL SAVINGS

was a decline in the below-line deficit. It would be unwise, however, to attach much importance to these short-period contrasts in Exchequer experience. The general pattern of the recent budget in relation to the capital account for the national economy as a whole certainly does not suggest that in the full fiscal year the Government will need to lean any less heavily upon the banking system than it did in 1949-50. On the contrary, it may be unable, over the year as a whole, to make any perceptible further reduction in its borrowings. Meanwhile, however, its policy of switching from Treasury deposit receipts to bills has reduced the clearing banks' holdings of the former to only £364 million, and the ratio of these to deposits to under 6½ per cent—in contrast with 41 per cent at the peak in 1945.

* * *

Central Bank for Ceylon

Reports from Colombo suggest that Mr John Exter, the American official who has drafted the experimental constitution of the new Central Bank of Ceylon, has agreed to remain in the Dominion as Governor of the Bank during its first two formative years. If these reports are confirmed, and if other necessary staffing arrangements can be expeditiously completed, Ceylon will soon be launched on an ambitious experiment in monetary control under American auspices. The legislation setting up this apparatus of control—modelled upon legislation lately introduced in some Latin-American countries—has already been passed by the Ceylon House of Representatives.

The principles underlying the new Monetary Law are, first, that the existing Colonial Currency Board system does not give the authorities sufficient control over the local money supply and pattern of bank lending to enable them to pursue either short-term counter-cyclical action or a long-term development policy; and secondly, that in a country such as Ceylon—with small and unorganized capital markets—traditional weapons of monetary control (such as those of discount rates and open market operations) need to be strengthened and supplemented by new devices if control is to be effective. The new law provides for wide powers to be vested in a Monetary Board composed of three members; two of these members (including the Governor of the Bank) will be appointed by the Governor-General of the Dominion for six-year periods. The other member will be a permanent civil servant representing the views of the Government of the day. This Board, besides controlling the discount rate and open market policy of the central bank, will be empowered to give orders to the commercial banks, laying down minimum levels for their cash reserves, maximum levels for their different types of loans, minimum ratios between their capital and their total assets, minimum letter of credit margins and maximum interest rates on deposits.

These powers are framed in such a way as to give the Monetary Board control over the direction as well as the quantity of bank finance in Ceylon. Before deciding how far it should bring these weapons into play, the Monetary Board is enjoined by the new law to keep an eye on a complicated series of economic indices, including the relation of domestic to world prices and costs, the balance of payments, the extent of automatic changes in money supply, and the cost of living index. The limitations of the old-fashioned Colonial Currency Board system—under which, it has been said, the individual colony has no more power of monetary control than the individual English county—have long been recognised in this country. It may be that the problem of monetary control in undeveloped economies, subject to wide cyclical fluctuations in their external balance of payments, can be resolved only by bringing into play a steam-roller of the sort now being manufactured in Ceylon. But in this case a deal of responsibility is going to fall on those who drive the new engine.

Prices Still Rising

Wholesale prices in April rose by nearly two per cent, the largest single jump since October when the initial effects of the devaluation were recorded. The Board of Trade Index was then 10 per cent higher than twelve months earlier and 9 per cent higher than last August. The rise in April was caused by higher prices for butter (following the reduction of the subsidy), coffee, tomatoes and potatoes. Raw material prices also rose sharply, particularly those of wool, cotton, non-ferrous metals, motor spirit and rubber. Thus, practically the whole rise in prices last month was accounted for by basic materials; intermediate products declined very slightly while manufactured articles rose very slightly.

This rise in prices seems likely on present indications to continue. In May, to quote only a few examples, the price of wool reached its highest point of all time, rubber has been selling at 2s. 3d. a lb., while prices of copper, lead, zinc and even tin (though to a much lesser extent) have also been rising steadily. On June 1st, the price of American cotton was raised by ½d. to 32.15d. a lb., its highest level so far; Brazilian types and most East and West African varieties were also increased in price. On the same day nickel went up by £64 10s. to £386 a ton.

The interim index of retail prices in April moved up one point to 114 (June, 1947 = 100)—the first rise since December and only the second since last May. The rise results from higher prices for vegetables and certain kinds of clothing and soft furnishings. The index has risen very slightly since devaluation, but nearly half of the constituent items are price-controlled. In these circumstances, the stability of the index means little or nothing.

Financing Social Insurance

It is now nearly two years since the launching of the National Insurance scheme, which administers an annual income of some £600 million; yet it was only a fortnight ago that the first accounts of the relevant funds were published—covering merely the nine months to March 31, 1949. The broad facts about the finance of the scheme had, of course, emerged from the omnibus figures given in the National Income White Papers, while details of the funds' investment holdings were published twelve months ago; but nothing was known about the details of distribution of income and payments. The accounts show that the main operative fund had, in these first nine months, an income of £397 million—excluding some special transactions. Of this, £286 million came from the contributions of insured persons and employers, while £93 million came from the Exchequer contributions and grant. Payments aggregated £299 million, so that there was a surplus of £97 million. In his commentary on the accounts, the Comptroller and Auditor-General

A Sensible Policy for Process Steam—II

Removing the Air Film Handicap

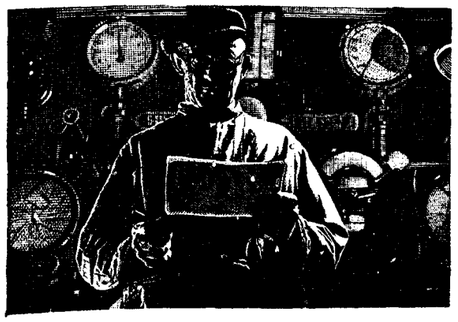
BY SPIRAX

The stagnant film of air, which is present on the condensing surfaces of all process steam plant, resists the transfer of heat from the steam to an extent which is out of all proportion to its substance.

A film of air only one-thousandth of an inch thick can put up the same resistance to heat flow as a wall of iron four inches thick or a wall of copper nineteen inches thick!

Efficient venting of air from the steam spaces is the only way to reduce the thickness of the film and so minimise its insulating effect.

The most effective method is to fit a small automatic air vent which will open to air but close to steam. This device will release air full bore on starting up and will open automatically during running whenever air collects.



The installation of an automatic air vent commonly results in a 10 to 20 per cent. improvement in process heating efficiency.

HOLIDAYS FOR BOILERS?

Steam boilers should work efficiently all the time. Unnecessary holidays are to be deplored. But if boilers use *untreated* water, scale will certainly form, and some sort of *holiday* however inconvenient and costly to other people must be given in order to dismantle and descale. But scale need never form if the modern method of boiler water conditioning with Calgon (sodium metaphosphate) is used. Calgon prevents scale. It saves endless trouble and far more money than it costs, as you will find if you consult Albright & Wilson's Technical Service Department. A really fit boiler does not need a holiday.

Capacity

CAPACITY counts in building and civil engineering. To construct the world's greatest knitting wool factory, steelworks in South Wales, several power stations, schools and other important buildings—all at one time and all on schedule—and meanwhile to raise in a year enough open-cast coal for the ration of half a million homes, proves immense capacity. That is what John Laing and Son Limited are doing.

Capacity means something more than size and great resources—though these are necessary. The firm's modern plant represents an enormous investment. But its skill could not be bought for any money: that comes of a century's experience, and a team built slowly of men picked, trained and tried. Those who are planning large scale construction will be wise to consult the firm whose capacity is proved by these facts.

EC 185

recalls that the rates of contribution were determined at the outset on the basis of an average unemployment level of 8½ per cent of employed persons, whereas the actual percentage in 1948/49 was less than 2 per cent. In consequence, aggregate contributions exceeded the estimate by £34 million, while unemployment payments fell short of estimate by £58 million. These differences explain almost the whole of the surplus, although it will be noted that sickness payments fell short of estimate by £8½ million. The subsidiary Industrial Injuries Fund was expected to show a surplus in its early years; the actual surplus for the nine months is £16 million out of receipts totalling £24.6 million. The combined surplus on these two funds was thus running at an annual rate of roughly £151 million during the initial period, compared with the £157 million indicated by the National Income White Paper for the full calendar year 1949.

The capital resources of the two social insurance funds include not only currently accruing surpluses, but also the large resources that had accumulated over the years in the various funds that were wound up when the scheme came into operation on July 5, 1948. The investments held by these old funds at that date were valued, at cost, at £898 million; they were thereupon transferred to the new National Insurance (Reserve) Fund at their then market value of £885 million, so that the book loss of £12.9 million has not figured in any public account. Under the terms of the Act, £100 million of these investments were transferred to the new operating Insurance Fund, so that its total, including the surplus, was £195 million at March, 1949. In addition, £16 million was held in the Industrial Injuries Fund and £786 million remained in the Reserve Fund. The aggregate investment holdings of these three funds, and of one further small fund, had a market value at the end of March, 1949, of £1,022 million, compared with a cost valuation of £1,001 million. The resources of the main operating fund are held entirely in floating debt and short bonds, but these were acquired from the Reserve Fund, which in turn used the proceeds to buy longer-term securities—notably Transport Stock, 1978-88. The holding of this stock amounts to £138 million and in point of size is second only to the £162 million of "Daltons"—out of a total of £805 million. Since March, 1949, the capital resources of the group of funds have presumably been augmented by some £160 million from the current surplus, but the growth in their aggregate current worth must have been much less than this, in consequence of last year's weakness of the gilt-edged market.

Shorter Notes

The arrangement by which the oil companies did not give effect to the full increase in "permitted" maximum prices after devaluation has been brought to an end. A new list of permitted maximum prices was issued on Wednesday by the Minister of Fuel and Power; it is not very different from the old list, but the Government objection to the "permitted" prices being implemented has been withdrawn. The major distributing companies have announced that they are raising to the full extent their selling prices for all the products named in the new list except fuel and heavy fuel oil. This means that petrol at pump (inner zones) will cost 3s. 0¾d. a gallon instead of 3s. Oil product prices have been under discussion between the Government and the trade since devaluation. There has lately been some hardening in world prices of products, and rail and road transport costs in Britain have gone up. All these factors appear to have been lumped together in the present increase.

★

The price of rubber in the London market reached 2s. 3d. a lb. at the beginning of the week and has since maintained that level. In New York it reached 34 cents a lb. against 18½ cents for general purpose synthetic rubber. Yet despite the dearness of natural rubber, American consumption has remained well above the level of twelve months ago. To ease the present shortage of supplies the American Government has decided to expand the output of synthetic rubber, and according to Mr John L. Collyer, chairman of the B. F. Goodrich Rubber Company, production in June is expected to be "substantially higher than at any time this year," with further increases in July and August.

★

A coal seam was ignited last week at the experimental underground gasification site at Newman Spinney, near Sheffield, and is still burning. Drilling of the boreholes started in December. The gas obtained from the seam is now being analysed; it is still too early to say whether the experiment is a success.

SECURITY PRICES AND YIELDS

A fuller list containing 366 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Pressed Steel; William Beardmore; Royal Mail Lines; Guest, Keen & Nettlefolds.

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

SUBSTANTIAL GROWTH OF BUSINESS

PROGRESS OF THE DEPARTMENTS

EFFECTS OF DEVALUATION

MR ARTHUR W. BLAIR ON NATIONALISATION

The one hundred and twenty-fifth annual general meeting of the shareholders of the Scottish Union and National Insurance Company was held at Edinburgh on May 24th.

Mr Arthur W. Blair, W.S., the chairman, said:—Gentlemen, as was the case twelve months ago, I find it necessary once again to begin my address to the annual general meeting on a sad note. I must tell you that the Earl of Mar and Kellie has found it impossible on account of ill-health to continue to serve on the board and has tendered his resignation.

Lord Mar was appointed a director in the year 1906 and, since then, he has continued, at all times, to take a most keen and lively interest in the affairs of the company. Even when advancing years and failing health began to bear upon him, he remained a most regular attender at our weekly meetings and continued to give us the benefit of his long memory of the company's affairs.

The resignation of Lord Mar has been accepted with deep regret and in the hope that he will enjoy an improvement in health and will be spared for many years to accept our affection for him and to share our friendship.

Since our last annual general meeting, the Hon. Ross Campbell Geddes has accepted a seat on the board. His experience and energy are already proving of great value and we extend to him a very cordial welcome.

It is appropriate at this stage also to extend a welcome to Mr M. G. Talbot Rice, F.C.A., who has joined our London board during the past year, and to Mr Halford W. L. Reddish, F.C.A., who has transferred from our local board in Birmingham to our London board.

Before I deal with the underwriting results, I should like to remind you that, a year ago, we made certain alterations in the form of our accounts to comply with the requirements of the Companies Act, 1948. These changes made it virtually impossible, in all the circumstances, to publish comparative figures for the previous year.

You will have seen from the report and accounts for 1949 that comparative figures have been supplied and that the comparison shows a substantial growth in the company's business during the past year.

DOLLAR INTERESTS

While it is the case that the company has continued to show satisfactory development, the devaluation of the £ has had a substantial effect upon certain of our published figures.

Our North American assets and liabilities were especially affected and we do a substantial volume of business in that part of the world. Following the devaluation of the £ in September last, we have thought it right to convert in our accounts at the new official rates of U.S.A $2.80 to the £, and Canada $3.08 to the £:—

(*a*) the figures of the Holding Company's United States and Canadian branches and United States subsidiaries;

and

(*b*) Assets (including investments) and liabilities in these currencies.

The net surplus arising from the revaluation at the new rates of exchange of the above assets and liabilities has been added to the reserves of the company.

I think it advisable at this stage to say that the value of year-to-year comparisons of figures may be somewhat misleading when they relate to a world-wide organisation like ours which is doing business in a great variety of different currencies at a time in world history when fluctuations in currency values and interference with the free movement of money have probably never been more complicated.

MERGER OF U.S.A. SUBSIDIARIES

In the course of last year we initiated plans for the merging of one of our U.S.A. subsidiary companies, the Central Union Insurance Company of New Jersey, into our other U.S.A. subsidiary company, the American Union Insurance Company of New York. This merger has now been completed so that all the business of our previous two American subsidiaries is now taken under the wing of the "American Union" which now remains our sole subsidiary in the U.S.A.

The main purpose of this merger was to strengthen the policyholders' surplus position and thus open up the way for the acceptance of an increased volume of business in the U.S.A. Without going into detail I would explain that the magnitude of insurances normally placed with companies in the U.S.A. is largely conditioned by the surplus funds available for the protection of the policyholders. The "Central Union" was rather too small a company to show sufficiently substantial surplus funds by itself and by merging it with the "American Union" we have placed the latter company in a very strong position in the matter of policyholders' surplus. We also expect to achieve some economy in operating only one instead of two subsidiaries. I have noticed that certain other British companies have completed, or are in process of completing, similar mergers of some of their United States subsidiaries and I feel sure that the effect will be beneficial to the insuring public in North America, to the British companies concerned and also to the dollar position of this country.

I should like to say here how much we appreciate the great assistance in completing the merger which we received from the directors of the United States subsidiary companies and from our officials and other advisers in the U.S.A.

LIFE DEPARTMENT

Turning now to the accounts themselves, you will notice that in the life assurance and annuity account the premiums have increased from £974,733 in 1948 to £985,476 in 1949. The considerations for annuities increased from £269,242 to £420,288. At the end of the year the life assurance and annuity fund stood at £14,150,714 compared with £13,599,525 at the end of 1948.

Notwithstanding these satisfactory results, it is a little disappointing that the total of new sums assured (after deducting reassurances) was £2,845,294 compared with £2,889,462 in 1948. Of these amounts the sum of £789,233 in 1948 and £961,524 in 1949 represented business under group assurance schemes. Consequently, although our group business increased substantially, the new sums assured under ordinary life and endowment policies showed a reduction of £216,459. To some extent the uncertainty of political and economic conditions may have contributed to this position, but you may rest assured that methods of improving our own service and sales organisation are under constant review. Life assurance constitutes such an invaluable protection coupled with such a great incentive towards thrift that, at the present time, it becomes a national, as well as a company, duty to take all possible steps to encourage the maintenance of saving through some form of life assurance or endowment cover.

FIRE DEPARTMENT

The premium income of the Fire Department reached a total of £3,981,428, showing an increase of £1,021,674 on the 1948 figures. This, however, is not a fair comparison, as part of the increase in revenue is attributable, following devaluation of the £ in September last, to conversion of our U.S.A. and Canadian dollar figures at the new official rates as I have already mentioned. Against this, however, must be set the factor that the figures are for the financial year ending December 31, 1949, whereas for 1948 they included certain overseas and treaty business covering a period of fifteen months (which was due to a change in the accountancy requirements for that year). After making allowances for these special circumstances, I am pleased to report that a steady expansion of the business of the Fire Department has continued during the year, both at home and abroad.

The claims experience shows an overall improvement compared with 1948, the loss ratio for 1949 being 42.3 per cent., compared with 47.9 per cent. in 1948, notwithstanding that the total fire wastage in Great Britain and Eire reached a new high level in 1949.

In the U.S.A. there was a substantial decline in fire losses last year and our loss ratio showed a very pleasing improvement. In Canada the claims experience still runs high and with an increased premium income requiring additional provision for unexpired risks, the underwriting results were again unfavourable.

In the rest of the overseas field, further development has been made, and the premium income has continued to expand. The results on the whole were very favourable on account of the spread of business, and, although the loss experience in some countries was not good, progress has been made on sound lines.

The trading surplus of the department for the year amounted to £461,513, and after making our usual provision of 50 per cent. for unexpired risks, the sum of £319,390 has been transferred to the profit and loss account. The fire fund now amounts to £3,590,714, as against £2,543,979 last year, and is 90.18 per cent. of the premium income.

ACCIDENT DEPARTMENT

The net premium income in the Accident Department shows a reduction from £908,383 in 1948 to £855,019 in 1949. At first sight this appears to represent an unfavourable trend. It must be explained, however, that, as in the case of the Fire Department, a certain amount of the 1948 premiums represented the results of 15 months' business and this is being compared with the figures for only 12 months in 1949. The premiums for 1949 are, in fact, more than the 12 months' premiums in 1948.

Moreover, the loss of workmen's compensation business, the effect of which began on July 5, 1948, only became fully evident in our figures for the year 1949. There is, however, another important factor which has contributed to the drop in premiums during the past twelve months. I mentioned at the annual general meeting a year ago that the claims experience on certain overseas motor business was proving unusually high. Well, after a fair and reasonable trial we came to the conclusion that, in some parts of the world, the steps which we knew to be necessary for the proper handling of the business in the interests of all parties, were unlikely to be applied. We therefore substantially reduced our commitments and, although a considerable reduction in premiums was inevitable, I am glad to say that the loss ratio has already shown a marked improvement. In other sections of the department our account has shown satisfactory development.

The trading surplus of the Accident Department for the year 1949 was £80,622 and, after making our usual provision of 50 per cent. for unexpired risks the sum of £74,283 has been transferred to the profit and loss account.

MARINE DEPARTMENT

As you know, our marine business is mainly handled by our associated company, the "Maritime" of Liverpool. It is pleasing to be able to show that the premiums in the marine account (which includes aviation and transit insurance) have increased when compared with the figures for 1948. Admittedly the increase is only a small one of £13,086, but when we take into account the recent substantial reductions in cargo rates it is encouraging to find that our total premium income has been more than maintained.

Most important, however, is the fact that the general experience of our marine business has continued to run well and a profit in respect of 1947 and prior years amounting to £150,000 has been transferred to the profit and loss account.

You may wonder why the transfer is for 1947 and prior years. The reason is this. Many insurance risks take 2, 3 or even more years to settle completely. We consider it imprudent therefore to asume any profit out of 1948 and 1949 until the claims which arose in those years have wholly run off.

I must point out that we have felt it wise to transfer from the profit and loss account the sum of £60,000 which represents part of the surplus in our exchange account. The reason for this is that we have substantial interests under the marine account in the hard currency areas and we must anticipate that we shall doubtless yet have to meet losses or pay repair costs in dollars which have appreciated in terms of sterling since the time when the risks were accepted and the premiums collected. The marine fund, which now stands at the total figure of £1,685,762, is considered fully adequate to take care of such contingencies, representing as it does 128.2 per cent. of the premiums.

INVESTMENT DEPARTMENT

From the investment angle the strain on sterling was a notable factor during the year. This resulted in both a serious fall in the values of home stock exchange securities and the devaluation of the £. As previously indicated, the income from our investments in the U.S.A. is naturally enhanced in terms of sterling.

Market values in the United States were higher at the end of 1949 than they were twelve months earlier. The fall in the market values of British securities, however, has reduced our margin of market values over book values, but that margin is, I am glad to say, still considerable.

Our national economy, although making progress in production and, since devaluation particularly, in reducing the various "gaps," is overburdened by continued excessive government expenditure and by the deadening effect of crushing taxation. In consequence, in investment matters a sense of insecurity has been produced. The gross rate of interest earned by the company for the year was £4 5s. per cent. compared with £4 4s. 4d. per cent. in 1948. The upward tendency, though slight, is encouraging, particularly as we have adopted a more conservative basis in arriving at the amount of our accrued interest at the end of the year

OVERSEAS VISITS

During the year since our previous annual general meeting a number of overseas visits have been carried out by members of the head office and London boards. At varying times, Mr Charles Younger, Mr Cowan-Douglas and Mr Mounsey have had occasion to visit South Africa and have taken the opportunity of calling upon many of the company's representatives and other connections and have brought back much useful information. Sir Lionel Fletcher, of the London board, in the course of an extensive tour of South and East Africa on behalf of other business interests with which he is connected also visited branches and agencies of the company, and reported fully upon local conditions and the company's business. Similarly, Mr Geddes has just returned from a visit to the U.S.A. and Canada, where he called upon certain of our connections in North America while he was there. I myself during a holiday last year was able to call upon certain of our representatives in France.

Overseas visits by members of the staff included a tour of the British and French West Indies and Cuba by Mr Hovell, the overseas fire superintendent, who also visited Belgium, Holland and Denmark. Mr Waggett, our European inspector, visited Portugal, France, Algeria and French Morocco. Mr Ashe, our Far Eastern manager, who we withdrew from Shanghai after deciding to terminate business in China, is at present visiting our connections in the Mediterranean and Near East areas and Mr Anstey, the London manager, is at present engaged on a visit to East Africa, the Rhodesias and South Africa.

Representatives of our associated company, the "Maritime," and other members of our own staff have also carried out overseas visits with the object of strengthening our ties abroad and helping the development of both old and new connections.

I am convinced that these overseas visits are of great value in keeping us in head office and in London in close and informed touch with our overseas officials, agents and representatives on whom the prosperity of the company to such a large extent depends.

OFFICIAL CHANGES

In the course of the year Mr T. E. Stevens, the general manager, intimated his wish to retire after having served over 44 years in the insurance business. With great regret the directors agree to accede to his request and Mr Stevens retired on pension at the end of the year, taking with him the good wishes of us all and our grateful thanks for his most valuable services to the company as general manager through a period which included the whole of the difficult war years and their equally difficult aftermath.

To succeed Mr Stevens the directors appointed Mr N. J. Johnston, the London manager, who has almost completed 30 years of service with the company, including 10 years as fire manager at head office. Mr Johnston, I have no hesitation in saying, already has, partly owing to visits in past years to our organisation in the States, Canada, Australia, and Africa, and for other reasons, a remarkable knowledge of your company's affairs and I feel that in his capable hands the company will be well served.

Mr B. A. Anstey, assistant London manager and formerly Eastern manager, was appointed London manager, Mr J. H. Holmes, the fire manager, was appointed assistant London manager and Mr G. B. Kerr, the assistant fire manager, was appointed fire manager. Several members of the home staff were appointed to overseas posts to cope with the continuing development of our overseas business.

NATIONALISATON

In the course of my remarks at the annual general meeting a year ago I made reference to the proposals to nationalise Industrial Assurance. I made it clear that, in my opinion, although the threat of nationalisation was not then directed against companies like our own, that threat did constitute a potential danger to the whole insurance industry and also to the valuable invisible exports which that industry provides to the great financial benefit of the country.

Since then we have seen the understandable word "nationalisation" replaced by the sinisterly obscure word "mutualisation" and we have seen a general election and a modification in the balance of political power. Little is heard at the moment of these schemes affecting the Insurance industry but it would be too much to hope that they have been forgotten. I feel, therefore, that it behoves us to continue, by every means and at every available opportunity, to educate the public concerning the true value to the economy of this country of the Insurance industry, as at present constituted.

We provide the equivalent of a vast export business which does not require the import of raw materials nor the provision of valuable shipping space. For our services, and the security we are able to provide, we bring a very large income to this country, much of which is in currencies which are vital to the well-being of every resident in these islands.

In addition, here at home, we provide, through Life Assurance, a highly competitive incentive towards thrift. In so doing we are able to provide from the funds, which we are safeguarding in trust for our policyholders, capital for purposes essential to the life of the nation. Any political interference with this highly complex, highly skilled industry could not fail to have repercussions detrimental both to the industry and to the nation.

STAFF WIDOWS' FUND ("MARITIME")

You will notice from the profit and loss account that there is an item in respect of reserve for Maritime Insurance Company's staff widows' annuity fund. The parent company has already a trusteed fund for staff widows and the "Maritime" is now proposing to introduce a similar arrangement in regard to its own staff. As a preliminary step the "Maritime" has this year transferred £25,000 to a reserve for this purpose.

STAFF PENSION FUND ("SCOTTISH UNION AND NATIONAL")

The notice convening this meeting seeks your approval to the constitution of a trusteed staff pension fund for the "Scottish Union and National." At present, pensions to staff are paid, at the pleasure of the directors, out of the annual income of the company.

The higher rates of salaries which economic conditions have made virtually essential for the rank and file of the staff make it inevitable that the cost of staff pensions will rise steeply in the near future. For this reason it appears highly desirable that steps should be taken immediately towards the constitution of a trusteed staff pension fund. Not only will this enable a certain amount of our future liabilities to be discounted by present contributions but also the formation of a fund of this kind accords

with the practice of other companies and it gives an additional sense of security to members of the staff.

I hope, therefore, that you will agree to the constitution of a trusteed staff pension fund and also to the proposed transfer this year of the sum of £50,000 to a reserve for such a fund.

I have visited several of our branches and sub-branches during the year. Other members of the board, as I stated, have been in several countries overseas and I feel that we can congratulate ourselves on the quality and loyalty of our officials and staff both at home and overseas. I pay tribute to them for their devoted service to the company during the past year. I also wish to thank all members of our local boards and agents, in this country and overseas, who have continued to give us their most valuable support.

The report and accounts were approved.

ANGLO-NEWFOUNDLAND DEVELOPMENT

EFFECTS OF ECONOMIC DISORDERS

MR ELLIOTT M. LITTLE ON THE OUTLOOK

The ordinary general meeting of Anglo-Newfoundland Development Company Limited was held on May 31st at the offices of the company, Grand Falls, Province of Newfoundland.

Mr Elliott M. Little, the president, was in the chair.

The following is an extract from his circulated statement:—

The year covered by the accounts before you was one of fluctuating fortune for the industries in which the group is interested, and reflected the sensitivity of markets to world events. The close of the first quarter saw the beginning of a severe fall in base-metal prices. Half way through the year the market for unbleached sulphite virtually collapsed, and this was followed by indications of a weakening of the newsprint market.

The year ended on a firmer note. Metal prices had recovered some losses, sulphite manufacture was economically worth while again, and the growing demand for newsprint in the United States had offset the loss of non-dollar markets, while the devaluation of the Canadian dollar in terms of United States currency ensured a better return from that market.

The parent company's profit of $3,611,548 fell short of the previous year's figure by $347,067.

The exchange difficulties of our customers outside the dollar area persisted and as the markets fell away more newsprint was made available to the United States. Towards the close of the third quarter of the year it appeared that the United States market was approaching saturation point and orders were difficult to secure.

The turn of the year saw a marked improvement when an upsurge of demand in the United States enabled our mill to resume its normal programme of six working days a week. The increased consumption in the United States market and the latent demand in non-dollar areas give a reasonable prospect for the maintenance of a normal rate of production in the immediate future.

GASPESIA SULPHITE COMPANY, LIMITED

A serious weakening in demand for unbleached sulphite developed in mid-year and was accompanied by falls in the United States market price. The reduced demand was partly brought about by inventory reductions on the part of pulp buyers but more largely due to the fall in the rate of operations of American paper mills. This company was particularly vulnerable as it is the only unit in Canada whose sole product is unbleached sulphite.

The effects of reduced production, together with lower sales and market values, resulted in a deficit of $195,274. When the United States dollar moved to a 10 per cent. premium over the Canadian dollar, the situation improved and towards the close of the year there was also evidence of a firming in demand and price.

TERRA NOVA PROPERTIES, LIMITED—BUCHANS MINE

The swift descent of base-metal prices which started in the spring of 1949 and continued into the summer was halted around mid-year and some recoveries were made in the following months. The year ended on an optimistic note.

As a result of lower market prices the net income was considerably lower than the high level achieved in 1948, notwithstanding that the quantity of ore milled, 334,000 tons, was 15,000 in excess of the previous year.

In February, 1950, a new ore-body was intersected which looks promising, but further investigation will be required before a firm statement can be made.

Excellent progress was made on the Rothermere shaft, which project was outlined to you in my last report. Development work to open up the new orebodies is scheduled to commence in June, 1950.

ANGLO-NEWFOUNDLAND STEAMSHIP COMPANY LIMITED

This subsidiary company owned and operated steamships which carried our products to the United Kingdom. The three steamships owned at the outbreak of war were sunk by enemy action. Under the provisions of the United Kingdom Government Tonnage Replacement Agreement a sum of £255,700, plus interest, was held to the credit of the company and payment was contingent upon replacement of the vessels by September, 1952. It was decided that shipbuilding or the acquisition of steamships was not warranted or likely to be for some years to come. An assignment of the credits held under the scheme was negotiated and the company received £265,700 as the proceeds of the sale. These proceeds were converted to Canadian dollars and bring the company's cash resources up to $2,237,051.

MONTMORENCY COMPANY LIMITED MONTMORENCY SHIPPING INCORPORATED

I mentioned in my statement last year that steps were to be taken to liquidate two of our shipping companies and the above companies were duly wound up during the first quarter of the year.

MONTMORENCY SHIPPING LIMITED

This company was incorporated on February 17, 1949, under the Dominion Companies Act. Its purpose is to charter suitable vessels as required for the freighting of the parent company's products to North and South American markets. The profit earned for the period has been carried forward in the books of this company.

An examination of the consolidated profit and loss account discloses the full effect of the impact of economic disorders upon our affairs. The group profit carried to surplus amounted to $2,868,585 which is a little under a half of the amount earned the previous year. The recovery in market conditions arrived too late to reverse the unfavourable trend of earnings which had developed, but 1950 was entered with all signs pointing to a trading era with a reasonable level of earnings to reward our enterprise and industry.

The report was adopted.

THE CAPE ASBESTOS COMPANY, LIMITED

INCREASED FINANCIAL STRENGTH OF THE GROUP

At the fifty-seventh ordinary meeting on May 31st the chairman, Mr Robert Walker, M.B.E., said in the course of his speech:—

The combined net trading profit of the group amounted to £708,137, compared with £527,423 in 1948. After allowing for certain small credits and charging depreciation and expenditure under specified headings, a total of £530,521 is carried to the appropriation accounts of the various companies of the group. Adding the sum of £287,843 brought forward from 1948, and £28,305, being provision for taxation which is no longer required, the amount available for appropriation is £846,669, from which it is necessary to set aside £177,577 for taxation. Of the balance, £56,614 has been placed to reserves. The dividend requires £50,651, leaving a balance of £561,827 to be carried forward in the books of the constituent companies of the group.

The consolidated balance sheet shows evidence of the expansion that has taken place during the year, and of the strength of the group's position. Fixed assets have increased by £279,112 to £2,145,608, while current assets, it will be seen, exceed current liabilities and provisions by £1,000,825.

Our own company's accounts show a reduced profit at £140,617 compared with £194,763 in 1948. Many factors contribute to this. I may say that in our trading in this country we have experienced growing competition for certain of our products. This is a healthy sign, and while it involves an obligation to devote increased expenditure to both technical and market research, we are ready and indeed anxious to do business in a world where service and high quality count. It is these conditions which, when they apply more universally to goods of all kinds, will do much to stem inflation and restore a sense of realism to our commercial life. Moreover, the cost of wages and materials has continued to rise, while we have found considerable difficulty in the sale of our high quality Pluto Board.

Adding the balance brought forward from 1948, £125,820, and over-provision for taxation in earlier years now no longer required, £26,087, there is £292,524 for disposal. Taxation absorbs £67,500, and £35,000 is placed to reserves. Dividends, including the final dividend now recommended, will require £50,651, leaving £139,373 to be carried forward to 1950. In the balance sheet the reorganisation of the share capital during 1949 shows in the new figure of £502,320, while you will see that reserves and surplus together amount to £1,458,539. Among the assets you will observe that the leasehold properties and buildings have increased by £104,920, which represents the acquisition of new headquarters for your company in Park Street, W.1. Current assets, although slightly reduced at £856,142, are £225,916 in excess of current liabilities which have increased to £630,226, principally due to an increase in the internal indebtedness to subsidiary companies.

After describing the activities of the company's factories and subsidiaries, Mr Walker announced the new capital proposals, dividing the ordinary capital into shares of 5s., distributing 1,339,520 of these to the shareholders, and offering the same number for subscription by them. The scheme, if approved, would provide the company with sufficient working capital for its present needs. The effect of these transactions would be to increase the company's issued ordinary capital to £1,004,640 with reserves substantially exceeding this figure. The appointment of Lord Elton and Mr George Courtauld as directors was confirmed.

THE UNION BANK OF SCOTLAND, LIMITED

INCREASED BALANCE SHEET FIGURES

SUBSTANTIAL INCREASE IN ADVANCES

LORD BILSLAND'S REVIEW

The annual meeting of shareholders of the Union Bank of Scotland, Limited, was held on Wednesday, May 24th, The Rt. Hon. Lord Bilsland, M.C., D.L., LL.D., chairman of the board, in the chair.

The chairman, in submitting the directors' report, said:—

My first duty today is to refer with deep regret to the recent death of Mr. Arthur Gairdner, and of Sir Alexander Walker.

Mr. Gairdner was associated with the bank for a long period of years and he splendidly maintained the high traditions of his family in the service of the bank. He was general manager from 1910 until 1919 and he conducted the affairs of the bank with great ability throughout a period of unprecedented difficulty. He remained a member of the board until his retirement in 1938. We pay tribute today to his distinguished service to the bank.

Sir Alexander Walker, who was an extraordinary director of the bank, was a man of great force of character and individuality, and a most generous benefactor to educational and other causes. We greatly appreciated his deep interest in the bank, and we recall today his great services to the country in the first world war.

A BICENTENARY

During the year the bank celebrated a notable event in the long history of its development—the bicentenary of the foundation of one of its constituents, the Ship Bank. The high traditions of the Ship Bank which played a notable part in the early days of Scottish banking are honoured in the Ship which remains the crest of the Union Bank of Scotland, Limited.

I have pleasure in submitting the report and accounts for the year ended April 1, 1950, which, with your permission, I propose to hold as read.

BALANCE SHEET FIGURES

The balance sheet which we present today shows a total of £84,157,000 which compares with £82,440,000 last year, an increase of £1,717,000. Deposits at £70,388,000 show a moderate increase of £667,000, and notes in circulation are £280,000 higher at £7,220,000. During part of the year our deposits attained higher figures than are shown at the date of the balance sheet.

On the assets side, cash, money at call and short notice, Treasury Bills and Treasury deposit receipts, amount in all to £21,700,000 which represents 28 per cent. of the bank's liability in respect of deposits and notes in circulation. For a number of years the country's floating debt has been financed to a large extent by the issue of Treasury deposit receipts to the Joint Stock banks. During the past year, however, the Treasury appear to have decided that the floating debt should rest more substantially on the broader basis of the Treasury bill. Between March, 1949, and March, 1950, Treasury deposit receipts were reduced from £1,135 million to £465 million, and from the point of view of the flexibility of the banking system the change is to be welcomed. Our holding of Treasury deposit receipts, which in 1947 amounted to £6,500,000, approximately 10 per cent. of our deposits now stands at £1,500,000, or [illegible] per cent. of deposits, a reduction of £3,000,000 since last year, due largely to the change in the Treasury method of finance.

British Government securities at £37,518,000 are £1,505,000 lower than last year. We are glad to report that, despite the sharp fall in the prices of gilt-edged securities, the market value of our investments is, in the aggregate, in excess of the amount at which they appear in the balance sheet.

LOANS AND ADVANCES

The most noteworthy feature in our balance sheet is the increase in loans and advances, which at £19,060,000 are £4,835,000 higher than last year. The high level of prices, the heavy burden of taxation, and the scaling down of the financing of trading commitments by the Government to which I have referred in previous years, have made a substantial increase in advances inevitable. The country's present economic stringency, however, makes it imperative that advances by the banks should be confined to providing finance for strictly productive purposes, and that facilities should not be granted for speculative buying of securities or commodities.

The costs of administration and the incidence of taxation continue to be heavy, but these have been offset by the earnings from the increased advances to which I have referred, and the profit for the year of £246,200, which is arrived at after making provision for every known liability or contingency, represents an increase of nearly £4,000. It has been thought advisable to set aside £80,000 as a reserve for contingencies and the usual allocation of £40,000 has been made in respect of our liability for pensions and allowances. After giving effect to these allocations and providing for the dividend of 18 per cent. recommended by the board, the carry-forward will amount to £172,500, an increase of over £7,000 on the previous year's figure.

A YEAR OF ECONOMIC CRISIS

The year 1949 was a year of economic crisis—the most serious in a succession of crises since the war. In the third quarter of the year a marked deterioration took place in the position of our balance of payments which led to devaluation of the pound sterling in September of that year. The extent to which we have been living since the war on the proceeds of gifts and loans from the United States and Canada has never been adequately understood by the mass of the people in this country, but the crisis which was reached in September brought us face to face with the reality of our position.

From the beginning of 1947 to the date of devaluation the gold and dollar deficit of the whole sterling area reached the very large total of $7,325 million. This has been met by American and Canadian credits and Marshall Aid to the extent of $5,350 million, by the International Monetary Fund to the extent of $725 million, and, as regards the balance, from our gold and exchange reserves.

CONSEQUENCE OF DEVALUATION

The only alternative to devaluation last September was an immediate and very severe reduction in our standard of living. The consequence of devaluation was to reduce the selling price of many of our exports and so apparently to enable us to compete more effectively in dollar markets. But there were other consequences. To earn dollars at the same volume as before devaluation it became necessary to increase the volume of exports *pro rata* to the extent of devaluation, and therefore to earn more dollars than before devaluation it became essential to achieve a very marked increase in our dollar earning capacity. Furthermore, devaluation also raised the prices of many essential imports which to some extent offset the advantage of devaluation gained for some of our principal dollar exports. Finally, it tended to raise the cost of living in this country and so affect adversely our general level of costs.

Devaluation, forced on us by the weight of adverse circumstances, provided not a cure for our difficulties but introduced a breathing space in which to restore our position. The time available to us is short—a period of two years during which we hope, but cannot be assured, that Marshall Aid will continue. The task is indeed a heavy one.

The economic survey for the United Kingdom for 1950 indicates that a substantial increase in the volume of exports should take place this year, but the improvement in our balance of payments is expected to arise mainly from a reduction in our dollar imports. The total volume of exports for the first quarter of 1950 is not yet known, but it is anticipated that it will show an increase of about 10 per cent. over the corresponding period last year.

NEED FOR INCREASED PRODUCTIVITY

It is clear that unprecedented efforts must be made to increase productivity in this country in order to achieve the much larger volume of export trade required, without sacrificing the position in our old markets, and that every effort must be made to produce more goods suitable to the dollar markets at prices they are prepared to pay. We may take encouragement from the fact that there is undoubtedly a more receptive attitude in America today towards the import of British, and particularly Scottish, goods of the type and at the price required than at any time in the past.

Strenuous efforts are being made by the Dollar Exports Board in this country, in association with the Chambers of Commerce, the F.B.I. and other bodies, to raise the volume of exports to the dollar markets and it is to be hoped that these efforts will have a full response from British industry.

A valuable series of pamphlets has been produced by that board which give most useful information and advice on the prosecution of export trade. Action on similar lines is being taken by the Canadian dollar Sterling Trade Board, acting in close co-operation with the Dollar Exports Board, and the Economic Co-operation Administration is also rendering valuable service in facilitating visits to America by teams representing British industry and in other ways. In this field in Scotland the Scottish Council has recently produced and circulated to Scottish industry a pamphlet based on the information obtained by representatives of the Council who studied the opportunities in the American and Canadian markets last autumn. Useful as all these aids undoubtedly are, it is most desirable that our manufacturers should visit North America to study the requirements of the particular market they desire to enter.

DEMAND FOR BRITISH GOODS

The demand for British goods in the sterling area remains at a reasonably high level, but it is bound up with the difficulty of unrequited exports. A considerable proportion of our exports to the sterling area constitutes exports of new capital and the repayment of past indebtedness, bringing in no imports in return. It is to be hoped that it may be

ound possible to effect a permanent settlement of the problem of sterling balances.

The difficulties of the present period have been aggravated by the change from sellers' to buyers' market conditions, and the outlook is affected both by the re-entry of German and Japanese competition and by the darkening international scene. It is to be hoped that the recent conference of Foreign Secretaries held in this country may result in closer co-operation and understanding and in the strengthening of the forces resisting aggression.

THE RECENT BUDGET

The outstanding feature of the Budget, opened by the Chancellor of the Exchequer on April 18th, was its failure to face the fact that our national expenditure, including the cost of Government, is far in excess of what the industry of the country should be asked to support. One cannot regard without grave concern the rigidity of our commitments, at a very high level, in face of revenue which is already beginning to fall. The current rate of taxation, which absorbs 40 per cent. of the national income, not only seriously affects costs of production, but deprives industry of the means of re-equipment formerly found to a much greater extent from profits re-employed in the business, and, most vitally, removes incentive from management and workers alike.

The principle of maintaining our social services at the highest standard we can afford is generally accepted, but they can be sustained only by a healthy economy. Retrenchment is always difficult, but the ultimate effects of expenditure beyond our capacity will inevitably be more painful. There appears to be a lack of appreciation on the part of the Government of the seriousness of our situation and of the leadership necessary to rectify it.

EMPLOYMENT IN SCOTLAND

Employment in Scotland has been maintained throughout the year at a level similar to that of last year and the short-term outlook continues favourable. The relative position in Scotland has shown continued improvement during the past year. As was to be expected, the growth of new industry has proceeded at a slower rate, but it can be said that gratifying progress has been made in the consolidation of the gains that have been made. In the autumn of last year the Scottish Industries Exhibition, opened by Her Majesty The Queen, proved most successful in creating new contacts at home and overseas and in the volume of business transacted. It was a notable feature of the exhibition that one-third of the exhibitors had commenced business within the past ten years, which is a reflection of the growth of new enterprise in Scotland since the end of the war.

The recent increase in rail freight charges of 16.2-3rds per cent. adds a serious burden to industry which is bound to be reflected in costs of production throughout. This increase will have a particularly serious effect on Scottish industry, including the new industries which are still at a developing stage. The products of Scottish industry, and many agricultural products are to a very considerable extent sold in England and abroad. Therefore, the effect of a flat percentage increase of all rail freight rates will impose a heavier burden on Scotland than on other parts of the country. It is impossible to feel satisfied that more could not be done to improve the position of the railways by internal reorganisation, and so lessen the burden upon industry.

THANKS TO MANAGEMENT AND STAFF

It is now my pleasant duty to express our very sincere thanks to the general manager, all our officials, and the branch managers and staff in Scotland and London for the very fine service they have given to the bank during the past year. We particularly appreciate the manner in which Mr John A. Morrison, the general manager, has conducted our affairs.

I now beg to move that the report and accounts of the bank for the year ended April 1, 1950, be approved, and that a dividend of 18 per cent. per annum be declared payable, less income tax, in equal proportions on June 10 and December 9 next.

Mr James B. Findlay, D.L., seconded the motion, which was approved.

Sir Samuel R. Beale, K.B.E., and Sir Hugh Rose, Bt., T.D., were re-elected ordinary directors of the bank.

The retiring auditors, Sir Ian F. C. Bolton, Bt., O.B.E., C.A., and Mr Francis G. More, C.A., were reappointed in terms of the Companies Act, 1948.

The thanks of the meeting were tendered to Lord Bilsland for his services in the chair.

DAILY NEWS LIMITED

GALLUP POLL AND THE GENERAL ELECTION

MR L. J. CADBURY ON NEWSPRINT SHORTAGE

The annual general meeting of the Daily News, Limited (proprietors of the News Chronicle and The Star), was held on May 25th at 12-22, Bouverie Street, London, E.C., Mr L. J. Cadbury, chairman of the company, presiding. The chairman, in the course of his speech, said :—

The supply of newsprint still remains our major preoccupation and the hope of returning to anything approaching prewar size, has steadily receded. The dollar position led a few weeks ago to a situation in which the Government told us that we must forgo any imports from Canada in the second half of this year. I am glad to say that, after strenuous representations to the Board of Trade, wiser counsels have prevailed; The Newsprint Supply Company, Limited, is to be allowed to import 25,000 tons in the second half of the year if the Canadian mills can supply it. This is important. It keeps that company's contract with the Dominion in being and with it the "escalator" clause. The latter means that the Newsprint Supply Company can step up its demands for Canadian newsprint by 50,000 tons each year, subject, of course, always to agreement from the exchange control authorities.

We are to some extent victims of the export drive. With increasing restriction on imported newsprint we have to rely more than ever on the production of British mills, but simultaneously they are being encouraged to devote a higher proportion of their output to export. Far, therefore, from securing a progressive increase in the size of British newspapers, we are due to fall back to six pages in July, and have none too certain hopes of returning to larger sizes in the autumn.

No industry in this country has been so severely hamstrung over the supply and guarantee of its essential raw material as the newspaper industry.

In contrast to the periodical press which has recently been freed of controls, it is still regulated on a hand-to-mouth basis, unable to forecast its future needs for more than a few months ahead, and even then with a sword of Damocles above its head threatening further curtailment in size.

Such a situation would be regarded as intolerable in any other major industry where planned production is essential to efficiency and economy.

One cannot help feeling that in allowing the present situation to continue with no immediate hope of relief the Government not only gravely underestimates the value of the service rendered to the nation by the press, but also fails manifestly to apply its own principle of planning ahead.

COMPETITION IN THE INDUSTRY

At our last annual meeting the return of competition was recorded. From January 3, 1949, newspapers could print as many copies as they could sell, though the size of papers remained (and still remains) under control, and many of the undesirable old competitive practices continue in abeyance. To economise newsprint, prohibition of the prewar habit of accepting the return of unsold copies has not been lifted. This is a salutary check on overprinting and thus wasting an undue number of copies that are not going to be sold or read.

Until February this year there was a complete ban on the use of contents bills. This form of competitive publicity requires a great deal of paper and is not practised by newspapers anywhere else in the world. Under present restricted supplies of newsprint it would clearly be a great mistake to allow their revival. Some modification of the "no contents bill" rule has been allowed since the general election, when "stock bills" were permitted—that is, those which did not advertise the day-to-day contents of the papers. It is to be hoped that there will be no further relaxation of this control, at least until paper becomes cheaper and more abundant.

The canvassing and gift schemes that were widespread in the scramble for sales before the war were dropped when it began. Their cancellation was confirmed early in 1940 by a definite Newspaper Proprietors' Association agreement that still remains in force. There is, in addition, an understanding that the big prewar money prizes should not be reintroduced. These bans are common sense and should continue.

NEWS CHRONICLE

During the general election the News Chronicle used its extra newsprint to provide a forum for all the political parties. The paper gave its readers an opportunity of hearing the views of a number of Cabinet Ministers and the chief front bench figures of the Opposition. In its editorial columns it maintained its independence while giving general support to Liberal ideals. This attitude of impartiality and independence was greatly appreciated by the public. The News Chronicle has proved that there is a large popular readership anxious for intelligent discussion of the major topics of the hour. To present the battle of ideas in a simple and attractive way is one of the chief aims of the paper.

Another notable News Chronicle feature during the campaign was the Gallup Poll. It was used to test the movement of political opinion at frequent intervals during the election. The graph charting the popularity of the main parties was followed with intense interest by the public at large and particularly by active workers of all political shades.

The final poll showed figures that were remarkably close to the actual election results :—

Parties	Final Poll Per cent.	Election Per cent.
Labour	45·0	46·1
Conservatives ...	43·5	43·3
Liberal	10·5	9·2
Others	1·0	1·4

During 1949 an interesting book was published entitled "The Press and its Readers." It is a report by mass observation for the advertising service guild. In commenting on the country's press it has some illuminating things to say about the News Chronicle. Of all the national daily Press the News Chronicle shows the highest percentage of space given to news, and of the penny nationals the highest percentage given to politics and foreign affairs. It is not perhaps surprising, therefore, that its readers appear to be among the best informed. For instance, on a poll by mass observation on the government then in power in Yugoslavia, the readers of the News Chronicle head the list.

THE STAR

The Star during the past year has continued to gain in circulation, prestige and influence. It has the second largest evening net sale in the world and its percentage of increase continues to exceed that of its competitors. Particularly gratifying is the growth of readership of its late editions not only throughout the suburbs, the city and the west end of London but also in every circle of life in the home counties. Owing to its bright layout and human interest it is immensely popular with women.

PRESS COUNCIL

I referred at some length last year to the report of the Royal Commission on the Press and its recommendation that a press council should be created. In doing so, I enumerated the various bodies that already existed to deal with press affairs. The report of the Royal Commission has been debated by all of them, including the Newspaper Proprietors' Association, to which this company is affiliated, but no agreed conclusions have yet been reached. It must always be remembered that it is not easy to reconcile any scheme of regulation with that basic principle of freedom of the press to which all parties are pledged.

At their recent meeting at Bath, the National Union of Journalists decided to form an "Ethics and Code of Conduct Committee." This suggestion is in line with one of the duties proposed for the press council, and its development will be studied with interest by all in the industry.

On the production side, I hope we shall come into line with modern business practice and form a joint industrial council.

But without waiting for this development or for the creation of a press council there is no reason why we should not get ahead with one of the recommendations of the Royal Commission, which proposed that the council should *inter alia* "promote technical and other research."

There is little doubt that in newspaper production this country is less efficient in the use of manpower than other countries such as Canada, Sweden and the U.S.A. Encouraged by the Government many industries have sent joint employer and trade union productivity teams across the Atlantic. Such a team was sent out by the letterpress printing industry who, in the last few days, have issued an instructive report. I suggest that we should make similar investigations. As an industry we are neither subject to the test of foreign competition nor do we have to compete in the export market.

There is thus a danger that we may not be as progressive and efficient as we should be.

DIRECTORATE

Since the end of the year certain changes have taken place in the management of our subsidiary operating companies. Lord Layton has resigned from the chairmanship of News Chronicle, Limited, and the Star Newspaper Company, Limited. He is taking this step in order to be free to devote himself more fully to public duties. He will, however, remain a member of the board of the Daily News, Limited, which owns the two newspapers, and also one of the trustees who control their policy. I am taking Lord Layton's place as chairman, and Mr B. F. Crosfield is taking my place as vice-chairman. Simultaneously Mr F. H. Waters is joining both boards as an assistant managing director.

The report was adopted.

BURY FELT MANUFACTURING COMPANY, LIMITED

SATISFACTORY YEAR'S TRADING

LT.-COL. A. BUCKLEY'S STATEMENT

The forty-fifth annual general meeting of the Bury Felt Manufacturing Company, Limited, was held on May 31st at Manchester, Lt.-Col. A. Buckley, C.B.E., D.S.O., J.P., the chairman, presiding.

The following is his circulated statement:—

From the accounts which accompany this statement, members will see that the company has again conducted a satisfactory year's trading.

The gross trading profit of £250,212 is somewhat less than the record profit of £278,504 attained in the previous year; however, the net figure after charging depreciation of £21,835 (as against £21,220), is not materially different at £107,544, compared with £114,797 for 1948. Income tax and profits tax have absorbed £116,163, whilst there is brought to credit an over-provision for tax last year of £4,766.

At £87,932 there is a slight increase in the written-down figure at which premises, machinery, plant, etc., appears in the balance sheet. This is chiefly represented by expenditure on buildings, the outlay on new machinery having been almost covered by the depreciation charged in the accounts.

The increase in stock-in-trade is the result of the higher prices of wool following devaluation and does not represent a material increase in manufactured stocks.

Our holding of tax reserve certificates stands at £90,000, against £65,000 last year, and cash is reduced from £386,798 to £368,508.

ALLOCATION OF PROFITS

This year we have appropriated £40,000 (compared with £50,000) to general reserve. Contingencies and stock depreciation reserve was £44,016 at December 31, 1948, and from this figure £3,932 has been appropriated along with the existing reserve of £12,000, to provide the initial liability under the staff pension scheme. There are now no known liabilities against the contingencies reserve and £14,916 has been allocated from profit and loss account to bring this reserve up to £55,000; this will be a most useful stand-by in the event of a heavy fall in wool prices.

The initial allowances on capital expenditure for taxation purposes have been substantial and £5,000 is carried to reserve for allocation against future tax liabilities.

After these appropriations and provision for a dividend of 75 per cent. actual, less tax, on the ordinary shares for the year ended December 31, 1949 (the same dividend as was paid for last year), £133,143 is carried forward in the profit and loss account, against £123,708 brought in from 1948. The substantial taxation liability for the year is again practically three times the net amount distributed to shareholders.

The unsecured loan stock has been repaid during the year.

LEVEL OF WOOL PRICES

The predominant factor in the past year's trading has been the level of wool prices. After attaining a high level in February and March, 1949, there was an appreciable fall and it appeared for several months that a more satisfactory and stable basis had been reached. Devaluation completely changed these circumstances and a perpendicular rise occurred which, at the date of this report, is still continuing. We have been anxious to keep the prices of our products as stable as possible and some economies in overhead expenses have been made, but a further increase in direct labour costs has had to be met.

During the whole of the year our plants have been fully employed and improvements have been effected wherever practicable. Production and turnover during 1950 have been more than maintained and we are satisfactorily meeting the increased competition in the home and export markets which I mentioned in my statement last year.

I desire to again record my appreciation of the good work performed by the management and staff whose efforts during 1949 have enabled a satisfactory result to be placed before you.

The report and accounts were adopted.

JOHNSON AND PHILLIPS

DIVIDEND MAINTAINED

The forty-fifth annual general meeting of Johnson and Phillips, Limited, was held on May 25th in London.

Mr G. Leslie Wates, J.P. (chairman and joint managing director), said that they recommended the same rate of dividend as last year and it would be payable on the increased capital.

Last year he had expressed the opinion that the company's trading position for 1949 was at that time assured. The figures now presented showed that that view had proved to be correct. Today the story was very different. Their order book in practically all departments was very much lighter than then, with the result that delivery times were much shorter. As to cables, for nearly all sizes and types they could give immediate delivery. There had been a certain amount of redundancy of labour and the labour force in the factory was smaller than it was this time last year.

Their export trade over the whole of the company's operations had maintained approximately the same proportion of the total as in 1948—that was nearly 40 per cent., but the idea of self sufficiency was growing more and more throughout the world, and to many countries, where hitherto they had found valuable markets, it was becoming increasingly difficult to export due to quotas, import licensing, tariffs or indigenous manufacture.

There was a further factor which was rapidly becoming most important. It was the growing serious competition, particularly in India, Pakistan and the Middle East, from the factories of Japan and Italy, and there were signs of a resurgence of German competition.

The report was adopted.

SUNDAY PICTORIAL NEWSPAPERS (1920) LIMITED

The thirtieth annual general meeting was held on May 31, 1950. The chairman, Mr H. Guy Bartholomew, in the course of his remarks, said :—

The accounts disclose an increase in net profit of £19,500, after all charges and providing fully for taxation.

Provision has been made for ordinary dividends at the rate of 30 per cent. and it is proposed that similar amounts as last year be transferred to reserve for contingencies and reserve for pensions.

Our main source of income is derived from the sales of the *Sunday Pictorial*. The upward trend of circulation, evident last year, has continued and at the present time, the *Sunday Pictorial* has a net sale in excess of 5,000,000 copies weekly.

The high level of circulation contributes greatly to the value of the *Sunday Pictorial* as an advertising medium. As a result of the substantial rise in our sales, we have recently announced an increase in the rates to be charged for advertisements as from June 4th next. It is gratifying to know that the keen demand for advertisement space in the columns of the paper continues to be maintained.

Costs of production were, in the main, substantially greater than last year, due chiefly to the additional cost factor associated with the increase in the number of pages per issue.

Trade investments now include an interest in a well-known Australian newspaper company—the Argus & Australasian Limited. That company owns, amongst other publications, the daily newspaper known as the *Argus*, which is published in Melbourne, in the State of Victoria. I am confident that when the new machinery of the most modern design, at present being installed in the *Argus* building in Melbourne, is fully in operation, this addition to our investments will become a most remunerative one for your company.

Included also under the heading of trade investments is the interest we have in A. E. Reed & Company Limited, which company issued, during the year, further capital of which we took up our proportion of ordinary shares.

We assisted an associated company to find the finance necessary for it to acquire a long lease on premises in London. These will, in due course, be used as a printing establishment for its own purposes and will afford additional printing facilities for the *Sunday Pictorial*.

You will be interested to learn that Reveille Newspapers Limited—one of the newspaper interests acquired in recent years—has recently announced that the circulation of its publication *Reveille for the Weekend* now exceeds 1,750,000 weekly.

Two new directors have been appointed to the board. Mr Sydney R. Elliott represents our interests on the board of the Argus & Australasian Limited of which he has been appointed managing director. Mr E. S. Birk is a partner in the firm of solicitors—Messrs Nicholson, Graham & Jones—who have acted for the company in commercial matters ever since it was incorporated.

Any forecast of the results of the current year's trading must be accompanied by the proviso that they depend to a material extent on the price we have to pay for newsprint.

In closing, I must record thanks to the whole staff for their contribution to what has been a satisfactory year of trading.

The report and accounts, with other items on the agenda, were adopted.

THE DAILY MIRROR NEWSPAPERS LIMITED

The thirtieth annual general meeting was held on May 31, 1950. The chairman, Mr H. Guy Bartholomew, in the course of his remarks, said :—

I am able to record that gross income from trading and from investments is greater than in 1949. Net sales of the *Daily Mirror* are higher than ever before and we have been able to extend our investment interest into Australia.

We propose to maintain the ordinary dividend by the payment of a final dividend of 17½ per cent. and have transferred a substantial amount to reserve for contingencies as well as a similar sum as in the year 1949 to reserve for pensions.

The increase in the total profit from trading is in part due to the additional revenue obtained from the greater sales of the *Daily Mirror*. With a net sale in excess of 4,500,000 there are more copies of the *Daily Mirror* purchased by the public than of any other daily national newspaper. This circulation is not the product of expensive publicity schemes, but is a reflection of the high regard that the general public have for the editorial content of the paper.

With this high level of circulation the value of the *Daily Mirror* as an advertisement medium is apparent. Following the increase in paging, additional space was made available for advertisements. The demand for space by advertisers is still greatly in excess of the supply.

There have been substantial increases in all costs of production. To show some £105,000 additional trading profit is most satisfactory.

The charge for depreciation is much heavier than previously. In addition to the depreciation at the normal rates, we have written off an amount equal to 40 per cent. of the cost of the new machinery delivered to us during the course of the year. When I tell you that a complete printing machine now costs more than double what it did before the war, you will appreciate the reason for providing at so high a level for depreciation.

Additions to the item for plant, machinery, etc., with which I include deposits on new plant, have been substantial. It should be realised that quite a lot of the machinery from which the *Daily Mirror* is produced dates back to the earlier issues of the paper. Though all the equipment has been maintained at the highest possible level of efficiency, replacement of most is a definite necessity. Particularly is this so when one has in mind the substantially increased circulations of not only the *Daily Mirror* but also the other publications that are printed on the machinery that we own—the *Sunday Pictorial* and *Reveille for the Weekend*.

It is appropriate to record at this stage that it is and will be our aim to finance our present commitments for capital expenditure entirely out of profits retained in the business.

The interest in our main subsidiary company —Anglo-Canadian Pulp & Paper Mills Limited—is unaltered. The consolidated accounts of that company indicate that it has had another satisfactory year of operations. The dividend of 75 cents per share paid in the year under review should at least be maintained in the current year.

The additions to our investments include slightly under 50 per cent. of the ordinary share capital of a company entitled the Argus & Australasian Limited. It operates in Melbourne in the State of Victoria and publishes, amongst other papers, the well-known daily newspaper the *Argus*. The *Argus* company is at present installing in Melbourne some of the most modern printing machinery, and

when fully equipped should be in an advantageous position to benefit from the developments that are so certain to take place in the area in which it operates.

Last year I referred to the interest we have in Reveille Newspapers Limited, the company owning the weekly paper *Reveille for the Weekend*. It is most gratifying to learn that, whereas twelve months ago the paper had a sale of over 640,000 copies, the current circulation is in excess of 1,750,000.

During the year, Mr Terence Donovan, K.C., M.P., was invited to a seat on the board.

There has recently been announced an increase in the price for newsprint. I am hopeful that if there are no further radical alterations in the price during the current year we shall, when next we meet, be considering accounts that show another satisfactory year of trading.

I take the opportunity of recording my thanks to the staff for their efforts, which have contributed greatly to a successful year.

The report and accounts with the other items on the agenda were adopted

WILLIAM BEARDMORE AND COMPANY, LIMITED

CONTRIBUTION TO RECORD STEEL OUTPUT

MR ALEX. WILLIAMSON'S STATEMENT

The annual general meeting of William Beardmore and Company, Limited, will be held in Glasgow on Monday, June 19, 1950.

The following is an extract from the statement by the chairman, Mr Alex. Williamson, C.B.E., B.Sc., M.Inst.C.E., which was circulated with the report and accounts for the year ended December 31, 1949.

I would commence my review of the affairs of the company for the year to December 31st last by referring to the changes in the constitution of the board since the last annual general meeting of the shareholders.

REORGANISATION OF BOARD

It was with great regret that in January of this year we received Sir James Lithgow's resignation as chairman and as a director of the company. In 1936 Sir James Lithgow and his brother, Mr Henry Lithgow, took over the financial control of the company, following on which Sir James was appointed chairman ; under the impact of his personality and inspiring leadership the business was brought to a high pitch of efficiency, and at the date of his resignation the fortunes of the company were at their peak. His departure from our counsels is an immense loss to the company and to the board.

I also regret to have to record the death of Sir Ralph Freeman, one of our directors, who was an engineer of outstanding ability and whose loss will be greatly felt by the company.

In the reorganisation of the board my colleagues have done me the honour of appointing me chairman, and my best endeavours will be devoted at all times to the interests and administration of the company. Mr J. G. Girdwood has been appointed deputy chairman. For the time being I am continuing in the office of managing director, and Capt. Q. H. Paterson has been appointed deputy managing director.

We are fortunate in having been able to arrange for Mr Alexander Stephen MacLellan and Mr William Wallace to join your board of directors ; the wide business experience and outstanding ability that each of these

gentlemen brings to our deliberations should prove of the utmost value to the company.

SATISFACTORY DEMAND

During the year under review the demand for our main products, steel forgings and castings has been satisfactory ; our works have been well occupied and our output has again made its contribution to the output record of the steel industry during 1949. Our heavy general engineering department has been further developed and we have completed several contracts for steelworks' plant. We have made satisfactory progress in the production of work rolls and sleeved back-up rolls for the new wide strip mills which are being installed in this country. Rolls of our manufacture are now considered by users in this country to be in the top class. We are now developing the production of cast-steel back-up rolls for which we foresee a substantial demand.

In the chairman's statement to the shareholders last year special reference was made to the work of our research department. We have in the last twelve months installed some valuable new apparatus which in the hands of the very efficient staff we have in our laboratories should achieve results which will be beneficial both to the country and to ourselves as a company. I should like to emphasise the importance of that work to the production of the special steels we undertake ; never has the necessity for the most intensive research into the properties of steel been so great as it is today, when amongst other things we are called upon to produce steels for motor forgings capable of giving satisfactory performance in steam turbines at operating temperatures which are much higher than in the past ; and also steel for gas turbines. Through its well-equipped laboratories and highly efficient staff your company is today taking a leading part in these modern developments.

THE ACCOUNTS

In dealing with the accounts the chairman stated that the surplus of total current assets over total current liabilities was fully £1,847,000, and then added, "Some idea of the strong position of the company is obtained when it is realised that in addition to the surplus I have just mentioned, the written down figure at which the fixed assets appear in the balance-sheet, £1,853,000, is, as was pointed out in the chairman's statement last year, greatly below the original cost of these assets, and probably about one-third of what it would be on revaluation today."

The chairman also mentioned that the net profit at £206,190 showed an increase over 1948 of £51,618.

NATIONALISATION

After referring to the question of nationalisation of the iron and steel industry, the chairman stated: "The record of state-owned industries is a sad and sorry tale, yet the urge to experiment in this direction seems to possess an irresistible attraction to politicians of a certain school who, it would appear, are prepared to see the pearl of principle dissolved in the acid of political expediency, ignoring the fact that when the dead hand of bureaucracy controls our industrial activities the taxpayer must pay the bill."

The chairman concluded his statement as follows: "The outlook, apart from the political uncertainties to which I have referred, is not unsatisfactory ; our order book, which is substantial, is approximately at the same level as last year owing to a welcome increase in the volume of orders in the last few months, but it must be borne in mind that the decision of the steel industry to bear the increased freight charges made necessary to meet the losses incurred by our nationalised transport system, will add materially to our costs of production."

THE BRITISH VACUUM CLEANER AND ENGINEERING COMPANY, LIMITED

GRATIFYING EXPANSION

DEMAND FOR GOBLIN APPLIANCES

DEVELOPING EXPORT TRADE

The forty-sixth ordinary general meeting of The British Vacuum Cleaner and Engineering Company, Limited was held at Goblin Works, Leatherhead, Surrey, on May 31st, Mr H. Cecil Booth, F.C.G.I., M.I.C.E., the chairman of the company, presiding.

The chairman, in the course of his speech, said :—

You will remember that when I addressed you last year I informed you that there had been a considerable recession in trade in the pre-budget period, affecting the accounts which I am now presenting. It is with satisfaction, therefore, that I am able to tell you that in the final six months of the year we more than made up the turnover lost, and that our total turnover for the year was a record.

The results from our industrial section were gratifying, and it is with pleasure that I am able to tell you that we have a number of large and important contracts in hand for the installation of B.V.C. ash and dust handling automatic plant in power stations both at home and abroad. This class of apparatus has now become an essential part of the boiler equipment of generating stations and other large steam raising units.

Most of you will probably have noticed the new methods used by chimney sweeps where by the use of a vacuum cleaner the old bogey of cleaning up the rooms after his visit has been eliminated. You will be interested to know that your company has been foremost in the provision of special apparatus relating to this new method.

"GOBLIN" HOME APPLIANCES

Over the year, sales of our well known "Goblin" electric vacuum cleaners were satisfactorily maintained and during the latter months of the year we developed and commenced production of our new "Goblin" electric washer. I am able to tell you that this new "Goblin" product which is complimentary to our other "Goblin" home appliances is already well established in public favour, and I am happy to say that production on this has meantime been built up and it is now established as a remunerative section of our business.

Substantial efforts have been made during the year to further develop our export trade ratio and I am glad to tell you as a result that further increase in our overseas trading has taken place. In this connection your company has again been well represented at a number of the important International Exhibitions overseas ; and at the British Industries Fair at Olympia, Earls Court and Castle Bromwich, our products were well displayed on various stands relating to the company's fields of manufacture. In accordance with the company's enterprising policy your directors intend to expand their export endeavour and to play an increasingly vigorous part in the dollar export drive.

FINANCIAL POSITION

Turning now to the accounts, I will, with your permission, seeing that they have been in your possession for the statutory period of twenty-one days, take them as read. It will be seen that our financial position has been well maintained. During the year we have been able to effect a very considerable reduction in our stock inventories and this has largely enabled us to reduce our bank loan account by £200,000. The profits for the year including those of our subsidiary companies after making the necessary adjustments for external interests show a substantial increase over last year, reflecting the improved trading results of our subsidiaries. Your directors propose that a dividend of 20 per cent., less tax, on the ordinary shares be declared (being the same as last year) allowing for an increased carry forward.

BOARD'S DIVIDEND POLICY

I should here remark that altnough we have fully subscribed to the principle of dividend limitation, it must not be overlooked that your company has for some years past been paying a substantially lower dividend than obtained in prewar years, and my undertaking as to dividend limitation on your behalf was qualified accordingly. I think I should make this position clear seeing that the present dividend of 20 per cent. is only equivalent to 5 per cent. of the prewar issue price and clearly calls for adjustment when possible. If, and when, the profits of the company provide for an increased dividend your directors will not be unmindful of their duty to the shareholders in this matter, but consideration will first have to be given to the capital requirements of the company in the light of its trading requirements.

You will be interested to know that taxation in various forms takes approximately five times the total sum provided during the year to cover depreciation of plant, management remuneration, loan and fixed interest, and net dividend. It can scarcely be contended that the shareholders of your company receive any undue proportion of the company's revenues! On the other hand one may well reflect on the incidence of taxation as a heavy and ever crushing burden on industry.

ORDER BOOK AT HIGH LEVEL

In all the conditions of what may be regarded as a difficult year through which we have passed, I feel that you will join with me in paying tribute to our managing directors and the whole management and employees for the very able way in which the business has again been conducted during this period.

Although I do not wish to venture a forecast of the current year, I am glad to tell you that the improvement in trade in the final six months of the year which has been under review, has been progressively maintained during the current year, and our order book continues at a high level.

In the coming year, during the Festival of Britain, the company will be celebrating the 50th anniversary of my original vacuum cleaner patent which gave rise to the foundation of this company and the vacuum cleaner industry throughout the world. I feel that your company has played a proud part in British industrial history.

The report and accounts were unanimously adopted.

In a warm tribute Mr J. J. Hambidge proposed the re-election of the retiring directors Mr H. Cecil Booth and Mr F. Heron Rogers and the motion was seconded by Col. C. F. Hitchins, D.S.O., and carried unanimously. The proceedings closed with a vote of thanks to the chairman proposed by Mr A. I. Belisha.

ARISTON GOLD MINES

MAJOR-GENERAL W. W. RICHARDS ON YEAR'S OPERATIONS

The twentieth annual general meeting of Ariston Gold Mines (1929) Ltd., was held on May 31st at the Chartered Insurance Institute, London, E.C.

Major-Gen. W. W. Richards, C.B., C.B.E., M.B. (chairman of the company), presided.

The following is an extract from the statement of the chairman, which was circulated with the directors' report and accounts for the year ended September 30, 1949.

During the year 267,500 tons were milled, compared with the 254,000 tons in 1948. The increase in the average mill head value to 7.401 dwts. per ton shows the highest value since 1945. From the re-treatment of accumulated concentrates a production of 2,778 ozs. was recovered.

Total costs, including development, at 42s. 11d. per ton milled compare with 41s. 10d. per ton in 1948.

The profit and loss account for the year shows an increase in our net profit for the year from £132,467 to £246,375.

Your directors have decided to retain the taxation reserve at £40,000, and have appropriated a sum of £60,000 towards general reserve which will then stand at £120,000.

After taking into account these appropriations and an amount of £9,904 written off concession expenditure, the amount remaining available is £199,265, out of which an interim dividend of 5 per cent., less tax, has been paid, and your directors recommend the payment of a final dividend for the year of 15 per cent., making a total of 20 per cent., the same as for the previous year. This will leave a sum of £75,515 to be carried forward.

The board has declared an interim dividend of 7½ per cent. on account of the current year, against 5 per cent. last year.

SUBSEQUENT OPERATIONS

During the period October, 1949, to March this year, 146,000 tons have been crushed. It is expected that the rate of crushing for March will be maintained and it is hoped that further progress to 30,000 tons per month will be eventually achieved.

The increase in production during the past six months and the higher price of gold have resulted in a gross revenue of £592,576, and a mine working profit of £297,449, being increases of £186,095 and £135,288 respectively over the corresponding period of 1949. Working costs have increased to an average of 40s. 5d. per ton and a further 5s. 11d. per ton has been spent on development, making a total of 46s. 4d. per ton milled.

Future prospects.—Owing to the sound present ore reserve position, namely, 3,074,738 tons of an average value of 6.63 dwts., and the substantial increases in tonnage expected from present development, the board has authorised the expenditure on plant and equipment necessary to bring the capacity up to 40,000 tons per month. The supply, erection and bringing into operation of this new plant, which includes a large new winder at the central shaft, will take from two to three years, dependent on deliveries and the limiting factor of available labour.

At the end of the current year it is expected we shall reap the benefit of the considerable amount of work carried out in development which should result in substantial additions of blocked out tonnages to our ore reserves. In this connection I would draw your attention to the development north of the north shaft, where there is every indication that there is a large tonnage of ore of good average value.

The report was adopted.

INCORPORATED ACCOUNTANTS

MR A. STUART ALLEN'S ADDRESS

The annual general meeting of the Society of Incorporated Accountants was held on May 24th in London.

Mr A. Stuart Allen, F.S.A.A. (the president), in the course of his address, said:

It is interesting to record that membership of the Society has increased by almost 7,000 in the past 50 years. The average annual net increase between the wars was 242, compared with 300 since 1947.

The British Institute of Management is taking steps to encourage the establishment in all parts of the country of autonomous local management associations with the object of promoting facilities for study and discussion of management problems. The council hopes that members will support these local associations when they are formed and take an active interest in their work.

THE PRICE LEVEL AND THE CAPITAL NEEDS OF INDUSTRY

The main part of the president's speech was devoted to a study of the effects of the rise in the index of wholesale prices for industrial materials and manufactures, including fuel, since the beginning of the century. With 100 as the index for 1900, the figure for 1938 became 175 and that for 1948 was no less than 350. Without making provision for the expansion of industrial activity, which was admitted to be essential in the country's economic stability, this doubling of the price level within a decade necessitated that in 1948 the capital resources available to industry should be twice those in 1938 if productive capacity was not to diminish. The natural and the only certain means of providing the additional capital which the sharply upward trend of prices made necessary, was by the accumulation of profits within the industry itself. The factor of taxation must therefore be introduced, and during the 10 years to 1948 the average rate of taxation of profits was approximately 10s. in the £—ignoring the excess profits tax.

For each £1 of taxed profit placed to price level reserve £2 must have been earned, so that the accumulations of capital necessary to maintain production were governed by the combined effect of the rate of increase in the price level and the rate of taxation.

The devaluation of September, 1949, with other recent events meant that the trend of prices was still sharply upwards, and there had been much discussion of the resultant problems. The fact that replacement of the bulk of the country's industrial assets had not yet become imperative served to disguise the gravity of the consequences but did not diminish their inevitability. The president stated that he was concerned to express the effects concretely and to indicate the magnitude of the burden upon the national resources which replacement would surely impose.

He continued: The need for the maximum volume of production at lower costs should accelerate replacement and modernisation, but the Economic Survey for 1950 makes it clear that our resources are hardly adequate for amortisation of assets on the basis of historical cost—it certainly suggests no solution to the problem which I have propounded, which is of increasing urgency.

The profits tax. Today it can be seen that a fiscal expedient introduced shortly before the war and estimated to produce an annual revenue of £20 million at a flat rate of 5 per cent. has developed into a levy which in 1949-50 depleted corporate resources by £260 million, and that at a time when modernisation and expansion of productive capacity were keynotes of official policy.

SCHWEPPES LIMITED

BUSINESS STILL INCREASING

The fifty-third annual general meeting of Schweppes, Limited, was held on May 25, in London, the Hon. R. Hanning Philipps, M.B.E. (the chairman), presiding.

The following is an extract from his circulated statement: The net profit for the year amounted to £222,362, compared with the previous year, £112,485. Your board recommends the payment of 12½ per cent. on the ordinary stock, the same as for 1948. The total dividends on all classes of stock represent approximately 4½ per cent. gross on the capital employed in the business.

Though by January 1, 1949, we had been trading competitively under our own labels for some eleven months, the soft drinks industry as a whole was at that date still a long way short of having freedom to satisfy the true extent of the public demand. In the case of squashes, fruit juices were under Government control until October, 1949; that is to say, the 1949 crop was controlled, which meant that the company, while getting its due share, could not secure the choice of quality which it would require under free trading conditions. In addition, during the whole of 1949 sugar, closely controlled, was short.

Our customers had marked their appreciation of our products and the reappearance of the company's brands with a very strong demand for our squashes, and this demand rose steadily during 1949. Under this combination of circumstances it would only have been possible to satisfy the demand at the expense of quality. This we refused to do.

For Schweppes mineral waters 1949 has been a remarkable year. While sales undoubtedly were helped by the prolonged and exceptional summer, I am satisfied that the solid basis for our increase is to be found in the growing popularity of soft drinks in general and of the public preference for high quality products. Looking forward to 1950, I am able to say that we have started the year well. Our sales for the three months show a satisfactory advance over the same period last year, but the unusually high sales of last summer will inevitably make it difficult to maintain last year's high level.

OVERSEAS ACTIVITIES

On the export side your company has done its utmost to respond to the Government's call to go all out for dollar earnings. The value of our exports to the United States in 1949 was nearly double the figure achieved in 1948. A first step has also been made in the important Canadian market, with the setting up of an agency in Canada in the autumn of 1949. In January and February of this year the managing director visited both America and Canada and discussed plans for the forthcoming season with agents and distributors on the spot, and arranged for a substantial advertising campaign. We look forward with confidence to an increase in sales to both countries in the current year.

In Australia, 1949 has been a year of steady advance, in spite of the hampering effect of the coal strike. None the less, output continued to improve, and a further improvement is expected this year when additional plant of a more modern type will be installed and in production. Steps are being taken to expand our advertising effort and our sales force will be augmented in step with the resulting development of business, for which we feel confident the future offers considerable scope.

In France, we have had a moderately successful year after a bad start. This year has opened with a slight advance in trade and we anticipate a better result.

The report and accounts were unanimously adopted.

BRITISH ENKA LIMITED

SATISFACTORY INCREASE IN PROFITS

The twenty-fifth annual general meeting of British Enka Limited, was held on May 24th in London, Mr A. D. Carmichael (chairman of the company) presiding.

The following is an extract from the circulated statement by the chairman:

The accounts show a working profit of £538,256, compared with £361,803 for 1948. After adding £1,250 interest earned, less interest paid, and charging £172,622 for depreciation of buildings, plant and machinery, £11,100 directors' fees and emoluments, £15,000 contribution to the staff pension scheme in respect of past service and £567 loss on the sale of fixed assets, and £187,524 provision for taxation, the net profit for the year was £152,693, comparing with £103,768 for the previous year. Adding £90,733 balance brought forward from last year gives an available balance of £243,426

The satisfactory increase in profits in 1949 is due to a substantial increase in production and economies in manufacture. The directors have decided to transfer £100,000 to general reserve, and they have restricted their dividend recommendation to the same rate as that paid out of 1948 profits, namely, 7½ per cent. On the increased capital, this dividend, after deduction of income tax at 9s. in the pound, will absorb £77,344, leaving a balance of £66,082 to be carried forward.

TRADING

Production was increased during the year from both the company's units. The existing section was improved, and by the end of the year the new unit was almost completed and the whole was brought into production in the early months of 1950. Steady progress has been made in the enlargement of the Viscose-making section of the plant, and when this is achieved, further expansion of production of yarn can take place. Much progress was made during the year in maintenance and repair work, necessarily neglected in the war years, but this work is not even yet completed.

The prices of raw materials again advanced, particularly the sterling price of wood pulp after devaluation of sterling in September last. These additional costs were offset by increased efficiency and higher rate of production.

The strong demand for our products continued throughout the year, both in the home and export markets and in particular we were able to resume exports to the dollar area following devaluation. Prices in the export markets are declining and approximating to those in the home market.

Our claim for deferred repairs has not yet been settled with the Inland Revenue and it has, therefore, not been possible to compute the final liability for excess profits tax. The taxation on initial allowances in suspense has been increased by a further £100,000. This amount represents the relief on the year's tax liability by reason of the initial allowance on fixed assets installed during the year. This reserve will be drawn upon in reduction of the taxation provision in subsequent years' accounts.

With regard to the future, demand for our yarns still remains strong, although there are indications that supply is catching up with demand. I have every hope, however, that the increased efficiency of our plant, together with the skill of our technical staff and our efficient sales organisation, will enable us to maintain our position in the industry.

The report and accounts were adopted.

A special resolution was also passed approving new articles of association.

ASSOCIATED ELECTRICAL INDUSTRIES

HIGHER PRODUCTION FIGURES

The fiftieth annual general meeting of Associated Electrical Industries Limited was held on May 31st in London.

The Rt. Hon. Oliver Lyttelton, D.S.O., M.C., M.P., the chairman, in the course of his speech, said: The volume of production in 1949 was approximately 11 per cent. higher than in 1948.

We believe that confidence between the directorate, the management and staff, and all those employed rests upon a solid foundation. If any proof of this were needed, it would perhaps be shown by the fact that we have over 3,400 men and women who have more than 30 years' service in the companies of the Group. Industrial relations have remained unclouded by any serious difficulties throughout the year.

On your behalf once more I pay a sincere tribute to the work of the staff and to all those employed in the Group.

The cash investment in the ordinary stock or equity now amounts to £25,344,000. During the four years 1946-1949 no less a sum than £16 million has been invested in the business, either by stock and loan issues or by the retention of profits.

LIMITATION OF DIVIDENDS

It is desirable that stockholders should realise how limitation of dividends affects them at a time of high taxation and increased earnings. During the three years 1947-1949, the company has provided for income tax and profits tax £8,252,000 and has paid out in wages and salaries £52 million, whilst the ordinary stockholders have received dividends of £2,700,000 before the deduction of taxes, or £1,485,000 net. The figure of £52 million for wages means that we have been able to increase the earnings of those employed by an average of nearly 17 per cent., and we have been glad to do it. The additional cost to the company has been £5,000,000. Thus the amount paid in tax has been more than three times, and the increases in earnings by our employees have been almost twice, the total gross amount received by the stockholders.

Two amounts, each of £1,250,000, have been transferred to general reserve. The first of these sums comes from the taxed earnings of the Group in 1949. The second represents a transfer from other reserves to general reserve. The general reserve now stands at £7,000,000.

In spite of the expanding turnover and increased invoicing, stocks and work in progress, taking into account progress payments, have shown a reduction of £3,020,000 during the year. We hope to establish a yet lower ratio between stocks and work in progress on the one hand and total output on the other during the course of the present year.

The total volume of orders upon the books of the company at one time during the year exceeded £100 million.

ELECTRONICS

I should particularly draw your attention to the striking increase in the orders received for electronic equipment of all kinds, which have exceeded the amounts booked in 1948 by no less than £6,250,000, excluding cathode ray tubes and valves. The business is still rapidly expanding.

We claim that the companies of this Group have made a great contribution both at home and abroad to the progress of this key industry. We feel confident that, supported as we are by a loyal body of staff and workpeople, and the most modern equipment, we have as great a part to play in the new field which electrical engineering is opening up in the second half of the twentieth century.

The report was adopted

PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY

SIR WILLIAM CURRIE ON "BALANCING CHARGES"

The one hundred and tenth annual meeting of the Peninsular and Oriental Steam Navigation Company was held on May 31st, in London, Sir William Crawford Currie, G.B.E., in the chair.

In reviewing the financial position shown by the accounts the chairman said that the excess of the Group's holdings of Government securities, etc., plus undrawn balances in the Government tonnage replacement account over amounts still to pay for ships under construction, had improved since 1948 by just over £2,000,000, from £5,600,000 to £7,800,000. Since the larger proportion of the companies in the Group were not wholly owned subsidiaries, however, their surplus funds were not available to other members of the Group.

Thus, although £6,000,000 had been set aside for depreciation and tax relief on initial allowances, as well as £1,684,000 to reserves for replacement of assets or as additional depreciation, nevertheless several of the principal companies of the Group were not free from financial anxiety.

The cost of new tonnage showed no sign of falling, and the cost of replacing old ships could not be financed out of the normal provision for depreciation unless this were supplemented by additional allocations, which allocations had to come out of profits that had already paid income tax.

BALANCING CHARGES

An aspect of taxation legislation of immediate importance to the shipping industry was the levying of "balancing charges." It was true that as a set-off against any balancing charge that might be levied following the loss of a ship an initial allowance would be obtained in respect of a new ship: but this was the case only where taxable profits had been earned in excess of the amount of the initial allowance, and it might be several years before the full benefit of the allowance could be obtained. In the meanwhile, the cost of the new ship had to be paid out of the insurance proceeds less tax on the balancing charge.

It was true, again, that the balancing charge could be deducted from the cost of the new ship, but depreciation on the ship was then restricted by being calculated on the reduced cost. Tax on the balancing charge had still to be paid, with the result that the profits available for ploughing back for development purposes were greatly reduced. As the cost of new tonnage had now reached a level which could not be expected to show a reasonable return on the capital outlay, it had been decided not to place further orders for passenger ships for the present. The proposed building programme had set further requirements at nine new vessels: so far only two had been ordered.

Without an improvement in port working there would be need for more than the nine ships envisaged—a formidable capital commitment.

There had not been a trade dispute in the industry for a long time, and the vote of the three principal seafarers' unions against the nationalisation of shipping showed a true understanding of an industry where flexibility in management, impossible under Government ownership, was indispensable. In the uast year, shipping had contributed £100 million to the country's invisible exports.

The report was adopted.

H. LEDGARD (SILMYRA FABRICS), LIMITED

MR HERBERT LEDGARD'S REVIEW

The second annual general meeting of H. Ledgard (Silmyra Fabrics), Limited, was held on May 31st at Grosvenor House, Park Lane, London, W., Mr Herbert Ledgard, chairman and managing director, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts :—

INCREASED PROFITS

I am glad to be able to report that your company enjoyed a satisfactory year's trading in 1949 and that, as you will see from the directors' report, the profit, after charging all expenses, including directors' remuneration and depreciation but before charging taxation, was £188,612 as against £124,028 in 1948. This is just about double the forecast of £95,000 (for 1948) made by the directors in the prospectus dated February 9, 1948, and I should like to take this opportunity of acknowledging again the contribution the management, staff and operatives have made to these results.

The progressive rise in profits is attributable to increased output and sales. The additional output has come mainly from Embroidery Mill, which was restarted in March, 1948, after derequisition, but this mill is now almost in full production and will cease to be a source of increasing turnover after this year.

A NEW MILL

In order to bring about a further substantial increase in production we are erecting a new mill, adjoining Embroidery Mill, on spare land belonging to the company. It is expected that the new buildings will be completed this year and that the whole of the new plant, including a number of automatic looms, will be installed by the end of next year. The estimated cost of the new buildings and machinery is £165,000 of which £9,566 was actually expended on buildings during the year. It is not proposed to raise any further capital for this project as it is hoped that it will be possible to finance the expenditure out of our existing resources and accruing profits.

CURRENT TURNOVER UP

Our sales so far this year are in excess of those of the corresponding period of 1949 and I think that despite increasingly competitive conditions we can look forward to another satisfactory year's results in 1950.

The 1948 dividend of 20 per cent. (10 per cent. interim and 10 per cent. final) on the ordinary share capital was for the period of 10¼ months and the equivalent dividend for a full year would be 22.86 per cent. Your directors feel, however, that the company would still be following a policy of moderation and restraint if the total ordinary dividend for the year were brought up to 25 per cent. and that it can hardly be expected that a company should establish, as its dividend limitation standard, the rate of dividend paid in its first year. The total of the preference and ordinary dividends paid and proposed to be paid would then absorb less than one-third of the net profits of the year.

You will see from the directors' report that the available balance is £98,280 and the directors take pleasure in recommending to the shareholders that a final dividend of 15 per cent. (actual), less income tax at 9s. in the £ should be paid on the ordinary share capital making, with the interim dividend of 10 per cent. (actual), less tax, already paid, a total of 25 per cent. (actual), less income tax at 9s. in the £ for the year to December 31, 1949. This absorbs £13,406 and leaves a sum of £84,874 to be carried forward to next year as compared with the sum of £23,118 brought forward from last year.

The report and accounts were adopted.

EVER READY COMPANY (GREAT BRITAIN), LIMITED

Manufacturers of Portable Electric Lamps, Dry Batteries and All-Dry Radio

NET PROFIT FOR YEAR (BEFORE TAXATION) -	£539,809
TOTAL RESERVES AND CARRY FORWARD - -	£1,715,220
DIVIDENDS ON ORDINARY STOCK - - -	35%

Points from the speech of Mr E. N. Rowbotham (chairman) at the annual general meeting of The Ever Ready Company (Great Britain), Limited, on May 31, 1950.

MR MAGNUS GOODFELLOW

It is with a deep sense of personal loss that I refer to the death, on August 31st last, of our late chairman and managing director, Mr Magnus Goodfellow. Magnus Goodfellow served with this company for thirty-seven years and had been chairman since 1928. My colleagues and I have lost a wise counsellor and friend and the company an able leader. Consequent upon his death the board have elected me their chairman.

HIGHER COSTS

As is shown by the accounts, the trading profit for this year slightly exceeds that of last year. In point of fact our sales for the year constitute a record in the company's history, but we have had to battle continually with rising costs of production, particularly of raw materials, without a compensating rise in the sale price of our products. I need hardly say that the matter engages the constant attention of your directors with, I think, satisfactory results, but there is always a time-lag between the increases in cost and a compensating rise in selling prices.

DIVIDEND POLICY

Although the net profits this year are so nearly comparable to those of last year, your directors have decided to recommend a reduction in the amount of the final dividend, because they do not feel it would be prudent finance to maintain the dividend and at the same time pay the very high profits tax on distributed profits including the addition imposed in October last. They feel in these circumstances that they would be paying out currently an unduly large proportion of the company's earnings. They therefore recommend a final dividend of 20 per cent. on the ordinary stock, making 35 per cent. for the year.

SATISFACTORY FINANCIAL POSITION

Turning to the profit and loss account, you will observe that we have placed the same amount as last year, viz., £80,000 to depreciation, which should be adequate in the light of the special writing off of £260,000 on plant, machinery and equipment referred to in the directors' report, and we recommend allocating £90,000 to reserve.

The valuation of our investments in the balance sheet shows an increase of £91,435 over last year's figure.

Stock at £1,424,722 has increased by approximately £150,000 over last year's figure. This is due partly to increased sales with the added necessity of carrying larger stocks of raw materials and partly to the trend of rising prices of many materials.

By mutual arrangements made during the year with some of our larger overseas customers, earlier remittances have been received on goods supplied. This has resulted in a decrease in debtors of £290,775.

Tax reserve certificates have been purchased during the year to the value of £300,000. In the opinion of your directors this amount is broadly sufficient to cover all taxation due from the company.

The surplus of current assets over current liabilities and provisions at £1,121,169 has increased by £114,360.

GOOD FUTURE PROSPECTS

This trading year has started satisfactorily and gives reason to think that sales will be well maintained. The demand for our products on the home market continues unabated, and overseas the sales of our well-known "Berec" brand of batteries and flashlights show substantial increases. We have not yet been able to meet fully the public demand for our popular All-dry Radio Receivers. It is apparent that this type of small portable radio has become almost a necessity in the homes of our countrymen.

The report and accounts were adopted.

ENGINEERING COMPONENTS LIMITED

RECORD EXPORT TURNOVER

The fifteenth annual general meeting of Engineering Components Limited, was held on June 1st in London, Mr C. C. Griffith, M.C. (the chairman), presiding.

The following are extracts from his circulated statement :—The group profit amounted to £302,172 ; this compares with £251,348 for 1948. It is proposed to pay a final dividend of 15 per cent. and a bonus of 5 per cent., both less tax (making a total of 30 per cent. for the year). It is proposed to transfer to general reserve £75,000, which will leave a balance of £38,903 to carry forward, against £29,220 brought in.

The increased profit is not due to increased turnover, but to superior methods of production which have our constant attention and to the fact that our employees have registered a steady improvement in production efficiency and rate of output, which, under our bonus scheme, proves beneficial to them as well as the company and the customer.

I am pleased to report that our export turnover for the year was the largest in the history of the company and every endeavour is being made to increase this.

Since the devaluation of the pound in September last prices of raw materials have risen, and our principal material, copper, has increased in price by 30 per cent. Early this year we had also to meet a considerable increase in the price of asbestos. What effect these and other increases may have in the future it is impossible to forecast, but we are doing all we can to offset them by better and more efficient production.

The report was unanimously adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 27, 1950, total ordinary revenue was £64,086,000 against ordinary expenditure of £55,990,000 and issues to sinking funds £70,000. Thus, including sinking fund allocations of £1,494,000 the surplus accrued since April 1st is £48,355,688 compared with £64,274,499 for the corresponding period a year ago.

CANADA and The British Industrialist

If you plan to enter the Canadian manufacturing field or to extend your operations there this Bank will be glad to provide up-to-date information.

Enquiries cordially invited.

THE CANADIAN BANK OF COMMERCE

(Incorporated in Canada in 1867 with Limited Liability.)

2, LOMBARD STREET, LONDON, E.C.3.

Head Office : **TORONTO, CANADA.**

REFUGE ASSURANCE COMPANY LTD.
Chief Office: OXFORD STREET, MANCHESTER 1.

ANNUAL INCOME EXCEEDS	£18,000,000
ASSETS EXCEED	£112,000,000
CLAIMS PAID EXCEED	£207,000,000
(1949 Accounts)	

THE CUNARD STEAM-SHIP COMPANY, LIMITED

FIVE PER CENT CUMULATIVE PREFERENCE STOCK

SIX PER CENT SECOND CUMULATIVE PREFERENCE STOCK

NOTICE IS HEREBY GIVEN that the Transfer Registers in respect of the above Stocks will be closed from June 7 to 13, 1950, both dates inclusive, for the purpose of preparing Warrants in respect of Dividends for the half-year ending June 30, 1950, to be paid on and after July 1, 1950.

By Order of the Board.
H. EAVES, Secretary.

Offices : Cunard Building, Liverpool. June 1, 1950.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for two posts in the Department of Economics and Social Science.

(a) Assistant Lecturer in Statistics. Initial salary £450 per annum, rising to £500 and then, on completing probation, by increments, to £750.

(b) Research Assistant in Economics for one year, with a possible renewal for a second year. Salary £450 per annum. Duties will include work on a scheme of research into Trends in the Economy of South Wales.

Applications (six copies accompanied by the names of three referees) should reach the Registrar, University College, Cathays Park, Cardiff, not later than July 3, 1950. The Registrar will supply full particulars of both posts on application.

Cathays Park, Cardiff. May, 1950.

RESEARCH SERVICES LTD., have a vacancy for a Research Officer. Aged preferably between 25 and 35, he must have had sufficient experience in the field of consumer and opinion research to be able to plan and carry through complete projects, including the stage of writing final reports. Applications (which will be treated confidentially) should give details of education, experience and salary required, and be addressed to: The Secretary, Research Services Ltd., 91, Shaftesbury Avenue, London, W.1.

ECONOMIST, 6 vols., Jan., 1947—Dec., 1949 (4 missing).—Offers to 14, Allendale Rd., Rotherham, Yorks.—Box 426.

YOUNG woman graduate (Economics), speaking French, German, Russian, with no prospects in present job, seeks worthwhile opening, preferably of an editorial nature.—Box 423.

HIGH TIME you tried the S. F. GRILL & CAFE, 6, Denman Street, Piccadilly Circus (25 years old). The Fried Chicken Plate—the Sandwiches—the Lemon Meringue Pie and lots of other good things to eat for lunch, tea and before "The Show." No service charge.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

FOR SALE.—*Economist*, 1945-49, few missing.—Offers to Box 425.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hong Kong)

ASSISTANT COMMISSIONERS, NATIONAL SAVINGS COMMITTEE

The Civil Service Commissioners invite applications for approximately 20 pensionable posts of Assistant Commissioner in the National Savings Committee.

Candidates must be at least 25 years of age on April 1, 1950, but candidates at least 21 and under 25 years of age on that date may be admitted if they have exceptionally suitable qualifications.

A University education and a knowledge of economics are desirable. Experience of public speaking, supervision of office procedure, and organisation of work with the public, will be an advantage.

Salary scale in London: £390 (at age 25) x £20—£650 x £25—£800 for men; £370 (at age 25) x £15—£450 x £20—£675 for women. Starting pay reduced by £25 (men) and £20 (women) for each year of age below 25. The salary scale in the Provinces is somewhat lower.

Particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 3085; completed application forms must be received by him by June 22, 1950.

OTTOMAN BANK

(Incorporated in Turkey with Limited Liability)

NOTICE IS HEREBY GIVEN that in accordance with Article 29 of the Statutes, the Annual General Meeting of Shareholders will be held on Wednesday, June 21, 1950, at Winchester House, Old Broad Street, London, E.C.2, at 12.30 p.m., to receive a Report from the Committee with the Accounts for the year ending December 31, 1949; to propose a Dividend; to receive a report concerning the renewal of the Convention between the Turkish Government and the Bank and, as the case may be, *either* to extend the duration of the Company and modify Articles 1 and 3 of the Statutes *or* to authorise the Committee to exercise all or any of the powers conferred upon the General Meeting by Article 43 of the Statutes; and to replace the retiring Members of the General Committee.

By the 27th Article of the Statutes, the General Meeting is composed of Shareholders possessing at least thirty Shares, who, to be entitled to form part of the Meeting, must deposit their Shares at the Chief Office of the Company, Istanbul, or at either of the several Branches or Agencies abroad (in London at 20/22, Abchurch Lane, E.C.4, and in Paris at 7, rue Meyerbeer, 9me.), ten days at least before the day fixed for the Meeting.

J. VASSALL ADAMS, Secretary to the Committee.

LONDON, May 30, 1950.

URWICK, ORR & PARTNERS seek additional staff for the Accountancy and Administrative Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:

1. Professional qualification in Accountancy.
2. Some years' responsible executive experience in senior industrial appointments.
3. Knowledge and experience of modern techniques of Cost Control.
4. Sound general education and wide interest in contemporary affairs.

Successful candidates will be trained as Management Consultants at the Company's own Training Centre. Applications should be addressed in WRITING to the Company's Offices, at 7, Park Lane, London, W.1, quoting Reference C.1037.

SALE: *Economist*, July, 1948—March, 1950. Offers?—Box 424.

THE negotiations designed to give effective shape to M. Schuman's proposal for the placing of European heavy industry under a single authority are to go ahead without British participation. That is the upshot of as sorry a piece of diplomatic muddling as the world has ever seen. The French wanted the British at the negotiators' table—or so at least they said. The British wanted to be there—or so at least they said. The fatal disagreement arose from the fact that the French Government made it a condition that all the participating countries should first sign a statement of their intentions. And when the British came to examine the text proposed from Paris they found that it would bind them in two ways: first, to accept, in general, the principle of pooling, before the negotiations could reveal exactly what it meant; second, to agree to the view that the scheme should be administered by an international body, constituted independently of governments but whose decisions should be binding upon them. In short, they were invited to surrender a portion of their national sovereignty to a body whose composition was undecided and whose purposes were unelucidated, and they were invited to do so from one day to the next. Not unnaturally, they objected; the French refused to modify their draft (which the other interested countries had accepted) sufficiently to meet the objections; so the negotiations are to go ahead without Britain—though London is to be kept informed of their progress.

It will be seen that there were really two points at issue—first, whether a commitment should be made to enter a scheme before it is known what the scheme amounts to; and secondly, whether governments should surrender any of their sovereignty to "independent" (which presumably means non-responsible) supra-national agencies.

On both these specific issues, if the argument be confined to them, there is a great deal to be said for the British Government's attitude. So far as concerns the first, the French were, to put the matter bluntly, following bouncing tactics. This is what they did on May 9th, when M. Schuman's first proposal caught the world by surprise. No prior consultations then took place and its dramatic effect was not weakened by lengthy exchanges between governments. It was possible to understand the French desire at that stage to preserve the element of shock, and the British took no exception to the unorthodoxy of M. Schuman's approach. When, however, the shock tactics were repeated on May 25th, the British became uneasy. The French had given no warning of the move. They had given no more than the vaguest explanations of what they intended. Moreover, they had drawn up a declaration that seemed designed to place special difficulties in the way of British participation. When it was learnt in London that the timing of the invitation and the text of the declaration had been discussed with the German Government, the feeling grew that France had been less than fair to its British partner.

Moreover, the principle into the acceptance of which the British

Government felt they were being bounced is one of the greatest importance. The fixity of the British Government's devotion to the protection of full employment in this country may be an awkward obstacle to projects of European integration ; it may turn out to be, even in a purely domestic context, a short-sighted policy ; but there can be no doubt at all that it corresponds to a very deep and widespread insistence on the part of the British Government's ultimate masters, the British people. Before any British Government can surrender their sovereign responsibilities for employment policy, they have the duty as well as the right to know into what sort of hands this very important power is to go.

On the matters that were formally at issue in last week's debate, therefore, the verdict must be that the British Government were well within their rights. If this were all that is to be said, then the answer to American criticism would be to enquire when the United States has been willing to accept any commitment without the lengthiest examination in Washington, or to accept any derogation of American sovereignty even with it.

*

Indeed, on the matters formally at issue—the visible portion of the iceberg—the British case is so strong that one is compelled to inquire why the French took a course which they must have known would lead to the result it did. The answer would lie, in part, along the lines that it is precisely the symbolic importance of a willingness to pool sovereign rights to which the French attach importance. French public opinion is becoming more and more convinced that Europe cannot survive at all except in some form that transcends the national state. The federal idea is strong in France, where in many circles it has almost taken the place of national sentiment. Disillusioned by their own government, sickened by the memories of war, the French people are less and less disposed to quarrel over sovereignty. They are coming to look on it as more an obstacle than a help to the securing of France's genuine interests. This mood of disillusioned internationalism is enhanced by the belief that Germany, left to itself, may swing its loyalties and its resources to the east and that Europe can resist Russian encroachments peacefully only by drawing Germany closely into the community of the west. Fear of Russia and fear of Germany thus reinforce the air of European unity. For the French, the integration of European heavy industry is a step towards this ideal. They want it, not alone for any effect that it may have upon the iron and steel industries—many of them would cheerfully admit that it would have very little—but as a proof that nations can submit important national interests to some higher authority. The pooling of national sovereignties is for them the very centre of the whole proposal ; if it cannot be accepted, then there is little merit in the plan ; and it is therefore essential to test at the start the sincerity of the negotiators.

This view is sincerely held in Paris ; but it is also possible to suspect an element of sly tactics. The French passionately want British participation in the scheme when it is set up. But British participation in the negotiations that precede its setting up may be, in their eyes, another matter. They have had plenty of experience in recent years of British skill in deferring and emasculating projects that have been accepted in principle. They may prefer to make more speed with their Continental neighbours and then present a scheme on which the British will not have the hardihood to turn their backs.

This is where the submerged part of the iceberg begins to reveal its shape. For what colours everybody's attitude towards last week's diplomatic imbroglio is the fact that the good faith of His Majesty's present Government in all matters of European economic integration is now universally suspect. It is difficult to find anyone on the Continent or in America, or even in unofficial circles in this country, who has not by now been driven to the conclusion that the British Government's desire is to sabotage any moves towards European economic unity under cover of accepting them in principle. This is a hard thing to say of any government. So far as this journal is concerned, we are not yet convinced that there is any bad faith, or that the explanation cannot rather be found partly in terms of real difficulties inadequately explained, and partly in those of personal vanity, personal fatigue and personal stupidity. But what must be recorded as a fact is that world opinion believes that Labour Ministers approach all these matters (as Philip Guedalla once said of the Baldwin Government's attitude to the League of Nations) like inverted Micawbers, waiting for something to turn down. If this is not a fair description, then at least it must be admitted that the British Government act as if it were. In last week's affair, for example, had there been an active desire to push forward, it ought not to have been very difficult to find a formula for acceptance of the French Government's invitation with the qualifications which are assuredly in the minds of the governments that did accept. As it is, the British Government has done itself great harm by its attitude—and this is not in the least altered by the fact that it was formally in the right.

*

For it is now quite evident that the Schuman proposal has become a test case. Irrespective of its detailed content, the French have succeeded in making it the symbol they wanted it to be. Are the nations prepared to surrender any of their jealously guarded sovereignty, or are they not ? One can regret that the issue was brought up by such unworthy tactics. One can regret that so mighty a principle as the pooling of sovereignty was invoked, and such high hopes of permanent pacification aroused, in support of a proposal which only those in its formidable technicalities can really understand —and whose actual practical accomplishments may yet turn out to be small. One can be deeply distrustful of the French and American leaning to the dangerous and difficult principle of federalism, and disappointed at the failure to realise how much sovereignty has already (as is remarked in the following article) been pooled in defence matters by much less spectacular and more workmanlike methods, in which the British have been the reverse of backward.

But when all these things have been said, the fact remains that at the bar of world opinion the Schuman proposal has become a test. And the British Government have failed it. Those throughout the world who suspect that in this island, of all incredible places, an attempt is seriously to be made to live to ourselves alone have had their suspicions confirmed. British left-wing thought has long ago refused to accept the blind and automatic external compulsions of the gold standard—or, indeed (as it would appear), of any international monetary system. Now it seems to be rejecting the idea of external compulsions by international planning. Do ministers then really believe that Britain can be isolationist ? And have they thought out the consequences for a crowded and exposed island of any such attempt ?

Fortunately, the chapter is not closed. An interdepartmental committee is charged with working out the British attitude to the French proposals. It is still possible for the Government to take its place at the negotiating table. But it will take some hard work to erase the impression left by last week's performance. Those who are charged with responsibility for representing this country might do well to remember that what is now most urgently in need of reconstruction is not the European iron and steel industry, but the world's confidence in Britain's willingness to play a constructive role in world affairs.

Common Defence

IT has been left to Mr Acheson, in the speech he made in Washington on May 31st, to insist on the "great and perhaps revolutionary significance" of the chief recommendation made by the Atlantic Council during its meetings in London last month. Either his fellow foreign ministers did not understand all that is implied by the decision to build up "balanced collective forces," or they decided that the time is not yet ripe to explain to their respective peoples what the principle means in practice. For surprisingly little has been said and written about a quite fundamental decision.

Mr Acheson is, of course, quite right. Any genuine attempt to create collective forces in place of the present system—by which each nation duplicates on a large or small scale what every other nation is doing—must involve revolutionary political, military and economic changes. It means that each country belonging to the Atlantic Pact accepts not only a common defence plan—that has been done—but also virtual dependence on allies, on the Atlantic community ; and the community in turn looks to each country to contribute what, in the common judgment, it is best able to contribute to the joint defences. In the common judgment—that is the point. Here surely is the first step towards a clear-cut pooling of sovereign rights: the handing over to the Atlantic Council—at least in principal—of the power to take collective decisions on matters which affect the military and economic policies of member governments. This principle is as drastic and far-reaching as anything in the Schuman proposal and makes it clear—as the latter does not—where political authority will lie.

This is not the first time that an American statesman has hailed some act of teamwork or declaration of principle by European statesmen as revolutionary, only to find later that the labour of the mountain has produced a mouse. But it looks as if Mr Acheson this time weighed his words very carefully before addressing Congress ; for this time what he had to say included the United States and Canada, as parties to all that is said and done by the Atlantic Council. This was not just another case of Americans urging Europeans to pull together ; it was a straight declaration that here was a common enterprise in which an example of practical co-operation could be and must be set by the United States.

> If we put this principle into practice (said Mr Acheson) it follows that the members of the Atlantic community will have to intensify their practice of developing common concern in the field of foreign affairs, and that they must also develop even closer and more cohesive economic policies.

It must be assumed, too, that the ten European ministers accepted this revolutionary "principle of balanced collective forces" only after most careful thought and consultation with their governments ; although it may have been easier to reach the conclusion than to see all its consequences. The sequence of events and argument appears to have been something like this. There exists a joint military plan for the land and air defence of western Europe. It represents the best available advice about the minimum effort that has to be made in the two or three years ahead. It is based on the detailed work of the Western Union military staff at Fontainebleau over the last two years, and on the deliberations of General Bradley and his British and French colleagues in the Standing Group of the Atlantic Pact organisation. It has been examined and approved by finance ministers and defence ministers and supply ministers, with and without Americans present. Carried out over two years, it will cost in its present form—according to French reports—£2,400 million more than the sum of the present annual defence expenditures of the five Brussels Pact governments.

*

Mr Acheson arrived in London in May to find his colleagues eager for a common defence plan but insisting that they could not pay for it without checking the process of economic recovery in Europe. To this the reply was made that there must be something wrong. With four times the resources of the Russians and their allies in Europe, with greater and more skilled manpower, with four times the steel and many times the oil, it is said that the Atlantic community cannot meet this defence bill. There must, therefore, be something wrong not only with its policies but also with its methods of organising itself. The answer suggested was that properly integrated defence forces would be more efficient and cheaper than the present aggregate of national forces; and this led to the decision that henceforth specialisation and the division of labour shall be applied by the Allies to their rearmament, and the traditional policy of balanced national forces abandoned. What is new and startling about this sequence is that for once the facts dictate the theory. The argument for economic integration and political union in western Europe has generally begun with the wish and has only later acquired its statistical and factual basis. The argument for military integration, on the contrary, has sprung from the facts, and the Atlantic Council have publicly acknowledged its cogency.

Enough has been said to show that there is happening in defence policy something different in degree and quality from what has been achieved in the OEEC, in the Brussels Pact and in the Council of Europe ; to show, too, that the strongest partner in the Atlantic

community already takes it seriously and has begun to think out the implications. For the layman it is impossible to see what these in detail will be ; he can do little more than guess at the facts and ask a few questions.

First, clearly, comes the question of payment. If one of the main purposes of having collective forces is to save money—or to spend it to better purpose—then it is important to consider the financial questions that will arise. Suppose that the defence of western Europe against bombing is allotted largely to British fighters, most of them based and manned in this country, but some based abroad. Do the Allies benefiting from this protection pay some proportion of the cost of a force greater than the British Government might think necessary for home defence only ? If so, how is the contribution made by continental allies—in whatever form—to be balanced in money terms against the British air contribution ? It is not easy to see how the " principle of balanced collective forces " can be carried out without a common defence budget or without special payments arrangements between allies.

Second, there is the question of specialisation. Let us assume that each of the principal allies has an obvious advantage in the production of one or more types of arms or equipment. The layman can only guess what they might be: the British in fighters and anti-submarine equipment, the French in artillery, the Dutch in wireless equipment, the Italians in light vehicles, the Americans in bombers and tanks. Is it proposed that for each weapon or piece of equipment the community should be largely or entirely dependent on output and supplies from a single member ? Clearly, the economies that could be achieved by such specialisation are considerable ; but have governments examined and agreed to dismiss the strategic arguments against them ? It is not difficult to imagine—and sympathise with—the misgivings of a French general who is told that he will be entirely dependent on British fighter support ; of British air marshals and admirals who are told that production of their wireless equipment is to be concentrated on the Continent. And yet, it seems, if finance ministers dig in their heels and declare that strategic arguments must give way to arguments of economy, there is no choice. The risks must be run ; but the decision—if it has been taken—is of fundamental importance. Moreover, if specialisation leads to standardised weapons and equipment two things should be clearly understood: that standardisation in its first stages is a lengthy and costly process, and that European governments cannot accept standardisation on American patterns and types only.

*

Third, there is the question of the American and—less difficult—the Canadian roles. If free deliveries of arms and equipment under the Mutual Defence Assistance Act continue for another year or two, the only effective land forces on the Continent will be dependent for their efficiency and expansion on American factories and ships. Any attempt to switch from American to home-produced equipment at a later date will be intolerably expensive. Does this mean that the American aid and Europe's dependence continue indefinitely, or does it mean that governments will one day have to pay for what they need from across the Atlantic ? It raises too, perhaps the most crucial point of all: the question whether integration of defence policies will be understood by Americans to mean that they must buy arms and equipment and supplies from their allies.

To ask this is less fantastic than it may seem. There is no reason why scientists and military technicians on this side of the Atlantic should not invent and produce better and cheaper weapons, equipment and devices than their American colleagues. It has happened in the past and it may be happening now. In such cases economic as well as military arguments would work together in favour of the European rather than the American product, not least because it would give Europe something it could sell for dollars. Yet American service opinion—to judge by its highly nationalist and jealous attitude in the past—would not immediately welcome the idea : it could be argued that the American fighting services must not become dependent on supplies from 3,000 miles away, on allies whose governments or policies might change, on industries which many Americans believe by definition to be less efficient than their own. If this opinion was against him, could an American Secretary of State allow himself to be overruled on such a decision by the Atlantic Council ? This is to put the issue in an extreme form, but in essentials it is not inaccurate. Will acceptance by the Americans of what Mr Acheson calls the " revolutionary principle " imply their full approval of consequences such as these ?

The prospect that they will approve them may be less remote than past experience—particularly during the war—might suggest. Our Ottawa correspondent described in an article in last week's issue of *The Economist* (p. 1223) how questions of this kind had already been argued for two years between the American and Canadian Governments, without finding more than a partial solution. If Canada is to produce efficiently for defence, it must buy a number of tools, materials and parts from the Americans and sell arms and equipment in return to the US Government ; not until recently was the way found by which this could be done. The American Defence Secretary, Mr Johnson, has used a clause in the " Buy American " Act of 1934 which allows his government to buy abroad if it would be " inconsistent with the public interest " to buy in the United States. Public opinion appears to have accepted this interpretation of the Act, and the three services in America are now preparing a list of items which can be purchased in Canada to the value of $15-25 million, and which will roughly match Canadian purchases for defence in the United States. This minor but important concession by the Americans was, of course, not made under the auspices of the Atlantic Council but in direct negotiation between Ottawa and Washington. It does, however, offer an example of the kind of adjustment of national policies that is made necessary by defence co-ordination, and of the kind of decision that will have to be taken by the Atlantic Council.

The question then arises whether cabinets will in fact accept the authority and advice of the Council, whether its collective judgment will be treated as final. If there is a reasonable prospect of their doing so—and it is difficult to believe that Mr Acheson would have said what he did if there were not—then clearly the twelve Atlantic Pact governments have agreed in theory to a limitation of their sovereignty in matters which they have hitherto regarded as strictly private. British opinion will therefore watch with eager interest—and sympathy—the reaction of Americans as they realise that now they, too, have to make a reality of " integration " and collective defence. On that reaction depends very largely whether the Atlantic Pact does or does not offer the best method of overcoming the weaknesses that arise from the disunity of the western world. If political forms can be developed in which America plays a full part, then there will be no need to fear that the British will drag their feet.

Dean Swift suggested to Queen Anne that the farthings minted during her reign should portray the great events of her time. Seven sets were struck, the rarest depicting the Queen as Britannia seated beneath an arch, as shown above.

One important event of Queen Anne's reign, not recorded in her coinage, was the establishment of the Sun Fire Office in 1710.

At that time, buildings insured by the Company displayed the ' Sun ' sign. Though this practice is now obsolete, the ' Sun ' emblem is to-day universally recognised as the symbol of Service and Security to be sought wherever insurance is arranged.

The Wages Dilemma

FOR something over two years the relationship of wages to economic policy has been governed by the formula known as " stabilisation of personal incomes " or, more familiarly, as the " wage freeze." The policy was based on an implicit bargain that if the Government could keep the cost of living stable and restrict the level of industrial profits—or at least of dividends—the unions would not add to production costs by initiating claims for higher wages. In retrospect it can be seen that the policy has been fairly successful ; the index of wage rates rose by 24 points between July, 1945, and April, 1948, but by only 9 points between April, 1948, and March, 1950. The policy of the wage freeze, nevertheless, is very nearly dead. The original bargain contained an escape clause which permitted unions to press claims involving " hardship," and this hole has been steadily widened until there is practically nothing left of the dyke. The likelihood of a rise in the cost of imports, as a result of devaluation, strained the confidence of trade union leaders in the Government's ability to keep the cost of living stable. The TUC's proposal that the unions should adopt a voluntary standstill on wages for one year (unless the cost of living fluctuated beyond a predetermined point) was accepted at a special conference in January, but only by a much narrower margin of support than had been given to the original policy of wage stabilisation two years before—and even so it made an exception for the lowest-paid workers. In the ensuing five months one important union after another has decided that it can no longer accept the policy.

By no means all the impending wage claims relate to the lower-paid workers. It is true that the National Union of Railwaymen, having failed to get support for an all-round increase, has lately been concentrating on increases for its lower-paid members, and that the tobacco and agricultural workers are concerned with minimum rates. But the claim of the Confederation of Shipbuilding and Engineering Unions is for an all-round increase of £1 a week based on a computation of increased profits in the industry. There are impending claims from unions catering for salaried employees such as teachers and civil servants, and there are several claims from craft unions designed to maintain the differential between skilled and unskilled workers. As the summer wears on and the annual conferences of the unions occur, it can be expected that more unions will reject the policy of wage stabilisation either in practice or in principle.

A year ago it was possible, without very much artistic licence, to paint a picture of a trade union movement expressing its solidarity by support of its leaders in a responsible policy in tune with the nation's interest. But it has now largely faded. The members of the General Council of the TUC still believe in the necessity of wage stabilisation ; indeed they see in it the only alternative to an undignified scramble for wage increases which might so lower the public standing of the trade union movement as to enable a Conservative government to deflate its position of power. But they have no authority with which to control the individual unions. And the leaders of the individual unions are powerless to curb—even when they wish to do so—the pressure of their members. The result has been a sapping of mutual confidence between the Government and the unions, between the TUC and the unions, between the craft and the general unions. More serious still, the efforts of the arbitration tribunals to carry out the spirit of the official policy of wage stabilisation have made the unions sceptical of the value of arbitration.

The growing clamour for higher wages poses a very awkward problem for the Government. If all the outstanding and impending claims were granted they would not only imperil the improvement in the balance of payments by raising the price of exports, but they would materially swell the inflationary pressure by outstripping the rate of growth in the national income that comes from increased production. But to resist all demands for higher wages would alienate Labour's most loyal supporters, and endanger the cohesion of the whole Labour movement. Hence, there has lately been much talk about the feasibility of a wages policy within

the Labour party, and a belated recognition that the policy of wage *stabilisation hitherto pursued* only deferred, and in no way solved, the problem of operating a planned economy in which the most important factor of costs escapes all control.

*

The ideas in circulation are of several kinds. There are still some who believe that the Government should assume absolute powers over the rates of wages, salaries and profits, raising and depressing economic rewards in accordance with the needs of the economy. The failure of detailed planning in other directions, together with the obstinate refusal of the British people to sign away such a large measure of freedom, seems to rule out such a course. There is some favour for a central organisation on the Dutch pattern (described in *The Economist* of June 3rd), with representatives of the employers and the unions acting as assessors to an official tribunal which would have the power to regulate wages. There is a revival of the idea of a *minimum* wage, not necessarily of a statutory minimum, but an official declaration of what ought to be *the fair minimum wage*. But all such ideas founder on the unaltering opposition of the trade unions (and of the trade union ministers in the government) to any system which infringes their absolute freedom to engage in collective bargaining.

Then there is the suggestion thrown out by Sir Stafford Cripps that a sum should be set aside from the prospective increase in the national income arising from higher production which should be divided among the claimants to higher wages: the Government would throw a bone to the trade unions and leave them to scramble for it. This idea might find some favour with the unions, but it bears no sort of relation to any known variety of economic planning, since in any contest for priority shares in a national wages bonus, the prizes would not go to those who were economically most meritorious, or to those whose response would be of greatest advantage to the community, but simply to those with the best bargaining positions, the most brazen voices or the most political pull.

There are a number of variants on this general idea, the most important being that the Government should give the TUC an indication of the surplus of production likely to be available for increasing wages: the TUC would then sift the claims of the unions and recommend priorities within this figure, relying on publicity to awaken the sense of loyalty in the union movement if one union appeared to be demanding more than its fair share. The chief weakness of this scheme —apart from the obvious one that it would be distributing a surplus before it was earned—is that the TUC can never afford to have a knockdown and dragout row with one of the big unions for fear of a major split, to which the experience of the Congress of Industrial Organisations with Mr John L. Lewis stands as sufficient warning.

Yet another method is discussed by a correspondent on page 1274.

It is probable that, if the present state of full employment continues, some sort of rough and ready method of controlling the demand for increased wages will be arrived at. This sort of practical empiricism is, in general, not a bad way of handling difficult matters that are not susceptible of logical solutions. But logic and reason should not be too badly departed from, and there are plenty of signs visible at present that the Government and the TUC are about to accept a working compromise which may be politically convenient, but runs about as directly counter to economic commonsense as it is easily possible to conceive. This is the proposal that wage increases should be granted only to the lower-paid workers.

*

It is true that with the gradual rise in the cost of living it is becoming exceedingly difficult for a man to live and bring up a family on an income of less than £5 a week. It is equally true that there are a number of industries, notably the railways, where minimum wage rates are as low as 91s. 6d. a week. But if hardship is the argument, then it is not standard wage rates but actual earnings that count, and with the economy running at a high level of activity average earnings are well above standard wage rates. Last October, for instance, evidence before the Court of Inquiry on the railway wage dispute showed that the average weekly earnings of porters were 112s. 7d., although their standard wage was only 92s. 6d. It is safe to say that there is no industry today and no even moderately large grade in any industry, of which it can be truthfully said that average earnings are below the hardship level. This is not to say that hardship does not exist; but where it exists it is because of special circumstances in the individual family's case—in which event the proper remedy lies with some form of social assistance—or else because of incomes that are permanently fixed in money terms—in which event wage increases that lead to price rises will only make it worse. It is always doubtful to what extent wage rates should be fixed with an eye to social hardship; it may be better to encourage workers to leave industries that cannot pay a living wage rather than to make it possible for them to stay; and if the community finds this too hard-hearted it can relieve distress by social security means. But even if the full humanitarian theory of wages be accepted, it still does not justify any wage increases at the moment.

But however much humanitarian considerations properly enter into the determination of wages, they certainly should not be the only factors to be taken into account. And when attention is turned to the economic arguments, it is very easy to demonstrate that flat-rate increases for unskilled workers are the reverse of what economic policy would dictate. The need is for productivity and for skill—every ministerial speech proclaims that it is on these that Britain's hopes of recovering its economic independence turn. The premium on skill—the difference that it makes to a man's standard of living if he elevates himself to a higher grade of ski

The ban by the London Society of Compositors on overtime by their members is still in force and as a result the size of this issue of The Economist is restricted. The second of two articles on "The Fishing Industry" has had to be held over; it is hoped to print it next week.

—has already been dangerously narrowed. The proportionate difference between wage rates is less than it was; heavy direct taxation eats into it still further; and the social services, by treating all alike (or, where they discriminate at all, doing so in favour of the poorest) whittle away still further the advantage of the man who contributes more than his neighbour to the national output. Is it sense, is it anything but nonsense, to go still further in the same direction? If there really is a limited sum, derived from rising productivity, that can be distributed to personal incomes, economic policy would dictate that it should all go to those who are building up the productivity of the nation, as a reward for skill not a solace for the lack of it.

This is not put forward as a complete basis for a wage policy. Indeed, time and reflection serve only to confirm the view that, so long as overfull employment and the freedom of collective bargaining are insisted upon, there cannot be any such thing as a coherent wage policy. But it ought to be perfectly clear that a wave of wage increases for the unskilled—and for the unskilled only—is the very opposite of a sane wages policy.

NOTES OF THE WEEK

Peace in Twenty Years?

The 20-year peace programme which Mr Trygve Lie has evolved as a result of his tour of the world's capitals is primarily a list of the disputes which in the last two years have brought the work of the United Nations to a standstill. He asks, for instance, that the bodies dealing with atomic energy, conventional armaments and the creation of an international police force should meet again, that all new candidates—eastern and western—should be admitted to the United Nations, that more support should be given to the practical work of the various international agencies and that efforts be made to enforce the convention on human rights.

As a peace plan it is not precisely inspiring, yet the western powers have everything to gain by welcoming it and agreeing to do what they can to set the machinery of discussion and negotiation in motion again. To leave the Soviet Union with the monopoly of the "peace" slogan is the height of folly and there need be no dishonesty in a western welcome to the Secretary-General's initiative. He is only asking them to do what they have long declared to be their policy.

The greatest obstacle, however, to Mr Lie's proposals makes no appearance in his peace plan. Undoubtedly it would be better for everyone and for the peace of the world if the United Nations were once again a meeting place of east and west but, since the question of Chinese representation is still unsettled, the Soviet Union is maintaining the boycott it began in January. At that time, it will be recalled, the Security Council decided against the admission of the Chinese Communists. Jugoslavia, India and the Soviet Union voted for them, Britain and Norway abstained, while France, Nationalist China, the United States, Egypt, Ecuador and Cuba opposed their admission. Subsequently, the British attempted—apparently with no success—to persuade the three opposing non-permanent members of the Security Council to see in a *de facto* recognition of Peking the best method of getting the United Nations back to work. Meanwhile the attitude of France and America has hardened. The British, too, have hardly been encouraged to further efforts by the Communists' cold-shouldering of their offer to have diplomatic relations with the Peking regime. Yet, if this deadlock cannot be overcome, no reconciliation at Uno can even be discussed, for the Russians will remain absent. It does not seem that Mr Lie in the course of his journeys has learned anything new about possible ways out of the Chinese *impasse*.

* * *

Third Year of Marshall Aid

The Bill authorising the United States Government to spend $3,121 million on foreign aid in the coming year has been passed by Congress and signed by the President. The sum still requires to be appropriated, but it is very likely that the amount of Marshall aid reaching Europe will not fall below the $2,850 million now authorised. The aid distributed under the Marshall plan has fallen each year from $5,800 million in 1948 and $4,200 million in 1949, to the present figure—and, although the decline is speedier than was forecast in the original project, it has kept pace with the fall in the world's dollar shortage. The new figure covers the gap which seems likely to occur in 1950.

The improvement has been due in part to the effects of devaluation, but the precariousness of the balance in world trade is underlined by the extent to which the present improvement in Europe's dollar supplies has been secured not so much by the action of the Europeans themselves as by the marked recovery in the American economy. Whereas, early in 1949, American imports fell by some $500 million, the recovery of purchases in the autumn and winter—particularly of raw materials—has made possible such achievements as the Sterling Area's favourable dollar balance in the first quarter of 1950. But any new recession in the American economy could have effects as unsettling as those of 1949, and the European countries clearly could not revert once again to the expedient of devaluation.

Even if some element of insecurity remains, however, the Marshall plan has succeeded triumphantly in its task of consolidating European recovery. It would be a pity if the apparent ease with which the latest authorisation has been passed, and the fact that it is the third and not the first of its kind, were to dull Europe's sense of gratitude or to lead any of America's partners to underestimate the sustained generosity that underwrites the plan. It is, after all, often easier to embark on a project than to secure the staying power necessary to see it through to the end.

Parliamentary Interlude

It is doubtful whether, amid the pleasing distractions of early summer, the British public could be persuaded to take much interest in their politics at the moment, even if this year's leisurely parliamentary programme had not permitted a long Whitsun recess. But for the politicians it is still an anxious time. It is true that with the recent relaxation in controls, Labour has little need to fear a sudden movement of public opinion against it. Indeed it is possible that if the economic weather remains set fair the Government may decide to take the risk of delaying a general election until next spring, following a piece of mythology (which seems to have a certain coincidence with fact) that from September to December in any year are good Tory months, while from Christmas until the Budget the tide runs towards Labour. However, Parliament will begin on the committee stage of the Finance Bill next week, and it is always possible that a defeat in the division lobby will precipitate an immediate dissolution.

For this reason, both Mr Churchill and Mr Morrison

have returned to their courtship of the Liberal vote. Mr Morrison has called down from the Highlands for Liberals to recognise the Labour party as the party of "progressives." His appeal is to the individual Liberal voter, not to the party, and by a rather simplified sketch of British political history he has sought to show that the Labour party is the natural development of the Liberal and Radical tradition. There are no barbs on Mr Morrison's hook, and he even referred to the Liberal party's part in the last election as "courageous" in innocent forgetfulness of his strictures upon its interference a few months ago. Mr Churchill's approach to the Liberals followed very much the same lines, although he was concerned to emphasise the common interest of Liberals and Conservatives in civil liberty. While the leaders of the two major parties besought Liberals to assist in producing a clear-cut political verdict at the next election, Lady Violet Bonham Carter, speaking at Oxford, reminded them that Liberals feel under no compulsion to sell themselves to one side or the other. If the time of the Liberal party as an independent political force has passed, Liberals can at least exercise an independent choice, based on men as much as on measures, as to which of the big battalions they will join. Unfortunately, neither Mr Morrison nor Mr Churchill seemed to provide much solid ground on which to base a choice.

* * *

Cry Liberty!

A Bill with the title "an Act for the better preservation of the liberties of the subject" sounds like a trumpet blast on an ancestral horn, even though the trumpeter be weak and the walls of Jericho are high and strong. The Bill that Lord Samuel has introduced on behalf of the Liberal Party is a successor to one that was given a second reading in the House of Lords in 1947 by a majority of 18 and it gives the Lords an opportunity of saying how far, if at all, the liberties of the subject have further diminished over the last three years.

The thirteen clauses in the Bill have only one unity; each provides a remedy for a specific abuse or seeks to restore a specific liberty that has now gone. Clauses 1, 6 and 7 are intended to revise certain provisions of the Supplies and Services Acts, to give Parliament and the courts greater powers, Ministers less. Another clause would impose religious and political toleration on all employers save those with definite political or religious ends to advance. Another would close the chink in the armour of habeas corpus made by the Visiting Forces (British Commonwealth) Act, 1933. Another would substitute for the tribunals entitled to impose penalties under various marketing schemes, which are now lay bodies sitting in London and in private, hearings in public before a local bench of magistrates. And there is the inevitable clause cutting down the rights of entry on and search of private premises given by so many emergency regulations to so many minor officials. Liberals in all parties are likely to find at least one proposition in the Bill which they will feel impelled to support.

A Bill of this kind presumably has two objects. It is a demonstration, the Upper House equivalent of a Trafalgar Square meeting, with the added advantage that no government could afford not to make some reply during a second reading debate. It is to be hoped that the Lord Chancellor will give the Bill, and its introducer, Lord Samuel, the courtesy of a reasoned comment on each of its separate proposals. But the Bill is also a parliamentary document which could reach the statute book. If it is given a second reading in the Lords, as seems probable, what should the promoters of it do next? In that situation, they should perhaps drop the clauses amending the Supplies and Services Acts, not because they are not needed but rather because the Acts themselves must be renewed in the near future and their detailed amendment could best be tackled then. They should, frankly, drop the clause that seeks to make employers, including local authorities, tolerant of their political opponents by Act of Parliament, if only because such requirements can so easily be avoided in practice. But the rest is worth fighting for. The right of entry, for example, is perhaps not often abused; but its existence has the bad effect upon the minor official that it corrupts his proper relationship with those whose servant he should be. Again, the right to fine a man an arbitrary sum should not be possessed by tribunals which have closer resemblance to a star chamber than to a court of law. This Bill gives Parliament a chance to restate the principle, now so obscured, that the purpose of laws and regulations is not to make easier the performance by civil servants of the tasks that they have so largely set for themselves.

Empty Victory in the Docks

The end of the lightermen's strike last Monday has settled little that really matters. The Dock Labour Board has established its legal right to dismiss unofficial strikers; unofficial strikers have shown that they can still strike without suffering any real hardship; the Communists remain cock-a-hoop, claiming as usual a non-existent victory over authority. The strike and its settlement were in fact simply another inconclusive instalment in the serial story of the struggle to maintain discipline in the docks.

This particular episode began with the suspension for seven days of 14 lightermen who had refused to abide by an agreement to work overtime which had been negotiated by their union leaders with the employers. In order to avoid too great a disruption of work, the Dock Labour Board arranged that half the men would be suspended one week and the rest the week after. The 91 other lightermen who were working on the same job promptly struck, saying that they would not return to work either until the sentences had been repealed or until the end of the fortnight, by which time all 14 men would have been reinstated.

The strike was not supported by the Lightermen's Union, and, after a few days of deliberation, the Dock Labour Board decided to establish its authority by cancelling the registrations of the 91 strikers. This meant in effect that the strikers were dismissed from employment in the docks for ever. Their cause was as promptly taken up by another 1,000 lightermen, who struck on the grounds that the Dock Labour Board was wrong to penalise men for striking. The Appeals Tribunal, however, upheld the legality of the Board's action. At the same time, the tribunal stated that the men wished to return to work and that they would in future abide by the conditions of the Dock Labour Scheme. The Dock Labour Board, having gained their point, reinstated the 91 lightermen.

Tempers cooled down, and some three weeks after the original strike had broken out, all lightermen went back to work. The strike leaders conveniently forgot to mention the promise which the strikers had given to the tribunal, and claimed that they had forced the Board to accept all their demands. If this story, in different settings and with different characters, were not so frequently repeated, it would not merit much comment. But it is a small-scale example of what has been continually happening in the docks during the past three years, and the Leggett inquiry into the docks would do well to examine it in detail.

* * *

Belgium: Little Change

The Belgian elections have proved all over again a number of facts that were perfectly clear before they were held: that a small majority of Belgians wish to see King Leopold back on his throne, while a large minority do not; that the King's supporters are mainly to be found among the Christian Social Party while the Socialists lead the opposition; that the royal question divides the country along all its lines of cleavage—Flemings voting for the King, Walloons against him, Catholics for his return, free-thinkers for his banishment. The elections have simply confirmed this pattern. Once again, a small majority has been secured for the King. The Christian Social Party have gained four seats in the Lower House and thus secured control of it. Once again, the opponents of the King have shown their strength The Socialist vote has increased. Once again division between Catholic and non-Catholic and Fleming and Walloon has found expression in the distribution of the vote.

Only over one point has a new situation arisen. In a sense, it is a technicality, but it is of decisive importance in Belgium's political crisis. The Christian Social Party now have absolute majorities in both Houses and can therefore—and will—repeal the Act passed in 1945 debarring the King from the exercise of his royal prerogatives. The majority in the Lower House is, however, only a majority of two, and in spite of jubilant Christian Social Party predictions that the party would secure most of the 57 per cent majority which voted for the King in the referendum, their proportion of the total vote was no higher than 48 per cent. Thus they cannot claim a majority of voting strength, although the distribution of seats gives them a majority in Parliament.

If the King returns under these conditions, he will do so as a party man. The more extreme Christian Social members are prepared to risk the hardening of every line of division in the country, which would be the inevitable result. But there are some signs that the King himself favours a more moderate course and might be prepared to sponsor—as he did some weeks ago—a compromise which provided for the transfer of his powers at least for a time to the Crown Prince. It is along these lines that the best hopes for Belgian unity now lie.

* * *

End of the Malayan Visit

The Secretaries of State for War and for the Colonies have now seen a great deal of Malaya at first hand, and Mr Strachey is completing his tour with a visit to Hongkong. Both are said to have made a good impression, and they have certainly taken pains to issue a whole battery of statements which should reassure people in Malaya about Britain's intentions. What is needed now is for them to carry the Cabinet with them on their return, and to turn words into deeds.

Added point is given to their first-hand investigation of the Communist guerrilla threat by Malaya's foreign trade figures for 1949, which have recently become available. These show very solid favourable balances with the United States, Canada, the Soviet Union, France, Germany, the Netherlands and Hongkong. In spite of a deficit of M$161 million (Straits dollars, worth 2s. 4d.) on its total visible trade, Malaya's surplus with the United States and Canada amounted to M$355 million, accounted for by exports of rubber, oilseeds and nuts, timber and non-ferrous metals Total visible trade with the United States, in fact, amounted to M$543 million, which was second only to trade with the United Kingdom, worth M$589 million.

It has been one of the most remarkable features of the emergency in Malaya that the constant attacks of the Communists have entirely failed to make any serious inroads on its economy—which accounts for no less than a fifth of all the sterling area's dollar earnings. This immunity cannot be expected to continue, even if the pressure from the Communists grows no greater. Output would almost certainly decline very sharply even if conditions became only a little worse than they are now. Indeed, the fact is that, on the contrary, the visit of the two Ministers has now raised considerable hopes that more will be done to bring Malaya back to peace. If it is not, the situation will be worse than if the Ministers had never gone at all—and that is saying a good deal.

Elections in Japan

The recent elections to the Upper House of the Japanese parliament have resulted in a victory for Mr Yoshida's Liberal party—which already has a majority in the lower house—with the Social Democrats running a strong second. The internal political situation is not greatly altered; from an international point of view it is important that the Liberals, having committed themselves to a pro-American policy have done so well at the polls, and some observers have interpreted the outcome of the elections as proof that recent reports of a growth of anti-American feeling in Japan are without foundation. The matter, however, is not quite so simple as that. There is no doubt that there has recently been a considerable revival of Japanese nationalism and that the Communists have been able to exploit it to a degree of success not adequately reflected in the election results. The reason seems to be that there is at present a sharp separation between sentiment and the sense of expediency in Japan; expediency causes the Japanese to vote into office a government acceptable to the Americans, on whose material aid Japan depends; but sentiment creates widespread sympathy for the militant nationalism which the Communists in Japan, as in Germany, have now made the central plank of their political platform.

General MacArthur has now issued a directive for the exclusion from public life of all the members of the Central Committee of the Japanese Communist party. This order is framed as an extension of the original "purge" directive of January, 1946, which was aimed at leaders of Japanese right-wing nationalist and militarist organisations. In those days the western Powers pretended, for reasons of high policy to agree with the Russian contention that Communists everywhere should be classified as democratic parties, even though they were unwilling to accept the further assertion that Communists alone had a right to the title. But in present circumstances it is clear that the survival of democracy in Japan is threatened as much by the Communists as by a revival of the old prewar type of anti-democratic nationalism.

General MacArthur has twice spoken publicly of the need for outlawing the Communists, and seems to have hoped that the Japanese Government would take the necessary measures without compelling him to invoke his powers as Allied occupation commander. The failure of Mr Yoshida's cabinet to take action cannot be ascribed to scruples about political liberty and still less to sympathy for Communism as a political doctrine; it arises partly from an unwillingness to suppress a party which has surrounded itself with the glamour of a patriotic defiance of the victors of the last war, and partly perhaps from the feeling that reinsurance in the direction of Moscow is wise while the future policy of America remains shrouded in obscurity. Until the United States declares its intentions towards Japan more definitely than it has done hitherto, the fence seems the safest place for a prudent Japanese to sit on.

* * *

Salary Estimates

Users of national income statistics have grown accustomed to minor revisions in the estimates from year to year. Some of these figures—as the compilers point out—are not only provisional but are necessarily based in certain cases on very incomplete information. But the changes in estimates of the nation's salary bill, as shown in this year's White Paper, are too drastic to be viewed as merely minor statistical adjustments. While the estimate of the total of salaries in 1938 remains unchanged, the estimates for 1946, 1947 and 1948 have been revised upwards (comparable figures for the war years are not published). The original estimate for salaries in 1948 put their total at £1,850 million; the new figure is £2,140 million, an increase of 15 per cent. The size of the wage bill, too, has been increased but not to anything like the same extent; the revised 1948 figure of £4,050 million is £75 million higher than the original estimate.

These changes are surprising, but there seems no reason to doubt the official explanation that they have been brought about by a new method of assessing both wages and salaries. Previously, the figure for salaries was reached by subtracting estimates of the wage bill from estimates of total earned income ; now, however, it is deduced directly. A larger and more accurate estimate has been made of those incomes which—either because they are too small or for other less creditable reasons—escape the net of the income tax collector. Owing to this basic change in the method of compilation, further revisions may well have to be made. In particular, the 1938 figure may be adjusted in order to bring it on to a basis more comparable with the new post-war estimates.

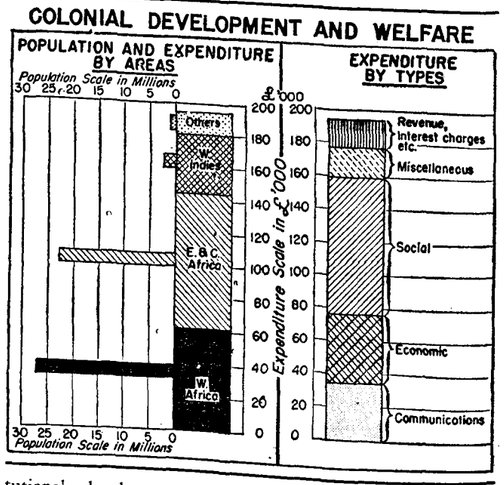
These revisions alter some of the figures put forward in the series of articles on personal incomes which appeared in *The Economist* early this year. The increase in salaries as a whole since before the war still lags a long way behind that of wages, but not quite so far as was previously calculated. (It should be remembered, however, that this is a comparison of the *revised 1949 figure with the unrevised 1938 figure* ; salaries may have been understated in the earlier years as well as in the later.) On the latest estimates, the total of salaries, after payment of direct taxes, has risen almost as much as the average price of consumption goods and services—on the old basis, salaries were down by 17 per cent. But although figures of the numbers of salary-earners are not published, there is good reason to believe that they have risen since 1938 by about 10 per cent. If this is so, the average salary-earner is some 10 per cent worse off in real net terms than he was in 1938. In contrast, the average wage-earner has about 20 per cent more purchasing power. These figures for average wages and salaries do not take into account any changes in the balance of men, women and juveniles. And salaries, in particular, cover a very wide range of occupations and incomes. The new statistics do not, of course, affect the scales of salaries in specific posts which were given in this journal in the issue of February 4th.

* * *

National Insurance's First Report

Although the national insurance scheme is still not two years old, the Ministry of National Insurance was set up in November, 1944, shortly after the Coalition Government had issued its White Papers on social insurance. Its first report, therefore, which was published this week [Cmd. 7955], has to cover the last year of the old uncomprehensive schemes of social security as well as the linking together and extension of these into the single system that came into force in July, 1948. This may explain why the report seems to leave out much that one would have expected to find in it.

The Ministry must be collecting a mass of social information. But only tantalising items are given. There are some detailed tables on family allowances, which show, among other things, that nearly two-thirds—63.1 per cent—of the families receiving allowances have only two children under the age limit, that is, receive only one allowance. At the other end of life, it is interesting to note that in the first year of the new social security scheme about two-thirds of the men and rather less than one-half of the insured women went on working beyond the age at which they became eligible for retirement pensions. It is also reported that the sickness rate in the winter of 1948-49, the first winter after sickness benefit was increased to 26s. a week, was not so high as was expected—though the seasonal rise persisted longer—but no comparison with *rates in earlier years is given*. Another omission is the number of contributors in each class (employed, self-employed and non-employed), and, since the extension of sickness benefit to self-employed persons on the same terms as to the employed was hotly debated in Parliament, it is a pity that the number of self-employed claiming sickness benefit is not given.



The national insurance scheme aims at abolishing want, at establishing a minimum income for every person or household in the land, supplemented or replaced in certain cases by the national assistance scheme. No indication is given in this report of how far the national insurance scheme is falling short of its aim and how often help from the Assistance Board has to be given. Some co-ordination between Board and Ministry, which at present issue reports at different times and for different periods, is clearly called for.

* * *

Colonial Ferment

In its annual report the Colonial Office sets a good example to the Ministry of National Insurance, whose first report is discussed in the previous Note. The colonial report (Cmd. 7958), which was published on June 1st, gives statistics—admittedly some of them provisional—for the year 1949, and its text carries the record up to the spring of this year. This up-to-dateness seems to have given a new character to the report. The old sedate atmosphere that used to emanate from it has given way to something that is far more in keeping with actual happenings in the colonies. The chronicle is no longer merely a dry-as-dust record, but seems to have caught something of the pace of events.

The former complacency is by no means entirely suppressed. The account of Malaya underrates the gravity of the situation there. Nor is there any mention of the deterioration of racial relations in Africa, which is probably the most serious blot on colonial policy in the period covered by the report. On the other hand, the political and constitutional developments recorded are momentous. The proposals for federation in the West Indies are one landmark. The report of the Coussey Committee (with its all-African membership) on constitutional reform in the Gold Coast is another. But the proposals for a new Nigerian constitution, with their emphasis on regional government, are even more interesting.

The constitutional changes in the colonies are the most spectacular developments in the period under review. But the material progress is also remarkable. For the first time the annual report is able to record that the development and welfare projects (the extent of which are illustrated in the accompanying diagram) are no longer hampered by shortages of materials and equipment—though technicians are still badly needed. For the first time development and welfare is approaching the limits imposed by finance. Economic advance, it is true, is still lagging far behind political advance. Yet its extent is indicated by the fall in the death rate—in Cyprus, for instance, the 1949 rate was one of the lowest in the world—and in infant mortality. British colonial policy in recent years has often been criticised for pushing ahead too fast with the grant of responsible government. But it may be that the improvement in the well-being of the colonial peoples, on whom the development and welfare policy is at last beginning to make a mark, is helping to set the pace.

* * *

Discontent in Cyprus

Within the last ten days the British authorities in Cyprus have committed to prison the editor and printer of a Right wing newspaper, on a charge of sedition, and the Communist mayor and four councillors of the town of Limassol, on a charge of contempt of court. No qualms need be felt about a possible miscarriage of justice ; the offences were genuine and proven. But there is cause for grave disquiet over the reasons that prompted such revolts against British authority. Are they the fault of unbridled local emotions, or of British mishandling, or both ?

The pattern of Cypriot politics is as follows. Setting aside the views of the Turkish minority—20 per cent of the total population—which fears domination by Greeks and wants British rule to continue, it consists of Greeks who are either true red or true blue, with virtually no shades between. The Left, which is very well organised from Moscow, contains one or two of the best brains in the island. The Right is sponsored and led by the local branch of the Greek Orthodox Church. There is no centre, for the few Greek Cypriots who possess liberal minds dislike responsibility and keep away from platforms. Immediately after the war, the Communists were in the ascendant. At last year's municipal elections they lost some ground to the Right, the percentage of votes for them dropping to some 40 per cent of the total. They lost less ground than was expected because, sensing that their campaign of self-government was less popular than the Right's campaign of *enosis*—union with Greece—they fell in with a Moscow instruction to switch their theme. In cynical disregard of happenings in Greece, they, too, began to preach *enosis*. They petitioned the United Nations on the subject. The Right, to keep abreast, organised a plebiscite which was held in January The two parties, usually sworn foes, sat in uneasy proximity at plebiscite meetings, and 95 per cent of the island's adult population voted for union with Greece. There has followed a series of what can only be described as " try-ons " with the British authorities, ranging from risky articles and the changing of street names to plaintive visits to the King and prime minister of Greece.

*

Much of the trouble springs from the fact that an astute and argumentative people, with politics in its blood, has no proper outlet for this pursuit. It has refused to co-operate in responsible government, which is permanently on offer from Whitehall, and is working off its emotions in all directions. An efficient but unimaginative British administration has, therefore, let itself be jostled into backstairs skirmishing. It has lost the initiative. It is doubtful if the British Government can now recapture this singlehanded. It could do so were it to take advantage of its old and firm ties with the Greek Government and royal house, and to make an Anglo-Greek proposition for some change that would suit all tastes in the Eastern Mediterranean, except those of Moscow and the Cypriot Communists.

German Trade Union Demands

The latest developments in the fight of the German Trade Union Federation for a share in the control of industry suggest that it has lost the good sense which it has shown regarding wage claims. Demands that have now been formulated in a draft law go so far beyond the limits of reason or democratic practice that the Federation lays itself open to the charge of being more concerned with concentrating power over industry in the hands of its central body than in securing benefits for its individual members. It proposes nothing less than a revolution in its exclusive favour, and with no mandate from the electorate.

To understand the full significance of the demands, it must be kept in mind that German firms are run by two bodies, the *Aufsichtsrat*, or board of directors, and the *Vorstand*, or board of managers. In all large firms it is the *Vorstand* which is of the greater practical importance, though it is appointed by the board of directors. The struggle for the *Mitbestimmungsrecht* revolves round the question whether—as the employers concede—the individual works council shall have representation in the *Aufsichtsrat* ; or whether—as the Federation demands—the central TU body shall have a half-share in the *Aufsichtsrat*, and, in addition, a similar share in new organs of control, named " economic committees." The Federation goes on to claim that its representatives on the new control committees must be able to veto the appointment of any members of the *Vorstand*, or other leading officials, who deal with conditions of labour in firms employing 300 persons and over. Finally, the Federation demands a 50 per cent representation in all chambers of commerce and agriculture, and—at the top—in a new Federal Economic Council which they propose to establish.

How undemocratic and extravagant these claims are may be grasped if they are translated into terms of a demand by the General Council of the TUC for a more than equal direct share in the management of all British industrial undertakings, private and public. It is small wonder that the negotiations between the Bonn Government, the employers and the Trade Union Federation leaders have led to a stalemate. The question, however, cannot be entirely shelved. Frustrated on the issues of wages and nationalisation, German trade union leaders seem bent on securing power by means of the *Mitbestimmungsrecht*, and Bonn is pledged to legislate on it.

Stranded Chinese Students

At a time when official relations between this country and China are in a very difficult stage—and *The Economist* has certainly not been guilty of underestimating their difficulty—there is at any rate one group of Chinese citizens who should not be made to suffer for events beyond their control. These are the Chinese students who have been living and working in this country. A number of them now want to return to China, some perhaps because they are in sympathy with the new regime and are eager to serve it, but the majority because they have completed their studies in this country or are forced to abandon them by the cessation of scholarship or sterling exchange payments from China originally granted by Nationalist authorities. Some of these students are now quite destitute; but they cannot return to China because the only practical route of entry is by Hongkong, and the Hongkong Government has been unwilling to grant transit visas for passage into Chinese territory.

No doubt there have been good administrative reasons for the Hongkong attitude. Some returning students holding only Nationalist-issued passports—and they cannot get new passports while the Chinese Embassy in London remains closed—might be refused admittance by the Communist authorities and become a charge on the Colony. Others, of Communist sympathies, having entered Hongkong, might remain there as agitators. But against these risks should be set the far more weighty consideration of according decent treatment to a number of men and women who are the guests of the British nation, who may well include some of the future leaders of China, and whose lifelong attitude to this

country is likely to be determined by their present experience. If the brains of Whitehall are set to work, it should not be impossible to devise a means of immediately repatriating all Chinese students who wish to go back. This is a matter in which bureaucratic red tape should be quickly untied and administrative ice unfrozen.

London University Commentary

The annual report of the Principal of London University for 1949-50 contains some illuminating comments on matters relating to the universities as a whole as well as to London itself. The year 1948-49 showed a decrease in the rate of growth in student numbers nearly everywhere; in London the actual numbers of full-time students in the non-medical faculties recognised by the University Grants Committee decreased. Is this a sign for the future?

The special grants given to ex-service students are now virtually at an end; the Minister of Education announced recently that he expected to make only 2,000 of these awards next year compared with the 13,500 which were awarded in 1947-48; the total number of new awards made by his Ministry and by local authorities is expected to be 12,700 for 1950-51 compared with 14,700 in 1949-50, and 21,890 in 1947-48. The consequences of such a policy are beginning to cause concern.

While most of the larger and older universities are not planning to increase their numbers further, they are naturally anxious that sufficient scholarships should be made available to fill the places they have already provided. Only half the local authorities have yet agreed to implement the recommendations of the Ministry of Education for increasing the number and value of university awards and those in the Home Counties have been among the firmest in their refusal. To overcome this difficulty Dr Logan, the Principal, suggests that the number of entrance awards to be given by the universities themselves should be increased. For the universities this would have the added advantage that these awards would be under direct university control, and the vagaries of local authority selection would be reduced.

Authority to do this exists and such a scheme could be incorporated in the next application for quinquennial grant for 1952-57. Any large-scale adoption of such a solution would, however, not comply with the proposals of the Working Party on Awards which suggested only a very modest increase (1,300 to 2,000) in the number of open university scholarships, while the main reliance was to be placed on local awards. If, however, under stress of economy cuts local authorities do not comply, some other form of awards will be necessary.

As a sidelight on this question, Dr Logan states that with the passing of the ex-service student it was expected that many more boys would come straight from school to university and would do their military service afterwards. Opinions differ about the academic advantages of this, but as a method of maintaining numbers for the next few years it is irrefutable.

* * *

Mr Menzies and the Communists

Mr Menzies, the Australian Prime Minister, has sensibly amended his Communist Party Dissolution Bill, but, at the time of writing, he does not yet seem to have succeeded in making the Bill a bipartisan measure. Although most of the amendments appear to be what the Labour Opposition and liberal opinion demanded, the Labour party is pressing for a still further watering down of the Bill. How far Mr Menzies will be prepared to go to meet the Labour objections remains to be seen. The Labour party has a majority in the Senate and by rejecting Mr Menzies' Bill they can force a dissolution of Parliament; on the other hand, in view of the present trend of opinion in Australia, the Labour party could hardly have chosen a worse issue on which to fight a general election.

The principal amendments which Mr Menzies has made are that, if a declared person or association gives evidence in a court of appeal, the onus of proof will lie upon the Commonwealth; that a special committee of the Solicitor-General, the Secretary of Defence, the Director-General of the Security Organisation and two others will examine the charges against each individual and organisation; that members of an illegal association who are not themselves Communists will be excluded from the operation of the Bill, and that the Governor-General may repeal the Act by proclamation, as soon as he is satisfied that it is no longer necessary for the security of the country. The Labour party would prefer the onus of proof to be placed even more firmly upon the prosecution and that declared individuals should be able to apply at a later date for an order from the courts revoking the declaration.

If such a measure as this is necessary—and the activities of the Communists in Australia, where they are more violent and do more damage to the economy than in Britain, perhaps makes it so—then Mr Menzies' amended Bill is probably as good a way as any of carrying it out. The chief objection to the original Bill, the placing of the onus of proof on the declared person, has been removed, and the Bill is now a fairly respectable example of how liberal methods can be used to defeat a totalitarian organisation.

State Education

Mr Fox's bill for providing the means of general education was thrown out on Wednesday by the large majority of 287 to 58. We are not sorry for it. The whole proceeding rested on what appears to us the false assumption "that the extent of education in this country is deplorably deficient." Judged of by any other country, the assertion seems incorrect. All that Mr Fox alleged in its behalf, was, that a certain portion—31 per cent. of males and 45½ of females—did not sign their name to the marriage registers; and that the per centage of criminals, who had received the instruction generally communicated in the national schools, had regularly increased. The first statement implies that the power of signing a name at a period of perhaps great agitation is identical with education. Nothing can well be more different. Writing is no more education than dancing; and it is highly probable that of the 31 per cent of the one or of the 45½ per cent of the other sex the larger part were educated to get their own living, and perform most of the duties of good husbands and wives, good parents, and good citizens. It may be doubtful whether those who could write were better able to perform these duties. Mr Fox gives us reason to suppose that they were not; and his second argument seems to knock his first on the head. He says that the per centage of criminals who had received the instruction communicated in the national schools, which includes writing, had regularly increased. The inference, therefore, may be, that writing increases crime, and renders men unfit to perform all the duties of good citizens. That is not our argument; it is a fair deduction from Mr Fox's statement . . . The great objection to Mr Fox's scheme is, that it would annihilate all private exertions. Whenever the State interferes to accomplish any object, people suppose it will be more effectually done than by any combination of individuals; and they conclude that they best fulfil their duty by merely paying their money. Mr Fox would substitute for individual exertions the payment of a tax.

AEI

But THIS is History!

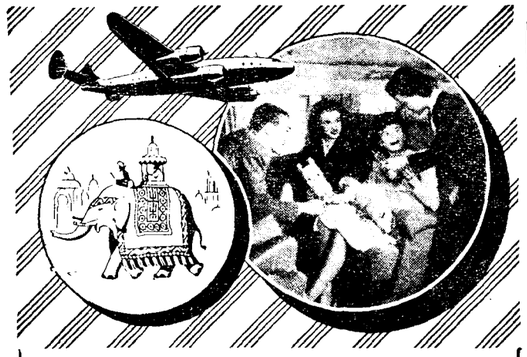
A FAMOUS DUKE OF GLOUCESTER (1743—1805) had a short way with history—and with the most eminent of historians:

"Another damned, thick, square book! Always scribble, scribble, scribble! Eh! Mr. Gibbon?"

In our place and age Associated Electrical Industries make bold to "scribble, scribble, scribble" a few figures. And they are well worth recording, well worth remembering: figures that make sense in the industrial history of today.

WHAT does it ADD UP TO?

Annual output	**£50,000,000**
Amount spent on research every year	**£1,000,000**
Square feet occupied by research	**600,000**
Men and women in largest factory	**18,000**
Men and women in smallest factory	**100**
Total number of employees	**53,000**



It all adds up to **AEI**

Associated Electrical Industries

And just what is AEI? It is the parent company of many of the greatest producers of electrical equipment—all names you will recognise in the list below.

The British Thomson-Houston Co. Ltd.
Metropolitan-Vickers Electrical Co. Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.
International Refrigerator Co. Ltd.
Newton Victor Ltd.
Premier Electric Heaters Ltd.

Personality and Prejudice

"From Napoleon to Stalin." By A. J. P. Taylor. Hamish Hamilton. 224 pages. 12s. 6d.

MR TAYLOR has produced a volume of reviews and essays that has the defects and merits of most such collections. The defects are due to the fact that these essays were inspired by fortuitous occasions—a centenary, a personal experience, the publication of a book—and lack any unity except that imposed by the personality and prejudices of the author. The merits are due to the pungency of that personality and the strength of the prejudices.

The essays fall into two parts, one historical, the other political. The historical essays range from Napoleonic topics through 1848 to Germany, France and the diplomatic situation at the turn of the century. The political essays deal with memoirs and documents published since the war, and with Mr Taylor's personal experiences at two international conferences—the conference on the history of 1848 at Paris, and the conference of intellectuals at Wroclaw. Several pieces in the second part of the book deal with topics already admirably discussed in Professor Namier's recent collection of reviews, "Europe in Decay."

The historical essays are too short to add to our knowledge, but they have the merit of containing stimulating generalisations that at least make the reader think again about his own interpretation of the nineteenth century. Is there, for instance, a grain of truth in the paradox that most German political activity is "a perverse aping of the earlier French achievement"? Does it, perhaps, illuminate the subsequent period to see 1848 as the year in which "Europe broke consciously with its past"? In essays as brief as these, too, there is no need to take too seriously all of Mr Taylor's bold generalisations—to talk of Caprivi as conducting an "experiment in Liberalism" and as "the only parliamentary Chancellor of Imperial Germany" is misleading; Caprivi was a routine conservative put as such into office by the Emperor. To suggest that Bruck's plans for an economic *Mitteleuropa* are scarcely to be distinguished from those of William II or Hitler is to misinterpret the Habsburg monarchy of the fifties in a way Mr Taylor avoids in his own "Habsburg Monarchy."

It is these *boutades* that give the book its flavour and the author does not attempt to conceal his prejudices behind a mask of impartiality. In his history and his politics, Mr Taylor makes a point of being a deviationist. If he deviates from many of the accepted views of 19th century history, he is also prepared to deviate from the paths of the fellow-travellers as his account of the Wroclaw Conference shows. Fortunately for him, this does not oblige him to give up that sympathy for the Slavs which colours his writing. Like other men of the Left troubled by the stupid rigidities of Soviet policy, he finds a refuge in Tito's Jugoslavia; the book ends with an essay, the longest in the book, in support of the Jugoslav claims to Trieste, and with a brilliant piece on the Tito-Stalin controversy.

Mr Taylor is at his best when his passionate pro-Slav and anti-German feelings are not involved and there are admirable notes on French colonial expansion, as well as penetrating character studies of Lord Salisbury and Lord John Russell. Above all, however, it is for their vigorous style and controversial qualities that these essays are worth reading, and not as sources of information on specific topics. They are points of departure for discussion rather than carefully balanced final judgments. As such they can be read with great pleasure.

Contrasts in Optimism

"Towards Freedom from Want." By D. Spencer Hatch. Oxford. (Geoffrey Cumberlege). 296 pages. 15s.

"New Worlds Emerging." By Earl Parker Hanson. Gollancz. 373 pages. 16s.

EACH of these two books carries a quotation on its title page: a quotation supremely well chosen to represent the spirit of the ensuing text. "New Worlds Emerging" opens with the challenge of the sixteenth-century explorer Robert Thorne: "There is no land unhabitable, nor sea unnavigable." "Towards Freedom from Want" strikes a very different note with Rabindranath Tagore's invocation to the God of "the poorest, and lowliest, and lost." Yet they have much in common. Each is concerned with the rescue of humanity from starvation, disease and squalor; each is the work of a practical enthusiast, impatient of theories and preconceived ideas or unconcerned with them; each, it is safe to say, deserves attention.

"Towards Freedom from Want" is a really entrancing book. Its attraction lies partly in the fact that it is a success story, told in the simplest terms and dealing with the simplest things, of pioneering on a hidden frontier; the frontier constituted by the untapped and wasted human resources of a squalid, starving and disease-ridden Indian village community. To read that story, of the growth of co-operation, of the wonderfully rewarded efforts of self-education, of the breakdown of cast barriers, of victory over innumerable obstacles made mountainous by ignorance and lack of funds, is to recapture the exhilaration with which in the undisillusioned twenties one watched such a Russian film as *General Line*. A small boy bee-hunting in the forest, an elderly outcast bearing a basketful of fine fresh full-sized eggs to the co-operative market, a whole village toiling in new-found unity to build, for the first time, a road linking them with the outside world—these and other similar pictures catch the

OXFORD ECONOMIC PAPERS

(New Series)

★The June issue contains a 70-page article by Professor E. H. Phelps Brown and Sheila V. Hopkins presenting the results of a new investigation into THE COURSE OF WAGE RATES IN FIVE COUNTRIES, 1860-1939 (United Kingdom, U.S.A., France, Germany and Sweden).

The issue also contains the Report of an Oxford Research Group on Productivity, an article on Retail Trading, by P. W. S. Andrews, and an article on the Equalising Effects of Death Duties, by G. Z. Fijalkowski-Bergday.

★In 1951 three issues will appear instead of two, as at present. The prepaid subscription rate of 21s., post free, for a year's issues will remain unchanged, and the price of a single copy will be reduced from 12s. 6d. net to 10s. net.

HUTCHINSON'S UNIVERSITY LIBRARY

imagination and warm the heart. But the pioneering element is not the whole story. More important is its underlying spirit, recalling that of Albert Schweitzer's story of Lambarene. Here, naïvely expressed, implied rather than described, is an ideal of New Testament neighbourliness all the more impressive for the complete absence of missionary intolerance and the fullness of the co-operation revealed, in spiritual as well as in material matters, between Christian and Hindu.

Dr Hatch deals with the human, the small-scale, the grass-roots; Mr Hanson with the technical, the continental, the aerial view. He is an optimist with a difference. Erosion? Pressure of population? Stagnation? Famine? Nonsense. The frontier is there for all to see. The Arctic can be hospitable, the promise of the Amazon Basin equals that of the prairies a hundred years ago. Africa can support a dense and highly civilised culture, if only the new pioneers will have the sense to learn from their existing inhabitants and co-operate justly with them. His evidence for these propositions ranges from the solidly practical to mere bluff assertiveness; he is bumptiously intolerant of disagreement, wonderfully tolerant, on the other hand, of any kind of brutality and tyranny, from Liberia to Siberia, whose result is a conquest of new resources. Of his understanding of the economic, as against the technical, situation enough can be inferred from the fact that the highest aim of United States policy, in his view, is to emancipate American industry from dependence on raw material imports from the British Empire. One wonders, with some misgiving, whether the assistance presently forthcoming from America under the Fourth Point will take its colour from the Hatches or from the Hansons.

Faith in the Commonwealth

"The British Family of Nations." By John Coatman. George G. Harrap. London 1950. 271 pages. 10s. 6d

THE title of this book, which on the wrapper is superimposed upon a map of the world with the Commonwealth countries picked out in the traditional red, gives it a somewhat outmoded air. In one sense this is misleading. Mr Coatman is not preoccupied with past developments; on the contrary his book contains little history and less constitutional theory. It is, however, indicative of the advantages and disadvantages of his approach. The events of the last decade have not shaken Mr Coatman's faith in the political ideas of the Commonwealth nor seriously modified his opinion of its place in the world. His faith enables him to write with understanding of recent developments in dominion status and with sympathy for colonial aspirations, but in the external field he makes insufficient allowance for the changes that have taken place in the pattern of world politics. It is partly for this reason that the book gives an impression of complacency, which is heightened by an almost ecstatic recitation of the vast potential wealth of various Commonwealth countries. Southern Rhodesia "may well provide the most spectacular example of industrial development in the Commonwealth in the next few decades"; Northern Rhodesia has "great possibilities" with its "immense deposits of copper"; "the immense promise of the African colonies is hardly appreciated"; "British Borneo seems to be one of the most promising areas for Commonwealth oil production in the near future." It all sounds very exciting, but, at a time when we have become painfully aware of the difficulties of translating promise into achievement, also a little unreal.

In the political field Mr Coatman is also disposed to overstatement or confident prediction. The reinforcement of the Colonial Office Ministerial team by the appointment of a Minister of State in 1948 is accorded overmuch significance, while the once familiar presumption that the colonies of today will be the dominions of tomorrow is accepted without any adequate examination of how far it is justified at the present time. But if all these are reasons why the reader should approach this book in a critical spirit he should not be thereby discouraged from reading it. It contains some shrewd comment and much useful information, selected with the insight that is born not of cool detachment but of affection.

Southern Survey

"Economic Survey of Latin America, 1948." UN Publications, H.M. Stationery Office. 279 pages. 15s.

THE Secretariat of the Economic Commission for Latin America has issued a report, which is the first step in the preparation of a complete and fully documented study of the economic condition of the South American republics. Although complete statistical data are lacking, and the available material not always strictly comparable, this is nevertheless a valuable commentary on both prewar and postwar conditions in the region. The clear graphs and tables, and the well considered conclusions drawn from them, will be an invaluable aid to all who are concerned, either practically or academically, with the subject.

While it is true that all Latin American countries depend in the main on exporting primary products, there is an important distinction in that the mineral producing and the tropical agricultural countries export to the United States, and are therefore in a position to import dollar goods in exchange, while the non-tropical agricultural countries export their basic products to Europe and Great Britain, and can only buy the dollar goods they need out of the conversion of their favourable balance of payments.

As a result of the depression and two world wars, attempts were made to achieve a more balanced economy, designed to decrease dependence on extra-hemisphere imports, and foreign capital in general. Industrialisation, and an enhanced war-time demand from the United States for South American products, seemed to be solving the problem along the desired lines, but contemporary conditions emphasise the permanent fact that the United States does not import meat and grain, while Europe and the United Kingdom do. For the non-tropical countries, therefore, economic integration with the ERP nations would appear indispensable; and owing to the disposition of natural resources throughout the southern continent industrial development in any of its republics must depend on the import of capital goods, either from Europe or the States. Moreover, the majority of Latin Americans still prefer to put their savings into real estate, so that industrialisation continues to need the stimulus of foreign investment. The long term conclusion of the survey is that the traditional economic pattern of the region can change little, in spite of the fact that the internal development of separate countries may show a drastic reorganisation.

Youth and the Youth Service

"Eighty Thousand Adolescents. A Study of Young People in Birmingham." By the Staff and Students of Westhill Training College for the Edward Cadbury Charitable Trust. Allen and Unwin. 188 pages. 12s. 6d.

No problem of today is more insistently brought to the notice of the ordinary citizen than the doings, or misdoings, of boys and girls between fourteen and eighteen or nineteen. Few so gravely afflict the national conscience, of none, perhaps, are the essential conditions so little understood. Explanations are frequent; efforts to find a remedy not less numerous; statistics, however, are in short supply. Considerable importance thus attaches to this survey. It is a serious effort, admittedly within a narrowish field, to get at the facts, and it took three years to complete.

It is based partly on visits to about a quarter of the youth organisations in Birmingham, partly on two questionnaires—one sent to the youth organisations; the other direct to the young people themselves. This second questionnaire, it has to be added, went to about 3,000 adolescents, there were 1,300

★ *A book of facts about people*

'The Home Market'

That there have been vast changes in our people's way of living since 1939 we all know. But what *are* these changes? 'The Home Market' tells the whole story—and tells it clearly and tersely with tables, pictorial diagrams, maps, using the minimum of text matter. From this book you learn the latest composition and distribution of population; changes in the number and size of families; drift from one region to another; what is earned and how it is spent; what papers people read.
You see a complete picture of the new Britain.
This is a book that every manufacturer and advertising man needs. It is also a book of great value to the sociologist, the economist, the administrator and politician. The first issues of 'The Home Market', of which Major G. Harrison and Mr. F.C. Mitchell of The London Press Exchange were joint authors, gained a high reputation in 1936 and 1939, and this first post-war edition has been brought entirely up to date and re-written by their colleague Dr. Mark Abrams.

replies, and the statistical tables are based on 1,000 replies. This may seem a rather slender statistical foundation. The research workers, however, were careful in selection, and, on the whole, the replies can be taken as generally representative and the conclusions reached as generally valid.

Those conclusions fall into two separate groups. One is concerned with the raw material on which the Youth Service works ; the other with the organisation and activities of the Youth Service itself. The answers, which the research workers believe to have been carefully and honestly given, give a fair picture of the raw material about which the national conscience is so worried. That picture can be described in two ways. On the reassuring side is the fact that things are not quite so bad as the sensational "snaps" in the press suggest. There is general stability of employment ; only a minority of young people drink or gamble ; about a quarter attend church or chapel regularly ; cinema attendances are of the order of three a fortnight, which is less than had been expected ; quite a substantial time is spent at home, though "at home" may sometimes be synonymous with "on the streets." Against that, however, is to be set the inescapable fact that the majority of these adolescents live in a sort of mental and spiritual vacuum. Few show any sign of ambition ; few read or want to read, except the easiest and least useful material ; not many have much in the way of mechanical aptitudes. In general, the concern seems to be to fill in leisure time with the minimum of effort.

As regards the Youth Service, it appears, on the evidence of this survey, that the organisations which keep their members and benefit their members are those, so to speak, with a purpose—the pre-Service organisations, the uniformed bodies, the clubs associated with churches and chapels, even the politically-minded youth clubs. The survey comes down very definitely on the side of the organisations with a religious background and purpose. The club which seeks merely to fill leisure has no future and is of doubtful value.

Letters to the Editor

Laval and Britain

SIR,—I was the correspondent of the *New York Herald Tribune* in Vichy from July 17, 1940, until November 12, 1941, and therefore I read with astonishment the statement of Jacques Guérard in his letter published in your issue of May 13th last that Laval was "no enemy of England."

I had seen Laval several times in his office on the Champs Elysées during the winter of 1939-1940 and knew from what he told me that he had never forgiven Britain for her part in taking sanctions against Italy in 1935 and so ruining his agreement with Mussolini. On July 25, 1940, Laval received the American newspapermen in his office at the Hotel du Parc at Vichy. My diary entry for that date says that Laval

> was very bitter against the English. When I asked him whether he didn't think that the future of France depended on Britain winning the war, he said (1) he was sure England wouldn't win the war, (2) that France didn't look to England to safeguard her interests.

About a month later Paul Baudoin, then Foreign Minister of the Vichy Government, said that he would receive the American press and would answer one question from each of us, if it were submitted in advance. My question, handed in to M. Guérard, at that time *chef de cabinet* to Baudoin, read:

> Other than by a British victory, how can France expect to regain Alsace-Lorraine and to retain her Empire?

M. Guérard refused to accept this question, declaring that it was "insulting."

—Yours faithfully, JOHN ELLIOTT

New York Herald Tribune

Wages Policy

SIR,—The position of the lower paid workers, especially of those earning less than £5 a week in basic earnings, has been an urgent problem for some considerable time, and in the new demands for wage increases we are bound to hear more on the subject. But so far I have seen no figures which would help us to understand how widespread the condition is, in what trades it is to be found and from these, why the position has arisen at all.

As matters stand at present, an affair of social concern, more political than economic, will be made the excuse for a general increase in wages with a long-term benefit to very few. In the contest those with less than £5 a week will receive differing benefits, depending on the strength in bargaining of their respective unions, and the ability of their respective industries to absorb the increased costs.

My own suggestion is that the Government should gather the material and statistics concerning all employed persons who are at present earning less than a certain "minimum" wage (say £5) for a basic week (say 44 hours). It should then classify the reasons why the wage earner cannot earn more either in the same trade or by moving to another.

For those who are still young enough to have prospects of promotion or upgrading, or could be trained for a more highly paid job, I think the Government, given the present economic attitude of society, should allow the incentive of moving to operate unaided.

But for those who are 40 years old or more a change is far more difficult, no matter what theoretical advantages wage differentials may offer. In cases such as these Parliament might well consider granting a subsidy in the form of a pension until the normal age of retirement, of an amount sufficient to bring the wages to the "minimum" level. The details could be worked out more fully only with the aid of more precise figures, but it would be an essential feature that the subsidies should be paid only to those at present in the employment, i.e. no future applicants could qualify. This would limit the economic disincentive effect to these few cases where we have presumed no incentive to exist.

Such a subsidy would also make the nature of the payment clearly recognisable—a social judgment about minimum living standards. As such it would not be chargeable to the industry, with effects on employment and prices. Other wage demands would then have to stand or fall on their merits.—Yours faithfully,

R. A. GREGORY

Featherbed Farming

SIR,—It is a mistake to discuss this matter from the standpoint of justice and injustice and moral indignation. The question which really matters is: in contemporary England is it intelligent to devote money and time to farming? In terms of currency per nutritional unit, British produce is not competitive with imported produce. This is supposed to show that the British farmer is inefficient and should have his profit reduced. In fact it means that the British farming process is a high-cost process like all other British processes, paying off too much all along the line: vet, engineer, worker, seedsman, miller, advisory officer, appliance merchant, fertiliser take too big a cut, like everyone else in Britain (except the farmer).

Food costs more than people want, so they think "bash the farmer and make it cheaper." But agriculture will not continue to function unless it earns on its capital comparably with other industries which require capital, pays equivalent salaries and provides for depreciation. If foreign, particularly American, produce could be freely obtained and if wars did not occur, there would be no need for agriculture to continue to function except in election years. But the same high-cost factors which make agricultural produce expensive, operating throughout the British economy, preclude food imports on the prewar scale. The impeccable efficiency of agriculture's urban critics has not, surprisingly, made them sufficiently competitive exporters to buy American food surpluses. In the event this nation, with a sigh, has resigned itself to eating English. It will also have to resign itself to doing so *at cost*, including interest, salaries and depreciation. If the cost is high, it has only itself to blame.—Yours faithfully, R. N. HIGINBOTHAM

Mill Farm, Robertsbridge, Sussex

Oxford on Keynes

SIR,—Surely Mr Fforde has forgotten imports, that sovereign remedy for inflation. I am the last to attack American fiscal policy *in recent years* for it is clearly this and nothing else that has saved the free world. When there was nothing to import, and a vast export surplus was necessary to preserve democracy elsewhere, a budget surplus was in order. But Europe can now supply the goods and the export surplus has become an incubus. Of all countries America has least to fear from inflation and most to gain from full employment, as with her large gold reserves she can import indefinitely.

Quite apart from the possibility of imports, we should mistrust the doctrine that unemployment regularly below 5 per cent is inflationary and therefore necessitates physical controls. Often and confidently asserted nowadays, it remains without proof. If it were true it would be an overwhelming argument in favour of physical controls. But even with an improving balance of trade so little unemployment has not been inflationary in France, and in any case inflation with physical controls is surely quite as noxious as without them.

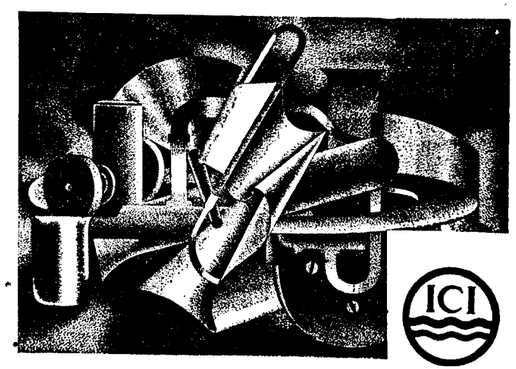
I remain convinced, Sir, that the crudest and most naïve attitude is here the right one. The post-Keynesian subtleties do not apply.—Yours faithfully, P. J. D. WILES

New College, Oxford

Defence of the Levant

SIR,—The main thesis of your article on "The Defence of the Levant," published in *The Economist* of last week, is that the first aim of the west with regard to the Near and Middle East should be the strengthening of the defences of this area. Although it is realised, especially in Turkey, that the defence requirements of the area are urgent, it seems to me that the pre-condition of a lasting and secure basis for co-operation between Near and Middle Eastern countries and the western world is the working out by the countries concerned and by the west of a general social and economic development plan covering the whole area and laying down, in as concrete a form as feasible and country by country, the social and economic standards, the achievement of which could be made possible by the efforts of the countries themselves and the help of the Atlantic community in, say, the next ten or twenty years.

This collective approach to economic and social planning might be the best way of overcoming national susceptibilities and I do not think that any of the governments concerned, however reactionary, could incur the responsibility of refusing to participate in this general scheme.



Until the time when the west has the vision and the audacity to interfere in the Near East with a view to helping governments which make progress towards the stated goals and to withdrawing support from governments which fail to do so, the inhabitants of the Middle East will continue to view all Great Powers as equally self-interested and their attentions as unwelcome and oppressive.—Yours faithfully,

7 *Peas Hill, Cambridge* OSMAN OKYAR

Achievements of an Industry

Genius for invention is inherent in the British people. In a previous series of announcements — "Ancestors of an Industry" — I.C.I. told the story of Britain's scientific pioneers from A.D.1144. The present series is designed to describe some recent British chemical achievements, many of which have been the genesis of new products and processes which have given fresh vigour to the nation's industry.

Such achievements have been sometimes the brilliant discoveries of inspired individuals, but are more often the work of teams of research chemists co-operating on a given task and working to a set plan. The announcements in this series are proof — if proof were needed — that the British spirit of initiative and enterprise is still alive.

AMERICAN SURVEY

Westminster in Washington

(From Our American Staff)

THE suspicion that, as the *New York Herald Tribune* said recently, "the old division between Executive and Legislature is increasingly impracticable under conditions in which the nation as a whole must assume large and continuing obligations in a greater political organisation" has led to some hopeful American exploration of British constitutional practices. It was for long assumed, and is still regularly asserted by the *Chicago Tribune*, that, because the British Constitution is not available, like the American, in one package, it does not exist at all. But lately it has been discovered and searched for some cure for those constitutional diseases which are epidemic in the United States Government but from which Britain seems immune.

The knowledge that the McCarthy episode would have been stifled at birth under the Parliamentary system, and that the Senate subcommittee investigating his charges was doing little more than strike partisan attitudes, led the *Washington Post* to suggest (in a three-column leading article reprinted all over the country) the creation of a Commission on National Security. It should be appointed, the *Post* thought, by the President "after genuine bipartisan agreement on its membership." This idea was welcomed everywhere as a means of climbing out of the McCarthy mess, and the British type of Royal Commission was mentioned more than once as a possible model. The value of the Royal Commission as an investigating device was brought forcibly to American notice when so many convictions were obtained in the Canadian spy case with so little fuss. Four years of hysteria having produced far less south of the border, magical properties are sometimes attributed to the British treatment.

The division between Executive and Legislature, however, is not, like Senator McCarthy, a disease which finally runs its course or one which is susceptible to cures; it is a structural defect in the Constitution, one which was the accidental product of Montesquieu's misunderstanding of the workings of the checks and balances of the English system. A first attempt to overcome this defect by outflanking the Constitution was made last week when the Secretary of State spoke to, and was questioned by, both Houses of Congress when he came back from Europe. The current popularity of British models was shown by the persistent way in which this session was compared to question time in the House of Commons.

The session was only partially successful—for a number of reasons, none of which need be continuing ones. The locust-plague of press, movie and television photographers will presumably leave such meetings in peace as soon as they have picked the publicity field clean. Without the blinding light and heat of the Kleig lights, all concerned will be more relaxed; the questioners, when they are used to the new procedure, will be less nervous and, therefore, less combative in manner. And it was, perhaps, a mistake to have the first question period for a Cabinet Officer immediately after he had read a long, taut state paper which contained a great deal of meat. The more intelligent among his audience obviously wanted time to digest it before asking questions and stayed silent, leaving the field largely to those who had brought their King Charles's Heads with them.

The performance bore little or no resemblance to question time at Westminster—except that questions were asked—and, indeed, the right model is much nearer home, in the Town Meetings of New England. That last week's session sounded at times more like the shareholders' annual meeting of a company that had had a bad year was a reflection of the curious mutual distrust between Congress and Mr Acheson. The questions emphasised the shareholders' concern with the misfortunes which had befallen the company's Chinese branch, but failed to show that anybody appreciated the importance of the agreements the managing director had just concluded for the development of the European market.

There were, however, enough members of Congress who approved the experiment—in particular those who do not belong to any of the committees studying foreign affairs and who appreciated the opportunity of questioning the Secretary of State at first hand—to give this experiment a second chance. It fits, after all, into the pattern of total diplomacy at home and the creation of an Atlantic Community abroad which Mr Acheson considers vital to western security. Each member of Congress must understand the nature of the crisis and accept his full share of responsibility for the operation of foreign policy; each member of the American public must understand and must behave in such a way as to help his country's policy. All the Atlantic countries must understand and integrate their policies to the same end.

*

Mr Acheson showed what had given him the greatest satisfaction during his European visit by the emphasis he put on the passage in his speech describing the meetings. "The significance of the discussions," he said,

> lies in the fact that they are working business meetings and that they are becoming a regular institution. In this aspect of the meetings, we see the outward sign of a comprehension which ran through every discussion and every resolution—that the North Atlantic Community is emerging as a political reality of the greatest importance.

It is only when such a political reality is in prospect that the policy of building balanced collective forces becomes a military possibility. And without balanced collective forces, and he repeated this view to the Senate Committees later,

> we can see no way to accomplish the job of defence and at the same time to get ahead with the constructive task of building a successfully functioning economy in the free world.

Having succeeded better than he hoped abroad, the Secretary of State must now turn his attention back to the home front. The gaps between country and country seem to be slowly closing; he must now try to close those between Executive and Legislature and between Government and people. Regular meetings with Congress seem the only way, short of a major change in the Constitution, to do the former while the latter means a wearisome series of speaking engagements over the next few months. His experience in San Francisco in March, where he started his campaign of explanation of the nature of the world situation, was an encouraging beginning, but only a beginning. Total diplomacy will have to be explained in every big city in the country before the balanced collective forces have what they so urgently need—a balanced collective opinion behind them in the United States.

For, as Mr Acheson told Congress,

> how far and how fast we go depends . . . especially on the United States. These meetings will be just as important as the Government and the people of America choose to make them. If we now support on a sustained basis the measures necessary to make this co-operative venture a success, we will not find wanting a similar response from our friends and allies.

Two days later, when explaining the second year's requirements for military aid, he offered no respite from the cost of preparedness in the foreseeable future, offering instead prospects of "more rather than less effort." Such bitter truths will not please either Congress or the country, both of whom have been told since the end of the war that the various foreign aid programmes would, within the arbitrary time limit put on them, make Western Europe economically viable and self-defending. But they flow inevitably from the reluctant admission that no end can be seen to the Russian cold war or to the need for permanent western vigilance, and Mr Acheson is stating them more and more bluntly.

At such a time the response of the friends and allies becomes important, as was shown by Senator Knowland's request for information on the proportion of each country's budget (national income would, perhaps, be a better guide) which is being devoted to defence. There is no doubt that the United States is willing to do its share—and, at the moment, more than its share. But the value of the American effort will not have been proved until Britain first, and other countries later, move from the category of dependence into that of independence—and finally into that of partners able to carry some of the burden.

American Notes

Arms for Allies

Provided they pay their money, Congress and the American people can take their choice of official statements on the Mutual Defence Assistance Programme and can make up their own minds both about the prospects for peace and the duration and cost of the programme. The President, sending Congress his request for a second year's authorisation for MDAP, denounced "Communist imperialism" and Russia's aggressive power politics in unprecedented detail; he seemed to imply that Europe will need the defensive strength which, as his accompanying report showed, has been mobilised with unexpected success during the programme's first year. But at his recent press conferences Mr Truman has insisted that genuine peace is nearer today than at any time since he took office. Mr Acheson, giving evidence to Congressional committees, emphasised that MDAP is a programme for preserving peace, not for waging war, but refused to make any concession to those questioners who hoped that its cost might be reduced before long. The Secretary of State is naturally anxious to allay Europe's apprehensions about the programme; the Secretary of Defence, on the other hand, is accustomed to encouraging the apprehensions that are an even sharper spur to Congressional generosity than are hopes that the generosity will not have to be repeated. Mr Johnson in his evidence therefore stressed not only the danger of war but also the possibility that military aid might cost less next year.

This seems improbable, since the programme is now changing from an emergency one in which small arms and surplus supplies were sent to the Atlantic Pact countries into a long-term one involving tactical aircraft and other weapons, the best and most modern that American technology can devise. Apparently it is the defensive potentialities of these new weapons that explains why both Mr Johnson and General Bradley now believe that a successful stand in western Europe is possible. And it is the knowledge that their soldiers would no longer be needed merely as expendable tank fodder that has made the new idea of balanced collective forces acceptable to European countries, an idea which goes far beyond that of the integrated planning on which Congress insisted last year.

Under the Administration's proposed authorisation for military aid in the coming fiscal year, the Atlantic Pact countries will have $1 billion, as they did during the present year. The rest of the total of $1,222,500,000—which is slightly less than last year, but slightly more than the budget estimate—is to reinforce the democratic dam at the other places where pressure is greatest—Greece, Turkey, Iran, Korea, the Philippines and the general area of China, which has come to mean South-east Asia. The effectiveness of such reinforcement is demonstrated by the fact that

£  $

Pounds and Dollars

Officers of the three Chase Bank offices in London have a particular interest in the problems and opportunities presented by Anglo-American trade—further, they are intimately and continually familiar with conditions on *both* sides of the Atlantic.

THE CHASE NATIONAL BANK
OF THE CITY OF NEW YORK
A United States Corporation with Limited Liability
LONDON — 6 Lombard Street
51 Berkeley Square Bush House, Aldwych

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Greece and Turkey this year need $90 million less than they did last.

Various changes which experience has shown to be desirable are also requested in order to make the legislation more flexible. Some modification is needed of the regulation requiring countries not eligible for military aid to pay in advance for any weapons they buy; the difficulties to which this has given rise in the case of Canada were discussed last week by our Ottawa correspondent on page 1223 of *The Economist*. The Administration would also like broader powers to foster military production in Europe; at present only materials and machine tools may be provided for this purpose. Finally, most important and also most controversial, the President has asked for authority to divert, at his discretion, a "small portion" of authorised funds to places not specifically mentioned in the Act, should Communist pressures be applied unexpectedly.

* * *

Commission of Last Resort?

Mr Sawyer's decision to throw two officials of the Department of Commerce to the Congressional lions does more than condemn them without trial—for few will take seriously the assurance that ouster proceedings do not reflect upon their loyalty. It also reveals, for the first time, a Cabinet officer attaching greater weight to the judgment, suspicions, and threats of a Congressional sub-committee than to the decisions of the Administration's own loyalty boards. In the midst of Senator McCarthy's attack upon "Communists" in the State Department, this is a concession that should not have been lightly made.

The two officials are Mr Remington, who was cleared of charges brought by Miss Elizabeth Bentley two years ago, and reinstated in a less sensitive post in the Department of Commerce, and Mr Lee. Mr Remington is in fresh jeopardy; a grand jury is considering whether new testimony that he was a Communist in 1937—when he was 18—warrants an indictment. Mr Lee is accused of using his position to delay aid shipments to the Chinese Nationalists, and of obtaining naturalisation under false pretences. Democratic members of a Commerce sub-committee are thought to have promised Mr Sawyer that, if he dropped these Jonahs, his department would escape the wholesale investigation that the Republicans are still demanding.

*

One of the reasons Mr Truman hesitates to appoint the high calibre, non-political commission to report on the McCarthy charges, which many observers believe alone would command public confidence, is precisely that it would reflect unfavourably, and quite unfairly, upon the work of the Loyalty Review Board. But the group of liberal Republicans, headed by Senator Smith of Maine, who last week denounced both Senator McCarthy's methods and Republicans who hope to profit from them, were only less critical of Democratic "whitewashing." Even if the sub-committee investigating Mr McCarthy's charges were blameless—and Senator Tydings, its chairman, has sometimes been over-hasty in jumping to favourable conclusions—the fact that three of its members are running for re-election this year is regrettable. It makes a unanimous verdict impossible to obtain, arouses suspicions of bias, and deprives them of the time to do a thorough job.

The President's reluctant decision to allow the sub-committee to see the 81 loyalty files of the State Department, which Senator McCarthy once said would settle the matter one way or another, is likely to have no such effect. Mr McCarthy insists the files have been "raped" of their incriminating evidence and that, in any case, they do not cover all his suspects. The *Amerasia* story alone opens up a new, though related, field of inquiry. Only two convictions were obtained, in 1945, against the staff of the magazine and those who had supplied it with secret government documents. The Republicans are far from satisfied that this was due entirely to the excessive zeal of government agents, who entered the office, and private homes, without a search warrant. Evidence so obtained cannot be used in a trial.

Senator Tydings himself has asked the President for the assistance of a non-partisan, fact-finding group, even though this may be interpreted as a confession of failure. Mr McCarthy boasts that he will keep up his barrage until election day, and few doubt his ability to do so. In view of the Democrats' inability to silence his guns on the political level, Mr Truman may be forced to create a commission of inquiry whose conclusions would carry conviction to members of both parties.

* * *

Segregation Struck Down

The President's civil rights programme for the Negro may be held up in Congress, but the Supreme Court took an historic step forward this week when it struck down segregation in three test cases. These revolutionary decisions, each one unanimous, follow close on the heels of the abolition of segregation in the Armed Forces. The issue was the right of the South to force Negroes to use "separate but equal" facilities. This "separate but equal" doctrine is the legal fiction that for over fifty years has permitted the white South to evade the guarantee of equal protection under the laws for all races embodied in the Fourteenth Amendment.

In fact, as has often been noted, separation has been rigidly enforced, and equality ignored. Had the Supreme Court merely found that the education and railway meals offered Negroes were inferior to those provided for whites, these cases would only have reinforced earlier decisions that have already required the South to begin to supply better education for its Negroes. But the Court went further, though it still attacked the "separate but equal" formula only by indirection. In the first case, that of Mr Henderson, who, unfortunately for the Southern Railway, was a member of Mr Roosevelt's Commission on Fair Employment Practices, it found that the refusal to serve him a meal because the only vacant seats were at tables reserved for whites was a violation of a little-known clause in the Interstate Commerce Act. In the second, Mr McLaurin complained that the University of Oklahoma, although it admitted him to white classes, forced him first to sit outside the door of the lecture-room and later in a section labelled "Reserved for Coloured." His meals could be eaten in the school cafeteria, but not with white students. These restrictions, said the Court, impaired Mr McLaurin's ability to mix with other students and constituted a violation of the Fourteenth Amendment.

It was in the third case, however, that the Supreme Court demonstrated that equality and separation could never exist together. It insisted that the very fact that the Negro law school set up by Texas excluded all whites—85 per cent of the State's population—prevented Mr Sweatt from mingling with his future colleagues at the Bar and thus placed him at an educational disadvantage. He was ordered to be admitted to the white law school. The highest tribunal has decided that no matter how excellent the facilities offered a Negro, they are not equal if they are separate.

*

There are no legal precedents for these decisions; indeed the 17 States that practise segregation counted upon a favourable verdict because they could not believe the Court capable of eating so many of its past words. The decisions apply only to these specific cases, though the Negro organisations can be counted upon to press the new doctrine with zeal, and, in graduate education, at least, to which few Negroes aspire, the barriers were already being let down. It would be optimistic, however, to expect the decisions to have an

effect upon the whole educational system of the South comparable to that exerted by the Supreme Court's decision to outlaw the "white primary." This was the device that prevented the Negro from casting an effective vote, and the Court's ban has resulted in substantial increases in Negro voting. It will take a long and painful—perhaps even violent—period of adjustment before segregation in the schools is abandoned. Mr Truman, however, may congratulate himself on having won back for his party some of the Negro votes lost when the Senate refused even to discuss a civil rights Bill; his Department of Justice filed briefs in support of the cases brought by the Negroes, and in the Henderson case opposed that of another government agency, the Interstate Commerce Commission.

* * *

Labour United?

The American Federation of Labour, standing on its usual dignity, showed little more enthusiasm than in the past for the suggestion, made by the Congress of Industrial Organisations in April, that it is time to reweave the various strands of the labour movement into a solid rope. Mr Murray, president of the CIO, really wants a number of separate ropes, specially designed for hauling labour's friends to Congress in the November elections, for pulling wages and welfare payments up to higher levels, and for other purposes where united action seems desirable in the interests of the country's 15 million trade unionists. But in his letter to Mr Green, president of the AFL, and to the heads of the independent unions, Mr Murray proposed the establishment of a joint committee which would work first, it is true, for "functional unity" to achieve these immediate aims, but later for the "organic unity" which has not existed since 1936. The CIO's unwillingness to discuss such an abandonment of its independence and the AFL's refusal to discuss anything else has frustrated all previous attempts to splice the broken ends of the trade union rope.

Mr Murray's concession this time did at least induce the AFL to unbend to the extent of proposing a renewed effort to achieve complete unity. Mr Green argues that as long as the two organisations are competing against each other for members, they will find it impossible to co-operate satisfactorily in other fields. The AFL can afford to be generous; at the moment its membership seems to be stabilised at nearly eight million, while the CIO, after a decline in 1948, can honestly claim only about five million. The fear that it will be swamped explains the CIO's reluctance to give up its independence. Nor can its ambitious young hopefuls, such as Mr Reuther, be expected to feel happy about a unity which would reduce not only the number of top jobs in the trade union world, but also their chances of getting them.

*

Another difficulty arises from the rival unions within each organisation claiming jurisdiction over the same type of worker. But today the old argument over craft or industrial unions is a dying issue, and the AFL hardly challenges the CIO's right to represent the big groups of automobile and steel workers who make up about one-third of its membership. The CIO's Communist purge has sterilised the red germ with which it might have infected the AFL, and its readiness to work with the AFL in the international trade union federation has removed another cause of friction. There is therefore rather more solid reason than in the past for hopes that the latest approach may eventually bring unity. The CIO leaders are expected to give their answer to the AFL counter-proposal this week. The conversations seem likely to go on at least until after polling day in November, since a breakdown would hamper the joint political action which is already being undertaken by various labour groups in many cities and States, and out of which a genuinely united labour movement may gradually be woven.

Run-off in North Carolina

Senator Frank Graham, of North Carolina, has helped to salvage some of the prestige the Administration lost when Senator Pepper was defeated in the recent Florida primaries. A supporter of most of the Administration's policies, and the true representative of the most progressive State in the South, Senator Graham secured nearly half of a record vote cast to decide the Democratic nominee for Senator. In a one-party State the primary is decisive. But Mr Graham failed, by about 13,000 votes, to secure an absolute majority, and the runner-up, Mr Willis Smith, has, and has used, the privilege of asking for a run-off on June 24th.

Like Senator Pepper, Mr Graham is vulnerable on two points: his former membership in various Communist-front organisations, and his belief in Negro rights, though he opposes a federal ban on discrimination against Negroes in employment. He was luckier than Senator Pepper in that his two chief opponents, Mr Smith and ex-Senator Reynolds, themselves observed considerable restraint, though a whispering campaign no doubt did Mr Graham some harm. But unlike Senator Pepper, Mr Graham is credited with having been led astray through sheer goodness of heart, and never remained with a subversive group once Communist penetration was apparent. He has a strong hold on the affection and pride of North Carolinians, won during his 19 years as president of the State university and a long record of public service. His lead is heartening proof that the race issue is no longer decisive in an enlightened southern State.

It seems likely that in a straight fight Senator Graham will win; he needs far fewer of the votes originally cast for the unrepentantly isolationist Mr Reynolds than his opponent does. To the Democrats, his success is important, not only because of his internationalist viewpoint, but because he is one of the few links between the northern and southern wings of the party.

THE WORLD OVERSEAS

Report on German Reparations

THE Inter-Allied Reparation Agency (IARA), established in January, 1946, to allocate German reparations to the allied nations (with the exception of the USSR and Poland) has laboured faithfully in a poor cause, beset with frustrations. It is, therefore, understandable that its report, covering the period from its establishment to the end of 1949, should be slightly rancorous in tone and biased in favour of the Potsdam Agreement. For this reason, and because the Agency did not deal with reparations for the USSR, its survey does not provide all the data for a complete judgment of the practical results of Potsdam.

Nevertheless, the report gives much interesting information. The Agency now knows roughly, at long last, the value of the final pool of reparations under its aegis. Of the two chief categories—industrial capital equipment and external assets—allocation of the former was due to be completed this spring. The total received by the member governments will, it is estimated, be as given in the accompanying table. (The figures given by IARA are 1938 values expressed in 1938 dollars. They must be multiplied by two, according to the IARA report, in order to get approximate values in 1949 dollars.)

THE TOTAL RECEIVED BY IARA NATIONS

German external assets within the jurisdiction of Member Governments and in neutral countries	$293,300,000
Incorporation of the Saar in the French economy	$17,500,000
Industrial capital equipment	$146,800,000
German merchant shipping	$43,200,000
USSR reciprocal deliveries	$1,500,000
Captured enemy supplies	14,700,000
Total	$517,000,000

By the end of 1949 the totals received by the individual member governments were as follows:

(In 1938 Dollars)

Country	Amount Received at End of 1949	Country	Amount Received at End of 1949
Albania	975,974	India	8,269,015
Australia	3,084,078	Luxemburg	1,578,497
Belgium	15,161,965	Norway	11,294,660
Canada	2,919,363	New Zealand	1,053,874
Denmark	17,277,486	Pakistan	1,168,328
Egypt	2,565,613	The Netherlands	34,500,986
United States	102,569,186	Czechoslovakia	11,177,432
France	68,054,728	Union of South Africa	6,940,352
United Kingdom	84,249,297	Jugoslavia	29,875,350
Greece	10,150,646	TOTAL	412,806,830

America the Main Beneficiary

Two remarkable facts stand out from these lists. One is the low value placed on the Saar. The other is that the United States has received more reparations than any other of the IARA nations. Considering the billions of dollars that the Americans have spent on aid to Germany, the amount gained is exceedingly small; but it remains remarkable in view of the lead which Americans have taken in opposing reparations.

The explanation of the United States' share lies in the fact that German external assets seized by the Americans were greater than those available to any other IARA nation. The US proportion of other reparations (capital equipment and merchant shipping) was only 7.34 per cent compared with a percentage of 11.80 originally allocated to America. The United States voluntarily renounced some 65 per cent of the merchant shipping allocated to it.

British Gains in Shipping and Steel

The British share of German capital equipment and merchant shipping together has been the greatest, amounting to 27.56 per cent of all IARA allocations in this category. France comes next, with 21.98 per cent and the United States third. The British share of merchant shipping was much the largest, amounting to nearly 50 per cent of the total available to IARA; but it was still only 370,000 tons. Norway, with 11 per cent, was the second largest beneficiary at sea.

German iron and steel plants accounted for 30 per cent of IARA's total allocations of industrial equipment, and nearly all of them were not allocated until last year. Britain secured the greater part of the biggest item—the Thyssen works—as well as the whole of the Bochumer Verein and the Hoerde plants, and a section of the Goering works. The Petersberg Agreement, however, subsequently removed some parts of these plants from the reparations list.

The Soviet Union was granted at Potsdam the right to have 15 per cent of all capital equipment removed from western Germany, in exchange for commodities of equal value, together with an additional 10 per cent for which no payment would be made. From the Agency's report it would appear that the Russians have paid their full percentage and received equipment to the value of only RM 50 million (1938 values), or about $12.5 million (1938). This information conflicts with the data of the western occupation powers, which show that the Soviet Union has received in all—in the strangely low values used by IARA—some $24 million on capital equipment account, ranking third in this category after Britain and France.

Whatever the exact values, it is certain that the Soviet Union secured all the advance deliveries made from the west up to 1946, and that the list of acquisitions (not in the IARA report) contains a formidable number of modern war plants. There is nothing in the Potsdam Agreement to justify IARA's assumption that the Russians were granted a prior claim to their 25 per cent share of capital equipment from the west.

War Plants for Czechs

In addition to capital equipment, the Russians secured no less than one-third of Germany's merchant shipping. IARA was left with only 750,000 tons at its disposal, representing only 3 per cent of the losses of the Agency's member nations. The Russian share of western reparations was, of course, additional to everything Moscow liked to claim in the sphere of Soviet occupation. At Potsdam, the western statesmen assigned to Moscow the right to seize the entire Hitlerite industrial empire behind a line running from Finland, down the Elbe, through Austria to the Black Sea.

Though the Russians agreed to settle Poland's reparations claims out of their share, Czechoslovakia, Albania and Jugoslavia became members of IARA, and so entitled to a share in the western slice of cake. It is ironic, in view of subsequent developments, to note that Czechoslovakia—whose own industry was greatly expanded by the Germans—has received as much reparations as Norway, and that the chief item consists of war plants.

Of all the industrial equipment allocated by IARA actual war plant only accounted for one-third. The IARA report argues that removal of the rest has had little effect on German recovery. In fact, IAFA stands staunchly by the original level of industry plan which called for the removal of 1,800 industrial plants. If there had not been such a long delay in carrying it out, the original programme, says the report, would have been reasonable and useful to the recipients. Though IARA hopes the latest list is inviolate, it is not sure. The Petersberg Agreement of last November reduced the list of plants made available during the four years to 680 or 38 per cent of the original total; but in spite of Dr Adenauer's signature to the allegedly final accord, the campaign to cut it still further goes on.

It cannot be doubted that, bad as the Potsdam Agreement was, the long delay in its execution made it worse. After four years, the purpose of further reparations appears to be purely to restrict German industrial power, at best for reasons of security, and at worst, to hamper German competition. German industry has revived to the extent that it has—reaching the level of 1936 in April, 1950—not because the damage done by reparations has been small, but because of American aid and the inherent strength of the country's industry and people.

Cyrenaica Votes for the First Time

[FROM OUR SPECIAL CORRESPONDENT]

IN September, 1949, the independence of Cyrenaica—until then administered by a somewhat heterogeneous collection of British officials who formed the Civil Affairs Administration—was proclaimed by the Emir Sayed Idriss es Senussi in agreement with the British Government. There were three strings attached to this independence. Foreign affairs, defence and foreign trade were left under control of a British Resident, while the Emir voluntarily continued to employ a number of British officials as advisers. Last week, in the next stage of Cyrenaican independence, general elections were held—the first the country had ever known. They were blessed by Mr Adrian Pelt, the United Nations Commissioner for Libya, who has the final word in any major proposal put forward for Cyrenaica, or indeed for Tripolitania and the Fezzan. His task is to bring about the unity of Libya by 1952, and to assist the administrations of the three component parts in their task of preparing the Libyans for real, complete independence in that same period.

The Cyrenaicans voted for representatives of a National Assembly, which will assist the Emir and his government in selecting the best means of administering the scattered and mainly nomadic population. This is difficult in a country still suffering from war damage, widespread poverty and the general dislocation which is due, basically, to the fact that the Italians neither associated Cyrenaicans in their administration—the first the country had ever possessed—nor trained them to take their place. That the British administrations, which followed the liberation of Cyrenaica in 1943, have not in their six years of existence built better foundations is due, firstly, to the chronic lack of funds which hamstrung all our Civil Affairs administrations, and, secondly, to the tortuous ambiguities of the Italian Peace Treaty, which effectively prevented the disposal of former Italian property or anything like the best use of existing resources. In fact, the Emir still has to employ between 300 and 400 foreign officials—about 200 of them British—and is entirely dependent upon British subsidies and grants for the bulk of his national income. This situation seems bound to continue, for it will clearly be some years before there are sufficient Cyrenaicans to replace the foreigners or internal sources of revenue to make British funds unnecessary.

How is Libya to be Unified?

From amongst the representatives elected to the National Assembly five will be selected to go to Tripoli, there to discuss with representatives of the other Libyan provinces what should be done to implement the United Nations resolution for the unity of Libya. This is the key point of the Uno resolution and it was, indeed, only by its inclusion that the General Assembly was able to dispose of the difficult and tedious question of the former Italian colonies in North Africa. But it is the very point that makes the administration of Cyrenaica so difficult. The setting up of an independent Cyrenaica, strongly bolstered up by British advisers and British money, can in some ways appear to contravene that resolution. And when the British Government, in collaboration with the Emir, sought to negotiate an Anglo-Cyrenaican Treaty on the lines of the British-Transjordan Treaty, under which Britain would maintain a Cyrenaican Legion and rent the naval base at Tobruk and air bases at Benghazi and El Adem—thus securing the defence of this important coastal belt and at the same time providing the Cyrenaican Government with a useful, regular revenue and the Cyrenaicans with employment—Mr Pelt stepped in and vetoed the project. It is now in abeyance, though a brigade of British troops is stationed there.

Development of Green Belt

It is clear that the first task of the new Government and National Assembly must be to concentrate upon means of pulling the country together, economically and politically. Either inside or outside a united Libya better means of livelihood must be found for the scattered population of around 300,000. The country has a certain natural wealth in the considerable herds of sheep, camels and goats which

are raised, grazing on the sparse inland scrub country in the winter and the more fertile coastal belt in the summer. There is already a ready market for this meat in nearby Egypt and sales could easily be made in Europe if better means of transport could be provided. By introducing better breeding methods and improving fodder this trade could well be extended. It must be remembered, too, that the Italians were turning Cyrenaica's green belt into a large and prosperous olive grove, with excellent fruit and vegetables and a certain amount of wheat, barley and maize as side-products. Most of this has been allowed to decay, but it could easily be built up again by providing the necessary initial capital and employing a few expert agriculturists. But, whatever improvements are effected, Cyrenaica must remain a poor pastoral country and, barring outside assistance, whether in the form of quid pro quos under a treaty or mere charity, one quite unable to afford the benefits to be reaped from a modern administration.

Opposition to the Emir

It is here that the political question enters the scene. Opposition to the Emir and the Senussi family, and the way of life they stand for, is beginning to show itself in Cyrenaica. It is fostered and fed to some extent by Arab League circles in Cairo, who see the Emir only as a tool of the British, and by the xenophobic Omar el Mukhtar clubs, which are composed of young townsmen of violent views and are characteristic of opposition movements throughout the Middle East. They have, however, a certain justification, for they, and they alone in Cyrenaica, have opened night schools and sports clubs and are beginning to develop a certain civic sense. But while they clamour

for complete independence, the way of life they desire is that of the west—and the two are incompatible. Either they must be prepared loyally to support the Emir and the government, turn their backs upon the towns and begin again to live the simple life of their fathers until such time as their efforts begin to bear fruit, or they must relinquish all ideas of independence and enjoy their radios, their fountain pens and their western suits as the bounty of the wealthy foreign power to which their country must be tied.

Search for a Ruler

The more one considers the Cyrenaican problem the graver must be one's doubts concerning the wisdom or even the practicability of a United Libya. Even so small yet so important a point as the finding of a suitable leader, or figurehead, is proving a difficult problem. The only possibility yet to have emerged is the Emir of Cyrenaica. The Tripolitanians are believed to have been ready to accept Sayed Idriss—but not the members of his grasping, Egyptianised family. He is reported to have refused the offer on those terms, and to be reluctant to accept it on any. He seems that rarity amongst Middle Eastern leaders—a man without any particular ambition and one conscious of his own limitations.

Could Sayed Idriss be induced to accept the appointment, the problem would be slightly easier but far from solved. The populations of Cyrenaica and Tripolitania have become more drastically separated in recent months than ever before. There are several reasons. The Tripolitanians are far more advanced than the Cyrenaicans who are indeed extremely backward, and there are three times as many of them. Thus the Cyrenaicans fear that in any united Libya they would be swamped. Then, politically, Cyrenaica has always looked to Egypt, where many of their leaders spent their exile, whereas Tripolitania looks to the west. The countries have different currencies—the Egyptian pound in Cyrenaica, British Military lire in Tripolitania. But the greatest obstacle to any real co-operation is undoubtedly the vast desolate wasteland which separates the two countries. The journey from Benghazi to Tripoli takes 38 hours, but few buses or motor-cars care to cross the barren Sirte Desert, and there is little day-to-day communication between these North African neighbours.

The outlook for Cyrenaica is not promising. The United Nations have decided the country's future, but have made no suggestions as to how it is to be assured or even insured. The unity clause appears to militate against any steps which Britain, as occupying power until independence was proclaimed, might propose, and yet puts nothing in its place. Unity may sound fine, may, in principle, be an excellent step—but Cyrenaicans will find that they cannot eat unity, nor will it provide working capital.

Unemployment in Europe

For the first time the Economic Commission for Europe has found it necessary to devote a section of its annual survey of Europe to the "problem of unemployment." The lack of detailed information from eastern Europe has forced it to confine its discussion to western and southern Europe. In any case, eastern Europe suffers rather from a shortage of industrial manpower, although there is a good deal of concealed unemployment in the form of agricultural overpopulation; and, when Mr Arutiunian told the ECE the other day that western unemployment was due to the dumping of American manufactures, he was making what propaganda capital he could out of eastern Europe's freedom from industrial unemployment.

In fact, serious unemployment in western Europe is confined to three countries—Belgium, Germany and Italy. The survey divides the rest of western Europe into three fairly distinct groups. The first consists of Norway, Britain and Sweden, where the number of unemployed continues to be as low as is compatible with the functioning of the labour market. The second group consists of France, the Netherlands and Switzerland, where there is still full employment, but where its maintenance seems to be precarious because of a sharp increase in the number of applicants for every vacancy registered at labour exchanges. In France the number of applicants for every 100 vacancies rose from 244 in 1948 to 673 in 1949, and in the Netherlands from 90 in 1948 to 180 in 1949. The third group consists of Austria, Denmark, Finland and Ireland; all these countries are now faced with an unemployment problem, but in none of them has it yet reached serious proportions.

no late nights...

Some thoughts on choosing an advertising agency

An early (novelist's) conception of an advertising agency was that of a one-man band run by a "card"—a forceful character who thought of the ideas, the slogans and even did the sketches—all by himself.

A later (film) notion was of a cocktail party kind—bright young writing men and clever girl artists; contact men, entertainment, good shows, late nights....

Some of us sigh for the times we never had, but a real life visit to a first-class advertising agency today reveals a group of specialists experienced in many fields. You see a close-knit organisation with well-planned methods of operation, marshalling trade facts, examining competitive trends, analysing clients' problems; with the ideas-men holding a watching brief until everyone agrees what the idea should be about.

Only then, when the message *behind* the advertisements has passed the test of many minds, are writers and artists left to interpret it in terms of interest to the public—to dramatise, to make memorable, striking. It is quite remarkable what they can do, for instance, with a simple trade message like "look for the name Morley".

The choice of an advertising agency is a matter that calls for a thorough assessment of the resources of the agency under examination—the extent of its services, its experience, its talents, its people. *We of the Pritchard, Wood organisation invite such examination and suggest, as an interim measure, that those interested may care to write for a copy of our new prospectus entitled "Choosing an Advertising Agency", which tells more about our outlook and the way we work.*

It is difficult to gauge the exact extent of unemployment in Belgium because of the extremely generous provisions of the present social security laws, which render them very liable to abuse. But the ECE survey takes the view that the problem still remains a serious one in spite of all the mitigating factors. It traces the origin of Belgium's unemployment back to 1946-47, when the Government reduced capital investment in its anxiety to destroy inflationary tendencies so that economic controls could be safely abolished. For some time the effect of this was counterbalanced by the unsatisfied consumer demand stored up during the occupation as well as by rising exports.

Remedies for Belgium

But when the volume of Belgian industrial exports fell fairly heavily during the last half of 1949, there was no longer an unsatisfied domestic demand to offset it. An intensive export drive would, of course, be one way of alleviating Belgian unemployment, but the survey feels that it could at best provide only a partial solution. There must also be an expansionist internal policy to raise the level of domestic demand. Public investment in Belgium during the last few years has been at a low level, although the need for it is obvious. Belgian productivity is unusually low compared with prewar and a good deal of industrial equipment is urgently in need of modernisation. The survey suggests that it might be a good thing to subsidise temporarily the purchase of new equipment in certain industries on the lines of the policy pursued in Britain to encourage the textile industry.

The influx of refugees into western Germany is, as is well known, largely responsible for the unemployment problem there. In February, 1950, when seasonal unemployment was at its peak, it rose to nearly 2,000,000, or about 14 per cent of all wage and salary earners. Almost two-thirds of the increase of over 600,000 in the total labour force during 1949 were refugees or returned prisoners-of-war, and among the refugees the percentage of unemployed is nearly three times as high as among the indigenous population. Any serious attempt to tackle unemployment in Germany must start with the adoption of an expansionist policy by the

(a) Estimate. (b) Second half of 1948.

authorities, either through the provision of long-term credits or through direct deficit financing by the Government. Only recently have the lengthy discussions along these lines resulted in the publication of a Government programme of deficit spending for investments, mainly in transport and building. The survey does not refer to the fact that the Bonn Government is inhibited by political considerations from a wholehearted attempt to solve the unemployment problem by economic means. It would prefer a solutio through the reunion of all Germany and the return of th eastern territories now under Polish rule, so that most c the refugees could return to their old homes.

Any success in reducing German unemployment will giv rise to serious problems because the consequent increase i the demand for industrial and consumer goods will lead t increased inflation if it is not met. It is estimated that thei is enough unused capacity in German industry to meet considerable increase in demand, but it may not be easy t meet an increased demand for food from domestic source In this case, if payments difficulties hamper increased foc imports, ECE thinks it may be necessary for the Bon Government to abandon some of its *laisser-faire* principl and reintroduce the rationing of some basic foodstuff Otherwise it will be either confronted with severe inflatic or be forced to abandon its employment policy.

The Vast Problem of Italy

In Italy, heavy unemployment is an old problem, which h its persistence through periods of preparation for war ar of inflation has clearly demonstrated its structural characte The survey estimates that 4,000,000 would now be a co: servative estimate of total unemployment, open and conceale agricultural as well as industrial. The expansion of agricu ture (where possible) and large-scale emigration (which any case distorts the age-structure of the population) are n by themselves a sufficient answer to the problem. The must also be large-scale industrial development, especial in the south. But Italy's dependence on imports of food ar raw materials makes any such development very depende on the balance of payments position. This will be difficu enough when Marshall aid ends without the addition imports which an increase in industrial activity would involv The immediate prospects for an expansion of industri exports, on which the solution of the balance of paymer problem must principally depend, are not very good, large because of the high costs of Italian industry. But if expansionist policy does succeed in reducing conceal unemployment (which in industry alone may exceed 250,00c and causes equipment to be worked more fully to capaci it may well result in an important reduction in costs. B so long as the population increase is not checked Italy economic problem must remain a vast one.

International Action Needed

The ECE survey concerns itself principally with natior action to reduce unemployment. But the Internatior Labour Office, in the extremely comprehensive and usel report* which it has just issued, considers that only co certed international action will be really effective. It la down four possible lines of such action. The first is t stabilisation and expansion of the volume of world trac The second "and perhaps the most important" is t promotion, through continuous intergovernmental consul tions, of concerted national action to achieve full emplc ment in each country. The UN Economic and Social Coun has already recognised the importance of this and kec under continuous review the measures taken by individi countries to maintain full employment. The third line action lies in more international arrangements to make t currencies of the major trading nations available to the r of the world whether or not they are maintaining the le of their imports; and the fourth lies in international co modity schemes to stabilise the prices of primary commoditi It is obvious that the countries of western Europe, whetl or not they are now actually contending with an unempl ment problem, have much to gain from the promotion these ideas.

GREATER STRENGTH AND BETTER INSULATION

Moulding cuts production time and costs

A better job because of BAKELITE

Telephone plugs must be rigid and possess good insulation. Components like these are often built up laboriously and expensively by hand from machined parts. Alternatively, moulding in Bakelite materials provides solid and reliable insulation and cuts down production time; one type of moulded plug, for instance, has been tested to withstand a peak voltage of 1,400 volts, although the distance between concentric metallic members is only 0.015". Bakelite moulding material could probably save time and cost for you. Why not write to us and see whether we can help to produce better results more easily? Or 'phone SLOane 9911 for information. Our experience is at your disposal.

BANK-INSURANCE UNITS

AND THE REVALUATION OF THE £

INVESTORS in Bank-Insurance Units secure a freely marketable investment spread over the selected shares of 50 British banks and insurance companies.

The Trust Fund is as under :

Insurance companies	37½%
Canadian $ banks	15%
Other Dominion, Col. and O'seas banks...	14½%
Home banks	21%
Discount companies	7%
Trustee securities	5%

Unit holders are benefiting from the revaluation of the £. The sterling income from the 15% of the Fund invested in $ shares of Canadian banks will show an increase and should enable the recent steadily rising trend of annual distributions on the Units to be continued. The 37½% of the Fund invested in the shares of insurance companies will also be strengthened, for a considerable part of their premium income is earned in $ and the sterling value of their large $ investments will greatly increase.

Units can be freely bought and sold at quoted *net* prices (and information obtained) through any bank or Stockbroker.

Offer price 7th June 21/6½. Yield (conservatively calculated on net cost including commission and 2% Gov't. Stamp Duty, and subject to *reduced* rate of tax, allowing for D.I.T. relief) £3/10/0%, which may be further increased by up to ½%, according to the amount of the Unit holder's income for tax purposes, by his claiming additional double income tax relief. (N.B. Surtax payers obtaining this relief would be assessed for surtax on a higher income.)

THE BUSINESS WORLD

The Strain of Finance

IN the recent chorus of chairman's speeches, one common theme has sounded loud and clear. This is industry's present difficulty in finding enough cash to pay for the extended factories, new plant, and larger stocks and work in progress that it needs. It may seem odd that this universal emphasis on industry's financial straits should be coinciding with a period of peak earning power. In fact, the coincidence is not basically remarkable; the factors which have inflated industry's profits are identical with those that have put up its new capital costs. If it were not for the fact that the Chancellor taxes away more than half of industry's profit, the problem of capital replacement and extension would be much less evident, for industry would be in a strong position to finance its own needs.

Some of the answers to these problems of maintaining and extending industrial equipment during a regime of high prices and heavy taxation will doubtless be provided when the report of the Tucker Committee appears later this year. A general review of the scope of the Committee's work was given in *The Economist* of May 27th. A more precise illustration of the effect of prices and taxation on the maintenance of industrial capital was given a fortnight ago in Mr A. Stuart Allen's presidential address to the Society of Incorporated Accountants. Mr Allen examined the financial history of a business started in 1900 with a capital of £100,000. He suggested that the price level in 1948 was three and a half times what it was in 1900; therefore if this business were to succeed in maintaining its real capital intact, it would need to have set aside in the 48 years an additional sum of £250,000, making the required £350,000 in all. But this was a net amount; before taxation, the total of the annual sums required to find net new finance of £250,000 would be £443,700.

If the business had succeeded in doing this by the end of 1948, it would then face the further need to make suitable allowance for 1949, on total resources standing at £350,000. Assume, said Mr Allen, that prices rose by 5 per cent in that year; then the "price level reserve" required to maintain capital intact would be £17,500. Add to this the net cost of £3,300 for a 6 per cent dividend on the original capital (a modest enough assumption) and the following astonishing figures result:

	£	*Per cent of Issued Capital* (£100,000)	*Per cent of Capital Employed* (£350,000)
Profits before tax	43,400	*43·4*	*12·4*
Incomes and profits taxes	22,577	*22·6*	*6·5*
Net profit	20,823	*20·8*	*5·9*
Price level reserve	17,500	*17·5*	*5·0*
Available balance	3,323	*3·3*	*0·9*
6 per cent dividend on issued capital	3,300		
Balance	23		

This is the conclusion: in order to maintain real capital, to pay a modest dividend, and to find 28s. 6d. in profits tax and income tax for every 20s. of dividend and 20s. 5d. for every 20s. set aside to reserves, this concern has to earn no less than 43.4 per cent gross on its issued capital. And the end-result is merely to maintain the established level of its industrial equipment and productivity, not to expand them.

This is, of course, an illustrative case and it rests on its own particular assumptions. But it does not beg the main question of the need to maintain industry's capital intact despite all the difficulties of high prices and high taxation. It speaks a language foreign to those trade unions which are urging a limitation of profits in order, as it is said, "to prevent extravagant profits being taken out of industry." It rubs in once again the important distinction between profits reckoned as a percentage of issued as distinct from employed capital. For some 559 companies whose reports appeared in the first quarter of this year, earnings before tax on issued ordinary capital were 27.1 per cent; the percentage reckoned on a minimum estimate of their real capital was 12.2 per cent, out of which well over one-third was put aside to general reserves. The calculation of these figures is shown in the following table. It will be noted that the latest figures of earnings show a sharp fall compared with those of the previous year, while dividend limitation has been faithfully observed:

NET WORTH, TRUE EARNINGS AND DIVIDENDS
559 COMPANIES REPORTING JAN.–MAR., 1950

	Preceding Year	Latest Year
	£ Million	£ Million
Issued ordinary capital	*286·3*	308·9

On net worth — Net	*4·5*	4·2
On net worth — Gross	*8·2*	7·6

* Including amounts retained by subsidiaries, and after taxation. † After tax.

These first quarter companies do not, it must be admitted, show signs of acute financial strain. The inset table opposite consolidates their own consolidated balance sheets to show their financial condition at, roughly speaking, September last year. The growth of reserves and some occasional increases in issued ordinary capital (mainly in shops and stores and motors and aircraft) raised their long-term resources from £973.8 million to £1,041.7 million. There was no general resort to increased bank borrowing, for the rise in overdrafts from £44.6 million to £55.6 million was accounted for entirely by the special requirements of the tobacco companies and particularly of Imperial Tobacco.

These companies showed a further increase in stocks,

from £329.4 million to £353.5 million, noticeably concentrated in the consumption trades (breweries, clothing and footwear, food and confectionery, shops and stores and tobacco all showed marked rises) and evident to a more modest degree in iron and steel and the various textile groups. It is impossible to say *a priori* how far these increases reflected greater volume and how far higher prices. It was suggested when the "Economic Survey" appeared that investment in stocks last year amounted to £150 million, of which half was real and half reflected higher prices. Comparison of *The Economist's* quarterly figures with these official estimates of stock movements is not four-square, but it is worth making the point that our analyses for the last four quarters show a total rise in stocks of £200 million. Part of this increase belongs effectively to 1948, and recent quarters have shown fairly modest increases. But no evidence has yet come to light to support the conclusion in the "Economic Survey" that expenditure on stock building this year should not be large. If the daily dash of commodity prices continues much longer, the financing of inventories will soon become a major problem once again, and the nation's investment account will be showing signs of strain.

Note: Detailed analytical tables relating to the balance sheets and profits of these companies appear in this week's issue of the *Records and Statistics* Supplement.

For the financing of stocks at higher prices, industry's resources are not capable of indefinite strain. Taxation will eat away more than half of the so-called "inventory profits" resulting from higher prices, so that stock replacement at higher costs will impose an appreciable new burden. From the latest figures, cash has been rising and so have debtors (though creditors, it is interesting to note, have fallen). But the cushion of gilt-edged securities which industry now has is no longer of its former thickness; the holdings of these 559 companies were reduced from £57.1 million to £32.1 million in the past year. Apart from these problems of financing current items, however, there remains the abiding problem of the maintenance and extension of fixed assets. The book value of the fixed assets of this group of companies increased during the year from £516.3 million to £579.0 million; it seems probable that this was largely a genuine increase and was affected to only a limited degree by accounting changes and revaluation of assets. In any case, the net figure for fixed assets after deducting accumulated provisions for depreciation has increased from £385.3 million to £427.1 million, spread over such groups as steel, food and confectionery, chemicals, newspapers and miscellaneous manufacturing. Here is an increase of over 10 per cent in the net book value of the fixed assets of a cross-section of British industry. Can it be supposed that these companies in fact increased their real fixed assets by this high proportion? Does not the calculation rather suggest that the cost of capital extension will involve increases in book values quite out of proportion to the increase in capacity—that existing book values are far lower than

present costs of replacement ? The argument comes full circle to Mr Stuart Allen's final point: it is indeed true that because the replacement of the bulk of industry's assets has not yet become imperative, the gravity and magnitude of the burden has been disguised. But replacement remains inescapable if British industry is to progress, and it will only be possible given a wiser attitude on the part of the Government and the community about the real nature of profits and their role in sustaining industry's capital.

Furniture and Efficiency

THE Furniture Development Council recently published its first annual report. Since this is the first of the development councils (apart from the special case of the Cotton Board) to give a review of its work, the report has some importance. The council came into being on January 1, 1949, after the employers' representatives as well as the unions had agreed to its formation. The open hostility shown to proposals for development councils in other industries was absent because the more thoughtful of the furniture manufacturers were well aware that their industry is open to many criticisms. It could hardly be expected that the council would have a great deal to show for its first year's work ; the report covers a period largely taken up in creating an organisation and in appointing staff. Since, "while not ignoring day-to-day problems," the development council "is mainly concerned with fundamental long-term questions," rapid action is not its prime concern.

Still, the question is raised whether and how a body of this kind can deal with the long-term problems of such a rambling industry. The council's activities have so far included a brochure on accident prevention, educational courses for foremen, and preliminary work on standards of quality. But at the root of the industry's troubles there lies chronic excess of capacity, a bias towards deterioration of quality, and inhibitions about technical improvements. The controls imposed by the Board of Trade since the war have created a regime of mediocrity ; they have prevented quality from falling below a certain minimum, but they have also prevented quality from rising above an average which is none too high. They have impeded the natural weeding out of the least efficient and preserved all the worst prewar features of the industry. Can so gentle a body as the development council cope with problems of this order ?

A statistical appendix to the report on the structure of the industry lends point to the question. By the end of 1949, 3,055 firms had registered. Their aggregate output is about £100 million a year, almost entirely destined for the home market. All but ten per cent of the industry's output is of utility furniture ; 2,900 firms have licences from the Board of Trade for utility production, although only 1,962 sent in returns last year. About 65 per cent of the firms registered with the council had sent in returns of their utility production by the time the appendix was prepared. They included all the large manufacturers, and probably constitute a fair sample. The returns show that 83 per cent of the firms were producing 23 per cent of the total product. Of the firms in the Furniture Manufacturers' Federation, to which almost all the utility furniture makers belong, nearly 70 per cent employ no more than 25 men.

It is understandable that under these conditions furniture production is only partially mechanised. Many of the smaller producers buy their wood already cut and upholstering and other specialised processes can be subcontracted. Alternatively, all the processes can be brought together under one roof and on one assembly line. Division of work presupposes long runs of each design, which are easiest to obtain on items like nursery furniture where standardisation has been readily accepted by the consumer. Even when the design cannot be so easily standardised, it is possible to contrive considerable changes in appearance with no more than minor alterations in the size and shape of the components so that an apparent multiplicity of designs can be produced on the same production line. But there are few furniture undertakings that are beyond the scale of modest workshops. Certain types of article offer special difficulties to flow production ; chairs are one such case. It is unusual to get a run of more than 500 for a single design of dining chair. Unless the design is then radically altered—and this involves delays while machines are reset and production is reorganised—the chairs have a generally similar appearance, even though their detail may be different. The smallest manufacturers standardise simply by devoting the whole of their production to a narrow range of articles and designs ; their output is too small for such standardisation to be noticed by the consumer.

The demand for variety in appearance prevents the widespread adoption of new materials like plastics or metals, or such new techniques as the pressing of curved laminations. One manufacturer has recently had a run of more than 40,000 of a light alloy kitchen chair, while another has built a press to produce curved sections. But in general the cost of the necessary tools and their lack of versatility rule out such techniques and materials for most types of furniture ; consumers simply will not take a standardised product, even though it would be cheaper and could be better made. The same problem arises over the introduction of the comparatively new technique of radio frequency heating. Until the end of the war, the glueing of furniture involved spreading the joints with animal glue and "pinning" the glued sections with nails or screws which held them together while the glue-line gradually dried. The bigger factories are working on the design of jigs for radio-frequency heating which will set a glue line of synthetic resin in a matter of seconds. The cost of the jigs is high but the possible benefits in speedier production are very great provided that the firm concerned is working on long runs.

The full economies of assembly-line production are difficult to realise, and the smaller firms have certain trading advantages over the larger. Retailers demand variety, and are able to make their demand effective because the producers are so numerous : and variety is easier to achieve in small-scale production. Only by the greatest ingenuity can the bigger producers secure the length of run which they need without allowing the standardisation upon which it is based to become too obvious. This may explain why, when the furniture industry expands, its expansion tends to take the form of a larger number of producers, rather than a marked

increase in the capacity of the individual firm. But it does not explain why standards of efficiency vary so widely between firms of the same size.

A formula for design which will satisfy both the industry's customers and its critics is certainly not easy to find. The public buys the designs which have been in production for the past 20 years or more ; many critics press for the "contemporary" designs based on, for example, Swedish styles. It may be too hasty to interpret the bare fact that modest quantities of this latter type of furniture can be sold as a significant change in public taste. On this matter the Council of Industrial Design might have been expected to give a lead ; instead, it has alienated many firms by encouraging styles which prove to have only a limited appeal. A new departure in style—and perhaps, even, a modified conception of the purpose of a piece of furniture—seems to be needed, and it will probably have to come from inside the industry. But the present conditions in which the industry has to operate tend to stifle experiment or initiative at birth. Since November, 1948, the industry has been free to make utility furniture to its own designs—within the specifications and the ceiling prices laid down by the Board of Trade. To ensure a minimum standard of quality the specifications are fairly detailed, and the furniture designed with their requirements in mind is likely to be stereotyped. The ceiling prices appear to have been fixed with the less efficient producers in mind, so that many others are making large profits.

Nearly 90 per cent of the industry's output is utility furniture. The utility scheme therefore wields immense influence and the evidence suggests that its general effect on the industry's development is serious. Not all furniture is sold at the ceiling prices, and this must be taken to mean that price competition is not unknown. But in such competition the large and the efficient producers are prevented from exploiting their potential efficiency. The minimum specifications apply to the industry as a whole and rarely make exception for individual firms. Therefore new processes or techniques of construction are discouraged unless they are of a kind which all the firms could apply with equal effect. Some producers, large and small, complain that monotony of production under the utility scheme tends to degrade their craftsmen into machine hands. Craftsmen's skill would be indispensable to the production of furniture of better quality, and the firms argue that a pound or two more on production costs would bring a remarkable improvement in quality and appearance. The ceiling prices prevent them from making these improvements ; articles priced above the ceiling lose the benefit of the utility mark and become liable to purchase tax. The tax increases the price of the article out of all proportion to the increase in production costs or the improvement in quality, and the article thereupon becomes unsaleable if it is of a kind for which some kind of utility substitute is available.

Many firms prefer to continue working under a scheme which, they admit, hampers efficiency and enterprise, rather than return to a prewar condition in which some manufacturers persistently lowered quality in order to reduce prices—a thing which they cannot do at present because furniture made below the utility specifications also bears purchase tax. The more conscientious manufacturer sold at a price dictated by his higher costs. But, in the furniture trade, poor quality is not always immediately apparent, and the conscientious producer suffered in consequence. Such manufacturers find that to-day they are working to a narrower margin because the quality of their furniture is higher than the minimum specifications.

The consequences of the scheme seem an unnecessarily high price to pay for curbing the competitive instincts of "unscrupulous" producers, many of whom are in fact high cost producers kept in business by the utility scheme itself. National advertising, which links the manufacturer's name with a guaranteed standard of quality, would protect the industry against a recurrence of these abuses if more firms could afford the advertising outlay. But the retailers oppose any suggestion of a direct approach of the manufacturer to the consumer and are strongly fighting even the present modest suggestion for compulsory marking of furniture with makers' names. This is a proposal which both the British Furniture Manufacturers' Federation and the development council are urging on the Board of Trade. What the industry wants, however, is some device which will protect the consumer from buying poor quality furniture, rather than means of claiming redress after it has been bought. If this could be done there would be no excuse for keeping the minimum specifications. This is clearly a job for the development council. But when the question arises of evolving standards of performance for the whole industry, then the dangers of setting the standards too high or too low become difficult to avoid. If it is to succeed the council will have to acquire the respect and co-operation from the industry, and not merely grudging acceptance. The same can be said of development councils in other industries ; this form of organisation is still untried, and it will stand or fall by its success in gaining the confidence and the active support of the producers whom it is intended to lead.

Business Notes

New" Money for the Treasury

The Treasury's decision, made known late on Tuesday, o ensure for itself part of the benefits from the early summer oomlet in gilt-edged took the market by surprise. But this atest operation, though of a type unfamiliar since the hirties (but familiar enough then), fits very logically into he pattern created by the circumstances of the recent BEA lotation, with its heavy take-up by the authorities. To close bservers of the budgetary position and of the extra udgetary funds, it seemed evident that, after this large ntake, the authorities would have little room for manœuvre vithout risk of credit expansion unless their cash position ould be strengthened, during a phase of gilt-edged buoyancy, y sales of securities. Had this situation been allowed to ersist, any adverse development later in the year might ave left the authorities with a poor disposition of resources vith which to approach the redemption of the £714 million f 2½ per cent. National War Bonds that mature finally in August, 1951.

The new operation has been skilfully contrived to meet this situation. A new tranche of the existing 2½ per cent Funding Loan, 1956-61 (of which £200 million is already outstanding) has been offered for cash at a price of 99½, but he cash issue was limited to £100 million and the lists were o open and close yesterday. At the same time, holders of the 1949-51 2½ per cent War Bonds have the right until next Saturday to exchange into the new loan at par, plus a cash payment to them of £1 13s. 9d. per cent—this payment representing the difference between the net price at which he bonds were quoted in the market on the eve of the announcement (101⅜) and the cash issue price of the new oan. The half-year's interest due on the bonds on August 1st next will be paid to all registered holders, including those f "assented" bonds. The existing 2½ per cent Funding Loan had been quoted in the market, for some days before he announcement, at 100 middle, including 7s. 3d. of ccrued interest gross at 4s. net; thus the cash operation ffered a slight—but only slight—turn. There is no suggestion that the "unassented" 1949-51 bonds are to be alled for early redemption, and, indeed, early calling now eems less likely than it did before.

* * *

Conversion Prospects

The whole operation is quite plainly designed for a double bjective. It is intended, first, to sweep in a little cash while he going is good; in the very short run this cash will be pplied to redeem floating debt—presumably in the shape of Treasury deposit receipts—but the real effects will be to ease the congestion that might otherwise have resulted from he BEA operation and to minimise the risk of undesirable redit expansion. Secondly, the linked conversion operation will scale down the hurdle that has to be surmounted before August twelve-month; and, if it is really successful, may even so reduce it that the authorities may be able to face with equanimity a postponement of the leap, if necessary, until the latest moment. The chances of a strong response, whether for cash or conversion, are not easy to guess. The discount market, which probably holds, even now, over £100 million of the 1949-51 bonds, will not convert, since the Funding Loan is quite unsuited to Lombard Street portfolios. The banks and other institutional holders may be ready converters, but their interest in cash subscription looked rather more questionable—even though it was open to the banks, if they wished, to "pre-encash" Treasury deposit receipts to cover their own or their customers' subscriptions. The conversion total, however, is likely to look substantial in any case, since the authorities themselves were believed to hold already up to half the £714 million of bonds, and, since the announcement, must have taken in a substantial amount from the discount market.

The operation has also prompted quite large switching from the 1951-53 War Bonds—on the argument that these are now rather more likely to be tackled before their final date—into the new 2½ per cent Exchequer Stock, 1955, and into the 1952-54 Bonds. The Exchequer Stock gained $\frac{3}{16}$ at 101⅛, while the 1951-53 issue lost $\frac{5}{16}$ at 101⅝. In general,

(f) Flat yield. (l) To latest date.

the operation has imparted a buying impetus that is sending ripples towards even those stocks that lie farthest from the shore. For the short run, this bullishness may be reasonable, but the astuteness of the official tactics in this latest move does not make it more so. Meanwhile, the strength of industrial equities continues. The boomlet touched off by the "dash of freedom" raised the industrial share index of the *Financial Times* by nearly 7 points in the three weeks to Wednesday last—the first day of the new Account. This is easily the most rapid advance since the spring of 1948.

* * *

EPU Travail

The Payments Committee of the OEEC and the inner group of experts concerned with the setting up of the European Payments Union have been fully engaged during the past week with the British proposals, the main outlines of which were sketched in *The Economist* last week. The main points still in dispute are the size and duration of the lines of credit that are to be extended by and to the EPU. The British proposals represent one extreme in these talks. They suggest substantial credit lines and a postponement of gold payments to the last possible moment. At the other extreme is the "hard money" school, represented by Belgium with the support of France and Italy. The Scandinavian countries are inclined to the British point of view. In this "line-up" it has been the task of US experts to find the middle way, and within the past few days a formula has been produced by Mr Averil Harriman's staff that may achieve the necessary reconciliation. Progress in these discussions will be reviewed by a Ministerial meeting of the so-called inner group that is due to take place on Monday next. On Friday of next week a meeting of Ministers in the Executive Committee of OEEC is due to be held, and there are hopes that an agreed EPU scheme will be ready for signature by that time.

Productivity in Engines

As the productivity teams return from the United States, they tell almost a standard story about the achievements and outlook of American industry and labour. The latest report comes from the team that examined the internal combustion engine industry. It relates the conclusions which

have now become familiar. Very considerably higher productivity is attained in engine production in the United States, and the reasons are to be found in technical, economic and labour factors. The conviction that higher productivity is a good in itself explains the ability of the American plant manager to arrange his operations on the assumption that each individual's time will be fully utilised during his hours of work, and also the willingness of the American worker to concentrate his skill on a particular operation, to accept the principles of time study, and to turn to other machines whenever he is not fully occupied.

These factors form part of the background common to America's industrial way of life. The report has some valuable observations to offer on the technical equipment of the American engine industry—its readiness to instal expensive special purpose machines; the profusion of readily accessible hand tools and aids; good plant lay-out and housekeeping; easy handling of work; much greater use of power (at 2 cents per horsepower per hour, compared with 1½ dollars an hour for a man developing one-quarter horsepower). This is not, the report is careful to point out, the result of intense specialisation on one or two types; the output of many plants is as varied as that of typical British factories. But there is greater standardisation of basic engine types. The manufacturer decides what he will build and makes sure that he sells it; if he fails he changes his production policy.

The particular worth of this report is to be found in the direct things it has to say about wages and apprenticeship. It argues with force that the wages structure of the engineering industry is out-dated, and recommends a simplified system based on the rate for the job, backed by a general acceptance of time study "applied fairly and correctly." All practices that may stand in the way of maximum output should be examined by employers and unions—among these questions are differences between skilled and unskilled workers' pay and the apprenticeship system "and all that this implies in regard to a skilled trade." The report puts the case quite frankly. Labour is plentiful in the United States and by British standards is generally unskilled. Outside the tool room and maintenance department, apprenticeship is rare. The individual worker has a narrow range of duties, but his standard of skill within that range is high and is quickly acquired. Production is organised on the assumption that the unskilled operator can master his job in two or three weeks. It is a system markedly different from the British, and pays handsomely in higher productivity. Can radical changes in thinking by managements and men in this country make such things possible here?

* * *

Rubber Puzzles

Estimates of world production and consumption of natural rubber issued by the secretariat of the Rubber Study Group this week show that in April output exceeded consumption. Yet it was in April that the price in the London market started to rise sharply, working up from 1s. 4½d. to 1s. 10d. a lb., before touching 2s. 5d. last week. The monthly figures suggest little sign of a "squeeze." World production is put at 140,000 tons compared with 130,000 tons in March, and consumption at 130,000 tons—some 5,000 tons less than in March. The totals for the first four months of this year suggest that production at 507,500 tons was only 10,000 tons less than consumption—a minor difference which, on the face of it could hardly cause such a dramatic rise in price as has recently occurred.

Comparison with 1949, however, tells a different story. Output between January and April this year was 62,500 tons lower than a year ago, while consumption was 20,000 tons more—a net swing in the supply and demand position of over 80,000 tons. Last year the price averaged 11½d. a lb. Since then, sterling has been devalued and the United States has entered a new phase of booming activity. These figures suggest that if the price a year ago was an accurate reflection of the different pulls of supply and demand, then rubber this year deserves to be markedly higher—though how much higher is impossible to estimate on general grounds.

A conspicuous feature of the April statistics is the sharp increase in exports from Indonesia; these totalled 60,000 tons compared with 40,000 tons in March, 25,000 tons in February and 22,000 tons in January. The increase in exports has occurred in both estate and smallholder rubber, which suggests that stocks of rubber hoarded owing to producers' unwillingness to hold local currency are now coming forward rapidly. In April, for example, 17,400 tons of estate rubber was exported and 30,000 tons of smallholders' rubber, while a further 12,700 tons (presumably smallholders' rubber) was smuggled to Malaya. In the first four months of 1950 total exports from Indonesia have amounted to 148,000 tons compared with 133,000 tons a year ago. At least it is no longer possible to argue that the shortage of Indonesian deliveries accounts for the high price of rubber. But the increase in shipments from Indonesia has been more than offset by a decline in exports from Malaya, where unfavourable weather has reduced output. Between January and April shipments reached only 209,000 tons, some 38,000 tons less than in the corresponding period of 1949.

* * *

Is Rubber Too High?

How far do these figures throw light on the future of rubber prices? They suggest that world production of rubber this year, forecast at 1,605,000 tons by the Rubber Study Group a month ago, may reach the estimate, although the forecast of world consumption (1,465,000 tons) may still prove to be too low. Secondly, they suggest that part of the "squeeze" in the rubber market in April and May was of a technical character and might have had some roots in speculative buying. Since the end of April the spot price in London has risen to 2s. 3d. a lb., where it has remained for nearly a fortnight, apart from last week's flurry to 2s. 5d. Is rubber at 2s. 3d. in fact "over valued"?

The export figures for Indonesia show that confidence in the local currency is returning and that hoarded supplies are coming to the market. On the other hand, weather in Malaya—at least until recently—has been particularly unfavourable for tapping and output has in consequence declined. But now that the weather is improving a larger volume of exports can be expected; indeed preliminary reports suggest that some recovery took place in May. Terrorist action apparently still has little effect on aggregate production.

The outlook for supplies suggests that they are likely to expand somewhat in the near future. What of demand? Despite the high price of natural rubber in the United States (it is now some 84 per cent above that for general purpose synthetic), American consumption is substantially greater than twelve months ago. There are indications that the high price is causing consumers to switch to synthetic rubber, but before any large-scale substitution can take place the output of synthetic must first be expanded. Such an expansion is in train, but the results may not be noticeable for at least another month. Meanwhile, American demand for natural rubber has apparently been well in excess of consumption, and just as a year ago inventories were being hastily reduced, they are now being as hastily accumulated.

More recently two new features have appeared in the rubber market. Forward prices have become very strong and December delivery is now only 1¾d. a lb. below the current spot quotation. Secondly, exports to the Netherlands are reported to be increasing—an increase which cannot be related directly to an expansion in Dutch consumption and appears to reflect Russian buying. So far, official Dutch trade figures (the latest refer to March) reveal no significant trends; even entrepot trade in rubber in the first quarter of this year was at a somewhat lower level than in 1949. There

is no present indication of any break in the firm tone of the market and any drastic fall in price seems to be ruled out for some months. But it is also clear that 2s. 5d. rubber is fantastic and that even 2s. 3d. might be difficult to maintain until the end of the year—unless commodity prices stage yet another spurt. Two shillings is probably the figure which consumers and rubber shareholders should come to expect after the recent flurry begins to settle down and perhaps by the end of this year the price may be a few pence lower.

* * *

Lower Nylon Yarn Prices

British Nylon Spinners this week reduced the price of all nylon yarns by 20 per cent. The company's Pontypool plant, which has a rated capacity of 10 million pounds of nylon yarn a year, is steadily expanding its production, and as output rises costs have fallen. This week's price reduction should not, therefore, be a matter of surprise. Until recent weeks, some difficulties have been experienced in increasing output, not because of any deficiency in the spinning plant but because of shortage of nylon polymer. British Nylon Spinners (which is jointly owned by ICI and Courtaulds) expected to get all its supplies of nylon polymer from the new Billingham plant, which has been designed to produce 10 million pounds of nylon polymer a year. The Billingham plant, it was hoped, would incorporate all the experience gained at ICI's original nylon plant at Huddersfield which is believed to have a capacity of about 1,000,000 pounds of polymer a year. Unfortunately, it is one thing to overcome the problem of designing a satisfactory pilot plant and another to overcome the technical difficulties, often unsuspected, of designing a large-scale plant.

Something of this kind happened at Huddersfield and also, it seems, at the much larger Billingham plant. Although the Billingham unit has been in production since May last year, it has been unable to deliver to Pontypool the expected quantities of polymer. The import of over 1,000,000 pounds of polymer from the United States during last year and of a further 67,000 pounds in January made up these inadequacies of home production, but when the American exporters, du Pont, brought a new spinning plant of their own into production they no longer had a surplus of polymer to export. None has been imported since January.

The situation at Pontypool in the spring was discouraging, but since then most of the difficulties at Billingham have been overcome and supplies of polymer are now coming through more closely to the planned rate. It still remains to be seen whether there will be plant to produce sufficient polymer to meet all demands for nylon for uses other than yarn when these are fully developed. As a solid material, nylon has strength and resistance to heat and solvents that are useful in many applications. The development of nylon moulding powders should considerably increase these outlets.

Three-quarters of the yarn produced at Pontypool is at present going to stocking knitters, and the remaining quarter is divided among weavers of dress fabrics and industrial users. The lower yarn prices, it is hoped, will enable weavers and knitters to quote competitive prices in hard currency markets. Exports of nylon yarn products are expected to reach £10 million this year and the export markets are likely to be limited only by the size of yarn production.

The IMF and Exchange Restrictions

Under the Articles of Agreement of the International Monetary Fund all signatory countries expressed their disapproval, in principle, of any restrictions on payments and transfers for current international transactions. It was agreed, however, that in practice such restrictions might need to be retained for what was optimistically termed a "transitional period"; the IMF was enjoined to report on whatever restrictions were still in force "not later than three years after the date on which the Fund began operations and on each year thereafter". Last March the Fund duly celebrated its third birthday, and its first report on outstanding "transitional" restrictions has now become available. The report shows that only the United States and four neighbouring Central American republics have been able to undertake the obligation to grant unlimited free treatment to current payments. A number of other hard currency countries (most of them in Latin America) also now grant exchange licences fairly freely, but among the war-affected countries only Belgium and Luxemburg have made substantial advances towards convertibility. Moreover, a number of member-countries whose currencies seemed to be in strong positions at the end of the war have had to impose restrictions over current payments; among those who have fallen from grace in this way the report mentions Canada, Uruguay, South Africa and the Philippines.

A sad commentary on the extent and complexity of the exchange control blight is provided by Part II of the Fund's Report. This lists the restrictions imposed by the separate member countries, and although only summarised particulars are given, the record requires ninety-four pages. In general, the Fund accepts this disappointing record with good grace; it confines itself to very meek expressions of disapproval about restrictions that are motivated by protective rather than by balance of payments considerations and about the tendency to relax restrictions by specified currencies rather than by categories of international transactions. Anybody who hopes to find in this document a clear expression of the Fund's attitude towards exchange restrictions—consonant with its recent pronouncement on premium sales of gold—will, however, be disappointed. The authors of the report have so obviously feared to appear as ineffective Canutes that they have been able to do little more than utter some rather banal comments on what they devoutly hope is a trend of improvement towards greater international economic equilibrium.

Outlook for "Shell"

Sir Frederick Godber has again done the next best thing to presenting consolidated accounts for the Royal Dutch-Shell group by including in his review of the operations of Shell Transport and Trading in 1949 some of the salient financial features of the group as a whole. Sir Frederick points out that £12,300,000—or little more than a third of the group's net profit of £35,732,000—was distributed to the two parent companies. This was sufficient to ensure an increase in net profit of Shell from £4,377,490 to £4,828,919, but the Royal Dutch net profit was actually reduced from fls. 83,090,610 to fls. 82,643,956. No less than £16 million of the operating group's profit has been placed to general reserve, £5,000,000 to stocks reserve, and £2,250,000 to exchange reserve. Even these big appropriations did not offset the drain on liquid funds in subsidiary companies. These funds were reduced from £126,114,000 to £120,285,000, after taking account of adjustments arising from the acquisition of Venezuelan Oil Concessions as a wholly owned subsidiary. Including £18,966,000 of liquid funds attributable to the group that are held by companies with a direct public shareholding, total liquid funds are approximately £139 million for the group as a whole—though, as Sir Frederick indicates, some of these funds are not freely transferable owing to exchange restrictions.

Against this apparent plethora of liquid funds, the ordinary shareholder of Shell may wonder why—dividend limitation apart—he is again restricted to a meagre 7½ per cent tax free dividend. Sir Frederick defends this determined austerity by pointing to the heavy commitments for working capital, exploration and expansion. He notes, for instance that £9,000,000 has been spent on a joint venture in Ecuador that has had to be abandoned this year; the group's share in it has been written off. The group has been particularly

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk — and all that it means to your dependants — *without* this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon. P.A/e

Please send me full particulars of 'General' Personal Accident Policies.

ACCIDENT FIRE & LIFE ASSURANCE CORPORATION LTD
General Buildings, Perth, Scotland

FAMOUS FOR ALL CLASSES OF INSURANCE

active in exploration in the Middle East, Venezuela, British Borneo, Canada and Tunisia. Heavy expenditure continues on the construction of refineries, particularly at Stanlow and Shell Haven, where the work is proceeding well. The tanker building programme has added nearly 1,000,000 deadweight tons to the fleet of the group since V.J. day ; the fleet, including vessels under construction, now amounts to 2,344,786 d.w. tons. Sir Frederick reiterates the familiar and accepted arguments of industrialists about the inadequacy of normal depreciation allowances to cover high replacement costs. He also shows that the group's requirements of working capital have been increased by the range of taxes on its products, not least the recent increase in the petrol duty, and by the ever-rising level of costs.

The Shell report, as usual, provides the first comparative picture of world oil output for the past calendar year, together with statistics by countries of the group's production during the year. Total world production is shown to have declined from 3,578.9 million barrels to 3,566.9 million barrels in 1949 ; output of the Royal Dutch-Shell group increased from 343.7 million barrels to 372.8 million barrels. The fall in United States output, in fact, restricted the overall expansion of Royal Dutch-Shell itself. The decrease of 170 million barrels in United States output was to some extent made good by the jump in Middle East production. Kuwait, Iran and Iraq increased their combined output by 89 million barrels. It is estimated that the USSR produced 251.9 million barrels last year compared with 222.5 million in 1948.

Cotton Commission Settles Down

Lancashire may not be reconciled to the Raw Cotton Commission, but it is noticeable that the criticisms of its policies and trading methods have much abated in the past year. The Commission's second annual report, with its frank and detailed description of trading during the year, sets a standard that Government departments concerned with commodity trading would do well to follow. The Commission in its attempts to explain its policies and actions is earning the respect of many who oppose it in principle.

In the year ended July 31, 1949, the Raw Cotton Commission made a gross trading profit of £3,879,000 ; after deducting trading expenses, payments under the cover scheme and interest on advances from the Board of Trade, there was a net trading loss of £707,000. Trading and administrative expenses represented less than 1½ per cent of the value of cotton sold and delivered during the year ; the cost of the cover scheme amounted to some 2 per cent of sales while interest on advances represented 1 per cent. In their attacks on the Raw Cotton Commission, private traders have claimed that the cost of their services before the war averaged 1 per cent of sales ; but this assertion cannot be proved by figures.

In addition to its net trading loss, the Commission wrote down the value of its stock on July 31, 1949, by £6,650,000 by a transfer from Reserve Fund, although the need for this write-off was considered to be temporary. Practically all the stock losses occurred in Egyptian, Sudanese and Peruvian growths. The stock figures, however, require a word of explanation. First, the end of the commission's financial year coincides with the end of the buying season, and stocks at this balance-sheet date tend to be abnormally large. Secondly, conditions in the cotton market before devaluation were exceptional, in that the former dollar-sterling exchange rate was having a distorting effect on the relationship between the sterling and dollar prices of similar commodities In the first six months of the Commission's current financial year the effects of devaluation have greatly altered the stock position. The value of stocks held by the Commission has risen sharply and although more than £3,000,000 has been paid to spinners under the cover scheme, operations in the half year ending January 28, 1950, showed a profit of £8,692,000 of which £6,650,000 represented the writing back of the previous provisions against stocks.

Plea for a Free Market?

The accounts, however, tell only a part of the story. The report describes the various trading difficulties which the Raw Cotton Commission has encountered. Until June last year, to take one example, the Economic Co-operation Administration issued procurement authorisations only at quarterly intervals, and ECA funds were provided only if the cotton was shipped before a fixed date. As the authorisations were published before the sales took place, the Commission found itself buying on a market that had been forewarned about the amount of money that the buyers had to spend.

In Egypt, the shorter stapled Ashmouni cotton, which can be substituted to some extent for the normal American staples, is being supplanted by longer-stapled varieties. Indeed, Ashmouni has recently been selling in Alexandria at a higher price than Karnak, which normally commands a premium. India has prohibited the export of all cottons except staples less than 1⅛ in. which may be sold to hard currency markets. The Commission, however, was able to secure 15,000 bales for Lancashire by exchanging a quantity of Sudanese cotton with India. Purchases from Peru are complicated by local currency regulations, which require exporters to hand their sterling receipts to the National Bank, against which they receive Peruvian soles at the official rate to the extent of 45 per cent and a certificate for the remainder. The certificate has to be married to a payment for sterling goods within 60 days. In these circumstances, it is hardly surprising that Peruvian exporters are unwilling to sell cotton.

This is a formidable catalogue of difficulties. Whether they would have been so severe in their effects if private trading in cotton were possible is, of course, a matter of argument. The Commission has been able to secure part of its supplies—chiefly from the Sudan, East and West Africa—under long-term contracts, but such cotton represents only some 20 per cent of its annual purchases. The rest has to be bought in the different terminal markets, and the Commission must find difficulty in cloaking its buying intentions. It is not surprising, therefore, that the Commission should argue, in discussing the difficulty of buying American cotton with ECA funds, that "although the issues cannot be definitely calculated and some element of risk is involved, the best interests of the country would be served by allowing the laws of supply and demand to operate more freely on world cotton prices." That is a wholesome thought and one not very much to the taste of the original supporters of the Cotton (Centralised Buying) Act, who thought they were to get something very different. The Raw Cotton Commission has taken more realistic views of its functions. It is trying to operate as efficiently as possible ; it has not failed to consider any proposal put to it by the trade, or shirked the task of improving its policies and its organisation.

* * *

Restrictions for Hongkong Sterling

The British Exchange Control authorities have this week imposed restrictions upon the freedom with which sterling assets of residents of Hongkong can be used. All such assets, including balances on bank accounts in Britain, have virtually been blocked and their disposal has been made subject to the permission of the Bank of England. Under the new regulations these assets are divided into two broad categories, those held in "Number 1" and those in "Number 2" accounts. The No. 1 accounts are those held for 25 banks operating in Hongkong through which it is intended to control payments to and from the colony. The intention is to canalise through these No. 1 accounts all normal operations in Hongkong sterling. All assets held for Hongkong residents other than the 25 banks mentioned in the appendix to the notice published this week will be blocked except for transfers to No. 1 accounts, investment of balances in sterling securities and the sale of securities for

cash or reinvestment. "Pre-zero commitments," however, can be settled from No. 2 accounts. These accounts may be debited with payment of cheques and bills drawn before June 5, 1950, and payments under confirmed and unconfirmed credits established before that date. In addition, regular payments to sterling area countries, including educational fees, insurance premiums, rents and rates, club subscriptions, etc., will be allowed from No. 2 accounts. With these exceptions, the normal stream of commercial payments to and from Hongkong accounts will be canalised through the No. 1 accounts.

The effect of these new restrictions is tantamount to removing Hongkong from the "scheduled territories." Their intention is to close a possible loophole through which capital can escape from sterling into hard currencies, including dollars. Hitherto it has been possible to transfer sterling freely from any sterling accounts in this country to those of residents of Hongkong. Hongkong residents have for their part had complete freedom to convert their sterling into Hongkong dollars and to sell those dollars for US dollars in the free market that functions openly in the colony. Hence the recent weakness of the Hongkong dollar has involved a similar fall in the sterling-dollar cross-rate to around US $2.40 in Hongkong. Official quarters in London emphasise that there has been no great leakage of capital through this loophole but that, since it existed, it was desirable to close it in the interests of the efficacy of exchange control. This is strange reasoning indeed. If there has been no leakage, there seems to be no particular reason why so much undesirable publicity should be given to a potential flight from sterling. If confidence is to be created, this is not the way to do it. The Exchange Control department at the Treasury and the Bank of England do not yet appear to have heard of the "dash for freedom."

* * *

Lombard Street's £1,000 Million

The recent publication of the balance sheet of King and Shaxson, Limited, makes it possible to bring together the accounts of nine discount houses and thus to present for 1949-50 a composite balance sheet covering by far the greater part of the discount market as a whole. The figures reveal that Lombard Street's portfolios of bills and bonds—both vastly expanded during and since the war—have now for the first time surpassed £1,000 million. For the notional year, with constituent balance sheet dates ranging from end-September, 1949, to end-April, 1950, the nine houses had a combined portfolio of £960 million. This represents an increase of £121 million, or 14.4 per cent, on the comparable figure for 1948-49, when the total of £839 million was, in turn, £90 million (or 12 per cent) above that for 1947-48. Thanks to an improvement in the form of the latest accounts of Cater, Brightwen and Company, Limited, it is at last possible to obtain a strict segregation of bond and bill portfolios. At the latest notional date for the former totalled £272 million, or slightly less than for 1948-49, even though the £277 million shown for that year excluded the shortest bonds in the Cater, Brightwen portfolio. The reduction, of course, reflects the first effects of the conversion and repayment of 1¾ per cent Exchequer bonds, of which the market was a large seller to the authorities before and during the operation. More recently it has taken in considerable lines of the new 2½ per cent stock, partly against sales of the 1949-51 War Bonds, and has doubtless also increased its holdings of the 1951-53 bonds in preparation for the repayment of the 1949-51 issue. There is no doubt, therefore, that the present bond portfolio of the nine houses is appreciably larger than that shown for their "spread" accounting dates. In addition, of course, there is need to make allowance for the three private companies that do not publish detailed accounts—an allowance that probably brings the present grand total up to some £350 million.

Bill portfolios for the nine houses totalled £688 million at the balance sheet dates ; the total for the twelve houses, if the unknown portfolios are roughly computed on the basis of the ratio of portfolios to published capital resources, would be about £775 million. An approximately comparable estimate for 1948-49 would be £620 million. But although the latest notional figure thus shows a large increase, it still understates the expansion of bill turnover that has taken place in the past year. Thanks to the Treasury policy, strongly resumed last July, of switching its borrowings from Treasury deposit receipts to tender bills, the allotments to the discount houses have lately been running, on the average, at about 45 per cent or more beyond their rate at the similar period in 1949. After this further large expansion the Treasury bill turnover is now running—at exiguous profit margins—at more than nine times its prewar level.

* * *

Base Metal Boom

Base metals become more feverish each week. Twelve months ago, prices of copper, lead and zinc had almost reached the end of a sharp fall from their postwar peaks. Copper had fallen from 23½ cents a lb. to 16½ cents ; lead from 21½ cents a lb. to 12 cents and zinc from 17½ cents to 9 cents. A slight recovery took place in July and August but the market turned weaker after devaluation. The real upturn began in November when American demand for copper once more began to outstrip current production. Zinc also became firmer, while lead, in contrast, weakened.

The full effect of the increased American demand on prices, however, has become apparent only in the past two months and the tempo of the rise has increased more rapidly. Copper which at the end of March was 18½ cents a lb. reached 22½ cents early this week. Zinc has risen from 10¼ cents to 14½ cents and lead from 10½ cents to 12 cents. Lead is only just back to its level of June, 1949. Zinc on the other hand shows a rise of more than 50 per cent in the past twelve months though it is still three cents below its postwar peak. Copper is now only one cent below the postwar peak of the first quarter of 1949.

Since last July, the Ministry of Supply's selling prices have been kept faithfully in line with those ruling in the United States. The close correlation is strikingly revealed in the accompanying table. Devaluation caused British prices to rise sharply and the recent increases in the American market have pushed British prices of copper and zinc to record levels. This week zinc was raised to £123 10s. a ton compared with £106 eighteen months ago and copper to £186 a ton against

£140 at the beginning of 1949. Lead, at £96 a ton is still well below the level of £123 reached in the first quarter of last year. British consumption of copper has lately been at a lower rate compared with twelve months ago; consumption of zinc has tended to expand while lead has shown little change. But American demand, particularly for copper and zinc, shows no signs of slackening even at present extreme prices.

German Trade and German Debts

Negotiations for a new trade and payments agreement between the sterling area and western Germany were resumed in London on Monday. These talks are a continuation of those that were shelved in March when the United States (though not Germany) objected to the British proposal that the present Anglo-German payments system (which allows an overdraft "swing" of £7,500,000 either way without dollar payments) should be replaced by a new system into which dollars would not enter at all. Settlement of this question of the "swing" must now wait on the establishment of the European Payments Union; the primary object of the present talks will be to make interim payments arrangements and to discuss trade schedules. At present the balance of payments between the sterling area and western Germany is narrowly favourable to Germany, but the Bank of England is believed still to hold very nearly the whole of the £7,500,000 in Deutsche marks that it accumulated earlier this year, and Germany has made extensive use of its sterling drawing rights. Figures now available show that British exports to western Germany amounted to £13 million in the first three months of 1950 (compared with £8,800,000 in the first three months of last year); British imports were also higher, at £9,600,000 compared with £8,400,000, mainly owing to larger purchases of machinery and chemicals. The Germans complain that they ran a deficit in the early part of this year because they "liberalised" their import policy more thoroughly than the British; whatever the merits of this argument, the present talks are certainly likely to lead to additions to the British list of unrestricted imports from Germany.

Meanwhile, a first and modest start is about to be made in the unfreezing of foreign assets in Germany. After three years of inter-Allied disagreement, a draft plan was approved by the Council of the High Commission last week and was passed to the Bonn Government for its comment; this plan should receive final approval in the course of next week. It provides for the partial unblocking of Deutsche mark balances, as distinct from claims in foreign currencies. It is estimated that the sums involved amount to some DM 165 million, of which some DM 25 million represents the postwar earnings of foreign film companies, while the remainder represents sundry prewar credit balances and restitution claims of emigres. Apparently, however, the new regulations will still forbid dealings in these balances between non-residents. This ban arises from the wish of the American authorities to avoid a free market in "investment" marks, since that would provide a potential investor with a cheap way of acquiring German currency without bringing foreign exchange to Germany; in practice, however, it is difficult to see how these regulations can prevent, say, a British bank from investing its own Deutsche mark balance in Germany on behalf of one of its British clients. This preliminary unblocking operation will be watched with interest because of the light it may throw on what will happen when the next, and more important, stage of German debt servicing is reached—when standstill and other foreign currency creditors (such as non-Reich sterling and dollar bondholders) are allowed to receive payment of their claims—but initially in German currency only.

Swiss Finance for OFS

Three new possibilities for raising capital for Orange Free States gold mines have recently been canvassed in the Kaffir market. Reports have circulated that new money is to come from Switzerland, France and De Beers. The first of these reports has now been confirmed. Anglo-American Corporation, which has seven major mining propositions in the OFS under its tutelage, has obtained from the Union Bank of Switzerland a loan of 50 million Swiss francs at 4 per cent repayable in 1962 at par with the right to redeem at par after 1957. These can hardly be called onerous terms. Weighed against the inauspicious Stilfontein 5½ per cent unsecured note issue, now quoted at 4½ discount, they appear very satisfactory from the Corporation's point of view, though, of course, with its wide spread of interests, Anglo-American represents a more attractive investment risk than any individual mine. The net proceeds to the Corporation will, however, amount to 46½ million Swiss francs, so that expenses in connection with the issue, including discount, must be regarded as heavy.

Yet it is doubtful whether the required money could be raised at lower cost in London, given the present contrary state of the Kaffir market. In fact, present doubts of ensuring the success of any appeal in London for capital for developing OFS mines must presumably have driven Anglo-American to seek other sources of capital. Like the Stilfontein issue, the Swiss loan to Anglo-American is in the nature of a prior charge. It is unlikely that more than a fraction of the large amount of capital required to bring the OFS mines into production would be forthcoming in this form from either British or foreign investors. Yet the absence of a better outlook in the Kaffir market and the rising demand for funds as development in the OFS proceeds suggest that this expedient—and any other that may serve—should be exploited to the full at the present critical juncture.

Canadian Fighter Aircraft

The only long-range jet fighter in the world, the CF 100, built by Avro Canada, is soon to make a non-stop flight across the Atlantic. The flight has a strategic importance beyond the prospective value of the fighter itself; it is the first Commonwealth military aircraft to be designed outside Britain since the war. Both Canada and Australia have their aircraft industries, but they draw largely on British and American designs under licence. A few independent designs went into production during the war, notably in Australia, but the postwar fighters have yet to show their paces. In the last war, air supremacy depended on rapid and continuous improvement of aircraft and engines. Firms building under licence are not usually capable of undertaking development work of this kind. The value of Avro Canada in commonwealth strategy rests in the fact that it provides a nucleus of proved designing ability outside the concentrated and vulnerable area of the British Isles.

The company was started in 1945 by the Hawker Siddeley Group to make engines and airframes. It uses none of the designs of the Group's British subsidiaries and imports only a handful of specialised components. The leading men were sent out from Britain and in a comparatively short time had trained a staff of more than 3,600. They have designed and flown two aircraft and an engine, each the only one of its class in the world. The CF 100 fighter is one of the largest fighter aircraft ever built. To cross the Atlantic non-stop presupposes a range of more than 2,000 miles. The C 102 is a medium range turbo-jet passenger aircraft, less ambitious and of more limited application than the de Havilland Comet but still representing a feat of aeronautical engineering embarrassing to the neighbouring United States aircraft industry whose turbo-jet airliners have not emerged from the drawing board.

In general, the big British companies are reluctant to let competent designers leave their main factories, because such ability is rare and hard to replace. Another major company with independent subsidiaries is de Havilland, whose Canadian and Australian companies have designed their own aircraft to meet specialised local needs. The Canadian has been the more successful. A trainer, the Chipmunk, is being ordered by the RAF as well as the Canadian Air Force. Their other independent venture, the Beaver, is a four-passenger light aircraft specifically designed for the Canadian lakes and the Arctic. It has been so successful in this limited field that the US Army is anxious to buy it for Arctic work, but is momentarily held up by the act which requires all military equipment to be made in the United States.

How is the South African Agreement Faring?

The Anglo-South African agreement has now been in operation for more than five months, but it is still very difficult to find out whether the sterling area's gold reserves are deriving as much benefit from it as was originally hoped. Since the beginning of this year, it will be remembered, South Africa has paid in gold for all imports considered "essential," and suppliers in all countries have had the chance of competing on equal terms for this trade. When this arrangement was first announced, hopes ran high that it would bring substantial reinforcement to the gold and dollar income of the sterling area; the "Economic Survey" drew particular attention to the importance of the agreement, and reports from South Africa suggested that in 1950 the sterling area should secure between one-quarter and one-half of the Union's £140 million of annual gold output.

The first clouding of this bright prospect appeared last April, when it became known that the accretion of South African gold to the sterling area's reserve in the first quarter of 1950 was only about the same as that in the last quarter of 1949. The disappointment caused by this announcement, however, was somewhat allayed by the publication of Britain's Balance of Payments White Paper. This revealed—and it was the first time such figures had been published—that the United Kingdom had purchased £68 million of new mined

HOW MUCH DO YOU KNOW?

How fast can we roll out the steel?

A modern rolling mill can turn out continuous strip steel from white hot slabs at the rate of 2,000 feet a minute — faster than a man can run. By modern methods and skilled work the steel industry is constantly breaking production records.

HOW many kinds of steel does Britain make?

Hundreds of different kinds of steel are being made, each for a special purpose, by firms among the 500 in the British steel industry. Think of the complexity of an industry whose firms make everything from pipe-lines to hairsprings, from bridges to surgical instruments, for use all over the world. Steel manufactures account for nearly half the nation's export earnings.

WHERE do steel tubes tap desert oil?

In the Middle East thousands of miles of steel pipe-line carry many million tons of oil every year through mountains and desert. Within the past year the British steel industry has won contracts for oil pipe-lines all over the world against world competition. British steel prices compare favourably with any in Europe or America.

WHERE is the trail of the Mounties?

In British Columbia, the steel industry has recently won a contract for rails to extend the Pacific Great Eastern Railway northwards. When the new system is complete, it will open up the vast resources of the Peace River country — at present without road or rail connection with the rest of the province — and save a journey by water of several days for freight. This is just another example of the steel industry's contribution to our export drive.

In output and exports

gold in 1949, most of which must have come from South Africa. The Union was thus shown to have supplied a substantially larger sum in 1949 than most people had thought to be obligatory upon it under the old arrangements (by which South Africa was obliged to sell gold to the Bank of England only to the extent that non-sterling payments had been made through London on the Union's behalf).

The next public development was a speech at the end of last month by Mr Louw, the South African Minister of Economic Affairs ; Mr Louw complained that the agreement was not working out as South Africa had hoped. Under the agreement South Africa had the right to decide for itself what goods were essential and would be paid for in gold (the details of this list of "essentials," unfortunately, have been kept secret, although its broad composition has been announced). Apparently, however, Britain has made it clear that there are certain commodities (such as tinplate) which, though not on South Africa's "essential" list, are still in short supply ; a substantial proportion of these commodities, in accordance with normal British export practice, will continue to be routed to hard currency countries and away from South Africa unless the Union pays for them in gold. There is nothing in all this to suggest, of course, that the agreement is in any way breaking down. There is enough in it, however, to make it worth while to reiterate the original plea of *The Economist* that more light should be thrown on the details of this rather makeshift agreement and, in particular, that the exact composition of South Africa's list of "essential" imports should now be fully divulged.

Shorter Notes

Coal output last week fell to 3,310,900 tons, the Whitsun holidays causing an estimated loss of 848,100 tons. Output during the summer is always affected by holidays, and to this seasonal factor must be added the steady fall in man-power now below 700,000. In the week ending May 27th, there were only 699,800 men on the colliery books, 500 fewer than in the previous week. Fortunately, the number of face workers remained unaltered. Since the beginning of the year, when the miners became free to leave the industry, the net weekly loss has been steady at about 500. Those who leave are usually comparatively young men who find it easy to get more congenial work in local factories. The Coal Board's schemes for attracting labour are aimed largely at juveniles and boys of about 18 and few of these recruits leave. It might pay to consider means of inducing men slightly older and already trained to stay in the industry.

*

Trade talks between Britain and the Netherlands were concluded in London this week. It is estimated that the course of payments between the guilder area and the sterling area will result in a growing Dutch deficit. While agreement was reached on the price of most food stuffs, Britain maintained its earlier refusal to pay higher prices for Dutch eggs, and, according to reports from Holland, no eggs will be imported by Britain. Nor has agreement yet been reached on the vexed question of Dutch transit trade in German exports to the sterling area.

*

The British Electricity Authority have made arrangements to insure the major risks arising from the operation of their undertaking, including fire and such other risks as are normally covered by enterprises engaged in manufacture and trade on a large scale, rather than to carry these risks themselves. Through the medium of the British Insurance Association they have negotiated cover with a Committee representing the majority of the British Insurance companies. A share of the cover has been underwritten at Lloyds.

*

The Dunlop Rubber Company opened its second big research centre at Birmingham this week. The first centre, which is in Malaya, deals with the problems of raw rubber ; the Birmingham centre will concentrate on questions of manufacture and use. It is planned as a research headquarters for all the Dunlop factories of which there are 25 in this country and 16 overseas.

SECURITY PRICES AND YIELDS

A fuller list containing 366 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement : J. and P. Coats; "Shell" Transport and Trading; Harland and Wolff.

COMPANY MEETINGS

ROYAL EXCHANGE ASSURANCE

230th ANNUAL REPORT

GROUP'S RECORD YEAR

SUBSTANTIAL CONTRIBUTION TO NATION'S INVISIBLE EXPORTS

LORD BICESTER'S REVIEW OF PROGRESS

The Two Hundred and Thirtieth Annual General Court of the Royal Exchange Assurance was held on May 31st in London.

The Governor, the Right Hon. Lord Bicester, who presided, said :

Gentlemen, the report and accounts of the corporation and the consolidated accounts of the Royal Exchange group of companies for 1949 have already been sent to you, and I feel it will be your wish that I should take them as read.

There were no alterations in the Court of Directors during the year under review, but I am pleased to say that Lord Catto resumed his seat on the Court on April 12th last.

There have been several changes among our principal officials to which I should like to refer. Our marine underwriter, Mr N. R. Jenkins, was I regret to say obliged to give up his work owing to continuous ill-health, and we hope relief from his responsibilities will be of great benefit to him.

At the end of the year Mr B. D. Cumming, who had been our chief accountant for many years, retired and I should like to pay tribute to his outstanding character and abilities which were of the greatest value to our organisation. His place has been taken by Mr D. E. Tyrrell.

Mr H. R. Roberts, formerly our manager in South Africa, has returned to London to take up the position of assistant manager at head office. Finally, Mr F. H. Egerton, who for the past few years was agency manager in London, has been appointed assistant manager for our group in Australia, and Mr K. J. T. Boag has succeeded him here.

I will now review the results of the various departments of the Royal Exchange Assurance, but before doing so I should like to mention that, in accordance with the 1948 Companies Act, we are including in our accounts for the first time comparative figures for the previous year.

LIFE DEPARTMENT

The life department issued 4,994 policies for sums assured amounting to £4,382,453 which is a slight increase on last year's figures. The total premium income of £1,806,022 shows an increase on the year 1948 of £83,604. Claims were £65,014 less, than in 1948 and were well within expectation.

You will have seen in the report that the overall rate of interest on our Life Fund this year is £4 2s. 10d. per cent., which compares with £4 4s. 4d. per cent. for 1948. In the normal course of events a higher figure might have been expected, and your directors are not unmindful of the important role the interest rate plays in the management of Life Funds.

While we of course endeavour to earn as much interest as possible, we are equally alive to the fact that our paramount aim must be to maintain a solid capital structure. The policy of the corporation has been shaped towards this end, and I am happy to say we have been well repaid. Our Life Fund is in an exceedingly strong position today and the somewhat smaller income derived from holding securities of a type less subject to depreciation in value has obviously been worth while.

Our Trustee and Executor Department has had a busy year. The total funds in hand and under the administration of the department at the end of the year exceeded £185,000,000, which is approximately £2,000,000 more than the total of twelve months ago.

FIRE BUSINESS

In the fire department I am pleased to be able to report an excellent year. The premium income exceeds £3,000,000 for the first time having risen by £508,203 to a figure of £3,451,421. Although a small portion of this increase is attributable to the effect of devaluation of sterling, there is nevertheless a notable increase in the whole field of the corporation's activities which is indicative of the very healthy state of our fire account.

As you may know, the volume of our overseas business greatly exceeds our home account and has contributed substantially not only to our own very satisfactory trading, but also to the nation's vitally important invisible exports.

The results of the fire department as a whole enabled us to transfer the sum of £481,790 to our profit and loss account.

MARINE DEPARTMENT

We are again making a transfer of £75,000 from the marine department to general profit and loss, after which our fund stands at £1,403,245 or practically 250 per cent. of our premium income.

The continued high cost of repairs, further increased in terms of sterling in respect of vessels to be repaired in the dollar areas, naturally calls for substantial reserves in respect of previous years' claims.

The Joint Hull Committee continues to receive the support of the market, and I feel special tribute should be paid to its excellent work.

Competition for cargo business has become very keen in recent months and it appears doubtful whether the rates prevailing, since the abandonment of the "Combined Marine Surcharges" agreement, will prove adequate having regard to the ever present hazard of theft and pilferage, coupled with the inferior quality of postwar packing materials now in use.

RECORD ACCIDENT PREMIUM INCOME

The premium income of our accident department increased by £214,355 to £2,300,150, which constitutes a new record.

The real effect of the National Insurance (Industrial Injuries) Act, 1946, which came into operation on July 1, 1948, has now produced the expected substantial reduction in the premium income for employers' liability insurance. The large amounts which are now being paid in settlement of common law claims indicate clearly that the liabilities for which our policies provide indemnities to employers are indeed heavy, and we are convinced that the present rates are insufficient.

I am very glad to say that the reduction in the employers' liability income has been more than counter-balanced by increases in other sections. This is particularly so in the Burglary section where, in addition, the signs of an improvement in our loss ratio have continued.

Our motor business shows considerable expansion but, in common with other insurers, the heavy cost of claims settlements has unhappily resulted in an underwriting loss on this particular section of the account. The overall result of our operations in the accident department is that we are able to transfer £144,945 to the general profit and loss account.

Before dealing with the profit and loss account of the "Royal Exchange" and eventually with our consolidated accounts, I would first like to explain to you as briefly as possible the way in which we have treated the effects on our accounts of differences in the foreign exchange rates following the devaluation of the £ sterling last September.

It has been our normal practice in past years to treat gains and losses on exchange when they occurred as credits or charges in the departmental revenue accounts.

EFFECT OF DEVALUATION

The effect of devaluation of the £ sterling in September was of course considerable, particularly in our United States and Canadian accounts, and to have kept to our normal practice would have distorted our underwriting results to a disproportionate degree.

We therefore allowed all gains on revaluing current assets abroad to accrue to an exchange reserve account. This account after receiving the assistance of an additional sum of £100,000 from the profit and loss account was sufficient to provide the means to enable us to set up all our liabilities at the new rates of exchange. By the adoption of this method we reflect in our sterling accounts underwriting profits comparable with those achieved in the various currencies in which the business was written.

Before leaving this subject of exchange, you will be interested to know that all our securities so affected, including those relating to the United States and Canada, continue to appear in our balance sheets at the rate of exchange in force at the time of acquiring them, so that we have a very substantial margin in this respect.

PROFIT AND LOSS ACCOUNT

Turning to the profit and loss account of the "Royal Exchange," the sum total of our departmental transfers amounts to £710,285 and the amount received by way of net interest to £206,235. These items, together with £59,028 being the proprietors' share of the life valuation surplus, and £115 made up of transfer fees and conscience money, give a total on the revenue side of £975,663. On the other side of the account £57,830 represents expenses not charged to other accounts, £60,000 is allocated to pension and staff allowance funds, and £434,000 represents United Kingdom taxation, including income tax 1950/51.

I have already mentioned the transfer of £100,000 to the exchange reserve account, and this together with the three items just referred to leaves a sum of £323,833 which is the balance we carry to the profit and loss appropriation account.

Your Court of Directors have closely reviewed the results I have put before you, and they are recommending a final dividend of 20 per cent., less income tax, for which I shall later seek your authority. This amount, together with the interim dividend already

paid, makes a total of 35 per cent. for the year. After providing for these payments we shall carry, including the balance of last year's account, a final figure of £892,302 to the balance sheet.

GROUP CONSOLIDATED ACCOUNTS

Turning now to the consolidated accounts of our group, I must draw your attention to the fact that the 1948 figures do not agree with those published for that year. This is because we have been able to include in our 1949 accounts those of our Dutch subsidiary, the "Amsterdam-Londen," and have therefore adjusted our 1948 accounts by the inclusion of the 1948 figures of that company.

As I shall later refer to the expansion in the consolidated premium income, I do not think I need here make any special comment on the revenue accounts and will therefore ask you to turn to the profit and loss account.

The total interest, less tax, amounts to £379,028 and the total group departmental transfers from the revenue accounts to £1,442,203 The proprietors' valuation surplus from the "Royal Exchange" and "British Equitable" life funds comes to £60,508 and a further two small items to £186. The total on the revenue side therefore amounts to £1,881,925.

On the expenditure side I would comment on three items. The sum of £570,583 transferred to exchange reserve account is a very much larger figure than that transferred by the "Royal Exchange" itself, and is chiefly due to the effect of devaluation in respect of the United States casualty account of one of our associated companies. Provision for United Kingdom taxation takes £699,417 and finally an amount of £20,000 is transferred to investment reserve account. This is in respect of one of our sub-subsidiary companies.

The balance carried to the consolidated profit and loss appropriation account is £384,625. As regards this appropriation account itself, I would like to add that the amount of £745 shown as transferred to general reserve refers to the accounts of a small foreign subsidiary. I mention this as, in talking of allocations to general reserve in respect of a group with assets of rather more than 56½ million pounds, the amount in question might appear somewhat trivial, but consolidated accounts are occasionally apt to produce items of this kind. The consolidated balance sheet in fact shows a general reserve item of just under £3,000,000.

OVERSEAS BUSINESS

From the figures I have given, I am sure you will feel with me that our group of companies has experienced a very satisfactory year. In fact it has been a record year, and our associated companies have again made their valuable contribution to this result. I am happy to say that we have largely re-established our overseas business on a pre-war basis, and have been able to achieve considerable expansion, thanks to our ability once more to maintain close contacts with our agents and friends abroad. But for the conservative manner in which we have treated the necessary exchange adjustments in consequence of devaluation of the pound sterling, the figures would have made an even better showing.

Although we have had an excellent year, we know from past experience this cannot always be the case as conditions can and do vary from time to time in many parts of the world. It is however very pleasing to be able to report to you that the year's total premium income, excluding our life business, reached nearly 16,750,000 pounds, or more than £1,600,000 in excess of the previous year, and that the result of transacting this large volume of business has been so gratifying.

TRIBUTE TO STAFFS

This, gentlemen, brings me to the completion of my annual review of the affairs of the corporation and its group of companies, and it is no mere formality for me once again to pay tribute to the magnificent team spirit in which our staffs both at home and all over the world have discharged their duties. I know it will be your wish that I should express sincere thanks to our general manager, the executive, branch and district office managers, and to every member of the staffs of the Royal Exchange Assurance and the associated companies for their individual contributions as a result of which I am able to present to you this most favourable report. In this expression of thanks, I know you would wish me to include our local directors and agents both at home and overseas for all the assistance they have rendered to us.

In concluding I would make these observations. I feel that as Governor of this great corporation I should draw special attention to the excessive burden of taxation. The damage to the stability of this country's trade and industry caused by the crushing weight of taxes is being stressed on all sides, and you have only to keep in mind our own figures as presented in this year's consolidated accounts, amounting in all to nearly £1,000,000 to see the unbalanced relationship between taxation and profits.

We in this country are fortunate in having a great fund of commercial ability and experience at our disposal, and if left untrammelled by political interference and allowed reasonable freedom to manage our own affairs, British Insurance will I am sure maintain its very substantial contribution to the national recovery, and to the well being of every member of the community. Given these conditions, I am equally confident of the ability of our group also to maintain and expand its position.

The Governor concluded by moving the adoption of the report and accounts.

Mr Charles L. Dalziel (sub-Governor) seconded the resolution and it was carried unanimously; the proposed dividend was approved; the auditor, Sir Nicholas E. Waterhouse, K.B.E., was re-appointed and his remuneration was fixed, and the proceedings terminated with a cordial vote of thanks to the Governors, directors, managers and staff.

THE LICENSES AND GENERAL INSURANCE COMPANY, LIMITED

CONTINUED PROGRESS

The sixtieth ordinary general meeting of The Licenses and General Insurance Company, Limited, was held in London on June 7th.

Mr Ronald Gilbey (the chairman), who presided, said:

A substantial advance has been made in the total assets and the premium income of the company has increased by £171,949. With interest earnings of £54,265 the total income of the company now stands at a figure of £1,762,309.

The life department progresses in measured form, the total of the funds having advanced by £129,431 to £688,251.

In the fire account there is an adverse difference in the loss ratio of 4 points in a claims cost of 53.7 per cent., but as the increase in the income has not been so rapid as that shown in 1948, the unexpired risk requirements have lessened, the result being that an increased profit is available for transfer to profit and loss.

Similar remarks would apply to the miscellaneous account, excepting that the claims ratio in this particular department shows an improvement on that of the previous year and the resulting profit over all advances to £46,872, affording us a distinct measure of satisfaction.

Interest earnings have again advanced, and separating the life from the general earnings we find a sum on the latter account of £32,615, out of which our dividend continues to be comfortably discharged.

The report was adopted and a final dividend of 22½ per cent., making 32½ per cent. for the year, was approved.

M. WISEMAN AND COMPANY LIMITED

INCREASED HOME AND EXPORT SALES

The thirty-third ordinary general meeting of M. Wiseman and Company Limited (Ophthalmic Optical Manufacturers) was held on May 31st in London. Mr Max Wiseman, chairman, presided.

The following is an extract from his statement to the meeting:—

During the year 1949 sales increased in both home and export markets. Consolidated group fixed assets increased by £18,153 and net current assets by £99,747; share capital and reserves thus increased by £117,900 to £589,949, of which reserves (including £84,073 provided for future income tax home and abroad) now stand at £345,749.

Consolidated profits, after charging taxation to date and all expenses, including ample depreciation, increased from £60,581 to £102,990. Out of this sum, dividends absorbed £21,266, and the remainder was retained in the business, £50,000 being transferred to general reserve, £20,000 to development reserve and £11,724 added to profit and loss account credit balance

EFFECT OF NATIONAL HEALTH SERVICE

The disadvantages inherent in the operation of the National Health Service are manifold. It is impossible to ascertain the live demand for spectacle frames and lenses in this country, as it is liable to immediate fluctuation, and alterations have recently been made with the intention of reducing the demand under the scheme. The industry is thus at the mercy of governmental economies which may at any time completely alter the trend of demand and obscure the future. The introduction of new patterns can find no ready response by the public in the home market, since only specified models are permitted to be supplied through the service. Moreover, the industry has recently been the subject of an investigation by the Board of Trade, and the Central Price Regulation Committee has given notice of its intention to reduce prices, which must have a disadvantageous effect on the company's turnover and profits.

Special efforts are being made to counteract the effects of this reduction by increasing the efficiency of manufacturing methods. Despite these conditions, it is believed that our stringent attention to quality and to service will result in our production continuing to find favour amongst our customers.

The company's export business continues to make satisfactory progress notwithstanding keen competition, and every effort will be made to expand still further this most important section of the business.

Sales for the first four months of this year show an increase, both home and export, over same period in 1949.

The factory at Mauchline, Scotland, is now in full production and contributing to the company's profits. Developments at the new Vale of Leven lens factory are proceeding satisfactorily and it is being established on the most modern methods.

The report was adopted.

FRIENDS' PROVIDENT AND CENTURY INSURANCE OFFICES

The annual general meeting of the Friends' Provident and Century Life Office was held on June 7th in London. Mr Herbert G. Tanner, J.P., the chairman, said:—

During the quinquennium the progress of our business has been remarkable as the following comparative figures for the years 1944 and 1949 will show:—

	1944 £	1949 £
New Life Sums Assured	2,110,000	9,630,000
Life Premium Income	920,000	1,532,000
Net Fire Income ...	726,000	1,900,000
Net Accident Income	350,000	845,000
Marine Fund.....	870,000	1,372,000
Total Funds	23,670,000	32,970,000
Total Assets	26,889,000	36,875,000

The growth has been marked as clearly in our Continuous Disability Department and in our House Purchase Loans.

There is before you a report dealing with the quinquennial investigation into the liabilities of the Friends' Provident and Century Life and Annuity Fund. It will be noted that the profit earned during the quinquennium, after making provision for a substantial strengthening of the reserves, was £797,385. Out of this surplus the sum of £621,797 was distributed among the With Profit policyholders. The balance was added to the carry forward.

Quinquennial investigations have also been made into the liabilities of the Sinking Fund and Continuous Disability Funds, both of which show a very healthy position.

The year 1949 has been outstanding both as regards progress and trading profit. The new life business at £9,630,156 was £2,068,837 in excess of our previous record in 1948. Our reputation as a specialist office in group life and pensions is now widely known. In the sinking fund account we have transferred £50,000 to profit and loss.

In the continuous disability account we have transferred £15,000.

The trading results in the fire department have been particularly noteworthy. At home the income continues to grow steadily. Overseas the picture is equally bright and there is no section of our fire trading in any part of the world where we have not shown a profit. We have been able to transfer £169,272 to profit and loss.

We are devoting special attention to the development of our accident account. The trading for the year has resulted in a transfer of £14,435 to profit and loss.

Last year I made reference to the formation of the overseas department. I said we were satisfied we were taking a wise step. Our confidence has been justified and it will be our definite policy to continue overseas development on sound lines.

Marine premiums advanced by over £75,000 and we were able to transfer £32,052 to profit and loss.

The total premium income in the fire, accident and marine departments reached £3,657,464.

The consolidated trading accounts show transfers to profit and loss of £288,821, and the amount carried to the appropriation account is £495,522. The dividend from the Century has been increased from 33⅓ per cent. to 50 per cent.

The gross interest rate earned by the Friends' Provident has increased to £5 8s. 0d. per cent. compared with £5 3s. 3d. per cent. in 1948.

The report was adopted.

162517

ATLAS ASSURANCE COMPANY

CONTINUED PROGRESS

MR RUDOLPH DE TRAFFORD'S STATEMENT

The annual general meeting of the Atlas Assurance Company Limited was held on June 2nd at the company's head office, 92, Cheapside, London, E.C. Mr Rudolph E. F. de Trafford, O.B.E. (chairman of the company) presiding.

The following is an extract from the statement by the chairman on the accounts and balance sheets for the year ended December 31, 1949:—

FIRE ACCOUNT

Our fire premium income at £4,153,275 exceeds that for 1948 by £151,362. Our underwriting profit amounts to £490,815, or 11.8 per cent., by comparison with £340,207, or 8.5 per cent., in 1948—a satisfactory result, especially as it is not mainly derived from any particular part of the world but from the general and widespread area of our operations. All concerned are, I think, deserving of our congratulations and thanks.

ACCIDENT ACCOUNT

In the accident department premiums have moved forward to £1,507,683, by comparison with £1,369,114 in 1948 and the underwriting profit is £92,832, or 6.2 per cent., as compared with £69,719, or 5 per cent. in the previous year. When regard is had to the fact that this profit emerges after setting up increased reserves—flowing from the increase in premium income and from devaluation—which, in total, amount to a figure approximating £76,000, I feel that here, too, we should record our appreciation of work well done.

MARINE, AVIATION AND TRANSIT ACCOUNT

Our premium income in 1949 amounted to £648,237, as against £617,921 in the previous year, while claims paid were £365,749, as compared with £316,460. Although, bearing in mind our commitments, our position is undoubtedly strong, your directors have decided not to make any transfer to profit and loss account. Not only are market trends, in terms of rates, for example, not encouraging under present-day conditions, but devaluation has rendered delayed claims even more speculative than they were only a few months ago. There are thus good reasons, in the opinion of your directors, for continuing to conserve resources. The Marine Fund stands at £1,090,636, as compared with £853,702 at the beginning of the year.

CAPITAL REDEMPTION ACCOUNT

The Capital Redemption Fund increased during the year from £2,356,662 to £2,467,518. A valuation of the liabilities at December 31st last revealed a small surplus, which has been left in the Fund.

LIFE DEPARTMENT

During 1949 our life assurance and annuity fund increased by nearly £580,000, and now exceeds £21 million.

The ratio of commission and expenses to premiums decreased from 13.5 per cent. in 1948 to 12.7 per cent. in 1949—a satisfactory result in present-day conditions.

The net rate of interest earned on the fund fell from £3 9s. 3d. per cent. in 1948 to £3 5s. 9d. per cent. in 1949 on account of a considerably increased liability for income tax. It is to be hoped that the decline in interest rates which has taken place in recent years has been arrested and that no attempt will be made to return to a policy of ultra-cheap money.

A year ago my predecessor referred to the substantial reserve against the risk of depreciation afforded by the margin between the total market values of our Stock Exchange investments and the values at which they appear in the balance sheet. I am glad to be able to tell you that this reserve proved more than adequate to cover the considerable fall in Stock Exchange prices which occurred during the year. This fall, however, has had its compensations, for we are now able to invest at a rather better rate of interest than that which was obtainable previously.

The sum of £335,058 was distributed to holders of with-profits policies in the form of a reversionary bonus for the three years 1947 to 1949 at the rate of 25s. per cent. per annum calculated on the sum assured and existing bonuses.

An interim bonus has been declared for the year 1950 at the rate of 25s. per cent. per annum calculated on the sum assured and existing bonuses.

PROFIT AND LOSS ACCOUNT

The outstanding item in this account is United Kingdom taxation. This amounts to £445,848 of hard-earned money derived from the toil and endeavour of many people working in many parts of the world and it will, I should judge, not be unwelcome to the Exchequer, while at the same time serving, it is to be hoped, as a reminder of the value of British Insurance to the body politic.

APPROPRIATION ACCOUNT

The transfer from profit and loss account is £509,439 and, after providing £136,125 for the dividend at the rate of 11s. 3d. per share, 4s. 6d. per share of which was paid in October last, and transferring £150,000 to the fire fund, the total carry-forward amounts to £585,973.

GENERAL

You would wish me, I know, to pay tribute to the services rendered, both at home and overseas, by our local boards, the directors of our subsidiary companies and to all those others who, in one capacity or another, represent the Company. We are particularly grateful to them for their loyal support in these troublesome and complex time and we well recognise that, in certain directions at least, their task has been made more difficult as a result of the threat of nationalisation or "mutualisation" which has overhung certain important elements of the insurance industry in this country. It is true that we, as a company, have not been offered a seat in the tumbril, but in many places overseas there is a natural tendency to regard the vast structure of British insurance as something indivisible as, indeed, to a great extent it is. Thus fine distinctions between different classes of companies which may be drawn here and may be understood here—even though somewhat imperfectly perhaps—can be quite incomprehensible abroad. Added to this is the conviction overseas that if nationalisation—call it what you will—were once to be embarked upon, even in a limited way, there would be no worthwhile guarantee that it would not in time envelop the whole of British Insurance. Naturally, we do not share that conviction but, coupled with the other factor to which I have just referred, it certainly does not render it any easier for us to earn those overseas currencies which are so essential to the national well-being and to which, over the centuries, British Insurance has made so great a contribution.

The report was adopted.

GUARDIAN ASSURANCE COMPANY LIMITED

ANNUAL GENERAL MEETING MAY 31, 1950

EXTRACTS FROM THE DIRECTORS' REPORT

CHAIRMAN, C. D. MEDLEY, ESQ.

LIFE DEPARTMENT

Net new sums assured amounted to £4,516,766, being an increase over the previous year of £500,161.

The net rate of interest earned on the fund, which increased during the year by £1,403,155 to £14,450,058 was £3 14s. 4d. per cent.

A quinquennial valuation of the liabilities under life assurance and annuity contracts has been made as at December 31st last, and to policies entitled to participate reversionary bonuses have been allotted in respect of each premium due and paid during the quinquennium ended December 31, 1949, at a minimum rate of 30s. per cent. per annum calculated on the sum assured and existing bonuses and at somewhat higher rates in certain groups to keep in line with the method of distribution used before December 31, 1939.

A new series of with profits policies was opened on January 1, 1950, and such policies will receive bonuses according to the simple reversionary bonus system.

FIRE DEPARTMENT

The net premium income at £2,872,915 showed an increase of £198,871 over the previous year. The loss ratio was 43.9 per cent. The amount transferred to profit and loss was £477,562 representing 16 per cent. of the premium income.

ACCIDENT AND GENERAL DEPARTMENTS

The net premiums were £2,622,961 against £2,071,796 in 1948. The loss ratio was 51.4 per cent. and the amount transferred to profit and loss £261,467.

MARINE DEPARTMENT

The net premiums amounted to £1,021,565, an increase of £4,408 over the previous year and the first year's settlements were 23.2 per cent. of the premiums. After transferring £130,000 to profit and loss the marine fund amounted to £1,369,563 which is equal to 134 per cent. of the premium income.

REDEMPTION ASSURANCE ACCOUNT

A valuation made at the end of the year revealed a surplus of £21,857, of which £9,000 has been transferred to profit and loss, leaving the amount of the fund at £1,761,174.

PROFIT AND LOSS

After making full provision for taxation, including that on the profits for the year, and transferring £66,500 to the staff pension fund, £18,565 to the staff widows' pension fund, £10,000 to the life assurance fund of a subsidiary company, £80,000 to investment reserve and £200,000 to general reserve, and providing for the final dividend recommended by the directors of 2s. (less income tax) on each ordinary and staff share, the balance carried forward was £340,178.

BALANCE SHEET

A valuation of the Stock Exchange securities was made as at December 31st last and again showed a surplus over their total value as shown in the balance sheet.

All the principal classes of insurance transacted; also trustee and executor business.

Head office: 68, King William Street, London, E.C.4.

LANCASHIRE STEEL CORPORATION LIMITED

LARGER TURNOVER AND PROFITS

SIR JOHN JAMES ON NATIONALISATION

The twentieth annual general meeting of the Lancashire Steel Corporation Limited, was held on June 1st, at the registered office, Bewsey Road, Warrington.

Sir John James, chairman and managing director, in the course of his speech said:

Dealing first with the consolidated profit and loss account, you will note that the net profit for the year has risen from £696,177 in 1948 to £950,558 in 1949, an increase of £254,381. This increase in profits was derived in part from the rise in stock values due to the alterations in the price structure of the industry which occurred in April of last year, but mostly from the employment of the whole of our undertaking on full load throughout a year during which records became averages, giving a considerable increase in the total value of the turnover of the products of the corporation and its associated companies.

It is, however, important to note that our liability for taxation amounts to £1,050,000. The effect of this heavy taxation on the prices we have to ask for our goods is one of grave concern, particularly in view of the fact that, due to the increased production in which we have played our part, the steel consumption of this country has been overtaken in bulk if not altogether in kind.

In short, we are offering the Home market too much of one kind and not enough of another—i.e., tubes, sheets and tinplates are still in short supply, whereas we are finding increasing difficulty in disposing of our wire, particularly rods, as well as rerolled products, due to the higher rate of production, and now that more steel is available in our own particular manufactures we are looking to the export market to keep us fully employed. With the completion of the industry's early planning which I estimate will come into full effect by the end of 1951, we should by that time have completely returned to a buyer's market for all our products either for home or abroad, and with it healthy world competition. At this stage our heavy taxation may prove a severe handicap, particularly in the export market.

CONSOLIDATED BALANCE SHEET

Turning to the consolidated balance sheet of the corporation and its subsidiaries, I would particularly wish to draw your attention to the disparity between the earnings from operations and the book value of the fixed assets, which alone in a business such as ours have made the earnings possible. The explanation, of course, is that the earnings are expressed in terms of present-day values, while the fixed assets largely represent expenditure incurred before the war in pounds of a much higher value. Present-day accountancy practice appears to have devised no means by which these varying values arising from the fall in the value of sterling can be reconciled to a common basis, and I would earnestly suggest that this is an aspect to which serious and urgent study should be given. In this connection I have noticed that the matter was referred to in the report of the Institute of Cost and Work Accountants. Meantime, I have no hesitation in saying that the present-day value of the fixed assets of the corporation and its subsidiaries cannot be less than three times the amount of the net book value of £3,355,677.

Encouraged by the splendid effort of the industry in 1949, I welcome its attempt to use any savings due to increased outputs and consequent reduction in steel imports to try and consolidate prices. With this object before it, the industry is wisely, I think, attempting to carry the increased cost of transport without serious interference with the price of its main steel products, so tending to check further increases in prices.

OPPOSITION TO BUREAUCRACY

I will not attempt to forecast the future of iron and steel except to say this is no time to risk upsetting an industry which has tried so hard to serve its country well. Although the nationalisation of iron and steel is now on the statute book, I sincerely hope that wiser counsels will prevail before plunging the industry into the rigid bureaucracy that now surrounds those industries already nationalised under which individualism is fast disappearing and is being replaced by something remote and unapproachable that has as yet developed only one policy, namely that of increasing its charges to those it was elected to serve.

Your directors are satisfied that our companies' plans are more than ever necessary to enable us to find full employment for our people; that increased production can only come from better equipment, and that the strain of rapid production processes must be countered by scientific control. With this conviction, your directors will continue to go ahead, with their capital expenditure programme, which you will note amounts to more than £2 million, knowing as they do that without a modern iron and steel industry the country cannot hope to play its proper part in the great problems that beset Western Europe.

PLANT EXTENSION

We are, therefore, pressing forward with our new steam and power plant and our gasometers and gas cleaning plant, which at long last are in the erection stage, though much behind the scheduled time. Our coke oven plant is being extended to meet our increased demand for coke and gas; the deferred reconstruction of our ingot heating furnaces and buildings is 60 per cent. completed and should be finished this year; our new rod and bar mill together with improvements of production processes in our existing rolling mills are now well in hand; part of our new road materials works is in production and our new coating and sizing plant is now in the final stage of design which will enable us to convert the bulk of our blast furnace slag for use in road-making, for which there should be an expanding demand, if roads are to be improved to take care of the steadily increasing road traffic, particularly in the North-West area. These developments, together with our plans for the further improvement of our ropery and hard wire machinery, which we have in hand, are in accord with our policy that good equipment means increased outputs and a lower cost of production.

Your directors are satisfied that the cost of this programme, together with other improvements we are contemplating, can be met out of our own resources, and I am confident that if we can continue to employ our undertaking fully we should be able to make a valuable contribution to the trading value of this country.

The report was adopted.

ANGLO-PORTUGUESE TELEPHONE COMPANY, LIMITED

CONTINUING PROGRESS: INCREASED REVENUE

NEW TARIFF AGREEMENT WITH GOVERNMENT

SIR ALEXANDER ROGER ON PROPOSED CAPITAL ISSUES

The sixty-third annual general meeting of the Anglo-Portuguese Telephone Company, Limited, will be held on June 27th at Strowger House, Arundel Street, London, W.C.

The following is the statement by the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts for the year to December 31, 1949:—

The accounts for the year to December 31, 1949, give details of the continuing progress of your company. You will remember I said in my speech last year that on September 21, 1949, the Portuguese Government fixed the rate of exchange for the dollar at Escudos 25 instead of Escudos 28.75, and for the £ sterling at Escudos 80.50 instead of Escudos 100 at which it had remained since 1940. On account of the alteration in the exchange rate some losses have arisen amounting to £9,658 which has been charged to contingency reserve, reducing it from £70,792 to £61,134. Total revenue for the year amounted to £939,664, an increase of £93,000 compared with £846,664.

PLANT MAINTENANCE

As has been the practice for many years past, the consulting engineers have investigated the position and condition of the telephone plant. During the war years when supplies of telephone material for maintenance, reconstruction and expansion were severely restricted, the company's plant was heavily overloaded and subjected to considerable strain. To take care of this exceptional wear and tear an additional allocation from revenue for depreciation has been made since 1944, and for 1949 over and above the normal depreciation allocations, the consulting engineers have recommended that this additional allocation should be continued. In their report the consulting engineers have stated that in their opinion the provision for renewals, which now stands at the large sum of £1,278,124, equal to almost 32 per cent. of the cost price of installed telephone plant, is adequate.

After allowing for depreciation, provision for renewals, and charging debenture interest, loan interest, and sinking fund instalments, the total expenses for 1949 were £878,632, compared with £786,191.

DIVIDEND AGAIN 8 PER CENT.

Net profit amounts to £61,032, against £60,473. The usual dividends of 8 per cent., less tax, on the ordinary and "A" ordinary stock absorb £57,172, leaving £3,860 to be added to carry-forward, bringing it to £49,893. This dividend rate of 8 per cent. has been maintained continuously for the past 23 years. The replacement cost of the telephone plant installed and in operation at December 31, 1949, at present-day prices is estimated at roughly over £8,000,000, as compared with £4,200,000 in the balance sheet. Shipments of telephone material for capital development and maintenance purposes from this country for use in Portugal during the year amounted to £62,300, bringing the total since the end of the war to £1,057,500. Purchases of locally manufactured material totalled £60,700. The company's reserves have continued to be fully invested in the business to the economic and financial advantage of all concerned in the efficient running of the company.

TARIFF NEGOTIATIONS

At the annual general meeting last year I gave you up-to-date information concerning our negotiations with the Portuguese Government regarding an increase in tariffs and clarification of the contract under which the company operates in Portugal.

As you will have learned from the announcement in the press on May 22, 1950, and amplified in the directors' report annexed to the 1949 accounts, these negotiations have now been completed. I visited Lisbon in April of this year and had the honour of being received by H.E. Dr Salazar on two occasions, as well as meeting some of his leading Ministers, and of discussing the matters of common import. Agreement in principle was quickly reached, and the necessary formalities to give effect to it were immediately put in hand.

BOARD SATISFIED

By means of a Portaria published in the official gazette, the "Diario do Governo," on May 2, 1950, the new tariffs which the company is authorised to charge for its various telephone services came into operation as from May 1, 1950. The scale of these increases takes into account all aspects of the revenue charges which fall upon the company by way of operating and maintenance expenditure, and provides for the interest and sinking funds on its existing loan capital, and for dividends on the present issued capital of the company. Allowance has also been made for the annual charges on the new capital required.

Your directors are satisfied with the present increase, which will enable us with confidence to complete our plans for raising fresh capital on attractive terms to meet the expansion of the company's systems and provide telephone service to the 27,000 applicants still on the waiting list. We have sincerely regretted our inability to connect subscribers at a faster rate than has been accomplished, and it is our intention to cut down as far as possible any further period of waiting.

During 1949 almost 5,000 stations were added to the system, bringing the total number in service at the end of the year to 93,434. Of this number 28,229 have been added in the last four years, involving capital expenditure of approximately £1,500,000.

POINTS IN THE DECREE

There was also published in the official "Diario do Governo" on May 19, 1950, a Decree authorising the company's contract with the Portuguese Government dated January 3, 1928, to be clarified and amended. The contract was signed on May 29, 1950. Translations of the various documents are available for inspection by stockholders at the company's offices, but I would like to refer to one or two points from the Decree.

It states that when the application was made for an adjustment of tariffs the Government informed the company of the necessity to revise certain clauses of the 1928 contract in order better to safeguard the interests of both parties, and that within that spirit of collaboration which has always permitted the maintenance of the closest and most friendly economic relations between Portugal and England, the company agreed that negotiations should be commenced towards that end.

It states further that during the negotiations which took place it was considered that the contract in its then form did not safeguard sufficiently the interests of either the company or the Government. Accordingly, the contract has now been amended and clarified in a manner entirely satisfactory both to the Government and to the company, and I would like to record on behalf of the Board my appreciation of the manner in which the negotiations have been conducted and completed.

NEW CAPITAL ISSUES

We are now proceeding with arrangements to provide the fresh capital required to expand the system, and to replace our existing loan from Telephone and General Trust, Limited, which has been employed in the business for the provision of new buildings, plant and equipment, and for maintenance, and much of it is already revenue-earning. Our proposals include the issue by the company of the unissued Ordinary capital of 400,625 shares by way of an offer to the existing stockholders, and the creation and placing of new debenture stock. Plans for both these operations are well advanced and full details will be announced shortly.

I am pleased to say that Telephone and General Trust, Limited, has indicated its willingness to continue, when the time comes, its financial co-operation with the company which has contributed largely to the success of our management and operation. The trust has been closely associated with the company since 1927, and the services it has been able to give us in the financial, technical and operating spheres have been of the greatest value. We are also assured through the medium of our associated manufacturing companies of obtaining the most up-to-date telephone equipment which modern technique and experience can produce.

INTERCHANGE OF VISITS

The course of the negotiations has inevitably involved close personal contact between representatives of your boards in London and Portugal, and during the year we had the pleasure of visits to London of Eng. Branco Cabral, chairman of your board in Portugal, and of Dr Bustorff Silva, the company's lawyer. These two gentlemen have given us support and advice over many years, and their willingness and constant attention to matters relating to your company's business have contributed much to the success of the recent negotiations. They have at all times been ably supported by their colleagues on the board in Portugal.

Mr R. S. Thorp, our general manager, has paid several visits to London, and on your behalf I should like to pay tribute to the efficient manner in which he has carried out his many and onerous duties throughout the year. It is pleasant for me to acknowledge also the untiring help in London and in Portugal of my co-director, Mr Hollyer, and the secretary, Mr Fyfe.

TRIBUTE TO STAFF

The year 1949 has presented the staff with many difficulties and problems. We have in Portugal over 3,000 employees, the great majority of whom are Portuguese, and one and all have carried out their duties loyally.

We have always regarded our enterprise in Portugal as one of great importance to both our countries, and today we see a field lying before the company in which we can render great service to the public of Portugal, and in providing finance and valuable exports from this country we can do much to further the expansion of Anglo-Portuguese trade. I, therefore, feel justified in saying I look forward to the future of the company with confidence.

UNION CORPORATION LIMITED

REVIEW OF CONDITIONS IN GOLD MINING INDUSTRY

COUNTRY'S COST STRUCTURE EATING INTO DEVALUATION BENEFITS

MR P. M. ANDERSON'S VIEWS

The ordinary general meeting of shareholders of Union Corporation, Limited, was held in Johannesburg, Mr. P. M. Anderson presiding.

The chairman said:—During the year your directors offered 232,000 reserve shares to shareholders at £10 per share in the ratio of one new share for every seven shares held. The issue realised a gross sum of £2,320,000, of which £145,000 constitutes an addition to the issued capital. The balance of £2,175,000 has been placed to the credit of share premium account, raising that account to £3,680,000.

The gross profit for the year was £1,548,997, an improvement of £177,854 over the preceding year. Revenue from dividends rose by £143,285 and the net profit, after taxation, amounted to £831,070, an increase of £145,867. During the year £219,382 was spent on exploration and charged to exploration reserve. Your directors considered it desirable to transfer £200,000 from profit and loss account to replenish this reserve, which now stands at £260,505. The expenses of the new issue, amounting to £42,728 have been written off. Dividends totalling 6s. per share, free of United Kingdom tax, or the same rate as last year, were paid on the increased capital and absorbed £558,000, leaving £213,008 to be carried forward to new account, compared with £182,666 in the preceding year.

Share and debenture holdings stand at £5,582,286, an increase of £1,443,839, largely due to the corporation exercising its rights in the recent increase of capital by St. Helena Gold Mines, Limited, and to its new investment in Stilfontein Gold Mining Company, Limited.

WITWATERSRAND

Before reviewing the affairs of the companies in which your corporation is specially interested, it is perhaps appropriate to comment on conditions obtaining in the gold mining industry of the Witwatersrand.

On September 19, 1949, South Africa, in common with the United Kingdom and many other countries, devalued its currency in terms of the United States dollar. As from that date, therefore, the price received for gold by producers increased from 172s. 6d. to 248s. 3d. per ounce fine.

Largely owing to an improvement in the native labour supply, the tonnage milled in 1949 by the Witwatersrand gold mines rose by 1,595,850 tons to 56,881,550 tons. Due to the greater output and the higher price received for gold during the latter part of the year, the working revenue at £110,617,436 was £14,443,081 higher than in 1948. Notwithstanding the increased tonnage milled, working costs rose by 10d. per ton during the year under review and totalled £76,667,643, while working profit at £33,949,793 increased by £10,159,376. In addition, the sum of £1,105,649 accrued to the industry from sales of gold at enhanced prices for industrial and artistic purposes.

DIVIDENDS AND TAXATION

Dividends distributed to shareholders increased from £12,774,387 to £16,663,805, while it is estimated that taxation and share of profits payable to the government will absorb £11,734,000, or 34.6 per cent., of the working profit, as compared with £7,500,000, or 31.5 per cent., for the previous year. Capital expenditure by producing mines amounted to nearly £3,500,000 and just over £2,500,000 was set aside to provide certain special benefits for European employees.

The total development footage driven by the industry during the year increased slightly to 2,039,877 ft. As a result of the lower pay limit, brought about by the increase in the price of gold, large tonnages of ore which were previously unpayable could be included in the ore reserves of the industry, which increased by over 31,000,000 tons to 196,738,202 tons, the average grade being 0.48 dwt lower at 4.87 dwts

As a result of the increased price of gold, it was possible to grant as from September 19, 1949, an increase in basic wage rates and certain other improvements in conditions of employment for European employees in the industry, including the inauguration of a pension fund for day's-pay employees. These increases were in addition to the non-recurring special benefits for which, as I have already mentioned, the sum of £2,500,000 was provided. In deciding upon these increases, the industry was assisted by the report of the Van Eck Commission on conditions of employment in the gold mining industry, which was made available shortly after devaluation. The improved position of the industry also made it possible to follow the service increment granted in 1948 to native employees by an increase in their basic wage rates.

UNDERGROUND LABOUR

There was some increase in the number of Europeans employed on the mines during the year, but the industry is still short of underground personnel. The native labour supply is also still below requirements, although the number of natives presenting themselves for employment in 1949 improved greatly. The average number at work during the year, at 287,549, showed an increase of over five per cent. as compared with 1948.

While devaluation has benefited the industry considerably by increased revenue and by permitting the profitable mining of ore which was previously unpayable, the steady and continuous rise in the cost structure in South Africa is rapidly eating into these benefits. In this connection, it is interesting to note that during the three months before devaluation working costs on the Witwatersrand averaged 26s. 3d. per ton milled, as against 29s. 2d. during the three months ended April 30 of this year, which is equivalent to an increase of 11 per cent.

Although the industry makes every effort to keep working costs in check, increases in costs continue to arise from causes outside its control. As examples one may cite the recent increase in prices of many basic foodstuffs and the 10 per cent. increase in railage rates, coupled with increased siding, handling, and port charges, announced by the Minister of Transport in March of this year, which followed on last year's increase in transport charges of seven and a half per cent.

INCREASING EFFICIENCY

With the object of reducing costs by attaining higher efficiencies, an Officials' Training Centre was established in 1948 at Geduld Proprietary Mines, Limited, to serve the mines of the Union Corporation group, and has since been moved to more suitable premises at The Grootvlei Proprietary Mines, Limited. Short intensive courses are given to officials and prospective officials on the lines of the "Training-within-Industry" pattern which was developed in Great Britain and in the United States of America during the war. The centre is proving successful.

In addition, a contract has been entered into with the Council for Scientific and Industrial Research for research into the methods and application of aptitude testing of native employees of the Union Corporation group of mines. The research so far done, while still largely of a preliminary nature, indicates that some useful results may be expected.

ORANGE FREE STATE

During the year eight gold-mining companies were actively engaged in shaft sinking in this new field, and a total of 17,044 ft. of shaft sinking was completed. On the property of one of these, St. Helena Gold Mines, Limited, which is under the administration of your corporation, over 19,000 feet of underground development was accomplished. In addition, extensive surface drilling by a number of companies was carried out over large areas. Since the year-end a further three mining companies have commenced operations, and recently it was announced in the Press that two further companies would be formed shortly to undertake mining operations in an area north of Odendaalsrus.

GOLD INTERESTS

The chairman, having reviewed the results of the gold mining and other companies on the Witwatersrand under the administration of the Corporation, then proceeded: During the year the corporation and various of its subsidiary companies continued active exploration over large and widely distributed areas. The work of prospecting includes extensive geological and geophysical investigations and the carrying out of substantial drilling programmes. While much information of interest is being collected, the results obtained during the year do not call for special comment.

OTHER INTERESTS

Chrome Mines of South Africa, Limited, has increased its production from its Groothoek mine in the Lydenburg district and its Zwartkop mine in the Rustenburg area of the Transvaal. The company's properties are now equipped to produce substantial tonnages of various grades of chrome ore and concentrates.

The operations of San Francisco Mines of Mexico, Limited, were not interrupted by strikes during the year and, accordingly, the company was able to increase its tonnage milled from 502,000 tons to 580,000 tons. The fall in base metal prices which began in the early part of 1949 substantially reduced the company's dollar revenue, but the devaluation of sterling in September last should have a favourable effect on the earnings expressed in sterling. The accounts for the year have not yet been published.

In 1949 British Enka, Limited, gradually brought into operation the new plant which has recently been installed at the factory at a cost of the order of £2,000,000. As a consequence of this and other favourable factors, the working profit increased from £362,000 in 1948 to £538,000 in 1949, and the net profit after depreciation and taxation from £104,000 to £153,000. £100,000 was placed to general reserve and the dividend for the year was maintained at 7½ per cent.

During the year the director nominated by the corporation to the board of Ultramar Company, Limited, resigned his seat on the board, and the corporation has since disposed of its holding in this company.

Bay Hall Trust, Limited, maintained its dividend of 6 per cent., free of United Kingdom tax in respect of the year 1949. At the end of the year the appreciation of its holdings over book cost amounted to £1,037,031.

South African Pulp and Paper Industries, Limited, again increased its output as a result of additions and improvements to its factory, and the company is at present extending its plant still further in order to produce about double the present output. The net profit after providing for taxation and depreciation was £290,463. Dividends declared totalled 1s. 9d. per share, being an increase of 3d. per share over 1948.

For some years past your corporation in association with certain other interests, has been investigating a project for establishing a further pulp and paper mill at the mouth of the Tugela River in Natal, where the water and raw materials available will make possible increasing production in keeping with the growing demand for paper in South Africa. It has now been decided, subject to certain assurances from the Government of the Union of South Africa and to satisfactory arrangements being made for raising the necessary finance, to proceed with the construction of a new factory at the Tugela River mouth.

Since the close of the year Mr A. Chester Beatty has retired from the board of your corporation. Mr Chester Beatty had been a valued director since October, 1940, and it was with regret that his colleagues acceded to his request to be allowed to retire.

One of our directors, Mr C. T. Pott, recently completed 50 years of service with the corporation and we extend to him our congratulations on this achievement.

The report and accounts were adopted and the retiring directors re-elected.

HARTLEY FABRICS

SUBSTANTIAL ORDER BOOK

The fourth annual general meeting of Hartley Fabrics, Ltd., was held on June 7th at Preston, Mr E. L. Hartley (the chairman) presiding.

The following is an extract from his circulated address for the year ended February 28, 1950: The trading profit for the group was £191,887, against £122,887 last year, and against £80,000 forecast in the flotation prospectus. Modernisation of plant and methods and "redeployment" have contributed largely to this satisfactory achievement.

After the deduction of depreciation, management salaries and commissions, and directors' and registrars' fees, there is left £171,270, compared with £105,612 last year. From this, income tax and profits tax amounting to £86,716 must be deducted, leaving £84,554 for disposal, as compared with £43,505 last year. The directors deem it prudent to build up a considerable reserve.

They recommend a final dividend of 10 per cent. only on the ordinary shares, making 15 per cent. for the year.

Modernisation is continuing in the producing companies. The ring-spinning frames which were on order last year are now in full production and are spinning a very good quality yarn. Output of yarn has increased by approximately 40 per cent., and output of cloth by 30 per cent. over last year's figures. The total turnover of the group has increased by nearly 30 per cent. over last year.

These excellent results have been produced by wholehearted co-operation of management and employees, practically all of whom are shareholders in the company. We have at present a very substantial order book, and unless unforeseen circumstances should arise we can look forward with confidence to another successful year.

The report was adopted.

RIO TINTO COMPANY, LIMITED

DIFFICULT CONDITIONS IN SPAIN

LORD BESSBOROUGH'S SPEECH

The seventy-seventh annual general meeting of the Rio Tinto Company, Limited, was held on June 8th in London, The Rt. Hon. The Earl of Bessborough, G.C.M.G., the chairman, presiding.

The chairman, in the course of his speech, said: You will have noticed an increase in the balance shown on the profit and loss account from £48,900 for 1948 to £103,592 for 1949. This followed a considerable reduction in the expenses of administration, taxes and so on, due mainly to the smaller amount required for taxation provision, owing to certain non-recurring adjustments, and partly to the transfer from administration to operating expenses of sundry items of expenditure which were originally hoped to be of a temporary nature, but which may now be considered as permanent. Similarly, the net return on sales of produce has diminished from £695,677 in 1948 to £597,614 in 1949.

On the other hand, the net income from investments in Rhodesia has slightly increased and the balance carried to appropriation account is £395,695, as against £348,363 for the previous year.

As regards the balance-sheet, creditors, debtors and stocks and stores in Spain all show a reduction in consequence of the adjustment of rates of exchange to accord with the rates now current in Spain. Your attention has already been drawn to this adjustment in the directors' report.

The market value of quoted investments dropped from £7,671,608 at the end of 1948 to £6,999,387 at the end of 1949: this drop of about £672,000 was in no way out of line with the general market decline.

With regard to the administration of the company no change in the constitution of the board has taken place since the last annual general meeting. Mr J. N. V. Duncan, commercial manager, has been appointed joint London manager.

RISES IN COSTS

To turn to Spain: Once again I can only report that despite every effort of the board, we should be flattering ourselves were we to record an improvement in the company's trading situation. Rises in costs continue; wages increases are imposed—sometimes even with retroactive effect; but the securing of correspondingly increased prices for the company's products sold in Spain is a process that takes time and when obtained these increased prices are not retroactive. I have often spoken of this time lag between increases in costs imposed upon us and the granting of increased prices in Spain; so long as this persists, the company cannot obtain a satisfactory return on its trading operations there. Shareholders will realise that this delay is a matter entirely outside the control of the directors despite their constant efforts.

The directors fully realise the difficult period of rehabilitation through which Spain is passing without the sustaining infusion of foreign aid which so many other countries at present enjoy. The board never cease to endeavour, in spite of import permit and other difficulties, to keep up the operational efficiency of the mine, which is in the interest of Spain generally and not only in that of the company. The directors well appreciate the difficulty for the authorities of fixing new and higher prices when even during the period that these are being considered, fresh increases in costs are arising. Nor, having had experience of retroactive wage increases, do they minimise the dislocation which might result from price increases being made retroactive. Nevertheless, in the light of the knowledge shared with the authorities of the recurring adverse effects of the time lags, they consider it to be no more than equitable that, when increased prices are granted, they should cover not only normal industrial profit but also include a margin for cost increases always supervening prior to the next price increase.

Turning now to pyrites exported from Spain, following the considerable cost increases experienced, the company has had to increase prices to a level where it is tending to lose its competitive position in European markets. The directors earnestly hope that the authorities will find it possible to arrest this tendency, unfortunate in its results alike for Spain and for the company, by granting a much higher special rate of exchange for foreign divisas resulting from pyrites sales.

AFRICA

Your board appreciate that the shareholders must feel disappointment that the knowledge and experience of mining matters gained over so many years by the company are not enabled to be productive of better results owing to circumstances which are, as I have just explained, beyond the directors' control.

They have therefore turned their eyes to Africa to see whether opportunities can be found for an active interest in mining propositions on that continent in addition to their existing investment holdings in Rhodesia.

In this connection the board are participating in a joint venture with the Frobisher Company of Canada in a copper and cobalt mining proposition in Uganda, which is still in an exploratory stage. In addition, they are proposing to carry out certain exploration work in South Africa.

From the investment point of view, the company joined a group formed to acquire shares in Tanganyika Concessions, Limited, from the British Government. Shareholders will have seen in the Press a full and detailed account of this transaction, on which I need not therefore enlarge.

DIVIDEND

The directors again recommend that out of the company's Rhodesian investment income, a dividend be paid on the ordinary shares in respect of the year 1949 at the rate of 10 per cent., free of tax.

THANKS TO STAFF

I should like to add on behalf of the board warm thanks to the staff at home and abroad. Since our last meeting, Sir Mark Turner, our managing director, paid a further visit to Spain in 1949, on which he was accompanied by Mr. G. E. Coke. As ever, they were most impressed by the way the staff there maintained their keenness and interest in the work. The activity at the mines in Spain is very considerable, in fact, the volume of the company's business in 1949 was increasing and was not unsatisfactory. I mention this as I should not like the shareholders to be misled into measuring the scope of our activities in Spain by the paucity of the financial benefit accruing to the company.

The staff in Spain and the workmen there did a good job and merit our sincere appreciation.

The report and accounts were unanimously adopted.

BRIGGS MOTOR BODIES LIMITED

INCREASED PRODUCTIVE ACTIVITY

The 15th ordinary general meeting of Briggs Motor Bodies Limited was held on June 6th in London. Mr. W. D. Robinson (chairman of the company) presided.

The following is an extract from the chairman's statement for the year ended December 31, 1949:

Your board of directors is pleased to present again a very satisfactory financial statement reflecting the results of a year of still further increased productive activity.

1949 was in many respects a year of great achievement and our volume of business reached an all-time high in peace-time production.

The net profit, after taxation for the year, amounted to £657,151, which compares with £483,345 for 1948 (as adjusted for the net benefits of initial taxation allowances relating to that year and explained in the directors' report).

In 1949 we spent a sum of £799,351 on buildings, machinery and equipment, and further commitments of this nature were pending in the amount of approximately £446,000 at the date of the accounts.

FURTHER CAPITAL EXPENDITURE

The company is faced with still further expansion of its productive facilities to meet the demands of its customers. Difficulty, however, has been experienced in finding suitable established factory space to cover the additional production programme contemplated. These additional productive facilities, when obtained, will, however, entail considerable further capital expenditure which it is hoped can be financed out of the company's existing resources. The directors recommend the payment of a dividend on the Ordinary shares of 12½ per cent., less Income tax, in respect of the year 1949.

We shall be engaged during the coming months in the rearrangement of existing factory layouts to meet new production programmes, alongside the maintenance of existing production, which is continuing at a high level. The results of the present year will depend upon (a) the achievement of this conversion without undue interruption, (b) the volume of exports being maintained, (c) the Government's attitude toward motor-car and commercial vehicle production for home consumption, and (d) the availability of steel supplies.

It is with the deepest regret that we report the sudden death, in February last, of Mr. J. E. McIntosh, our deputy chairman and managing director. Mr. McIntosh had had more than 23 years' service with the company, its predecessor and Briggs Manufacturing Company of Detroit, and was chief engineer for a number of years. His long experience in engineering and commerce, together with his shrewd judgment, were of great value to the company, and we wish to record at this time our sorrow over the loss of so able a colleague and friend.

At the meeting Mr. Robinson referred again to the untimely death of Mr. McIntosh and announced the intention of the board to appoint Mr. S. W. Cochrane deputy chairman and managing director of the company. Mr. Cochrane, who was present, was the company's sales manager from its inception until 1940, and since that time had been an executive of its American associate, Briggs Manufacturing Company, at Detroit; he hoped to take up his official duties early in July.

The report was unanimously adopted.

YORKSHIRE FINE WOOLLEN SPINNERS LIMITED

SIR FRANK BINNS'S STATEMENT

The second annual general meeting of this company was held on June 6th in London, Sir Frank Binns, Kt. (chairman and managing director), presiding.

The following is an extract from the chairman's statement: Again it gives me great pleasure to report the progress of the company.

It will be seen that, after providing for the final dividend and making adequate provision for taxation, the excess of current assets over current liabilities has materially increased in comparison with last year, and, in the opinion of the board, the liquid position is highly satisfactory.

The trading for the year has again been satisfactory. The combined profits of the group, before remuneration of directors and depreciation, amount to £215,038 (compared with £189,684 last year), and rents and interests received make the total £215,275. After deducting depreciation and remuneration of the directors, the profits, prior to taxation, are £179,117, in comparison with £160,552 last year. Income tax and profits tax absorb £96,800 (£85,850 last year), leaving a profit available for distribution of £82,317, as compared with £74,702.

ADDITIONAL MACHINERY AND PLANT

Once more we have adopted the procedure of giving considerable thought to the perfection of our plant and during the year have completed many improvements, which are again proving conclusively that there are many advantages to be obtained by adapting ourselves to the latest types of machinery. Quite a number of these types of machines have been added to our plant during the course of the year, and we are pleased to be able to report that they are proving to be extremely successful, and are greatly assisting us in increasing our production. Generally, it is our intention to pursue this principle, both as regards plant and buildings, and during 1949, additions totalled £37,012.

KNITTING WOOLS, MENDING WOOLS, DARNING WOOLS

Production of these three types of wools has greatly increased, and represents quite a reasonable proportion of our total production. It is our intention to make every effort to increase very considerably the production of these lines, as they are very adaptable to a comprehensive machinery company like ours.

At the present time we are very busy producing "Lambswool" yarns and "knitting wools" of many qualities, a large proportion of these products being destined for export to countries including the United States and Canada.

We are pleased to be able to report that during the course of the first four months of this year production has again been maintained and, in comparison with the corresponding period of last year, is quite satisfactory.

The orders on our books show a notable improvement, even in comparison with what we considered to be an excellent position in 1949. We have business to proceed with which will run the mills for some considerable time, and on certain of our products it is quite impossible for us to book further orders until October or even November.

Should existing demand continue and circumstances remain as they are at present, your directors anticipate that the results for 1950 should give your every satisfaction. We shall naturally do all in our power to try to achieve this objective.

The directors recommend a final dividend of 25 per cent. on the Ordinary shares, making 35 per cent. for the year.

The report was adopted.

CAMP BIRD, LIMITED

DIVIDEND AGAIN 10 PER CENT.

The forty-eighth annual general meeting of Camp Bird, Limited, was held in London on June 6th.

Mr F. C. Heley, the chairman, in the course of his speech, said:

The political and financial problems have remained with us throughout the year under review, and their solution is still far from imminent. On the trading side of our business, therefore, conditions have been unusually difficult. Consequently, I was very surprised to read in a London evening paper an expression of disappointment with the results achieved. I have no doubt, however, that shareholders will accord a more reasonable appraisement of the year's work (which has yielded a dividend of 10 per cent., after transferring £40,300 to investment reserve, and adding about £7,000 to the carry-forward), and will allow your directors a certain amount of satisfaction with the position they are able to lay before you today.

The result of operations on the Camp Bird Mine has been to turn a loss of £1,900 last year into a profit of nearly £12,000. The mine is at present being developed by tributors under royalty terms, and in order to encourage them to improve the equipment of the mine and accelerate development, we agréed to waive our royalties during the whole of 1948. These payments were resumed as from January 1, 1949.

The categories of our investments remain substantially the same as last year, namely, in round figures, 60 per cent. in gold and platinum mining, 20 per cent. in silver and base metals and 20 per cent. in miscellaneous. Their geographical distribution also shows little change—59.7 per cent. is in South Africa and Rhodesia, 1.6 per cent. in West Africa, 12.7 per cent. in Australia, 14.6 per cent. in America and 11.4 per cent. elsewhere.

The report was adopted.

AULT AND WIBORG, LIMITED

RECORD SALES

The sixteenth annual general meeting of Ault and Wiborg, Limited, was held in London on June 9th, Mr Gerald Wellesley (the chairman) presiding.

The following is an extract from his circulated statement:—

The year under review has been a highly satisfactory one, sales having reached a record figure in the history of the group. Profits of the group before taxation have risen to £331,255 for last year, as compared with £276,442 for the previous year, and profit of the company to £310,840, as compared with £278,979. The directors recommend a further dividend of 13½ per cent. on the ordinary stock, making 20 per cent. in all.

This limitation of dividends was originally accepted by us as a purely temporary measure, designed to assist our country's economy, and it is worthy of note that, while the company has adhered strictly to the restriction, there have, during the period, been no less than three separate increases in wages to our operatives, plus a reduction of one and a half hours in the working week, and the granting of an extra week's annual holiday, all negotiated with the trade unions concerned.

Despite the increased competition now experienced throughout the world, our company's export business shows a considerable increase. The official control of many of our more important raw materials, continues to hamper our exports.

Your company's business continues to be active and healthy and we look forward to the future with confidence.

The report was adopted.

LONDON BRICK COMPANY, LIMITED

DEMAND EXCEEDS PRODUCTION

The fiftieth annual general meeting of the London Brick Company, Limited, was held on May 31st in London, Sir P. Malcolm Stewart, Bt., O.B.E., D.L., Hon. LL.D., the chairman, presiding.

The chairman, in the course of his speech, said: The trading profit and sundry income for the year amounted to £849,115, compared with £619,555 last year. After providing for depreciation of fixed assets and for taxation and other charges, there remains a net profit of £209,497. After deducting the dividend for the year on the Eight per Cent. Cumulative Preference stock and the interim dividends, totalling 15 per cent., less tax, paid on the Ordinary stock, there remains a balance of £6,272.

Our subsidiary company has maintained its profits for 1949, its works being fully occupied. The good proportion of export trade has been maintained.

Last year we spent on capital account over £550,000, and we have an estimated capital expenditure for the current year of some £750,000. A heavy expenditure has been and is being made to secure a higher degree of mechanisation bringing in its train improved efficiency.

During the past year and this year we have spent large sums on additions to our transport fleet. We have purchased recently the freehold of the Elstow Works, a Whitbread property. We cannot afford further to deplete our working capital. Therefore, we have made an application to the Capital Issues Committee for permission to issue 350,000 ordinary shares, the outstanding balance of the authorised capital, at a price to be agreed.

HEALTHY ORDER BOOK

Throughout the year under review the demand for all the company's products exceeded the productive supply. This position holds today, and while an overflowing order book is often regarded as fortunate it can become embarrassing. Our commercial success has been largely built upon an efficient and rapid delivery service, which we do our utmost to maintain under present difficulties, some at times beyond our control.

Every effort has and is being made to increase our production to meet the heavy demand. While the 1948 production decreased, by 6.15 per cent., compared with 1947, owing to the sudden reduction of the building programme which caused much dislocation of our organisation and the closing of works and general reduction of production, there was an increase of 22.65 per cent. in 1949 over 1948. This year, 1950, we aim to increase our production further by 10 per cent.

To meet the national demand for economically priced facing bricks we have increased the proportion of our manufacturing capacity allotted to their production. The considerably increased production of hollow clay blocks is not only finding a ready market but it is assisting to meet the demand for bricks. On a number of important building contracts our walling blocks have been employed satisfactorily for the inner skin of the building in replacement of bricks.

The economic use of alternative building materials underlines the practical value of the much-expanded programme of our research department and its investigation of new and improved building materials. The new research and laboratory block at Stewartby will be completed by the end of the year.

As you are aware, this year of grace, 1950, marks the jubilee of our company. It also registers 50 completed years of my tenure of office as a managing director and 25 years as chairman.

The report was adopted.

H.P. SAUCE LIMITED

The twenty-fifth annual general meeting of H.P. Sauce Limited was held on June 1, 1950, at the Queen's Hotel, Birmingham. Sir Patrick Hannon, the chairman, in the course of his speech, said:—

It will be observed that satisfactory development has attended every branch of our productive activity. A comparison of the figures of the preceding year will indicate the vigour with which our progress has been sustained and will be regarded with satisfaction as evidence of the further growth of stability of our company.

The accounts present a new high record of production and turnover last year. The consolidated profit and loss statement records an increase in the trading profit of the group of £145,503, after charging £32,905 as increased provision for depreciation, which has been necessary in view of the considerable progress which has been made in the modernisation and extension of the company's plant during the year. The final figure of net profit, £240,028, shows an increase of £59,571 and must be regarded as a very gratifying result.

I should like to refer briefly to the consolidated balance sheet, which shows so completely a sound and healthy position. Fixed assets stand at £617,948 after provision for depreciation, an increase of £149,106, to which I have previously referred, whilst investments have increased by £17,894, after writing down quoted securities to market value, and current assets have been increased by £173,151. The total interests of the shareholders of H.P. Sauce Limited at present book value now stand at £2,709,207.

In the view of the directors the present Government's policy of stabilisation of dividends is in present economic circumstances of the country desirable, and we have, therefore, recommended that a final dividend of 9d. per stock unit, representing the same rate as last year, be made, and that transfers be added to various reserves as shown on the profit appropriation statement totalling £74,784.

The most important development in National Financial Policy which occurred in 1949, affecting the country as a whole and every industrial undertaking, was the devaluation of the £ sterling. The repercussions of that policy are even now only beginning to be felt in our internal economy and external trade relations. As a company, we are perhaps fortunate in that we have valuable interests in the United States and the benefits derived from our U.S.A. subsidiary following devaluation will meet substantially the increased costs which have to be borne as a result.

I would like to acknowledge again the intimate friendly relations which subsist between Lea & Perrins Inc., New York, and our group of companies in Great Britain. The advancement of our market opportunities in the U.S.A. will receive the continued attention of your board. Lea & Perrins Inc. still hold pride of place in the distribution of Worcester Sauce throughout the whole of the American Union; the Albion Bottle Company retains its full productive capacity; Macks (Walsall) Limited, engaged in the production of Pickles and other products, has undergone a large measure of reconstruction, and is now in its improved efficiency playing its full part; Fletchers Sauce Company Limited, Selby, maintains its influential connection in Yorkshire and the North; our Australian company, notwithstanding many local difficulties, is improving its output and increasing its marketing area, whilst the continued prosperity of our Canadian associates is entirely satisfactory.

The report and accounts were adopted and the retiring directors, Lt.-Colonel C. F. D. Perrins and Sir Patrick Hannon, were re-elected.

THRELFALL'S BREWERY COMPANY, LIMITED

AN EXCELLENT ACHIEVEMENT

The sixty-third annual general meeting of Threlfall's Brewery Company, Limited, was held on June 8th in London.

Major C. M. Threlfall, J.P. (the chairman), in the course of his speech, said: During the year there has been a steady decline throughout the country in the output of beer, but compared with the general trade we have been most fortunate in not being nearly so much affected by this. In fact, the figures in the accounts disclose the comparatively small extent of this decline we have experienced, and I think you will agree that this is an excellent achievement. The Chancellor required all brewers to increase the gravities of their beers by three degrees over the brewings for the corresponding period of the 1949-50 fiscal year. To meet this additional cost the Chancellor of the Exchequer agreed to adjust the Beer Duty, which, in effect, means the Exchequer and not the brewers will meet the extra charge. The beers now being sold by your company are approximately only 10 per cent. below their prewar strength, and our customers are at least getting better value for their money. At the present time, however, it is too early to forecast what the effects of this change will be in regard to increased sales.

The net profit for the year amounts to £310,045.

The report was adopted and a dividend at the rate of 22 per cent. per annum for the half-year (making 20 per cent. for the year) and a bonus of 2 per cent. on the Ordinary stock, were approved.

PEARSON AND FOSTER (BRADFORD), LIMITED

(Manufacturers of Wool Dress, Costume and Mantle Cloths, etc.)

SATISFACTORY LEVEL OF TRADING

The annual general meeting of Pearson and Foster (Bradford), Limited, was held on June 1st at Bradford.

Mr A. H. Johnson, O.B.E. (chairman), in the course of his speech, said:—As I anticipated in my statement at the last annual general meeting, the results of the trading have continued on a satisfactory level and the record profits which have again been achieved amply justify that anticipation.

You will remember that in January last an offer of shares in the proportion of one new ordinary share for every five held was made to the shareholders, and I am pleased to say that all of these were readily taken up.

The trading profit of the group for the year, after providing for depreciation and directors' remuneration, has amounted to £148,779, as compared with £120,780 for the preceding year. The provision for taxation in respect of these profits amounts to £83,149, the interim dividend has already been paid, amounting to £8,250. The recommended final dividend of 30 per cent., which this year absorbs £14,850, as compared with £12,375 for last year, is, of course, to be paid on the capital increased by the additional shares issued during the year.

The first few months of the present year show very satisfactory results and, in the absence of any serious and unforeseen change in the market conditions, your directors look forward to the future with every confidence.

The report was adopted.

AMALGAMATED ROADSTONE

SHARE ISSUE TO FINANCE NEW LIMESTONE UNDERTAKING

The fourteenth annual general meeting of Amalgamated Roadstone Corporation, Limited, was held on June 8th in London, Mr J. S. Killick, C.B.E., M.Inst.C.E., the chairman, presiding.

The following is an extract from his circulated statement:

The report and accounts clearly show the company's position, and it is sufficient to draw your attention to the following salient points:

Whereas only £87,579 net is proposed to be paid to our shareholders, no less than £119,464 is provided for current taxation. The balance carried forward is £51,290, compared with £42,142 in the previous year —an increase of £9,148. The amount provided for depreciation is £97,469, compared with £82,701.

During these last three years provision for ordinary depreciation and mitial allowances written off aggregate £380,000, which is approximately half of the total amount of capital expenditure on plant and equipment incurred in those three years, amounting to approximately £780,000.

The policy adopted by your board since the end of the war has been to modernise your quarries, which has involved considerable capital expenditure, a policy which has already borne fruit and will undoubtedly prove to be of the greatest value in the years to come. It is unfortunately a characteristic feature of the two years before benefits of such capital expenditure are reflected in the profits.

So far I have only dealt with the normal development of our undertaking and have not included any reference to the new enterprise which we are now launching as a subsidiary company, entitled Amalgamated Limestone Corporation Limited. It is to finance this new limestone undertaking that we are arranging to issue for cash the unissued 223,320 £1 6½ per cent. cumulative preference shares of the company.

PROSPECTS OF NEW BUSINESS

You will note that while the parent company, Amalgamated Roadstone Corporation, Limited, will retain at least half of the ordinary share capital of the new limestone subsidiary, we are giving to the ordinary stockholders of the parent company an opportunity to subscribe for one 1s. share in the limestone subsidiary for every £1 of ordinary stock held in the parent company. We consider that we have every reason to believe that this new business, based on sound foundations, should earn substantial profits, and that these 1s. shares should become of considerable value within a comparatively few years. I must, however, point out that it is not contemplated that dividends will be paid during the first few years. Your directors are showing their confidence in the undertaking in that they are prepared to subscribe for 250,000 1s. shares on the same terms as those offered to stockholders.

The results of the current year's trading to date show a satisfactory improvement on the corresponding period of last year, but it should be borne in mind that still further cuts in road expenditure have been demanded by the Government for the 12 months commencing April 1, 1950, and it is too early to judge what effect this may have during the second half of our financial year.

The report and accounts were adopted and the dividend distribution of 10 per cent. for the year was approved.

BRISTOL AEROPLANE COMPANY, LIMITED

40th ANNIVERSARY

The fortieth annual general meeting of the Bristol Aeroplane Company, Limited, was held on June 1st at Bristol.

Sir William G. Verdon Smith, C.B.E. (the chairman), in the course of his speech, said :— This is the fortieth annual general meeting. Few companies in aviation can claim such a long and distinguisned record.

ACCOUNTS

A satisfactory trading profit has been earned, though at £1,225,663 there is a decrease of £172,895 in comparison with 1948. Devaluation is showing its influence, so are the steeply rising prices of the nationalised industries; and government expenditure leads to increased taxation. A particularly disheartening example is the increased petrol duty which, falling on aviation fuel used for testing, will cost a further £100,000 per annum. Provision for depreciation (£324,535) is supplemented by the transfer of £200,000 to general reserve. We recommend the same final ordinary dividend as in the past ten years, 6 per cent., less income tax, leaving a carry forward of £236,705. Capital reserve and surplus have increased from £7,335,247 to £7,576,813. The rise in the cost value of fixed assets (£257,077) is accounted for by additional buildings, plant and equipment. There is a reduction in the net value of stocks and work-in-progress. The net value of current assets has risen by £370,126 to £5,307,284.

AIRCRAFT DIVISION

The division has virtually completed its deliveries of BRIGAND aircraft. Production of the well-known Bristol FREIGHTER has continued steadily. Helicopter development has been vigorously pursued. Deliveries of Type 171 are starting. Type 173, designed to carry twelve passengers, is making satisfactory progress. September 4, 1949, was a historic day for the company, when the BRABAZON made its outstandingly successful first flight. The construction of the first Mark II BRABAZON with Proteus gas turbines is making steady progress. Our latest transport aircraft, the Type 175—named BRITANNIA —progresses well.

ENGINE DIVISION

The HERCULES remains the most used British engine for civil and military transport. The division continues the manufacture of CENTAURUS engines for the Airspeed Ambassador, Hawker Tempest and Sea Fury aircraft. The THESEUS propeller turbine has been operating with R.A.F. Transport Command. The Hermes 5, with THESEUS, has created a favourable impression. Rapid progress is being made in the development of the larger PROTEUS, to be used in the Princess Boats, the Brabazon and the Britannia. Important new developments include a large turbo-jet with an extremely low fuel consumption.

CAR DIVISION

Prospects have improved. The recent reduction in purchase tax has resulted in increased home sales. A satisfactory proportion of our output is going overseas.

THE BRISTOL AEROPLANE COMPANY (HOUSING) LIMITED

The housing company has continued to make a large contribution to the school building programme. We have also found new and encouraging markets in Australia.

The report was adopted.

BRITISH TIMKEN, LIMITED

TAXATION AND INDUSTRIAL REPLACEMENT

Mr Michael Dewar, chairman of British Timken, Limited, presiding at the annual general meeting, said:—

I am again able to report a considerable increase in turnover. This increase in turnover is being maintained during 1950 as our very extensive plant extensions come into operation. Our railway division is meeting with increasing success, and our output in this section particularly continues to increase with gratifying rapidity.

At the end of 1948 we had capital commitments of £275,000, the amount actually expended during the year being £369,000 on British Timken account alone. At December 31, 1949, the capital commitments for British Timken amounted to £388,000. Your board are of the opinion that our capital requirements are likely to remain at a high rate in the near future, both for replacement and for extending your company's manufacturing facilities.

The company is deriving satisfactory profits due to the very high rate of turnover—all our factories having worked a day shift and a night shift during the past year. Consequently a relatively small drop in sales would cause a disproportionate fall in the profits.

Although we are experiencing what appears to be an ever-increasing demand for your company's products, we do not view the present position or the future with real assurance, as every few months something happens to cause a rise in prices, and we are facing the demand of the engineering unions for a very considerable wage increase.

With regard to our own prices, however, our last alteration was a reduction of 5 per cent. in May, 1948, and we have been able to maintain our price level without alteration since that date.

The most important thing which the Government can do is to see that the purchasing power of our money remains stable. The present inflationary pressure may make it easier to make profits, but unfortunately, the profits made do not cover the increasing cost of replacements.

This increasing cost will absorb, not only our depreciation, but also the amounts we have placed to reserve from our taxed profits.

The engineering unions are contending that an increase in wages can be paid from the profiis of the engineering industry without causing any increase in prices. We feel that this is impossible. To ensure employment for our work-people, we have to keep our plant up to maximum efficiency and to utilise new ideas and new machines, ruthlessly scrapping obsolete plant.

In our business we have, not only to maintain our physical assets, but to face continual extra expense through new and improved methods of manufacture. Unfortunately, practically all of the most modern machine tools that we employ have to be imported from the United States. The cost of such machines has now risen, through devaluation, by 40 per cent., so that even more capital is required and more profits have to be set aside to meet this increased cost.

This increased cost means that when a machine has to be replaced the untaxed depreciation we have been able to set aside is now no longer sufficient to purchase a machine capable of the same output, and consequently, unless we are enabled to carry to reserve large sums from taxed profits to meet the increased cost, we should in effect be presenting a portion of our company's capital assets to those who purchase our bearings, and, in fact, as a very high proportion of your company's products is exported in completed articles, it would mean that we are exporting our capital.

Any estimate as to the future must necessarily be a guess, but we should be much happier if we felt that the political framework in which we have to work was more suited to the economic facts as they are, rather than to Utopian Socialist dreams.

I cannot close my remarks without thanking all members of our organisation for the efforts they have made during the past year.

LISBON ELECTRIC TRAMWAYS, LIMITED

PROPOSED UNDERGROUND RAILWAY IN LISBON

The annual general meeting of the Lisbon Electric Tramways, Limited, will be held on June 28th in London.

The following is an extract from the statement circulated by the chairman, the Right Hon. Sir Hugh O'Neill, Bt., P.C., M.P., with the report and accounts:

Last March Sir Alexander Roger, K.C.I.E., who had been chairman of the company since November, 1945, asked to be relieved of his duties as chairman, and I was elected chairman in his place. To the great satisfaction of all his colleagues Sir Alexander has agreed to remain a member of the board. We shall therefore continue to have the benefit of his long experience of affairs in Portugal and his advice on all matters connected with the company.

Reference was made in last year's report to the study company formed to consider the practicability of constructing an underground railway in Lisbon, and it was mentioned that we had arranged for experts in both the construction and operation of underground railways to visit Lisbon in order to advise us on the project.

The experts engaged by us were Messrs Mott, Hay and Anderson, civil engineers of great experience in the construction of underground railways, and Mr J. P. Thomas, M.I.E.E., a late general manager of the railways section of the London Passenger Transport Board, who was assisted by Mr A. G. Evershed, A.C.A., whose services were kindly loaned by the financial department of the London Transport Executive.

These gentlemen examined the report produced by the Underground Study Company, which not only dealt with the cost of construction of the proposed underground, but contained estimates of the revenue to be earned and the costs of operation. They furnished an interim report on their examination last year, but were unable to reach their final conclusions until further geological surveys had been made. Early in 1950 they again visited Lisbon to examine further borings and inspection pits which had by then been sunk.

The final reports presented by our experts show that the scheme is technically possible, but they also show conclusively that owing to the high capital cost and the limited number of potential passengers, sufficient revenue would not be earned to cover the cost of operation and to provide for the financial service of the heavy capital expenditure involved.

Your board has carefully considered the whole matter of participating financially in the construction of the underground railway, and had it appeared to be financially sound would have been willing to become substantial shareholders. In view, however, of the above reports, it has been decided that it would not be in your interest to undertake any further financial commitments in the underground project.

The board of the Underground Study Company and other Portuguese authorities concerned have therefore been advised of this decision. The advice and assistance of our officials in Lisbon and of our experts will still, if required, be at the service of the Underground Study Company.

ODHAMS PRESS, LIMITED

SATISFACTORY RESULTS

The thirtieth annual general meeting of Odhams Press, Limited, was held on June 8th, in London.

Mr A. C. Duncan, F.C.A. (the chairman), in the course of his speech, said that the gross revenue was up by £2,489,000, and whilst the production costs were up by £2,152,000, the result of the year's operations was a trading profit of £2,204,000, an increase of £338,000 over 1948. The net profit after taxation of £1,041,000 compared with £908,000 for the previous year, an increase of £133,000. He was sure stockholders would agree that that was a satisfactory result of the year's operations. The ordinary dividend recommended of 20 per cent. was an increase of 2½ per cent. and was in the opinion of the Board, a modest gesture of recognition to the stockholders in view of the fact that the share capital of the company was written down by 60 per cent. in 1924, and that capital cut had never been replaced. The dividend represented a return of 8 per cent. on the original £1 shares. It was interesting to note in passing that if the actual capital employed in the business attributable to the ordinary stockholders was taken into account, the dividend proposed was less than 3¾ per cent.

The company's interests were not confined to the production or publication of any particular type of periodical, but ranged over a wide field. The circulations of their newspapers were eminently satisfactory, and, in the periodical section of their business, their publications were not only on the up-grade, but in some cases showed large and satisfactory increases during the last year.

He was happy to be able to assure the stockholders that so far this year the company's operations were going forward on a satisfactory basis.

The report was adopted.

NOTICES

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE (UNIVERSITY OF LONDON)

Applications are invited for appointment in October, 1950, to Assistant Lectureships in Economics. Salary £450-£550 per annum, with superannuation benefits and family allowances. Candidates are invited to give in their application the names of three referees and an indication of any special interests in the field of Economics.

Applications should be received not later than June 25, 1950, by the Secretary, London School of Economics, Houghton Street, Aldwych, London, W.C.2, from whom further information may be obtained.

CANBERRA UNIVERSITY COLLEGE, AUSTRALIA

The Council of the College invites applications for the newly created CHAIR OF ECONOMICS. Salary will be at the rate of £1,500 (Australian currency) per annum, with adjustments to cover variations in the cost of living, at present an additional £136 (Aust.) per annum.

Further particulars, and information as to the method of application, may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is July 3, 1950.

COUNTY BOROUGH OF IPSWICH EDUCATION COMMITTEE

SCHOOL OF COMMERCE AND SOCIAL STUDIES

Principal: H. G. BENNER, B.A., B.Sc.(Econ.)

Applications are invited from men and women for three new permanent full-time posts at this school, made necessary by growth of numbers.

Applicants should be qualified to teach some of the following subjects:—

Mathematics, Geography, French and German up to Intermediate standard. Shorthand, Typewriting and general commercial subjects.

The appointments will date from September 1st. Burnham Scale.

Forms of application may be obtained from the undersigned, to whom they should be returned, when completed, within fourteen days of the appearance of this advertisement.

17, Tower Street, Ipswich. J. T. HILL, Chief Education Officer.

OXFORD UNIVERSITY TUTORIAL CLASSES COMMITTEE invite applications for the post of full-time tutor in Berkshire. Candidates should have a good Honours Degree in one or more of the following subjects: Economics, Politics (Theory and Institutions), History, Philosophy. Salary £450 to £850, according to experience and qualifications.—Particulars and application forms from Organising Secretary, Tutorial Classes Committee, Rewley House, Wellington Square, Oxford. Closing date, June 24, 1950.

UNIVERSITY OF LONDON

The Senate invite applications for the Chair of Political Science tenable at the London School of Economics and Political Science (salary £1,800 a year). Applications (10 copies) must be received not later than August 18, 1950, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY COLLEGE OF THE WEST INDIES

INSTITUTE OF SOCIAL AND ECONOMIC RESEARCH

Applications are invited for research appointments from persons with qualifications in economics, sociology or allied social sciences and with some experience in research. Investigations may need to be undertaken in any part of the British Caribbean.

Appointments will be made at an appropriate point in the scale £400 x £25-£500 or £600 x £25-£800, according to qualifications and experience. One appointment will be on the scale £800 x £25-£1,000. There will be children's allowance of £50 p.a. for each child up to a maximum of £150. Superannuation under F.S.S.U. Appointments will normally be for three years in the first instance. Free passages are provided.

Applications (six copies) giving names of three referees and full particulars of qualifications and experience should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1, Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date June 30, 1950.

PROGRESSIVE BUSINESS MEN'S FORUM. "Private Enterprise or Socialist Planning in Production." Debate between Anthony Fell and Pat Sloan. Thursday, June 15th, 7.30 p.m. Heal's Restaurant, 196, Tottenham Court Road, W.1. Visitors 3s. 6d.—Hon. Sec., 33, New Cavendish Street, W.1. Welbeck 0186.

SALES Forecast and Budgeting Manager is required by a large firm of manufacturers of non-consumable household products to take charge, as a senior executive, of forward sales budgeting for production ordering purposes of the firm's commodities. Salary in the region of £1,000 per annum dependent upon experience and qualifications; pension scheme in operation. Write giving particulars of age, education, positions held and salaries received to Box 434.

QUALIFIED ACCOUNTANT (Chartered, Incorporated or F.C.W.A.) invited to join the management consultancy staff of The Wallace Attwood Company. Permanent position at high salary awaits the man with good education, ability to work with others, and substantial experience of standard process and batch costing and administration procedures, both manual and mechanised.—Write, stating age, education, qualifications, experience, present salary and salary expected, to The Wallace Attwood Company, Chantrey House, Eccleston Street, S.W.1.

Statistical Summary

EXCHEQUER RETURNS

For the week ended June 3, 1950, total ordinary revenue was £41,872,000 against ordinary expenditure of £62,071,000 and issues to sinking funds £550,000. Thus, including sinking fund allocations of £2,044,000 the surplus accrued since April 1st is £27,606,000 compared with £27,212,000 for the corresponding period a year ago.

NOTICES

ACCOUNTANT—FOR SIERRA LEONE PRODUCE MARKETING BOARD

Applications are invited for the post of Accountant to the Sierra Leone Produce Marketing Board, engaged in the purchase, export, processing and marketing of Sierra Leone Produce and in the development of the agricultural industry.

The Accountant will be responsible for the keeping of all books and accounts in connection with the Board. Applicants should be Chartered, Incorporated or Corporate Accountants.

The salary of the post, which is non-pensionable, and for one tour in the first instance, is £1,000 per annum, plus expatriation pay of £300 per annum. A cost-of-living allowance is at present payable at the rate of 12½ per cent of basic salary. Quarters are provided where available and a rental is charged at the rate of £90 per annum. An outfit allowance of £60 will be paid on first appointment. Free passages are provided on appointment and when proceeding on leave at the end of a tour of duty. Leave on full salary is granted at the rate of seven days for each completed month of resident service. The selected candidate will be required to pass a medical examination of physical fitness to serve in the tropics. Applications, giving full details of age, education, experience and professional qualifications, should be addressed in the case of applicants in the United Kingdom to the Managing Director, Sierra Leone Produce Marketing Company, Ltd., 5, Buckingham Gate, London, S.W.1.

SUDAN GOVERNMENT

ASSISTANT SUPERVISOR, SECRETARIAL TRAINING

The Ministry of Education requires an Assistant Supervisor, Secretarial Training, aged 30 to 40, for service in the Sudan. Candidates must hold a University Degree in Commerce or Economics, or its equivalent. Preference will be given to those who have full-time teaching experience.

Appointment will be on short-term contract for a period not exceeding six years. Salary scale ranges from £E771 to £E1,644 per annum. Commencing salary will be determined according to age, qualifications and experience, but will not exceed £E1,331 per annum. Cost-of-living allowance varying between £E142 and £E352 per annum, according to the number of dependents, is at present payable, and, subject to certain limitations, an outfit allowance of £E60 is payable on appointment. There is at present NO INCOME TAX in the Sudan. Free passage on appointment. Full particulars and application form may be obtained on application to: Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Assistant Supervisor, Secretarial Training."

LEADING MERCHANT and Agency House has vacancies for Mercantile Assistants in Malaya. Candidates should be single (aged under 30) and of the standard of intelligence required for a University Honours Degree. Previous business experience an advantage, but not essential. Those appointed will serve a probationary training period in London. The standard required of successful candidates is very high.—Application should be made by letter, giving full details, to Box 296, Dorland Advertising, 18-20, Regent Street, London, S.W.1.

SCIENCE MUSEUM (Ministry of Education).—The Civil Service Commissioners invite applications for the post of Director of the Science Museum. Candidates must be at least 35 on July 1, 1950; they are expected to be scientists of established reputation with proved administrative ability. Salary at present £1,800, but will be revised in due course in accordance with the Chorley Report.—Particulars and application forms from Secretary, Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. 3123; completed application forms must reach him by June 20, 1950.

THE PERSONNEL DIRECTORSHIP OF SELFRIDGES LTD. will shortly become vacant when the Director now responsible retires through age. Applications are invited with a view to appointing a successor from candidates with human understanding and having a wide experience of handling staff of both sexes in commerce or industry. Retail experience is not essential. It is intended that the position, which will be well remunerated according to qualifications and be pensionable, should carry with it a seat on the Board after a reasonable introductory period. The age preferred is between 35 and 45 years.—Applications in confidence should be addressed to: The Chairman, Selfridges Ltd., 400, Oxford Street, London, W.1.

SHIPPING MAN, aged 43 years, Latvian, Academic Degree Economics, Fluent English, German, Russian, seeks position any part of the world (U.K. approval of the Ministry of Labour essential). Twenty years' extensive shipping experience, chartering (including estimating of voyages, etc.), ship management and general agency work; sound knowledge shipping accounts. Three years' seagoing practice.—Please write Box 187, c/o Barker & Howard, Ltd., 79, Fenchurch Street, London, E.C.3.

ASSISTANT MARKETING OFFICER required by well-known manufacturing and distributing Company in London, employing modern marketing techniques. After a brief period of intensive training, the successful candidate will be carrying out fact-finding investigations, and will assist in conducting the Company's publicity. Candidates should be 25-30 and hold a first- or second-class University Degree. They should preferably have some relevant specialised knowledge. The post calls for a high level of general education and ability and a clear analytical mind.—Box 437.

RESEARCH ASSISTANTS required for the Economics Department of the International Wool Secretariat. Qualifications required for two of the posts are first or good second Honours Degree in Economics, some knowledge of statistical methods. For third post essential requirement is thorough knowledge of advanced statistical methods used in Demand analysis. Foreign languages desirable for one of the first two posts. Commencing salary £400-550, plus pension scheme.—Applications, with full details, to International Wool Secretariat, Dorland House, 18-20, Lower Regent Street, London, S.W.1.

KEESING'S Contemporary Archives, vols. VI and VII complete (January, 1946, to June, 1950), for sale; £5 each volume (Publisher's price £15 the two). Current subscription from July can be arranged.—Rev. Hillyer, Christchurch Vicarage, Finchley, N.12.

UNIVERSITY OF DURHAM

THE DURHAM COLLEGES

Applications are invited for the post of Domestic Bursar in a small hostel for women students. Full particulars may be obtained from the Secretary of the Durham Colleges, 38, North Bailey, Durham.
S. HOLGATE, Secretary.

MANCHESTER SHIP CANAL COMPANY

APPOINTMENT OF ASSISTANT TO THE SECRETARY

Applications are invited for the position of Assistant to the Secretary of the Company. Candidates should be under 28 years of age and should be of high ability suitable for an eventual position of responsibility. They should possess legal qualifications or have had experience of public administration, and preferably should be University Graduates. Applications, giving full particulars, should be addressed to the Managing Director, Manchester Ship Canal Company, Ship Canal House, King Street, Manchester 2, and be received not later than June 30, 1950. Envelopes should be marked "Personal." Testimonials are not required in the first instance.

ANGLO-ISRAEL CHAMBER OF COMMERCE

Applications are invited for the post of General Secretary to the Anglo-Israel Chamber of Commerce, in process of foundation in London. Knowledge of Hebrew and commercial conditions in the United Kingdom and Israel essential. Adequate salary. Applications giving detailed curriculum vitae and references should be addressed to: Anglo-Israel Chamber of Commerce (in foundation), c/o 18, Manchester Square, London, W.1.

SENIOR EXECUTIVE, University engineering training, 25 years' world-wide high-level experience industrial business management in leading concerns, now available for full-time appointment with headquarters preferably London Unusual knowledge contemporary affairs, exceptional ability to choose and handle men, organise and take responsibility. Fully trilingual: English, French, German; fair Italian, Spanish. Would particularly welcome proposals from medium-sized firms seeking reorganisation or development their export trade on sound basis. Scope more important than remuneration.—Box 438.

THE Civil Service Commissioners invite applications for appointments as *Senior Scientific Officer* and *Scientific Officer* to be filled by competitive interview during 1950. Interviews began in January and will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1950, may eventually be announced. Successful candidates may be appointed immediately. The posts are in various Government Departments and cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a university degree in a scientific subject (including engineering) or in mathematics with a first or second class honours, or an equivalent qualification, or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer posts taking their degrees in 1950 may be admitted to compete before the result of their degree examination is known.

Age Limits: For Senior Scientific Officers, at least 26 and under 31 on August 1, 1950; for Scientific Officers, at least 21 and under 28 (or under 31 for established civil servants of the Experimental Officer class) on August 1, 1950. *Salary Scales* for men in London: Senior Scientific Officers, £700 x £25-£900; Scientific Officers, £400 x £25-£650. Rates for women are somewhat lower

Further particulars from the Secretary, Civil Service Commission, (Scientific Branch), 7th Floor, Trinidad House, Old Burlington Street, London, W.1, quoting No. 2887.

A YOUNG Scots gentleman, strong personality, well educated, good industrial experience especially in steel, commercial and organising ability, qualified engineer, fluent linguist, widely travelled with valuable contacts, exceptional vision and initiative, seeks administrative appointment carrying direct and heavy responsibility. Present salary £1,575 per annum.—Write Box 444.

FRENCH NATIONAL, 27, fluent French and English, Doctor of Law and of Economics of the University of Paris with Honours for thesis on a question of monetary economics, professional experience in law practice, financial journalism and international banking, seeks a position such as would preferably require aptitude for research work, sound economic culture and, if possible, particular knowledge of French economic and financial conditions and law, tax and foreign exchange systems. Free to take up new position in September—sooner if necessary.—Box 442.

VERSATILE twenty-seven year old general manager of Shanghai-Hongkong Export/Import firm requires change of political scenery. Anywhere this side of iron curtain where writing on wall not quite so evident, though West Indies or New Zealand preferred. Small investment (up to equivalent of US $5,000) considered. If necessary wife can act as secretary. Suggestions, advice and offers of well paid jobs welcome at Box 431.

LEADING manufacturers of school clothing require area representatives, particularly in London and the North of England. Must be first class salesmen, *persona grata* with retail shops and stores, and experience of the school trade is desirable. The prospects are excellent. All replies in confidence.—Write Box 428.

MEDICAL men prescribe strong tonics for patients who are "run down." A good advertising agency advises aggressive advertising for businesses that need "bucking up."—Consult SAMSON CLARKS, 57-61, Mortimer Street, W.1. MUSeum 5050.

M.A. (Hons.) Oxon. 26, Maths., Econ., Stats., Phil. Ex-officer, desires position of responsibility. State salary, prospects. Box 432.

WANTED back numbers of Economist and Records and Statistics. Please state price and condition.—Box 430.

FOR SALE.—Economist 18/10/47-24/11/49 (Nos. 5434-5548). What offers?—Box 433.

ENGINEER-ECONOMIST, age 46, seeks change of environment where literary flair can be developed.—Box 435.

AGGREGATE ASSETS at 31st March 1949 £96,642,721

Established nearly 90 years.

BANK of NEW ZEALAND
Incorporated with limited liability in New Zealand

Represented at over 230 points in New Zealand and at Melbourne, Victoria; Sydney, New South Wales; Suva, Fiji; Apia, Samoa.

London Office: 1, Queen Victoria St., E.C.4 O. M. Samuel, Manager.

Head Office: WELLINGTON, N.Z. P. L. Porter, General Manager.

THE NATIONAL BANK OF SCOTLAND LIMITED

Head Office: EDINBURGH ESTD. 1825

Branches throughout SCOTLAND

LONDON OFFICES: 37, Nicholas Lane, E.C.4; and 18/20, Regent Street, Piccadilly Circus, W.1.

(1949 Accounts)

HOW MUCH SHOULD YOUR ADVERTISING COST?

The answer *can* be given by a professional organisation. It is a measure of costs and possibilities: an equation between capital, profit and potential market, short term and long term. Thirty years of planned advertising have produced the evidence on which to base *your* successful campaign. If you would like to know how we can help you, write for the pamphlet, "How much should your your advertising cost?"

ROBERT BRANDON AND PARTNERS, LTD.,
Advertising and Public Relations,
45, Dover Street, London. W.1. REGent 0901/2.

YOUNG Irishman, with University education and wide business experience, desires post as Irish agent or representative with firm of repute. Interested firms please write Box 427.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees payable by instalments, if desired.

Prospectus from Dept. P 17, WOLSEY HALL, OXFORD

NATIONAL BANK OF EGYPT

Incorporated in Egypt. Liability of Members is Limited.

BANK MANAGER (41), B.Com., desires post where hard work, keenness, intelligence and integrity are required. Highest references.—Box 436.

THE Civil Service Commissioners invite applications for about 15 pensionable appointments as Examiners and Provincial Assistant Official Receivers in the Bankruptcy and Companies (Official Receivers) Service under the Board of Trade.

Candidates must be at least 25 years of age on January 1, 1950. The work comprises investigation into the affairs of companies in compulsory liquidation and of partnerships and individuals in bankruptcy.

Membership of one or more of the following bodies is desirable:—
Institute of Chartered Accountants in England and Wales.
Society of Incorporated Accountants and Auditors.
Society of Accountants in Edinburgh.
Institute of Accountants and Actuaries in Glasgow.
Society of Accountants in Aberdeen.
Institute of Chartered Accountants in Ireland.
Association of Certified and Corporate Accountants.
Chartered Institute of Secretaries.
Corporation of Certified Secretaries.

Practical experience in liquidation and bankruptcy work is also desirable.

The salary scale in London is (men) £675 x £25-£800; (women) £550 x £25-£675. The rates for posts in the Provinces are somewhat lower. There are prospects of promotion.

Particulars and application forms from Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1, quoting No. 3097. completed application forms must reach him by June 29, 1950.

Socialism *Contra Mundum*

ONCE again, the Labour Party has shown its almost phenomenal gift for bad timing. That Mr Attlee would make a statement on the Schuman Plan on Tuesday had been known a full week in advance. It was also known that a White Paper giving the full exchange of Notes and memoranda between the British and French governments would be published on the same day. Everything thus seemed to be set for a major clarification of British policy and, in ordinary circumstances, both the White Paper and the Prime Minister's statement would almost certainly have been given a good reception. Between them, they made it clear that the British Government's interest in the Schuman proposals had been close and friendly from the start, that the reason for their hesitations was a perfectly understandable desire not to accept commitments in advance of knowing what they were, and that no dogmatic clinging to the principle of unlimited sovereignty would prevent them from seeking means of joining in the Schuman Plan later on. Mr Attlee claimed that, while Britain must continue to fulfil its world-wide political and economic responsibilities, this proviso did not entail a refusal to abandon complete freedom of action. On the contrary, the creation of an Atlantic community "will require by a more effective pooling of resources the surrender in an unprecedented degree by each country of the ability to do what it pleases." Altogether, one would have felt, a practical and sensible attempt to repair the damage done—not only, or even mainly, by the British—a fortnight ago.

Unhappily for the Prime Minister, the effects of this grand set piece of Government exposition have been almost completely cancelled by the letting off, the day before, of a large Labour Party squib in the shape of the National Executive's document upon European Unity. In this twelve-page résumé of the party's attitude to closer European integration, the conclusion that appears to emerge is that the Labour Government will co-operate with Europe only if it adopts socialist policies and accepts the principles of public ownership and planning. The fact that Dr Dalton presided over the press conference held to launch the document only confirmed this impression, since no man has done more than he to convince Europe that the Labour Party stands for socialism or nothing in its dealings with its neighbours. Thus, while Mr Attlee portrayed the Government's policy in a reasonable and co-operative light, and denied heatedly that ideology had anything to do with Britain's relations with Europe, every critic and commentator from Bonn to Buffalo has seized upon the National Executive's document and drawn from it the conclusion that socialist isolationism and Schachtian autarky are the real foundations of British policy. The Government have therefore only themselves to blame if there is dismay in Paris and anger in Washington. It is true that many of those who are most indignant, especially in America, appear to be basing themselves on one or two sentences and not on the document as a whole. But that is no mitigation of the foolishness of the authors of the pamphlet in providing such

conveniently quotable occasions for misunderstanding. They should have known—and, if they did not, they do now—that after five years' experience the world is very quick to believe the worst of the Labour Party's international intentions.

*

The incredibly foolish timing of the document's publication has not only made Mr Attlee's task much harder. It has ensured a bad audience for the document itself. By publishing it in the midst of the Schuman controversy, its authors have drawn attention to its weakest section —the discussion of European heavy industry. Here, indeed, the impression given is dogmatic, isolationist and insufferably self-satisfied. But in general the first reactions of the critics are really less than fair to the document. To call it isolationist is nonsense. The isolationists today are above all those who would like to build up a separate geographical bloc in Europe which, by preserving neutrality between the United States and the Soviet Union, will keep out of the "cold war" the two of them are supposedly waging against each other. If the British Labour Party, on the ideological ground that the Americans are wicked capitalists and co-operation with them is impossible, had thrown in its lot with the supporters of neutrality in Europe and striven to build an isolated bloc, a "Third Force," between Russia and America—then, indeed, the charge of isolationism—the isolation of Europe from the United States and the division of the free world—would have been justified. As it is, the Labour Party's rejection of this dangerous and insidious form of isolationism could hardly be more explicit.

> The Third Force is a valuable concept if it means political solidarity against extremism of Right or Left. . . . As a neutral geographical bloc based on the Western fringe of the Eurasian land mass it is a sterile and dangerous concept . . . the Third Force must be a world wide alliance against totalitarianism wherever it is found.

From this the document draws the obvious conclusion —that the Labour Party must stand for as close a co-operation with the United States and with the Commonwealth as with Europe. To call this isolationism is really to stand on one's head.

Nor is it true to say that the Labour Party rejects full co-operation with its neighbours and rules out, *a priori*, any sacrifice of sovereignty. What the document does —surely very sensibly—is to put its weight behind the confederal principle as opposed to the federal principle of association. It rejects the direct surrender of sovereignty to a super-Parliament—suspecting shrewdly that every other European government would really do the same—and proposes instead that governments should sacrifice freedom of action to common policies and common institutions upon the basis of full understanding, negotiation and concession. The distinction is not always appreciated; but it is vital. Confederalism means that the existing national governments should progressively and willingly pool some of their sovereignty. Federalism means that they should have their sovereignty taken away from them and given to a supra-national body. The first is surely the more fruitful approach, since it makes it possible to enlist the support of governments behind the principle of unity. Federalism may be intellectually more satisfying, but since every government's interest is against it, its progress must inevitably be much slower.

There is nothing in the confederal approach to exclude Britain's eventual participation in a pooling of iron and steel resources or in any other economic proposals. On the contrary, the method is in process of securing considerable success in the setting up of a European Payments Union. And even if this method of the agreed pooling of sovereignty were not giving practical proofs that it works, the Labour Party has every justification for saying that the British electorate is not prepared for anything more drastic—nor, for that matter, is the American Congress.

Why, then, has a document whose political sections represent on the whole so admirable and balanced an approach to the question of international co-operation been greeted with such hostility and even disgust? The reason lies partly in the tone; other nations like neither to be lectured nor to be patronised. But the chief reason has been mentioned already. By bringing out the document in the heat of the Schuman controversy, the authors have riveted attention upon its economic sections; and these do indeed lay the Labour Party open to the accusation of preferring ideology to co-operation and of putting the preservation of national planning before the possibility of international advance.

*

The thesis that these sections of the document put forward is that the central economic need of the time is to secure full employment. This is being triumphantly achieved in Britain by means of planning and control, and the extension of public ownership to the basic industries, including, at some point, iron and steel. Indeed, full employment cannot be secured by any other means, for if industries work for private profit, they will contract production in bad times, whereas such a time may be precisely the moment to expand. Unless, therefore, other European countries are prepared to adopt the chosen British methods of planning and public ownership, Britain cannot participate in schemes of European integration; for, without this safeguard, these schemes would, by definition, be opposed to the overriding aim of full employment. This, briefly, is the argument set out in the National Executive's document and it must be admitted that, given the premises, there is a certain bald and blind logic in the carrying of the argument to its extreme isolationist conclusions. But, unhappily for the shaping of Labour's economic policy, the premises are wrong or, at the very best, unproven.

Few people will quarrel with the starting point—the necessity of maintaining high and stable levels of employment. Politically and economically, the need to pursue full (as opposed to over-full) employment is as urgent as ever it was, and the document does well to suggest that the working out of a common approach to the problems of full employment might be a valuable task for the Council of Europe. It is the methods proposed for securing full employment that lay the Labour Party open to the charge of unsubstantiated dogmatism. In the first place, it is simply not true that planning and nationalisation have maintained full employment in Britain in the last five years. Full employment here—as in France and Switzerland, or Scandinavia or the Commonwealth—has been maintained partly by Marshall Aid, partly by the level of postwar demand and partly by the phenomenal prosperity of the United States. What has done the trick has not been the successful application of socialist principles in Britain but the successful working of capitalism in America. In 1949, a mere

five per cent fall in the level of American business activity was enough to bring Britain to the brink of financial disaster. The real test of planning as a means of securing full employment will occur when there is a real falling off of world demand for Europe's products. That contingency has not yet arisen seriously. Until it does, British methods can claim no more magic than those, say, of the *Plan Monnet*.

One may go further and ask whether the Labour Party recipe of combined planning and nationalisation is likely in any case to prove effective in the face of falling demand. Nationalised industries must pay their way as well as private institutions. Will their managers risk large expansions at a time when demand for their products is falling? Is an industry presided over by a Lord Citrine more amenable to governmental prompting than a private undertaking, which at least does not have to risk a formidable parliamentary inquisition in the event of failure? If it is only a question of the government's providing subsidies, fresh capital and protection, there is no reason why the ownership of industry should be changed. Such methods could be applied equally to either public or private ventures.

This raises another doubt. Is the forced-draft expansion of industries that are not paying their way necessarily the best method of maintaining full employment? May it not have the opposite effect of locking up still more of the community's resources in uneconomic activities? If it postpones deflation at the moment, may it not do so at the cost of imposing an even sharper contraction later on? There is evidence for the belief that some of the purely national planning undertaken in Europe in the last five years, has magnified, rather than reduced, the distortions that beget depression. The steel industry has been expanded at the expense of the steel using industries. But if, in a slump, steel making were expanded still further—as the Labour Party seems to suggest—the degree of waste and redundancy would expand in the same measure. The whole planning thesis depends on the arrogant assumption that "the gentleman in Whitehall really does know best." But the only thing that the gentleman in Whitehall has shown that he does know how to do is to freeze the existing pattern of industry, and in a changing world nothing is more calculated to ensure waste, impoverishment, and, in the end, unemployment.

The Labour reply would no doubt be that Europe could support a much higher level of steel production, provided real demand were made effective. This is in effect an admission that demand, both national and international, is the key to full employment. But the maintenance of demand does not necessarily turn upon physical planning, upon control and upon nationalisation. On the contrary, the most effective methods of maintaining sustained demand are financial and may be practised as effectively by non-planning governments as by convinced planners. Nor, above all, is national autarky a means for expanding international demand. There could be no greater disservice to the Labour Party's own ideal of full employment than, in its name, to reject the possibilities of expansion by means of international co-operation and trade.

Such an attitude seems so contrary to good sense that one is tempted to ask whether some of the hesitations in the Labour Party spring not so much from the belief that they must stand for planning or nothing but from the uneasy suspicion that they would not like even planning if it were international and, therefore, out of their own control. Certainly the movement "from crisis to expedient and back to crisis" which has characterised British policy in the last five years hardly provides favourable precedents for the international planning of Europe. Certainly nothing that has been done in this country in the way of nationalisation or control suggests that the government knows how to keep employment stable while permitting the economy as a whole to remain flexible and dynamic. The European anti-planners do not know either—but they at least do not claim to have found the philosopher's stone. In the last analysis the indignation which the Labour Party's document has aroused is due to its astounding lack of modesty. No party and no nation knows all the answers. Planners who have no plan, and progressives who wish to avoid change, should not feel surprised if the world rejects with indignation the assumption that their own infallibility must be the starting-point for co-operation among the nations.

Peace for Japan

THE meeting of American policy makers that is to be held in Tokyo next week comes not a moment too soon. Allied policies towards Japan have too long been drifting aimlessly towards an obscure climax, and the uncertainty about American intentions is creating in the Far East a situation which becomes every month more like that of Germany. For the questions whether there shall be a peace treaty with Tokyo, and what are to be Japan's relations with its ex-enemies, have been made more urgent by developments of Soviet policy in China and by the increasing boldness with which opinion in all Japanese parties speaks out against the occupation.

The parallel with Germany is, of course, imperfect, Japan is not divided in two, and the Red Army does not stand on its frontier; its Communists have neither the prestige nor the power that direct Russian patronage has given them in eastern Germany. There is no Oder-Neisse line and no refugee problem—but there is the memory of "Manchukuo" and the certainty that the population will exceed 100 million by 1970. Yet the bidding for Japanese—as for German—favours between the Russians and the Americans has begun. The problem of maintaining Japanese political and economic independence against the massive Sino-Russian alliance on the mainland of Asia is above the horizon. What was a political problem has become a defence problem. The date is not far off when the supply of free dollars will dry up and Japan—like Germany—will have to export to its old markets in order to live.

In short, the Americans see a grave risk that all the work of the last five years may be undone, and the independence of Japan placed in jeopardy, if the wrong decisions are now made about its future relations with the outside world. For eight months or more progress on the peace treaty that the State Department believes to be urgently needed has been held up by differences with the Department of Defence. The Chiefs of Staff hold that to retire from Japan would be to leave too large a gap

—from Okinawa to the Aleutians—in the American defence line for the Pacific, and would invite overwhelming Russian pressure on a disarmed Japan. And the Department of Defence sees no way both of preserving Japanese independence and protecting American interests save by remaining technically at war with Japan and continuing the occupation. Their advisers point out that to retain only three or four isolated bases would be to put the whole American position in Japan at the mercy of one or two atomic bomb attacks.

Such are the problems that Mr Johnson, Secretary of Defence, and General Bradley will be discussing with General MacArthur in Tokyo. And with them will be the Republican Mr John Foster Dulles representing the State Department—and some less exclusively strategic considerations. These include the view that to prolong an occupation under which the Japanese are already chafing would make them even less willing than they are already to grant bases to the Americans. If Japan is to become stable and friendly, some risks must be taken and some good will assumed. In the view of the State Department the recent election victory of the Liberals, who have made it clear that they would sign a peace treaty that excluded the Soviet Union and China, provides an opportunity to start negotiations. A separate peace of this kind is all that is possible in the present international situation; for the Russians would be unlikely to sign, or even discuss, a treaty that allowed American troops to stay in Japan, and the United States would sign no other. Somehow—for Mr Truman has said he hopes for an early peace conference—these two views have to be reconciled; it would surprise no one if the compromise solution made a civilian commissioner of General MacArthur and retained American troops in Japan as defenders rather than occupiers.

*

Before examining what are, or should be, the British and Commonwealth interests involved, it is as well to recognise that whatever solution is agreed between the State Department and the Defence Department is likely to prevail in the long run with all other interested governments, save China and the Soviet Union. The running of Japan has been a peculiarly personal American business, and the recent course of the Soviet cold war has made its future of increasing importance to Washington. Unless the Japanese are to be allowed to rearm—which has not been seriously discussed—the defence of their islands must be America's concern; and the Japanese will bring confusion and uncertainty into world trade unless American advice and influence can be used to plan their buying and selling in their old markets.

The British interest is clearly that peace and stability should be maintained in Japan by moderate men who will work with the Americans and their allies; that Japan's role in South-east Asia should grow within the limits of an agreed policy; that leniency should not displace too quickly control and distrust; and that the British and other governments should have direct access to Japanese statesmen and officials for the conduct of their commercial and political relations. There has been much discontent among British traders with the controls exercised—or not exercised—by General MacArthur's staff over the economic policies of Tokyo; and the sooner the system of interlocking bureaucracies comes to an end the better. Equal partnership—in the sense that it has been offered to the Germans—is something to be discussed and defined for the future. What is needed now is a treaty or instrument in which Japan's postwar rights and liabilities would be clearly defined.

*

At present American authority in Japan is established by the provision, accepted in August, 1945, that "the authority of the Emperor and the Japanese Government to rule the state shall be subject to the Supreme Commander for the Allied Powers, who is empowered to take such steps as he may deem necessary to give effect to the terms of surrender." These powers may not be used in current American practice, but to give them up *in toto* in the present state of international relations would be a reckless gamble. If a peace treaty involved doing so, it would be better to have no treaty. There is, indeed, much more to be hoped from an occupation statute that would be framed by the Americans in consultation with friendly governments, and would not require Japanese consent. Such a statute would provide for the termination of the technical state of war and for a resumption of normal diplomatic relations between Japan and states recognising the statute. In this way, many of the frictions of the present system might be got rid of, and Japan would regain a large measure of sovereignty in the conduct of foreign affairs. What is more, time would be gained for working out what is to be the economic role of Japan in South-east Asia. The danger now is that a waning of American authority and financial aid will bring Japanese economic policy into this vulnerable area as an uncontrollable factor at the very moment that Commonwealth plans for assisting its development are taking shape.

The Americans have been inclined to regard political questions relating to Japan as very much their private business and best left to the authority and skill of General MacArthur. But the economic problems now arising in connection with Japan cannot be so regarded; they have a far wider significance and cannot be much longer avoided if Anglo-American relations are not to suffer. For example, the effort of the Americans to make the Japanese pay their way and stop buying food and raw materials with free dollars is turning them towards their old markets in South-east Asia. There—notably in Siam and Burma—they are bidding with machinery, textiles and consumer goods, cheaper than the west can offer, for rice surpluses that are barely sufficient to feed Malaya and neighbouring countries. If food shortages are created by this growing Japanese demand, the Americans will find themselves pumping into underfed and discontented South-east Asia the very aid that they have tried to cut down in Japan.

That is only one matter on which there is a clear need for close British and American co-operation. There is also the further question of how long Japan can be held off from the lure of vast potential markets in the Communist-controlled mainland. Japanese businessmen—like their colleagues in the Ruhr—are campaigning vigorously against the American policy of checking war-potential exports to the Soviet sphere of influence. They have heard the siren-cry of the Russians, who promise great trade opportunities in China provided that the Americans are allowed to retain no bases in Japan; these opportunists believe they can provide China with just those goods for the development of its industry and agriculture that would otherwise have to be bought from the west. These are questions that range far beyond the limits of American occupation policy; they should be considered and can be solved only as part of the grand strategy against the Russian cold war.

Whether the decision goes in favour of a treaty or of an occupation statute there are difficult times ahead in Japan. It will be fought every inch of the way by the Soviet and Chinese governments; the Communists will bid for leadership of Japanese national feeling; the Yoshida government will be torn between its dependence on American aid and its desire not to lose the allegiance of voters to the extremists of right and left; the peoples of south-east Asia will watch with bewilderment the west's handling of their defeated conqueror. And all this may well happen during election year in the United States. The Americans will need all the support and wisdom their friends can offer them; and the sooner active consultation begins the better.

The Fishing Industry—II

Gambling in Fish

THE fishing industry has been described as undergoing a protracted industrial revolution. Certainly during the thirties there were signs that the slow spread of large scale operation, heavier capital equipment, and vertical integration of successive stages of production and marketing were leading to more profitable and stable conditions. But, if the newer methods of organisation prevail over the old by only slow and faltering steps this is due not so much to lack of enterprise or vitality as to the peculiar nature of the trade itself. Its supply of raw materials on the one hand, and its markets on the other, change not only from one decade to the next, but from week to week and from day to day, so that large scale organisation and far-sighted investment need to be associated with an uncommonly high order of ability. At the same time there is the perpetual chance of a windfall for a small man willing to back his own judgment, and this will always keep a number of both fishermen and merchants hanging on to the industry by the skin of their teeth, cherishing their independence and living on hope. The slow and painful process of rationalisation was further discouraged in the late thirties by the threat of war and admiralty requisition which made new trawlers a dubious investment, and thereafter by price control which has until this spring sheltered the whole industry from harsh economic reality.

The scale of ownership of fishing boats varies greatly. At one extreme are those at Hull, where three-quarters of the long distance trawlers were owned in 1934 by firms with fleets of 10 or more. Next come the near water trawlers based chiefly in Aberdeen, Grimsby, Fleetwood and Milford Haven, which with Hull land over three-quarters of Britain's white fish. Here the ownership is less concentrated; in 1934 for instance only one-third of Aberdeen's boats was owned in fleets of 10 or more. The herring drifters are mostly owned by the skippers and so are the boats of the inshore or "village fishermen" who go out for one night to fish with long lines for prime fish which many of them market through local fishermen's co-operatives. In most cases the crew shares the profits, skippers and mates taking as a rule 10 per cent and 7 per cent respectively of the net proceeds for their whole pay. Share arrangements are complicated and vary greatly, but they are an essential part of a trade where working hours and routine have no meaning, and where only bursts of whole-hearted effort by all on board, when the fish are at hand, can make a trip successful. The risks of the industry are borne by the deckhand as well as the owner, as was instanced in the disastrous herring season of 1949, when many deck hands received only £2 a week plus their food, for fifteen weeks of hard work. Whether too big a proportion of fishermen's wages is liable to fluctuation is not easily decided; the court of enquiry into the trawler strike of 1946 declared that the proportion was too big in the trawling sections. But if the prizes are removed along with the risks, the livelier hands may begin to look to safe jobs ashore.

Prices of fish are more erratic at the ports than at the fishmongers. Virtually all landings are auctioned on the quayside by an agent who acts for the owners; he calls a price for each lot and brings it slowly down until some buyer accepts. Early landings fetch the best price each day, since there is much to be done (cleaning, grading, sorting and packing) before dispatching it inland on the afternoon trains. Thus the price paid is not solely related to the quality of the fish, and the producer must accept whatever he can get without reservation or have a highly perishable catch left on his hands. Fish meal factories pay only just enough to make sale to them preferable to dumping in the sea. The producers thus take the brunt of the risks of market as well as the

risks of nature. Before the war attempts to obviate this double risk were made by the better organised producers at Hull, partly by deliberately restricting the catch and partly by withholding fish which fell below a minimum price, but nowhere else was such concerted action even envisaged. A poor market, however, and the pace set by Hull will probably cause ownership to become integrated into bigger units.

*

Distribution was estimated to add nearly 100 per cent to the landing price of fish before the war, and since controls were removed, the proportion is probably higher. "Too many people trying to make a living out of it" is the fisherman's constant complaint. J. B. Jefferys in "The Distribution of Consumer Goods"* estimates that before the war 47 per cent of fish passed from the port auctioneer, via the port wholesaler and the inland wholesaler, to the retailer, while some 5 per cent was handled by three or more wholesalers before reaching the shop.

There were before the war, according to Mr. Jefferys, between 1,700 and 1,800 port wholesalers (known as "merchants") and a further 450-500 inland wholesalers, and they are still as numerous as ever. Their respective working margins he estimated at 25 per cent and 19 per cent on an average, with retailers adding a further 40 per cent. Realized profits after wastage were somewhat lower, but the total effect was to add between 80 and 150 per cent on to the fisherman's price.

The mystery of such a large number of dealers is partly explained by the casual nature and small capital of many of the merchants. A fish "lumper" or porter can go into the market on any morning on the strength of a borrowed pound or two, take up a promising lot, cadge a few boxes and pack them off to an inland dealer to whom he is quite unknown for sale on commission; he may be lucky, and if not the venture is no more expensive than backing horses. This is an extreme example, but the majority of merchants work with little capital, cleaning and packing in ramshackle premises with all the hallmarks of waste and inefficiency. In Aberdeen, for example, in 1942, eight merchants handled 70 per cent of the catch, and no fewer than 219 other merchants divided the rest between them. They all stay in business because retailers and wholesalers throughout the country each like to keep in touch with as many port merchants as possible, as a safeguard against local scarcities.

An industry that alternates so swiftly between glut and famine, with a commodity whose value falls rapidly every hour it is out of the sea, has found that it pays in the long run to have this surplus capacity. But the Duncan Report in 1934 suggested that the same flexibility could be achieved with greater efficiency in layout, personnel and quality of service by a Marketing Board. With powers to license merchants and inland wholesalers, such a board could gradually sweep away the agglomeration of little fish houses and enforce more reliable standards of quality and grading. The optimum position lies somewhere between the two extremes of great flexibility leading to unreliable quality and high costs, and a formal stability bought at the price of a rigid organisation unable to cope with sudden gluts.

Such a delicate balance, however, is unlikely to be achieved by the industry without outside assistance; and since the war put an end to the White Fish Commission, the Duncan report has been shelved. The taking over of port wholesaling functions by the producers themselves, which seems to the outsider the obvious solution, has been tried here and there with indifferent success; it would appear that an entrepreneur must specialise in either producing or merchanting to succeed in this complicated trade. Also, it is hard to see how good relations between owners and fishermen would survive the experience of owners recouping on the merchanting transactions what the ships lost as producers; this difficulty has been experienced where owners of unprofitable ships have had interests in ice and coal companies, while their fishermen took the brunt of low prices.

*

The weekly consumption of fresh fish in the United Kingdom is now half as big again as it was in 1934-38, but its traditional rivals at the margin of the household budget—fresh fruit, vegetables and eggs—have this year made their influence felt sharply at the beginning of the summer season. It is becoming obvious that in the next few years there will probably be more fish on the British market than can be consumed. Quality is a bigger problem than price, since few housewives can judge fish expertly, and cheap fish, instead of being appreciated, tends to be suspected. Fried fish sales are probably the most elastic market for cheap varieties, but these are unlikely to ease the general situation very much.

If consumption is to be maintained even at present levels, bold and imaginative methods will be needed to give the public fish that it enjoys instead of a grey horror that it endures. Danish boxed plaice and soles sent direct to inland markets are in great demand at a good price because they are more reliable, fresh and carefully packed than anything the British fishermen produce. These are a luxury item at present, but the same extravagant attention to detail is essential if fish as a commodity is to live down its present reputation.

Besides quality, however, novelty is the great essential. It is unfortunate that so many new experiments in marketing fish, in canning, freezing and filleting, should have been launched, not to make dull fish better, but to make bad fish bearable. These bad starts will also have to be lived down, for modern housewives have proved repeatedly that ready processed, easily served food is what they want; corn flakes have ousted porridge, tinned salmon has ousted its weight in fresh fish—even the poorest customers queue up for fried cod and leave cheap herrings on the fishmonger's slab. It should not be beyond the ingenuity of the industry to fillet herrings, to popularise frozen cutlets of absolutely reliable, branded quality, or to rival tinned salmon with a ready-to-serve white fish.

The fishing industry is facing a jaded market at home, the loss of export markets abroad, and a threat of cut-throat foreign competition everywhere. Its present difficulties therefore command a sympathetic hearing. But assistance will be worse than useless unless it is applied in a way that stimulates those major changes in the industry which seem so obviously desirable, but which the industry appears powerless to carry out alone.

NOTES OF THE WEEK

Relief for the Government

The Government's victory by a majority of 14 in the division over the petrol tax, at the beginning of the committee stage of the Finance Bill, has given Mr. Morrison and the whips renewed confidence that they will reach the haven of the summer recess without disaster. They will still need vigilance during the further late night sittings which are to come, but the omens are, for the moment, favourable to them. The Government's majority over all other parties has fallen to 8 with the arrival of Mr Macmaraway, the Unionist Member for Belfast West, whose position has been challenged because he is a clergyman in the Church of Ireland. But although he has taken the oath, he has not yet taken part in debate or in divisions. The government whips have at last begun to evolve an effective method of shaping the pattern of debates to suit their own ends. The idea originated among their own back benchers where the more restive left wing members of the last parliament have now formed a group ready to provide speakers at short notice in order to keep a debate running until the full Government voting force can be mustered. The Tories for their part are making little effort to camouflage their intentions when it comes to calling a division, so that it would require a gross error in generalship on the part of the Labour whips to bring the Government down during the remaining six weeks of the session.

The Finance Bill is the only really controversial legislative measure to be considered during this time. Of the meagre list of 22 measures which have so far come before the Commons since the election, seven have already passed into law, six have gone on to the Lords and nine remain for consideration. There are another two or three minor measures such as the Street Works Bill still due to come down from the Lords, but of these the Medical Bill is the only one of any importance apart from finance for the Commons to consider. The project to give the cinema industry a further £1,000,000 through the Film Finance Corporation will, if adopted, require a short bill, but the real controversies during the remainder of the session will arise, apart from the Finance Bill, not over legislation but on such questions as the future of the groundnut scheme and, above all, on the Schuman Plan. On these the Government is likely to have an uncomfortably rough ride.

* * *

Bonn and Strasbourg

Dr Adenauer's government is in process of accepting the invitation to be represented in the European Assembly at Strasbourg. All parties except the Socialists, the Communists and the extreme right wing voted for the motion on the first and second reading in the Bundestag, and the final decision seems to be a foregone conclusion. Dr Adenauer made no new points in his speech introducing the proposal, but the old arguments are, after all, eminently sound. His main emphasis was, naturally, upon the nature of the German choice between an east which offers enslavement in return for submission and a west which offers friendship in return for co-operation. Dr Adenauer pointed out that Germany's advance towards freedom and complete control of its affairs depended upon evidence of its own good intentions, and a refusal to participate in the European Assembly would hardly be interpreted as a gesture of solidarity with the west. A turning point has been reached, and Germans should realise that "the co-operation of the European countries is absolutely necessary to withstand pressure from the east." The Chancellor went so far as to say that the vote would show "who is for the east and who is for the west."

What, then, is one to say of Dr Schumacher, who has taken the Socialists into opposition to the measure? No German politician is more alive to Communist pressure or more menaced by it. Yet he has violently opposed the invitation to Strasbourg ever since it was first offered and showed himself as unrepentant as ever in the debate. Since, however, the reasons he gave for his attitude included every known argument, big and small, relevant and irrelevant, the most likely explanation is, perhaps, that Dr Schumacher is faithfully pursuing his duty to oppose. He refused because the Saar was to be included. He refused because Germany was only to have associate status. He refused because a hard enough bargain had not been driven. He refused—significantly—because the next step would be an invitation to join the Atlantic pact, and the one after the decision to rearm Germany. In a word, he was for the west but only a west moulded to his own liking. The attitude is not unknown in other Socialist parties, but it has brought them no conspicuous success in European affairs.

* * *

France Enjoys the Cure

A number of the French parliamentary parties have held their spring conferences during the last month. These have led to no disturbance of the reigning coalition of *Mouvement Républicain Populaire*, Radicals and Socialists (the latter out of the government but voting with it). Yet it is possible, if highly unlikely, that between now and the parliamentary recess in 5 or 6 weeks M. Bidault's government will disintegrate.

Last year M. Queuille was wobbling just about this time as a result of a difference of opinion about the price of petrol; but he managed to play out time until the holidays. This year, although *immobilisme* has hardly given place to dynamism, the government seems stronger for several reasons. First, France is feeling the psychological benefit of the long slumber under M. Queuille; second, the economic situation is satisfactory (an unusual decline in wholesale and retail prices occurred in May and there is a prospect of an excellent harvest); third, M. Bidault's team has promised a greatly accelerated construction of houses; for 1951 the target is 100,000. The government intends both to increase its own building programme of low-rent houses and also to stimulate private building. The recent reduction of the discount rate of the Bank of France from 3 to 2½ per cent will presumably contribute to this end.

The MRP Congress at Nantes gave no evidence of a change in the complexion of the party. M. Bidault was re-elected as president with an overwhelming majority; the motion on Roman Catholic schools recommended the extension to them of state-assistance but in a manner conciliatory to the Socialists. The party also declared itself against an outright return to the system of single-member constituencies, but did not dogmatically oppose all electoral reform.

The Radicals, who, in their prewar heyday raked in seats by means of the single-member system, are naturally the main antagonists of proportional representation. But there is no sign that this issue will bring about a break of the coalition. It is, indeed, far more probable that, since it is to the interest of all other parties to reduce the present Communist representation of 180 seats by some measure of electoral reform, this change will be ultimately negotiated among them in the form of a compromise between the two principles.

The French Socialist Party has, on its own admission, lost a quarter of its subscribing members during the last year. But this is a fate suffered by all parties in times of quiescence and there is no solid evidence of a

decline of Socialist strength in relation to the other parties. Such a falling off may, however, became apparent in next year's elections because the Socialists are becoming more and more of a sect with no appeal beyond their immediate clientele, which is largely composed of medium and minor civil servants.

* * *

Parties of the Right

Among the opposition parties two groups, the one boldly, the other faintly, hold the stage ; the RPF of General de Gaulle and the ultra-conservative *Parti Républicain de la Liberté*. The PRL, which, with the other small groups (the Peasants, the Independents, the Democratic Alliance—of which the chairman is M. Flandin) forms the parliamentary Right, is hardly of consequence for the future. On the other hand, de Gaulle's *Rassemblement,* which, as it did not yet exist at the elections of 1946, is only indirectly a parliamentary force by means of its *inter-groupe* which unites in the Assembly a number of deputies belonging to other denominations, is certainly of great importance.

The general's star, however, rises chiefly when the government is in difficulties. (The devaluation of the pound last September and the Saar dispute this spring were instances of its temporary ascendancy.) His party's refusal to welcome the Schuman proposal has done much to reduce its dim grandeur in the eyes of those for whom such a development is essential. The decision was taken on the grounds that the present government was incapable of either negotiating such a momentous policy with adversaries as ruthless as the Germans, or of enforcing it in a country as undisciplined as France. It was further objected that the main consideration presenting itself to both Frenchmen and Germans was not economic but strategic, i.e., emphasis should be on the planned decentralisation of heavy industry towards the Mediterranean and North Africa rather than upon its rationalisation *in situ*. In the eyes of many Frenchmen the attitude of the RPF to this question indicates a certain archaism in the movement, which leads it to view practical problems without the necessary modicum of international idealism.

The rather peculiar process of government under which France has pursued the course of recovery during the last 18 months certainly owes nothing (as our Paris Correspondent explains in an article on p. 1335) to great men and resonant oratory (M. Petsche, the unobtrusive non-party minister, has been typical of French rulers during this period.) It remains to be seen whether the country will again move forward on the road that for a moment it seemed to be taking after the war at the time of the big schemes of nationalisation, of social security and of the re-creation of the French Empire. All depends upon whether the moment inexorably demands action of a kind that only a majority party can take. It is not yet clear whether the Schuman Pool and, with it, the problem of western defence will soon create a situation in which France must be subjected to new legislation and tighter administrative controls.

* * *

Return to Groundnuts

At long last, full information on the past and future of the East African groundnut scheme is becoming available. On Monday, the Overseas Food Corporation announced that a working party had been set up to give advice on the long-term and short-term agricultural policy to be pursued at Kongwa. This announcement coincided with the publication of the report of the Committee of Public Accounts into the accounts of the Overseas Food Corporation for the twelve months ended March 31, 1949. The auditors' strictures on those accounts were made known last October when the accounts were published. What the Committee of Public Accounts now reveals is that the board of the Overseas Food Corporation did not make available to the Ministry of Food the auditors' memorandum, drawn up in August, 1948, which gave due warning that, in view of the situation in the stores and accounts departments in East Africa, their report on the corporation's accounts would be bound to contain these strictures. This oversight on the part of the board is the more reprehensible in that the Ministry of Food accepts the blame for the "headlong" manner in which the groundnut scheme was launched and which was persisted in even after the difficulties had become apparent.

The Public Accounts Committee is naturally mainly concerned with the financial question. But its report also raises the issue of where final responsibility for the groundnut scheme should lie. The three parties concerned, the Ministry of Food, the United Africa Company—its managing agency in the first year—and the Overseas Food Corporation, all handsomely accept some blame for the scheme's failure, presumably on the principle of blame shared is blame halved. But on the general issue of who is responsible for policy, the position is still obscure. If, as seems to emerge in the evidence to the committee, the decision to proceed with large-scale clearing at Kongwa instead of changing over to experimental pilot schemes was a Government decision, why did the then Minister of Food so consistently refuse full information to Parliament on the plea that the corporation's responsibility for the scheme must not be blurred ? On the other hand, Sir Leslie Plummer made it quite clear in his evidence that he was not in favour of pilot schemes, and it may be that the Ministry was acting on his advice. The only thing that seems reasonably clear is that the device of the public corporation seems, in this case at least, to confuse rather than clarify the responsibility for spending the taxpayer's money.

* * *

Boxes of Tricks

It is open to question whether public opinion in democratic countries benefits from the alternate doses of scare and encouragement that statesmen offer whenever they discuss defence questions in public. One month the cry is all for stiffer upper lips, better teamwork, and the need for planned strength against Soviet forces, whose divisions are always numbered in round millions and whose aircraft are always presented in scores of thousands. The next month it is all for confidence in superior industrial and scientific techniques, for new weapons against old tactics, for mobility against mass, for deterrents versus power to strike back. The truth surely lies between these two extremes, and it is time that one or two statesmen to whom all Europe will listen expounded that truth so far as security allows. In this country, for instance, a month has passed since revolutionary decisions about defence were taken by the Atlantic Council ; but no one has yet thought fit to explain what they mean to Britain and its allies. Mr Attlee and Mr Shinwell must surely see the danger of drifting into the position that so perplexed Mr Baldwin—of not daring to speak candidly about rearmament for fear of losing the votes of a "pacific democracy."

The latest disturbing swing towards misleading optimism is occurring in America. The Secretary of the Army has taken up the theme of Dr Vannevar Bush and spoken of guided missiles, proximity fuses, tactical uses of atomic weapons and so on. In so far as this doctrine discourages talk of Europe's providing tank-fodder while the Anglo-Americans sit in machines, and in so far as it concentrates more attention on the qualities in which the west is strong, the doctrine is sound and refreshing. But it could quickly become a myth, an obsession like that belief in the V weapons which was fostered by Hitler's propaganda. For politicians will grasp only too readily at the idea that boxes of tricks—not yet in mass production and barely off the drawing board—can take

the place of trained men, and at the hope that everything in which a potential aggressor is strong is becoming obsolete. The purpose of the Atlantic powers is to prevent war by adequate preparation ; they will not get it if their political leaders encourage the same kind of myths and escapism as prevailed in the thirties.

* * *

India and South Africa

Relations between India and South Africa, which have never been very happy, have taken a turn for the worse. Last week the Indian Government announced that, because of the Group Areas Bill which will give effect to Dr Malan's *apartheid* policy, they would not take part in the round-table conference about the Indian minority in South Africa. The South African Government have pointed out that, when the conference was mooted earlier this year, the Indian delegates were told about the Group Areas Bill and the effect it would have on Indian communities in South Africa. They find it difficult to understand, therefore, why the Indian Government should now suddenly decide that the Bill destroys the purpose of the conference.

The Indian Government certainly seem to have been unreasonable. The broad outlines of the Group Areas Bill were known some time before the preliminary discussions in South Africa in February ; if India thought that the Bill made it impossible to find a basis for agreement, it should have made its objections clear at the start. To appear to have been willing to disregard the Bill and then dramatically to call off the proposed conference because of it, is clumsy diplomacy to say the least and considerably weakens India's case.

In any event it is unlikely that the South African Government would have been prepared to discuss their domestic policy. The original purpose of the conference was to find a way either of persuading South African Indians to emigrate to India—which is what Dr Malan wants to do—or of bringing an end to the everlasting friction between the Indians and the rest of the racial groups in the Union. The Indians in South Africa are, however, South Africans and not Indians by nationality ; the Indian Government were invited to the conference not because their sovereign rights were involved but because whatever course of action was decided upon their help would be necessary. Clearly, there could not be a mass emigration to India unless India was willing to accept the immigrants ; second, there could be no racial peace between the South African Indians and the rest if, among other matters, India did not agree to stop its agitation in the Union. The Group Areas Bill does, of course, have some bearing on racial peace, but, whatever the rights and wrongs of the Bill, by implying that they would not talk business until it had been amended or abolished, the Indian Government are asking Dr Malan to accept a degree of interference which they themselves would never tolerate.

Money for Malaya

One of the most important results of the recent visit to Malaya of the Secretaries of State for War and for the Colonies is that Britain will almost certainly pay more towards the fight against the Communist guerrillas. Like other changes now likely to flow from the visit this step is welcome, belated though it is. Each of the two ministers is now in the curious position of being for the moment the chief expert in his own department on the subject of Malaya, and it will be their job to convince Sir Stafford Cripps that Britain must take over a much larger commitment.

Why, in fact, should the British taxpayer pay more towards the cost of the Malayan campaign than the £5,000,000 paid over to Kuala Lumpur last year, the £3,000,000 already promised for this year, and the expenses of the imperial forces maintained in Malaya at an annual rate of about £5,000,000 ? The first answer is that the Federal Government needs all its available resources for financing long-term developments, like more schools, medical facilities and social services, in order at least to counter false Communist accusations that it is doing nothing to improve the lot of the people. Indeed, this is a vital part of the campaign itself. With emergency expenses constantly mounting, the Federation ought, as an absolute minimum, to have a firm undertaking from Britain that it will bear a fixed proportion of them.

But wider interests are also at stake. As Sir Clive Baillieu, the chairman of the Dunlop Rubber Company, recently put it:

> The raw material strategic axis of the whole western world stretches from just east of Suez through the Middle East, India, Malaya, Indonesia and on to China. . . . There lies ahead of us a period of uncertainty and grave risk for the whole of this vital supply base.

If the struggle in Malaya is lost, or allowed to run on, nearly all that remains of British power, prestige and influence would be lost throughout the east. And with it would go much of the country's trade and standard of living. All these things hinge upon adequate British financial assistance to Malaya.

industry. It has always been vocal on political as well as industrial questions, and there are a number of able and determined Communists among its branch leaders. Its deliberations are, therefore, an interesting indication of the state of opinion among the workers of the left wing of the Labour Party and beyond. One point emerged very clearly from this and other recent conferences ; nationalisation may temporarily be a closed issue at Transport House, but it is very much a live one elsewhere. Mr Jack Tanner, in an otherwise temperate presidential address, urged that political expediency should not mean the relaxation of pressure by the trades union movement for nationalisation.

> We should not water down our programme in the hope of placating ill-informed middle-class voters but should go all out to convince these people, and the waverers among the workers, of the correctness of our Socialist policy.

However unrealistic it may be, and however unpopular with Mr Morrison, this is an echo of a view that has a number of adherents among the younger Labour MPs. But in the discussion that followed, it was clear that considerations of political expediency do now affect the thinking of even the extreme left. A fiery resolution for the nationalisation of the engineering and shipbuilding industries without compensation and on syndicalist lines was watered down after considerable argument, with only the Communist element supporting it to the bitter end.

Although Mr Tanner beat the usual trade union drum about the iniquity of high profits, he made some sensible remarks on the importance of maintaining a proper reward for skilled labour. He pointed out to the union the error of the line they had made him take in demanding an all round increase of £1 a week, in the hope of a quick settlement, when they should in fact have concentrated upon a revision of the wages structure. If Mr Tanner can persuade his union of the fallacies of their claim for an all round increase, it is possible that there may be a basis for a negotiated settlement in the protracted dispute between the employers and the unions in the engineering industry.

* * *

The Enugu Inquiry

It is difficult to feel satisfied by the report (Colonial No. 256) of the commission of inquiry into the disorders that occurred in the eastern provinces of Nigeria last November. There was a time when inquiries into similar disturbances in the colonies were accepted at their face value. Perhaps they were unfair to Government or employers ; but these took the rap, action was promised on the recommendations and the British conscience was quieted. Today, however, colonial governments have to consider the effect of a commission's report, not on British public opinion, but on public opinion in the colonies, where the extremists will be only too glad to have another propaganda weapon to wield against "British domination." Two years ago, the report on the Accra riots was accompanied by a Colonial Office memorandum criticising some of the commission's recommendations and findings. Now, after some delay in publication, the Enugu commission's report is accompanied both by a dispatch from the Governor of Nigeria and a reply to him from the Secretary of State.

The Governor accepts the commission's recommendations on the improvement of industrial relations and the trade unions and the strengthening of the Labour Department—a small group of experts to advise on these matters has already been appointed. He is also prepared to accept the criticism of the action of the superintendent of police, who is found to have made an error of judgment in giving an order to fire before it was necessary. What he does not accept is the commission's finding that the Chief Commissioner of the eastern provinces treated the go-slow movement at the Enugu colliery as a political agitation instead of as an industrial dispute. He disagrees particularly with the commission's statement that the Chief Commissioner gave an order for the removal of explosives from the mine "at all costs." This finding could not be justified by the evidence.

On these two points the Secretary of State supports the Governor, although he agrees with the commission's criticisms of the Chief Commissioner's actions in other respects. At a time when any dispute in Africa so easily becomes political —as is shown by the events in Nigeria subsequent to the Enugu disturbances—it is the essence of good government to distinguish a purely industrial dispute when one arises. It is thus a pity that on this all-important matter there should be public disagreement—without the evidence itself being made public.

* * *

Development Charges Relaxed

Dr Dalton chose the occasion of the debate on town and country planning in the House of Commons to announce "a further little experiment in freedom." The new concessions refer to development charges. The enlargement of dwellings by not more than 7,500 cubic feet (instead of 1,750 cubic feet) and the lateral conversion into flats of not more than three adjoining houses will be exempt from charge. The Minister also promised to try to reduce the scope of the order which fixes what changes in use of property are liable to development charges. In particular, exemption from development charge (though not from the need to get planning permission) will be given, on conditions, to residents who wish to use part of their dwelling for business purposes. These are welcome relaxations. The Exchequer will suffer an inconsiderable loss, but many small owners will be relieved of one cause of frustration and annoyance.

The Minister refused to reduce the rate of development charge below its present level of 100 per cent. He argued that since building labour is fully employed there is no need at present to offer an inducement to develop, whilst admitting that the need might arise later. He did agree to consider the suggestion that a firm statutory basis of valuation for development charges should be laid down in place of the more elastic technique at present employed by the Central Land Board. It is doubtful whether this second proposal would work well on its own. Some flexibility in the fixing of development charges is desirable. It is better to secure it by varying the rate of charge than by juggling as at present with valuation techniques; but to combine a system of rigid valuation with a 100 per cent levy would be most unsatisfactory. The debate produced further evidence that piecemeal amendment will only increase the anomalies and complexity of the Town and Country Planning Act. What is needed is a complete new Act, and there is no reason, with the present leisurely parliamentary schedule, why this should not be forthcoming.

* * *

Complaints from Hungary

The report on Hungary's economic progress made to a recent meeting of the executive committee of the Workers' Party was a mixture of praise and blame. Mr Geroe, the president of the economic council, produced statistics to illustrate his cheerful and optimistic picture of the country's general economic progress ; but he also had hard things to say about some "serious shortcomings" and about lack of discipline on the part of the workers to whom he addressed a lecture full of much sound common sense. He pointed out that wages were increasing more rapidly than productivity, and he denounced the popular belief that "one can build socialism without any special effort or sacrifice." Mr Geroe, therefore, stressed the need for improving labour discipline ; wage frauds, which apparently are widespread, must be

BRITISH OVERSEAS AIRWAYS CORPORATION

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship'. But . . . have you ever stopped to ask yourself . . .

*Illustration: Courtesy of Mr. J. R. Jones and Messrs W. S. Hodgkinson & Co. Ltd., Wookey, Som.

"Who are Britain's Craftsmen?"

*Introducing Robert Jones. With half a century's service behind him, he is a vatman in a paper mill. A swing of his wrists and a mass of fibres and water becomes a sheet of high quality hand-made paper. A starting point of a trade that enables Britain to export increasing quantities of books and printed matter.**

But . . . does craftsmanship mean only handcraftsmanship? Bigger, speedier and more complex machines are the showmen of the vast paper and printing trades . . . but behind them, away from the limelight, the craftsmen work on as before. And must there not be craftsmanship at every stage if the finished article is to be a masterpiece ? Monsanto think so, and they follow this rule in making chemicals for a long list of British industries. Monsanto chemicals for the paper trade are playing an increasingly important part in the production of better paper for Britain and the world.

*Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

MONSANTO CHEMICALS LIMITED

stopped, and wage norms, which have become obsolete since their last revision in January, 1948, must be revised once more.

Mr Geroe also felt uneasy about Hungary's foreign trade. He complained that "the major part of the industrial managers treat the question of production for export with an air of sovereign disdain." And although trade with the Soviet Union and the "people's democracies" had increased by 63 per cent since last year, trade with the west was falling behind. One reason for this is the poor quality of Hungarian goods. It is said, for example, that a Budapest enamelware factory lost an order worth nearly £15,000 because of shoddy samples.

Hungarian leaders are, of course, extremely anxious that the new five-year plan, which is to change Hungary from a great food-producing country to a predominantly industrial one, should get off to a good start. And, even if the plan's ultimate object is to expand industrial exports to the east, it can hardly succeed in its initial stages if it is cut off from western machinery and equipment.

*

The executive committee of the Workers' Party also heard a report on "clerical reaction" by the Education Minister, Mr Revai. It had been preceded by a violent anti-clerical press campaign, leading up to the arrests of many priests and teachers of religion. This new campaign against the church seems to have been touched off by the refusal of the bishops to sign the Stockholm "peace conference's" demand that the atomic bomb should be banned. Every section of the clergy is accused of some heinous crime or other. The monastic orders, accused of being "imperialist agents and reactionary rumour-mongers" are shortly to share the fate of their Czech brothers. But Mr Revai's reference to the "bitter determination" with which the clergy are supporting the resistance of the Kulaks to the "Socialist transformation of agriculture" gives a clue to what is perhaps the basic reason for the present campaign. Although the part to be played by agriculture in the new five-year plan is over-shadowed by industry's part, it is nevertheless vital to the success of the whole. The Hungarian Communist leaders, who have recently ordered a slowing-down of the drive for collectivisation, well understand the grave effect that peasant opposition may have on agricultural production.

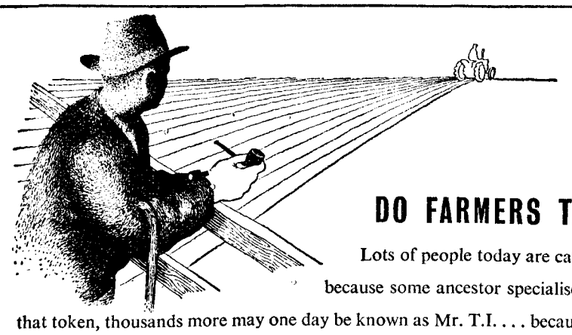
Integration or Disintegration

Wednesday's debate in the House of Lords on the position of the RAF reflected the anxiety that is raised in British minds by the conception of "balanced collective forces" agreed on by the North Atlantic Treaty Council. Does this mean, Lord Swinton and Lord Trenchard asked the Government, that the RAF is no longer to be a balanced force on its own? Is the function of providing a strategic bombing force to pass to the Americans, except in so far as Britain has commitments outside the North Atlantic Treaty area? It is never very easy to get a precise explanation of service policy from Lord Alexander of Hillsborough, but he did so far clarify the various and somewhat contradictory remarks made by ministers over the last few months as to declare that:

> There is no intention that the Royal Air Force shall concentrate on one particular role, or that the part we play in the defence of western Europe will be such as to result in any unbalance of the Royal Air Force.



This may mean much or little, but from remarks embedded in the rest of a long review of RAF policy, it appears that the Government intends to press on with the production of the Canberra medium bomber, while continuing with the design and prototype production of heavy bombers.

It has often been urged in *The Economist* that Britain cannot afford to devote the necessary productive resources to a full scale programme of heavy bomber production, while meeting all her other military commitments, and that strategic bombing is a task which must be left primarily to the United States Air Force. The opposition which this argument arouses is largely based on distrust of the sense of reality of the United States Congress and on doubts about the superiority of the heavy bomber types currently being produced in the United States. Against this it can be argued that the tightening of the North Atlantic Organisation, which produces the need to integrate defences, also makes it increasingly less possible or likely that Congress will wish to or be able to retreat from its responsibilities in the event of trouble. In the second place the argument against British production of heavy bombers is not an argument for disbanding the British companies or design teams which are experienced in bomber design, nor for the RAF to cease to evolve superior techniques of heavy bombing. If the closer integration of Atlantic defence means anything it must surely mean a willingness on the part of the member nations to abandon the kind of national pride which refuses to recognise the results of faster technical progress elsewhere. Until it is clear that the United States would accept and build a British designed heavy bomber if it were demonstrably superior to, say, the B36, Britain cannot afford to relax her interest in heavy bomber production as well as design, but equally until that stage is reached, there can be no great substance in the concept of "balanced collective forces."

Dupes and Deceivers

The recent decision of the House of Commons on the subject of Post-office deliveries on Sunday, and the bill which is now under discussion in the House of Lords for the more effectual suppression of Sunday trading, seem to us to betray a spirit and to indicate intentions against which it is imperative on every one who wishes well to the best interests of society to make a resolute and peremptory stand. The Sabbatarians, though small in numbers, are yet formidable as a party, because their activity is unwearying, and their encroachments on the rights and the freedom of their fellow-citizens are cloaked, both to themselves and to the world, under the guise of religious zeal, and because—such is the unfortunate temper of Englishmen—they can at any time fill up their ranks and augment their appafent influence by the nominal adhesion of thousands of the indifferent, the timid, and the ignorant—the easy dupes and the willing deceivers. *Any* cry, raised by *any* body, in the name of religion or religious decorums, is certain in this country to be swelled, by the ready echo of the thoughtless of all ranks, into a shout loud enough to drown the voice of reason and justice .... Those who presumptuously designate themselves *par excellence* the religious world have been allowed hitherto to preach, with too little contradiction, the insufferable dogma, that all who venture to oppose their schemes cannot be religious men at all, but must be content to rank under the banners of the Principle of Evil. The language they have been permitted to use is to be attributed fully as much to the moral cowardice of one party as to the assumption of the other. . . . If those whose habits of serene reflection have led them to worthier conceptions *than commonly prevail*, would fearlessly raise the standard of that freedom of the mind which they profess to prize, beyond wealth or worldly honours;—if, disdaining to truckle to popular clamour or to humour popular delusion, they would boldly speak their conviction . . . they would find that thousands who now acquiesce in a reluctant and discreditable silence, would eagerly crowd into their ranks, and place them in a majority, which would secure at once their victory and their safety.

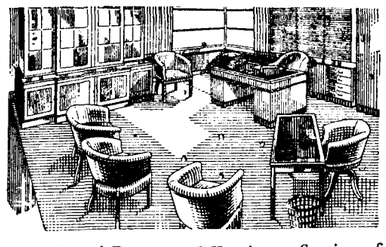
DO FARMERS TALK T.I.?



Lots of people today are called Wainwright or Smith simply because some ancestor specialised in agricultural machinery. By that token, thousands more may one day be known as Mr. T.I. . . . because TI certainly work for farmers.

They supply the precision steel tubing, the wrought aluminium alloy, which are the basis of so many of the modern farmer's tools. When farmers talk tractors, milk transport tankers, separators, cheese vats, bottle filling plant and many kindred subjects, more than likely they are talking TI, while their ploughman no longer homeward plods his weary way. He cycles TI.

The letters TI mean Tube Investments Limited, of The Adelphi, London, W.C.2 (Trafalgar 5633). They also stand for the thirty producing companies of the co-ordinated TI group, makers of precision tubes, of bicycles and components, of wrought aluminium alloys, electrical appliances, pressure vessels, paints, road signs, metal furniture . . . and essential mechanical parts for a thousand and one things which everybody uses.

Letters to the Editor

What Price the Price Mechanism?

SIR,—You revert in your issue of June 3rd to your thesis that we must be prepared to risk a certain degree of unemployment "if there is to be a sufficient disinflation of demand to allow the price mechanism to do its work." I yield to few in admiration of that respectable device; yet my demand for it is not inelastic. Will you tell us what price in unemployment you think we may be called on to pay for it? Was there, for example, sufficient unemployment in, say, 1937, to allow the price mechanism to work? If so, what level of unemployment today would restore the flexibility we then enjoyed? The first question may be a matter of opinion; but the second can be estimated.

Although there were 1,150,000 more unemployed registered in Great Britain in 1937 than in 1949, most of the difference has no connection with controversial issues of policy. First, there have been three technical changes in the compilation of the unemployment statistics which, to judge by their effect at the time they were introduced, account for nearly 170,000 of the difference.

Secondly, since the war two classes of unemployed have practically disappeared, those normally in casual work, and those temporarily stopped. This accounts for 260,000 of the difference. There are two reasons. Some persons now get paid when out of work from other sources than the Unemployment Fund; dockers, for example, by the Dock Labour Board, and building workers by their employers for time lost through bad weather. Secondly, minor and seasonal fluctuations in demand are being met by cutting down the overtime of all workers, rather than by laying some of them off. These changes are not a diminution in the real amount of unemployment, but a renunciation by employers and trades unions of practices whereby they used to milk the Unemployment Fund.

Thirdly, unemployment of maladjustment has largely disappeared. This used to be measured by a comparison between the degree of unemployment in the depressed and the prosperous halves of the country. So measured, unemployment of maladjustment was about 570,000 in 1937, and is about 100,000 today. Migration of labour in the war years, and greater activity in our old exporting industries, are responsible for the decrease of 470,000.

These three causes account for 900,000 of the difference between unemployment in 1937 and 1949. The remainder of 250,000 still exaggerates the effective change between 1937 and 1949.

First, the number registering as unemployed is certainly affected by the level of unemployment pay. Before the war, a married man with a family of three who was unemployed received in benefit 55 per cent of the average weekly earnings of a man at work; today he receives only 35 per cent. Secondly, since 1948, sickness benefit has equalled unemployment benefit in amount, and people who are incapacitated as well as unemployed often find it more convenient to draw sickness benefit than to register as unemployed. Lastly, between the wars, labour exchanges were so preoccupied with relieving unemployment and protecting the Unemployment Fund from abuse, that they were not effective agencies for placing people in work. The war changed all that. One week less spent between jobs by those who become wholly unemployed reduces average unemployment by about 90,000.

In the light of all these considerations I am tempted to suggest that with another 100,000 unemployed on the register, that is with an unemployment percentage of a little over 2, the flexibility of our economic system would be as great as in 1937 in the prosperous half of the country, provided the rigidities attributable to other aspects of Government policy were removed.

Is this the sort of risk you expect us to run? If so, is it not arguable that it is not so much the general degree of disinflation which is at fault, as the emphasis placed by Government on different inflationary and deflationary devices?—Yours faithfully,

PIERS DEBENHAM

25a Wellington Road, Birmingham, 15

[We agree with Mr Debenham that crude statistical comparisons throw very little light upon the problem, and we do not think that *The Economist* has been guilty of the elementary fallacy of saying that because the figures of unemployment are so low, therefore there must be overfull employment. Our belief is rather based upon qualitative observation. We do not know what the unemployment figure would be if there were a sufficient disinflation to liberate the price mechanism, but we suspect that the increase above the present figure would be greater than Mr Debenham's 100,000. For one thing, some of the factors mentioned by him, which have served to reduce the unemployment total in recent years, might begin to operate in reverse if the tide turned. And for another thing, he does not mention one very large factor which should have operated to *increase* the figure—namely, that the number of persons insured against unemployment has been increased since the prewar years by about one-third. Bitter experience of discussion of the subject of unemployment prompts us to add that nobody in his senses wants more unemployment for its own sake. Our own position is that it is better to risk a little now as a means of fending off a great deal later on.—EDITOR.]

Confidence in Hongkong

SIR,—The interesting articles of your Special Correspondent in South East Asia, which appeared in your issues of May 20th and 27th, do not refer to Hongkong, which after all is cheek by jowl with victorious Communism. May I offer a few observations from this exposed vantage point?

We are blessed with a highly efficient and splendidly equipped police force which has adequate support from naval, military and air forces. We have so far been spared the terrorism which at one time seemed a real menace, and infiltration of subversive elements has been kept in check. We are now benefiting from the most effective type of anti-Communist propaganda, the personal testimony of the thousands who have flocked here from the oppression in south China. Local workers have now heard from friends and relatives the truth about the state of paradise which was supposed to prevail in Canton. Hongkong traders know to their cost what their up-country connections are suffering at the hand of ruthless tax gatherers and of officials forcing the sale of Victory Bonds.

Foreign and Chinese businessmen are also learning. They can now compare the remarkable claims to industrial and economic progress put out by Peking Radio with the efforts of agents of the People's Government to secure the help of the capitalist world in procuring and financing supplies which China needs and which are presumably not available east of the Iron Curtain. And of course it is essential to find a market for the produce of China so as to earn the foreign exchange required to finance purchases. The effect of this activity is reflected in the Hongkong trade figures for the first four months of the year. These show that imports from the whole of China (including Macao) rose from HK$186.7 million in the corresponding period of 1949 to HK$225.9 million in the first four months of 1950, while exports increased to the astonishing total of HK$443.4 million from HK$126.8 million. Not recorded in the Colony's statistics are the various transactions in coal, salt and north China produce to Japan against metals on a barter or escrow basis which benefit Hongkong in various ways. Both Communist China and Nationalist China are dependent upon the commercial machinery of Hongkong and so long as security forces are maintained here full advantage will be taken of that machinery.

Your Special Correspondent would no doubt feel that the natural complacency of the Hongkong businessman seems to be as deeply ingrained as ever. We have seen what has happened in Shanghai and we shudder to think of what might have happened here. But the lesson of premature independence to the various countries of South East Asia should be clear enough now and we are placing our faith in the determination of the British Government to hold Hongkong and to ensure its inviolability.—Yours faithfully,

John D. Hutchison Ltd., Hongkong P. S. CASSIDY

Furniture and Efficiency

SIR,—In your article on "Furniture and Efficiency" you say "On this matter," i.e. furniture design, "the Council of Industrial Design might have been expected to give a lead: instead it has alienated many firms by encouraging styles which prove to have only a limited appeal."

May I point out that the Council of Industrial Design was set up in 1944 "to improve standards of design in British industry by all practicable means"? It has never wavered in its endeavours to encourage the production of good contemporary design, using available materials and techniques to the best advantage. This is sheer common sense. But anyone who knows the furniture trade and the way it has handled design problems in the past will realise that such a radical change is not easily accepted, although no alternative has appeared. Moreover, the retail buyer finds it much easier to buy what has sold in the past, the retail salesman is used to selling it and the customer, who seldom has any experience of what to look for, buys what is placed before him. Is it not certain, therefore, that a good design is bound to have a limited appeal at first? The really remarkable thing is that numbers of retailers are beginning to sense the fact that many members of the public are potential customers for a better standard than is being offered.

We can claim that our approach to the retail trade, including courses on design for training officers, buyers and sales staff, exhibitions in shops, articles in the trade press, small booklets, etc., is at least partly responsible for a movement which I believe will grow a great deal over the next few years.—Yours faithfully,

GORDON RUSSELL, Director

The Council of Industrial Design

Hospital Finance

SIR,—It is difficult to see how the detailed analysis of hospital costs which you recommend could provide the Government with a useful check on extravagance. Hospitals vary widely in age and construction, and in the type and standard of service they offer to the patient. The cost of maintaining and staffing an old rambling building covering a large acreage bears no comparison with like costs in a modern vertically constructed building. And, moreover, the cost per occupied bed will vary similarly with the standard of treatment both to in- and out-patients, with the distribution of beds among the specialties, and with the size of the wards.

Effective Parliamentary control over expenditure is essential. But if such control is to be exercised without destroying the genuine desire and ability to work the service efficiently that undoubtedly exists, the Treasury must recognise that the health service is a unique departure in public finance, and abandon its attempt to confine the hospital service within a straitjacket.

If economy is to be encouraged, provision must be made to allow money to be transferred from one sub-head to another; and if the Regional Boards are to be entrusted with power to match their responsibility, block grants must be the first and fundamental step towards strengthening their position. Freedom to plan the hospital service within a fixed financial limit is essential at regional level. There is no need to look for precedents from which such freedom might broaden down. It is time for the health services to create a precedent.—Yours faithfully,

B. W. THOMAS

Books and Publications

According to Hoyle

"The Nature of the Universe." By Fred Hoyle. Basil Blackwell. 118 pages. 5s.

THE attention of the public, where physical science is concerned, has in the last few years been painfully concentrated on the very small; but intermittently people turn in awe to the contemplation of the very large, and realise uneasily the triviality of our microbe activities measured against the vast and slow processes of the universe we inhabit for a moment. When in this mood, the layman has fed his curiosity for almost a generation now on the series of books written by Jeans and Eddington; in the view of Mr Hoyle, it is high time he was given something more up-to-date, for in many respects the new cosmology turns that of Jeans and Eddington upside down.

Whether this little book of five broadcast lectures will be the forerunner of such another masterly series remains to be seen; but certainly Mr Hoyle has the knack of transmitting intricate matters without condescension and without jargon, leaving the reader with the exhilarating feeling that he is after all well qualified to grasp what he had believed to be the preserve of the initiated few. Mr Hoyle speaks with unbounded confidence, and it is not his fault that his cocksureness at times somewhat undermines his authority; probably Jeans and Eddington were wrong, but the relish with which Mr Hoyle points this out inspires the reader with a sneaking hope that there will turn out to be a few flaws in his own solutions.

In five short chapters only a rather sketchy outline of the universe can be given; but Mr Hoyle conducts us across the light-years with great skill, keeping up a running commentary of novel, intriguing and startling facts, which combine to form a coherent picture of what the new cosmologist believes of the universe and its processes. He tells us, for instance, that the Ice Ages occurred because the sun got hotter, which it may do again if it runs into a wisp of interstellar gas; that the interstellar gas itself, though unbelievably tenuous—one atom per matchbox—contains a thousand times more matter than all the stars and galaxies put together; that our galaxy is considered young at an age of four thousand million years, during which time our sun has made the circuit of it some twenty times. Then, after getting us to think quite comfortably in terms of millions of years, he calmly tells us that the star explosion of whose debris the solar system is a fragment happened out of a clear sky in one minute flat.

These star explosions are not rare occurrences; in fact several of them have been witnessed by astronomers, and the chances of the formation of a planetary system similar to our own, and capable of supporting life, as a result of them can be calculated. It appears, on present theories, that each galaxy may have as many as a million planetary systems, and within the observable universe there are about a hundred million galaxies. Somewhere, says Mr Hoyle, there must be a cricket team which can beat the Australians.

Only twenty-five years ago, Jeans with great solemnity limited the possible number of habitable planetary systems in the universe to two. We are ready, under the spell of Mr Hoyle's breezy confidence, to deride these poor delusions, but perhaps inclined to hedge a little when it comes to accepting the results of his own calculations. Sometimes he gives the impression that he regards the sliderule and the differential equation as mightier than the telescope and the spectrometer,

and we may humbly but obstinately inquire whether some little unobserved fact may not drastically alter the picture, as many have been altered before.

Much heat was also aroused in the broadcasts by the remarks on the after-life, which close the book. By contrast they are so elementary that they can safely be ignored without detracting from the value and interest of the rest.

Tales of Kongwa

"The Groundnut Affair." By Alan Wood. The Bodley Head. 264 pages. 12s. 6d.

DESPITE the revisions which are known to have taken place, Mr Wood's book remains a severe indictment of the Board of the Overseas Food Corporation, as it existed before the dismissal of Mr Rosa and Mr Wakefield. *A fortiori* it is a still more severe indictment of the man who was at the head of that Board and of the Minister who put him there. What the reader will want to know is whether the indictment appears well-founded and just—more especially as it comes from the pen of one who up to a short time ago was a servant of those whom he now publicly criticises. The public have by now become accustomed to the aura of political pride, prejudice and personal recrimination which has surrounded the corporation for so long. They have, therefore, been waiting for a description of what is being done in East Africa in their name and with their money which does not attempt to defend the indefensible nor yet to shift the blame for mistakes, but which is at once authoritative, truthful and impartial.

The present book may be presumed to be authoritative in the sense that until comparatively recently its author had access to the files of the corporation and to the ear of its chairman. His record as a journalist provides sufficient warranty of truthfulness, but what of his impartiality? The background of a threatened libel action from which the book emerged showed no obvious signs of impartiality on either side to the dispute. It is, therefore, pleasing to find that the standard is high, even though it has been written so close upon the events which it describes. Certainly there is nothing in it which, judged by the evidence provided within its own covers, would seem to the uninformed reader to be manifestly unfair. Nevertheless, the book as a whole is pitched in a key so high and strident that it is difficult to resist the thought that the author has been a little too keen to prove his case, a little too eager to get the utmost out of his self-imposed brief.

The book is, however, more than a mere attack on the corporation. Mr Wood has the eye of a competent reporter for atmosphere and a good story. Much that he writes is, therefore, lively and vivid, particularly the description of the terrain, the story of the early adventures of the first working party at Kongwa and the sketches of some of the men working on the scheme. But Mr Wood is also at pains to show that the groundnut scheme is fundamentally a grand example of "socialist" planning, which remains no less noble because it has been mishandled. (By whom? Conservatives?) What he writes on this theme will strike many as irksome, and not a few as ridiculous.

The book closes with a thoughtful chapter on the future, which contains the suggestion that the scheme must "have a much more direct co-operation with the Government" (of Tanganyika) and a postscript which contains some jejune observations on Africa and African development.

Stimulus for the Soldier

"Defence of the West." By B. H. Liddell Hart. Cassell. 390 pages. 12s. 6d.

THIS book is designed to stimulate the military thought of the leaders who will succeed Montgomery, Patton, and von Rundstedt. But as in earlier days, the stimulation of military thought will antagonise or at least annoy many amongst those for whom the tonic is prescribed. There is no harm in this, but it is a pity that Captain Liddell Hart has chosen to irritate the impartial reader by the too frequent use of the refrain, "I told them so." His capacity for ideas, and his argument, or most of them, are sufficiently formidable by themselves.

What would another war be like? Captain Liddell Hart's answer is that it will depend on circumstances—and so it will. But a beginning of a new war will not be like the end of the last war, firstly just because it will be the beginning and secondly because science and thought have moved on. However, it is a fair assumption to make that if there is a war, the Russians will only be stopped from flooding over Europe or into Africa through the Middle East by land forces. Captain Liddell Hart estimates that a western European army of 20 divisions would provide a ground-check to the Russians, whose army has its limitations and may, he believes, be less efficient than it was in 1945. He has much to say assertively on the structure of the British Army. It may be that his confidence in his own tactical ideas is misplaced, but it is refreshing to find a man with positive ideas. May it not be that the failure of the Atlantic powers to agree how they would fight the battle of Europe at the start of another war, or to appoint a Supreme Commander who will decide it for them, is delaying the reorganisation and re-equipment of western armies?

Captain Liddell Hart asks what kind of army Britain needs and answers that it must be a quality army available on the scene at the start of a war. For this purpose short-term conscripts are doubly inadequate: regulars must be recruited and can be recruited with better conditions. With a total strength of about 250,000 men there should be nine or ten divisions of which four must be armoured. The divisions should be smaller —of five battalions or four armoured regiments and a motor battalion. Brigade and one of the higher headquarters could thus be eliminated. He advocates that the Army should work in units of five instead of units of three.

Such an army would, he argues, cost less than today's figure of 380,000 men in a training army. But the initial cost of up-to-date equipment will clearly be substantial; for example £24 million for the new tanks of two more armoured divisions, unless we can invent a rocket firing tank of lighter weight than the Centurian. The book was written before the Army Estimates of 1950-51 provided one more example of the democratic tendency to pay too little for equipment in peacetime.

There are many other theories and ideas on defence which will attract or repel the professional. No one can charge the author with forgetting that an army is incomplete without air power and without a tactical air force. But he is aiming at the wider public, the people who elect the Government, pay for defence, and desire not just to win a war but to prevent it. In a chapter on Home Defence he argues that the best way for Britain to deter an aggressor is to diminish its vulnerability. Preparedness in its fullest sense includes civil defence measures such as deep shelters, underground passages from house to house, protective shoes and clothing, artificial harbours, alternative supply arrangements, emigration and so forth. If we take the threat of atomic war seriously, then we must consider the provision of underground factories and underground life. All this is as alarming in its cost as in its consideration, but no less alarming than the thought that too little has been done.

The great defence problem facing the west is a problem of choosing what are the first things that must be paid for first. The political and military leaders have to choose not only the course which is best, but the course which their citizens will accept as best. The idea man—Captain Liddell Hart is still the leading military writer of ideas—plays an invaluable part in his country's defence, even if some of his ideas are found to be impracticable or wrong. But where is the young writer of his fecundity but with direct experience of modern warfare to challenge or stimulate Captain Liddell Hart himself?

Correction.—"Economic Survey of Europe in 1949" (United Nations Publications). The price of this is 15s. (by post 15s. 9d.)—not 22s. 6d. (23s. 3d.) as was advertised in our issue of last week.

★ *A book of facts about people*

'The Home Market'

That there have been vast changes in our people's way of living since 1939 we all know. But what *are* these changes? 'The Home Market' tells the whole story — and tells it clearly and tersely with tables, pictorial diagrams, maps, using the minimum of text matter. From this book you learn the latest composition and distribution of population; changes in the number and size of families; drift from one region to another; what is earned and how it is spent; what papers people read.
You see a complete picture of the new Britain.
This is a book that every manufacturer and advertising man needs. It is also a book of great value to the sociologist, the economist, the administrator and politician. The first issues of 'The Home Market', of which Major G. Harrison and Mr. F.C. Mitchell of The London Press Exchange were joint authors, gained a high reputation in 1936 and 1939, and this first post-war edition has been brought entirely up to date and re-written by their colleague Dr. Mark Abrams.

AMERICAN SURVEY

Democrats and Republicans

(From Our American Staff)

IN a non-Presidential year the primary election serves other purposes besides its main one of letting each party choose its candidates for State and Congressional posts. It may show how the national Administration is faring; it is also a means of testing the health of party organisation within the States. The fight for control inside each party, usually more or less concealed, comes out into the open. These secondary aspects explain the unusual interest aroused by the spring primaries in the southern States, and in Pennsylvania, Iowa and California.

Basically, it is still the validity of the Roosevelt revolution which is at stake. In some States, the struggle takes the form of revolt against long-established party machines. The defeat of the Grundy Republican machine in Pennsylvania was a classic example. The question now is whether Mr Duff, who won the Republican nomination for Senator, can continue to control Pennsylvania as well as represent it (always assuming that having won the Republican primary he will also win the November election) or whether the machine, though defeated, is still strong enough to keep a hold on patronage. On the other hand, the victory of Mr Hickenlooper, Senator McCarthy's ally, in Iowa, though expected, was impressive enough to encourage right-wing Republicans.

In other States, it is the machine that struggles to regain or retain its position. In the Democratic primaries of Florida, Alabama, and North Carolina the forces of reaction took the initiative. In Florida they defeated the New Deal Senator, Mr Claude Pepper, and cheers were loud among those Democrats and Republicans who have never ceased to hate the entire fabric of Rooseveltian reform and its supporters. In Alabama reaction lost, and in North Carolina it lost at least the first round (a "run-off" between Mr Smith and the liberal Senator Graham is still to be held). In Virginia, the Byrd machine was so shaken by the attack made on it last summer that it is trying to save its life by mending its ways. State funds amounting to $45 million have been released for schools which previously were told no money was available, and Senator Byrd himself, who used to vote consistently at Washington with the Republicans, has more recently been cleaving to the Administration line.

In these States the conservatives accused Senator Pepper and Senator Graham of North Carolina—as last year the Byrd supporters accused Mr Francis Pickens Miller in Virginia—of being "nigger-lovers," consorters with Communists, and friends of the Congress of Industrial Organisations. In Alabama similar charges were made by the militant Dixiecrats who had seized control of the Democratic party machinery and in 1948 had gone so far as to erase President Truman's name from the ballot and hand the State's electoral votes to a third-party candidate. But what they had won in 1948 with these tactics they lost in 1950.

The southern score, so far, is inconclusive, and the extent of disintegration within the Democratic Party in the erstwhile "solid South" will not be known until more States report. The southern conservatives, who so often vote against the Administration, might logically be expected to take the final step and join the official opposition, but logic loses on two counts. First, the Republican Party itself is also split, and, secondly, the emotional revulsion of Southerners against the party of Abraham Lincoln is still so strong that they cannot join it openly without losing caste. Yet Republicans are known to exist in the South, and to vote there, and not all of them are Negroes, nor industrial émigrés from the North. Suspicion even exists that such natives as Mr Byrd of Virginia have a working understanding with them.

Mr Hugh Scott, former chairman of the Republican National Committee, born in Virginia, recently made the charge that his party in the South is run by "hard-bitten professionals who sell the party down the river for patronage, power and personal advantage," and named Alabama as a typical example. It is common knowledge that Republicans by the thousand vote in Alabama for Democratic candidates, and that no Republican runs for office there with zest. It is even suspected that Senator Taft himself has no enthusiasm for altering the *status quo*, since he has for years controlled southern delegates at Republican national conventions, and a reinvigorated Republican organisation in the South might endanger these pocket boroughs.

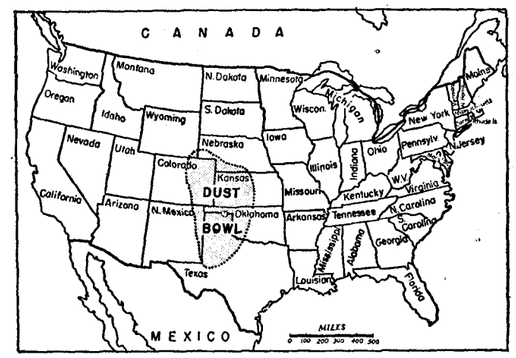
★

The divisions among Republicans are hardly less chaotic than those of the Democrats, and in recent months Republicans have become quite as outspoken. Mr Scott's outburst was directed in part against Mr Taft by name, Senator Margaret Chase Smith of Maine presented the protest against McCarthyism on the floor of the Senate itself, yet all of them are staunch Republicans. Mr Gabrielson, the official chairman, is a Republican of 1908 vintage, who deprecates everything that has happened since. It is not impossible that he finds Senator McCarthy's witch-hunting useful in rounding up the Republican troglodytes. Governor Dewey of New York is a Republican who knows not only that many things which have happened since 1908 cannot be corrected, but also that the party's interests do not end at the water's edge, and that things said in Washington are audible in London, Paris, Berlin and Moscow. Mr Robert Alphonso Taft, as Mr Alsop brilliantly revealed in a piece called "Robert and Alphonso," is a split personality, who habitually takes at least two opposing positions and spends his time making them both sound reasonable, until the listener tries to put them together. Mr Taft is a moderate conservative in domestic affairs, an isolationist abroad. And then there is the California Republican, Governor Warren, who embraced all this and Democracy too when he ran on both party tickets in the recent primaries.

The situation in California is typical only in the sense that it shows what can happen when intra-party control gives way to inter-party agreements. Ever since the first decades of the century, when the liberal forces there rose up against the political domination of the Southern Pacific Railroad, California has proclaimed its belief that the man was more important than the party. Candidates are therefore allowed to run not only on the primary ballot of their own party, but also on that of their opponents. This is heresy to the more hide-bound party members in other parts of the country.

These critics see in the growing tendency to stray from the political fold the breaking up of the two-party system. They claim that responsible party government in the United States has become a fiction, and that Congressmen, like Cabinet officers, once in office, become satraps building empires on their own accounts and giving only lip service to party programmes and purposes. The Democratic whips had recently to remind the southern Democratic Senators who, through seniority, monopolise the Committee Chairmanships when their party is in power, that they might lose these valued posts if they continued to disregard the interests of their northern colleagues. At stake was the Rent Control Bill, which is of great importance to Democrats representing urban districts.

The two-party system, however, has an extraordinary resilience, and while it does from time to time give off a new shoot, that moment has not yet arrived. The party which has been in power "too long" (and "too long" is a relative term) is always subject to charges of neglecting the public interest for its own; the party out of power usually looks as flabby, indecisive and lacking in sense of direction as the Republicans appear to the Democrats to-day. Finally, a weak President, whose affability is interrupted only by stubbornness, gives lesser aspirants the chance to occupy the spotlight, make their own mistakes, conduct their own circuses, and exhibit the party bag of political tricks at its most threadbare. But if the delicate health of the two-party system must not be over-emphasised, neither can one disregard the frictions arising under single party domination not only in the "solid South" of the Democrats, but also in the northern States that for many years were almost as solidly Republican.



"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Dust Bowl Again

The winds blowing across the great plains during the last few months have been laden with good top soil and with memories of the dust bowl of the nineteen-thirties. In this area at the foot of the Rocky Mountains, where the average rainfall is less than 20 inches a year, a nine months' drought, the worst in a decade, has killed off much of the winter wheat crop that should hold the soil from blowing away. So far this spring only about 2½ million acres have been damaged by wind erosion, but another year of inadequate rainfall could make an ominous situation critical. During the wet and prosperous 'forties, farmers had no time, and no obvious need, to take the advice of the agricultural experts; now they are once more coming into their own.

The immediate remedy is to start cover crops where grain plantings have failed; where they are fit to harvest, stubble

must be left long enough to hold the soil (8 to 12 inches). Looking further ahead, much can be done by better tillage, new types of machinery, water conservation and improved crop rotation. The long-term solution is to return to grass the two million or more acres of unsuitable soil that have been ploughed up in the past ten years. But once this arid, sandy land is dry, it is almost as difficult to grow grass as wheat on it. Nor does the grain farmer have, or want, the livestock and capital equipment necessary to make grassland a paying proposition at present.

Stockfarming has even less appeal for the absentee "suitcase" farmers, the speculators who ploughed up much of this marginal land under the influence of high prices, made profits equal to their original investment several times over and are likely to abandon their farms when they cease to pay. It was on abandoned land, overcultivated and then

WORLD-WIDE COMMERCIAL BANKING

deserted by farmers who could not make a living off it in the depression, that the dust storms started in the 'thirties. Few of these speculative farmers co-operate in soil conservation schemes, in spite of the rewards which the government offers to those who do. They are encouraged in their soil-destroying practices by another form of government reward, the high prices guaranteed for wheat.

Congress has just, after some delay, given the Commodity Credit Corporation the additional $2 billion in lending authority which it had requested to enable it to carry on its price supporting operations this year. Nearly all its existing authority of $4,750 million had been committed by the beginning of April, but from the latest crop reports it looks as if some of these funds may be redeemed before long. For example, the export demand for wheat may have to be met in part this year out of reserves; at present this summer's harvest is estimated at only 945 million bushels, the smallest in seven years. The winter wheat yield has been lowered by drought far beyond the developing dustbowl.

* * *

Oil Under the Sea

Texas has lost its constitutional argument with the United States. Three years ago the Supreme Court ruled that the federal government had "paramount rights" over the oil and other mineral resources lying between the low-tide mark and the three-mile limit—resources that the few fortunate States were busily and profitably exploiting. Texas and Louisiana at once claimed special status that rendered them immune from the decision. Louisiana argued that its sea-ward boundary, at the time it became a State, had been fixed at nine miles out; Texas invoked its ten years as an independent power, and pointed out that the Treaty of Annexation under which it became a State provided that Texas should retain title to "waste and unappropriated land."

The Court had little difficulty in deciding that Louisiana fell in the same category as California. On Texas, the decision was a narrow one, four to three. But the majority argued that the United States admitted Texas on an "equal footing" with her sister States, and that this ruled out any special privileges. What effect this may have on Texas' treasured, though never exercised, right to subdivide into five States is a constitutional footnote that has not been written.

The effect of the decision is to cast Texas and Louisiana into the Congressional limbo in which California has existed since 1947. The Court's decisions do not give the United States legal title to these disputed miles of sea bed—wrongly referred to as "tidelands"—and they do not prevent Congress from deciding to validate the claims of the States; they merely make it plain that Congress has the constitutional right to reach what decision it chooses. Texas and Louisiana still look to Congress to save them from the Court, and Texas makes much of the fact that the revenue from underwater oil leases pays for its school system. But despite the activity of the advocates of States' Rights, Congress has not been able to summon up enough voters to override Mr Truman, who in the past has prevented the legislators from giving back to the States the properties the Supreme Court has all but declared national. On the other hand, the Administration's supporters cannot push through a Bill authorising the federal government to take over the granting of leases and direction of development. California, under an agreement with the Attorney General, is continuing to grant leases and receive rentals, although the money so received cannot be spent. It is not expected that at this late stage in the session, a Bill reasserting the rights of the States can be passed, despite the indignation of Senator Connally, and the pressure of Mr Rayburn, the Speaker of the House, both from Texas.

California, Here They Come

Out of the confusion of California's primary elections have come candidates for Governor and Senator who will present the voters with a clear choice next November. The two Democrats are even Fairer Dealers than Mr Truman; their opponents are both above the Republican average. Mr Warren, the Republican Governor who hopes to succeed himself, is respected for his achievements, Mr James Roosevelt, the Democratic candidate, for his father. He, of all men, will hardly be able to make capital out of the fact that Mr Warren is the first Governor of California to seek a third term. Mr Warren accuses Mr Roosevelt of irresponsibility, of promising the millenium if he is elected; but Californians have never found it difficult to believe that the millenium is at hand. Representative Nixon, the Republican candidate for Senator, is one of the few whose reputation has been enhanced by membership of the Un-American Activities Committee; his part in bringing Mr Alger Hiss to trial will be a great asset in the present anti-Communist atmosphere. However, it is not he, but one of her Democratic rivals, that has been trying to pin the Communist label on Representative Helen Douglas, the other aspirant to succeed Mr Downey, the retiring Democratic Senator. During their terms in the lower House, she and Mr Nixon have taken opposite sides on every important issue.

Mr Roosevelt has been called "a chip off FDR." No one suggests that he is a replica of the whole block, but he had enough of his father's personality and political ability to keep Mr Warfen from repeating his 1946 feat of gaining the Democratic as well as the Republican nomination. The Governor nevertheless managed to win over 600,000 Democratic votes, mostly in his own San Francisco area, and his total of 1,600,000 in the primary compares with only 950,000 given to Mr Roosevelt. Mr Nixon also collected a sizable number of Democratic votes, but the Democratic organisers bravely maintain that, if there is a heavy poll in November, the obvious appeal which the Republican candidates have for conservative Democrats will help them very little. A visit from the President would, it is thought, do a great deal to get out the Democratic vote, but Mr Truman's memories of Mr James Roosevelt's faithlessness in 1948 may be stronger than his desire to see Mr Warren beaten.

*

In Iowa, a State even more accustomed than California to turn Republican in a non-presidential year, Mr Truman has no reason to hesitate before repeating the intervention which in 1948 unexpectedly swung the State to the Democratic side, and every reason to hurry to the aid of Mr Loveland, until recently his Under-Secretary of Agriculture. Mr Loveland is expected to stand almost entirely on one of the most controversial planks in the Fair Deal platform, the Brannan plan for a new method of supporting farm prices, in this agricultural State whose farm leaders head the opposition to the scheme. Mr Truman's readiness to help Mr Loveland will be fanned by the fact that his Republican opponent, given five times as many votes in the primary, is Senator Hickenlooper, who last year ignominiously failed to smear the Atomic Energy Commission with Communist paint, but is now backing Senator McCarthy in his efforts to do the same to the State Department.

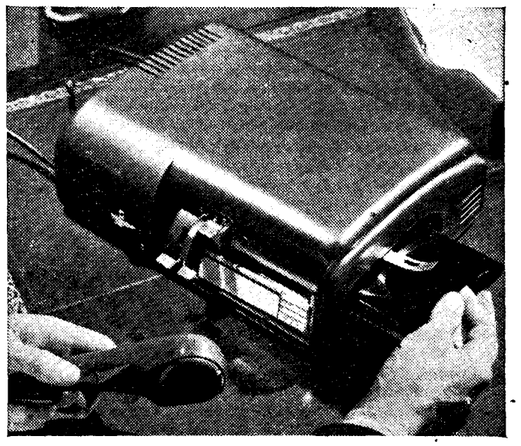
Rubber Rises

In the folklore of the American business world, imperialist rubber producers exploited America's dependence on rubber tyres for its livelihood. The war liberated the United States from this reliance on a legendary foreign monopoly and the State Department is understandably worried when the doubling of the price of natural rubber

encourages the revival of a dying prejudice. Of more immediate concern is the long-term effect which these price rises may have on hopes of a permanent increase in the dollar earnings of natural rubber. Until now, as far as can be judged from available figures, the rise in total consumption of rubber this year (it is running at least ten per cent above 1949) has been so great that the amount of natural rubber used has not fallen seriously. But the proportion of synthetic in comparison with natural is climbing steadily, although it is still only about one-third of total consumption.

When the fixed price of domestically-produced synthetic rubber (18½ cents a pound) was higher than that of natural, it was not difficult for the government to hold synthetic production down to only a little above the level required by considerations of national security. But with natural rubber selling at about double the price of synthetic, the pressure of demand is pushing output at the government-owned synthetic plants up from 19,000 tons in January to an anticipated 35,000 tons in July. If the shortage of benzol can be overcome, production from these ten plants is likely before long to be at an annual rate of 500,000 tons, which would meet about half of American requirements for rubber. The government is, however, refusing to bring any of its five stand-by plants back into operation, as the rubber manufacturers ask, unless there is some guarantee that demand will continue at present rates for at least a year. It seems possible that it may, for business prospects are becoming steadily rosier and an unheard-of number of new automobile wheels are needing tyres.



The Rubber Reserve Corporation's reluctance to go to the expense of taking its plants out of "mothballs" is because the price of 18½ cents (which it does not seem to consider increasing) is profitable only when plants are working near capacity. At the present rate of output, the Corporation can apparently meet current demands from old customers, but is refusing to supply firms who only became interested in synthetic as the price of natural rubber went up. Such firms are likely to decide that it would be wise in future to keep a foot permanently in the synthetic door. Some manufacturers are urging the government to build up a reserve of 200,000 tons of synthetic rubber, as a safeguard against future crises, whether market or military.

The present international situation, and particularly the Communist threat in the rubber producing areas, is the reason given for Congressional reluctance to hand America's only nationalised industry over to private ownership, as the government has asked. The Senate Armed Services Committee has now recommended, and the Senate is expected to take the advice, that the present law, under which synthetic rubber plants are operated by private companies on behalf of the government for a fixed fee, should be continued, but only for two years, not for the three that the House has approved.

Shorter Note

Largely as the result of the last minute success of the Citizen's Committee for the Hoover Report in mobilising public opinion behind the President's plans for governmental reorganisation, 16 of the latest batch of 21 plans have gone through. About 35 per cent of the Hoover recommendations have now come into effect. The Senate had earlier refused to allow the centralisation of authority in the Treasury and the Department of Agriculture which it permitted in the Departments of Labour, Justice, Commerce and the Interior. Similarly it refused to give the chairmen of the Interstate Commerce and Federal Communications Commissions administrative powers which it has granted to the chairmen of the Federal Trade, Federal Power, and Securities and Exchange Commissions, and of the Civil Aeronautics Board. The other plans that have now been accepted deal with the Labour Department and the General Services Administration.

The TIME-MASTER
SMALLEST-EVER DICTATING MACHINE!

Slip in a MEMOBELT, on with the switch and you're set for 15 minutes perfect recording

DICTAPHONE now brings you the latest and best in office dictating machines. It's the new TIME-MASTER, the smallest-ever machine *because it records on plastic Memobelts!* No discs, no cylinders — just expendable plastic belts that give perfect, crystal-clear recording.

Easy to use. Just think out loud — the Time-Master does the rest. You can record any notes, letters or sudden thoughts without calling for your secretary. When most convenient, she transcribes easily from the perfect recording of your words.

Memobelt — smallest, low-cost plastic medium. The plastic Memobelts slip in and out of the machine in a second. They carry on the tested Dictaphone principle of cylindrical recording; that means constant speed, constant quality recording AND uniform back-spacing. And Memobelts are so small, they can be sent by post in a standard envelope — up to ten at a time for a 2½d. stamp.

Only the Time-Master offers all this!
1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back-spacing, rapid place finding. 4. Simple, automatic operation. 5. Mailable, filable, expendable Memobelts low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd. (Dept. O), 107 Kingsway, London, W.C.2.

THE WORLD OVERSEAS

Recovery in Sweden

(From Our Special Correspondent)

EVEN its fiercest critics are beginning to concede that the economic policy of the Swedish Government is proving less disastrous than they had expected. The mere visitor to Sweden is impressed by the obvious soundness of the country and the steady rhythm of recovery: industrial production in 1949 was 50 per cent higher than in 1938, a figure surpassed only by Canada and the United States. Of course, as the Swedes are not slow to point out, they have little to recover from. Yet so familiar are the problems which the framers of Sweden's postwar economic policy must face and so similar their policies to those of other countries—and especially Britain—that this different background is sometimes overlooked.

It is now beginning to assert itself. The reserves of strength in an economy which was strained, but not damaged, by the war become apparent when one is shown costly and ingenious machines built as late as 1945 and told that they are soon to be scrapped as obsolete. This represents a luxury of capital investment unthinkable for countries whose savings have been shot up into the air—or shot down from it.

Both in this respect, in its virtual self-sufficiency in food and in the ready market enjoyed by its staple products, Sweden is in a strong position which ingenuity and diligence enhance. The attitude of the trade unions towards productivity affords an example of enlightened alertness which could well be imitated in other countries. It was the unions, for example, that insisted on the provision of fiscal incentives to plough back profits into industry. Their argument was simply that industry could be kept more efficient in that way and, being more efficient, was more likely to make larger profits, of which the unions would see they got at least their share. A similar line of thought has led to the widespread adoption of piece-work; it applies to more than half of all industry. Nor are the employers backward in their efforts to increase efficiency.

The result is that, after a period of difficulties caused partly by war, partly by faulty financial policy, Sweden is well on the way to achieving a balanced economy. The general development of trade, with its main trading partners in the last three years, is shown below:

DEVELOPMENT OF SWEDISH TRADE 1947–49
(Million Kronor)

	1947		1948		1949	
	Imports	Exports	Imports	Exports	Imports	Exports
United States	1,631	348	692	292	415	248
United Kingdom	441	490	860	671	746	727
West Germany	106	19	96	134	279	315
TOTAL, all countries	5,175	3,220	4,945	3,979	4,334	4,250

It can be seen, however, that the improvement shown in these figures is more the result of restrictions on imports than of increased exports: last year's imports in fact were only 90 per cent of the 1938 figure. And the black spot, as in similar tables for other countries, is the failure to increase significantly exports to the United States. The strong demand of a home market based on full employment also limits exports. But it should be added that the wartime drive for greater self-sufficiency led to the expansion of certain industries—textiles, for instance—to a stage where their production noticeably reduces the need for imports.

The most serious factor is the shortage of Sweden's most important raw material, wood. Owing to a miscalculation of the rate of growth of the forests, more timber has been removed in the last twenty years or so than was replaced by the annual new growth. The result is that for several decades supplies will be limited—about 600,000 standards of timber compared with 860,000 prewar and about 2,500,000 tons of pulp and paper compared with 2,800,000 tons. It should not be difficult to dispose of this, but it would obviously be desirable in a sellers' market to have more to sell. On the other hand, there will certainly be difficulty in disposing regularly of the amount of pulp sold to the United States before the war: 742,000 tons, for instance, in 1938. After devaluation sales increased, so that 320,000 tons instead of an estimated 250,000 tons of pulp were sold in America. But this demand can be satisfied only at the expense of other customers.

More Manufactured Goods

With a limit to the raw materials available to the forestry industry, other branches of the export industry must increase their efforts if exports as a whole are to grow. This is happening. The revival of the Ruhr, which took nearly 9,000,000 tons of Swedish ore a year in the 1936-39 period, and the increased demand of a growing British steel industry have given a fillip to iron ore exports, which may this year approach the record figure of 15 million tons. But it is from manufactured goods such as ships, ball-bearings and electrical equipment that the main increase must come. Last year these types of goods accounted for 18 per cent of total exports compared with 14 per cent in 1936-38. Income from shipping, too, has increased. Sweden's merchant fleet is now over 2,000,000 tons, compared with 1,600,000 before the war. It is, moreover, the most modern in the world, with a large proportion of 15-knot ships and several of 20 knots. Net receipts from shipping in 1949 amounted to some 550 million kronor, the addition of which to the value of exports shown in the preceding table produces a very satisfactory figure.

These favourable developments are the background to the relaxation of import controls which have now been removed on goods which in 1948 represented nearly 54 per cent of Sweden's imports on private account from the ECA countries, although Belgium and western Germany are excluded.

The background to these favourable developments is the success of the Government's disinflationary policy and also, one might add, the admirable discipline of organised labour. The cardinal points of this policy have been price subsidies and frozen wages, the strict control of the prices of key commodities and services, and a high rate of capital investment on projects likely to increase export capacity. Price subsidies will end next January. Thus the negotiations this autumn of the collective contracts governing the rates of pay for each industry will certainly record increased wages all round. In its present vigour the Swedish economy can easily bear them.

Thoughts Behind the Schuman Offer

[FROM OUR PARIS CORRESPONDENT]

WHILE the Ministry of Interior has been keeping order, the Ministry of National Defence laying the foundations of the new army and the Ministry of Finance and Economic Affairs strengthening the franc, the Foreign Office has chiefly devoted itself to its one overriding task—the settlement of the German problem. In this activity M. Schuman has come into closer and closer touch with France's other main extra-parliamentary planning body, M. Monnet's Commission for Modernisation and Re-equipment. As the world knows, the fruit of the co-operation of these two men and certain other ministers and high civil servants is the Schuman proposal.

After a rather melodramatic month of Franco-English journalistic discussion, terminated by last week's diplomatic tennis match, it is perhaps worthwhile recalling the main attitude of French governments towards Germany and the character in French eyes of the German problem itself. For the impassiveness of M. Schuman's front in face of Dr Adenauer's regime (for instance German truculence over the Saar drew the mildest of French ripostes) and the idealism of the pool proposal itself have somewhat obscured the extreme apprehension of the French government concerning the turn of events in Germany since the Petersberg agreement. In other words, the pool is regarded by these Frenchmen as Europe's last chance of solving the German problem.

As is frequently pointed out, the German problem for France differs in proximity and intensity from the German problem for the British and Americans. For, although all three nations wish both to prevent future German aggression and to use the German economy for western European ends, it is only France which is still unshakably persuaded that no military control of Germany is ultimately possible unless its heavy industry is removed once and for all time from German national jurisdiction. No other measure will, the French believe, safeguard Europe from the essentially volcanic nature of Germany as a community, which derives from three immutable factors; its psychology, its resources and its geographical position. The Communist *Bereitschaften* and the mass demonstration of youth at Whitsun are more significant in French eyes than all the acts and aspirations of western German democracy in its present context. "It is only the colour of the shirt that has changed."

Politics—Not Economics

For M. Schuman the vital consideration is, therefore, not so much the economic benefits from the abolition of dual pricing of coal and the many other irrationalities of investment and production which hamstring European recovery. Much more important is the whole principle of the independent authority which he has proposed, a political innovation which he believes capable of transforming the very atmosphere of German public life. It was this ideological side of the venture to which Britain was asked to subscribe. Britain was asked to recognise that the sole means of integrating Germany into Europe lay in establishing the pool, in which there would be no more British, French or German coal and steel but only European coal and steel; which would be a fund of European resources controlled, perhaps, not even by nationals of the participating countries. French spokesmen particularly stress the non-technical character of the pool's administration. The board of from 6 to 10 directors would be men such as Sir Oliver Franks or Mr Lilienthal. (Base metals, it is suggested, are much less mysterious than atomic energy. So why shouldn't a don or a lawyer be put in charge of them?) The sole obligation of these directors—who, once nominated, would be answerable to no single government—would be to act in the collective interests of the participating nations. The governments would commit themselves by treaty to obey them.

French opinion has not yet really fathomed the political meaning of the government's proposal, which is chiefly discussed as a purely economic measure. In so far as the independent authority is looked at intrinsically, it is seen mostly as a Franco-German agency in which the Germans would somehow or other gain the upper hand. Apart from the Communists, the main doubts have come from the Socialist Party—which, most of all, has demanded the inclusion of Britain in the pool as a security measure—and from the RPF Gaullist spokesmen who, while also expressing grave distrust of any Franco-German joint venture in France's present state of "weakness," are not surprised by the British refusal to commit themselves to the French objectives. They believe that Britain's interest in Germany is exclusively strategic, and that the economic sacrifices that participation would obviously entail for Britain would far outweigh the vague and sporadic fears about the political fate of the continent. For the Gaullists, the one immediate necessity is to give France a strong government, so that it may launch a far larger plan of European defence—an activity in which Germany would be the subordinate. In its present "chloroformed" condition France, in their view, is quite unable to organise a European economic authority or enforce its will.

De Gaulle in the Wilderness

There is doubtless truth in the assertion that Europe cannot be united by government pronouncements and the mere establishment of "independent" machinery. For, since the independent authority will require the parent nations to enforce its will, it takes a strong government—not a weak one—to delegate authority over vital matters of national existence. But M. Schuman appears to be a more realistic propagandist of Europe than General de Gaulle to the extent that he, a minister in office, has proposed a new mode of supra-national executive action, while the General is still harping in the wilderness on the future national role of his own country. This role has, however, a rather too military colouring for 20th century national consumption. Is it impossible that France's European and domestic lives will in some way be entrusted to different types of leadership?

Prospects of Greek Recovery

[FROM AN ATHENS CORRESPONDENT]

AT the end of the second Marshall year economic conditions in Greece are still deeply affected by the strains and stresses of the last ten years. American aid enabled the level of aggregate real consumption to increase slightly during the last two years. According to unofficial estimates, real wages in manufacturing industries approached 75-80 per cent of their prewar level, but living conditions in the agricultural areas are very bad and much worse than before the war. The average real earnings of the civil servants are about 50 per cent of their 1938 level, and real earnings even before the war were very low indeed.

According to the official estimates, the volume of gross home investment during 1949 reached the 1938 level, and it appears that replacement and repairs of the main losses of the last ten years will be soon completed. But the rate of progress of the main projects of productive development, which will make possible the necessary improvements in living conditions, was very slow during the last two years. The civil war absorbed a great part of the national effort and resources as well as of the drachma counterpart of Marshall Aid, and the civil strife and the very low level of pay of the civil servants intensified the disorganisation of the state administration, already paralysed by the occupation. The inadequacy of the governments of the last four years

contributed to this administrative inefficiency; for most of them were composed of politicians brought up in an attitude of *laisser faire* and the practice of unco-ordinated measures of economic policy. Lastly, apart from the burden of military expenditure, government finances are also inflated by the increased number of civil servants, which in its turn further contributes to the inefficiency of the administration.

Recovery of Production

Although the threat of inflation, with its distorting consequences, has not disappeared, the excessive inflation of the occupation and of the first post-liberation years came to a halt during the second half of 1949. This was achieved by increased home production, reaching on the average 80 per cent of the 1938 level, and by securing a fairly steady flow of imports, mainly of foodstuffs and other essentials. The latter, however, were paid for almost up to 70 per cent by American funds. During 1949 the total volume of imports approached the 1938 level although the composition of imports has changed compared with prewar because of the larger proportion of capital goods being imported for reconstruction purposes.

To a very large extent the low level of Greek exports is due to the loss of the German and east European markets, which together absorbed in 1938 more than 50 per cent of Greek exports. The volume of Greek exports to the United States is halved compared with prewar, and Britain is the only major market in which the 1938 level of imports from Greece has been re-established. Throughout the interwar period the chief Greek export was tobacco, which accounted for more than 45 per cent of Greek export earnings. More than 20,000 metric tons of Greek tobacco (more than half of Greek tobacco exports) went to Germany and central Europe. High costs, because of inflated prices at home, and the continuing overvaluation of the drachma, despite the exchange rate readjustment of last September, constitute serious additional difficulties. The Government is taking action to reduce costs at home and to compensate producers for the difference due to the high external value of the drachma. But unless the central European, particularly the German, market for Greek tobacco is re-established the prospects of recovery of Greek exports are remote.

Delays in Economic Plans

The balance of payments difficulties, together with the acute pressure of over-population and under-employment, indicate that Greek economic development should aim at an increase in the output of home agriculture and manufactures in order to reduce import requirements and diversify exports. These aims are embodied in the successive Greek programmes which have been submitted to the Organisation for European Economic Co-operation and were in principle accepted by the American authorities. But lack of agreement between the Greek and American authorities on the details of the industries which are to be established or developed is delaying the fulfilment of the programme. The complications of a bureaucratic administrative machinery, together with the lack of central economic thinking and effective co-ordination, contribute to these delays. According to the latest official estimates, up to December 31, 1949, only 50 per cent of the total expenditure planned both in foreign exchange and drachmas, for reconstruction purposes for the first two Marshall years, was executed.

The backbone of the Greek development programme is the exploitation of the hydro-electric potentialities of the country. These must be combined with large scale irrigation works which, in combination with projects of land development, would increase by more than 20 per cent the volume of agricultural production by 1952. The major increases are expected in cotton, potatoes, rice and wheat, and will accordingly reduce the great dependence of Greece on imported foodstuffs and raw materials. The programme should more than double the supply of electric power and will allow a substantial reduction in coal and fuel requirements. It appears that most of the preparatory technical work is at an advanced stage and has been agreed by the ECA authorities; actual execution will probably start before the end of 1950.

The large deficit in the government finances is a great drain on the national resources and a constant source of inflationary pressure. Government expenditure during the current fiscal year, ending June 30, 1950, was estimated at about 5,750,000 million drachmas.* This figure corresponds to 30 per cent of the value of the national product in 1949 and compares with the corresponding proportion of 21 per cent in 1938. About 35 per cent of total government expenditure is for military and security expenses, and more than 10 per cent for the relief and rehabilitation of the refugees.

Government revenue from all sources during the fiscal year 1949-50 was estimated at approximately 3,900,000 million drachmas with an expected deficit of more than 1,700,000 million drachmas. This had to be covered almost entirely by the drachma counterpart funds of Marshall Aid; and the absorption of more than 40 per cent of these funds by the Government deficit imposes corresponding restrictions on the level of investment for development projects.

No Reductions in Defence

It appears that great efforts are being made by the new Minister of Finance, Mr G. Kartalis, a man of energy and ability, to reduce the deficit in the new budget which is being prepared. It is generally agreed that effective defence forces must be kept to deal with any new threat from Communist guerillas. It is therefore unlikely that substantial reductions in the defence budget will be possible. The Government hopes that the American authorities will allow it to be treated separately and that additional military assistance will be given under the general arrangements for European defence. Reductions in government expenditure are being sought mainly in decreasing imports and subsidies and expenditure on the refugees. If the civil administration were drastically reorganised probably half the number of present civil servants would be adequate, and much more efficient. But any such reduction would have to be combined with substantial increases in the pay of those who remain and with the provision of ready opportunities of re-employment for the rest.

Increases in government revenue are expected mainly from the prospective rise in the national income and by taking severe measures against tax evasion. The recent steps against the shipowners who owed tax arrears have already shown their first results. Out of the $10 million which were due, $3,000,000 have already been collected and the balance will be paid in agreed instalments. Also, of the 200,000 million drachmas of expected revenue from the levy imposed in February, 1949, on the wealthier taxpayers, 110,000 million has been collected and revenue from this source will probably rise to 130,000 million drachmas. It is estimated that total Government expenditure during the next fiscal year will not be less than 5,000,000 million drachmas of which 2,000,000 million drachmas will represent military expenditure. Government revenue is expected to be about 4,000,000 million drachmas.

It is generally realised that substantial advances must now be made in the Greek development projects. So far there has been a gap between the general directives of action embodied in the reconstruction programmes and the machinery for their fulfilment. The new Government, particularly the Minister of Co-ordination, Mr Tsouderos, have been taking stock and it appears that plans for the reorganisation of the administration are being worked out and that some good progress in reconstruction may be expected in the coming months. The prospects of improvement entirely depend on the way in which the three Coalition parties and their leaders work together.

British Airmanship

SOMETHING TO BE PROUD OF

The past 31 years have seen not only the development of British airlines from the first London-Paris service to a vast network covering nearly 70 countries, but also the steady maturing of something beyond machines and scientific progress. Throughout Britain and the world this has come to be known as British Airmanship and already it has earned a significance comparable with that which traditionally attaches to British Seamanship.
British Airmanship sums up the reputation for skill, enterprise and reliability which in just over a generation of air travel has become inseparably associated with British airmen — something, indeed, to be proud of.

NICKEL AND OUR COAL

Do you know that nickel plays a vital part not only in the production of coal but also in its conversion to light, heat and power? The cutters, conveyors and miners' lamps that are used in the mining of coal, the railway engines and the road vehicles concerned in its distribution, the plants converting it to steam power and electric current—in all these, nickel is present, toughening and strengthening the metals used in their construction, making them staunch against the attacks of wear, corrosion and heat.

Thus nickel is contributing to the efficiency of the tools and equipment with which Britain is achieving her recovery.

SIMON ENGINEERING GROUP

Two important innovations—the by-product coke oven and automatic roller flour milling—were introduced into Britain seventy years ago by the late Henry Simon, founder of the Simon Engineering Group. To-day Simon-Carves are among the largest international coke oven builders, and Henry Simon—the world's largest milling engineers—have been called by a Canadian miller "the recognised world authority on the art of modern flour milling practices." In their other specialities—notably power stations, coal cleaning plants, sulphuric acid plants, granaries and grain handling equipment—the Simon companies have likewise done much pioneering work and are among the acknowledged international leaders.

BRITISH BANKING SURVEY

The following three articles form the first part of the extended and remodelled postwar version—introduced in May, 1949—of The Economist *Annual Survey of British Banking. Owing to the continued refusal of overtime working by members of the London Society of Compositors, it has unfortunately proved impossible to arrange, this time, for simultaneous publication of the associated 16-page special selection of British Banking Statistics in the* Records and Statistics *Supplement; it is hoped to publish this in next week's Supplement.*

A parallel editorial survey of Foreign and International Banking, and an associated statistical selection, will be published next autumn.

Changing Patterns in Domestic Banking

BY contrast with the exciting happenings on the external front of Britain's finances, the trends on the domestic front often appear staid and uninteresting. Especially in its banking sector, they nowadays receive a good deal less attention than they deserve. This makes it more than ever desirable to devote part of these Annual Banking Surveys to a little reflective retrospection. It is certainly a rewarding exercise this year, for the patterns of domestic banking have altered more strikingly in these past twelve months than in any previous postwar period. The changes also present an intriguing paradox. For some time past, the principal active influence upon the banking structure has been the demand for advances, traditionally the least liquid of the banks' assets; and since the autumn of 1949 advances have been expanding at an unprecedented rate. Yet the technical flexibility of the banking system, so far from diminishing, has markedly increased—and is also now without precedent in modern times. The third outstanding characteristic of the year is that these two major changes—the growth of bank advances on the one hand, and the simultaneous growth in the supply of liquid assets on the other—have been taking place within an unaltered framework. That is to say, there has again been very little change, on balance, in the total volume of outstanding bank credit.

In the twelve months to May 17th—the latest "make-up" date for which figures are available—the net deposits of the London clearing banks dropped by £40 million, to £5,649 million, a figure that diverged by no more than £7,000,000 from the total for May, 1948. If the figures for April were taken as the basis for comparison, the net change over twelve months would be only £2,000,000, and over two years £11 million. This two-year steadiness has led some observers to regard the first Crippsian budget as a watershed in postwar credit topography, sharply dividing the aggressive credit expansion of the Daltonian regime from the phase of stability and incipient contraction. The implication is that disinflationary budgeting brought with it a circumspect monetary policy that ensured an equilibrium in the volume of money. Closer scrutiny shows this to be too naïve a view. In the first place, it needs to be emphasised that stability of bank deposits is not, in itself, evidence that a disinflation policy is succeeding in its wider objects. The reasons for this caveat have often been explained in these columns (see, for example, last year's Annual Banking Survey), and need not be detailed again now. Briefly, the object of a disinflation policy is to ensure that sufficient savings are created, without the aid of inflation, to meet the community's need for finance. But the fact that the need is met without any net creation of new credit by the banks does not of itself prove that the savings generated outside the banking system have not been partially stimulated by inflationary pressures.

Secondly, a stable level of deposits is not of itself conclusive proof even of the circumspectness of monetary policy in its more limited sense. The relative stability in 1948-49 in fact concealed a substantial effective increase in the volume of money, because a large amount of credit created just before the beginning of that period (for the Argentine rail purchase operation) became available for public use only gradually during the course of the year. Except for a brief distortion caused by the shifting of foreign balances before the devaluation, no comparable influences have been at work in the past year. It can fairly be said, therefore, that 1949-50 was the first postwar phase of effective monetary equilibrium.

The ability of the banking system to meet increased demands for advances over a period in which the total volume of credit, so far from continuing to rise, has actually shown a small net decline, is attributable, of course, to the fact that the Government has been reducing its own demands upon the banks. In this technical sense at least, the policy of disinflationary budgeting has worked according to plan. In 1949-50, the central Exchequer again secured an "overall" surplus, and although this was appreciably smaller than that for

1948-49, a moderate part of the difference was made good by an increase in the surplus of the social insurance funds (to £157 million), thanks to the fact that the National Insurance scheme operated for its first full year. On the other hand, the sterling accruing to the central government from external sources must have been appreciably less than in the previous year. For the calendar year 1949 the net deficit on the balance of external payments as a whole was estimated at £35 million less than that for 1948, and the difference probably becomes rather greater than this when the comparison is shifted forwards to annual periods ended in mid-May.

These three factors taken together explain why the central government was able during 1949-50 to reduce still further its indebtedness to the banking system, but they do not explain why the repayments should have been substantially larger than those made in the previous year. To measure the extent of these repayments it is necessary to assume, first, that increases in the banks' advances and investments, taken together, represent finance provided, not for the central government, but only for the private sector of the national economy and for such public bodies (e.g., the British Electricity Authority) as borrow direct from the banks; and, secondly, that no bank finance for the private sector is provided by other means. On these assumptions, which are only approximately correct, fluctuations in the central government's requirements for bank finance are indicated by the changes in other bank assets considered as a whole—i.e., Treasury deposit receipts, money market assets and cash.

On this basis, as Table I shows, governmental repayments amounted in 1949-50 to no less than £256 million, in contrast with only £75 million in 1948-49 and with net borrowings of £14 million in 1947-48. In view of the decline in the resources available from the budget surplus and from external sources, the new equilibrium in bank deposits is quite evidently attributable not to the disinflationary policy alone but also to the pursuit of a more restrained monetary policy. In 1948 the authorities even lacked the courage to restrain an irrational rise in the gilt-edged market, whereas in 1949 they realised the dangers of trying to resist a steep fall. With this gilt-edged background in mind, the implication to be drawn from the figures is that in the past year the authorities have tended to concentrate their available cash resources rather upon repaying active indebtedness to the banking system than as a means of adding to their holdings of longer-term securities.

Especially because monetary policy seems to have played so large a part in the past year, it is rather questionable whether the volume of money can be as effectively stabilised in the coming year. As an article on page 1350 shows, it is doubtful whether the authorities, in the current fiscal year, will have any net cash available for repayments to the banks. In these circumstances, the movement of deposits may be governed much more closely by the trend of advances. In the past six months, as the accompanying figures illustrate, these have been rising at a greater average monthly rate than at any previous period of British banking history:

(£ Million)	1946/7	1947/8	1948/9	1949/50
May–November	+107	+105	+17	+46
November–May	+135	+129	+85	+165

Last month, it is true, there was some slackening of the rise, chiefly because of the repayments made by the

BEA out of its initial receipts from the new loan. But, although there are likely to be further repayments of this kind, both by the BEA (from the successive calls on the loan) and by other borrowers now awaiting a chance to approach the capital market, there is no doubt that the rise in aggregate advances will continue. The best that can be hoped is that it will be less pronounced than in the past six months, during which the economy has been adjusting itself to the higher level of raw material prices resulting from devaluation and from the American boom.

Although continuing demands for advances may provoke, over a period, some renewed expansion of deposits, there is no possibility that they will impose any strain upon banking flexibility. Had the Treasury maintained the former disposition between Treasury deposit receipts and bills, the swing of bank finance from Government to private borrowers would certainly have reduced banking liquidity. But, thanks to the official policy of combining debt repayment with a massive switch from TDRs to bills, the banks' ratio of flexible assets to deposits has been greatly enlarged, as Table II shows. The advances ratio has risen during the past six months from 24.3 to 28.0 per cent of deposits, compared with 15.5 per cent at the end of the war. Yet the ratio of money market assets has risen over the year from 22.3 per cent to the unprecedented level of almost 30 per cent, in contrast with a mere 6½ per cent at the low point in 1945. In consequence, the inflexible assets—advances, investments and TDRs—now stand at the unnaturally low proportion of under 60 per cent, compared with an equally unnatural peak of 82 per cent in 1945 and with a prewar norm of 70 per cent (when, of course, there were no TDRs, but advances stood much higher).

In one important respect these striking changes represent a welcome move towards normality, in that the sweeping reduction in TDRs gives to the banks, considered individually, a much greater freedom to determine for themselves the disposition of their assets. But, since the glut of liquid assets is so unaccustomed, the City is still wondering why the authorities should have chosen to provoke it. Is it possible that they want the banks to venture still further into the gilt-edged market ?

Sterling's New Role in Europe

THE task of fitting the sterling system into a new European payments structure is going to present the authorities with some very difficult problems. Since sterling is used as a medium of exchange between European and non-European countries (including countries outside the sterling area), the compensation that is to be achieved through the European Payments Union will never be automatically self-balancing. Within a closed or complete circuit of monetary compensation—embracing, for example, only those payments arising from intra-European dealings as such—the total of the deficits would equal that of the surpluses. The adjustment would be precise, automatic and immediate. But since, for example, Belgium may be paid in sterling for its exports to Egypt (which lies outside both the EPU and the sterling area) and since Italy may pay in sterling for its imports from Siam (both countries are in the transferable account group), it follows that the periodic compensations operated by EPU will balance only if London itself completes the operation. After the transactions mentioned above, Belgium's increased and Italy's decreased holdings of sterling will be duly entered into the periodic compensations of EPU and will, therefore, affect the position of those countries (and of Britain) vis-à-vis the Union ; but the final balancing will be achieved in London by book entries that will lie quite outside the EPU ; the net change in Britain's position vis-à-vis the Union will be offset by a writing down of Egyptian plus a writing up of Siamese sterling balances.

It is through the London banking mechanism, therefore, that the compensation will be completed. Similar action will be taken by all members of the EPU that have dependent or associated non-European territories adhering to their own currency areas, but none of them, of course, will have to face the same order of difficulties as the United Kingdom. There are three reasons for this. First, the sterling area is far more extensive than any other currency area. Secondly, sterling is used by many countries that lie outside both the sterling area and the EPU. Thirdly, the abnormal accumulation of sterling balances creates a difficult problem that does not affect other European currencies.

This last circumstance is of particular significance. If Britain's relations with the European Payments Union are not to be seriously embarrassed, considerable control will have to be exercised in the liberation of sterling balances. To the extent that they enter into European compensations and build up claims by EPU against Britain, liberated sterling balances will be converted into a form of obligation on which gold payments will sooner or later be due. The burden of Britain's sterling liabilities, and of the unrequited exports to which they give rise, is already heavy ; it will become heavier still if it leads to direct losses of gold. The acceptance by Britain of full membership of EPU might, therefore, be made yet another occasion for raising the question of a more even international distribution of the burden of Britain's war-accumulated debts.

Another important consequence of Britain's participation in the European Payments Union will be the need to renegotiate a large number of bilateral payments agreements with non-sterling countries. Britain has insisted that it should be entitled to make agreements with other EPU countries governing the extent to which the surpluses emerging from the periodic compensations would be held in sterling and also the extent to which comparable deficits could be met from existing sterling resources. Britain intends to negotiate agreements whereby net creditors in these periodic compensations shall hold in sterling such part of their surplus as arises in sterling—subject, however, to the credit limits that are agreed under the EPU scheme. This means that specific limits will now have to be set for overdraft facilities in all cases where the existing bilateral agreements provide either for an unlimited overdraft "swing" or, as in the one-way agreement with Italy, for accumulations of sterling by the non-sterling country but for no accumulation of the other party's currency by Britain. The obligation upon Britain to renegotiate these agreements will be welcomed by the Americans, who have always contended that the "unlimited swing" agreements have discriminatory effects in international trade ; such countries as Sweden and Italy, which have acquired substantial sterling balances on which no gold settlement has been due, have

Not all the gold is in Kalgoorlie

The many opportunities open to business men in Australia and New Zealand are far richer than the famous "Golden Mile" of Kalgoorlie, Western Australia gold mining centre.

The Bank of Australasia offers up-to-date information on prevailing market conditions to business men interested in trade in Australia or New Zealand. Write for our booklet "The Answers To Your Questions" which may be obtained from the Bank on request. It contains not only information concerning the commercial world but also more personal details about life in these two Dominions.

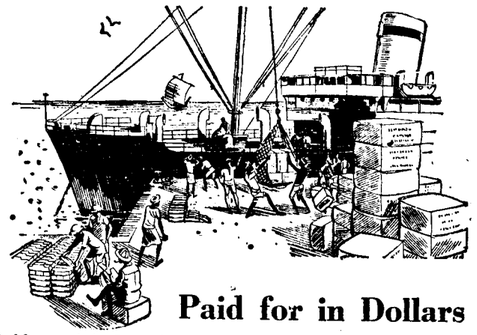
naturally tended to buy from any country that would accept their sterling, even if in doing so they failed to buy in the cheapest market.

The new bilateral agreements will also govern the use of "old" sterling held by EPU countries. At present the use of sterling held by European countries is regulated by the terms of the existing bilateral agreements; different facilities are accorded to those in the "transferable" and those in the "bilateral" account groups of the exchange control system. Britain is now prepared, as part of its responsibilities as a full member of EPU, to end this differentiation as between countries now to become participants in the EPU. Any net debtors to EPU in the periodic compensations that have accumulated sterling balances before July 1, 1950, will be offered the right to use those sterling balances to cover their cumulative deficit with EPU (and thus put off the evil day when they will have to pay gold to it).

All this is a very considerable advance towards complete transferability of European currencies. It involves a departure from detailed control over the use of European sterling balances. Some of these accumulated balances are substantial, and the creditors might so organise their intra-European trade as to make larger drafts on them than they could do under the present system of control. If a substantial drain occurred, it is possible that the EPU claims on Britain might exceed its gold-free borrowing rights from that institution so that Britain might lose gold to the EPU. That possibility has been duly envisaged; it is believed that the matter has been under discussion with the United States experts and that some provision has been made by which any consequent gold losses by Britain would be underwritten at least in part out of the $600 million pool with which EPU will be launched.

In renegotiating the bilateral payments agreements, Britain also intends to provide credit facilities (i.e. to be prepared, if necessary, to run up sterling area holdings of individual European currencies) wherever the present arrangements are not fully reciprocal. These credit margins, however, will not be available to finance any deficits that the countries concerned may incur *vis-à-vis* the EPU group; the intention is that they shall be used to meet only such part of the deficit of non-sterling countries as corresponds to their deficit in sterling.



To sum up, as a result of this series of renegotiations, the bilateral agreements with the countries in Europe will conform to a single pattern. They will all have strict credit limits operating reciprocally; they will lay down that accumulated sterling outstanding on June 30, 1950, will not be put into the current compensations, but that it will be made available to any present holder of sterling balances who becomes a net debtor to EPU; they will bind net creditors of the EPU to hold in sterling such part of their credit as has accrued in sterling; conversely, they will provide net debtors of the EPU with credit margins on which, if they have no accumulated sterling resources, they will be able to draw up to the amount of their sterling deficits.

It follows that any gold payment clauses in existing bilateral agreements with European countries will either be abrogated or will fall into desuetude. They should be replaced by provisions that conform with whatever gold payment conditions are made to apply to the EPU

mechanism. Unless the two systems are thus harmonised, it will be impossible to give effect to Britain's suggestion that gold payments made to or by EPU should depend on each country's cumulative surplus or deficit, irrespective of whether it has been incurred in clearing units or in sterling.

It is evident, therefore, that the coming into effect of EPU will have to be followed by a period of intense activity during which the network of bilateral payments and monetary agreements between Britain and the other participating countries is reshaped. The controls governing the use of sterling in Europe will emerge from that process of adaptation considerably simplified, without the blemish of discrimination, and a long step nearer the ultimate goal of complete transferability and convertibility of sterling.

Financing the Buyers' Market

THE pronounced swing from a sellers' to a buyers' market during the past eighteen months has largely brought back to London the burden—and the business—of providing credit to "carry" British exports between the time of their shipment and the time of their arrival overseas. In the early postwar days British exporters could insist on obtaining payment before—or at latest upon—shipment of their goods. Foreign importers, or rather their bankers, had therefore to open irrevocable credits with the British banks before goods left Britain; British banks were in effect confined to the relatively risk-free rôle of paying agents. Under arrangements of this sort there is at most a gap of a few days between paying out and reimbursement, and the banks are covered throughout—so long as they operate strictly within the terms of the credits. Most clearing banks, at any rate, are likely to hold balances for the overseas bank well in excess of any short term risk they assume, although the tendency to concentrate foreign balances at the Bank of England has drawn off much of these deposits. As a result, this sort of business was—and indeed still is—done largely by the clearing banks. Rates are too fine to leave much margin, and profit is negligible unless turnover is large.

Today, however, the manifold financing methods of the prewar era are returning into use. Especially in the hard currency markets, importers are able to demand more time to pay. In the softer-than-sterling markets, in particular in South America, where inflation is still raging, the hunger for imports is still unassuaged, but experience has shown that the authorities there are more amenable to granting import licences when they know they have a breathing space before they need find the foreign exchange. As a result, exports to South America are now commonly shipped for payment against sight or usance drafts; theoretically, this means payment on sight or up to 120 days thereafter, but it is all too common to find the London bank out of funds for considerably longer periods. There is a heavy backlog of remittances from countries such as Costa Rica, Venezuela, Colombia, Brazil and, of course, from Argentina.

Shortage of sterling overseas and a return to more competitive conditions are not, however, the only reasons why the British banking system is now extending more credit to overseas trade. A certain amount of foreign borrowing in London is still attempted for speculative purposes. The great upsurge in this sort of borrowing came, of course, in the months before devaluation when there was a sudden revival in demand for facilities that—under various guises—were tantamount to finance paper. In most cases such business was refused outright; occasionally rulings were sought from the Bank of England. But although few bills that were merely finance paper got through the meshwork, there was nothing to prevent foreign banks or importers from borrowing in London for up to four months if the borrowing could be shown to be to finance some sterling export. The reflux of foreign currency after devaluation shows what dimensions a speculative movement can assume even though essentially confined to delaying actions of this kind. At present, of course, there is no speculative borrowing of this type in hope of any quick gain. But there are still many overseas buyers who, having to borrow some "international currency," prefer to borrow sterling.

Another reason for the present heavy demand for overseas lending is the comparatively low cost of borrowing in London. This applies particularly to demands from France. Now that the French authorities are no longer short of sterling, France does not have to borrow to meet its current sterling needs (as it did in 1947 and 1948). But French merchants are faced with the fact that a London credit with all charges costs them less than 3½ per cent per annum, while the annual rate in their own country is between 8 per cent and 10 per cent.

For similar reasons, but with rather less success, Italian banks and traders have been attempting to borrow in London for some time past. The discrepancy between interest rates in Britain and Italy is even greater than between Britain and France. To the indignation of some Italian bankers, however, obstacles are still placed in the way of their access to the London market; the British authorities see little justification for lending to Italy on any substantial scale so long as the Italian government holds large amounts of currently-earned sterling. The Treasury's attitude towards banking operations that earn hard currency is, however, more benevolent. For example, American importers from India and Pakistan have again taken to financing purchases through London, primarily because the cost of borrowing is lower here than in New York. This, of course, is the very sort of transaction that was commonly done through London before the war, but its value to the country is greater than before. London advances sterling to the American importer, who puts up dollars when the bill is due—and, of course, pays the discount charges and acceptance commission in dollars, too.

*

Are rates charged to overseas borrowers too low? At present the minimum acceptance commission agreed is ¾ per cent per annum. The clearing banks, as a group, are evidently content with this rate, but the accepting

houses agreed to it after the war reluctantly and under pressure; they find the ¾ per cent commission barely remunerative even when—as now—losses are few and far between. They argue, too, that the present charges mean that invisible income from overseas is gratuitously lost, since rates could be put up quite substantially without scaring much business away. Against this, however, the banks point out that, now that the Export Credits Guarantee Department will insure either the exporter or the banker direct for up to 90 per cent of sums pledged, the risk in financing foreign trade is little greater—and therefore the charges should be little higher—than if finance were extended to the Government.

So far attention has been paid only to the recent extension of bank finance to help British exporters and to foreign borrowers. The amount of bank finance extended to the British import trade has also increased in recent months. This increase is largely a consequence of the return of import business from Government agencies to private channels, and of the rise in raw material prices.

It is very difficult to obtain any estimate of the extent of the recent increase in bank financing of overseas trade in general. In the accounts of most of the Big Five, the value of acceptances is hidden in an omnibus item embracing a variety of liabilities (although the Midland Bank did append a chart to its 1949 accounts showing that the aggregate value of documentary credit business done in 1949 was over four times as great as in 1938, some 20 per cent higher than in 1947 and 80 per cent larger than in 1946). The figure for acceptances in the balance sheets of the accepting houses provides a more reliable guide to the increase in this sort of finance. Among the houses that publish balance sheets, Hambros Bank shows much the largest increase in acceptances; these, at £16.1, were fully £4.2 higher than twelve months before. It may be, however, that given their present resources, some accepting houses have extended their total acceptance liabilities as far as their—admittedly conservative—policies allow. Apart from the latitude allowed by possible switches from inland to overseas acceptances, any big increase in overseas acceptances may have to wait on an increase in the capital of the acceptance houses, and that, in turn, must wait until acceptance business becomes more remunerative. The revival of the bill of exchange is also to some extent reflected in the rediscount liability of the discount houses; at the latest balance sheet dates the combined rediscount liability of the nine houses whose figures are published was £80,650,000, or £4,100,000 higher than in 1948-49. This, however, is in no way a guide to the total volume of commercial paper in the market; it merely serves to indicate the value, at one particular moment, of bills resold by the market to the banks. One other way in which the British banking system is increasing its aid to overseas trade must also be mentioned. Under the Exchange Control Act, bank credit to non-residents is limited to a maximum of 120 days (and banks are in fact by no means eager to lend to foreigners for longer periods than this). Exporters, however, are increasingly being asked to allow longer credit than the banks would grant. It often happens therefore that an exporter gives credit to his overseas customer himself, and recoups himself in the interim by borrowing from his bank on overdraft; a certain amount of the recent increase in advances is due to business of this kind.

THE BUSINESS WORLD

The Extra Budgetary Funds

TWO recent developments have drawn public attention afresh to the always intriguing question of the so-called "extra budgetary" funds—those sources of Government finance that acquired such notoriety during the Daltonian cheap money drive of 1946. According to classical principles, British public finance should as far as possible be brought to focus in the annual budget, and all receipts and payments should be displayed for public scrutiny in the budget accounts; the budget was the occasion for the Government, through the Chancellor of the Exchequer, to give an account of its stewardship in the use and management of all public funds for which it was responsible. The City and a wider public are now realising how far modern practice has departed from these salutary principles, in consequence of the huge growth of funds for which the central government is responsible but for which it does not have to account through (or even on the occasion of) the budget.

The first reminder is to be found in the initial accounts of the National Insurance Funds; and the second in the ease with which "the departments"—that is, the various official custodians of the extra budgetary funds—subscribed for up to two-thirds of the recent £150 million loan of the British Electricity Authority. The existence of large funds of this kind raises questions of high principle, especially of constitutional practice and monetary policy. But, in terms of workaday practice, it is in the gilt-edged market that their effects and implications are most apparent. Indeed, no one can attempt to measure the forces that play upon the gilt-edged market without some knowledge of the extent and structure of the funds and the principles on which their influence may be brought to bear. This is especially true of market conditions at the moment.

*

Though knowledge of these funds is important, the authorities have always made it as difficult as possible for even expert observers to get the facts. Most, but not all, of the relevant accounts are published, but only after a long interval and some cover periods different from the national financial year. No comprehensive statement is published to show the resources and disposition of the funds as a whole. Such piecemeal treatment generally ensures that each individual account attracts the minimum of publicity—a circumstance well suited to the authorities, who are well aware that only by a major effort of research can the outside observer assemble the scattered data and make even a minor penetration of the veil of official obscurantism. Most people beyond the few who follow such matters closely learnt with astonishment that the National Insurance Funds were administering capital assets exceeding £1,000 million; and those who thereupon probed this striking fact were more surprised still to learn that these funds are not only "extra budgetary" but are virtually an extra budget in themselves. They have an annual income of some £600 million, equivalent to roughly three-quarters of the whole budget of the central government before the war, and of this income more than two-thirds, comprising insurance contributions from employers and employees, is in form *indistinguishable* from national taxation. In the calendar year 1949, the insurance funds retained a net surplus of £157 million, so that their capital resources must now be approaching £1,200 million.

Vast though the insurance funds are, they hold only a moderate proportion of the assets of the departmental funds as a whole. In response to an annual question in Parliament, the Chancellor has for some years past disclosed the total of public debt held by Government departments as at the preceding March 31st. Except that it takes no account of holdings of government-guaranteed stocks, as distinct from direct obligations of the British Government, this total must comprise virtually the whole of the funds of the departments concerned. The latest figure, relating to March 31, 1949, and disclosed last November, was £3,753 million, of which £406 million comprised floating debt. Scrutiny of the separately published accounts of investments held by the National Debt Commissioners on behalf of the trustee savings banks (at end-November, 1948), the Post Office savings bank (at end-December, 1948) and the National Insurance Funds (March 31, 1949) showed that these three entities accounted for all but £400 million of the total £3,753 million of departmental holdings of direct Government debt and for nearly all their holdings of non-floating debt. They also held £304 million of guaranteed securities, bringing the grand total of disclosed departmental holdings up to nearly £4,060 million.

*

Even this very large figure does not measure the full extent of the extra budgetary resources that have significance for the gilt-edged market. The bald information given in the Parliamentary answer takes no account of funds held by the Government in a fiduciary capacity—such as, for example, holdings for account of the Public Trustee, the Treasury Solicitor, the Charity and Ecclesiastical Commissioners and, of course, the various currency boards—although the investment policy of certain of these bodies might be to some extent responsible to official views. More important still, it excludes both the Issue Department of the Bank of England and the Exchange Equalisation Account, even though the disposition of these assets is wholly at the discretion of the Treasury. There is no longer any means of ascertaining whether the Exchange Account now holds any sterling assets; the prewar limit of £575 million upon its borrowing powers was withdrawn at the outbreak of war, and it has not been disclosed to what larger figure they have been

exercised—the current worth of the gold and exchange holdings alone is £710 million. No accounts whatever are published to throw any light on this question. The Issue Department of the Bank of England, however, holds nearly £1,290 million of Government securities, excluding the £11 million of permanent debt. This means that the extra-budgetary resources definitely known to be at the disposal of the central government amounted, at March 31, 1949, to about £5,350 million; and this "known" aggregate, which is the minimum extent of the funds, has probably since increased by some £100 million. A roughly comparable figure for March, 1939, would be just over £800 million—excluding the sterling assets of the Exchange Account.

Many people are under the impression that these vast funds necessarily give the Government great power to dominate the financial scene and even that they provide a reservoir that might be tapped to aid the central budget. The first of these impressions is only partially true; the second is wholly false. The accumulated resources represent money that has been entrusted by the public to the Government in divers capacities, but this money, instead of being kept in the form of idle cash, has all been fully employed in one of two distinct ways. First, it may have been used to meet the current deficit of the central government, and lent by the department concerned to the Treasury against "internal" issues of floating debt or against sales of special internal securities such as terminable annuities; or, secondly, they may have been employed by the Government in re-purchasing its own longer-term debt from the public. It follows, therefore, that before the capital resources of these funds can be used to support the gilt-edged market by taking in longer-term securities, the departments must first get command of cash in exchange for the "internal" Government debt they hold. If they are to do this, the Treasury must first increase its own borrowings from the banking system (by increasing its weekly offerings at the Treasury bill tender or by placing additional Treasury deposit receipts with the banks) and then transfer this cash to the departmental funds concerned in repayment of its "internal" borrowings from them against tap Treasury bills or ways and means advances.

*

Thus, at any given moment, the departmental funds cannot be brought to bear for net new purchases of securities from the market without a corresponding expansion of credit, necessitated by the Treasury's additional borrowings from the banks. As the early postwar experience has shown, a Chancellor who is prepared not only to disregard the investment conventions that are supposed to govern the employment of some of the funds but also to embark recklessly upon credit expansion, can produce a very large distortion of the gilt-edged market. But a government that is aware of the dangers of credit expansion in conditions such as those ruling today dare not, except in the short run, finance by this means any large net intake of securities from the market.

This means that if the authorities are determined to follow a prudent monetary policy, their power to use the departmental funds for net new purchases is conditioned, not by their vast capital resources, but by the extent of their net current income available for investment. This is a much smaller sum, and is mainly represented by the net surplus now accruing to the National Insurance Funds at the rate of about £160 million a year. Moreover, as an article in the June issue of *The Banker* points out, it is likely that in this current fiscal year the whole of this sum will be bespoken for current outgoings of the central government. If net encashments of small savings and net repayments of tax reserve certificates continue at the same rate as in 1949/50, they will together absorb rather more than £100 million. And if Britain's external balance of payments produces the surplus of £50 million assumed in the Economic Survey, the central government would have to find an approximately equivalent sum to finance net purchases of gold and/or to repay overseas sterling balances at present lent to it against floating debt. Hence, even if the "overall" budget of the central government shows no deficit, it will still have to find a sum roughly corresponding to the net inflow from the insurance funds.

If these calculations are broadly correct, the recent intake of BEA stock must have confronted the authorities with a stringent position that could be corrected only by an undesirable credit expansion or by sales of securities for cash. The new funding issue was evidently designed to provide the cash—but the pace at which the authorities have since found themselves required to absorb the "unassented" 1949/51 War Bonds means that it will be some time before the full relief to their position becomes apparent. In the meantime, they are drawing skilfully upon the great scope that the departmental funds afford them for shaping the gilt-edged market by judicious and carefully-timed switching of their holdings.

Business Notes

Short Bonds and the Coal Issue

The very large switching operations that were set moving in the short bond market by the Treasury's announcement of its cash and conversion issue of 2½ per cent Funding Loan have continued during the past week, and some of them seem likely to go on for some time, despite the fact that the conversion offer closed today. By far the biggest of these movements has been that in the 1949-51 National War Bonds. The discount market, for which the new stock is quite unsuited, at once assumed that the 1949-51 bonds were in much greater danger of being called for early redemption. Accordingly, the discount houses and other holders who could not countenance conversion have been selling their holdings as fast as possible to the authorities—but the price has been maintained at the level of 101 to which it dropped soon after the Treasury's first announcement. It is generally believed that the discount market has now virtually exhausted its holding of these bonds, and that the special buyer has absorbed £100 million or more. In consequence, although the authorities have been able to sell considerable quantities of somewhat longer bonds—notably the 2¾ per cent Exchequer Stock—the £100 million of cash secured by the outright offer of the new tranche of funding loan (cash lists for which closed on Friday of last week) has not been immediately available for redemption of "active" floating debt held by the banks and the money market. Thus the reduction in debt disclosed by last Saturday's revenue return occurred almost entirely in that portion of the floating debt held internally by the "departments."

Meanwhile, although the cash issue of Funding Loan was fully subscribed—applications for amounts beyond £1,000,000 were scaled down by 14 per cent—the new scrip has not been able to retain its opening premium. In view of the fall that had occurred in the price of 1949-51 bonds, however, the discount on the new stock was for a time sufficiently narrow to allow the more nimble of the would-be purchasers to gain a minute advantage by buying the 1949-51 bonds in order to convert. Since then the discount on the new stock has widened to ⅛ middle. Another major cross-current that has been started in the market has been the selling of the 1951-53 bonds, on the still rather questionable argument, reported here last week, that they are likely to be redeemed next year. Opinion is still sufficiently divided for the sellers to find buyers without further sacrifice; the price has, in fact, regained ⅛ of last week's loss, at 101⅛. The same general line of reasoning has led to some revival of discussion of the possibility that 3½ per cent War Loan (1952 or after) might after all be regarded as a "short." Since the Treasury's announcement of the Funding issue, purchases by a few bold spirits have raised the price from 92⅞ to 93¼. But this still leaves the redemption yield, on the hypothesis of redemption in 1952, at £6 6s. 10d. per cent. That in itself is surely a sufficient commentary upon the prevailing view of these chances.

*

None of these factors in the short bond market had any relevance to the choice of terms for the first issue of "Coal Stock." On the assumption that this was to be a 3½ per cent issue, on the pattern of the recent electricity loan, the terms almost wrote themselves. The stock could hardly be as long as 1980-82, as some had suggested, for the British Electric Stock, dated 1976-79, stood at 1⅛ premium on the eve of the announcement, to yield only a penny less than its coupon rate. The authorities, bound by the stipulations of the Coal Industry Act to issue stock strictly on the prevailing market basis, have therefore been punctilious in stretching the dates by a mere year. The stock, issued on June 15th, takes the form of 3½ per cent Treasury Stock, 1977-80; unlike the other nationalisation issues, it is a direct charge as to principal and interest on the Consolidated Fund. The amount of the stock allotted, under the arrangements for expediting the ponderous compensation provisions in the Coal Act, was not disclosed in the formal announcement, but it will represent no more than a modest proportion—perhaps £20 million—of the £164 million that must eventually be found.

The Ninepence Stays

From one point of view, the Government's decision to double the tax on petrol and other light hydro carbon oils has merit. Indeed, the merit can be said to have grown since petrol was derationed. When the Chancellor outlined the proposal in his Budget speech, it could hardly be described as an attempt to let prices do the work of rationing, for all that the Government then proposed was to double the private motorist's basic ration in nine of the twelve ensuing months. The removal of rationing profoundly affects the argument about doubling the tax, though it is important to remember that the two events were not directly associated. It is also necessary to keep in mind that rationing by the purse means rationing by cost; therefore, it is important to examine on whom the extra costs will fall.

Viewed from this aspect, several reservations suggest themselves. Rationing by the purse is, broadly speaking, desirable, because it gives the consumer the choice of laying out his income as he thinks best, and not according to the number of coupons that somebody else thinks best. But if, as a consequence, the costs of public transport, road haulage, and many industrial raw materials are also increased, it is desirable to ensure that the advantages of the first step are not outweighed by its consequential disadvantages. Unfortunately, the Government have not been too successful in rebutting the criticisms of the Opposition on this point. Mr Gaitskell on Wednesday appealed for a sense of proportion on the question of increased costs. But he himself cited some examples of increased costs (2d. to 2.9d. per vehicle mile for public service vehicles, for example) that could hardly be called negligible. And no addition, however small, to the high level of British costs is to be treated as if it were merely a matter of secondary importance.

A further point remains on the Budget implications of the tax. The net effect of derationing petrol will be to increase the revenue by £23½ million. But this extra sum will not be used—as it might have been used with advantage—to fortify the surplus; indeed, it has already been earmarked —£7,000,000 for more national assistance benefits, £3,500,000 to relieve agriculture of the petrol duty, and £9,500,000 for relief from double taxation. So the original purpose of the increased petrol tax—to raise the wind to finance income tax concessions, has been broadened to raise more wind for other purposes. All this the private motorist will no doubt be able to "afford," even if he may dip into savings to find the money—in which case, resort to the price mechanism in the case of petrol will paradoxically increase the inflationary pressure. But the potential effects on industrial costs are the important matter that has to be resolved. The Chancellor declares that, "on the whole," these will be "infinitesimally small." Perhaps on this occasion his judgment will be better than it was at the time of devaluation.

Belgium and EPU

An eventful and somewhat acrimonious week has been spent by the experts who have been working in Paris on the European Payments Union plan in preparation for the Ministerial Council meeting due to be held this weekend. The basis of discussion has been the American counter proposal which was intended to provide a midway house between the original Belgian Ansiaux scheme and the subsequent proposals made by the United Kingdom delegation. This American scheme provides for a considerably wider extension of credit facilities than was promised under the Ansiaux plan. On the other hand, it steps up the scale of gold payments indicated in the British memorandum. The compromise has apparently proved acceptable to Britain but not to Belgium; indeed, at the time of going to press despatches from Brussels suggest that rather than accept this American formula Belgium would prefer to stay out of the proposed European Payments Union.

Under the American plan Belgium would have been called upon to extend credits of 10,000 million Belgian francs in financing its surpluses with other western European countries. This proposal, at a time when Belgium is beginning to struggle against relatively high costs and prices and is, therefore, still pursuing a policy of severe deflation at home, has not unnaturally proved unacceptable to the highly orthodox authorities who now direct Belgian monetary policy. Belgium, moreover, is cast in the EPU proposals for the role of a "structural creditor." Belgian authorities, therefore, see no advantage in extending this substantial additional amount of external credit if at the end of it they are merely to be boycotted and discriminated against as a "structural creditor" and without receiving the conditional grants which, under the present scheme, they can claim against their intra-European surpluses.

The Belgian threat to keep outside EPU may be merely a tactical move in preparation for the Ministerial Council meeting of OEEC. The next few days will show. If it is more than this and if in fact EPU must be launched without Belgian membership, a great question-mark arises about its effect on Benelux; there can be no possibility of one segment of this Siamese twin being inside EPU and the other outside.

The Australian Pound Again

When the Australian cabinet started its series of economic discussions last week-end, political reporters were equally divided on whether it would or would not decide to lift the sterling value of the Australian pound (now at 16s.) to or towards parity. This division of opinion was not surprising for, when the meetings broke up, it was apparent that the cabinet itself was also divided on the question. Most of the Liberal members argued that the inflation of the internal value of export earnings (which the present exchange rate creates) was driving up Australian prices and costs, was encouraging the growth of "bubble" domestic industries, and was so warping the pattern of the economy that readjustment was going to be very painful when export prices fell. The Country Party members of the cabinet (led by Mr Fadden, the Federal Treasurer) agreed that readjustment would indeed be painful, but they were not prepared to countenance an appreciation of the pound that would oblige farmers and other voters to face it sooner than need be.

The debate, in short, is back where it was both a year and six months ago. Last summer, it will be remembered, the Chifley Government was believed to have shied off revaluation at the last moment because of a fall in Australia's export price index and of the imminence of the Australian general election. The same two factors dictated its decision to devalue the Australian pound to the same extent as sterling in September. After September the prices of Australia's staple primary exports rose so abruptly that it was widely believed that the Australian pound would be revalued once December's election was over; the election, however, saw Mr Fadden hoisted to the Treasury and it was he who then put forward the specious argument that the whole question could not possibly be considered "until the export season ended in June." Now that June has come (and although the export price index—and the pressure of inflation—is higher than ever) Mr Fadden has apparently found new reasons for delay; it may be noted, incidentally, that he has gathered behind him a rather weightier body of support from Australian economists than he seemed to possess in December. The case for and against revaluation may be fairly evenly balanced—a change in exchange rates is never a panacea for economic ills. But the Australian authorities would be well advised to take some definite action soon to prevent this rumour from cropping up at six-monthly intervals; during the past few weeks exporters, importers, investors and all others connected with the Australian scene have again been tying their affairs into incredible knots in their attempts to anticipate something that may never happen.

Russia to the Rescue

The Board of Trade Mission has left Moscow with a contract in its pocket for "substantial" quantities of timber and pit wood. No details of quantities or prices have yet been disclosed, but it is suggested that the contract may be for more than 150,000 standards in the coming season, compared with 100,000 standards shipped last year. Payment will be in sterling, and will be freely usable by the Russians for sterling purchases, except for certain items barred for strategic reasons.

The new contract will bring some useful relief to the acute shortage of softwood in Britain. The shortage does not arise from a world shortage, though demand arising from the construction boom in the United States is high. So far as this country is concerned, the inadequacies of the buying policy of the Timber Control are having more immediate effects. Last year, when Germany was still a net exporter of softwood, Britain found that tactical

WHEN IT'S A QUESTION OF TIME...

How many minutes away is your manager?

IN SOME organisations a man away from his desk might, to all intents and purposes, be miles away. People must leave their desks in the course of their work, and things should be so organised that when they do they can be located instantly when wanted.

H-P 826

delays in making purchases made it possible to secure lower prices. The same tactic seems to have been tried this year, but with less happy results. So far, the Timber Control has some 225,000 standards under contract from Finland, and has purchased only 27,000 standards from Sweden. Last November Sweden offered some 250,000 standards at a price somewhat higher than in the spring. This offer was not accepted and now Sweden has only 70,000 standards left and is quite willing to keep them to replenish its own rather low stocks. Small quantities can probably be secured from Jugoslavia, Poland, Czechoslovakia, Norway and Italy, though these countries together cannot satisfy the bulk of Britain's requirements.

Last year these amounted to 1,150,000 standards, of which some 63,000 standards were home produced. Stocks at the end of February, the latest published figure, amounted to 338,000 standards and they are believed to have fallen below 200,000 standards last month—enough for two months' consumption. There is a small emergency reserve of 38,000 standards, from which 1,000 standards had been drawn by the middle of May. A normal prewar stock was well over three times and probably nearer four times the present level. Even at the end of 1947 Britain had some 607,000 standards in stock. The building trade is at present working on a subsistence basis, and dependent not on timber imports but on the very arrival of timber cargoes. When the argument turns on the merits of Government purchase and private trading, let it be remembered that the responsible authorities have permitted stocks of softwood to fall below 250,000 standards, a figure which the Minister of Works has within the past month described as "an absolute minimum." An extra 50,000 standards from Russia will be a useful contribution, but it will not mean sudden plenty.

* * *

Shakeout in Rubber

A week ago, it seemed hardly possible that the rubber market could boil over so quickly and with such a drastic shakeout in prices. But these things have happened and no one could say that the health of the rubber market is the worse for it. On Friday last week, rubber closed at 2s. 3⅜d. buyers and 2s. 4d. sellers. On Monday last, the price fell 3d. a lb. and on Tuesday there was a period when it was below 1s. 10d. By the middle of the week, conditions had become steadier, and the market closed on Wednesday at 1s. 11¼d. buyers—a fall of 4d. compared with the previous week's close.

These excitements followed the course of the Singapore market very closely. There, it was observed, speculators were anxious to cut down their commitments after the American State Department's criticisms of "wide and speculative swings" in the price of natural rubber. The implications of this comment, and its bearing on synthetic rubber policy in the United States, are examined in the American section of this issue. There is, inevitably, a certain amount of argument in rubber circles in London on whether official American statements were justified. The very behaviour of the market has shown the dangers of an unwieldy speculative position in Singapore, but there has been no weakness in London. American buying policy, it is asserted, has played its part in accentuating the rise, and there is the usual criticism of American efforts to talk down the price of natural rubber.

The fact remains that natural rubber was too high, and that the plantation industry knew that it was too high. The industry will have no cause for complaint if rubber remains somewhat below, rather than above, two shillings for a period. At that price it is making a comfortable living, and it is not running such a manifest risk of provoking the American consumer to produce and use more synthetic rubber as was the case when rubber touched 2s. 5d. in a spasm of feverish buying a fortnight ago. The plantation industry needs prosperity, not a boom; it has the more promise of the former since it has discarded the latter.

* * *

Gold Standard for France?

The French monetary authorities are clearly gaining self-confidence. This is as it should be at this time of the year when the tourist season is beginning in earnest and bringing with it its flood of foreign currencies. One traditional sign of confidence came at the end of last week with the decision of the General Council of the Bank of France to reduce the Bank Rate from 3 to 2½ per cent. This move was soon followed by a somewhat startling statement by the Governor of the Bank of France that the franc would soon be stabilised in terms of gold and furthermore that it would thereafter become freely convertible into all currencies including the dollar. This statement of intention must stretch credulity rather far. There is, of course, very good reason why France should in the near future notify an official parity for the franc to the International Monetary Fund and thus fall into line with almost every other member of that organisation. No par value has been agreed with the Fund since January, 1948, and it is time that this anomaly should be corrected. If the new European Payments Union, which is due to begin operations on the 1st July, is to work in conjunction with the IMF, allowing member countries to draw on their IMF facilities in order to help the intra-European compensation, it will behove all participating countries to notify official parities for their currencies with the IMF because it is only on that condition they can have access to the facilities of that institution.

It is, however, a far cry from this to the suggestion that the franc is again to become freely convertible. There can be no denying the improvement which has taken place in the French economic situation, including the balance of payments. The French gold reserves, however, are still quite inadequate to provide the necessary margin of safety for such a move. The gold in the Bank of France is down to the equivalent of D523 million as compared with the 1939 average of D2,700 million. A more cautious view seems to be taken by no less a personage than the French Finance Minister, who, following the pronouncement of the Governor of the Bank of France, stated this week that all question of legal stabilisation of the franc must be regarded as "premature." In this matter the opinion of the Minister of Finance may be regarded as paramount.

* * *

Australia Taxes Rayon Cloth

Australia has raised the tariff on imports of woven piecegoods containing more than 50 per cent rayon from 1½d. a square yard to 1s. 6d. Grey cloth and fabrics for one or two special uses are exempted. The move is plainly intended to protect the new rayon weaving and finishing industries in Australia. Some increase in the tariff had been regarded as possible ever since the Australian weavers instigated a Tariff Board Inquiry some eighteen months back, but few can have expected an increase of this order.

Australian rayon weavers can supply about 25 per cent of the local demand for rayon cloth, and there are plans to raise this proportion to 40 per cent. Both Courtaulds and British Celanese are putting up plants in Australia which should in a year or two be capable of supplying enough yarn to satisfy the increase in weaving capacity. There is no tariff on rayon yarn imported into Australia. The four firms who gave evidence to the Tariff Inquiry Board in support of protection from foreign imports produce about 6,000,000 square yards of cloth a year. This cloth costs 1s. 6d. to 2s. a yard more (in Australian currency) than imported British cloth. The four firms have American backing and have

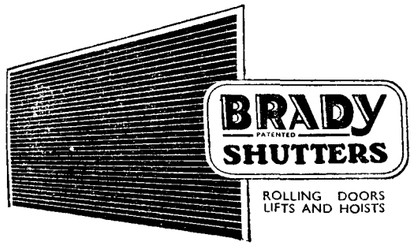
HOW DO YOU MEASURE "SERVICE"?

"SERVICE" is a word that is used very freely these days — often, it must be admitted, by people who seem to have very little understanding of what it really means.

At Hoover Limited we measure Service — our own or anyone else's — by the extra care and effort that is given to the customer's interest *over and above what is necessary from a purely commercial viewpoint.* Service is attention to a customer's needs at the right time and at the right price. Service means taking as much interest in a customer's requirements *after* making a sale as when he or she is being persuaded to buy. Service in the Hoover sense of the word means providing customers with expert technical assistance in their own homes, offices, factories or anywhere else Hoover products are used.

In short, Service is to Hoover much more than a word. It is the cornerstone of Hoover policy.



HOOVER LIMITED

Factories at

PERIVALE GREENFORD MIDDLESEX • CAMBUSLANG SCOTLAND
MERTHYR TYDFIL SOUTH WALES • HIGH WYCOMBE BUCKS

It's an old-fashioned word

"Service" as understood in industry has lost a lot of its old meaning — but the Brady service is still exceptional, and as famous as the Brady Shutter. The roller shutter is not a new invention but, in the Brady roller Shutter, there is a lot that is new — new patents, new materials, new finishes — which have greatly extended their usefulness. In factories, offices, hotels, houses, on commercial vehicles and aeroplanes we can show how a Brady Shutter helps the job along, as efficiently as Brady hand and power operated lifts.

A Sensible Policy for Process Steam—12

Water film against process output

BY SPIRAX

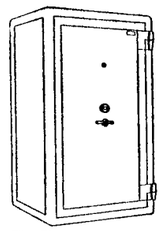
The condensing surfaces of process steam plant are coated with a film of water. The film is highly resistant to the flow of heat from the steam. It interferes seriously with heating and output performance.

The film is a result of two happenings; one good, one bad.

The steam, giving up its heat, condenses on the surfaces. Its condensate is then discharged quickly, as it has served its immediate good purpose. A film of it remains.

But the moisture *brought in* with the steam has no such contribution to make: it is a stowaway. It merely adds to the resistant film.

Yet to minimise the insulating effect and so accelerate the rate of heat transfer, the thickness of the film must in some way be reduced.



To do this effectively, it is of the greatest importance (*a*) *to dry the incoming steam* by the use of a small separator before the steam inlet and (*b*) to insist upon the steam trapping installation being *correctly designed for the particular conditions.*

Heating and output performance respond immediately when those measures are properly applied.

represents much more than the encouragement of secondary industries; it seems designed to assist firms to write off their high plant costs very rapidly. When the tariff inquiry was being held, import duties per yard of rayon cloth were 1½d. for British goods and 4d. for most-favoured-nation countries, while the general tariff was 9d. a yard. The increase is not as large as the weavers sought, but it certainly ought to provide a comfortable degree of shelter for them.

Higher prices for rayon cloths in Australia will reduce total sales and thus enable the local industry to increase its proportion of the market more rapidly. The outlook for British exporters of rayon cloth to Australia is bound to be seriously affected. The accompanying table shows that one quarter of total British exports of rayon cloth has been going to Australia. Last year 42½ million square yards of rayon cloth (excluding mixture cloths) were shipped to Australia with an export value of £7.6 million and an average value of 3s. 6d. a yard. The Association of British Manufacturers in Australia, the local clothing manufacturers and the chambers of commerce are combining to protest against the big price increase which results from the tariff.

Men's Clothing Report

All of the earlier productivity teams sent from this country to study industrial methods in the United States have been concerned with heavy industry and engineering. The latest report is concerned with a consumer industry—factory-made men's clothing. The team reports that "productivity in the clothing industry of America is undoubtedly greater than in Britain"—the same unvarying conclusion, but this time notwithstanding the team's discovery that "American clothing manufacturing methods are similar to British methods." Why does the British clothing industry fail to extract similar advantage from similar technique? The differences in productivity are explained by differences in approach to marketing. Selling in an American bulk market rests on the willingness of the consumer to restrict his range of choice in order to obtain a cheaper finished product. Having made his decision on designs, an American clothing manufacturer will put them into production in a wide range of materials and models and in a larger number of sizes than are normally made in Britain. But he will not accept modifications which might interrupt a long production run and will refuse orders rather than vary his specifications to suit a retailer's judgment of what the customer wants. This process does not lead to standardised clothing and stereotyped designs; variety is maintained both between firms and within a single firm.

If long runs are assured, it becomes possible to break down the operations so that the worker can specialise—say, by continually performing the same operations on cloth of the same weight. Thus he acquires speed and skill, contributes a high standard of work and earns at a high rate. This willingness of American labour to work hard and fast has been observed by every returning productivity team. This particular report is disturbing because it deals frankly with differences of industrial output and behaviour that do not stem from different economic conditions in the two countries and cannot be brushed aside with the assertion that the British clothing industry would be just as good as the American if it were free from Government regulation and unhampered by the utility scheme. The team has returned convinced that the American manufacturer is producing a better quality garment. He shrinks his cloth before it is cut, refusing to leave this task to the weaver; as a result, no distortion of shape takes place during manufacture. Throughout all stages of production, the garment gets more pressing and more careful finishing than it does in this country and—most surprising of all—far more of the pressing and sewing is done by hand than in British factories. When American factories are able to put a high degree of craftsmanship and hand work into a mass produced article, what remains of the comforting assertion that the best of British consumers' goods are superior in quality and, therefore, justifiably higher in price?

* * *

Courtauld's Bumper Profits

The preliminary statement of Courtaulds for the year to March 31, 1950, completely belies the forecast of lower profits made a year ago when the spectre of the sellers' market was haunting the directors. In the event, after setting aside £2,102,154 against £1,605,005 for additional depreciation and charging £250,000 (£659,422) for obsolescence, consolidated profit before taxation amounted to £5,892,857, compared with £4,328,113 in the previous year. After deducting £2,831,830 for taxation (only some £35,358 more than in 1948-9 owing to a credit of £955,363 arising from initial allowances) group net profit of £3,060,257 is calculated at nearly double the previous year's figure of £1,531,641. Even so the dividend remains at 7½ per cent, unchanged since 1941. In the previous year's accounts taxation relief of £659,422 derived from initial allowances was treated as a provision for obsolescence, but in the latest accounts a special reserve has been created to accommodate initial allowances.

In explaining this satisfactory turn of events the preliminary statement of the company does not mention the fears expressed last year, but attributes the achievement to the investment of substantial funds in new plant in the past five years. This is now bearing fruit in significant increases in production, particularly in rayon staple. Production of staple fibre for the whole country increased from a monthly average of 7,300,000 lbs. in the year ended March 31, 1949, to 11.3 million lbs. in the twelve months ending March, 1950, reaching a record total of 15.21 million lbs. in the final month of the year.

In the absence of export figures for the group, it seems likely that devaluation provided the necessary stimulus to sales—the latest financial year includes a full six months period since devaluation. Total British rayon exports expanded substantially from the low point reached in October last. Exports of single yarn rose from 1,340,000 lbs. in October, 1949, to 2,150,000 lbs. in March, 1950, while exports of piece goods increased from 12½ million square yards in October to 18 million square yards in March.

Dunlop's Difficulties

Two different difficulties beset Dunlop Rubber at present. The first is the physical one of producing rubber in the hazardous conditions in Malaya. The second is to tune the company's buying policy to the wide fluctuations in the price of the commodity. In 1949 the

21,000 employees of the group in Malaya succeeded in producing almost as much rubber as in the record previous year, while output of latex was actually the highest ever recorded. Their difficult situation is, perhaps, best epitomised by the private fleet of armoured cars patrolling the estates. At the annual meeting of the company this week, Sir Clive Baillieu rightly praised the production achievement, but had to record that the general situation in Malaya had steadily deteriorated.

Sir Clive omitted any reference in his speech to the effect of fluctuating rubber prices. Although it is the biggest producer of rubber in the Commonwealth, Dunlop Rubber is also a substantial buyer of the commodity. The group's trading experience in 1949, when rubber prices were fairly steady at substantially lower levels than at present, was disappointing. Trading profit was reduced from £10,726,303 to £9,404,813 despite a rise of £12 million to £141 million in turnover. This reflects a decline in profit margins from 3.9 per cent to 2.7 per cent, which Sir Clive attributed to a "continued rise in cost values." At the present enhanced prices of rubber and cotton—which is also an important raw material both for tyres and textiles made by Dunlop—it may be asked how profit margins have been faring in the current year. In his review with the accounts, Sir Clive indicated that the company's policy was to "keep inventories at the lowest possible level consistent with efficient production." In conformity with this aim, inventories were actually reduced by over £1,000,000 to £28,348,000 in 1949. The group's use of rubber in manufacture appears to have been running at a high rate in the final quarter of 1949—tyre production in that quarter absorbed 32,047 tons compared with 106,533 tons for the full year. It is, therefore, conceivable that Dunlop would have been happier in recent months with a higher level of stocks. At least that has been the experience of some American rubber manufactures that have kept their stocks low.

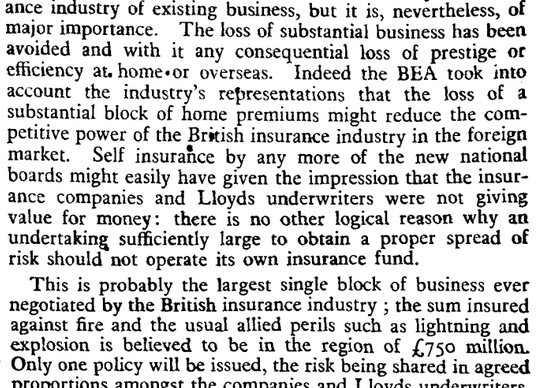
The implications of lower profit margins and the counterpart of rising costs in the face of growing competition also occupied most of the speech of Lord McGowan at the ICI meeting last week. He stated that although the group managed to expand its turnover by £10 million in 1949, the future trend of sales depends on the ability to keep costs down "in face of the increasing burdens which manufacture in Britain has to bear." Although Lord McGowan welcomed the double taxation relief to be extended in the Finance Bill as helping to ease these burdens, he declared that "we should like to see the Chancellor go all the way and give full relief, as we shall still be at a disadvantage as against formidable competitors in the world markets, such as the United States, who are more realistic in this respect."

* * *

Insurance by the Nationalised Industries

The decision by the British Electricity Authority to insure with the companies and Lloyds underwriters and not to operate their own fund (briefly reported last week) has been much welcomed by the insurance industry. When, early in 1947, it became known that the National Coal Board intended to carry its own insurance risks, the market was naturally apprehensive that this step would be taken as a precedent by other nationalised industries. Representations were made to Sir Stafford Cripps, then President of the Board of Trade, who declared in July, 1947, that it was no part of the government's policy that nationalised industries should not insure in the ordinary market. The railways, which were next taken over, mostly had old-established internal insurance funds in being, and these were carried on by the Transport Commission.

As soon as the nationalisation of electricity became effective on April 1, 1948, discussions, which have led to the present agreement, were initiated by the British Insurance Association, acting on behalf of the majority of British insurance companies and also Lloyds underwriters. The insurance arrangements made by the old electricity undertakings were continued on an interim basis by the BEA. Thus the present agreement involves no more than the retention by the insurance industry of existing business, but it is, nevertheless, of major importance. The loss of substantial business has been avoided and with it any consequential loss of prestige or efficiency at home or overseas. Indeed the BEA took into account the industry's representations that the loss of a substantial block of home premiums might reduce the competitive power of the British insurance industry in the foreign market. Self insurance by any more of the new national boards might easily have given the impression that the insurance companies and Lloyds underwriters were not giving value for money: there is no other logical reason why an undertaking sufficiently large to obtain a proper spread of risk should not operate its own insurance fund.



This is probably the largest single block of business ever negotiated by the British insurance industry; the sum insured against fire and the usual allied perils such as lightning and explosion is believed to be in the region of £750 million. Only one policy will be issued, the risk being shared in agreed proportions amongst the companies and Lloyds underwriters. Detailed procedure has been worked out which will cover the whole country and all insurers; this sensible arrangement should save much time and money on both sides. Besides fire the agreement covers other risks such as employers' liability at common law, which it is common commercial practice to cover by insurance.

Hard bargaining by an insurer as well placed as the BEA has no doubt meant that premium rates have been finely drawn, but the insurance industry would almost certainly be prepared to underwrite the business at cost rather than lose it. The insurances of the gas industry have been continued since nationalisation through the usual market channels; there is no reason to suppose that they will now be disturbed.

* * *

Prices Boom in May

British wholesale prices continued their upward climb in May. The Board of Trade index showed a rise of 1.9 per cent—the largest monthly increase since last October. The total rise in the combined index since devaluation, taken between August and May, is 11 per cent. Of the prices

of industrial materials, those of basic materials alone have shown a rise of 24 per cent, intermediate products of 10 per cent and manufactured articles of 3½ per cent. The impact of the higher cost of raw materials on the price of finished goods is only just beginning to be felt. Import prices in April were, on the average, 18 per cent higher than before devaluation, but for raw materials alone the increase was as much as 25 per cent.

The domestic consumer may hope to avoid the full consequence of these higher prices, but some further rise in retail prices is to be expected. The latest published figures for the interim index of retail prices refer to April when the index had risen nearly 2 per cent since devaluation, chiefly owing to dearer food and to increased costs of light and fuel and some household furnishings. This index, of course, by no means reflects the price movements of all consumer goods and services.

Part of the rise in wholesale prices last month was attributable to higher rail freight charges, which affect some iron and steel items, bricks, tiles and fertilisers. But, in the main, the higher index reflects the mounting prices of non-ferrous metals, wool, rubber and some other (mainly imported) raw materials. The price of rubber rose most sharply—by about 20 per cent. The monthly average price of copper advanced by 5½ per cent, of zinc by 11 per cent and of pig lead by 10 per cent. The upward surge in wool prices also continued; merino and crossbred prices rose by around 11 and 10 per cent respectively. In contrast, American cotton was only about 1½ per cent dearer—but further increases in cotton were announced early in June. Between August and May the group of wool items in the wholesale price index rose 48 per cent; the corresponding increase in cotton items was 20 per cent.

Shorter Notes

The Whitsun holidays were responsible for a fall of 255,000 tons in the annual rate of steel production in May. But production reached an annual rate of 16,597,000 tons, some 188,000 tons higher than the rate of production during May last year, when there was no holiday. Production of pig iron was higher than during April, the annual rate being 9,646,000 tons compared with 9,492,000 tons. It is lower by 54,000 tons than the annual rate of production reached during May last year, one of the peak months.

*

The value of United Kingdom exports in May is provisionally estimated at £183 million, of which £12.4 million was to Canada and £8,200,000 to the United States. The daily rate of exports was three per cent higher than in March, previously the best month. Exports to Canada in May were 23 per cent higher than in April, the biggest increases being in machinery and vehicles. The daily rate of exports to the United States was 30 per cent higher in April. Imports during May are provisionally valued at £228.8 million, compared with £211.4 million in April.

*

The Cable and Wireless (Holding) reconstruction scheme has been finally sanctioned in the Chancery Division. The company is now enabled to proceed with the detailed allotment of the stocks to be issued under the scheme. Settlement of dealings in these stocks since the scheme was approved by stockholders is expected to be possible by the end of June. This is also the date by which Sir Edward Wilshaw hopes that all payments under the scheme will be made.

*

Burmah Oil Company has been awarded £4,583,870 compensation as its share of the £10 million ex gratia payment to British business concerns whose property suffered war damage in Burma.

*

The purchase is announced of the entire share capital of Higginson and Co., private bankers, by Philip Hill Investment Trust. Before the deal, Higginson and Co. were converted to a limited liability company with a capital of £500,000 in £5 shares £1 paid.

*

Skyways, Ltd., the largest British aircharter company, has gone into voluntary liquidation. Operations are being continued, though on a much reduced scale, by a new company, Skyways (1950), Ltd. The changes have been made subsequent to the termination of Skyways' contract with BOAC to fly a scheduled service to the Persian Gulf. This service had been the main source of employment for the company's fleet of three four-engined Skymaster aircraft, the only fifty-seat aircraft privately owned in this country. The Skymasters have been sold abroad.

SECURITY PRICES AND YIELDS

UNION-CASTLE MAIL STEAMSHIP COMPANY, LIMITED

INCREASED TRADING PROFITS

RISING COST OF OPERATION

SIR VERNON THOMSON ON THE OUTLOOK

The annual general meeting of The Union-Castle Mail Steamship Company, Limited, was held on June 8 at Winchester House, Old Broad Street, London, E.C.

Sir F. Vernon Thomson, Bt., G.B.E., the chairman, in the course of his speech, said:

The report of the directors and the audited accounts of the Union-Castle Company for the year ended December 31, 1949, now submitted set out the position of the company clearly. In this postwar phase we are now reaping the benefits of our shipbuilding programme.

The trading profits of the group as a whole show an increase of about £300,000 compared with 1948. This increase is accounted for in part by the fact that the 1949 accounts include results of a full year's trading of King Line, Limited, whilst the 1948 accounts included the profits of that company for one month only. Also, there was an increase in the profits of other subsidiary companies for the year 1949.

Moreover, the company had the benefit throughout the past year of the use of the two new Mail vessels, *Pretoria Castle* and *Edinburgh Castle*, and for almost the whole of the year of the Intermediate vessel *Dunnottar Castle*. On the other hand, it has been necessary to provide a full year's depreciation on the two costly new ships, which accounts for the increased charge for this all-important item.

NET PROFIT MAINTAINED

It will be observed that, after providing for depreciation, taxation and debenture interest, the net profit of the company for 1949, before taking into account balance of profits relating to previous years now available and earlier taxation provision no longer required, is almost exactly the same as that for 1948. A further £1,000,000 has been transferred to general reserve, which now amounts to £3,500,000.

As stockholders will be aware, the company has a superannuation fund and a widows' and orphans' fund for its salaried staff. These funds, which were inaugurated in 1912 and 1921 respectively and have been strengthened in recent years, do not provide for weekly-paid or female staff. It has been the company's practice for many years to make "ex gratia" allowances to old employees or their dependants not provided for by either of these funds, but the board feel that the time has now come when these arrangements should be placed on a permanent basis. In 1941 the sum of £50,000 was set aside with this in view, but the time was not then opportune for inaugurating a scheme of this kind. From the accounts before you today it will be observed that the directors have allocated £250,000 from the company's profits for 1949 to the staff provident account. This combined sum of £300,000 will be utilised for the provision of pensions or other benefits for those of the company's shore personnel who are not already within the scope of the superannuation or widows' and orphans' funds.

RESERVES EXCEED £10,000,000

The total reserves of the company, including the credit balance in profit and loss account, now exceed £10,000,000. The policy of ploughing back into the company a substantial part of its earnings makes for stability and enables us to provide the high-class, costly tonnage essential in our overseas services between Britain and South and East Africa today. It also strengthens the company against the unknown vicissitudes of the future.

The company's ships are well written down, and appear in the balance sheet at a moderate figure for tonnage of their standard. Current assets exceed current liabilities by over £4,000,000 and a glance at the consolidated balance sheet emphasises still more the financial strength of the company and its subsidiaries.

In these circumstances an increased dividend would seem not unreasonable. The temporary limitation of dividends linked with restraint in wage increases has, however, been urged as a duty in these times of emergency to combat inflation and assist national recovery. Obviously some small additional distribution by this company would not of itself substantially promote inflation, but if important companies ignore dividend limitation claims for wage increases would follow automatically with the corollary of aggravated inflation, which it is in the national interest to avoid.

Apart from such considerations, a ship is a wasting asset. To keep a fleet of our size efficient and up to date we should never be long without a ship on the stocks. And the cost of their replacement being so high (the two at present building will cost over £4,000,000), our prospective capital requirements necessary for the efficient operation of our services are an important item which must never be lost sight of. In all the circumstances which have received the most careful consideration of the board, the directors do not recommend a distribution higher than the 8 per cent. which has been paid for each of the three preceding years.

FLEET

At December 31, 1949, the fleet consisted of 26 vessels of 378,317 gross register tons. It has been maintained in a highly efficient state, as is our custom, and happily was operated throughout the year without serious accident.

During 1949 the *Pretoria Castle* and *Edinburgh Castle* completed their first year in service, and fulfilled our highest expectations both as regards efficiency in operation and popularity with passengers.

The motorship *Bloemfontein Castle*, which is a fine new passenger and cargo ship of over 18,000 tons gross register, entered service in April this year, and is at present making her first voyage out west and home east. Thereafter it is intended that she shall proceed via South Africa to Beira, and turn at that port, thus reinaugurating the company's intermediate service to and from South and Portuguese East African ports. This vessel, which is a one-class ship, the first built for the company, is a most attractive vessel, and will, we believe, prove popular with passengers who do not require all the amenities of first-class mail ship travel, but who wish to make the voyage in comfort at moderate fares and with the whole of the public rooms and public decks available to them.

NEW TONNAGE

It is probable that the time will come when we shall wish to return the *Durban Castle* and *Warwick Castle* to the intermediate service to Beira and back, but in any case the *Llanstephan Castle* and, to a lesser degree, the *Llandovery Castle*, old favourites, will need to be replaced by faster and more up-to-date tonnage.

Accordingly, after protracted negotiations, an order was placed last February with Messrs. Harland and Wolff Limited, Belfast, for the construction of two further intermediate passenger and cargo vessels, each of about 17,300 tons, for the company's round Africa service. The keels of both vessels have been laid, and we hope that the first vessel will be delivered by September, 1951, and the second in December, 1951. It is proposed to name these ships *Rhodesia Castle* and *Kenya Castle* respectively.

PASSENGER TRAFFIC

Owing to the reduced number of immigrants to South Africa travelling during 1949, the number of outward passengers fell appreciably compared with the record figure for 1948. Homeward traffic showed a substantial increase, however, whilst the number of coastwise passengers was greater, so that in the aggregate our passenger earnings in 1949 were slightly better than for 1948. Generally speaking the reversion to prewar seasonal fluctuation in passenger traffic is becoming increasingly marked.

CARGO TRAFFIC

It will be recalled that, in order to assist the exchange position, the South African Government found it necessary, as from July 1, 1949, to restrict imports, and in consequence our carryings to South Africa were much reduced during the last six months of the year, with consequent reductions in earnings.

It was difficult to obtain satisfactory cargoes for the company's vessels engaged in the U.S.A./South Africa trade, owing to import restrictions.

PORT CONGESTION

The reduction in congestion at ports in East and Portuguese East Africa, which I mentioned last year, was unfortunately not maintained during the latter half of 1949 and the early part of the present year, and in fact, the position became so bad at the port of Beira that the United Kingdom/Continent Conference Lines very reluctantly had to impose a surcharge on outward rates of freight to that port. Discussions have taken place between the interested Governments with a view to effecting an improvement in conditions at Beira.

Congestion has also been experienced at East African ports, and the consequential delays have added to the costs of providing passenger and cargo liner services to and from these ports.

OPERATING COSTS AND DEVALUATION OF STERLING

The unhappy upward trend of operating costs, an experience common to us all, upon which I have commented at each of the last four annual general meetings of the company, continued unabated. This trend was accelerated by the devaluation of sterling which brought in its train a series of increases in prices of the goods and services (such as port facilities) which shipowners require to maintain their vessels at sea and in port. The heaviest increase was in fuel oil and Diesel oil prices, the main effect of which will be felt during 1950. We estimate that the cost to the company of the increase in oil prices alone will amount to more than £650,000 per annum. This, stockholders will of course appreciate, is a serious factor.

Apart from the greatly increased cost of building new ships, carrying with it the need for increased provisions for depreciation already mentioned, our running costs are now more than 200 per cent. above the prewar level, some items of expenditure costing four times as much as before the war. In contrast to this I may mention that the average increase in our passage rates is less than 75 per cent., and in our freight rates less than 100 per cent., above the prewar level.

The devaluation of sterling was not without some benefit, however. One immediate effect was to increase by about 40 per cent. the sterling price of gold, which is South Africa's principal product. This transformed the economic position of the Union, and the difficulties in which South Africa was placed during the earlier part of the year were greatly alleviated, although the drastic measures previously taken by the Union Government to rectify these were also having a salutary effect.

Already it has been found practicable to modify somewhat the restrictions imposed upon imports into South Africa, and it may be that further modifications will gradually become possible.

OUTLOOK

I have already referred to the improvement in South Africa's economic position during recent months. The other territories of Southern and East Africa are continuing to develop and, although these are days of difficult and constantly changing conditions, I think we can look forward to a satisfactory demand for the services which it is our constant aim efficiently to provide.

In the course of a short business visit to South Africa towards the end of 1949 I again had the pleasure of meeting the Prime Minister, Dr Malan, and members of his Cabinet. I formed a favourable impression of the progress which the Union was making and generally my great faith in South Africa's future was strengthened. I am also glad to say my colleagues Mr C. L. Dalziel and Sir William Clark have since been able to visit the Union.

BOARD

It was with deep regret that we accepted the resignation of Mr A. M. Campbell, C.M.G., from his position as chief agent of the company in South and East Africa and as a member of the Board. Mr Campbell had served the Union-Castle company for 46 years, and his wide knowledge of the company's affairs and its personnel were of great value to the company, whilst he was held in the highest esteem throughout the Union. We are all profoundly sorry that his state of health is such that he is no longer able to carry on his duties. I am sure those of you who knew Mr Campbell will join with the directors in hoping for improvement.

STAFF

You will realise that the satisfactory operation of the company throughout another year, upon which I have been able to report to you today, has been in no small measure due to the loyal and zealous service rendered by its personnel ashore and afloat, and my colleagues and I wish once again to express on our united behalf appreciation of their good work.

The report and accounts were adopted.

DUNLOP RUBBER COMPANY LIMITED

LARGER TURNOVER BUT LOWER GROUP PROFIT

The fifty-first ordinary general meeting of the Dunlop Rubber Company Limited, was held on June 12th in London, W.

Sir Clive Baillieu, K.B.E., C.M.G., the chairman, in the course of his speech, said:—

When I spoke to you last year I referred to the very serious nature of the disturbances then occurring in Malaya, and expressed the hope that Government policy, designed to rid the country of the bandit forces and restore peace and security to this supremely important area, would bear fruit.

Despite the devotion and courage of all the services engaged against the terrorists, I regret to say that the situation to-day in Malaya, after showing some improvement in September and October of last year, has steadily deteriorated. "Too little and too late," has been the tragic commentary on Commonwealth policy and action in Malaya in the last two years.

To-day, far more than yesterday, there is a growing recognition what this menace in Malaya portends, not only to Malaya itself, but to south-east Asia, to the Commonwealth and to the security of the world at large. There is now welcome evidence that those at the centre of power see that this menace is directed at the integrity of the Commonwealth and that it can only be met by mobilising the full and united resources of the Commonwealth itself.

There are on our estates approximately 21,000 persons who have lived under conditions of incessant strain during the past twelve months. We have taken all possible steps within our power to ease their anxieties and to ensure their safety; and recently we have provided a fleet of armoured cars for their protection.

TYRE DIVISION

Last year I referred to the fact that in the early months of 1949 it had become apparent that dealers in the United Kingdom had adequate stocks and that as a result there had been some reduction in the demand for tyres for replacement purposes. The rubber consumed in this country for transportation purposes fell from 117,043 tons in 1948 to 106,553 tons in 1949. The significant feature however, was the fact that during the last quarter of the year no less than 32,047 tons were consumed for these purposes. This figure of course includes rubber used in tyres sold for all purposes.

Export sales from the various divisions of the company during 1949 were a record.

During the last few days you will have heard of the opening of the new Dunlop Research Centre at Birmingham. Its completion will give the company opportunities for extending and co-ordinating the research facilities of the group. The application to Dunlop products of new synthetic materials, as they become available, is kept constantly under review by our technicians.

GENERAL REVIEW

The continuation of present inflationary trends, and of the high and oppressive level of taxation, permit no deviation from the prudent dividend policy of past years, which has been designed to strengthen our financial resources, in order to increase our efficiency and to provide for the expansion of our business and of employment. The dividend this year has accordingly been kept at the level of recent years.

During the last five years a sum of £11 million has been provided for depreciation, but as the rates of depreciation allowed by the taxation authorities are today inadequate we, in common with industry generally, are obliged to pay tax on our greater provision. You will see from the directors' report that during the same period taxation has taken £16,200,000 after allowing for excess profits tax refunds, and out of the remaining taxed profits we have put to reserve a total of £10,400,000 in order mainly to meet the capital requirements of the business.

If it had not been for the ploughing back of these profits, we could not face, as we do, with confidence in ourselves and our resources, a situation so charged with uncertainties and with the menace of the ever-growing claims which the State makes upon the product of industry.

Whatever the experts may seek to prove by their figures, we know that the volume of private savings has diminished, is diminishing, and so threatens the very future of employment and well-being of this country.

STATE EXPENDITURE

Last year I expressed the opinion that the vast and menacing increase in State expenditure constituted the basic inflationary influence in our whole economy. I believe this statement to be profoundly true.

When the history of these times comes to be written, in an atmosphere removed from the controversies and distractions of the day, I also believe it will be agreed, that it was industry which made the decisive contribution to the reconversion of the country from war to peace, to the restoration of our manufactures and to the rebuilding of our export trade. And this has been achieved in the face of many difficulties and of the persistent pressure of an inflationary situation.

We welcome the end of petrol rationing, the substantial modifications of the control of steel distribution and the measure of relief provided from double taxation. These are all helpful—if belated—decisions that will assist industry and give greater freedom to our economy.

But we must recognise that we are still as a nation living beyond our means. Government expenditure still towers to ever higher levels. There has been no real relief from taxation, no adequate restoration of incentives. We are caught in a vicious circle of ever-rising State expenditure, of increasing taxation and rising costs. There is an added urgency to come to grips with these inter-locking problems of State expenditure and taxation, because of the increasing pressure on industrial costs due to rising raw material prices and distribution costs.

Last year I pointed out that the Dunlop group earned a net margin of profit after, all charges and taxation, of 3.9 per cent. of sales. The corresponding figure for 1949 fell to 2.7 per cent.

FACTS MUST BE FACED

To save ourselves we shall be forced to shed many illusions that have beguiled our postwar thinking. In the end we must face the facts and realities of our situation, however unpalatable they may be and to whatever extent they conflict with long-cherished beliefs.

Today, we are gathering the fruits of wise leadership in past years. We can face the future, firm in the assurance to be derived from a soundly based business, strengthened by the growing diversity of its manufactures and the ever-increasing contribution from our overseas interests.

The report was adopted.

GREEN HEARN AND COMPANY

(Manufacturers of "Lyndale" Coats and Suits)

STEADY AND SOLID EXPANSION

The twelfth annual ordinary general meeting of Green Hearn and Company, Limited, was held on June 9th in London, Mr Michael Marks (one of the joint managing directors) presiding.

The following is an extract from the statement by the joint managing director (Mr M. Marks) circulated with the report and accounts for the year ended December 31, 1949:—

The profit of the company and its subsidiary, I. Green and Company (Mantles), Limited, for 1949, amounted to £85,235, the comparative figure for 1948 being £69,674 in respect of the parent company only.

After deducting directors' fees £200 and making provision for taxation and reserve for future taxation 1950-51, the net balance transferred to profit and loss appropriation account is £39,169, the comparative figure for 1948 being £28,395.

The reserve for equalisation of dividends is now increased to £13,500, and, being already subjected to income tax deduction, will be adequate to cover future preference dividends many times. In this connection, it will be seen also that, of the original preference share capital, more than one-quarter has been redeemed.

DIVIDEND AGAIN 32½ PER CENT.

Including the balance brought forward from 1948 and after allowing for the preference dividend paid and accrued, the interim ordinary dividend of 12½ per cent. and preference share redemption reserve, the sum of £45,624 remains to the credit of profit and loss account. From this, your directors recommend the payment of a final dividend of 20 per cent. (actual) less income tax, which, with the interim dividend, makes 32½ per cent. for the year, as before.

Last year, your directors applied £11,798 in respect of special surpluses on the war damage claim and accumulated interest thereon towards writing down goodwill to £37,000, which originally was at a figure of £50,836. In view of the expenditure on fixed assets of the nature involved in the conditions attaching to the agreement for excess profits tax (post-war refund), the opinion of eminent counsel was taken, upon which your directors are now able to eliminate the sum of £18,898 standing to the credit of that account, by a transfer in further reduction of goodwill; and, in addition, your directors also recommend the appropriation of £8,102, so that in the aggregate result goodwill will now stand reduced to a figure of £10,000 only, which it is hoped further to reduce in future years.

Thus, the sum of £23,122 will be carried forward, as against £12,588 carried forward last year in respect of the parent company.

RECORD TURNOVER

Our turnover continued its steady and solid expansion and, while we have been able to indicate that each succeeding previous year showed a higher figure than that in the year before, the figures for 1949 constitute a new record. Your directors are happy to be able to add that, such is the reputation of our "Lyndale" products, the sales figures in this current year to date, so far compare most favourably with those for the same period last year. It will be observed that our wholly owned subsidiary, I. Green and Company (Mantles), Limited, has now recommenced its manufacturing operations the total production therefrom being, entirely for our company to ensure a source of production for the additional turnover demanded by buyers in all the leading stores throughout the country. The advances to I. Green and Company (Mantles), Limited, cover the cost of the factory, its machinery, equipment and working finance, these assets all being included within the consolidated accounts now submitted. The expansion of the company's business also necessitates the carrying of a larger holding of stock, likewise to be expected in current trading conditions. Although there was an increase on fixed assets last year of £35,769, the current assets show a surplus of £133,390, as against £140,270 last year.

The report and accounts were adopted.

ANGLO-PALESTINE BANK

RESULTS AGAIN SATISFACTORY

CONSIDERABLE EXTENSION OF BUSINESS

MR S. HOOFIEN'S STATEMENT

The annual general meeting, being the forty-eighth ordinary general meeting, of The Anglo-Palestine Bank Limited, was held on June 12th at 6, Gracechurch Street, London, E.C., Mr. S. Hoofien (chairman of the company) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ending December 31, 1949, and was taken as read:—

The past year has been one on which we can look back with some gratification. The accounts show a not inconsiderable extension of business and the results, too, have again been satisfactory.

INCREASED DEPOSITS AND LOANS

Deposits have gone up by £16,400,000 and loans and advances by £3,400,000. Liquid means show an increase of £11,800,000. The item of documentary credits has fallen by £1,200,000, mainly due to an increase in bulk buying. The decrease of £1,000,000 in guarantees, etc., is incidental, partly setting off the increase in the previous year.

The net profit, after making full provision for taxation and bad and doubtful debts, and after a generous contribution to the contingencies fund, shows an increase from £255,000 to £292,000, and your directors have, therefore, found it possible to appropriate to the reserve fund an amount of close upon £200,000, to bring it up to the figure of the paid-up capital (including the Preference shares) namely, £870,000.

Notice has been given on March 30, 1950, to the holders of the four and a-half per cent. cumulative redeemable preference shares of the directors' intention to redeem these shares on July 1st at a premium of 1s. per £1 share, in accordance with Article 7 of the articles of association.

RELEASES OF STERLING BALANCES

Releases of sterling balances to Israel during the year were governed by an agreement between the two Governments which was concluded in May, 1949. A further agreement for releases during 1950 was reached on February 10, 1950. Mr. David Israeli, an assistant general manager of this bank, again served on the delegation which negotiated the agreement. The vexed matter of the claims and counterclaims resulting from the relinquishment of the British Mandate over Palestine in May, 1948, has also been happily brought to an end by an agreement concluded on March 30, 1950, which seems to give reasonable satisfaction to both parties. It will interest shareholders to learn that this agreement disposes of the rival claims of the United Knigdom authorities and the Israel authorities to a deposit of £1,793,000 held by the bank. This deposit is now to be held at the disposal of the Government of Israel.

It has also been agreed between the two Governments to continue in force the arrangement of 1947 for the avoidance of double taxation. The relevant exchange of notes was published as Treaty Series No. 19 (1950) Cmd. 7912, dated February 10, 1950. The agreement has now been given statutory effect by Order in Council made May 10th.

These agreements, reached in an atmosphere of mutual understanding and good will, have, one may assume, helped to pave the way for the recent de jure recognition of Israel by H.M. Government. Trade relations between the two countries, which had necessarily suffered to some extent from the unavailability of sterling, show a tendency towards renewed extension. This trend will no doubt, be welcomed on both sides, and the bank will, as heretofore, do whatever is in its power to further it.

REOPENING OF JERUSALEM OFFICE

We have recently been able to reoccupy our Jerusalem offices, one of the most prominent buildings in the town, which was situated in one of the "security zones" closed to the public since 1946. The new part of Jerusalem is rapidly resuming its normal aspect. We may take some pride in the part which the bank has played in the various measures undertaken, with no small success, towards the economic rehabilitation of Jerusalem. I feel confident that the essentially simple problem of finding a modus for the safeguarding of, and free access to the Holy places in the Israel section of Jerusalem will find its solution without the quite unnecessary complications which have been under discussion for some time.

During the year we have opened a new branch in the Haifa Bay district, and in the course of 1950 we expect to open two new branches in Tel-Aviv, one in Acre and one in Lydda Town. We maintain a foreign exchange service for travellers passing through Lydda Airport and similarly serve incoming travellers in Haifa port. We are also planning for the opening of a further number of branches and agencies throughout the country to meet the demands for banking facilities and services by the increasing population.

The issue department and the Government loans servicing department have been functioning smoothly.

SUBSIDIARY COMPANIES

The General Mortgage Bank of Palestine Limited, our most important subsidiary, has not been able to extend its business during the past year, as the capital needs of the Government rendered the issue of further debentures impracticable However, in the course of 1950 a considerable extension seems probable, as the Government, within the framework of its Development Budget intends to acquire debentures to an amount of several million pounds in order to enable the bank to grant mortgage loans for a corresponding amount. These loans, it is intended, will be guaranteed by the Government. The dividend on both the ordinary and preference shares has been maintained at 6 per cent.

The A.P.B. Investment Company, Limited has considerably extended its business and the directors have been able to decide on a first distribution of a dividend of 6 per cent. on the ordinary shares for the period of 18 months ending December 31, 1949.

The Otsar La'Taasiya, Limited (Industrial Credit Corporation) and Otsar La'Haqlauth, Limited (Agricultural Credit Corporation) have both done well and are extending their business.

None of these four subsidiaries has suffered any loss in consequence of the events of recent years, any more than the bank itself. They have not, indeed, suffered any loss during the whole course of their existence.

PROPOSED CHANGE OF REGISTRATION

There remains one important matter to which I feel I should make some reference. As shareholders are aware the bank is registered as an English company. In Israel, where practically the whole of the business is conducted, it is registered as a foreign company. In view of the important position which the bank holds in the financial and economic structure of the country it is only natural that the Israel Government and the public should desire the bank to be an Israel company and under the present circumstances this desire is naturally shared by your directors. I should perhaps point out that in fact since 1932 your directors have been meeting regularly in Palestine; that as from April, 1947, the United Kingdom Inland Revenue Authorities consider the bank as non-resident in the United Kingdom for tax purposes; and that since February, 1948, when Palestine was excluded from the sterling area, the capital and reserves of the bank have been treated as being invested in that country. Your directors have consequently reached the conclusion that the change of registration would be in the best interests of the bank and of its shareholders. Discussions have therefore taken place with the bank's advisers on the best methods of effecting this change while ensuring that the interests of the shareholders should in no way be prejudiced thereby. I hope that the scheme under discussion will in the near future be ripe for submission to the Treasury authorities both in the United Kingdom and in Israel whose consent will be required. Shareholders will be advised of all particulars at the earliest possible opportunity. In all, I believe we can look back on a successful year of consolidation and extension in the public-spirited manner which has become part of the bank's tradition.

DIVIDEND RECOMMENDATIONS

Your directors recommend a total dividend for the year on the ordinary and "A" ordinary shares of 13 per cent. subject to income tax. On account of this total dividend an interim dividend of 6 per cent., subject to tax, was paid on November 14, 1949. The final dividend, therefore, will be at the rate of 7 per cent., subject to tax. Shareholders resident in the United Kingdom will receive the final dividend under deduction of Israel income tax at 5s. in the £, and United Kingdom income tax at 4s. 6d. in the £, thus giving provisional relief under the agreement referred to above at the rate of 4s. 6d. in the £. The dividend counterfoils will contain a statement as to the effect of the double taxation agreement.

The extension of business during the year has again placed a considerable burden on the management and the staff and I should again like to place on record the directors' appreciation of their devoted services.

The report and accounts were unanimously adopted and the dividends as recommended were approved.

The retiring directors, Mr S. Hoofien and Dr A. Hantke, were re-elected; and the remuneration of the auditors, Messrs. Jackson Pixley and Co., having been fixed, the proceedings terminated.

IMPERIAL CHEMICAL INDUSTRIES, LIMITED

TURNOVER £10,000,000 HIGHER

LORD McGOWAN'S SURVEY OF ACTIVITIES

The twenty-third annual general meeting of Imperial Chemical Industries, Limited, was held on June 8th in London.

The Rt. Honourable Lord McGowan, K.B.E., D.C.L., LL.D., the chairman, in the course of his speech, said:

The consolidated trading results were about £4,000,000 lower in 1949 than in 1948. The main factors accounting for this were additional costs of production—including wages, raw materials and fuel—not reflected during 1949 in increased selling prices, and a fairly sharp reduction in the export prices of some of our products to meet the competition, which I forecast when I spoke to you last year. Today we must keep a careful eye on our prices if we are not to lose business to keen competitors. We have not been unsuccessful, and, indeed, at £174,000,000 our turnover is £10,000,000 higher than in 1948. The total value of exports was also higher in 1949 than in 1948. In 1949 we did a larger volume of business at a smaller margin; this reduction in the margin of profits being due to both increased costs and reduced or maintained selling prices.

DEVALUATION

Devaluation of the pound sterling in September, 1949, had the effect of increasing substantially the cost of some of our raw materials, but this increase in cost was more than offset by the increased sterling proceeds of exports. Since devaluation we have been able to obtain for many products both an expansion of trade and increased sterling prices; the devaluation of the pound sterling thus resulted in an improvement in our export trade, but much of this advantage is likely to disappear to the extent that costs in Britain rise as a secondary result of devaluation.

Nevertheless, since devaluation, there has been a substantial improvement in our turnover, both at home and abroad, and I believe that with the very solid foundations upon which the company's operations are based, we shall continue not merely to maintain, but to expand, our total sales. Much depends upon our ability to keep down costs in face of the increasing burdens which manufacture in Britain has to bear, and this has our constant attention. We cannot overlook the possibility of competition from Germany and Japan.

The final dividend proposed for 1949 is 7 per cent., making a total of 10 per cent., which is the same as in the past few years.

OVERSEAS ACTIVITIES

In its overseas activities, the company's fortunes are, of course, subject to all the winds of political disturbance that blow. In the sub-continent of India for example, the tension between India and Pakistan has made conditions difficult. In China the southward sweep of the Communist armies has meant a curtailment of our activities there.

In other parts of the world, particularly in South America, difficulties have arisen because of currency restriction and import licensing, but, generally speaking, the company has fared reasonably well, having regard to these conditions, and we are not unhopeful of the prospects of the future when, in some countries at any rate, these restrictions upon trade and upon the remittance of profits may be eased.

In Australia, notwithstanding considerable industrial unrest, our subsidiary company, Imperial Chemical Industries of Australia and New Zealand, Limited, celebrated with increased profits for 1949 not only the twenty-first anniversary of its incorporation but also the seventy-fifth year since the foundation of the first factory which ultimately became absorbed in its undertaking—a notable double event. In Canada, too, our associated company, Canadian Industries, Limited, has achieved a new level of prosperity, higher indeed than its record figures for 1948.

PURCHASE OF ARNOLD HOFFMAN AND COMPANY

So far as the United States is concerned, I have an encouraging story to tell. The negotiations announced some time ago for the purchase of a controlling interest in the share capital of Arnold Hoffman and Company, Inc., have been successfully concluded, and the company now owns 70 per cent. of that corporation's capital. Through the organisation of this American corporation we expect to be able to develop by manufacture in the United States the results of patient research in our own laboratories in Britain, and we also expect to find new openings for the export to the United States of products manufactured in Britain.

In South Africa, our associated company, African Explosives and Chemical Industries, Limited, the ordinary share capital of which we own jointly with De Beers Industrial Corporation, Limited, continues to prosper and to expand. A heavy capital expenditure programme is in progress designed to increase the capacity for the production of blasting explosives and fertilisers.

DOUBLE TAXATION RELIEF

Before leaving overseas matters, however, I must not fail to refer to the amendment to the current Finance Bill which the Chancellor of the Exchequer intends to move with the object of giving double taxation relief, within limits, upon income arising from those countries with which, for one reason or another, it has hitherto not been possible to make double taxation treaties.

This step is most welcome, as the total home and overseas burden of taxation in some of those cases has been crippling—sometimes exceeding 70 per cent.—and has been having a most serious deterrent effect upon overseas trading and investment. We should, however, like to see the Chancellor go all the way and give full relief.

THE CURRENT YEAR

When I last addressed you I said that I saw no cause for pessimism, nor was there at that time. Shortly afterwards, however, there was a recession of trade in the home market and a distinct falling off in the sales of many of our products. In addition we had to reduce our prices in certain export markets because of competition. Although towards the end of the year business at home improved, the improvement was insufficient to compensate for the earlier fall in home sales and price reductions in the export markets. At a time like this, with the world so disturbed, it is more dangerous than ever to prophesy; all I can say is that we are very satisfied with the trading for the first months of this year and that as far as one can see at the moment the prospects are encouraging. I can only hope that exchange and import licence restrictions will not make conditions more difficult in our export markets.

You will be glad to learn that we have maintained cordial relationships with the various trade unions to which different sections of our employees belong. This is a matter which your directors regard as of the highest importance.

The report and accounts were adopted.

GENERAL MINING AND FINANCE CORPORATION, LIMITED

SIR GEORGE ALBU'S REVIEW

The fiftieth annual general meeting of shareholders was held on June 6 at Johannesburg, Sir George W. Albu, Bt., presiding.

The following is an extract from the chairman's speech: Revenue for the year at £571,265 shows an increase of £99,059 on that of the previous year, and the profit for the year at £462,856 was £99,579 more than in 1948. This profit, added to the unappropriated balance of £142,175 brought forward from the previous year, made a total amount available for distribution of £605,031. Dividends for the year were maintained at 25 per cent. The unappropriated balance carried forward at the year end was £153,373.

In October last shareholders were offered 379,374 shares at £5 5s. per share in the proportion of three new shares for every ten shares held. In consequence of this offer, the issued capital of your corporation was increased to £1,643,953 in shares of £1 each, and £1,571,262, being the premium accruing as the result of the issue, less the expenses involved, has been credited to share premium account.

Since the year end a further 33,333 reserve shares have been issued, as a result of which the issued capital now stands at £1,677,286 in shares of £1 each fully paid up.

Investments in stocks, shares and in Government and municipal securities at £3,908,845, show an increase of £548,340 on last year's figure. The aggregate market value of investments is largely in excess of the book value as shown in the balance sheet.

GOLD MINING INDUSTRY

The most important event during the year under review was the devaluation of the South African pound in terms of the United States dollar, which became effective on September 19, 1949. The immediate benefit to flow to the gold mining industry was the increase in the amount received for an ounce of fine gold from 172s. 6d. to 248s. 3d., which has resulted in a material improvement in working profits of the individual mining companies. These increased profits have a beneficial effect upon the country as a whole, including the Union Treasury, which will receive a higher rate of tax. This increase in revenue per ounce of gold has meant that the pay limit of ore reserves has been decreased, in consequence of which low grade ore, previously classed as marginal or uneconomic, has now become payable, resulting in large increases in ore reserve tonnages. The overall effect is to extend the lives of the mines and to give to those mines previously working at little or no profit a new lease of life.

The supply of native labour, though still inadequate, improved considerably during the year.

Much progress has been made in the initial stages of development of the new goldfield in the Orange Free State in which your corporation is largely interested. To date no fewer than 12 mines have been sited, on nearly all of which shaft sinking has been commenced, while further prospecting and drilling operations are being carried on over a widespread area. Although it is impracticable to attempt to assess the potential of any mining area until a large amount of development has been accomplished, the recent results of reef intersections by shaft sinking and disclosures from development can be considered as distinctly promising.

Large amounts of capital are still required to bring not only the mines for which mining leases have been granted, but also other potential mining areas in the Free State to the producing stage, and it is of interest to note from the recent instances of the issue of debenture stock, that financial institutions have shown their faith in the potentialities of this new field. This new method of obtaining finance for these projects will reduce the amount of money required from shareholders and is to be commended. I sincerely trust, therefore, that the Government will not introduce further legislation which might discourage the flow of capital from overseas so vitally necessary, not only for the development of these fields, but for the whole economy of this country.

The chairman then referred to the affairs of the companies in which the Corporation is mainly interested, namely: West Rand Consolidated Mines, Limited; Van Ryn Gold Mines Estate, Limited; East Rand Proprietary Mines, Limited; Durban Roodepoort Deep, Limited; Crown Mines, Limited, and General Exploration Orange Free State, Limited.

NEW INTERESTS

The 33,333 reserve shares to which I referred when dealing with the increase of capital of your corporation were issued as part consideration for the acquisition of a substantial shareholding in Consolidated Rand Investment and Trust Company, Limited. This company holds a substantial interest in its associated company, Transvaal Mining and Finance Company, Limited, and the more important interests of these two companies are their holdings of shares in Blinkpoort Gold Syndicate, Limited, Doornkop Sugar Estates, Limited, Free State Geduld Mines, Limited, Hall Longmore and Co., Limited, Lydenburg Platinum, Limited, Masonite (Africa), Limited, South Roodepoorte Main Reef Areas, Limited, and Transvaal-Orangia Exploration, Limited. Consequently your corporation's interests have now been extended to include these companies.

Copies of the full report of the proceedings may be obtained on application to the London office.

SIMMS MOTOR UNITS LIMITED

ENCOURAGING OUTLOOK

MR TOM THORNYCROFT'S REVIEW

The thirtieth ordinary general meeting of Simms Motor Units Limited was held on June 8th at the company's works. Mr Tom Thornycroft (the chairman) presiding.

The following is an extract from his circulated speech:—

The past year's excellent results have been brought about by hard work, improvement in manufacturing efficiency, and a great team spirit. They are in no way due to price increases to customers—prices still being only 50/60 per cent. above 1939, and in some cases less than this.

I feel we need not be afraid of any fair competition, however great, as we have always been able to compete by reason of the high quality of our products and the excellence of our after-sales service. Our relations with Government departments and nationalised industries remain very satisfactory, and it appears that their policy is not to encourage one vast private monopoly for the supply of electrical and fuel injection equipment, but to share the business. There is a certain amount of danger from large monopoly interests unless these are properly controlled—the vehicle industry and engine manufacturers would be very reluctant to see the elimination of competition in the supply of the vital components manufactured by your company. By offering good value, quality and technical service at fair and economic prices we are confident of retaining and extending the goodwill of the trade.

The outlook for 1950 is encouraging despite the many difficulties with which we are faced. The liquid position continues to improve and this is giving us more chance of taking advantage of modern machine-tool improvements. It is of the utmost importance to keep up to date in regard to the use of the latest and most efficient machine tools and equipment.

The improvement in the organisation that I mentioned last year has been continued, we have a fine team, and the results show what can be done.

HAYESHAW, LIMITED

SATISFACTORY PROGRESS

The annual general meeting of Hayeshaw, Limited, was held on June 13th in Manchester.

The following is the chairman's statement which was circulated with the report and accounts.

The profit for the year amounts to £164,252, as compared with £130,018 for the previous year, after providing £56,314 for depreciation as against £40,600. Taxation takes £91,544 of this profit. The directors recommend a final dividend of 5 per cent., again making 7½ per cent. for the year, which will leave an increase in the balance carried forward of £48,887, bringing the total to £85,580.

EXTENSIVE RE-EQUIPMENT

Since the formation of the company in 1947, the sum of £165,165 has been spent on the modernisation of our mills, and the balance of our commitments for new equipment amounts approximately to £470,000.

The Board of Trade has approved our re-equipment schemes, which therefore rank for the 25 per cent. subsidy under the "Cripps' Plan." The programme is timed for completion in April, 1952. The company's spinning mills will then be in a position to supply about 70 per cent. of their output in ring yarn.

We are deriving notable advantages in continuity of production and long runs from our close association with Tootal and with Clegg and Orr, and it is anticipated that a large proportion of our new ring yarn output will be absorbed by their expanding weaving capacity on automatic looms.

In anticipation of the capital expenditure involved, the board has issued at par £300,000 of 4½ per cent. unsecured notes, 1955/60, which have been placed privately by Lazard Brothers and Company, Limited. Part of the proceeds of this issue has been used to repay other bank and loan facilities.

The introduction of the forward contract by the Raw Cotton Commission has enabled stocks of cotton to be reduced and assisted us in dispensing for the time being with bankers' acceptance credits.

DISTRIBUTION OF AVERAGE SALES POUND

The distribution of the average sales pound was:—

	£	s.	d.	%
Raw materials		12	11	64.6
Other supplies, expenses and services		1	6	7.4
Wages, salaries and pensions		3	10	19.2
Provision for depreciation ...			5	2.1
Taxation			9	3.7
Dividends (net)			2	.9
Retained in business ...			5	2.1
	£1	0	0	100.0

Throughout the year all our mills again operated at full capacity. Demand for our wide range of single and doubled yarns remains strong.

CO-OPERATION IN REDEPLOYMENT

Both subsidiaries continue to enjoy the benefits of workstudy and the establishment of modern operating standards. The wholehearted co-operation of our workpeople and their trade union leaders in these methods, which are comparatively new in the spinning industry, has proved invaluable and a determining factor in deciding the scale of our re-equipment programme.

With the growing strength of our organisation and with our valuable associations, I look forward to the future with confidence, believing we are well prepared to meet the exacting demands of competition.

On your behalf, I express to management and workpeople my appreciation of their sustained efforts during the year.

The report and accounts were adopted.

THE NATIONAL BANK OF NEW ZEALAND, LIMITED

FURTHER EXPANSION

The seventy-eighth annual general meeting of The National Bank of New Zealand, Limited will be held on July 6 in London.

The following is an extract from the circulated statement by Sir Sydney Parkes, C.B.E., the chairman:

We are able to report a further expansion in all phases of the business of the bank.

The net profit of £168,300 although slightly higher than last year, is modified by increased expenses and heavier staff costs. The interim dividend of 2 per cent., less United Kingdom income-tax, was paid, and the directors now recommend a final dividend of 3 per cent., less United Kingdom income-tax.

The level of trade within the Dominion has been good throughout the year. The buying power of the public does not appear to have slackened, but with a wider range and better quality of merchandise available trade has been more balanced than in recent years.

The deposits of the trading banks have been higher month by month than in the previous year and reached the peak figure of £N.Z.213,000,000 in February, 1950. Advances in general have been lower than the previous year, the highest amount being £N.Z.94,000,000 in March, 1950.

PRIMARY INDUSTRIES

Climatic conditions throughout the year were favourable and the volume of primary production was high. For the seven months to February 28, 1950, the weight of butter graded for export was 7.1 per cent. higher than the previous year, and cheese showed an increase of 7.7 per cent., although more recent reports indicate that these good figures are not being maintained for the rest of the season. Meat killings for export are at a high level and an important item in the increased weight is the additional tonnage of beef, which was up by 4,700 tons for the first half of the season. Lambing percentages were exceptionally high and it is anticipated that the total of lambs killed will exceed 12,000,000 carcasses.

New price agreements covering dairy produce and meat for the current season were negotiated with the United Kingdom Government last July and these allowed for the full permissible increase of 7½ per cent over the previous year. Prices at the 1949-50 series of wool sales have considerably exceeded those of the previous season, and new peak prices have been established for superfine half-bred and super merino wools. Competition at all sales has been well spread, Bradford being the mainstay of the market, particularly with medium and crossbred wools, while Continental buyers contended strongly for the fine wools.

W. T. HENLEY'S TELEGRAPH WORKS COMPANY LIMITED

FRESH RECORDS

The annual general meeting of W. T. Henley's Telegraph Works Company Limited, was held on June 9th in London, Sir Montague Hughman (chairman of the company) presiding.

The chairman, in the course of his speech, said: 1949 was a year of great activity in the whole organisation of this great company. We were able to complete the year with a record output in volume and a record turnover. The export turnover showed a considerable increase over any other year, and business in the home market gave us the opportunity of reducing the large accumulation of orders and to offer more favourable delivery times for new business. Keen competition is present in the activities of every section of our business. It is gratifying to note that in the 113th year of our history fresh records have again been achieved.

During last autumn the Government announced its policy of retrenchment of expenditure, and some overseas countries restricted imports, or local conditions made it difficult to export. From this you will see that having increased our sales overseas very considerably, a proportion of these have been made from local stocks, which have not yet been replenished. The point I want to get home is that while our business last year was very large at home and abroad, there are many factors which we have to face in 1950 which may result in a reduction in our volume of business.

DEVELOPMENT AND RESEARCH

Our research laboratories have had another arduous, but successful, year of progress. Our plant development department continues to work at high pressure. All the buildings having been completed at our new Birtley factory, production commenced on a small scale this year.

Our business in power cables reached record postwar levels. The tonnage leaving the works exceeded that of 1948 by 10 per cent. Our copper wire mills produced an all-time record output. Our engineering works have continued to make steady headway with very satisfactory results, and certain new lines are already well established. The combined output of both North Woolwich and Birtley Rubber Cable Works shows a slight reduction in mileage over 1948, but the tonnage of what we despatched showed an increase over 1948. Export figures were affected by the falling off in demand.

Henley's Tyre and Rubber Company Limited: The recession in demand for tyres of all kinds in the home market remained for the first half-year of 1949 and left us with large stocks of finished tyres. The figures for 1949 show that a loss has been incurred.

The profit earned by the parent company and its subsidiaries, after charging depreciation, taxation, etc., is £758,583, which, added to the balance brought forward from the previous years, makes a total of £1,624,896. I am sure stockholders will regard this as a very satisfactory position.

As regards the future, you have a very valuable business and we have very loyal workers both at head office, the works and overseas. The combined team method is what I am always happy about and you can rely upon everyone putting forward his or her best for Henley's not only during the current year, but in the future.

The report was adopted.

POWER SECURITIES CORPORATION, LIMITED

ORGANISATION FULLY EMPLOYED

The twenty-seventh annual general meeting of Power Securities Corporation, Limited, was held on June 15th in London.

Mr William Shearer (chairman and managing director), in the course of his speech, said: In my speech last year I referred to the serious adverse effects on the national economy resulting from the present penal rate of taxation and the continuance of unnecessary controls, and I then expressed the hope that a halt would be called to further experiments in nationalisation. The result of the recent General Election has, fortunately, imposed a temporary restraint in certain directions, notably further nationalisation experiments, but high taxation and unnecessary controls continue to be an intolerable burden on business, commerce and the individual citizen.

EVER-RISING COSTS

The ever-rising cost of labour and materials, and the discouragement to full and productive work resulting from high taxation and restrictive practices, are factors outside the control of any individual firm. In these circumstances, it is becoming increasingly difficult to quote on competitive tenders for public works with any assurance that the price quoted will bear even a reasonable relation to the ultimate cost. As the result, it is unfortunately necessary to introduce safeguards against increased costs arising from these factors to the detriment of expansion of business.

Our organisation, which, as you are aware, embraces the engineering and construction business of Balfour, Beatty and Company, Limited, was, however, fully employed during 1949 and the total capital value of work in hand at the close of the year was in excess of £30 million.

Our financial business has been rather more active than during the previous year, the volume of underwriting business having shown a substantial increase. In October last we again handled an issue of capital for the East African Power and Lighting Company, Limited consisting of one million £1 4 per cent. preference shares at par and one million £1 ordinary shares at 30s. per share. A minimum of one-third of each class of share was made available for applications received in East Africa, and the issue was completely successful in both countries.

Turning now to the accounts, you will see from the consolidated profit and loss account that the gross profit amounts to £410,513, which compares with £378,641 in 1948, an increase of £31,872, while on the other side of the account the consolidated net profit at £115,642, shows a small decrease of about £13,000 on the preceding year. You will note, however, that £100,147 has been provided this year for depreciation of property and plant, which is £37,036 more than the provision made in the last account. To the net profit of £115,642 must be added taxation over-provided or recoverable in respect of the previous year, amounting to £15,184, which, together with the balance of profit brought forward of £132,473, makes a total of £263,299, out of which the usual instalment for past service benefits of £5,650 has been paid to our pension fund, £43,314 has been transferred to general reserve, and £55,000 to contracts reserve. After paying or providing for the dividend on the preference shares, and the proposed dividend on the ordinary shares, the amount to be carried forward on the current year is £113,685, £132,473, brought in.

The report

THE AUSTRALIAN ESTATES COMPANY LIMITED

SATISFACTORY RESULTS FOR 1949 BUT INCREASED EXPENSES

MR D. C. F. LOWSON'S REVIEW

The annual general meeting of the Australian Estates Company Limited, will be held in London, on July 4, 1950. The following are extracts from the circulated statement of the chairman, Mr D. C. F. Lowson:

ACCOUNTS

The revenue from all sources for 1949 totalled £903,126, compared with £846,451 for 1948. The increase is accounted for by the special distribution from the Joint Organisation for the disposal of wartime wool stocks, amounting to £75,179, which was received during the year.

Revenue was well maintained in all departments of the company's business but expenses continue unavoidably to increase and the charge for taxation on the year's profits is again very heavy.

The net profit for the year is £247,156, compared with £215,082 for 1948, and, after adding £113,831 brought forward from the previous year, there is an amount of £360,987 available for appropriation.

The continued satisfactory results enable the board to recommend a dividend of 7 per cent. on the Ordinary stock and, in addition, to make a special distribution of 3 per cent. out of the exceptional receipts from the Joint Organisation.

After paying the dividends and making the appropriations set out in the profit and loss account, including the transfer of £100,000 to general reserve, the amount to be carried forward to 1950 is £144,237.

PASTORAL

The average price realised for the company's wool clip was slightly higher than in 1948. It has always been our policy to shear and market our clip early in the season and consequently in 1949 we did not reap the full benefit of the increase in prices which followed the devaluation of sterling.

The total number of sheep owned by the company shows a slight reduction as compared with 1948 due to resumptions of some of our sheep areas. The average price realised for all our sale sheep was about 13s. a head higher than in the previous year, though we did not sell as many as in 1948.

Our cattle properties maintained a high turnover at an improved price on 1948. Ordinary station expenditure again rose steeply during 1949, due to increases in award rates and cost of all stores and materials; and the expense of operating most stations is now two to three times higher than it was in 1939.

It must be borne in mind that, in the event of a fall in the price of wool or live stock to more normal levels, we shall be seriously affected by these increased charges and costs which will not be capable of easy or early reduction and which will tend to be of a more or less permanent character; so that it is quite possible to visualise our present substantial profits from these departments being turned into a loss, even if the amounts our products realise are considerably higher than they were in 1939.

SUGAR

The current level of Australian sugar production is in the neighbourhood of 940,000 tons per annum; of which approximately 500,000 tons are consumed internally and the balance of 440,000 tons are exported.

The agreement recently negotiated between the Governments of the United Kingdom and Australia provides that the United Kingdom will take the whole of Australia's exportable surplus from 1950 to 1952, and thereafter, until 1957, will find a market for 600,000 tons annually. Consequently, even if internal consumption only remains at its present level, there will be a potential annual market for 1,100,000 tons of Australian sugar.

As a result of this new arrangement, and also since the introduction of new cane varieties, it is expected that there will in future be larger crops to be crushed at the mills in which the company is interested. It has, therefore, become necessary both to modernise and to increase the machinery and equipment at both "Kalamia" and "Pleystowe" and the expenditure at each mill, over the next four years will involve some hundreds of thousands of pounds. This expenditure, however, is necessary both to support the arrangement to supply additional sugar to overseas markets and to cater for higher cane supplies that will be grown in future and which the mills will be under an obligation to take.

The programme of expenditure has been carefully studied by the company's consulting engineers and technical staff; and two members of our research staff left in January to spend three months investigating sugar plants and equipments in the United States and West Indies so that any additions to our mills can be modelled on latest sugar mill practices.

AGENCY

Our woolbroking, stock and station, merchandise and sub-branch businesses all had a high turnover for the year, and the policy of establishing sub-branches in Queensland and Victoria, which has been followed in recent years, has proved successful, both in strengthening our main wool-selling centres in Melbourne and Brisbane and in providing greatly improved services to the company's growing number of clients. The company has been fortunate in securing competent and energetic branch managers and officers.

WOOL

The total Australian wool clip for 1949-50 is expected to amount to approximately 3,400,000 bales, as compared with 3,275,272 bales in the previous year, the increase being due to a continued recovery in the size of the flocks in the Eastern States, which had fallen considerably during the drought years of 1944-45. There is little doubt that it will exceed £A.250 million in value, which is rather more than five times the average value of Australian wool for the five prewar years and surpasses the previous record of approximately £A.195 million paid for the clip of 1948-49.

The future appears bright for a continuation of satisfactory wool prices. The Joint Organisation for the disposal of wartime wool stocks increased their offerings during the season under review without any apparent influence on the market; and it is expected that by the end of June this organisation's stock will be less than 500,000 bales, as compared with more than 10 million bales in June, 1945.

There are indications of a consumer resistance to present prices from many countries, but wool continues to go into consumption very freely; it has been estimated that the world is at present using more than 1,000,000 bales in excess of the annual production. If this is correct, and with only a limited quantity available from the Joint Organisation stock pile, a shortage of raw material appears to be close at hand which could be accentuated, having regard to the higher standard of living which is the aim of so many countries to-day.

The continued very high price of wool is bound to lead to increased efforts to produce and use substitutes which, from the point of view of the long-term outlook for the industry, is to be regretted.

GENERAL

In accordance with the policy of which shareholders are already aware, we have added to our investments in this country connected with food and agriculture as opportunity offers. Your board believe that it is in the best interest of the company not only to have, as already exists, a diversification of our activities but also a spread of our interests so that we are not subject to all the hazards and uncertainties of one individual industry or one individual country.

At the very high and often inflated prices for many properties and businesses now ruling in Australia, the board feel that it would be a mistake merely to acquire new properties out there for the sake of doing so; at the same time, we are anxious to maintain the full scope of our interests in Australia and our general manager there has much in mind the desirability of acquiring further interests and properties when this can be done on an attractive basis. Meanwhile we are pursuing a policy of carrying out improvements to, and modernisation of, our existing valuable assets so as to bring them up to the highest possible state of operating efficiency, to reduce costs or at least to check their tendency to rise and thus make them able to withstand any more difficult times which may lie ahead.

We are naturally sorry that dividend limitation is still with us; but, having regard to the fact that no ordinary dividend was paid for ten years between 1929 and 1939, we feel justified in making a special distribution on this occasion of 3 per cent out of our share of the profits of the Joint Organisation for the disposal of wartime wool stocks, from which we received last year £75,179.

Our whole organisation in Australia has given yeoman service under the able and inspiring leadership of our general manager, Mr Colman, and has maintained the company's high standard in all its branches.

NOTICES

...of Industrial Administration membership literature for ...trated, Management Reviews, B.I.M. Bulletins, ...Offers.—Box 443.

...good experience ...tories

EXPERT Shorthand-Typist, City Merchant's office, hours 9.30-5, 5-day week.—State qualifications, experience, to Box 447.

MALE ACCOUNTANT, age 30 to 35 years, required by United Overseas Petroleum Company Ltd., West Hall, Byfleet. Must have practical experience of accounting up to balance sheet standard. First-hand knowledge of shipping and shipping accounting. Accustomed to supervising staff and working on own initiative. Should be a member or finalist of at least one of the Institutes or the Chartered Institute of Secretaries. Personnel Supervisor.

Statistical Summary

EXCHEQUER RETURNS

For the week ended June 10, 1950, total ordinary revenue was £61,951,000 against ordinary expenditure of £62,879,000 and issues to sinking funds £260,000. Thus, including sinking fund allocations of £2,304,000 the surplus accrued since April 1st is £26,419,000 compared with £22,509,000 for the corresponding period a year ago.

HIS MAJESTY'S COLONIAL SERVICE
SIERRA LEONE

A vacancy exists for an Economist in the Department of Commerce and Industry, Sierra Leone. Duties will be to build up the Economic Branch of the Department, to conduct economic surveys and research into the economics of production of the principal agricultural commodities, to collect data necessary for the establishment of primary and secondary industries, and to conduct socio-economic research. Appointment is on contract for a period of two tours, each of 18-24 months, in the first instance. Salary offered for a suitably qualified man is on a flat rate of between £1,600 and £1,800 a year, with gratuity payable on satisfactory completion of contract at the rate of £37 10s. for each period of three months' service. In addition, a temporary cost-of-living allowance of £125 a year is payable. Partly furnished Government quarters are normally available and £150 a year will be deducted for rent. Free first-class passages on appointment and on leave are provided for the officer and his wife, provided permission is given for the officer's wife to accompany him. Income tax is at local rates which are very much lower than those in the United Kingdom. Leave on full pay is granted at the rate of 7 days for each completed month of residential service.

Candidates should be under 50 years of age, and should possess a University degree with First or Second Class Honours in Economics, and should have had considerable experience of administration, research and economic planning. Preference will be given to persons possessing post-graduate qualifications in research, or with previous economic experience in under-developed territories. Form of application can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1. The closing date for the receipt of completed application forms is June 30th.

COUNTY BOROUGH OF SOUTHEND-ON-SEA
EDUCATION COMMITTEE

MUNICIPAL COLLEGE

Principal: R. W. Wilson, B.Sc. (Eng.), A.C.G.I., Whit. Sch. D.I.C., A.M.I.E.E.

Applications are invited for the post of full-time Teacher of Commercial Subjects for the Department of Commerce.

Salary—Burnham Scale.

Particulars of the post and forms of application may be obtained from the undersigned (stamped addressed foolscap envelope), and should be returned by not later than 14 days after the appearance of this advertisement.

H. BOYES WATSON,
Chief Education Offi...
Education Office, Warrior Square, Southend-on-Sea.

MURRA...

UNIVERSITY OF LONDON

The Senate invite applications for the Chair of Political Science tenable at the London School of Economics and Political Science (salary £1,800 a year). Applications (10 copies) must be received not later than August 18, 1950, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Staff Tutor in Economics in the Department of Extra-Mural Studies, at a salary scale of £550/£50/£900 per annum, or Junior Staff Tutor at a salary scale of £450/£25/£500 per annum. The status and salary of the successful candidate to be fixed according to qualifications and experience.

Applications, stating age, academic qualifications and experience, and the names of three referees together with copies of two testimonials, should be received not later than June 24, 1950, by the undersigned, from whom further particulars of the conditions of appointment may be obtained.

STANLEY DUMBELL, Registrar.

May 23, 1950.

UNIVERSITY OF NOTTINGHAM
SCHOOL OF AGRICULTURE

SENIOR AGRICULTURAL ECONOMIST

Applications are invited for the appointment of a Senior Agricultural Economist. Salary scale: men £710 to £850, women £620 to £710, plus cost of living bonus, men £90, women £72 per annum. Candidates must be graduates in Economics and/or Agriculture.

Form of application and Conditions of Appointment may be obtained from the undersigned.

H. PICKBOURNE, Registrar.

CROWN AGENTS FOR THE COLONIES

Industrial Officer required by the Government of Nigeria for the Department of Commerce and Industries for one tour of 24 to 36 months with prospect of permanency. Commencing salary according to qualifications and experience in scale £711, rising to £1,290 a year. Outfit allowance £60. Free passages for officer and wife and assistance towards the cost of children's passages. Liberal leave on full salary. Candidates, not over 35 years of age, should have had a commercial training with experience in the management of industrial or commercial enterprise and of accounting. A University Degree in Economics or Commerce would be an advantage. Apply at once by letter, stating age, whether married or single, and full particulars of qualifications and experience and mentioning this paper, to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M/N/25576/3C on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

OUR APPOINTMENTS BUREAU WELCOMES ENQUIRIES

from Professional Men, Directors and Higher Executives who have vacancies for secretaries with a University standard of training. For interview by Employers, students are selected from among those who have completed their course with the full London College Diploma. In accordance with our established custom, no fees are charged for this service. Please write or telephone to:—

Repairing the Damage

THE countries of western Europe have spent a very bad-tempered week. The greatest target of criticism has inevitably been the British Government and the Labour Party's pamphlet on European unity. But the general display of ill-temper has not been confined to the critics of Britain. The Belgians aroused criticism by their refusal to enter the European payments scheme save on their own terms, and the French upset the Germans by attempting to abolish double prices for German coal before the Schuman talks started. Altogether, the European family appears to be very much on edge. These displays mark the extent to which the issue of European integration touches the most vulnerable points in the particular European countries. The European economy as a whole has reached a turning point in its development. All that can be accomplished in the way of internal recovery has virtually been achieved. Production has been restored, investment has increased, financial stability has been more or less regained. The next steps in Europe lie in one direction only—in new and better methods of international co-operation. The new projects—liberalisation of trade, the payments union, the Schuman plan—all extend beyond the bounds of national sovereignty. They raise in hard practical form the question of greater integration.

But it is precisely at this point that the most sensitive problems of national interest arise; it is defensiveness and self-interest that explains the edge on European tempers. In the short run, there is no necessary harmony between national self-interest and the wider gains to be achieved by freer trade, greater specialisation and a fuller division of labour. In fact, in this century, Europe has always tended to reject the international division of labour in favour of national protection. Today the tendency is still strong. For instance, the Economic Commission for Europe has pointed out that even the mild degree of liberalisation of trade achieved in Europe in the last year has already led to a crop of new private cartels intent upon the old and unhappily well-proven method of integration by self-interest—that of fixing prices and dividing markets. The question of full employment complicates, but does not change, the basic conflict. A government pledged to full employment is no doubt more unwilling to risk the sectional unemployment which successful competition from abroad could entail. But the proof that the relatively new policy of full employment is not the villain of the piece lies in the fact that the worst barriers in European trade were thrown up during depression and collapsing employment.

For the time being, however, Britain with its espousal of "national planning for full employment" has contrived to attract to itself the major share of western Europe's black looks. Some of the comments from across the Channel and the Atlantic may have been exaggerated and unjust, but they are a danger signal of the degree of distrust that British policies have aroused. To be universally suspect is not

a comfortable or worthy posture for any Government and the attempt must at once be begun to repair the damage. The weakness of the British Government's present position is that they appear to be aware of only half the problem. The risks of abandoning the protection of a cloistered economy and of entering into a more liberalised economy in which all western European countries could contribute towards a wider division of labour, higher productivity and expanding trade are apparently never far from their minds. Yet they seem oblivious of the opposite risk—eventually lethal for a trading nation—of the stifling of demand and the stagnation of markets brought about by economic nationalism. The only sure way of counteracting the deplorable impression made by British policy in recent weeks is to demonstrate that a myopic brooding over the risks of unemployment is not the last word of British statesmanship.

Happily there are two immediate opportunities for the new approach. To one of them, Britain is already committed. The new payments scheme (which, with modifications to meet Belgian objections, will come into force in July) is a radical departure from Britain's previous insistence upon bilateralism. In so far as purely financial obstacles have stood in the way of a greater flow of European trade, the new mechanism which restores the convertibility of European currencies in current trade and permits a measure of discrimination against the dollar can become an instrument of liberation.

Financial mechanisms do not, however, cushion national economies against the consequences of freer trade and freer competition. Here a new proposal recently put forward by Dr Stikker, the conciliator of OEEC, grasps the very conflict between national self interest and the advantages of wider and freer trade. Briefly, Dr Stikker suggests that the policy of removing all quantitative restrictions upon private trade should be pressed home. Instead of the percentage of 60 per cent already agreed, the level should be raised to 75 per cent by the end of 1950. For the remaining 25 per cent, which contains a number of basic commodities, there should be no general removal of restrictions but the nations should proceed to abolish their quotas, commodity by commodity. To prevent too great a disturbance in the local economies which might be the first symptom of such a revival of direct competition, Dr. Stikker suggests that a general fund should be established by the governments concerned to assist the modernisation of industries falling behind in the competitive race or to start alternative industries where local enterprises become completely redundant. In this context, the Stikker proposals seem to echo one important aspect of the Schuman plan—the concentration of output upon efficient producers and the possible provision of subsidies to less efficient enterprises during "the period of transition."

There are inevitable dangers in both projects. Financial compensation can easily degenerate into subsidies to the inefficient. The difficulties of finding alternative employment for capital and labour—particularly in hard-pressed economies such as Italy—should not be underrated. Nor, above all, have European governments yet felt the full strength of their own entrenched vested interests in business and in the trade unions. But the proposals may offer some hope of breaking the age-old deadlock between national self interest and international integration. Above all, they provide a framework within which Britain could, if it wished, show that it supported international expansion as ardently as it now advocates national planning and employment policies.

The Government's first hesitations about joining the Schuman talks have, of course, made it more difficult to enter effectively into any discussions for promoting an expanding European economy. But it is not too late to reverse decisions which have done Britain nothing but harm and earned it nothing but suspicion. The Stikker proposals at least have not yet been the subject of Britain's customary cold douche of official comment. Here the field is wide open for a new initiative. But even in the more confused and trampled field of the Schuman talks, it cannot be too late to undo some of the damage. Next Monday the House of Commons will debate a motion urging the Government to participate in the Paris talks with the sensible reservation already made by the Dutch—that Britain may withdraw from the talks if the proposals put forward are demonstrably unworkable. It would be an act of statesmanship to accept the motion and to bring to an end the self-imposed isolation in which Britain stands ingloriously today. Some swallowing of pride would not be a heavy price if it restored the concert of Europe.

Poland Since Rokossovsky

THE Polish Government and the Polish people have lately received the price for their submission to Soviet suzerainty. Their present frontier with Germany, the notorious Oder-Neisse line, has been "officially recognised" by the east German republic as a permanent and unalterable "frontier of peace." The German Communist government announced on June 7th that it had assigned to Poland the resettled and reorganised area known to all Poles as the "recovered territories"—some 44,000 square miles of agricultural land, coal mines and Silesian industry.

The Germans who signed this agreement knew quite well that to recover those territories, to restore to them the millions of German refugees who were herded away in the grim trek of 1945, will be the main hope and inspiration of German nationalism. Yet they, who work night and day to rouse German nationalism in the west against the Americans, British and French, were ready—with an opportunism as cynical as that of Stalin in August, 1939—formally to accept the frontier and to clasp hands with their comrades of the Polish Communist Party. No doubt, they were forced into it; for them, too, it was a price—the price demanded by the Soviet Government before it would allow the eastern Germans to begin to assume the conduct of foreign affairs that was promised last autumn. Until eastern Europe in general, and the Poles in particular, had been shown that the Germans of the Soviet zone had become "different," that they were willing to make publicly a renunciation of national aspirations unthinkable to the vast maiority of Germans west of the Elbe—until then, the Russians could not safely allow Herr Ulbricht and his colleagues any rope.

The signing of this agreement is an outstanding event in Poland's postwar history, second in significance only to the appointment last November of the Russian Marshal Constantin Rokossovsky as Poland's Minister of Defence and master of the armed forces. Indeed, there is a clear connection between the two events. The sending of the Marshal to Warsaw with powers to watch, report and give orders was a stern warning to the Poles that there must be no Titoism, no "bourgeois nationalism," no faltering in co-operation with the Soviet Union, during a period when Moscow was building up the political prestige of the east German republic, wooing nationalism throughout Germany, and taking steps towards rearming reliable Germans. Policy to Poland had to be stern while policy to Germans was flattering; now that the job with the Germans—or part of it—has been done it is their turn to feel the strong hand and the Poles' turn to be appeased.

*

What has been happening in eastern Germany during this period of active Soviet policy is well known; less well known, because pains have been taken to conceal it, is the sequence of events in Poland, the proudest and most anti-Russian of the east European peoples. Even the small group of professional Communists who dominate the present regime under President Bierut had hoped at one time that zeal in the service of the Kremlin would leave them some measure of political and economic independence. They could not believe that Poland would be made to travel along the same path as Bulgaria and Czechoslovakia. Their disillusionment may only have begun with the arrival of Marshal Rokossovsky seven months ago; it must have been completed when, early last month, the Marshal joined the Polish Politburo. For in no other satellite country has a Russian been introduced into the national Politburo, the source and centre of political power. And it is remarkable that the appointment was announced by the Polish press in a brief and matter-of-fact way, so that this latest exercise of suzerainty should not be too widely noticed and understood.

In the seven months that passed between these two events, the sovietisation of Polish life has been pushed forward at remarkable speed. The entire wholesale trade and three-quarters of the retail trade have been nationalised; the drive to force the peasants and their land into collective organisations has moved into top gear; the resistance—both political and religious—of the Catholic Church, stubbornly maintained for five years has been met with force; and throughout the military and social life of Poland the stamp of Soviet practice and theory has been imposed.

The results for which Rokossovsky is—or may be thought to be—largely responsible are to be seen most clearly in the Polish armed forces. The army budget has been doubled from 60 billion zloty in 1949 to 130 billion in 1950; the term of military service has been lengthened from 24 to 27 months in the army and to three years in the air force and navy. Most significant of all, the security police have been placed under army command, with General Radkiewicz, its chief, responsible to the Marshal. It is reported that the strength of the security force has been considerably increased and its budget raised by 20 per cent, to a figure twice that of 1948. The strength of the army is now estimated at over 350,000 and that of the security police at 120,000.

Further evidence of the Marshal's influence has appeared in two Bills passed by the Polish Seym. One substituted the Soviet system of military organisation for the Polish; the other ensured large reserve forces and a steady process of indoctrination against western influences by ordering regular military training for men up to the age of 50. As in Czechoslovakia, strenuous efforts have been made to eradicate all links with those countries that rose to the defence of Poland in 1939 and all memories of service with them. Over two hundred officers in the highest ranks have been removed and their places taken by Russians and Poles trained in Soviet military academies. The high officers of the future will come from among the cadets who are being sent to the Soviet Union for military and ideological training. To the same end, political education on Soviet lines in the army has been greatly developed. Shortly after taking up his duties, Marshal Rokossovsky dismissed General Wongrowski, head of political education in the army, who has now been succeeded by General Naszkowski, for the last three years Polish Ambassador in Moscow.

*

To judge what is being done to integrate Polish heavy industry with the plans of the Soviet Union and other eastern governments has become increasingly difficult, owing to the working of the State Secrets Law of last December, under which the passing or discussion of any item of information by workers and others is a grave offence. But enough has been said and written to show that here, too, the Soviet example is being closely followed. Last month, for example, the economic council of the Polish Cabinet decided "to adopt in Polish factories the same system of organisation that exists in Russia." What this will mean in detail is not yet known, but official statements show that the main intention is to put each factory under a single manager. He will be responsible for the discipline of the workers as well as for quantity and quality of output; and this reform will mark the end of the system of collective management in which workers were represented through their delegates.

In the administrative sphere, Bolshevisation has gone ahead in forms which are visible to the whole population. On May 23rd the old and cherished institution of Lord Mayor of Warsaw was abolished as part of a national plan for liquidating the former system of local government. In its place there are now being set up some 4,000 local national councils, or soviets, of which the chairman in the majority of cases is a member of the Communist Party. These councils are, according to President Bierut, only temporary and are to prepare the ground for election of permanent councils at a later date. Their tasks are to

> increase the political watchfulness and raise the political consciousness of the masses and their affinity with the international camp of peace led by the Soviet Union, to fight against diversion and the class enemy.

Three weeks ago, at the first session of the new national council for Warsaw, the deputy premier Mr Zawadzki declared that, in accordance with the teachings of Stalin, the new councils were "the expression of a state

of a new type, exercising more and more successfully the dictatorship of the proletariat." They are not in any way responsible to the Polish parliament, whose authority has been steadily whittled away, but are entirely under the control of a small group of Communists in the State Council, presided over by President Bierut. Through this chain of command the party has a firm grip on all kinds of local activities of strategic, economic and social importance, including road-building, housing and the siting of factories.

In a matter of months, therefore, the *Gleichschaltung* and bolshevising of Poland have been pushed forward at a speed that has surprised and dismayed all, including many Polish Communists, who expected more cautious treatment and more dignified status for a country in a key strategic and economic position—indeed, the most powerful satellite in eastern Europe. The claim to "equality between socialist states," now so vigorously asserted by Marshal Tito in Jugoslavia, has been silenced by disciplinary action in the highest ranks of the Party. So, with great skill and boldness, the Russians have been able to play on Polish fears of German national revival without modifying in the least their own policies in Germany—save for the recognition of the Oder-Neisse line.

That recognition has, of course, no international validity; that can be given only by agreement between the four Potsdam Powers. The way therefore lies open for the Russians, at some future date, to reverse their policy, and to argue that acceptance of the present Polish frontier by the east Germans in no way commits any future government of a united Germany. As the years pass, Polish industry, agriculture and military strength will become more and more enmeshed in an imperial Communist system which will make the wooing and winning of a united Germany the main aim of its foreign policy in Europe. If it turns out that the lure of eastern markets and food supplies is not enough, then the Russians will be free to consider whether to pay the price of frontier revision. By then, if Marshal Rokossovsky's work has been done properly, the Poles will be powerless to resist. Indeed, there is always the possibility that eastern Germany and Poland will be so integrated with the Soviet Union that a revision of their common frontier will be regarded by the Communist leaders of both as an administrative matter of purely domestic concern.

Wood and Trees

NEARLY five years ago, the Forestry Commission was reconstituted under the general control of the Minister of Agriculture and given powers to proceed with an ambitious scheme of afforestation. The reasons for the anxiety which gave rise to the scheme are obvious enough. Two world wars, and half a century of neglect on the part of many private owners, had left the woodlands of Britain in a sorry and depleted condition. By dint of wholesale and often indiscriminate felling, more than half of the nation's timber requirements during the last war were secured from home sources, compared with a mere 4 per cent in the years immediately before the war. Britain's woodland area is very small compared with that of most European nations, and reliance on imported supplies of timber has become almost complete. Since imports had to be drastically curtailed during and immediately after the war, the devastation of home woodlands was correspondingly great.

The decline of Britain's assets of native timber is the result of a long period of neglect, coupled with the enormous demands of war. Before 1919 there was no national policy for forestry, and even today state forests account for no more than a quarter of the woodland area. For most private owners, forestry has been at the best a subsidiary enterprise, and woodlands were kept up mainly for sport and amenity. After the middle of the last century, cheap timber supplies from overseas—together with the ending of the Royal Navy's demand for oak—robbed private forestry of its profitability. The incidence of death duties (even though standing timber is not liable for duty until it is cut and sold) has understandably taken away the incentive to plant trees which will not mature for several generations. Nevertheless, private woodlands provided the timber needed in the last war, when almost 350,000 acres were felled. Last year the total area of British woodlands (excluding woods of under 5 acres) capable of economic management was put at no more than 2.4 million acres (or only four and a half per cent of the surface area of Great Britain). Of this area, however, no less than 1,000,000 acres of private woodlands need complete regeneration and are at present unproductive. The nation's resources of timber are perilously small.

These resources cannot be quickly replenished. Woodlands may take from 50 to 150 years to mature and yield a commercial return. This point needs emphasis, since the main argument for a vast programme of state afforestation is one of strategy. In wartime, timber is bulky and costly to import. Standing timber within the country, on the other hand, can be reserved without cost for use in an emergency. It is clearly desirable that the nation should preserve, as an absolute minimum, enough timber to meet all essential needs during a siege of several years. Nevertheless, trees planted now would be of no assistance in a war fought within the next generation—in fact they would occupy some land which might otherwise be used for food production.

There are, of course, good arguments that can be advanced in favour of a policy of large-scale afforestation. It is a stable and important source of rural employment—especially in the depopulated uplands of Wales and Scotland, where many of the new forests will be planted. Although forestry is to some extent competitive with sheep farming, it is complementary to agriculture as a whole and its decay can have a deleterious effect on soil and climate. Finally, there are uncertainties about the supply of timber from overseas. It may be a long time before the world's virgin forests are exhausted, but it will be a long time also before adequate resources can be developed at home. It is these factors which have led the Government to introduce an ambitious long term programme of forest expansion. The eventual aim of the Forestry Commission is to secure 5,000,000 acres of effective woodland by 1995, of which 2,000,000 acres would be got from existing woodlands (with the aid of substantial replanting) and 3,000,000 acres from new schemes of afforestation.

The immediate points of interest concern not the ultimate objectives but the schemes and methods at present being adopted. However important the ultimate expansion of British forestry may be, it is difficult to see how an ambitious programme can be justified at the moment. Forestry is a field of very long-term investment and there are many urgent economic problems to be solved before the British economy acquires a stability in which it is possible to plan fifty years ahead with any assurance. But at the same time violent fluctuations in the forestry programme would have the effect, as in the inter-war years, of raising costs. For the five years 1946-51, £20 million has been set aside as a subsidy to the Forestry Commission, with the declared object that 365,000 acres should be afforested or replanted, 290,000 by the Commission and 75,000 by private owners. It is clear that the programme was too ambitious and it is not surprising that the Commission has failed to fulfil its share of this expansion. Parliament will soon have to consider the next five-year programme, and it should not countenance too fast an expansion—both because of the cost in resources, and of the danger of sudden recoil. Steady aims, not spasmodic attacks, are the essentials of successful forestry.

★

The size of the planting programme is not the only important question of policy. The Forestry Commission is in a unique and dominating position—even though the Minister of Agriculture can now give directions to it if he chooses. After the war it became the largest landowner in Britain but recently a number of its agricultural properties have been handed over for management to another public body, the Agricultural Land Commission. Its powers of compulsory acquisition enable it to bulldoze farmers out of their hill farms. Its virtual monopoly of new planting enables it to change the whole character of the landscape. At present the Commission owns 600,000 acres of trees. One day it may own 3,000,000 acres, together with wide interests in adjacent lands. It will be a far more powerful landowner than any eighteenth century Lowther or Cavendish, and it will become extremely important to devise ways of maintaining its sense of responsibility to the public.

The Commission is also in a powerful position in its relation with the private owners of woodland who are its competitors. Their co-operation is essential to a successful programme of forest expansion. The Commission administers the grants which have been available under the Forestry Act of 1947 to owners who adopt an approved long term plan of timber production under the so-called "dedication schemes." Since the war, owners have been as reluctant to participate in state schemes as they were before the war. Recently, however, some new concessions have been offered to the owners. Their reluctance to commit their heirs too closely has been met by providing that in exceptional circumstances descendants may be released from the agreement. The fear of dictatorship by the Commission has been reduced by the promise to set up an independent investigating committee to review disputes which are not subject to arbitration. Since in forestry, as in other fields, experts often differ, it is important to leave scope for schemes which may offend the canons of orthodoxy. Finally, the scale of grant payable under dedication schemes has been increased.

Another main grievance of the private owners has been ended by the decontrol, last December, of timber prices, which was followed by a general rise in prices of about 25 per cent. This has not prevented suggestions that forestry products should be given the same kind of guarantee as is given to farm products under the Agriculture Act. Apart from the practical difficulties in the way, which are almost insuperable, it should be remembered that the main need today is to encourage planting for the future—which is best aided by specified grants—and not to assure owners of high prices for mature timber, which would only have the result of causing further fellings.

Both private owners and the Commission are in difficulties over the marketing of timber thinnings. Home-grown pitprops command a lower price than imported ones because of inferior preparation. The Forestry Commission has now joined with private owners for the purpose of negotiating pitwood prices with the National Coal Board, and it is this fact more than any other which is causing greater willingness by owners to join the dedication scheme. Nevertheless, a trial of strength between two big public corporations is hardly a solution to the problem. Waste and overlapping could be avoided by the creation of the joint marketing organisation for pitwood proposed by the Select Committee on Estimates—so long as this body, in turn, did not exploit its monopoly position. Standardisation and better preparation is the way to overcome the miners' traditional distrust of home-grown pitprops.

ALLIANCE
ASSURANCE COMPANY LTD.
Head Office: Bartholomew Lane, London, E.C.2
FIRE · LIFE · ACCIDENT · BURGLARY · MOTOR · MARINE · ETC.
The Alliance undertakes the duties of Executor and Trustee and of Trustee for Debenture Issues.

One of the main tasks facing the Commission is to secure a better balance between different types of development. It has been accused of paying too much attention to the acreage planted and too little to the quality and suitability of the timber grown. New afforestation uses up new land and is often costly—especially when it involves the provision of houses for forest workers. Although the planting programme will not make great inroads on land needed for food production, it does not follow that forestry can be concentrated only on land which is sub-marginal for agriculture. The most suitable land for forestry is often land on hillsides, which provide sheep with their winter keep.

The Government has the duty of moderating the ambitions of the Forestry Commission and of ensuring that public subsidies are applied to afforestation on the most suitable land. The Commission in its turn has responsibilities to a wide public. It must exercise them with due attention to the possibilities of private woodlands and with more care for the effect of forest expansion on farming and landscape. What is needed is not an over-ambitious attempt to expand Britain's forest resources without regard to other economic and agricultural policies, but a programme sufficiently modest and realistic which can withstand drastic alteration in the years to come.

NOTES OF THE WEEK

Ripples from the Schuman Pool

The Schuman proposals have acted as a valuable catalyst in British domestic politics, setting astir party opinions which have been hardening rapidly ever since the general election. This effect is not surprising, since M. Schuman has presented the central issue of European union—how much sovereignty each country is prepared to surrender—in the immediate terms of South Wales coal and Middlesbrough steel.

The Liberal reaction has been the most immediate and the most direct. Their party Council has endorsed the plan wholeheartedly and the Liberal MPs tabled a motion of support before Whitsun. In the other two parties the proposals have produced a more complicated effect. Mr Churchill, aware of opposition not only from those who persist in seeing some conflict with Commonwealth interests in the plan, but also from those who are obdurate about the surrender of any sovereignty, is treading warily. So far he has only been able to commit his party to a motion calling for the Government to enter the Paris talks on the same conditional basis as did the Netherlands, to which he has secured the signatures of Mr Clement Davies and other leading Liberals. In next Monday's debate, the Opposition attack is, however, likely to concentrate on the Government's handling of the delicate negotiations rather than on the merits of the plan itself.

Dr Dalton's far from delicate intervention in these negotiations has provided the Opposition with plenty of stones to hurl. The Labour Executive's pamphlet on "European Unity" has also angered some Labour MPs and has provoked the federalist Mr R. W. G. Mackay to a public attack on his party leaders. But it would be a gross miscalculation of the state of opinion in the Labour party to regard this reaction as widespread or to believe there is any real dismay in the Labour ranks at the hostile reception of their pamphlet abroad. Many senior members of the party, including a strong section of the Cabinet, believe that the pamphlet has placed the Conservatives in the position of advocating foreign control over the British steel and coal industries: they believe this view will be unpopular with the electors. Others relish the emergence of a real dispute at a time when the policy of Labour is coming more and more to resemble that of its opponents. There is some foundation for the belief that Dr Dalton by this one act has regained for the first time much of the support in the Labour movement which he had before his fall in 1947.

*

The combined Conservative-Liberal motion on the plan has itself considerable significance. This is the first time in the present parliament that there has been prior agreement between the two opposition parties about a major issue, although they have frequently voted in the same lobby. It will be interesting to see if this accord is merely an accidental result of the present row on foreign policy, or whether it represents the first step in a determined effort by the Tories to secure a united front by agreeing to work together with the Liberals in Parliament. Mr Churchill, in his speech to the Conservative Women's Associations during the recess, hinted strongly at such common action as an immediate Conservative objective at Westminster.

* * *

The Conference of Six Begins

With the best will in the world it is difficult to follow French tactics and intentions over the Schuman pool proposals. Their importance, in the first place, lay in the dramatic gesture made to Bonn, an offer which opened up to the Germans the prospect of taking in one flying stride that return to "equality of rights" in Europe that at one time looked like taking months, if not years. The British Government could be—and was—rebuked by European public opinion for not seeing the overriding importance of this effort at Franco-German reconciliation, and for concentrating attention on ways and means of forming and running the pool.

Now that four governments of Western Union, without the British, plus the Germans and Italians have begun work in Paris and have heard an eloquent and detailed exposition from M. Monnet, it seems clear that, after all, the details are to receive considerable attention from the outset. One had the impression that the purpose of the conference would be to prepare as quickly as possible a general treaty in favour of surrendering some measure of control over coal and steel industries to a "higher authority." Instead sub-committees of experts are being formed to study four matters: the organisation and working of a higher authority; its purpose; the powers that it should have; the sanctions to be applied against members of the pool who do not comply with the authority's decisions and the method of appeal against them. In other words, no one is leaping in the dark and the conference is showing an almost Bevinesque attention to crucial details. This is in many ways a good thing; but where is the jet-propelled fight towards a new Europe which was talked about three weeks ago?

The French have shown the greatest courtesy and understanding in the arrangements that have been made for keeping the British informed through their minister in Paris. The British in turn are tactfully keeping to themselves their ideas about the control of coal and steel, so that they cannot be charged with checking or diverting promising currents of thought that may be running on the other side of the Channel. The conference on the pool will be a great test of statesmanship, of the ability to take great decisions without getting into untenable political positions. If the six governments should get stranded in detail there might be an opportunity for Mr Bevin—paradoxical though it may seem—to come along and lift them out.

Britain and China

Mr Trygve Lie, faint yet pursuing, is coming back to Europe to try to solve the China deadlock before the Assembly opens in September. He thinks—and many think with him—that otherwise the Russians will never return to Uno and that there will be no place left where east and west can talk. He will get support from the British Government who—though they have so far abstained, out of consideration for American feelings, from voting in a hopeless cause—have been working hard in the corridors to secure the seven Security Council votes needed before the Peking delegation can oust that of Nationalist China. Five affirmative votes are Mr Lie's for the asking—those of India, Jugoslavia, Norway, the Soviet Union and Britain, all of whom have recognised the Peking government. Egypt is believed to be a waverer. If Mr Lie could unearth one more realist he might turn the scale.

On balance it is to be hoped that he may do so. The west is deriving nothing but harm from the present situation. The Russians are at fault with their bullying, boycotting tactics; but they have not chosen a worthless case on which to walk out of some two dozen meetings. Who can argue that Nationalist delegates now represent the people of China? Unpalatable as the situation may appear after months of Soviet bad manners, there is a case for ignoring Russian tactics and judging the issue on the basis of fact. The Communist government now clearly controls China both internally and in matters of foreign policy. To deny this is gratuitously to present Moscow with some valid propaganda points against the "capitalist reactionaries" for use in south east Asia and Persia.

It should not be forgotten that the Soviet Union gains greatly by continuance of the present deadlock which leaves China alone *tête-a-tête* with its powerful neighbour. The Russians have shown their awareness of the fact, for instance the number of acts designed to perpetuate China's exclusion—by a requisitioning of American consular property and the recognition by Peking of the Ho Chi-Minh "government" in Indo-China. One can understand the reluctance of the American Government to commit itself on the issue of China, since the China lobby in Congress is behind Senator MacCarthy's damaging campaign. But, in the interests both of the United Nations and of greater western contacts with China, the deadlock should now be brought to an end as speedily as possible.

* * *

Engineers and Common Sense

The announcement that the vote in the Union of Foundry Workers on the "strike or arbitration" ballot, organised by the Confederation of Shipbuilding and Engineering Unions, has shown a majority against strike action has come as a surprise to the public and no doubt as an unpleasant shock to the Communists among the union's leaders. The Foundry Workers' Union was one of the seven which originally pressed for a ballot to be taken, despite the opposition of the majority of other unions in the Confederation. It might accordingly have been assumed that its members would support strike action. The voting among the engineering workers in the National Union of General and Municipal Workers is reported to have shown that 80 per cent of its members favour arbitration. If these two results, which represent the two extremes of union opinion, are typical of the feeling in the industry, the possibility of a national strike in the engineering industry becomes remote, since a two-thirds majority is required for such a course. The vote of the Amalgamated Engineering Union will, however, be the decisive factor because of the dominant position which its size affords it in the Confederation.

If the requisite majority is not obtained, the dispute will presumably be referred automatically to arbitration. All that the ballot will have achieved will have been a delay of several months and a possible strengthening of the employers' resistance to the wage demands of the unions. As Mr Jack Tanner told the AEU National Committee last week, the confederation's decision first to go forward, against his advice, for a £1 a week increase, and subsequently to hold the ballot, succeeded only in postponing negotiations on the revision of the engineering wage structure. It is to be hoped that, once the ballot is over and done with, both the unions and the employers will have achieved a state of mind in which it will be possible to discuss reform rather than merely to threaten coercive action.

The same is equally true on the railways. The National Union of Railwaymen has been holding a series of informal talks with the Railway Executive about its claim for the lower-paid men. In this case the issue is complicated by the fact that, since its most recent claim was put forward, the two other railway unions have decided to put forward wage demands. The only basis on which the Railway Executive ought to entertain these claims is that of a thorough going investigation into the wage structure and differential rates of railway wages and earnings. Since it would appear that the special economic committee has agreed that the general council of the TUC should abdicate any further direct resposibility for wage restraint, the individual unions will now be left with the direct responsibility for conforming to the national economic interest in framing their policies. There will be no superior authority to whose plans lip service can be paid while individual pressure tactics are pursued.

* * *

Protecting the Retailers

Last Friday's debate in the Commons on resale price maintenance provided a remarkable exhibition of blind swiping and swatting from both sides of the House. Resale price maintenance is a device by which manufacturers constrain shopkeepers to charge consumers uniform prices which, left to themselves, they might prefer to reduce in order to attract custom. The picture of manufacturers banded together to enforce high prices naturally rouses indignation. On the other hand, it is precisely analogous to the action of a trade union constraining its members to charge for their work uniform prices which, left to themselves, they might prefer to cut in order to get or keep a job. This makes any logical attack, in the name of freedom and the consumer's interest, rather difficult for the Left to carry through. The defence of the practice from the Conservative side last Friday similarly displayed some odd contradictions, since it follows an election programme that specifically promised the encouragement of competition—a point on which Mr Harold Wilson laid gleeful and damaging emphasis. Deprived of a reliable background of principle, the debate was fertile in irrelevancies, unsupported assertions, and curious hair-splittings; and there emerged from both sides of the House evidence of a terror of change, a clinging to the *status quo*, an overriding concern that no individual now engaged in the retail trade should on any account be squeezed out of it.

By far the most constructive contribution came from Mr C. A. R. Crosland, the Labour member for South Gloucestershire, who wound up the debate; he dispelled the bogy of reckless price wars by pointing out that they were almost invariably the fruit of general depression and would have no *raison d'être* in a time of full employment; he cut cleanly through the ambiguities of the Lloyd Jacob report itself to condemn not merely collective but even individual price maintenance. Since the debate was then brought to a close, no one got a chance to drive Mr Crosland into any of the uncomfortable corners provided for him by previous speakers from his own side of the House.

*

The question of resale price maintenance is of course only one item in the major debate of spur versus featherbed,

and adaptation versus insulation. To say this is not to condemn all such practices automatically. One cannot always be certain that the very maximum of competitive flexibility, the sweeping away of all comfortable safeguards, will yield the best economic results in the long run, let alone the best social climate. There is a case, if not for the featherbed, at least for the shock absorber. But it is impossible to believe that the restrictive price-propping—now affecting nearly a third of private expenditure—constitutes such a desirable minimum. The complacency of Conservative spokesmen hardly encourages confidence in their power or will to restore those economic sanctions for efficiency to which, in general terms, they pay lip-service.

* * *

Counting Heads

A draft Order-in-Council, providing for a census of the population of Great Britain on April 8th next year, was laid before Parliament last week. The question confronting those responsible for a census must always be how to obtain as much information as possible without provoking the resistance of the public or making the returns too complicated. In this heyday of the statisticians there is probably no end to the questions that would provide useful information for some research worker or some Government department. The temptation to suggest that this or that question should be included is consequently almost irresistible. Even so, the Registrar-General appears to be too cautious. It is true that, for the purpose of collecting more information on fertility, he has brought himself to include more questions to married women under 50, which are the sort of questions that newspapers describe as an unwarrantable intrusion on the privacy of individuals. Another new question, for which Parliament's approval must be obtained, as it goes beyond the specifications laid down in the Census Act of 1920, is the age at which employed or would-be employed persons finally ceased their full-time education. As in the previous census, the population will be classified by their occupations as well as by their industries ; that is, it should be possible to obtain the number of skilled workers, clerical workers, managers and so on in the country without going through the laborious process of adding them up industry by industry.

Two omissions suggest themselves. First, no information is to be sought on incomes, either of individuals or households. This might be resented ; but if the Americans can bring themselves to accept such a question in their census this year, could not the British ? Secondly, in the section on housing, there is no question whether a house is rented or owned or what rent is paid. This surely would not be resented and would provide valuable information. It is true that the more the information that has to be tabulated, the longer it is before the results are available. As it is, it will be many years after the census before the last figures are published. But could not this difficulty be got over by the issue of preliminary results based on a sample of the full returns ? It would add greatly to the value of the census if the information obtained by it could be made available more promptly.

* * *

Arab Security Pact

Out of kindness, *The Economist* has hitherto described the internal quarrels of the Arab League as cracks and its face-saving devices as ways of papering them over. Now they have become fissures that no papering can hide. At the League's meeting in Alexandria last week there were two main items on the agenda. One was the action to be taken against Jordan for tacitly admitting the result of the Palestine war by its annexation of Arab Palestine. The other was the reply to be made to the recent Anglo-Franco-American declaration on arms for the Middle East.

Jordan holds that its recent union with Arab Palestine was realistic, was constitutionally carried out with local consent, and is no longer a matter for discussion. It therefore boycotted the League meeting, and the way was open to an outburst of dynastic and family acrimony. Egypt, with the Kingdom of Saudi Arabia tagging at its heels, is enraged at any increase in the lands belonging to the Hashimite family. But its motion to expel Jordan from the League was baulked by Iraq—which, out of family loyalty, tried to effect a compromise. It was decided therefore that Jordan should, for the moment, hold Arab Palestine as "trust property." Egypt, meanwhile, saved its face by securing all signatures but Iraq's to a collective security pact.

This, which is modelled on the Atlantic Charter, provides for mutual military aid in the event of attack, and for joint machinery headed by a permanent Chiefs-of-Staff committee. But what is the use of such a pact without the key signatures of Iraq and Jordan ? And who among five jealously mistrustful states is going to trust his neighbour ? The Egyptians, who have the only sizable army of the five, refused to communicate any details about the size or nature of the help they could send abroad. The other armies have no force worth sending. Who supposes that a Saudi Arabian camel corps can fight against modern weapons, or that Egyptians can be spared outside their own strategically important country ? Why did Syria and Lebanon, who will know this, toady to Egypt's *amour propre* by signing so meaningless a document ? The answer is that they too are ready to put their hand to any agreement that seeks to snub King Abdullah. All five, too, are ready to sign any document which, on the face of it, suggests that local armies can defend the Middle East without the presence of British troops in the area. The extent to which this is a pipe dream will be shown in the series of articles on the strength of their defences, which begins on page 1390 of this issue.

* * *

Packing the Egyptian Senate

There is certainly nothing unusual, no departure from accepted practice, in the action of Egypt's Wafdist government in "packing" the senate with its own supporters. Indeed, the Wafd have long alleged that many of the senators displaced last week to make room for Wafdists and friends of the Wafd were "illegally" appointed—in other words put in by exactly similar means but by non-Wafdist governments ; thus the Wafd may even claim to have righted a wrong. But the fact that there has been no departure from the traditional Egyptian habits of nepotism, political racketeering, and the unwise intermingling of politics, business and finance, has aroused uneasiness and regret in those who saw the re-emergence of a strongly supported popular government as a sign of slightly better things. No one who knows Egypt expected that the return of the Wafd meant the dawn of parliamentary democracy. That day is still a long way ahead. But here is a majority government attempting even more ruthlessly to stifle all opposition than did the minority governments which it succeeded. And the personalities of some of the new senators do not augur well for the programme of assuring the rights and well-being of the common man on which the Wafd romped home in the elections last January.

Best known in this country of the new senators is Ahmed Abboud Pasha, Egypt's leading industrialist and a reputed multi-millionaire, who is a very strange bedfellow indeed for the "party of the people." Another is Farghaly Pasha, who has been much in the Egyptian limelight in the past few weeks in connection with certain developments in the Alexandria cotton market. The other new members of the upper house are the usual run of rich landowners, lawyers and minor politicians, all of whom obviously contributed in one way or another to the Wafdist cause. One can unfortunately expect from few of them any real contribution

Bowater mark . . .

THIS IS A NEWLY registered trade mark—symbolic of the drive, integrity and world-wide service which are associated with the Bowater Organisation.

THE SUBSIDIARY COMPANIES of the Organisation in this country which sell the production of the Bowater paper and board mills, either in original or converted form, have been recorded, by entries made in the Trade Marks Register, as Registered Users of the mark.

IN ADDITION to being used to identify goods manufactured by or for its registered proprietors, the mark will appear on the properties and equipment of the Bowater Organisation and as an advertising symbol.

THE BOWATER PAPER CORPORATION LIMITED
(registered proprietor of the trade mark for the home market)
BOWATERS SALES COMPANY LIMITED
(registered proprietor of the trade mark for export markets)
9 PARK PLACE, ST. JAMES'S, LONDON, S.W.1

What do your retailers think of your advertising?

Today, more than ever before, people are brand conscious and your retailers look to you to create a demand for goods by advertising to the maximum number of people.

The Daily Mirror has the largest daily net sale in the world—over 4,547,000 and, at a very economical space rate tells your product story to millions of people whose purchasing power is high.

Daily Mirror

THE LARGEST DAILY NET SALE IN THE WORLD

tc the improvement of living standards or a decrease in the steadily rising cost of living—probably the two most vital problems for about 19 million of Egypt's 20 million inhabitants.

ECE Goes On

The greatest achievement at the recent meeting of the Economic Commission for Europe (ECE) in Geneva was that the organisation survived intact. In spite of the bitter controversy that marked the debates of the two-week session, neither the eastern nor the western Europeans were prepared to take the initiative in destroying this last remaining forum where they can meet together in public.

The Soviet bloc made its customary references to the "impoverishing" effects on western Europe of the Marshall Plan, and the Russians brought forth the familiar resolution condemning as discriminatory the export licensing policy of the west, particularly of the United States. There was little attempt from the other delegates to counter these accusations, with two notable exceptions. Mr Vilfan of Jugoslavia managed to embarrass the Russians with a request that the Commission should investigate the economic blockade of Jugoslavia by the Cominform countries, but his resolution failed to get western support and was defeated. The other exception was the French delegate, M. André Philip, who made a number of vigorous rebuttals on the principle that the Communists should not be allowed a monopoly of the rostrum.

In the end, the delegates accepted unanimously the annual report of the Commission and also voted for the continuance of all the ECE technical committees. The meeting concluded with amicable promises of co-operation from both sides of the iron curtain.

* * *

Russian Grain for Europe

Perhaps the most arresting development of the session was the news that a further attempt is to be made to solve the east-west trade deadlock. Mr Myrdal, Executive Secretary of ECE, told the delegates that "subject to reservations" various governments had assured him on his recent trip to Moscow, London and Paris that they were ready to undertake multilateral and all-European conversations with a view to expanding intra-European trade. With this encouragement, Mr Myrdal is hoping by the end of the summer to submit to interested governments concrete projects for negotiations.

The spark for his initiative was provided by a Russian hint that east European grain could be made available in large quantities to west European nations. Such a possibility was welcomed by many of the western delegates, though privately some of them saw it as merely another Soviet propaganda move. The cynics suggested that, when it came to the point, the Russians might use the occasion to demand in return that the western nations relax controls over exports of war-potential goods to the east. Tactics of this kind might be a useful device for splitting the west: even within the western group—especially in Germany—the extent of export controls has long been a contentious point, with the United States insisting on a more rigorous export licensing system than some of the Marshall nations are willing to put into force.

To the sceptics it seemed, too, that if the Russians were really serious about increasing trade with the west they would probably choose the bilateral approach rather than the multilateral one now being worked out at Geneva. For they could hope to gain higher prices, and also greater practical concessions on export control, by dealing with single governments rather than at ECE, where their hand would be revealed to many nations and also to American observers.

Some observers, however, feel that the Russian move may herald a genuine change in policy, a new willingness to promote intra-European trade. This school believes that the Soviet Government may be prepared, as a first step, to enter into a European grain agreement on the lines of the International Wheat Agreement, under which they would sell for cash, leaving for later settlement the question of how this money could be spent. Perhaps the Soviet view might be that it is time for the Kremlin to offer some positive proof that there is a practical alternative to "Marshallism."

* * *

Judiciary and Executive

In his address at Birmingham University last week-end, Lord Justice Denning emphasised the importance of the independence of the judges. It is so fundamental to the constitution that it is usually taken for granted. But, as he pointed out, it is the essential difference between the free and the totalitarian countries, and in consequence the principle will be none the worse for being given a public airing.

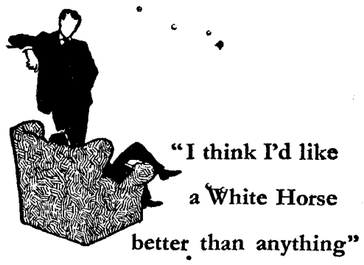
Yet it is a pity that Lord Justice Denning, who, unlike so many judges, is always ready to state a commonsense, non-legalistic point of view, did not go farther into the question of safeguarding individual liberties in the modern state, however freedom-loving it may be. It is quite true that the judges stand between the individual and the state, "protecting the individual from any interference with his freedom that was not justified by the law." But this qualification—not justified by the law—lets in all manner of encroachments, or what the individual sees as encroachments, on his freedom, simply because modern legislation is so all-embracing, so sweeping in the power it gives to the executive. Judges, Lord Justice Denning said, have the right and the duty to point out that a piece of legislation is not, in practice, fulfilling Parliament's intentions; but they cannot criticise or set aside Parliament's intentions, and, therefore, except in the very rare instances where executive action is *ultra vires*, the individual who considers that he is being hardly done by has no recourse. It is not that the people have no confidence in the judges' administration of the law, but rather that they have no confidence nowadays that the law is on their side. Too often, so it seems to the individual, it appears to be on the side of the Government departments.

Two other comments on Lord Justice Denning's address may be made. He spoke of the people's confidence, equal to that felt in the judges, in the chairmen of tribunals where they are independent of the executive. Here again the qualification is important, for most of the tribunals to which an individual can appeal are appointed by a Minister, and may indeed consist of an official of the department concerned in the case at issue. Secondly, Lord Justice Denning spoke of the significance of the Crown Proceedings Act of 1947, by which Government departments were subjected to the jurisdiction of the courts. But in spite of this important new principle, the attitude still prevails that Government departments are above the law, that their officials know best and that it is their convenience which must have priority.

* * *

New Zealand's Upper House

The Liberal Government in New Zealand has decided to abolish the Legislative Council—the upper house of the New Zealand Parliament. The members of the upper house, who at present number twenty-five, are appointed for a term of seven years. The Labour Government, which was defeated in 1949, was in power for fourteen years and the majority of the present members of the Legislative Council are therefore opposed to the policies of the present Government. The Prime Minister, Mr. S. G. Holland, has announced that enough new members—the present number is well below the permitted limit—will be created to ensure the passage of Government business during the session. Thereafter, a special committee will consider a practical alternative chamber before the council is abolished.



The Legislative Council has not recently been held in high esteem in New Zealand politics. It has been treated with scant respect by the House of Representatives and Mr. Holland's decision to do away with a body that has a great potential nuisance value without great popular prestige is understandable enough. A similar problem will arise with the Canadian Senate (whose members are appointed for life) when the Liberal government finally goes out of office. But it is to be hoped that the principle of two-chamber government will be retained by the use of some alternative means of selection; there is a dormant act on the New Zealand statute book which provides for an elective Legislative Council. In a country as much given to political and social experiment at New Zealand, there seems a strong case for retaining a revising chamber.

The New Zealand decision has two points of interest for British constitutional theorists. The first is purely ironic, that—after the torrents of left-wing oratory which have lapped against the foundations of the House of Lords—a government of the Right should find its legislative programme in danger of obstruction by its upper house. But there is a more serious aspect which should be considered by those who advocate a reform of the House of Lords by means of substituting the nominative for the hereditary principle. In all countries

The Odious Brougham

The House of Lords, in which business is usually transacted in a quiet and dignified manner, was the scene this week of a remarkable piece of rudeness. Lord Brougham was the chief performer. Just before the debate began on Monday, his lordship . . . informed the Lords that Chevalier Bunsen, the Prussian Ambassador, was seated in the gallery appropriated to the peeresses; that he had intimated to the Chevalier that his presence there was contrary to the rules of the House, that he was keeping out two peeresses, and that if he did not go out he should have to have him turned out. As the Chevalier had been conducted into the seat by the officers of the House he did not comply with the noble lord's admonitions, whereupon the noble baron desired one of the officers of the house to "take him out." In fact, the Chevalier was actually turned out of the gallery, by Lord Brougham enforcing the orders of the House, and left it "accompanied by two or three ladies." Such a discourteous proceeding, more offensive to the English public than to the Prussian Ambassador, never occurred before in either house of Parliament, and there is only one peer in Parliament, or perhaps only one man in the empire, who could have been guilty of it. Lord Brougham's wrong was apologised for and repaired as promptly as possible by the ministers. . . . But on Tuesday the Marquis of Lansdowne gave notice of a motion for Friday to provide accommodation for foreign ministers. . . . The result will be that a gallery or some other convenient place will now be appropriated to the foreign ministers, and . Chevalier Bunsen . . . will have the satisfaction of procuring for them in the House of Lords recognised and proper accommodation. The place allotted them hitherto has been behind the throne, but except as they imported chairs from some neighbouring apartment, they could not sit, and it is not creditable either to the peers or the architect of the house that a suitable place was not provided for foreign ambassadors when the house was prepared. The blunder will now be remedied, and Lord Brougham's turbulence, more beneficial in its consequence than most of his lordship's less reprehensible proceedings, will have the effect of remedying an undesigned omission.

where the upper house has been entirely or largely composed of nominated members, it has proved to be either merely the creature or else the scourge of the executive according to the length of the latter's term of office. It has no opportunity, as it has under both the hereditary and the elective principles, to achieve a reputation for independent and judicious criticism and review.

* * *

The Biter Bit

The path of the class warrior who is also an employer is a thorny one, as was shown in this week's dispute between the *Daily Worker* and its warehouse staff. The warehousemen stopped work last Friday as a protest against the management's appointment of a new night publisher whose managerial capacity did not seem to the packers and porters to match his ideological qualifications. Both sides agreed to submit the dispute to the arbitration of the Printing and Kindred Trades Federation, which has upheld the managerial rights of the *Daily Worker* to appoint whom it chooses to carry out its orders. It is obviously a matter of great sadness for the *Daily Worker* to be reminded that it is just another irresponsible anti-syndicalist employer, but it has stood up gamely to this test of its doctrinal orthodoxy. The issue of Wednesday announces the arbitration award in one column, while in the contiguous leader column it doubts the wisdom of the foundry workers in rejecting strike action on the grounds that "an arbitration tribunal never gives a verdict on the basis of abstract justice."

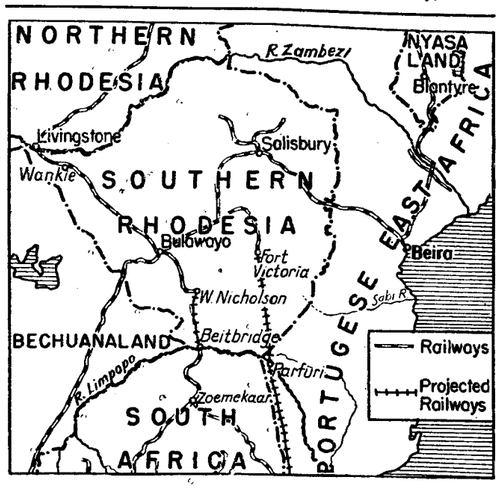
* * *

Good Terms for the Finns

The new Finnish-Soviet Trade Agreement, concluded last week, after seven months of hard bargaining, appears to be good business for the Finns. It provides, at least for three years after reparations end in 1952, a solution to one of their most serious problems—what to do with the inflated metal and shipbuilding industries when compulsory deliveries by them are no longer made under the Armistice terms.

In the five-year period ending December 31, 1955, Finland will export to Russia no less than 57 ships (including 20 small tankers), 200 barges, 60 schooners, industrial and timber-working equipment, cables, pumps and vehicles, besides building a complete new power station in Karelia and sending the more usual exports of prefabricated houses, pulp and pulpwood. The Russians will send to Finland 455,000 tons of wheat, 320,000 tons of sugar, considerable quantities of oil and petrol and lesser quantities of rye, cattle cake, bitumen, industrial chemicals, steel billets, ferro-manganese, cars and machinery.

The total value of trade will be 1,410 million roubles ($352.5 million) each way. Prices should be world market prices, but the Finns fear that, so long as the Russians are the sole buyers of these products, the prices may be affected by the desire to apply political pressure. This remains to be seen; at previous Soviet-Finnish trade talks, although there has been hard bargaining, prices have been quite fair. The refusal of the western powers to send "strategic exports" to the Soviet Union may help the Finns by putting them in a stronger bargaining position for their own heavy industrial products.



Thus the paradox of Russian behaviour towards the Finns is repeated. If this agreement works properly, Finland's economy will be strengthened and, to that extent, the Finnish Communists deprived of opportunities of agitation—and not for the first time. On the other hand the aura of personal success that now surrounds the Agrarian Premier, Mr Kekkonen, may revive an earlier tendency to flirt with the Communists in the hope that their support would consolidate his position *vis-à-vis* the Social Democrats. But in any case the present unhappy division of Finnish politics between town and country—Agrarian and Social Democrat—will continue and, while it does, the anti-Communist front will be weakened.

Agreement on Beira

A twenty-year convention covering the port of Beira was signed in Lisbon a week ago between Southern Rhodesia, Portugal and Britain. Its main provisions are that the Portuguese will maintain the port and the railways connecting it with Southern Rhodesia and Nyasaland in a state fit to deal with the traffic to and from those territories. In return, the British and Southern Rhodesian governments undertake to prevent any discrimination against Beira, as other outlets from central Africa develop. If traffic does fall off, the three governments will consult about it.

This convention represents something of a Pyrrhic victory for the Portuguese. Their concern about Beira is most understandable, since they have been pressed for months to improve the dock facilities and re-equip the railway, which

they took over from a British company last year. But there is very little likelihood that, with the formidable expansion going on in the Rhodesias, Beira will do anything but work to capacity for many years. Indeed, the port and railway still urgently need further capital development.

At the African Transport Conference, which is due to take place in Johannesburg in October, far-reaching decisions should be taken about financing and starting work on one or more of the new railways at present under survey—partly with Marshall Aid funds—to provide the Rhodesias with additional outlets to the sea. The most suitable for Southern Rhodesia is likely to be the one proposed for a link-up with Lourenço Marques. But the Americans are deeply interested in the problem as a whole, since a solution to Africa's transport difficulties should free and cheapen the flow of vital raw materials to the western world. If the Portuguese could persuade themselves to be less cautious about pushing on with the expansion of Beira, their decision would be widely welcomed and strongly supported in both the United Kingdom and the United States. There are already sterling funds available, and Washington would almost certainly be willing at least to make a detailed examination of dollar requirements. Portugal should take the bull by the horns.

Letters to the Editor

The Schuman Plan

SIR,—Your leading article of June 10th on the Schuman Plan and the Atlantic Council illustrate how essential it is today to view our problems in a wider than national perspective: there is no acceptable solution to the German problem except on a European basis, nor to that of the defence of western Europe except on an Atlantic basis. So we are faced with more and more international committees which are becoming vested with the control of our interests and future. That decisions should be taken on an international basis is all to the good, but may a democrat voice his doubts on the growth of a system which is set fair to preclude the people and their parliaments from control over the decisions taken?

When an international committee reaches a decision—and this is accepted by member governments in those cases where this is required—neither parliament nor the nation can demur without disrupting international trust and accord. If electors appear less interested in international affairs than in the past, may it not be because in present conditions the machinery for dealing with them does not allow the elector's interest to be of much effect?

Everything points to the need for a western political authority deriving its power from the peoples, and not from national governments, whether to secure democratic control over M. Schuman's coal and steel authority or over Atlantic defence decisions on such matters as a common defence budget. Until the west makes Mr Churchill's "one spasm of resolve" to establish a democratically constituted political authority, the western peoples cannot bring to bear their common sense and the momentum of their desire for prosperity and peace.—Yours faithfully,

MARTIN MADDAN

Featherbed Farming

SIR,—You yourself have pointed out that whatever the rights and wrongs of the accusations recently levelled against the agricultural community, farmers must realise that if the present food subsidies were withdrawn they would find it far harder than they do today to sell their produce at remunerative prices. No amount of justification of the present system can alter this fact any more than it can alter the necessity for farmers to concentrate every effort upon reducing costs as much in their own interests as in those of the consumer.

There are, however, two factors which are in danger of being overlooked by the general public. During the war the agricultural industry willingly agreed to control of prices, with the result that almost everything produced on farms in this country was sold at prices far below those that could have been obtained in a free market, and far below the prices ruling in practically every other country in the world. It was an essential part of this agreement between producers and the Government that in return for a restriction of profits during the war and the immediate postwar period, prices would be maintained at a remunerative level in later years, even though this might mean paying the British farmer prices higher than those ruling in the open world market. Now is the time for the consumer to stick to his side of the bargain.

The second factor which tends to be overlooked is the financial returns in agriculture compared with those in other walks of life. The farmer himself, although today leading a prosperous life, is not receiving a return out of all proportion to his skill, effort and investment compared with other industries or professions. Take, for instance, the large farmer, who is generally accepted as being the most prosperous of all those engaged in agriculture—the man farming a thousand acres. His net profit before paying his own salary or interest on capital is shown by most surveys to be between £4 and £5 per acre—say, £5,000 per year. His investment in stock and equipment on his farm and the working capital necessary for operating his holding is at today's prices in the neighbourhood of £40 per acre, or £40,000. In an undertaking as exposed to natural hazards as is farming a 10 per cent return would not be considered unreasonable by most industrialists, but let us take a more modest figure of 7½ per cent. Three thousand pounds, therefore, of his profit can be set off as a fair return on his invested capital, leaving £2,000 as his salary. The question is, could such a man, had he gone into some other industry or profession, reckon to earn £2,000? I suggest that anybody with the training, experience and ability necessary to make a profit of £5 per acre on a thousand acre farm certainly has no less skill than a country doctor or solicitor, a clerk to a small county council, or an assistant secretary in a Ministry.
Yours faithfully,

H. D. WALSTON

Thriplow Farms, Cambridge

What Price the Price Mechanism?

SIR,—May I say at once in reply to your comment on my letter, that I have never thought *The Economist* guilty of any elementary fallacy over unemployment statistics? The fallacy is, however, well entrenched in the public mind, and must be dispelled before your arguments receive the attention they deserve.

As to your comments on my conclusions, first, I was not trying to argue that the changes in the composition of the unemployment statistics which I noticed were irreversible, but that they were irrelevant to a judgment on the adequacy of disinflation. The "large factor," which I did not mention, the increased numbers insured, is large only in its effects on the unemployment percentage. When the change occurred in 1948 it scarcely produced a ripple in the statistics of unemployment.

You appeal to qualitative judgments. I find these difficult to make in comparing 1937 and 1950; but they are very relevant between late 1947, when the symptoms of overfull employment were obvious, and today, when they are, as obviously, less. Yet the associated increase in unemployment is about 50,000.—Yours faithfully,

P. M. DEBENHAM

25A Wellington Road, Birmingham, 15

Stranded Chinese Students

SIR,—As one of the stranded, I read with great interest your comment entitled "Stranded Chinese Students" in your issue of June 10th. I should like to point out that this harsh and inconsiderate action of the Hongkong authorities has already caused a wave of indignation not only among those Chinese students studying in this country, but also in other parts of the world. As far as I am aware, Chinese students in America and France are also experiencing the same sort of difficulties. Although those in America (more than ten times the number in this country) can now sail for North China direct, their bitter feeling still persists by reason of the fact that the refusal of Hongkong transit visas has long delayed their passage and because the easiest access to South China is still denied to them.

As to Chinese students in Europe, we are in a much worse position. To go to China by way of America is out of the question owing to the prohibitive cost. In any case, such an arrangement is impossible, as a Hongkong visa is again the prerequisite for the grant of an American visa.

Consequently, ever since February, we have been stranded in a foreign land. Our scanty savings ruh down day by day. By now quite a few are already unable to pay their landladies.
—Yours faithfully,

K. N. HSU

Books and Publications

Mankind's Optimism

"The Proper Study of Mankind. An Inquiry into the Science of Human Relations." By Stuart Chase. Phoenix House. 283 pages. 16s.

THE faith that science alone can solve all human problems has more adherents on both sides of the Atlantic than is perhaps realised. Its appeal is not on the whole to scientists or the sophisticated, many of whom may find it old-fashioned, but it does bring consolation to the spiritually displaced. Natural science, the argument runs, has given man control of his material environment. If his resulting state is not altogether comfortable, that is not because of too much but of too little science. What is now needed is that social science should give him control of his human environment. But it is seldom asked by whom this control is to be exercised, or to what end. Yet these questions cannot be dodged. To say that science is ethically neutral, when it is a question of the social sciences, is not enough. For no scientific discipline can be effectively isolated from its applications.

But doubts about the omnipotence of the scientific method do not trouble Mr Stuart Chase. The ground he covers is wide. In under 300 pages he promises nothing less than "an attempt to explore the possibilities of applying the scientific method . . . to the problems of human relations." However, apart from some glancing tributes to "such European masters as Malthus, Marx, Machiavelli, Adam Smith," this volume is confined almost entirely to recent American work, in "cultural anthropology, social psychology, sociology, economics, and political science," and some other fields.

There is no doubt that a great deal of work under the general heading of social science is being done in America, far more than anywhere else, and that some of it is valuable, since too little is known elsewhere about this vast multicellular activity. But the breathless enthusiasms of Mr Chase will not help the ignorant to find their way about, though it may allow them to indulge the day-dream of a world safe for, and saved by, science. Scattered through the book are tantalising glimpses of investigations which must, the reader feels, be interesting if only he were given a chance to take them in. But he is swept along in a mad rush of quotations, anecdotes—often in the historic present—and unconscious assumptions which it would take another book to disentangle. Mr Chase likes the appeal to authority, even where the need of it is not obvious, as:

> One cannot . . . multiply horses by apples. . . . To do so violates the principle of dimensional homogeneity, says Jones, and he has powerful support from other competent mathematicians . . . including Lancelot Hogben, author of *Mathematics for the Million*.

This kind of thing really is not fair to America or its social science. On the other hand the long list of this author's previous books—a majority of them around and about "economics"—and the wide popularity they evidently enjoy cannot be other than symptomatic of "the bewilderment of a generation which has lost its way." Though such books may satisfy a need, they are not harmless. As Mr Chase observes,

> "We mortals are so prone to believe anything we hear, especially in eight-point type, that a solemn obligation devolves upon those of us who deal in words to do everything in our power to make them clear and true."

Men and Events

"British Politics Since 1900." By D. C. Somervell. Andrew Dakers. 265 pages. 15s.

THIS is a book of which the politically minded layman has stood greatly in need. The immediate past—the events which have been absorbed *seriatim* from the newspapers or the confused recollections of one's elders—is neither so interesting nor so easy to understand as periods, like the mid-Victorian, which are now part of history. Mr Somervell has successfully overcome both these obstacles by writing a straightforward account of the ups and downs of twentieth century politics with clarity as its main object. It is a measure of the author's knowledge of his subject that there are no cryptic allusions and there is no attempt to dazzle the reader with erudition. Mr Somervell uses only a sardonic wit to savour a plain tale.

Unlike most political histories, this one is confined strictly to its terms of reference, and the course of events is described solely as it affected the development of politics. Thus the period of the first world war receives some attention since during it there was considerable political regrouping. But the years from 1940-45 are dismissed almost in a line, since "what followed in the next five years, though the most amazing chapter in British history, is a blank in the history of British politics. We had real leadership and politics was in abeyance." This strict definition of political history has the effect of greatly clarifying the development of twentieth century politics. Although the main purpose of the book is to explain the course of politics rather than to state a case, Mr Somervell presents an underlying and unifying thesis:

> When, omitting the wars as abnormalities, one transfers one's attention from pre-war politics to inter-war politics and then onward to our own post-war politics one senses what mathematicians call a progression. The men remain the same size but the problems they are called upon to deal with grow bigger and bigger.

From the political standpoint the period is a twilit age, since more and more "events ruled men instead of men ruling events."

Mr Somervell obviously has little faith in socialism as a doctrine but his portraits of the Labour leaders are fair and illuminating and his judgment on the actions of the Labour party would draw dissent only from its bitterest partisans. His judgment leads him astray on only two occasions: he brushes aside the Spanish Civil War as a trivial side show when in fact it had the most profound effect on the growth of a left wing consciousness among the British middle class; and he describes Mr Zilliacus as an exotic "with no roots in British soil." Mr Zilliacus with his rebelliousness, his doubts and his hesitations surely represents a continuous, if unimportant, tradition in British politics. Since the balance between events and men is his theme, Mr Somervell emphasises the successes of the Baldwin government of 1924-29 and the domestic progress of the thirties. Although Mr Churchill obviously comes as near as anyone to being the hero of the book, Mr Somervell is at some pains to question what influence he could in fact have exercised over the course of foreign affairs in order to prevent the second war. The book is full of excellent descriptions of men, of measures and of events, and to have dovetailed them so skilfully into a simple coherent narrative is a sign of Mr Somervell's mastery, if not of events, at least of their record.

Rule by Intellect

"Intellectual Capitalism." By Johannes Alasco. World University Press. New York. 140 pages. $3.00.

THIS is a book at once stimulating and disappointing. Capitalism, says Mr Alasco, is a great deal older, a great deal tougher, and a great deal more mutable than is generally realised. What distinguishes the capitalism of the classic era, the eighteenth and nineteenth centuries, from that of earlier and later times is merely the nature of the controlling asset by which the ruling class governs economic life. Land came first; raw materials next; machinery with the Industrial

A CHALLENGING WORK

Modern Capitalism and Economic Progress

by THOMAS WILSON
Editor of the Oxford Economic Papers

Some of the important questions dealt with:

★ The alleged evils of capitalism
★ The economic basis of democracy
★ Inequality of income and wealth
★ Monopoly and industrial efficiency
★ The nationalisation of industry
★ Inflation ★ Mass unemployment

'The Home Market'

That there have been vast changes in our people's way of living since 1939 we all know. But what *are* these changes? 'The Home Market' tells the whole story – and tells it clearly and tersely with tables, pictorial diagrams, maps, using the minimum of text matter. From this book you learn the latest composition and distribution of population; changes in the number and size of families; drift from one region to another; what is earned and how it is spent; what papers people read. You see a complete picture of the new Britain.
This is a book that every manufacturer and advertising man needs. It is also a book of great value to the sociologist, the economist, the administrator and politician. The first issues of 'The Home Market', of which Major G. Harrison and Mr. F.C. Mitchell of The London Press Exchange were joint authors, gained a high reputation in 1936 and 1939, and this first post-war edition has been brought entirely up to date and re-written by their colleague Dr. Mark Abrams.

Will he grow?

schweppervescence lasts the whole drink through

Revolution ; finance thereafter ; and in the future, finance will be superseded in its primacy by "intellectual capital"—patents, goodwill and know-how both technical and commercial. The managerial revolution is on, but with a difference. In Mr Alasco's view it is perfectly compatible with as much democracy as has ever really existed under any other régime. There are always rulers and ruled, those who act and those who are acted upon ; the essence of democracy is continuous and revocable consent by the latter to the policies of the former, and democracy is endangered less by change in the nature of the ruling class (e.g., in Mr Alasco's phrase, a change from stockholders to jobholders) than by institutions and legal fictions which deny the change and prevent the understanding on which consent can be intelligently based.

All this is well and freshly said, and constitutes a valuable and stimulating exploration of the border between economics and political theory. Mr Alasco, however, forfeits much of his reader's confidence by dogmatically reasserting the most extreme individualist view of society, brushing aside all that sociology can teach concerning groups and the group ethos. His forecast of a society in which the obsolete "controlling assets" (land, material capital, finance) will be publicly owned and nationally planned, but the new "controlling asset" of intellectual capital will have inevitably reverted to private hands, has all the plausible unreality of an abstract construction equally remote from the market place and the polling booth. The book, in fact, displays both the strength and the weakness of the solitary thinker whose ideas have neither been blunted by compromise and misgiving nor toughened in the give and take of controversy and empirical test.

Change or Decay

"The Pilgrimage of Western Man: A History of Europe from 1500 to 1949." By Stringfellow Barr. Gollancz. 370 pages. 7s. 6d.

To the memory of my father and mother who taught me to love the great tradition which every generation must learn and change.

THE dedication of this book indicates what the reader may anticipate ; that he is disappointed is not altogether a condemnation of the author, who does not send us empty away, but substitutes the unexpected. His thesis is, in fact, that every generation refused to learn, and that change was always brought about by instinctive grab and greed, rather than by conscious reorientation.

The "great tradition" is shown in its apotheosis in the Medieval synthesis, based upon St. Augustine's vision of the City of God, and the thirteenth century is idealised as an era of pristine integrity and unity. The serpent in this Eden is commerce—the exchange of goods for gain, instead of for the "just price" of the Middle Ages ; the opening up of Venice to Eastern trade, and the growth of her navy to protect it, were the fruit of the Tree of Knowledge which started Western Man on his downward path. This titilation of his appetite for luxury and power initiated the corruption of the Church, the break up of religion, the dawn of enlightenment, the fury of nationalism, and the debacle of universal war.

Mr Barr's style is minatory, but stimulating. He points a seemingly objective statement with a wry and slightly vindictive sarcasm ; or deliberately understates:—"among their enemies they (the Jesuits) had the reputation of believing that the end justifies the means" ; or blandly confuses terms, using Calvinist and Protestant synonymously. He also resorts to what might be called the rhetorical premise, in order to demolish a non-existent case: "the student of history frequently assumes," or "modern democrats frequently think."

Those who hold that the pilgrimage of Western—or any other—man is a series of improvisations in adaptation to changing circumstances, sustained by a faith in some ultimate good, will find much food for controversy in this book. But few will deny that it is a compact and readable summary presented from diverse and significant view points ; and few will quarrel with its conclusion that the response to the challenge of today lies in "the establishment of a government for the new community which modern technology has created."

Through the Ideological Jungle

"Les Doctrines Sociales en France, 1930-1950." By Albert Pasquier. Pichon et Durand-Auzias, Paris. 527 pages

M. PASQUIER, who is a member of the Faculty of Law at the University of Caen, describes this extensive work not as a detailed record of social doctrines but simply as a general account of their evolution. The book contains, however, enough -isms to befog all but the clearest intellects. To take only the homely term "liberalism" we find several quite separate varieties of the species. A *libéral,* or rather *néo-libéral,* may be *"conservateur," "a-doctrinal" "intégral," "conchet"* as well as *"social"* or *"spiritualiste."* And within the anarchist and marxist zones distinctions of doctrine are even more luxuriant. To the non-French, non-professional philosopher the main value of M. Pasquier's study lies precisely in his presentation of the whole range of France's political ideology so that it may be viewed in its entirety as the obdurate national phenomenon that it is. To the outsider the individual political *climats* are as hard to differentiate as the *climats* which grow Burgundy wines. The important fact is that they exist.

M. Pasquier defines the term *"doctrine sociale."* A doctrine, he says, is made up of three elements: *philosophie de base ;* material ends ; programme, or means to those ends. In the last resort doctrines differ primarily as to their basic philosophies. Sooner or later, that is, politicians who affirm and politicians who deny the principle of subjective liberty are going to fall out. Nor is agreement more durable between either objective or subjective libertarians on the one hand and anarchists (who believe in the doctrine of *all* the liberties) on the other. M. Pasquier's historical thesis is, indeed, that French social doctrines, which between the years 1930 and 1945 had tended progressively to sink their philosophical differences first in an economic programme, then in a wartime adaptation to reality, have since become once more thoroughly divided, their adherents taking refuge in the inevitable partiality of a philosophical first principle. However the book's final section, which deals with the philosophy of General de Gaulle's movement, advances greater hope of political unity in France. For the *Rassemblement du Peuple Français* deliberately does not seek a pukka, brand new doctrinal framework. It is something of a hotchpotch (*poly-doctrinal,* as M. Pasquier puts it), seeking a minimum programme in which "some will be able to see an end ; others hope for a beginning." Thus, he argues that it is possible that the RPF will be enabled by its catholicity to solve the social problem of a sectarian country. For a party that is not concerned with the academic defence of its doctrine has a better chance of solving the social problem through sound sociological practice. M. Pasquier's book contains a very full table of contents which greatly facilitates reference to the various doctrines which he assembles and analyses.

Economics of the Superstructure

"Co-operative Industrial Research." By R. S. Edwards. Pitman. 285 pages. 20s.

THE Industrial Organisation and Development Act of 1947 was based on the fact that competition ensures that all the firms in an industry move forward together, but not necessarily that they move at the right pace. Leaders are needed in each trade, pouring in new ideas, watching for the growing points, helping new departures, and removing the dead tissue of ancient

reputable but cumbersome customs. Once let a new departure be launched and competition will do the rest. But someone must give the first push. Individual firms may do it, stepping out ahead of the rest. But experience shows that they very often do not. In that case special organs are needed as a superstructure to each industry intended, not to issue orders to firms, but to set their feet by education and persuasion on the paths down which competition will then press them.

Economists tended to talk in the last generation as if central leadership and common services could be enjoyed to full advantage only in a monopoly organisation. Central leadership in competitive industry smelt, however fair its outward seeming, like a trade-association conspiracy against the public. Today, Sir Raymond Streat and the Cotton Board somehow fail to fit into this picture. Apparently we can now have our competitive cake *and* feast to repletion on unimpeachable virtuous central leadership. If this is generally so, it is of great practical importance. But is the Cotton Board unique ?

Professor Edwards, in this very useful study, deals with an element of the superstructure which now has a generation of history behind it, the co-operative industrial research associations. They are well worth studying from the side of science and technology alone, and Professor Edwards has dealt competently with these. But he has done still better on the side of economics: for, over and above his excellent analysis of the specific problems of research associations, he has built up a body of theory which can be applied to a whole range of other problems.

Professor Edwards's blindest spot is human relations. One would have liked more analysis, though there is a good deal, of how the research associations have solved the problems of personalities and confidence—the typical problem of industrial relations, with managing directors as the irritated underlings—on which the Act of 1947 has so far been wrecked. It is startling to hear associations advised to "move cautiously" in human relations research. There is certainly a prejudice among natural scientists, including many of the leaders of scientific research in industry, that what is social is not science. But who is a professor of the London School of Economics to encourage this ?

Shorter Notices

"Handbook of Latin American Studies: 1946. No. 12." Prepared by the Hispanic Foundation of the Library of Congress. Harvard University Press. $8.50. (Geoffrey Cumberlege. 68s.) 364 pages.

THIS is a selective guide to material published in 1946 on Latin America in the major branches of history, economics and the arts. It differs from its predecessors in that there are no longer separate sections for Archives and Folklore. The section on Labour and Social Welfare has been omitted this year but will be reinstated in the thirteenth handbook.

"The Indian Cotton Textile Industry (1949 Annual)." Editor M. P. Gandhi. Gandhi and Company, Bombay. 450 pages. Rs. 6.

"The Indian Sugar Industry (1949 Annual)." Editor M. P. Gandhi. Gandhi and Company, Bombay. 400 pages. Rs. 6.

IN addition to production and trading information and statistics these year books contain a review of the past and prospects of the cotton textile and sugar industries respectively and give details of the latest tariffs and government control orders. Appendices give lists of the cotton textile mills and the sugar mills in India and Pakistan. The books would be easier to use if the pages were numbered consecutively throughout instead of in sections.

AMERICAN SURVEY

Regular Work

(From Our American Staff)

THE new contract signed on May 23rd between the General Motors Corporation and the United Automobile Workers' Union continues to be of interest to both businessmen and labour leaders. Its outstanding feature is the five years for which it is to run, with no grounds for reopening negotiations recognised by either party. In addition, the contract includes a funded, non-contributory pension plan, linked to the national social security programme, a modified form of the union shop, improved arrangements for contributory insurance and increased vacation pay. Wages, as under the previous contract, are to be adjusted quarterly in accordance with the cost of living index, provided they do not fall below the basic rate ; an "improvement" increase of four cents an hour is to be allowed annually for all wages, and an additional five cents an hour, this year, for certain skilled jobs. Both parties to the contract recognise in principle that higher living standards depend upon technological advances.

In Washington on June 8th, Mr C. E. Wilson, head of the Corporation and a man who thoughtful architects of a reconstructed Republican party should not overlook, explained the contract from the company's point of view. He noted that, while the four cents improvement factor represents about 2½ per cent of average wages, it was calculated not on the technological advance which General Motors expects to be able to achieve, but on the average advance which the country as a whole is likely to accomplish. General Motors expects to do a little better than the average, and to use that margin for improving its products or lowering its prices. But technological benefits, Mr Wilson stressed, can be dissipated through strikes, featherbedding, absenteeism and artificially short work weeks ; hence the importance of a long-term contract. He added:

> Both parties completely accept the principle of progress including the use of machines, mechanical power and better organisation, better working conditions and better arrangement of the work in order not to waste human effort. If the people of this country really understand this principle . . . I have no worries about our country being able to stand the costs of pensions, insurance and high wages.

Mr Wilson's optimism was repeated, a week later, in a study released by a businessmen's research organisation, the Committee for Economic Development, on "How to Raise Real Wages," which predicted that the average employee's real hourly wages will be double in about thirty years, if productivity continues to rise at the same average rate as in the past. The committee indicated four main reasons why output per man-hour, which at the turn of the century was about 50.5 cents in terms of 1949 dollars, is now about $1.83. Chief among them were improvements in production processes and increased capitalisation. The average industrial worker now uses seven times more mechanical energy than

in 1900, and expenditures on technological research were nine times as large in 1940 as in 1900, and doubled again by 1950. Capital for each worker now averages above $10,000, with about a tenth of the net national product devoted to expanding plant, equipment and inventories. At the same time, the health, training and skill of the labour force have improved, and so have management's methods. To keep up this advance the committee proposes ten objectives for industry: the growth of industry should be stabilised and serious business recessions avoided ; seasonal unemployment should be reduced ; the quality of new businesses should be raised and the mortality among infant businesses lowered ; the tax system should be reformed to make risk-taking more attractive ; equipment should be replaced more rapidly ; the imports of the United States should be increased in comparison with its exports ; there should be more employment opportunities for older people, and more incentives for efficiency among the rank and file of employees ; the knowledge and training of the labour force should be drawn upon regularly and make-work rules and featherbedding should be abolished.

★

This report, and the General Motors contract, are evidence that pace-setting business leaders regard continuity of production, with unit costs lowered by an active technology and with a major part of the savings promptly passed on to the workers and the consuming public, as a formula desirable enough to justify the risk of some very long-term commitments. Continuity of employment, under conditions reached in the General Motors contract, seems equally attractive to the labour pace-setters. The speech of Mr Walter Reuther, president of the United Automobile Workers, at the steelworkers' convention on May 10th affords an interesting parallel to that of Mr Wilson. After congratulating the steelworkers on leading the fight for pensions, and ending the double standard by which company executives received pensions while factory workers did not, Mr Reuther continued:

> There is another double standard that we are worried about and which your president, Mr Murray, has done a lot of fighting for, and that is the question of the guaranteed annual wage. Here again you see the double standard. C. E. Wilson gets $600,000 a year. His kids eat by the year and live by the year, he gets paid by the year, and that's a good arrangement. But the General Motors workers, like the steelworkers, their kids eat by the year, they pay rent by the year, but they get paid by the hour, and that creates a problem.

So far, few industries have plans guaranteeing either annual employment or annual earnings, although there are some firms, whose steady production makes guarantees especially practicable, that have operated such plans for some years with success. At the close of the war a report on guaranteed wages was prepared in the Office of War Mobilisation and Reconversion, and received strong support from the Congress of Industrial Organisations, but little has since been done about it.

Yet it seems clear that labour's energies are in the immediate future going to be directed more towards keeping a maximum number of people at work under the conditions at present established in the best plants, rather than toward improving those conditions. Workers who have both wages today and pensions tomorrow place a new importance on being on the job long enough for the pension to fall due. Moreover, loss of a job at today's level of pay and prices is an even more serious matter than it used to be. The average weekly benefit for total unemployment, available under the federal-state insurance system in March of this year, was $20.90 for the country as a whole, with a range from $13.13 in Florida to $24.66 in Wyoming. The Department of Agriculture's low-cost diet for a family of four runs at about $18. Over half a million claimants have exhausted their right to unemployment compensation already ; relief levels are lower still, and recipients in most States are not eligible if they have cars, houses, or life insurance. The fall of the unemployed from current standards of living is, nowadays, a long fall.

The emphasis which both labour and management put on continuity of production and employment should be a major factor in prolonging the present boom. If the boom slackens, trade union leaders are likely to argue that management must accept responsibility for the victims of technological unemployment by retraining workers, and by providing dismissal pay if retraining is impossible. Earlier retirement may also be suggested, though both sides are aware that it is the generation now at work that must support young and old as well as themselves, and that more work opportunities for the elderly are to everyone's advantage. Should a more serious downswing develop, requests for slower application of new processes, and for a shorter work week, are to be expected.

Labour leaders will also probably press for pooling of the financial resources of small firms in a given industry, firms which by themselves are in no position to offer long-term contracts of the General Motors type. Whether on a trade basis (as in the garment industry and the Detroit auto parts industry) or on a geographic basis (as in the proposed scheme for Toledo, Ohio) joint plans, administered through the union, are on the increase. Unions will also try to improve employer-employee relations and attempt to show corporations that the union shop is more efficient from the standpoint of the employer, as well as desirable from the standpoint of the employee. Employers will also look more favourably on many unions if the danger of jurisdictional disputes between rival unions becomes less of a threat as the result of the attempts now being made to reunite the various national labour organisations.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Play Business

[FROM OUR AMERICAN STAFF]

THE strain on New York's supply of theatre seats for "South Pacific" has been relieved, in theory, by the creation of a touring company that is taking the musical comedy to clamorous audiences in Cleveland, Chicago and points west. No way has been found to make the stars, Miss Mary Martin and Mr Enzio Pinza, into twins, but even without them, the road company, making its first appearance in Cleveland, found all the seats sold for its scheduled two weeks' run (gross income $135,000) and was forced to return $603,000 to disappointed would-be purchasers.

The financial record of this bit of theatre property is of the kind that tempts all men to become "angels"—that is, backers of plays. The original investment was $225,000, which marks the play as expensive even in this day of high production costs when an average drama, without music, may cost perhaps $20,000 before it opens. Its first New York performance was on April 7, 1949, and by June 1st, when the 1948-49 season ended, its net earnings had averaged $12,000 a week. This year's record has been at least as good. According to *Variety*, the weekly newspaper of the show world, its gross income for a slow Lenten week in March was $50,600, while its nearest rival, "Kiss Me, Kate," took in $47,100. Both are musical comedies and both charge a $6 top for seats to those who manage to purchase at box-office prices.

In the case of "South Pacific" the box-office operates on a schedule at least six months ahead of the date of request. Thus anyone sending a cheque in April may receive a pair of seats for November, but the precise date must be left flexible. Quicker and surer ways exist, that are more or less legal, but they are shrouded in mystery. The price of seats in that shadowy realm populated by lobbyists, page-boys, and ticket brokers more avid than honest, has been set by rumour at $40 to $60 a pair. The dishonest brokers were scourged last season by the New York Commissioner of Investigations but, if tickets came out of odd corners while his broom was at work, they did not stay out long.

Such records fling about the American theatre (which is to say the New York commercial theatre) a golden aura that proves, on closer inspection, to be made of pure tinsel. Broadway is prosperous, in spots, but elsewhere it is threadbare. Nor is the record of "South Pacific" a reliable index. In 1948-49 some $6,500,000 was invested in sixty-three productions. The fifteen that were hits cost $1,940,000 and earned $2,176,000 in the course of the year. But the red side of the ledger showed $4,535,000 lost on plays that failed, or that were scheduled to close by the end of the year.

★

The shrinking number of theatre properties, plays and other appurtenances of what is carefully called the "legitimate" theatre (perhaps to distinguish it from vaudeville, variety and the circus) started in the early nineteen-thirties. No new theatres have been built since then, and twenty-one of the fifty-two then in existence have been handed over to the activities of radio and television by owners more interested in steady profits from their real estate than in acting as patrons of an art. Plays are fewer, and gross earnings are smaller. In 1947-48 Broadway saw sixty-seven productions ; sixty-three appeared in 1948-49 ; in the season which ended on June 1st, fifty-one plays opened and of these only seven were hits, while thirty-five were failures. The financial figures tell a similar story ; Broadway's gross income this year was $28,614,500 as against $28,840,700 last year. When to this are added the figures of touring income, from shows sent to other cities, the decline is steeper—$49,169,200 this year compared with $52,498,600 last year.

Actors are fewer, and so are actors' jobs. Some 11,000 actors appeared in drama and musical comedy during a 12-month period in the late nineteen-twenties. They averaged about 14.6 weeks of employment for each actor, a figure which shocked this non-statistical profession, whose members then cherished the illusion that an actor worked 33 weeks of every year. In 1948-49, out of 6,000 members of Actors Equity, only 4,692 "played somewhere on a stage under an Equity contract," and half of them did not work more than six weeks in the season. The source of these doleful figures is a study entitled "Why be an Actor ?"

The result is that the potential demand for seats, whether it is static, as some believe, or increasing with the growth and progressive mobility of the population, has come to be fantastically out of proportion to the shrinking supply. New York alone has more than 8,000,000 inhabitants, not counting the circumambient commuter and the visitors from other places who come to do business by day and to amuse themselves by night.

Any other industry, facing a similar situation, would, in this day of mass production, increase its output and widen its distribution to meet the demand. But the theatre world is caught between the contradictory laws of art, industry and real estate. For at least two decades its reply to increasing demand has been to restrict its production and raise its prices, while engaging in more profitable affiliated enterprises. The connections between Broadway, on the one hand, and Hollywood and the radio-television ranges on the other (these latter, of course, ministering more or less adequately to the amusement demands of the millions) are so intricate that few outsiders can disentangle the thorny maze of reciprocal contracts.

The theatre world attributes most of its woes to the competition of these giant rivals for funds and talent, to rising production costs, or to restrictive practices on the part of employers or employees. It is true that, though its economics may seem twisted when compared to those of other industries, the theatre in its business relations is subject to whatever winds are blowing. The costumes it buys suffer the same rise in costs of needles, buttons and cloth as afflicts the purchaser of cotton aprons or of woollen suits for less glamorous purposes. The wages it pays and the hours of work it secures are set by negotiation between organised groups that accept the philosophy and procedures of trade unions and cartels. This unionisation covers, or seeks to cover, all the people who work in the theatre, actors, chorus girls and musicians, as well as stage hands, and even

THE
NATIONAL CITY BANK
OF NEW YORK

Incorporated with limited liability under the National Bank Act of the U.S.A.

Founded 1812

Head Office : 55 WALL STREET, NEW YORK
London Offices :
117 OLD BROAD STREET, E.C.2
11 WATERLOO PLACE, S.W.1

the producers are more or less united in the League of New York Theatres.

It is probably true that such a degree of organisation tends to make the commercial theatre fall back more and more on established patterns or on proven successes. New themes or ideas, experiments in play writing or in stagecraft, are expensive ventures at the going Broadway rate of investment. More and more they tend to become the province of the subsidised theatre, whether it belongs to a college or a community, or is maintained by private funds.

But the present plight of the American theatre stems from even deeper maladjustments. In recent years a new eye has tried to see the American theatre whole, setting Broadway, road shows, stock companies and subsidised experiments in fruitful relation to one another. This is ANTA (American National Theatre and Academy) which, with a federal charter secured from Congress in 1935, but no public funds, has been trying to work along lines somewhat similar to those adopted by the British Arts Council. So far it has become the recognised voice of the American theatre in UNESCO councils, has supported an experimental theatre for a season or so, has tried (vainly) to establish a professional theatre in Washington, and has just acquired the lease of New York's Guild Theatre, with offices and class rooms, that it hopes to make a centre serving professional, college and community interests throughout the country.

ANTA's way is not easy. With more enthusiasm than cash, it is also handicapped by the lack of a tradition of national support for the theatre, by the country's size and the competition between regional centres, and by the gulf between Broadway and the country, and between the professional theatre and that operated by colleges or communities. Not the least of its difficulties is that endemic suspicion with which the theatre industry views those who would save it from its own hardening arteries.

American Notes

Britain on the Brink

Britain's reluctance to dive into the Schuman "coal-steel pool" before testing the depth and temperature of the water confirmed American suspicions that Britain's unwillingness to get its feet wet was preventing Europe from swimming out into the sea of economic integration. Many American observers, therefore, feel that the statement on European unity, issued by the Labour Party's executive committee, has cleared the air by showing Europe that it must take the plunge without waiting for Britain. Such observers hope, too, that the statement will clear the minds of the British electorate, show them that socialism at home is incompatible with unity abroad, and induce them to vote for Conservatives.

The isolationists are not among these wishful thinkers, for they are rejoicing that the British, who they have been told "can never be wrong," apparently do not believe that foreign commitments are a necessary response to the Soviet challenge. Those responsible for American foreign policy are of course aware, now that they have had an opportunity of reading the Labour pamphlet, that this sarcastic isolationist argument is, as usual, a wilful misinterpretation. But they are understandably concerned because an excuse has been given for reconsidering the whole basis of the Marshall plan and, indeed, of the Atlantic treaty.. The excuse is almost sure to be used, unless Britain's friends can prove, as they are now trying to do, that the Labour Government has no intention of digging its toes into the executive committee's isolationist line. Mr Hoffman has suggested that the most valuable proof would be whole-hearted British participation in the European Payments Union. In any case, in future, when objections are raised against subsidising socialism, it will be difficult to argue that British socialism concerns no one but Britain as Mr Hoffman has done so effectively in the past. This is perhaps the worst aspect of a situation which he rightly deplores.

The immediate impact of the British ineptness will have been dissipated by the time Mr Averell Harriman takes up his new duties as special assistant to the President, in August. Nor will he now be dealing with the integration of Europe; his new task is the integration of Washington. He will have to reconcile, or at least to gather together in a form that will enable the President to reconcile, the differences between the 46 government departments and agencies and the 32 interdepartmental committees that are now concerned with America's international responsibilities. The need for this new post is obvious and it has been proposed before. The job, it is said, will be what Mr Harriman makes it; he is well qualified, by experience, ability and patience, to make it something important, but he will probably find that co-operation is even harder to cultivate in Washington than it has been in Europe.

* * *

Blow to Basing-Points

In his second important veto of the session, that of the so-called Basing-Point Bill, President Truman has once more listened to Senator Douglas and the progressive wing of his party. The measure would have legalised uniform delivered prices when they are not an element in a price-fixing conspiracy, but would not have permitted the revival of the basing-point system that the Supreme Court has decided violates the anti-trust laws. Business men who, before the decisions in the cement and rigid conduit cases, were accustomed to make near-by customers pay the freight charges of those further away from the mill or factory, must find what comfort they can in the President's assurance that the Bill was unnecessary. His veto message adopts the view of the Federal Trade Commission that independent freight absorption—that is, when it is not part of an industry-wide scheme to fix prices—is perfectly legal.

The President was not forced to choose, as he was over the Kerr Natural Gas Bill, between substantial contributors to party funds and his election-winning principles. The Bill drew most of its support from Republicans, though its friends included Senator Myers, from the steel State of Pennsylvania, and Senator O'Mahoney, normally in the van of the trust-busters. The measure was designed to reassure businessmen who complain pitifully that under recent judicial interpretations they are prosecuted if they compete, and prosecuted if they don't. But one reason for the veto was the fear that the Bill, like any amendment to the anti-trust laws, would require lengthy judicial interpretation and hence would cause more confusion than it settled. The issues are extremely complicated, and the Administration, as well as Congressional Democrats, was divided. When asked, recently, merely to explain the basing-point system to a Congressional committee, words failed Mr Fairless, of the United States Steel Corporation; he was forced to resort to an arrangement of paper drinking cups to illustrate his belief that the ability to quote uniform delivered prices made it possible for mills to compete for custom in distant markets.

Despite his soft answer to business, Mr Truman accepted the view of Senator Douglas, who argued that the Bill should have been renamed a Bill "to weaken the anti-trust laws" for two reasons: because it would reopen the door to some of the evils of the basing-point system that few outside the interested industries deny was an instrument of monopoly, and because it would have encouraged forms of competition that lead to monopoly, such as uneconomic favours to certain customers. Small businessmen were in the van of those demanding a veto on the score that the Bill weakens their protection under the Robinson-Patman Act. They insisted that in default of a veto they would regard with scepticism the President's proposals to aid small business. Unquestionably the Bill, by making "good faith" a perfect defence, and requiring proof that competition had been injured, would have made it harder for the government to win anti-trust cases.

Also strongly opposed were Senators from the South, who fear that the return of freight absorption would blight their hopes of industrialisation by permitting distant suppliers to wipe out local competitors. The veto is a death-sentence for the Bill, at least at this session, for it does not command a two-thirds majority. Business is disappointed, but philosophical; with freight charges so heavy, and business so good, there is not the incentive to revive delivered pricing that a slump might bring.

* * *

Amerasia Disinterred

The New York grand jury, which has been investigating subversive influences for eighteen months, ended its life last week in a blaze of glory. It did what the Secretary of Commerce had failed to do and forced Mr William Remington to resign from his government post; it indicted him for committing perjury by denying that he had ever been a Communist, and thus convinced him that he must give his full attention to the preparation of his defence, for the second time, against this charge. The grand jury then drove through the Department of Justice's warning lights and led the public to a clearer view of the *Amerasia* case than that presented by either Senator McCarthy, or the Tydings committee that has been investigating his charges against the State Department.

In the summer of 1945 the Federal Bureau of Investigation raided the offices of *Amerasia*, a fellow-travelling magazine devoted to Far Eastern matters. Hundreds of confidential government papers were found and two officials of the State Department were arrested, as well as four members of the magazine's staff. The officials were soon released and only two of the journalists were convicted; their trial seemed perfunctory and the penalties light. The magazine itself died soon after, but the case against it was not buried very deeply. There is more flesh on the *Amerasian* bones than on those of the other corpses which Mr McCarthy has exhumed in his efforts to prove that America's Far Eastern policy was poisoned by Communism.

The Administration was naturally reluctant to have a further inquest on *Amerasia* just when the Senate was showing signs of being ready to rebury Mr McCarthy's corpses. But the grand jury gave no support to his charges that the prosecution in 1945 had been both lax and subjected to improper pressure; it put the blame on weaknesses in the espionage laws. The jury did not, however, nail down *Amerasia's* coffin, for it recommended a full explanation of the details of the case. The government documents may have been unimportant, as Senator Tydings says, they may never have been transmitted to Russia, which in any case was not then an enemy country, but they were stolen and they were secret. Until the case is cleared up, there must remain a suspicion that the State Department's security methods, apparently inadequate then, are still inadequate now.

This is the real point of the case. Senator McCarthy may have over-simplified his accusations, but Senator Tydings has over-mystified his answers. As a result, responsible Republicans, who believe that in the long run their party is bound to lose on the McCarthy swings, think it may be able to win on the Tydings roundabouts, and that *Amerasia* may be the pay-off. It is time that the President appointed the non-partisan commission, to go into the whole question of security and subversion, that has apparently only been delayed by the difficulty of finding suitable members of unquestionable authority.

New York in the Melting Pot

After twenty years in the political limelight, and an enviable record at Albany, Mr Dewey is retiring voluntarily from the race for the governorship of New York State, which he twice failed to make a stepping-stone to the Presidency. The drain of public service upon his health is his chief reason, though it is also thought Mr Dewey may wish to provide more handsomely for his family than is possible upon a Governor's income of $25,000 a year. A retirement at the age of 48, however, has none of the marks of permanence, and Mr Dewey himself insists that he is not withdrawing from politics, and that he will be free, and even by duty bound, to keep a foot in the door by discussing important national and international issues. There is a hardy rumour that Mr Dewey will also devote himself to advancing General Eisenhower as Republican candidate for the Presidency in 1952.

For the present, however, his decision not to run throws back into the melting pot control of the State that casts the most votes and sends the strongest delegations to the Presidential nominating conventions. It leaves a vacuum in the Republican Party, for although the Republicans do not lack moderate progressives, few combine, as Governor Dewey does, a constructive record at home and abroad, with proved efficiency, both as an administrator and vote-getter. Even his critics, of whom there are many, must concede this much. In New York, the machine politician is the immediate beneficiary. It appears that Mr Dewey's successor on the Republican ticket is likely to be the weak and somewhat elderly Lieutenant-Governor, Mr Hanley, whom the Demo-

cratic machine may well defeat without having to accept a candidate it cannot control. Mr Franklin D. Roosevelt, Jr., whose inherited name and smile put him at the head of the Democratic aspirants, despite his inexperience, as long as Mr Dewey was in the running, may be laid aside in favour of some more "deserving" and less controversial Democrat, who will appeal to the conservative voter outside the cities.

Another retirement of a well-known political figure, overdue in the view of many, and far from voluntary, is likely next November, when Representative Vito Marcantonio will at last have to fight a coalition candidate. Mr Marcantonio, chairman of the Communist-dominated American Labour Party (like the Liberals confined to New York), survives to voice pro-Russian views in Congress because in 1948 the Republicans and Democrats split the opposition to him. Mr Marcantonio was returned on about a third of the total poll. This year Republicans and Liberals will support a Democrat, Mr James Donovan. Mr Marcantonio, who has been in Congress since 1934, with only one break, has entrenched himself by devoted service to his impoverished Puerto Rican, Italian, Negro and Jewish constituents, and has voted for every labour and civil rights Bill; but his Communist sympathies have cost him the support of the unions as well as that of the major parties, who in the past have not disdained his aid.

Shorter Notes

The Act setting up a National Science Foundation to promote basic research and education in the sciences at last became law on May 10th. President Truman had vetoed an unsatisfactory version over two years ago and there had been a further delay this year because the House of Representatives added a clause providing that the Federal Bureau of Investigation should screen every applicant for a job or a scholarship and disqualify anyone who might be described as a loyalty risk or who had ever joined a subversive organisation. Both the FBI and the Department of Justice strongly opposed making the FBI prosecutor, judge and jury in this way and succeeded in convincing Congress that the final decision should rest with the Foundation's Board of Directors, who would also be able to assess a man's professional ability. Full security tests will now be given only to scientists dealing with strictly secret material.

★

The Fahy Committee, the President's committee on equality of treatment and opportunity in the armed services, appointed nearly two years ago, has issued a summary of progress, in which it finds that great gains have been made in all three services towards abolishing discrimination against, and segregation of, Negroes. As an article in *The Economist* of May 6th explained, the basis of the changes has been not moral indignation but the desire to promote efficiency. The Navy has made most progress, the Air Force is doing well, but in the case of the Army the changes are so recent that the committee thinks it is too early to appraise the effect of the new policy.

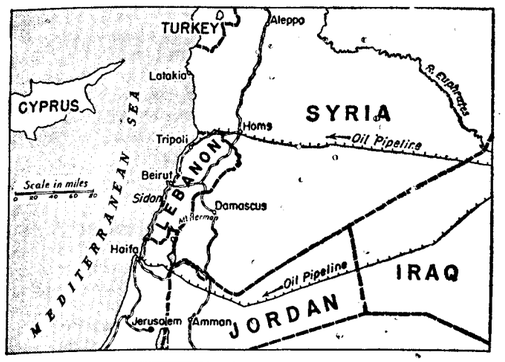
★

The death of Representative Lesinski, Democrat of Michigan, means that the House Education and Labour Committee will now, under the seniority rule, have as its chairman a conservative Southerner, Representative Barden, Democrat of North Carolina, instead of a man who has consistently followed the Fair Deal line. Labour classifies Mr Barden as an "enemy," and he can be counted upon to do his influential best to prevent the Taft-Hartley Act being repealed when it comes up again next year. He has also been responsible for the bitterness of the religious controversy in the debate on the new Education Bill, a bitterness which has made it unlikely that this very necessary Bill will be acted upon during the present session.

THE WORLD OVERSEAS

Defenders of the Middle East

(From Our Cairo Correspondent).



IN The Economist *of June 3rd, 1950, a leading article set out the main problems of the defence of the Middle East. The following articles describe in detail the political, economic and military factors which affect the defence of each country in the area. The first deals with the Lebanon.*

Until the end of the 1914-18 war, the countries now known as the Lebanon and Syria did not exist; they formed part of a large Arab country, under Turkish domination, stretching, roughly, from the Taurus Mountains to the Sinai Peninsula and from the Mediterranean Sea to the Syrian Desert; if it had a name of its own it would be Syria. Under the peace treaties this area was divided into two mandated territories of which the northern part was allotted to France and split up into the four Levant states—later reduced to two—the Lebanon and Syria. After the last war both obtained their independence. It cannot be said that France did very much for either country—particularly Syria, where foreign domination was more bitterly resented—but independence seems to have done little more. They are, further, naturally one geographic and economic unit and, whilst carving them up may have served French aims at the time, and given a little extra security to the half a million Christians in the Lebanon (50 per cent of the population), it has resulted in almost continual friction and jealousy.

In considering the Lebanon as a potential cog in the defence mechanism of the Middle East, it is important to realise that, for all practical purposes, it has no defence services of its own. In the current budget a sum of £L15.5 million —about £2,500,000—(just under 20 per cent of the total) was allocated to the Ministry of Defence. This maintains an army of some 5,000, a small air force and a few small patrol vessels, all equipped with French weapons and, basically, French trained. It is, for its size, a good little force but suffers from the immense drawback, common to all Middle East armies except the Israeli, of having no experience of modern warfare. Except for a minor engagement or so during the Palestine war, the Lebanese Army has never heard a shot fired in anger. Its main purpose, which it carries out effectively enough, is to supplement the *gendarmerie* in the important task of maintaining internal security and keeping the country safe for the present Lebanese Government. The country has no fortifications and it is out of the question that its armed services could guard any strategic installations—airfields, of which there are several constructed by the Allies during the war, radio stations or harbours—against an invasion or even against a well-organised internal uprising. Some of the tribesmen, particularly those from the Jebel Druze, are brave and, on an antiquated pattern, good guerrilla fighters; but they would need long and intensive training before they could adapt themselves to modern methods.

The Lebanese Government is, in effect, the prime minister, Riad es Solh, who is a clever politician and adept at breaking up any serious collaboration among any sections of the fairly large but normally disunited opposition whenever their activities look like threatening his position. He remains on friendly terms with the president, Sheikh Bishara el Khoury, and his entourage without, however, allowing him too much power or influence. He realises that his main support comes from the merchants and bankers who operate the Lebanon's flourishing free market, and he is too clever to seek to hamper them by controls, regulations or even heavy taxes. On the whole, Riad es Solh is reasonably popular. There have been one or two singularly clumsy attempts on his life. These have happened to coincide with the emergence of some particularly delicate political or economic situation from which they have successfully drawn public attention. When his government did have to meet a determined and properly organised *coup*, it went off, fortunately for them, at half-cock. This was the movement led by Antun Saadeh, almost certainly betrayed to Riad es Solh by Colonel Hosni Zaim, whose friend Saadeh had been.

Although the Lebanon's vote in Arab League decisions is equal to that of any other member, its contributions to the

League's effectiveness are limited. Owing mainly to the largely non-Arab or at least non-Moslem character of its population, there is little general enthusiasm for the League. To make up for this, Riad es Solh has taken upon himself the role of mediator, and he can usually be relied upon to put himself forward in that capacity when differences break out between other members. In the ordinary line-up of the League's seven members, the Lebanon's stand is unpredictable. Slightly anti-Hashimite—because it fears the emergence on its boundaries of a powerful Moslem country—the Lebanon has no close friend. Nor has it a traditional enemy, not even Syria, with whom its relations are at the moment exceedingly strained.

The Soviet Legation in Beirut has long been the main Middle-Eastern centre for the dissemination of Communist propaganda. In spreading this gospel, it finds ready recruits both amongst the Christian minorities, particularly the Armenian and Greek Orthodox communities, and the students (from all over the Middle East) who attend the excellent universities and schools in the Lebanese capital. The Lebanese Communist party was declared illegal some three years ago, and its newspapers were suppressed; but this only sent the party underground and resulted, it is believed, in the newspapers and a flood of other literature being printed inside the Soviet legation or being brought into the country by and issued from the legation. Periodic campaigns are organised against the Communists, but they are almost entirely ineffective and do no more than round-up a number of unwary fellow-travellers. One of the great strengths of the Lebanese Communists is that, apart from certain Soviet diplomats, their leaders are unknown, nor have the police any clear idea how the organisation is run. They believe, however, that the party has a paid-up membership of between 6,000-8,000 and is planning a campaign to try to gain control of the still embryonic but potentially important trade union movement.

On the whole, the Lebanon's relations with the west are good. One certainly finds few examples either in cosmopolitan Beirut or in the lovely country districts of the xenophobia which, on a large or small scale, is encountered everywhere else in the Middle East. At the time of "liberation" from the French there was a wave of francophobe feeling; but once the French were officially out of the country this died down swiftly and in all spheres French influence is being steadily reaffirmed. A treaty of friendship has been drawn up with the United States, but it has not yet been signed nor have its terms been made public. Undoubtedly American interests in the Lebanon have increased since the construction of a pipe-line from the Persian Gulf to Sidon on the Mediterranean, and will further increase when the line begins to function. There are rumours that the American Air Force wish to build an air base in the Lebanon similar and complementary to the present base at Dhahran in Saudi Arabia, the eastern end of the pipe-line. Similarly there has been an extension of British interest in this country since the Iraq Petroleum Company moved their headquarters from Haifa to Tripoli.

Altogether the Lebanon is totally unlike any other part of the Middle East, and in the cosmopolitan luxury and ease of Beirut it is difficult to imagine Communism flourishing —or democracy either. And in the constant intrigues of Lebanese politicians and "rackets" of bankers and brokers, it is difficult to find anything solid upon which to build even a tiny bastion of Middle East defence. It is an entirely materialistic and opportunist country—beautiful, amusing, charming but, for any serious consideration, a complete waste of time.

The Communists of Malaya

[FROM OUR SPECIAL CORRESPONDENT]

COMMUNISM in Malaya is nothing new. The Malayan Communist Party (MCP) has been at work for just over twenty-five years, but it is only lately that the party has seriously threatened the liberty and prosperity of the people it seeks to undermine. It claims, of course, to be no more than the experienced guide to a spontaneous movement of all the Malayan peoples, which is said to have broken out against the excesses of British imperialism in 1948. This attitude lies behind all that the party does and says. "This war," as the MCP has said from the beginning of the emergency," will be a national revolutionary war of the people of all races and classes, with the workers and peasants as the mainstay. . . . It is . . . a progressive and a sacred war." The attitude further emerges in the successive changes which have taken place in the names and membership of the organisations prosecuting the war. During the course of last year, the whole question was clarified and tidied up by two important MCP announcements. First, the object of the struggle was stated to be the establishment of a People's Democratic Republic, of which details were then given. This had never previously been done. Secondly, this is to be achieved by a "People's Liberation Army"—an omnibus title for all the various guerrilla forces which was only adopted a few months ago. It is important to note that membership of the People's Liberation Army does not qualify

anyone for membership of the MCP: "members of the party must first go through endless training and tests of endurance, and discard all bourgeois ideas." These characteristic Communist attitudes, familiar elsewhere, have been made crystal clear in Malaya too.

The Communist decision to begin open revolt against the British in June, 1948, is now used to condemn as incorrect the party's previous policy of a "Peace Period United Front." The fact that this decision is incompatible with the claim that the Malayan peoples' national uprising was spontaneous does not, however, seem to worry the MCP. It is cloaked in part by the constant plugging of the words of Lenin that "without a revolutionary theory, there can be no revolutionary movement" and by the effort made to relate the Malayan "national revolution," under MCP leadership, to "the era of general collapse of world imperialism." It is proclaimed that "both the Malayan Revolution and the South-east Asian Revolution are parts of a world democratic movement." Although it has received relatively little physical assistance from outside Malaya, the MCP has certainly obtained a great deal of direct inspiration and intellectual instruction. This, while helping to enlist support from an

impressionable population, has also been an aid in keeping up the guerrillas' often wavering morale.

Inspiration from Outside

These Communists in Malaya love rushing into print, or at least into the hand-written and cyclostyled sheet. Consequently, a great deal is known about them—their organisation, their aims, and their hopes and fears—from captured documents, such as manifestos, orders and diaries. Indeed, the main trouble for the British is that most of this material is in Chinese and, owing to the shortage of Chinese translators, a good deal of it is never translated at all. From the military angle, however, quite enough is normally available to provide the British intelligence staff with a complete picture of the Communist order of battle—just as in any other war. The guerrillas are organised into distinct regiments, companies and sections; and even when the British have had little contact with any particular section for some time, they usually know from written material captured elsewhere what area it is in. Although the guerrillas live by achieving local tactical surprise, the general operation for the British forces is like chasing coveys of partridges from one field to another. The dominant quality of Sir Harold Briggs' new drive, moving northwards from Johore, is that it is much more systematic than ever before.

Elaborate Propaganda Machine

Behind the guerrillas' military organisation, or rather working parallel with it, there is an elaborate and most effective MCP administration for disseminating propaganda; every operational section, for instance, has its political education officer. At the head of the MCP is a central executive committee, which works through a central bureau responsible for propaganda details. This bureau has regional organisations which push out a flood of leaflets, posters and booklets to the public, as well as keeping the several Communist newspapers in circulation and ensuring a proper flow of documents for party members themselves. The bureau takes great pains to relate world events, as painted by Moscow and Peking, to the Malayan scene—even though the connection is sometimes lost on its audience—and, on a smaller scale, to make sure that Malayan Communist literature is specially distributed locally in support of any major guerrilla operation. The British, incidentally, have been slow and inept at countering Communist versions of incidents and their local propaganda.

The Communists produce a large number of news-sheets, most of which circulate only in particular areas and largely among the guerrillas themselves. Some of the main ones have been the *Vanguard* in Selangor, *Humanity News* and *Lenin News* in Perak, *Freedom News* in Johore, *Upset Press* in Penang and Kedah, and *The Volcano* in Malacca and Negri Sembilan. These are all in Chinese. A little has also been produced in Tamil for the Indians, together with occasional sheets in Malay and English. Continuity of publication is not a strong feature.

Promise of a Millennium

The content of all this Communist propaganda covers a wide range, effectively and cleverly. Sometimes it harps on the pure theme of British oppression and British weakness. Sometimes the appeal is more positive and specialised, to workers against employers, to Gurkha, Malay and British troops against their officers, to the general community against registration for identity cards—a vigorous, self-interested Communist appeal this—to the Chinese against the Malayan Chinese Association, or to students against "the enemy's strategy of perpetuating a poisonous system of education based on subtle deception." In addition, there are special lines of propaganda for the individual races, in reply to government propaganda, and to make it appear that the banned and defunct Communist Pan-Malayan Federation of Trades Unions is still in being.

All these mental gymnastics are clearly not in vain. Immensely heartened by the final Communist success in China, and playing on the memory of the previous British withdrawal, the Malayan Communists' proposals for a People's Democratic Republic are as important as anything they propagate. They already claim to offer a specific and well-planned alternative to British rule. All British and imperialist capital is to be confiscated, and "extortionate taxes" replaced by "reasonable and light simple taxes." There would be equal rights for all races, higher minimum wages, free and universal elementary education, free hospitals and sanatoria for the aged, many new technical schools and universities—and the land owned by the peasants. It is small wonder that the promise of this millennium has proved a high spot in the Communist campaign to turn Malaya upside down. Some of the British counter-propaganda is well handled, but it greatly needs extending if the battle is to be won on all fronts—on the psychological and economic, as well as the military. Victory on one is useless without success on the others.

Tito and the Peasants

[BY A CORRESPONDENT RECENTLY IN JUGOSLAVIA]

THE peasants hold the key to the success of the Jugoslav five-year plan. They must provide food for the increasing industrial population and for Jugoslavia's developing exports. It appears that they have not been producing enough, and this has been bluntly admitted by Jugoslav leaders including Tito, Djilas and Pijade. This sets the government a problem which in its present position—with foreign currency short and every effort concentrated on investments in industry—is extremely difficult to solve. Coercion was tried as far back as 1946 and failed to produce results. The peasant reaction to harsh measures which have been applied from time to time over the past four years is to produce less, eat more and refuse to bring surpluses to market. Out of a total population of 16 million, 69 per cent are peasants, and it is impossible (as Russian experience proves) to coerce three-quarters of the population. Tito's recent statements and policy show that he has no intention of trying to do this.

Jugoslav peasants have many causes for complaint; and this year they are very voluble about them. The government pay them too little for their produce; they are not left with as much as they would like to sell at the huge prices of the free market; they can buy very little with their often large savings of money; in some parts of the country they have had to do too much "voluntary" labour, often working their animals as well as themselves on such jobs as timber hauling. Some of them have been forced into co-operatives or penalised heavily for not joining them.

The other side of the picture is not mentioned in these complaints, but most peasants—certainly all those who are old enough—remember agrarian conditions in the 1930's. This explains why peasant dissatisfaction does not mean peasant disaffection. Most peasants know that they now get prices undreamed of in prewar times. Most of them are eating more and better food than ever before; peasants returning from Belgrade market eat white bread, hard-boiled eggs and bacon for lunch, and that is nothing to what they eat at home. This is not true for peasants in the poorer parts of the country, but figures of wheat production in Jugoslavia and its disposal prove that average consumption of wheat products must have gone up in the past few years. The following table shows Jugoslav wheat production in 1949 compared with an average prewar figure:

WHEAT PRODUCTION
(In Tons)

		Exports	Balance
1933-37 (average)	2,349,654	150,558	2,199,086
1949	2,866,620	15,000	2,871,620

At the prewar standard of consumption, 2,265,000 tons of wheat would have been sufficient for the present population of 16.1 million, but as can be seen from the above table, 6,620 tons more than this were consumed.

(In Tons)

Total wheat, 1949	2,886,620
Bought by the State	671,540
On free sale	801,839
Kept for seed	451,034
Left for peasant consumption	1,633,747

As ration cards are issued to 5,400,000 of the total population (this includes some poor peasants who do not produce enough to feed themselves), this means that the peasant two-thirds of the population are consuming more than two-thirds of the wheat.

In spite of this, the government has had difficulty in getting the peasants to fulfil their sowing targets. Tito stated in an election speech at Drvar that 500,000 hectares less were sown in 1949 than in the previous year, and the whole area sown was only 92.6 per cent of the sown area of 1939. Recent newspaper reports state that spring sowings are still seriously behind schedule. This may be because of passive resistance among the peasants, but it is probably also because planned targets (nearly 2,000,000 more acres to be sown than last year) are very high and difficult to fulfil without more machinery and a more efficient organisation.

Meat and fats are also insufficient. There have been complaints in the papers of the illegal slaughter of animals. There is a manifest shortage of fats in all the towns, in spite of the fact that, according to Tito's figures in parliament, there are 721,000 more pigs (but of lesser size) in Jugoslavia today than before the war. The "linked prices" system was introduced two years ago, to try to get the peasants to sell more produce to the government at fixed low prices in return for coupons, which enabled them to buy consumer goods of the quality and quantity the peasants most wanted. The latest official report of the Ministry of Finance stated that peasants have bought 10,903 million dinars worth of goods under this scheme, and from the list given it seems that they have spent most of their coupons on kerosene. The goods available were glass, tobacco, cement, kitchen ware, etc. But what the peasants would like to buy are high quality consumer goods such as radios, watches, clocks, electrical gadgets, kitchen stoves, as well as pins, needles, thread, fancy textiles and leather goods. They also want farm machinery, tractors and trucks. Very few indeed of these things are available yet. The Cominform blockade cut off one source of supply and the insistence of the government on industrialisation first has meant that few consumer goods have been imported from the west.

Problem of the Co-operatives

There is also the problem of the co-operative farms. Co-operative farming—which the Jugoslavs strenuously maintain to be a different thing from collective farming—has been pushed ahead very rapidly in the past two years. In 1948 there were 1,318 co-operatives in Jugoslavia; in 1949 they have been increased to 6,603 and now number 6,500. This rapid development was achieved often by forceful methods which are now admitted to have defeated their own purpose. Whilst satisfying the ideological necessity of "socialising" farming, it frightened the bulk of the peasants and at the same time did not succeed in stepping up production sufficiently to meet present needs. Although joint farming of larger areas of land will eventually produce more than individual strip farming, it cannot do so until there are sufficient machines, fertilisers, and tested seeds for the needs of the co-operatives, and until there are sufficient material awards available for those peasants who have joined co-operatives to make them the envy of the private peasants. This is not the case at present. Tito stated recently that the government policy now is to consolidate the co-operative farms that have been created, making them models of their kind, before any new ones are founded.

Seventy-five per cent of Jugoslav agriculture is still in the hands of private peasants. The government now has the problem of simultaneously improving the co-operatives and trying to get the private peasants to increase their sowing, fatten their stock and sell more to the government. Exhortation has reached its limit, though it will certainly continue. Investments in the co-operatives will have to be increased—they amounted to 11,000 million dinars last year and are scheduled at 13,000 million this. It is still not enough. More machinery must be made available; tractors are now being made in Jugoslavia and others are being imported. They are very few compared with the need. Incentives will also have to be provided for the private peasants. Jugoslavia recently received a loan from the Export-Import Bank of $9,000,000 for consumer goods and it is probable that much of this will be spent on machinery to make goods in Jugoslavia. This means that results will be qualified by the lack of trained labour in Jugoslavia and the wastage and inefficiency natural in a Balkan country that is

only just learning to industrialise. If the desired consumer goods are to get to the peasants this year, they will have to be imported. Jugoslav leaders recognise this and seem to be prepared to do so, providing they can make the necessary arrangements with countries which Tito described as "saturated with consumer goods," and providing they can obtain the necessary foreign currency or credits.

Broadcasting in the Soviet Union

[BY A CORRESPONDENT]

DURING the thirty-two years since they seized power, the rulers of the Soviet Union have succeeded in building up an elaborate system of mass indoctrination. Propaganda in the USSR has for long been a recognised and official part of the activities of the state ; it is now the factor upon which, to a large extent, depends the continued success of the Soviet Communist Party's programme of transformation of the Russian empire, and, as Communists believe, eventually of the whole world, into a Communist "family of nations."

Among the many instruments of propaganda used by the Soviet Government none had a more rapid development than radio broadcasting. In 1922 Lenin defined broadcasting as "a journal that needs no paper and knows no distances." With remarkable foresight he impressed upon his followers the necessity of building up a Union-wide radio network. Now, the Soviet radio propaganda system has outgrown, both in size and in importance, Lenin's boldest dreams. But, apparently, it still does not satisfy the present needs, and the Soviet Government are at present embarking on what is called "the complete radiofication of the Soviet Union."

As broadcasting is conceived primarily as an instrument for the spread of Communism, it is only logical that it should have been organised into a highly centralised system with headquarters in Moscow. Broadcasting follows closely the organisational pattern of the Soviet press, from which it takes most of its propaganda material. At the top there is the Committee for Radio Information of the USSR Council of Ministers and, immediately below it, the All-Union Radio Committee, the authority that has direct control over broadcasting. Both committees work under the close supervision of the Propaganda Section of the Central Committee of the Soviet Communist Party, which is the final authority in all propaganda matters.

Moscow Calling

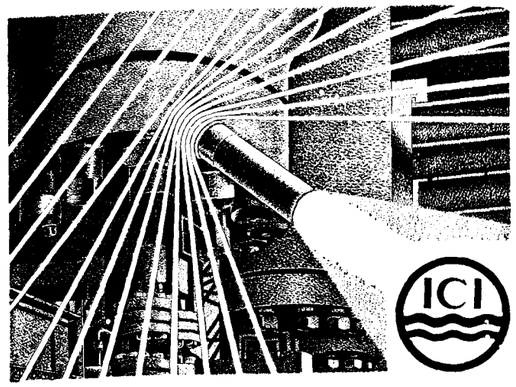
Radio Moscow, besides its special broadcasts beamed to almost every corner of the globe, has three separate Russian-language services. One of them runs round the clock and is transmitted to every part of the Soviet Union through a complicated system of relays. This is done through the provincial radio stations which have very little independence. Their contribution to the broadcasting programme may seem considerable if measured in terms of time, but it largely consists of translations of Moscow items into local languages, rehashed propaganda adapted to local needs and such additions of folk music and local colour as may seem necessary to give broadcasts a "national" character. Generally speaking, at least one-third of the local broadcasting time, and in many cases much more, is given to direct relays from Moscow. In this way uniformity of content and interepretation is achieved throughout the Soviet Union.

Relays from Moscow and the local stations' additions are made available to Soviet citizens not through individual listening, but usually through a network of loudspeakers installed in all public places such as factories, restaurants, schools, "palaces of culture" and parks as well as in private homes. The system consists of one or several so-called reception radio-points which connect the nearest radio station with the loudspeaker network. In 1940 it was stated that 6,000,000 of these existed. If two or more stations are audible, the radio-point is tuned in to them or to Moscow, in accordance with a listening schedule worked out by the local radio committee or party propaganda man. Radio-points are operated by a reliable staff of "radists," as wireless operators are called in Russia, who are responsible to the local party authorities. After listening hours the radio-point is kept under lock and key. Radio listening on collective farms is organised on similar lines.

While many of the larger towns have their own radio stations and most of the smaller ones are provided with radio-points, about two thirds of rural communities in the Soviet Union have no wireless. Accordingly, the Soviet Government have recently put into operation a five-year plan which it is stated, "will bring the radio to every farm and every house on the territory of the Union." In 1947 there were 5,500,000 sets, and the current five-year plan promises 3,000,000 more. The annual output of sets is believed to be about 900,000. Another recent official declaration said that the Soviet radio industry is about to start the operation of "a mass television system of high precision"; mass production of a cheap type of universal electric generator and of new makes of wireless sets for collective farms is to begin shortly.

Collective Farm Listeners

In view of the magnitude of the undertaking, the Soviet authorities intend to shift the greater part of the job on local youth organisations. The most responsible part of the work has been put into the hands of the Society for Co-operation with the Army, which may indicate that the plan has also a military aspect ; the Communist Youth organisation, Komsomol, will also co-operate. Many members of both organisations are now being directed to follow training courses in propaganda and wireless maintenance, and are later to be put in charge of newly-organised radio-points in collective farms. As can be clearly seen, the Soviet authorities intend to strengthen and expand the existing system of radio propaganda and collective listening so as to make it entirely watertight.



In these circumstances it would seem that the outlook for western radio propaganda is entirely hopeless. Fortunately the prospect is much better than it looks. True, it is most unlikely that any western broadcasts will reach the average Soviet citizen. But it is also true that in spite of this a potential body of listeners to western broadcasts does exist in the Soviet Union.

Who are these listeners? They are, first of all, responsible party and state officials, who have wireless sets for official use in their offices and private sets at home ; secondly, senior (but not necessarily old) technical experts who are often allowed the same liberties ; and, thirdly, the many thousands of wireless operators, communication men, monitors and others, civilians and military, who deal with wireless as part of their work. These men can listen in in spite of strict control and many of them do listen. To these must be added a considerable number of soldiers stationed outside the borders of the Soviet Union, in various Communist-dominated countries, where radio listening is a much less complicated affair. The total probably runs into many tens of thousands. How many of these actually listen to western broadcasts cannot be exactly known, but the number must be considerable if the violence of the Soviet reaction—jamming and counter-propaganda in the press—is taken into account. The extension of the Soviet listening radio system, now planned by the authorities of that country, will provide many more thousands of potential listeners to western broadcasts as more and more men are trained as supervisors and operators of small provincial and collective farm radio points.

Power Cartridge

Modern explosives date back only to 1866 when Alfred Nobel invented dynamite. Of the many explosive substances which followed nearly all can be usefully employed in mining and quarrying, but powerful explosives may be difficult to control, save in the hands of experts. Some explosives, however, had until recently no use except in firearms. But in the early 1930's I.C.I. research workers at Ardeer in Scotland discovered a method of modifying explosives so that their power may be accurately controlled and harnessed for useful work.

At first what are called Power Cartridges, loaded with this modified explosive, were used for starting aeroplane engines. But further research at Ardeer has led to the discovery of new substances which achieve similar results with much greater certainty. Power Cartridges, for instance, can now be made to exert several horsepower for periods varying from one hundredth of a second to several minutes. Their uses range from starting farm tractors and heavy oil engines to propelling model aeroplanes, and from driving in rivets to operating fire extinguishers and the landing gear of aircraft.

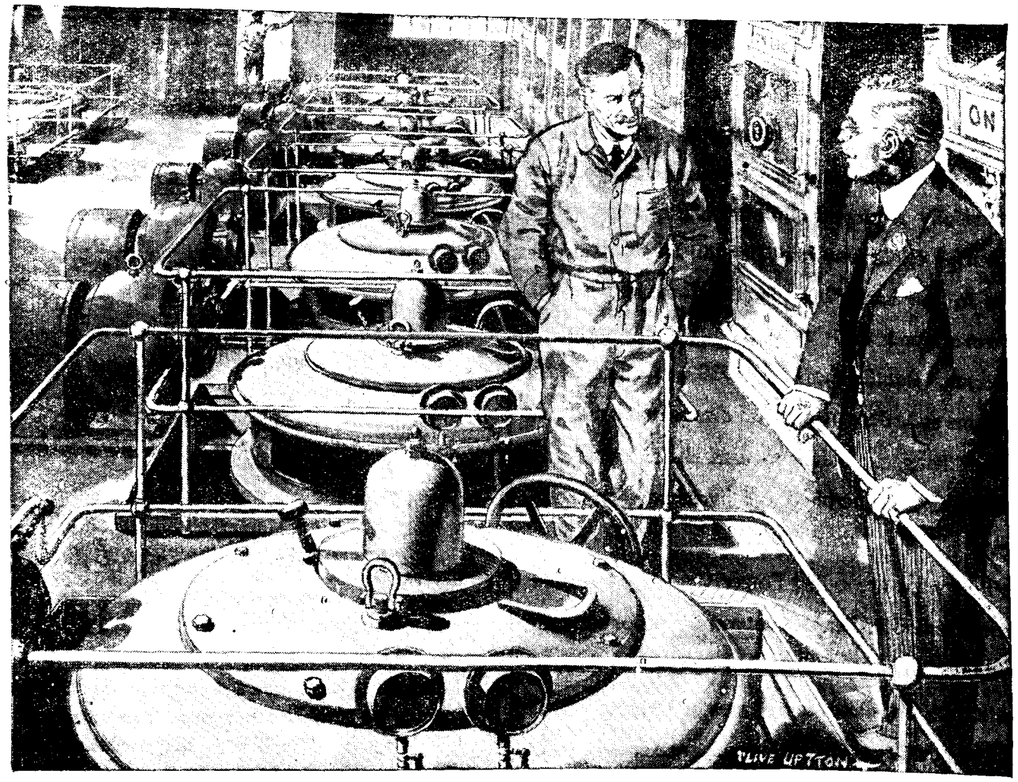
THE BRITISH COLONIES

A Second Survey by

THE TIMES

Interest in the problems and prospects of the British Colonies has never been so marked or so widespread as it is to-day. This is very understandable, since scarcely anything that happens in the world at large is without its effect upon a particular colonial territory or upon the political and economic future of the Colonial Empire as a whole.

The Times Survey of the British Colonies published last February was so widely welcomed that a second Survey is to be published in July, devoted like the first to a variety of colonial territories and problems but giving particular attention to the British West Indies.



Federal and constitutional issues in the West Indies will provide leading topics of discussion, and among other West Indian subjects dealt with are the major industries and cultural problems.

Other articles range from East Africa, Malaya, Fiji and the Antarctic and in subject fro.n cricket to Missions.

This is a Survey which nobody alive to the present importance of the British Colonies should miss.

July—Price 3d.

FROM NEWSAGENTS AND BOOKSTALLS

We've solved some problems in our time!

In 1927—a Power Station problem. Generators driven by turbines. Turbines dependent on vacuum produced by condensers. Condensers supplied with river water by pumps. Pumps driven by electric motors. And to join the ends of this chain of interdependencies—the motors driven by current from the generators. That circle once broken by stoppage from any cause, the motors had to find power from elsewhere or the turbines could not be re-started.

¶ Obvious answer—a stand-by battery. But batteries idle for long periods are apt to prove work-shy when most needed. We worked out a new system of charging—the continuous feeding of a battery with exactly that fraction of charge which otherwise it must daily lose through standing unused. We called it trickle-charging.

¶ We started something, there. Trickle-charging is universal, now, for stand-by batteries. Our own Keepalite automatic emergency lighting system, using trickle-charged batteries, is in use all over the world.

¶ And the Chloride battery that began it? Dismantled at last after 22 years. Was it worn out? Far from it. Good for many years more service. But the building in which it stood has just been demolished. They're building a new Power Station.

¶ *Our battery research and development organisation, the largest & best equipped in the country—if not in the world—is always at industry's service, ready at any time to tackle another problem.*

THE BUSINESS WORLD

Soap and Fats

RUMOUR has it that the soap ration is likely to be abolished soon. Last week the Minister of Food said that rationing of soap would not be taken off "next month" but he hoped it would be ended before long, and promised to increase it before supplies were freed. Retailers assert that it is price and no longer rationing that governs their sales and that their stocks of soap are large enough for comfort. Now that the points scheme is ended, derationing of soap would yield further administrative economies. In the past nine months, a notable improvement in the supply of fats has taken place. The cooking fat ration has been increased to 2 oz. a week; bigger fat allocations have been made to manufacturers; butter has been raised to 5 oz. a week, and margarine can be taken instead if desired. The soap ration has also been increased and the better-known branded makes are more readily obtainable. These increases reflect the improvement in world supplies of fats and oils in the past year.

In general, edible oils are used to make margarine and compound cooking fat, while inedible oils, grease and tallow are used to make soap. But the division of raw materials and their uses is not precise. Before the war, a significant proportion of edible oils was used in making soap, and an appreciable, though smaller quantity, is still used. The use of different oils and fats in soap-making in Britain is shown in Table I. The main ingredients are palm oil, acid oils, palm kernel oil, tallow and bone grease. Greater quantities of acid oils and palm and palm kernel oils are now used than in 1938, and much less tallow and bone grease, coconut oil, and whale oil. Whale oil now goes almost wholly to making margarine and cooking fat and so do much larger quantities of coconut oil, palm kernel and palm oils. Soap makers have had to practise economy in scarce materials, none of which has been free enough to increase margarine and soap output at the same time. Last year the output of both margarine and cooking fat was over twice as large as in 1938, but soap production was only 80 per cent as much.

These conditions in raw material supplies, however, are changing fast. World production of oils and fats has increased steadily in the past two years; last year's estimated total of 21,700,000 metric tons was slightly larger than the prewar figure. The main contribution to world supplies in 1949 was the record production of oils and fats in the United States for the second season running. America had, in fact, a net export of 500,000 tons, whereas in 1948 it had net imports of 100,000 tons. Increased production in British West Africa, Indonesia and to a much smaller extent in Malaya also helped to expand the available supplies. World output for 1950 was forecast last week by Mr J. C. A. Faure of Messrs. Lever Bros. and Unilever Ltd. at 22,800,000 tons—1,200,000 tons more than the 1934-38 average. But this expansion in supplies is not sufficient to match the increase of population, and supplies per head this year will still be well under the prewar figure. To reach it, output would have to increase by a further 1,500,000 tons.

All these are figures of world production, and for dollar-hungry consumers they show too optimistic a picture. The world's production of oils and fats is up, but total exports are down because producers are using more themselves. Total exports increased last year by 727,000 tons to 4,730,000 tons—still more than a million tons below the average of 5,830,000 tons between 1934-38. Mr Faure estimates that exports may increase this year by a mere 90,000 tons to 4,820,000 tons; thus substantially the whole of the projected increase in output (of just over a million tons) will be consumed in the producing countries, half of it in Europe. Detailed estimates leading to this conclusion are given in Table III. The big increases in output are in the dollar areas, and the big falls in the soft currency areas. This would not matter if currencies were convertible, but they are not. Supplies for Britain have to be sought from soft currency areas. Before the war exports from these areas totalled nearly 5,100,000 tons; in 1950 they are forecast at only 3,230,000 tons. British West Africa and Malaya are the only two soft currency countries whose exports are expected to return to their prewar level. Marshall dollars have, of course, enabled western Europe to benefit from

America's large exports. In 1949 some 440,000 tons of American oils and fats came to Europe (mostly to western Germany) of which 60 per cent were shipped under ECA authorisations.

There are indications that this year at any rate the supply of soft currency oils and fats will increase. American acreages of cotton, maize and groundnuts have fallen, though soya bean output is likely to increase substantially. It is true that India has prohibited the export of groundnuts (of which it was an important prewar supplier) but is prepared to sell groundnut oil. The Argentine Government has agreed to allow a restricted export of linseed, and substantial shipments in 1950 are expected. The Nigerian groundnut crop has been halved owing to bad weather, but this area could increase its supplies if transport could be obtained to move its large stocks. Improved political conditions in Indonesia are reflected in larger shipments of palm oil, and though exports of copra are expected to decline, total exports of vegetable oils from Indonesia may be 15 per cent higher this year. The past few months have witnessed the re-entry of Manchuria into world trade, with an export of 100,000 tons of soya beans ; shipments of groundnuts and groundnut oil from China, surprisingly enough, are expanding.

Soap manufacturers have noted that supplies of palm oils and palm kernels are likely to increase slightly, while groundnuts and whale oil are expected to decline. Groundnut acid oil, a residue from the refining of groundnut oil, is an important raw material for soap and at present it is relatively scarce. Had the East African groundnut scheme proved successful, the derationing of soap would certainly have been possible this year. In fact, world exports of groundnuts this year are likely to be less than 60 per cent of the prewar quantity. Britain's supplies of oils and fats from Commonwealth sources are mostly bought on contract, and it can be assumed that such quantities as are available for export from these countries will come to Britain. For other supplies, Britain has a new and an important competitor. Germany is now becoming a large buyer in the world market. American prices for fats and oils, which tended to be below those for soft currency supplies even after the devaluation of sterling, have recently risen to approximate parity with them. If American prices were to continue to rise, the United States might become a buyer in soft currency markets—welcome action in closing the dollar gap, but leaving less oils and fats for Britain and western Europe at higher prices.

Until adequate supplies of butter and lard are available, margarine and compound cooking fat are likely to have first call on any increase in supplies of oils and fats. Admittedly, the weekly ration of four ounces of margarine is not being fully taken up, but housewives and manufacturers might be willing to take more if they had more sugar. Despite the prospective increase in the supply of butter, production of margarine and cooking fat would presumably have to be maintained at its present level ; if so, such additional supplies of raw materials as may be available to soap manufacturers this year could hardly raise their production above 85 per cent of the prewar level. Whether soap can safely be derationed therefore depends upon whether the unrestricted demand at present for soap is expected to be at least 15 per cent smaller than before the war. The question can, however, be put in another form: Will the increased use of soapless detergents cover not only this gap but also any additional demand per head of population due to changed social habits ? Since soap was derationed in France, consumption has fallen well below the ration, which itself represented only 60 per cent of prewar consumption. Something of the sort might happen here.

The great expansion in the production and sale of soapless detergents since the war is obviously of major significance to the postwar soap market, and must be left to a subsequent article. Given so many unknown factors, the Ministry of Food is likely to move cautiously in derationing soap. The Ministry would have to continue to allocate raw materials to soap manufacturers, unless margarine and cooking fat could also be free. If, further, the Government took the view that the maximum price of soap could not be raised (although soap does not play a very important part in the interim index of retail prices) the prospects of derationing might be thought distinctly speculative. But it might still be a step worth taking.

Business Notes

A Conversion Puzzle

The result of the Treasury's conversion offer to holders of the 1949-51 War Bonds has caused something of a mystery in the gilt-edged market. It was announced on Tuesday that when the offer closed last Saturday holders of £505 million out of the £714 million of bonds had tendered their holdings for conversion into the new tranche of 2½ per cent Funding Loan, so that appreciably more than £200 million (allowing for small conversions of stock held on the Post Office register) remains unconverted. The figure of £505 million for conversion applications does in fact align fairly closely with the first guesses in the market; but the estimates then were based on the assumption that the biggest single block of private holdings—namely, the £100 million or more held in the discount market—would not be converted. In fact, as recorded in these columns last week, the discount market quickly sold most of its bonds for cash, and the bulk of these offerings were absorbed by the official buyer. In other words, if it is assumed—and the market at first took it for granted—that the official holdings were converted automatically, that would mean that private conversions were very small indeed, since the combined holdings by "Departments" and by the discount market at the outset of the operation could not have been less than about £450 million and might have been appreciably more than that.

So small a conversion by private holders as this reasoning implies would be in itself a little surprising; but apart from that, it is not easy to believe that private holders have been anxious to hold more than £200 million of a bond that has so short a life when they had the chance last week to convert at an effective price of 101 3-16 or to sell for cash at 101. (Since then the withdrawal of the official buyer has forced the price down to 100¾.) The market has toyed with the theory that foreign holdings might have been large; but there is no reason to suppose that this was so, or that foreigners would necessarily abstain from conversion. Similar arguments apply to industrial holdings and to those of the banks, even though some banks are believed to have preferred to keep moderate amounts unconverted.

* * *

Unconverted Official Holdings?

The difficulty of explaining this £200 million has therefore led to the suggestion that the authorities did not, after all, convert the whole of their holdings. In some ways this is quite the most plausible explanation of the puzzle. It would be strictly in line with the assumptions, made here at the time of the operation, that one of the objectives was to strengthen the cash position of the "Departments" after their big intake of BEA stock. It is conceivable that the market selling of 1949-51 bonds for cash, which temporarily absorbed the whole of the proceeds of the issue for cash, was on a larger scale than the authorities had envisaged. If so, it would obviously be prudent to keep part of the departmental resources in a bond that will be turned into "internal" floating debt within a year or so at most instead of committing them wholly to a longer stock of somewhat uncertain marketability.

Meanwhile, whatever the truth about the conversion result, there is no doubt that the official tactics have been highly successful in the wider sense. Although the underlying factors in the capital market are no more favourable than they looked a few weeks ago, and although the "departments" face a constricting cash position, the authorities have succeeded not merely in capitalising for themselves, but actually in reinforcing, the buoyancy that was showing itself at the time of the BEA flotation. During the past week virtually the whole market has advanced further. The new "coal" stock has risen to ⅜ premium, and some optimistic buyers of 3½ per cent War Loan have raised it by fully two points above its level of early May.

* * *

Reform of Government Accounts

It was hardly to be expected that the Committee on the Form of Government Accounts, whose report was published this week, would present a cut-and-dried plan for reform. The issues involved are so complex, and the various interests that have been clamouring for reform have such divergent needs, that an enquiry of this character was never likely—however thorough and far-ranging its investigations—to feel itself able to offer a definitive and precise solution. If these difficulties are realised, the report should be welcomed as providing a firm basis from which further studies—both official and unofficial—of the problem can proceed ; and it is to be hoped that no time will be lost in setting them in motion. Although the committee has not pushed its conclusions to the point of detailed proposals, its views on the basic issues of principles are quite definite—and most of them point in the right direction. In particular, it is satisfied that the main Exchequer accounts and the framework of both Estimates and Appropriation accounts should remain on a cash basis. It believes that adoption of an "income-and-expenditure" basis would "encounter insuperable practical difficulties," would not lead to economies in staff, and "would offer no practical advantage for services other than trading services." On the other hand, the committee is emphatic that the "trading fund" method—which provides a logical means of linking income-and-expenditure accounts with the central cash accounting—should be established, by legislation, for all large and permanent trading operations and that for all trading activities for which this method is unsuited trading accounts should be published.

This opinion runs roughly parallel to the proposals made by Professor Hicks in his book *The Problem of Budgetary Reform*, but is perhaps unlikely to be shared by certain other academic circles that have given attention to this matter, or by professional accountants considered as a group. The committee shows, however, that many of the business

proposals for reform assume a much closer analogy between the problem of government accounting and commercial accounting than does in fact exist. In this the committee is probably right—if only for the reason that the first need in government accounting is that it shall enable the governmental machine to satisfy the principle of "accountability" to Parliament.

* * *

Data for Economic Analysis

The main effort of the committee, apart from its emphasis upon the need for an income-expenditure basis for trading services and for a reconciliation of this basis with the central accounts, has therefore been directed towards the elimination of the present distortions and anomalies in the central system of cash accounting and towards a general tidying-up of the accounting structure as a whole. Some of its recommendations with these ends in view would represent a very real advance. For example, it proposes that Appropriation accounts should be supplemented by statements of current assets and liabilities of departments; that there should be a general statement of government assets and liabilities, eliminating any inter-departmental balances and listing government holdings of shares and other securities; that there should be a strict segregation of current and capital expenditure in the Estimates and Appropriation accounts and that the cash Estimates for trading services should be supplemented by an estimated "income-and-expenditure" account; that the national debt return should show departmental holdings of securities "with some indication of what is included" and that there should be a comprehensive annual report of operations by the National Debt Commissioners.

All these are valuable and constructive suggestions; but from the all-important point of view of ensuring the data necessary for the formulation and informed criticism of wider economic policy, perhaps the most significant suggestion is that a quarterly statistical return should be published showing the "consolidated relations with the public of the central government and all its agencies and connected statutory organisms." Somewhat regrettably, the committee has not tackled the difficult task of formulating precise suggestions for such a return: it contents itself with the suggestion that the possibilities "might be given close and urgent study by collaboration between accountants, statisticians and economists in the government service." Very wisely, it emphasises that, in the provision of data for economic analysis, speed in publication is incomparably more important than accounting precision. In this important direction there will be no real progress unless the responsible officials learn to prefer broad and comprehensive estimates, rapidly compiled, to the meticulous and scattered details of firm audited accounts that become available only after long delay.

* * *

Insurance Fund Holdings

Less than five weeks after the publication of the full accounts of the National Insurance and Industrial Injuries Funds for the year ending March 31, 1949, the National Debt Commissioners have made available the lists of their holdings of securities for these funds on March 31st last. As usual these lists are presented in about the most unhelpful form which is consonant with statutory obligations. They are spread across three separate returns from the Stationery Office (at 2d. each), they provide details of nominal (not market or cost) values, and they make no attempt to aggregate the hundred separate items shown or to compare them with the equivalent figures provided last year.

Nevertheless, the returns do provide a reasonably up-to-date picture of the holdings of the only extra-budgetary funds that are at present running a large surplus of income over expenditure. They show that the nominal value of securities held on behalf of the Insurance and Industrial Injuries funds ran up by £170 million (from £1,040 million to £1,210 million) in the year to March 31, 1950. The largest holdings shown in the current returns are those of

NET PURCHASES BY INSURANCE AND INDUSTRIAL INJURIES FUNDS 1949-50

(£ Million—Nominal Values)

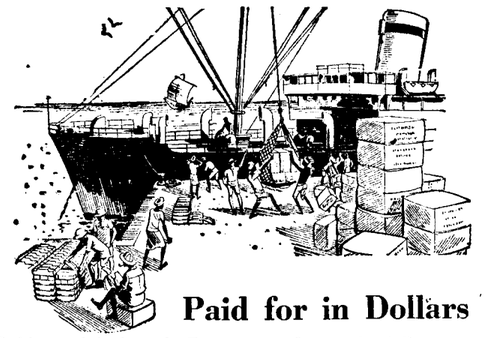
Gas Stock, 1990-95	39·0
Savings Bonds, 1955-65	29·7
National Defence Stock, 1954-58	21·5
Savings Bonds, 1960-70	20·1
Transport Stock, 1978-88	19·5
Treasury Stock, 1975 or after	11·2
Funding Stock, 1956-61	6·3
War Stock, 1955-59	6·0
Other Non-floating	12·6
Floating Debt	5·2
TOTAL	171·1

"Daltons" (£212 million), Transport Stock 1978-88 (£156 million), Savings Bonds 1964-67 (£112 million) and Savings Bonds 1965-75 (£109 million). The main changes in holdings during the latest financial year are shown in the accompanying table. It will be seen that the biggest increases were in Gas Stock (which was, of course, the only big gilt-edged issue during the year) and in various types of medium dated stocks, of which the funds are in general large holders. Apart from a small depletion in holdings of Dominion, Colonial and Local Authority stocks (totalling £1,000,000 in all) these funds were not net sellers of any security in the year. Their holdings of 1¾ per cent Exchequer Bonds, 1950, were evidently converted into 2½ per cent Exchequer Stock 1955 without any net sales or purchases of the new security. The general conclusion that emerges from these accounts is, therefore, that the holdings of the insurance funds were not aggressively "played upon" during the year in order to support the Government's monetary policy. No doubt there was ample scope for this in the securities of the Issue Department of the Bank of England.

* * *

EPU Taking Shape

At the meeting of the Special Committee of OEEC Ministers in Paris last weekend, the long and tangled negotiations for the formation of the European Payments Union seem to have entered their penultimate phase. Although some questions of principle have still to be decided, and many points of detail remain to be filled in, agreement seems to have been reached—subject to final approval by the full Ministerial Council—on all those matters that might, even at so late a stage, have produced a new deadlock. Since the main problem that awaited solution at the weekend meeting had arisen chiefly from the objections raised by Belgium to provisions based upon Britain's counter-proposals, the agreement has perforce involved a movement towards the Belgian point of view, notably in the matter of the extent of EPU credit to be received by or granted to participating countries.



The point at which net claims arising from intra-European payments become receivable or payable wholly in gold is now fixed at 15 per cent (instead of the 20 per cent suggested by Britain) of each country's total visible and invisible trade in 1949 with other members of the OEEC group. Moreover, the point at which gold payments come into play for the partial financing of deficits and settlement of surpluses has been brought a long step forward. Whereas Britain had proposed that debtors should have "gold-free" borrowing rights equal to 10 per cent of their basic trade turnover and creditors should have gold-free lending obligations equal to 5 per cent, the proportion has now been agreed at only 3 per cent for both. For the remaining 12 per cent in the quota, debtors

THE TEST OF TWO CENTURIES

In the two hundred years since Glyn, Mills & Co. became a name in Lombard Street, great changes have shaped the course of history. In those changes this now famous bank has preserved unaltered its tradition of a private Banking House offering the most comprehensive financial facilities.
To-day, as in 1753, Glyn, Mills & Co. provides a banking service to meet the special requirements both of the large public corporation and of the private customer.

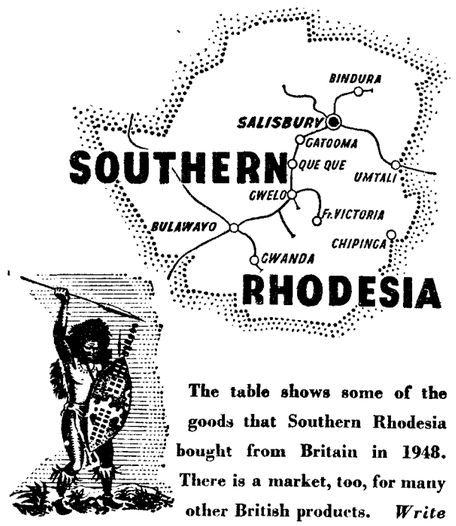
BYRON.

Customers who are travelling or holiday-making in this country may, upon request, make arrangements with the Bank for encashment of their cheques during the course of their travels.

If you are going abroad you will find it convenient to take Travellers' cheques issued by the Bank payable on demand by our correspondents throughout the world. Your bank manager will be pleased to explain.

MARTINS BANK
LIMITED
LONDON DISTRICT OFFICE: 68, Lombard Street, E.C.3.
HEAD OFFICE: 4, WATER STREET, LIVERPOOL, 2



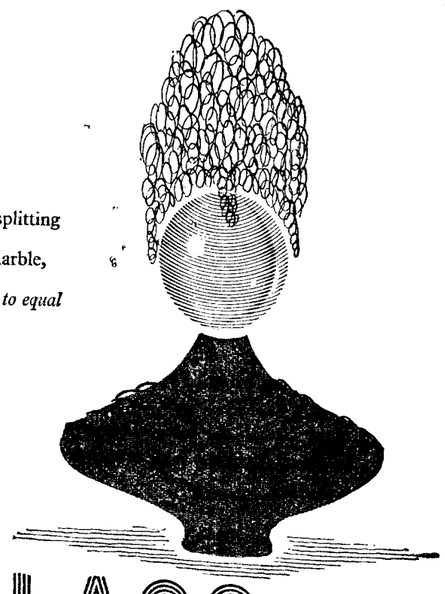
The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

A comprehensive banking service is available at the Bank's branches in
INDIA PAKISTAN CEYLON BURMA KENYA ZANZIBAR UGANDA TANGANYIKA and ADEN

NATIONAL BANK OF INDIA LIMITED
Head Office: 26 Bishopsgate, London, E.C.2.

TOTAL 1948 U.K. EXPORTS TO THE TERRITORY WERE £15,507,000. THESE INCLUDED:



CUTLERY, HARDWARE, IMPLEMENTS	£471,000
ELECTRICAL GOODS & APPARATUS	£959,000
MACHINERY	£1,915,000
POTTERY, GLASS, ABRASIVES, ETC. ...	£472,000
WOOLLEN & WORSTED YARNS & MANUFACTURES	£563,000
COTTON PIECE GOODS	£2,221,000

The table shows some of the goods that Southern Rhodesia bought from Britain in 1948. There is a market, too, for many other British products. *Write for our new booklet 'Overseas Markets'.* It contains detailed trade tables for Southern Rhodesia and other territories where the Bank has branches.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

Note this head of fine hair

You read a lot of hair-raising stories nowadays. You hear a lot of hair-splitting arguments . . . So what will you say when we tell you about our Pet Marble, *which grows glass hairs so fine that it takes* 500 *of them, bundled together, to equal the thickness of one human whisker!* You don't believe that? . . . well, listen to this: THE FINEST ALL-ROUND INSULATING MATERIAL IN THE WORLD IS MADE OF FILAMENTS LIKE THESE, SPUN FROM GLASS MARBLES. It's used in buildings, dynamos, ships, railway engines, refrigerators, aeroplanes . . . It's called:—

FIBREGLASS
TRADE MARK

FIBREGLASS LIMITED, RAVENHEAD, ST. HELENS, LANCS. TELEPHONE: ST. HELENS 4224

will be able to secure credit in the average ratio of three units of credit for every two units settled in gold; within this 12 per cent, a sliding scale would cause the ratio to ascend from 1:4 to 4:1 (Britain's suggestion, it will be recalled, was that the sliding scale of partial gold payments should operate over a range of 10 per cent, with an average ratio of credit to gold of 3:1). For creditors, there will be no comparable scale; once the 3 per cent of gold-free credit has been provided, each claim (up to the limit of 12 per cent) will be settled by equal extensions of credit and receipts in gold.

* * *

Amortisation of Balances

These particular shifts towards the Belgian point of view naturally involve revisions equally applicable to all participating countries. In addition, however, Belgium has received two specific concessions. In the first place, in consideration of the fact that Belgium's external trade (which includes a large proportion of entrepot trade) is unusually large in relation to national income, it has been agreed that the Belgian quota of credit obligations and rights shall be appreciably reduced—apparently by about 18 per cent—below the figure indicated by the general formula. Secondly, the ECA authorities are to make a substantial proportion of Belgium's Marshall allocations for 1950/51 in the form of "direct" instead of "conditional" aid.

Apart from the new provisions for credit limits, there also appears to have been some modification in the expected arrangements for dealing with balances accumulated before June 30th. Britain's proposal that any net debtor on the EPU compensations should have the right to draw correspondingly on its accumulation of "old" sterling seems to have been adopted; but it is not quite clear whether parallel facilities will be available to holders of "old" balances in other currencies. The whole question of the future of such balances is, however, apparently to be worked out, in the first instance, by bilateral negotiations between the countries concerned, with the intention that debtor countries shall agree with the creditors schemes for the amortisation of their holdings over a period. These new bilateral agreements, under which Britain will also seek to arrange that net creditors in the EPU compensations will agree to hold in sterling such portion of their surpluses as accrue in sterling, have in due course to be submitted to the OEEC for its approval.

* * *

Purchase Tax on Vehicle Chassis

The Government's decision to alter the charge of 33⅓ per cent purchase tax on the total value of a commercial vehicle to the value of the chassis only provides evidence of the administrative inconsistencies of the tax in its original form. It would not be difficult to collect purchase tax on the whole vehicle if chassis and body were made by the same manufacturer, but in fact nearly half the commercial vehicle chassis made by the motor industry are sold to body-builders, of whom there are believed to be about a thousand, compared with about thirty chassis manufacturers.

Under the original proposal, the body-builder was to be responsible for payment of the tax. Many anomalies would have arisen—for example, where finishing operations were contracted out, the amount paid by the body-builder would have been lower than if he had done all the work himself. But the real reason for the change almost certainly comes from the nature of the body-building industry—a few big manufacturers and an unknown number of small ones. There would have been widespread opportunities for evasion, and there was, in fact, nothing to prevent a purchaser from buying the untaxed chassis alone, and providing his own body-work.

The new selling prices have not been announced yet—there are some difficulties in deciding where the chassis ends and the body begins—but some of them will show little change. The £106 purchase tax previously charged on a £380 10-cwt Morris van will fall about £23; the saving is negligible on a 5-ton platform lorry where the chassis costs £485 and the body-work barely £80. Battery-driven vehicles of all types will show a big reduction in tax since a battery will not be counted as part of the chassis. The more elaborate the body-work, the greater the proportionate tax reduction. Special purpose lorries, such as milk and petrol transports, will benefit the most. Some of them would have borne £1,000 tax. Two other classes of vehicles become wholly tax free. These are pedestrian-controlled delivery vans and the type of Land Rover that is not intended for road use. The new tax will not be levied until July 1st, and any tax paid before that date is to be refunded.

Another Coal Crisis?

The outlook for the winter's coal supplies is more serious than output figures alone would suggest. If production can be continued at its present rate there is no reason why the lower of the Economic Survey's two targets (205 million tons of deep-mined coal) should not be reached by the same hair's breadth as in 1949. The threat to the winter's supplies comes from the rising rate of consumption. During the first 24 weeks of this year inland consumption was 2.3 million tons higher, and total consumption (which includes exports and bunkers) was 3.6 million tons higher than in the same period last year. Coal production, including opencast production, was only 1.5 million tons higher. Coal stocks at the end of last week were 10.2 million tons, 1.4 million less than at the same time last year. The rise in industrial consumption has been met and the rate of exports increased only by allowing stocks to run down. To start the winter with stocks below 16 million tons is to run some risk, but there is no source from which the extra 6,000,000 tons can be saved by the beginning of November—unless exports were cut, which is unthinkable.

PRODUCTION AND CONSUMPTION OF COAL IN BRITAIN
January 1 to June 18 (24 Weeks)
(Million Tons)

	Production		Consumption		
	Total	Deep-Mined	Inland	Export (including Bunkers)	Stocks
1949	100·1	94·5	91·1	7·8	11·6
1950	101·6	95·8	93·4	8·8	10·2

The Coal Board would be reluctant to miss any opportunity of sending coal abroad, because its profits owe much to the higher prices in the export market. A succession of ministers, culminating in Sir Stafford Cripps last weekend, have warned the miners that their future depends on maintaining exports and so keeping the good will of export customers, but perhaps these exhortations should have been addressed to the ex-miners. The increase that has occurred in the past twelve months in output per man shift, from 1.09 to 1.17 tons, in consequence of mechanisation, has partly concealed the fall in production caused by the shrinking labour force. Nevertheless, it has been calculated that the net loss of some 23,000 miners represents four to five million tons of lost output. The labour shortage is worst in the West Midlands and in Yorkshire, where the mines have to compete for labour with other, more congenial occupations. The greatest need is for face workers, but in some pits men who could be up-graded to the coal face have to be kept on haulage for want of unskilled men to take their place.

Nearly half the shrinkage in the labour force took place last year before the ring fence was removed from the industry. The Coal Board has taken no steps to check the wastage of

young trained men, the cause of most of the trouble. Last year the country was saved by a mild winter and by the miners' quite unexpected increase in production in the last few weeks. Will these save it yet again?

* * *

Larger Exports and Record Imports

Exports last month showed a sharp recovery compared with April, when the figures were reduced by the Easter holidays. The May total of £188.4 million was only £2,000,000 less than the record achieved in March. The volume of exports, now calculated on a new basis, was estimated at 165 per cent of the 1947 level. Increases were recorded for virtually all items. Vehicles rose by £4,800,000 ; exports of new motor-cars (37,463) and commercial vehicles (31,070) both established new records, while shipments of agricultural tractors (7,825) were the highest for over a year. Canada, incidentally, became the largest market for cars, while car exports to the United States were nearly double during the month. To some extent, however, this represents a seasonal increase ; such a high rate of exports to these two dollar markets will be difficult to maintain. Exports of machinery and iron and steel manufactures—the next largest groups—also expanded sharply in May, but shipments of machinery were still below the levels reached in both March and January.

Textiles showed a welcome increase last month, but whereas cotton exports were still substantially below last year's level, shipments of wool textiles were nearly 50 per cent larger. Large exports of copper, copper manufactures and unwrought tin brought total shipments of non-ferrous metals in May to the highest yet recorded. Pottery exports also increased and so did shipments of coal and raw wool.

Exports to Canada continued the steady improvement begun last October ; their daily rate in May was 23 per cent higher than in April. The dollar value of these exports, both in Canadian and American currency, was the highest for any month since the export drive, but the average value for the first five months of this year (in U.S. dollars) was slightly less than that reached in the first quarter of 1949. The daily rate of exports to the United States in May increased by 30 per cent, but the average dollar value of such exports this year is 10 per cent. lower than in the first quarter of 1949.

Imports in May totalled £228.7 million, a new record. The main increases occurred in the raw material group: large quantities of raw wool and raw cotton were received and record supplies of hardwood. Receipts of grain and flour, fresh fruit and vegetables were also exceptionally large. The excess of imports (valued c.i.f.) over exports and re-exports (valued f.o.b.) amounted to £40.3 million, against £55.7 million. The corresponding figure for the first five months of the year, £64 million, is nearly £20 million higher than a year ago.

* * *

Financing the OFS

Sir Clive Baillieu was in a more optimistic mood at the Central Mining meeting last week when he switched his attention from the serious position in Malaya to the gold belt in the Orange Free State. Like Sir Ernest Oppenheimer, he is by no means pessimistic about the ultimate prospect of securing sufficient finance to develop the OFS mines. He estimated that between £30 million and £35 million of new capital will be needed in the next five years to bring the first ten mines to the production stage. These figures are not at variance with Sir Ernest's own calculations of the requirements of the Anglo-American group, which is responsible for rather more than half the burden of development in the area. According to his estimate, Anglo American alone will require rather less than £50 million to finance its share. Of this amount around half has already been secured, apart from funds obtained under the recent arrangement with the Union Bank of Switzerland. Sir Ernest is also confident that investors will subscribe the remainder when the time comes. Sir Clive Baillieu gave his opinion that OFS had a potential output of at least 600 million tons of high grade ore. He compared this estimate with the output of a similar tonnage of lower grade ore from the Far East Rand over the sixty-two years of its existence to date.

The Kaffir market showed little immediate response to these views. Even though the June dividends exceeded expectations in some cases, the *Financial Times* index of gold mining shares fell to 116.41 on Tuesday, the last day of the account. The index then stood only 7½ points above its level on the eve of devaluation and 22 points below the peak of 138.36 on February 28th this year. A substantial rebound in the new account prompted the opinion in the market that Kaffirs are at last sold out. If that were so, many of the bulls would be heartily relieved.

* * *

Coal Compensation Delays

Last week's issue of the first instalment of 3½ per cent Treasury Stock 1977-80 at par amounting to approximately £20 million is the first of many stages in the process of allocating the total compensation of £164,660,000 to the colliery companies. Many of the nationalised companies are still servicing high dividend preference stocks pending repayment of preference capital. The issue of the new Treasury Stock goes some way towards facilitating schemes of repayment. As from January 1, 1949, interim income has been limited to one-third of former revenue, compared with one-half paid before that date, and there is a further proviso that total interim income may not exceed the interest on the final amount of compensation to be awarded.

The effect of this reduction in interim income is now clearly reflected in the reduced revenues accruing to the companies. This makes the need for the quicker completion of compensation payments more evident. Companies are now faced with long delays while the assessment of compensation for individual collieries by the District Valuation Boards can be made. A more expeditious method has for some time been under consideration by which the companies would attempt to arrive at mutual agreements about the division of the sums allotted to the several districts. Such agreements would then be submitted to the District Boards for approval. According to Mr Andrew White, the chairman of Pease and Partners, his board is willing to try out this new approach, and there is nothing in the Act itself which appears to preclude it. The chairmen of Carlton Main Colliery and Yorkshire Amalgamated Colliery have spoken in the same vein in recent months. But unless concerted action on these lines can be taken—and voluntary agreement would not always be easy—the deliberations of the District Valuation Boards may well drag on for several years.

* * *

Shipping Russian Timber

The Board of Trade has now announced that 153,000 standards of timber have been purchased from Russia for delivery in 1950, with the possibility of a further 50,000 standards to be shipped later. The usual shroud of secrecy is maintained over the price, but it is believed to be lower than that recently asked by Sweden. Nor is the proportion of the total quantity to be carried in British ships yet known. Recent imports of Russian grain were brought mainly by Russian ships.

Requests have already been made from London for ships of 1-2,000 standards capacity for prompt July loading in the White Sea, which suggests that at least part of the total quantity will be brought in British ships. There is no lack of suitable tonnage. Britain is buying very little timber from Sweden this year and the bulk of the Finnish and Polish contracts will have been fulfilled by next month.

The chartering of timber ships by the Ministry of Transport for the Baltic and Russian trade has in the past been far from satisfactory, and it came in for sharp comment by the Comptroller and Auditor General in his report, published a fortnight ago, on government trading accounts for the year 1948-1949. The loss of £648,000 on the Ministry of Transport's trading account arose from the chartering of timber ships. A number of foreign timber ships were "time chartered" in 1947 and additional tonnage was chartered in 1948. In that year, however, imports fell below the combined capacity of these ships and of available British ships, so that some of the foreign ships chartered by the Ministry had to be used on less remunerative work during the timber shipping season. The Board of Trade was charged freight at the controlled rates that were inadequate to cover the Ministry's costs and for the whole year the Ministry sustained a loss of over £800,000 on these ships of which £340,000 was calculated as the loss on importing timber and charged to the Board of Trade. Freight rates were decontrolled in December, 1948, and since then the Board of Trade has generally made its own arrangements for shipping timber. At the present time timber is urgently needed in Britain and it is to be hoped that the Board will not lose valuable time—as it did in buying timber—in trying to save a few pence by bargaining for cut rates.

The most disappointing aspect of the new Russian contract, however, is the quantity. If the full 200,000 standards are procured (which would be 100,000 standards more than last year) and if the bulk of them arrive before the end of the year, the worst consequences of the timber shortage would be prevented. But the total available supplies would be little more than that required by the current housing programme ; there would still be no margin for building-up stocks.

* * *

FCI and Steel

The latest report of the Finance Corporation for Industry raises some interesting questions about the nature of the "gap" that it is filling among British financial institutions. Its original purpose was defined in 1945, in the words of the Chancellor of the Exchequer of the day, as

> the provision of temporary or longer period finance for industrial businesses of the country with a view to their quick rehabilitation and development in the national interest, thereby assisting in the maintenance and increase of employment.

From this definition, the accepted idea of the FCI's work was to assist particularly in the provision of capital for the rehabilitation of the basic industries. But the FCI had scarcely been set up before coal and transport were nationalised, and direct Government aid had been promised for the rehabilitation of the cotton industry.

Yet the bulk of the business carried out by the FCI has arisen, paradoxically enough, from the Government's insistence on nationalising the steel industry. Without question, this policy did create a "gap." It may have been arguable whether individual companies in the steel industry could have raised all the money they needed for their development programmes from their own resources and from the new issue market. In the case of Steel Company of Wales—the biggest project—the public was prepared (when nationalisation was in the air but not spelled out in a Bill) to provide £15 million and the FCI undertook to provide another £35 million. But after the Bill had appeared, it was quite certain that finance on the required scale would not be forthcoming from the public.

So it appears that out of total advances and future commitments amounting to nearly £67 million the steel industry accounts for £53 million, of which £20.8 million has been taken up. A clause inserted specifically into the Iron and Steel Act provides for the repayment of these advances in cash eighteen months after the date of transfer. The measure of assistance to the steel industry in relation to the FCI's other business is shown below :—

ADVANCES AND CONTRACTS FOR FUTURE ADVANCES

End March	Advances	Commitments
	£	£
1946	254,500	1,080,500
1947	1,862,051	799,400
1948	4,737,801	41,275,750
1949	10,969,029	50,079,557
1950	32,702,386	34,160,255
Of which :—		
Steel	*20,812,945*	*32,237,055*
Other	*11,889,441*	*1,923,200*

These figures illustrate the relatively limited scale of FCI's operations in industries other than steel. Meanwhile, the Corporation's gross income rose last year from £242,397 to £705,276, but its net income, after meeting interest charges and making provisions against investments, was actually reduced from £126,449 to £105,489.

* * *

Freeing the Grain Trade

Informal discussions have been taking place between the National Federation of Corn Trade Associations and the Ministry of Food on de-controlling the grain trade. Mr. Leslie G. Phillips, chairman of the federation, emphasised at the annual general meeting last week that so far the talks were only exploratory and did not commit the Ministry in any way. Mr. Phillips explained that the scheme proposed by the federation is in three stages. The first would allow the trade to import and to sell to the Ministry of Food on a c.i.f. basis. The second would cover the period when the Ministry's stocks—which are believed to be large—were being liquidated. And the third and final stage would involve the relaxing of import regulations and the abolition of rationing, price control and manufacturing control.

Complete decontrol of the grain trade would of course involve decontrol of flour milling and the selling of flour. The National Association of British and Irish Millers is believed to be preparing a scheme for submission to the Ministry of Food, but this problem is more complicated since

"Don's going up to Oxford next term"

"That's going to cost his people a pretty penny!"

It need not—if a Scottish Temperance Educational Assurance Policy is taken out when a child is born or soon after. Write for full details to The Scottish Temperance & General Assurance Company Ltd., Dept. N, 109 St. Vincent Street, Glasgow.

C4902

it would presumably mean the elimination of the subsidy on national flour and the subsidy on bread.

But apart from these large questions, the feasibility of even the first stage of the federation's scheme would depend on two factors: the adequacy of available supplies and the possible increase in dollar expenditure. But for the failure of the recent Argentine maize crop, coarse grains could have been decontrolled this summer. Now decontrol must wait until next year, provided that the coming harvests fulfil their promise. Most of the coarse grains come from sterling sources, and the small quantities required from the United States could be financed by the Economic Co-operation Administration. World supplies of wheat are more than adequate, even with the prospects of a smaller American crop this summer. But the freeing of the wheat trade is complicated by the need to provide a guaranteed market for the British farmer and also because much of Britain's imports cost dollars. The prewar Wheat Commission could be resurrected to cover the first contingency while the latter is in some part safeguarded by the international wheat agreement. But the problem of the bread subsidy is much more intractable. Until the world price of wheat falls so low as to cancel out the present subsidy, or alternatively, until the Government is willing to let the retail price of bread rise to its true level, the wheat trade is unlikely to be freed.

* * *

Anglo-Iranian Profits

The Anglo-Iranian preliminary statement for 1949 has apparently pleased nobody. The figures themselves are not unimpressive. Some decline from the bumper level of profit in 1948 was only to be expected following Sir William Frazer's warning last year that profit margins were likely to be affected by rising costs and lower oil prices. The uncertain factor was the extent to which this contraction had been offset by the increase, from 190.4 million barrels to 204.8 million barrels, in crude oil produced by Iran and by the remarkable rise from 46.5 million barrels to 89.9 million barrels in Kuwait's output for 1949.

The preliminary statement is unhelpful on this point, since it does not disclose trading profit. Nor does it give the taxation provision for the year. In failing to include the taxation charge, Anglo-Iranian has ignored the recent request of the Stock Exchange that this item be included in all preliminary profit statements. There is no apparent reason why this information should have been omitted. On the contrary, since there are Government-appointed directors on Anglo-Iranian board, conformity with Stock Exchange requirements would have been a helpful gesture to the public authority of the Stock Exchange Council. The statement simply indicates that net consolidated profit declined from £24,471,888 to £18,444,209 after deducting an unspecified charge for taxation and deducting £24,353,920 for depreciation and other sums written off compared with £17,683,902 in 1948. Without knowledge of the taxation charge—it amounted to no less than £28.3 million in 1948—no stockholder can attempt any estimate of trading profit for 1949 comparable with the 1948 figure of £68,384,706 (after charging royalties). After adding back amounts written off to consolidated net profit in 1949, the gross profit after taxation is £42,798,129 compared with £42,155,790.

The decline from £23.3 million to £17.3 million in group earnings attributable to the parent company's ordinary capital has entailed cutting the allocation to general reserve from £16 million to £10 million, but preference stock reserve again receives £1,000,000 and the carry forward has been raised by £277,532 to £1,885,970. Appropriations on this reduced scale still enable Anglo-Iranian to make a substantial contribution from profits towards its heavy capital commitments, yet there is apparently nothing more to spare for ordinary stockholders—the biggest is the British Government—who again receive 30 per cent. The preliminary statement shows that this dividend absorbs £6,041,250 gross. Here again Anglo-Iranian pays no heed to the Stock Exchange requirements for preliminary statements; these specifically ask that dividends should be shown net.

* * *

Gold Standard for France?

A note under this heading last week attributed to the governor of the Bank of France a statement that the franc would soon be stabilised in terms of gold and would thereafter become freely convertible into dollars. This report was based on an agency message and calls for correction, since it is understood that the governor of the Bank of France has made no declaration of any kind on this question.

SECURITY PRICES AND YIELDS

A fuller list containing 366 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Timothy Whites and Taylors; Wiggins Teape; Hudson's Bay Company.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (n) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 14 years, 4 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (h) Assumed dividend 18⅛% after capital bonus. (l) To latest redemption date. † Free of tax. (m) Yield basis 35%. (n) Yield basis 26⅛% after capital bonus.

COMPANY MEETING

GUEST, KEEN AND NETTLEFOLDS, LIMITED

MR. J. H. JOLLY'S STATEMENT

The annual general meeting of Guest, Keen and Nettlefolds, Limited, was held on June 22nd at the Queens Hotel, Birmingham, Mr J. H. Jolly (chairman and managing director) presiding.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1949, and was taken as read:—

It is my pleasurable duty to augment the information provided in the annual report of your board and the consolidated accounts accompanying this statement. In the result the achievement of 1949, taken as a whole, was better than seemed possible when we had our annual meeting in June of last year. The portents of declining volume of trade did not materialise as severely as seemed probable at one time, and in some directions the trend of sales improved.

The various works' managements applied themselves to achieving economies and more new machinery came into production. The managements were ably supported by the staffs and workpeople throughout the group and I have the privilege, on your behalf, of recording the thanks of the stockholders and the directors for these loyal services.

THE ACCOUNTS

You will remember that the accounts submitted to you at the annual meeting in 1949 were somewhat complicated in that the trading periods of the various companies in the group were not for a complete 12 months in all cases. On this occasion the various companies' results are for a full year to December 31, 1949.

In addition to the comments in the directors' report on figures in the annual accounts, it may be useful if the following points are made:—

The balance sheet of the holding company shows a considerable increase in the interests in subsidiaries. This represents the funds passed to subsidiaries to finance their schemes of development and extensions of which you were notified last year. Steps have been taken during the year to convert into share capital the funds permanently required in their businesses, previously represented by loans from the holding company. It should be mentioned that £1,000,000 (Australian) has been subscribed in cash by Guest, Keen and Nettlefolds, Limited, at par for shares in Lysaght's Works Proprietary, Limited, Australia.

Trade Investments—The principal movement on this account is due to the receipt of a further capital instalment of the sale price of the company's holding in the Oroncra Iron Ore Company, Limited.

The real aggregate value of trade investments is difficult to assess, but the balance sheet figure is undoubtedly much below their true worth.

FIXED AND CURRENT ASSETS

Fixed Assets—In the consolidated balance sheet you will observe a net increase of £3,225,992 in fixed assets of the group. This is after the deduction of the year's provision for depreciation, which has been substantially increased on this occasion

Net Current Assets—Current assets, less current liabilities at December 31st last—namely, £23,988,598 — compare with £17,716,153 a year before. You will observe that bank loans and overdrafts are considerably less, mainly due to the fact that the Lysaght Scunthorpe Works Company's development expenditure is now being provided for out of loans advanced to that company by the Finance Corporation for Industry, Limited, which appears as a secured loan at the sum of £3,400,000 at December 31, 1949.

Reverting to the item of current assets, you will note the substantial advance in the amount for stocks of raw materials, finished goods, etc. The rise over the year at £2,266,097, though considerable, seems now to be levelling out again and was in no way due to the carrying of excessive stocks. It probably has relation to the passing of the postwar stringency, and traders generally being able to acquire more easily the volume and variety of trading stocks required.

TRUE RETURN ON CAPITAL EMPLOYED

The balance sheet has been strengthened by the £2,256,630 ordinary stock which was issued at 37s. 6d. during the year and which after allowing for expenses, brought in £4,124,451 additional capital. The issued capital (preference and ordinary) is now £18,863,607 and the reserves of the group now amount to £20,181,468 giving a total capital employed of £39,045,075, of which £31,464,618 is attributable to the ordinary stockholders. This question of total capital employed is of major importance and deliberately ignored by critics when talking of dividend rates and the reward to risk-bearing capital provided by stockholders. The point is plainly instanced by the figures of this company in the following table:—

	Issued Ordinary Capital	Gross Dividend on Issued Ordinary Capital	Capital employed attributable to Ordinary Stockholders	Gross Rate of Ordinary Dividend on Capital employed
	£	%	£	%
Year to March 31, 1947	9,026,520	11	19,534,898	5·08
Year to March 31, 1948	9,026,520,	11	22,450,010	4·42
9 months to December 31, 1948	9,026,520	10	25,592,185	3·53
Year to December 31, 1949	11,283,150	11	31,464,618	3·94
	Jubilee bonus	1¼		0·54

Before leaving this subject of capital employed, it is interesting to recall how much capital expenditure has been proceeding in the group. Omitting the major development schemes (not yet completed), by two of the scheduled companies, and excluding Guest, Keen Baldwins Iron and Steel Company, Limited, the group has spent in the last four years:—

	£
On land and buildings	2,906,664
On plant, machinery and equipment	8,071,393
	£10,978,057

These are large figures, and private enterprise is fully entitled to the occasional praise it receives for its part in the national production effort. But, as a provider of the means, it is surely entitled to make an adequate profit on its risk-bearing capital, whether newly-subscribed or deriving from funds retained in the business. As stockholders you have in four years put £11 million to work. The main reasons for doing so were increased efficiency and the expectation, given good conditions of trade, that profits would be maintained and in some directions improved. Efficiency leads to good profits. We shall continue to strive for efficiency, but "fair shares" as interpreted by the present Government seems to mean that in their opinion you are not entitled to any greater reward.

NATIONALISATION

The Iron and Steel Bill became an Act on November 24, 1949. It remains to be seen whether the present Government will persist in the folly of allowing it to come into operation on the scheduled date (January 1, 1951) or on such later date as may be appointed by the Minister of Supply. Reference is made in the directors' report to the extent to which your group is presently affected.

It is now quite clear that the opinion of the electorate is against the nationalisation of iron and steel and we therefore continue to hope that the power of the Government to put the legislation into effect will be nullified by events or by a belated recognition by the Socialist Party that this doctrinaire measure would not make the same contribution to the welfare of the country, the thousands of users of steel, or the workers engaged in the industry, as under private enterprise.

Meanwhile, the evidence accumulates in industries already nationalised that they cannot be run at a profit without substantially increasing the prices of their services to the public, in spite of the optimistic forecasts to the contrary by the supporters of nationalisation.

STEEL MAKING SUBSIDIARIES

Guest, Keen Baldwins Iron and Steel Company, Limited (G.K.N. proportion of ordinary capital is 57.1 per cent.)—This is the largest of your steel subsidiary companies with its production of steel at the 600,000 ton mark in 1949. The 1948 tonnages were very high, but excellent management, backed by a good team, succeeded in 1949 in establishing new production records in all departments, with satisfactory results on profits. Since your last annual meeting various departmental plant extensions at Cardiff have been brought into commission and will result in increased mill production. At the company's Dowlais works authority has been given for considerable modernisation and expansion of the iron foundry, whose principal output is ingot moulds for steel works.

John Lysaght's Scunthorpe Works, Limited (100 per cent. subsidiary of John Lysaght, Limited)—The development scheme of which you were advised last year is proceeding well in that construction is, so far, up to date with the programme. The new soaking pits, the cogging mill and the Morgan continuous billet and sheet bar mill are completed and successful rollings have been carried out. Production is now in course of being transferred from the old mill to the new plant. The new coke ovens

are completed and are now in continuous operation.

The full benefit of the developments will not be experienced until completion of the additional steel furnace capacity. The final part of this programme will not be completed until 1952. At various periods during this stage, disorganisation of production will arise, causing temporary difficulties in maintaining regular outputs of steel, but, when completed, the steel-making capacity at Scunthorpe works will be raised to about 500,000 tons annually.

MANUFACTURING SUBSIDIARIES

John Lysaght, Limited—In addition to the Scunthorpe company (referred to elsewhere) this company has two subsidiaries in England—John Lysaght's Bristol Works, Limited, and the Uskside Engineering Company, Limited, Newport, Mon. Both companies had a successful year's trading and improved their profits. Authorisation has been given for the extension of the production capacity at the Bristol works.

An agreement has been entered into with the Rheem Manufacturing Company of America to put down a steel-drum manufacturing plant at our St. Vincent's Works, Bristol. The proposed new company to undertake this will be known as "Rheem-Lysaght, Limited," and will be 60 per cent. owned by John Lysaght, Limited, and 40 per cent. by Rheem. Production is planned to come into operation as the increase in steel sheet production makes supplies available.

Lysaght Dominion Sheet Metal Corporation, Limited, whose works are at Hamilton, Ontario, will in future trade as Lysaghts Canada, Limited. In 1949 the company registered improvement in profits and turnover owing to increased supplies of raw material. Consideration is being given to broadening the basis of the Canadian company's trading by the gradual introduction of the manufacture of some products similar to those of Exors. of James Mills, Limited, in this country.

John Lysaght's principal interests abroad are, as you know, in Australia. In 1949 the Australian works continued to be hampered by insufficient supplies of coal, culminating in the coal strike there which caused a complete cessation of production for many weeks. The combined effect of coal and steel shortages was to restrict sheet production for the year to about two-thirds of capacity. It may be that in the current year some further sporadic interruptions to production may occur before Communistic elements accept the defeat which the new Australian Government intends to inflict on them. Given adequate supplies of coal and of steel, our Australian companies should give a good account of themselves in 1950.

PRESENT DAY PROBLEMS

Generally: It is impossible within the limits of this statement to review the activities and results of all member companies of the group at home and abroad. Many companies have not been referred to. Some have increased their profits in 1949 and others have had a more difficult year because of the fluctuations of trade, or in overcoming the initial difficulties of establishing manufacture abroad. There is a renewed and strong inclination for the Dominions and other countries to make themselves independent of imports from this country. It is difficult indeed to endeavour to assess which are likely to be the most desirable new opportunities overseas out of the many projects suggested to us. It would be unwise to attempt all of them. There are many considerations, and not least the financial and managerial, which limit the extent to which expansion abroad can prudently be undertaken. Within these limits we have selected some of the more promising.

The problems confronting the home companies are not likely to get less with advancing costs of coal, electricity, gas, railway rates, and the shorter working week. Their cumulative effect on national costs of production is likely to be very serious now that we are facing the increasing competitive power of low-cost production of foreign countries.

GOVERNMENT SPENDING

It seems ludicrous to us as manufacturers that so little is done by the Government to reduce their own colossal spending, which is in itself maintaining inflation. In this regard if manufacturers adopted for themselves this wasteful Government policy of non-revenue-earning expenditure, they would quickly price themselves out of the export markets on which this country's existence depends. In spite of our endeavours as manufacturers in making economies wherever we can, the Government's extravagant "planning" may nullify all our efforts to be competitive in world markets.

The report and accounts were unanimously adopted.

THE FINANCIAL TIMES, LIMITED

A YEAR OF EXPANSION

MR BRENDAN BRACKEN'S SPEECH

The twenty-second ordinary general meeting of The Financial Times, Limited, was held on June 13th at Winchester House, Old Broad Street, London, E.C., the Right Hon. Brendan Bracken, M.P. (the chairman), presiding.

The secretary (Mr A. E. Knock) having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen,—With your permission I will take the report and accounts, which have been in your hands for three weeks, as read. (Agreed.)

MR HARGREAVES PARKINSON

We meet in the shadow of a great loss. By the untimely death of Mr Hargreaves Parkinson there is lost to this company a director of achievements manifold, one who was always wise in council and courageous in action. Few men have done more than he did to heighten the standards of financial journalism. He was a man of infinite pleasantness and of invincible integrity. Our company has been diminished by his death.

There is but one compensation for the sharpness of our loss. During his long service as editor of *The Financial News* and later of *The Financial Times*, Mr Parkinson took great pains to create and retain a staff of first-rate young men who have every reason to remember him with thanksgiving for all he taught them as well as for his invariable kindness and steady encouragement. In a newspaper business men are far more important than money. And so I must again aver that Mr Parkinson's death is a hard blow to us.

THE ACCOUNTS

Before passing to more general matters, I will deal briefly with the figures before you. They are rather more satisfactory than I had expected when I spoke to you last year. The consolidated profit before charging taxation amounted to £477,190, compared with £526,922 in the preceding twelve months. This decline occurred despite a modest increase in the earnings derived from our printing interests, and is chiefly attributable to a fall in our revenue from prospectus advertisements in *The Financial Times* owing to the inactivity in the new issue market for the greater part of 1949. There was also an increase in the cost of producing that journal owing to the greater number of pages printed and the introduction of new services to readers. We should not grudge this cost.

DIVIDENDS

After charging taxation and deducting the proportion of profits applicable to outside shareholders in our subsidiary companies, there remains a balance of £211,598, of which £13,988 has been retained in the accounts of subsidiaries. The dividend on our Five and a-Half per Cent. Preference stock absorbs £24,200 net. An interim dividend of 7½ per cent. has already been paid on the ordinary stock and, if you approve the payment of a final dividend of 12½ per cent. and bonus of 5 per cent., the sum of £68,750 will be absorbed, leaving £104,660 to be added to the balance carried forward. This conservative distribution of the company's earnings is, in your directors' opinion, fully justified at the present time.

Costs of production continue to rise, and the full effect of devaluation has still to make itself felt, while so far this year revenue from prospectuses has been very much lower than in the corresponding months of last year. All newspapers are suffering from rising costs, and competition for advertisement revenue is keen and, let me say, salutary. We are doing all that we can to maintain our revenue figures, and to control the rise in costs, but our first consideration must be to maintain the quality of *The Financial Times*.

THE BALANCE-SHEET

In the balance-sheet of The Financial Times, Limited, current assets exceed current liabilities by £426,568, while in the consolidated balance-sheet the corresponding figure is £731,926. We can therefore claim that our liquid position is rather satisfactory. It must be realised, however, that our printing interests have substantial commitments for new plant and machinery and ample resources are essential to us as an insurance against the uncertainties of the future. With taxation at its present level and absorbing nearly twelve shillings of every pound we earn, it is no easy matter to augment those resources while at the same time providing shareholders with a fair return.

Within the limits imposed on us by the control of newsprint consumption, we have during the past year further expanded the industrial as well as the purely financial contents of *The Financial Times*. Our purpose is to justify our claim that *The Financial Times* is one of the "world's leading business newspapers." Besides providing the business man with a comprehensive news service covering the whole field of national and international economic affairs, articles and special supplements are regularly published surveying the progress and problems of particular industries.

BRITAIN'S RIGID ECONOMY

Since devaluation there has naturally been a considerable increase in the nation's holdings of gold and hard currencies; indeed, when we remember the sacrifices that a devaluation of over 30 per cent. will impose on the people of this country, it would have been a disaster if there had been nothing to count on the other side of the ledger. This increase in our hard currency reserves is, of course, largely due to the continuing fever of inflation in the United States, here, and in other lands. A "recovery" that must be largely ascribed to inflation may be a very transitory affair. A small recession in the United States during 1949 played havoc with our gold and hard currency reserves. History has an incorrigible habit of repeating itself, which cannot even be cured by those modern Canutes, the Controllers in Whitehall. The ghastly rigidity in our economy created by acts of Government and of the twentieth-century Luddites of the T.U.C., in alliance with many employers, makes us the most vulnerable of nations in the event of a big recession in the United States. This rigidity must also severely handicap British exports in the days of fierce competition that are drawing nigh.

In the past year the volume of trade financed through the traditional machinery of the City of London has substantially increased, and the increase would have been greater if the Government had admitted earlier the value to the country of London's terminal commodity markets and its international banking services, but instead the capital required to finance the increasing trade is being syphoned away by the high rate of Government expenditure.

TAXATION BY UMBRAGE

All those many businesses in the City which live by the calculation of risks find it impossible at the present level of taxation to accumulate sufficient reserves out of their profits to offset their inevitable losses. Their enterprise is hamstrung. The Government calls for the spirit of the merchant adventurers. *The spirit is still there, and the* patriotism in which it grew; what is lacking is the spur of adequate profits and the recognition of their respectability. "Many, indeed, fail with greater efforts than those with which others succeed," a wise philosopher once said, "not from difference of merits, but *difference of opportunities; but if all were done* which it would be in the power of a good Government to do, by instruction and by legislation, to remedy this inequality of opportunities, the difference of fortune arising from people's own earnings could not justly give umbrage." It is not only individuals but the whole nation which suffers from our system of taxation by umbrage.

THE SHORTAGE OF CAPITAL

In the City and in large and small businesses throughout the country the injury done by high taxation is already visible, but, though the symptoms are only visible here and there, the malady is deep-seated and serious. Industry is running short of capital, and this shortage will soon endanger both our competitive powers in the world's markets and our social security at home. What is most alarming is the Government's blindness to the harm that is being done. The country is "advancing," says the Chancellor; therefore all is well. He might have said the same to Sisyphus. But can we advance no faster? In which direction are we going? And at what cost?

The truth is, high taxation leaves no margin of safety for the fluctuations in international trade which are beyond our control and which we must accept. Unless we recognise that Government expenditure must be reduced by a frontal attack, even at some immediate cost, and unless we make the attack soon and press it home, the reduction will come in a way that will do permanent harm to everyone by a further depreciation in the value of money. No economy can indefinitely support a rate of taxation which takes over 40 per cent. of the national income. If we do not act on the early symptoms of the disease, it will soon be beyond our control.

The chairman concluded by moving the adoption of the report and accounts.

Major-General Guy P. Dawnay, C.B., C.M.G., D.S.O., M.V.O., vice-chairman, seconded the resolution and it was carried unanimously.

The proposed dividend was approved; the retiring director, Major-General G. P. Dawnay, was re-elected, and the remuneration of the auditors, Messrs. Price Waterhouse and Co., was fixed.

SUEZ CANAL COMPANY

INCREASED TRAFFICS, RECEIPTS AND EXPENDITURE

M. F. CHARLES-ROUX'S REVIEW

The annual general meeting of the Suez Canal Company was held in Paris on June 13th.

M. Francois Charles-Roux, the chairman, *in the course of his speech*, said: The outstanding features of the financial year are the increase in traffic and receipts, the rise *in expenditure, the discontinuation of* passenger dues, the commencement of the seventh programme of large-scale improvements and the implementation of the Convention of March 7, 1949.

An analysis of this progressing traffic shows that during 1949 petroleum is still the *main factor in the increase recorded.* But the transit of vessels other than tankers, or in other words, shipments of commodities other than petroleum, are also increasing and this upward trend is appreciably more marked than heretofore. This is a promising sign for the years ahead providing it is continued.

The probable completion towards the end of *1950* of one of the overland channels—linking the Persian Gulf with the Eastern shores of the Mediterranean and having a *yearly output estimated at 15-20 million tons* —must, inevitably, divert some portion of the petroleum traffic from the Suez Canal.

Provided the world remains at peace, it seems possible to base our forecast for the near future on a general resumption of trade, different in character, yet substantial in volume and perhaps still growing, and on a petroleum traffic which, whatever may happen, is likely to remain at a very high level.

In 1949, as in 1948, the increase in receipts was accompanied by a simultaneous increase in expenditure. In point of fact, the rise in expenditure was proportionately greater than the rise in receipts. This will explain to you why the increase in dividend is not, as was the case last year, proportionate to the increase in receipts.

ABOLITION OF PASSENGER DUES

We have deemed it expedient to sacrifice one source of income, namely, the collection of passenger dues. We were prompted to make this concession to our shipowner clients in the first place by our desire, a traditional point of our company's policy, to lighten whenever possible the cost of transit through the Suez Canal; and secondly as a result of the representations made to us regarding the calculation, for the purpose of exemption from transit dues, of the tonnage of crew spaces. Considerable difficulties of a practical nature stood in the way of a solution to the latter problem.

Furthermore, we had been approached twice, in writing, by representative ship-*owning bodies, with a view to obtaining* purely and simply a reduction in the transit tariff based on ships' tonnage, and it seemed to us that the time had not yet come to grant this wish of our clients, considering that our shareholders had received no dividends throughout the war and that we were *carrying out extremely expensive improve*ments to the Canal for the sole advantage of shipping. You are aware of the extent of these works, since the programme was submitted to you before they were undertaken.

The pains we take and the sacrifices we make to ensure safe and speedy transit through the Canal, as well as the maintenance and the improvement of this waterway have earned us the high esteem in which we are held by our clients. At its latest meeting in London the International Chamber of Shipping expressed the wish, which it communicated to all interested Governments, that the Suez Canal's future régime should, after the end of the present Concession, continue to offer to shipping the same guarantees as those assured by the present company. We are honoured by the *implicit testimonial that* such a wish contains.

Egypt, for her part, cannot remain indifferent to the added efficiency which our great programme of works will be *bringing* to the Suez Canal 18 years before the end of the Concession granted to the company which built it and operates it.

DIRECTORS' REPORT

The following are *extracts from the* directors' report: During the year 1949 traffic in the Suez Canal again showed an appreciable increase. This favourable trend has continued during the first few months of 1950, but there are certain indications *that the commercial traffic established or re*vived since the war is now tending to become stabilised.

With 10,420 transits and a net tonnage of 68,862,000, the maritime traffic through the Canal in 1949 was larger than ever. Although the tonnage of tanker traffic was seven times greater than in 1938, its proportion to the total traffic did not increase in 1949. On the other hand, other types of traffic regained and even slightly exceeded their pre-war level.

The total weight of goods carried via Suez was 61 *million tons*, exceeding by 24 per cent., the previous maximum reached in 1948. First place in the north-south movement of commodities is again held by cereals. Manufactured metals contributed to a greater extent than any other commodity to *the increase in north-south traffic*, thus reflecting the remarkable development of the European metallurgic industry during 1949.

LARGER DIVIDEND

Receipts for 1949 amounted to *25,936,945,898* francs, an increase of 6,001,503,797 francs over those for 1948, whereas expenditure, at 11,040,238,698 francs *increased by 4,932,457,103* francs. After allowing for interest on and amortization of capital, i.e., 1,072,667,910 francs, there remains an available balance of 13,823,994,290 francs.

Operating receipts, excluding profits made on transfers of funds, increased by 8,361 *million* francs, or 48 per cent.—half of this increase being due to the increase in traffic and the other half to the nominal inflation of our receipts as expressed in francs. The waiving, since last August, of the collection of transit dues on ships of under 300 tons entailed a loss of about 38 million francs under that heading. Expenditure increased by 81 per cent. over 1948.

To the available profit of 13,823,994,289 francs, has to be added the sum brought forward from the preceding year of 85,920,804 francs, *bringing the amount avail*able for distribution to 13,909,915,093 francs.

The proposed distribution brings the gross dividend to 7,500 francs. Notwithstanding an important increase in expenditure, which under certain headings is liable to increase still further, your board has considered it possible to suggest a *slight* increase in the dividend.

A copy of the full report, in French, will be sent on application to the company, 1, rue d'Astorg, Paris (8), or 6, Bishopsgate, London, E.C.2.

RECKITT AND COLMAN, LIMITED

EFFECTS OF DEVALUATION

FACTORY EXPANSION AT HOME AND OVERSEA

MR J. B. UPTON'S STATEMENT

The annual general meeting of Reckitt and Colman, Limited, was held on June 7, 1950, in London, Mr J. B. Upton, the chairman, presided.

The following is an extract from the directors' report for the year ended December 31, 1949:—

Trading profits amount to £3,538,174, as against £2,865,497 for 1948. The increase of £672,677 is due chiefly to larger sales both at home and abroad.

Devaluation of sterling in September, 1949, had very substantial effects on the profits of the group as a whole. The 1949 exchange profits have arisen as a result of the conversion of net current assets, expressed in oversea currencies, at post-devaluation rates of exchange. £128,323, which arose in connection with subsidiaries registered in the United Kingdom but operating abroad, is subject to British taxation and contributes to the available profit for the year. £410,992, which arose on the consolidation of the accounts of subsidiaries registered abroad, is only taxable if remitted as dividend. A further sum of £108,938, arising by the same process, being undistributable, has been carried direct to capital reserve. Of the £410,992 referred to above, £163,489 is included in the £535,236 transferred to capital reserve, and £247,503 has been transferred to Foreign Exchange consolidation reserve.

The normal depreciation of properties, buildings and plant amounted to £298,098, compared with £246,004 in the previous year. A further sum of £170,000 has been transferred to capital reserves; this is the approximate amount of extra depreciation for the year which would be required to provide for the replacement of fixed assets in the United Kingdom. As we pointed out last year, this provision is not allowed as a charge before arriving at the amount on which income tax and profits tax are payable. In certain Continental countries, by contrast, an actual revaluation of fixed assets to reflect the decreased value of money has received official sanction and the increased depreciation is allowed for tax purposes. The balance sheet now incorporates these assets as revalued in 1947 and 1948 with corresponding adjustment of the provisions for depreciation. The net effect is an addition to capital reserves of £180,653.

The taxation of moneys set aside for the replacement of fixed assets at present-day costs is only one of the burdens which industry has to carry. The increasing prices of commodities generally have meant a considerable increase in the amount of working capital required for industrial undertakings. The heavy taxation of undistributed profits is thus a severe drain on the savings needed to provide these funds and a great handicap to progress.

The total of British, Dominion, and foreign taxation is no less than £1,965,405.

The bonus to employees under the prosperity sharing scheme is larger this year as a result of increased trade and of the exchange profits referred to in paragraph 3. The amount available has risen from £154,000 in 1948 to £210,000, to which is added the sum of £8,000 relating to the previous year.

The growth of the United States subsidiary and the consequent increase in its capital requirements led the directors of that company to capitalise a part of its undistributed profits; £535,236 has been transferred to capital reserve to reflect this decision.

After transferring £200,000 to general reserve the directors recommend the payment of a final dividend of 5 per cent., less tax, making 20 per cent., less tax, for the year. This is the same rate of dividend as has been paid each year since the formation of the company.

The shareholders' capital and reserves employed in the group now amount to £13,281,895, an increase on the year of £1,626,332.

UNITED KINGDOM

Last year attention was drawn to the wide range of products which the company manufactures. This is a source of strength and it is believed that there is ample scope for development.

In most sections of the business there was, during 1949, a further improvement in the supply of raw and packing materials and, as a result, very satisfactory sales were achieved both on a value and a tonnage basis.

It is still true that mustard needs meat as much as meat needs mustard, and naturally our sales continue to be affected by shortage of supplies.

Robinson's lemon and orange barley waters are as popular as ever, but the restricted supply of sugar still limits production.

During the year we introduced Robrex, a pre-cooked baby food combining three cereals and incorporating the latest developments in infant dietary. The ease of its preparation commends it to mothers, and it is now established in many of the leading clinics in the country.

The products of Joseph Farrow & Company, Limited, our Peterborough subsidiary, are in good demand, but continuing shortages of certain materials used in the canning industry, notably tinplate and sugar, hamper the development which their quality would justify.

Last year we reported that we had been able to start the introduction of Disprin, a new form of analgesic tablet incorporating aspirin. It has the advantages of being soluble, substantially neutral, and palatable. After preliminary introduction to doctors and hospitals throughout the country, we commenced advertising to the public. Disprin has been well received and is likely to be a valuable addition to our list of pharmaceutical products.

Dettol is widely used in hospitals and by the medical profession. It is used in 99 per cent. of the maternity hospitals and in 92 per cent. of all the hospitals in the country. On sale through chemists' shops to the general public, it is one of the best selling lines in retail pharmacy.

Purchase tax exemption is allowed to dispensing packs which satisfy the regulations, and accordingly the large quantities of Dettol and also, now, of Disprin, which are supplied to hospitals and other institutions, and to chemists for filling doctors' prescriptions, are sold tax free. The public must, however, pay tax at the rate of 33⅓ per cent. on their retail purchases. It is an unsatisfactory feature of the tax regulations that antiseptics for personal and medicinal use, such as Dettol, bear this tax while household disinfectants are tax free.

In our last report we said that little progress had been made in rebuilding the factories destroyed during the war. Now we are glad to report that permanent rebuilding has commenced. Work is in progress on a large new factory block in Hull and on a new flour mill at Norwich. Licences have been received for a building at Norwich to replace, partially, the starch works there, and also for new offices in Hull.

In July, 1949, your company took a majority interest in the Cocker Chemical Company, Limited. This company was formed to take over the business of Dickinson and Son, whose works at Oswaldtwistle produced, among other valuable chemical specialities, raw materials for some of our products.

OVERSEA

Our oversea sales again made good progress in most countries and in total were the best in the company's history, both in volume and value.

Development since the war has been mainly in products which we launched before 1939. The marketing of new products has been held up in most countries by lack of materials, machinery, or factory space, but we are glad to report that these difficulties are disappearing and we are looking forward to the greater scope which we shall have for enterprise. The development of new products will, however, require a substantial investment in introductory advertising before increased profits can be expected.

In the United States the completion of the Rochester factory extensions has resulted in speedier and more economical handling of goods and we are glad to report that sales and profits reached a record level. As we reported a year ago, we have done our best to increase our dollar exports by transferring back to our English factories the manufacture of certain British products for the American market. The greater part of our trade in the United States, however, is in products of American origin and these continue to be made in factories at Rochester and Philadelphia. Our trade in the United States last year was equivalent to about 45 per cent. of our total oversea turnover.

We have been able to increase our exports to Canada by the introduction of lines manufactured in England and we are pressing ahead with this development.

Work has already begun on our new South African factory in Durban and it is expected to be in partial use this year. Plans have also been completed for a new office building in Cape Town.

We have now obtained a licence for extensions to our Australian factory in Sydney and are making preparations to build.

In New Zealand also we have been given a permit to extend our factory and our factories in France and Holland are also being extended.

Our trade in South America is healthy, apart from difficulties encountered in Argentina through shortage of exchange and consequently of raw materials. Trading conditions in Argentina are difficult and the immediate future is unpredictable, but we feel that the natural resources of that country are such that the difficulties should eventually be overcome.

Our trade in India and Pakistan is suffering from various limitations such as restrictions on the importation of finished goods and shortage of certain raw materials. About three years ago we acquired a new site near Calcutta which is suitable for factory development, and we hope that a decision may be taken soon to extend our manufacture there. We expect that we shall be able to report a year hence whether or not we have decided to go ahead. If we do so, a substantial investment will be involved.

In general, we can report that while we are at present encountering difficulties beyond our control in Argentina and India, these have been more than counterbalanced by progress elsewhere. In these times it is impossible to expect that we shall be free of difficulties in all countries of the world, but much the greatest part of our oversea trade is in markets which are likely to be stable and prosperous.

GENERAL

From the date of the formation of Reckitt and Colman, Limited, in 1938, it had been intended that the pension schemes then in operation should be consolidated into a men's pension scheme, a women's pension scheme, and a male staff pension scheme applicable throughout the home organisation. During the war it was not possible to proceed, but as foreshadowed in the 1948 report we are happy to say that it has now been possible to work out schemes which have proved satisfactory and acceptable to both men and women employees. Liabilities for the company's back service contributions to these schemes have been created, which will have to be met [illegible] current year as soon as they have been [illegible] by the actuaries. The revision of [illegible] pension schemes is now being

[illegible] been our policy not only to [illegible] activity of our products at as high [illegible] maintained but also to keep them up to [illegible] Temple [illegible] ually on the look out for [illegible] and the [illegible] range. To this end [illegible] have had [illegible] cial staffs collaborate [illegible] Company [illegible] cipal branches and their [illegible] recondito-ordinated. Shortages and [illegible] [illegible] main materials delay the introduction of some lines at home, but the markets served by our oversea subsidiaries have the benefit of research at home, as does the home market of research conducted oversea.

Much emphasis has recently been laid by Government spokesmen on the need to increase productivity by all possible means. This question is constantly under review by our managements, who make every effort to this end by such means as the revision of administrative organisation, the improvement of factory layout, the installation of labour-saving methods and machines whenever they can be justified, the training of staff and operatives, and the use of incentive wage schemes for work which can be fairly measured. Good results would not be secured without active co-operation throughout our organisation, and we should like to thank all our employees, at home and abroad, for this and for their loyal and valued service during the year.

The report and accounts were adopted.

The annual general meeting of Reckitt and Sons Limited and J. and J. Colman Limited will be held on Monday, July 10, 1950.

RANSOMES SIMS AND JEFFERIES

INCREASED DEMAND

The sixty-sixth annual general meeting of Ransomes Sims and Jefferies, Limited, was held on June 16th at Ipswich, Mr J. H. W. Pawlyn (the chairman) presiding.

The following is an extract from his circulated statement:—

Reference has been made in the directors' report to the 30 per cent. increase in agricultural despatches again achieved this year. This increase in our agricultural implement sections has been more noticeable in the export market than in the home market. The demand for the home market remains satisfactory and we have introduced several new designs of implements during the year which are in good demand. Small but unavoidable increases as intimated last year have been made in selling prices.

In common with a number of other British manufacturers, our trade with many overseas countries has been severely restricted by shortage of sterling exchange, and the difficulty our customers abroad experience in obtaining licences. The South African and Argentine markets were closed altogether against our goods for an appreciable period of 1949, but are now opening up again.

The net trading balance of the company and its subsidiaries amounts to £308,714. From this is deducted contribution paid to staff pension trustees £30,391; debenture interest £30,000; profits tax £40,335, and income tax £81,837, leaving a net available profit of £126,151.

Deducting the net profits of subsidiaries not dealt with in the accounts of the holding company from this profit of £126,151 leaves a profit of £117,818 for the year dealt with in the accounts of the holding company. Adding thereto the balance brought forward from last year of £80,369 the total available is £198,187.

Your directors recommend a dividend on the Ordinary stock at the same rate as last year (namely, 7½ per cent., less income tax, on £1,000,000 Ordinary stock).

The report was adopted.

THE SEA INSURANCE COMPANY LIMITED

RECORD PREMIUM INCOME

The seventy-fourth annual general meeting of the Sea Insurance Company Limited, was held in Liverpool on June 20th. A statement by the chairman, Major A. Harold Bibby, D.S.O., D.L., has been circulated with the report and accounts for the year ended December 31, 1949.

The total premium income for the year in all departments amounts to £2,788,127, the highest in the history of the company.

The devaluation of sterling last September brought with it a variety of problems, due to substantial operations in all parts of the world, particularly in the United States of America, as a result of which the accounts under review have borne the full weight of the increased liability for claims, without the corresponding increase in value of currency premiums.

The marine, aviation and transit account, after providing £472,000 to meet outstanding claims, shows a balance of £336,363 transferred to profit and loss account. The premium income for 1949, at £1,685,638 shows a modest increase over the previous year. The future of the marine market cannot be regarded with complacency in view of the downward trend of cargo rates and higher cost of repairs.

The fire department premium amounts to £597,950 compared with £588,646 in 1948. The account has been credited with £132,006 which covers the increased cost of liabilities due to devaluation.

The accident department premium is £504,539 compared with the previous year's figure of £310,994. The account has been credited with £83,502 which covers the increased cost of liabilities due to devaluation.

The profit and loss account shows £200,000 reserved for the United Kingdom taxes. It is again recommended that a final dividend of 1s. 9d. per share be paid which, with the interim dividend paid on October 13, 1949, makes a total payment of 3s. 6d. per share, costing £48,125 after deduction of tax. Investment income shows a satisfactory increase.

The balance sheet shows total assets of £5,558,015, and the market value of investments is considerably in excess of the figure shown of £3,856,823. The value of the dollar investments has materially increased, but [illegible] has been taken in the accounts of [illegible] appreciation.

SCAMMELL LORRIES, LIMITED

INCREASED EXPORT TRADE

The twenty-seventh ordinary general meeting of Scammell Lorries, Limited, was held at Watford, Herts, on June 15th, Mr E. R. Cartwright, C.B.E., M.I.C.E., the chairman, presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts for the year to December 31, 1949:—

Dealing with the activities of the company over the last year, the results obtained can be regarded as very satisfactory. The excess of current assets over current liabilities is £1,044,583, which, when compared with £1,021,182 of the previous year, shows that our strong liquid position is being steadily maintained.

The net profit before taxation is £199,858; income tax and profits tax absorb £103,411, and after deducting £3,712 dividend on preference stock the balance of net profit for the year is £92,735.

Trading results for the past year can be explained in a nutshell. Sales are slightly up, profits are down. Increased costs are making themselves felt and the additional expense of obtaining export markets is having its effect. In considering the distribution of profits your directors have kept in view such problems as increasing export sales, development of additional types of vehicles and Government views on the limitation of dividends, and they are recommending the same dividend on ordinary stock as in recent years.

In view of the present high level of prices your directors consider it advisable to increase by a further £50,000 the stock reserve, which will then amount to £150,000. They recommend also that the plant and machinery reserve be increased by the sum of £10,000 and the general reserve by a further £20,000 and that the balance of £48,150 be carried forward.

ALL TYPES IN GOOD DEMAND

All types of Scammell vehicles were in good demand during the year and the articulated vehicles, both for general road haulage and frameless tanker work, have lost none of their popularity. I have previously informed you that the "Scarab" mechanical horse had already undergone successful prototype tests, and I am glad to tell you that this vehicle was brought into full production late in the year, after having been delayed by certain material shortages due to restricted supplies. We developed and put into production, also, a front-wheel drive 10-ton tipper vehicle with an impressive cross-country performance, and we are hopeful that this vehicle will prove a useful addition to our range of heavy vehicles in certain overseas markets.

You will be glad to hear that the quantity of vehicles shipped overseas last year almost equalled our total exports for the two previous years.

It is with great concern that I view the grave reactions that will follow the imposition of purchase tax on commercial vehicles and the higher petrol and fuel oil duties. To inflict measures which can only lead to increased costs seems to me to be most ill-advised, particularly when it is vital that our export prices should be kept as low as possible to meet increasing world competition.

Our order-book is satisfactory and we are continuing the policy of broadening the basis of the company's production wherever possible. If there are no abnormal national occurrences the prospects for your company in the present year appear to be quite satisfactory.

The report and accounts were unanimously adopted.

LONDON AND MANCHESTER ASSURANCE COMPANY, LIMITED

MR A. H. DAWES ON MUTUALISATION

Mr A H. Dawes, chairman, presiding at the eighty-first annual general meeting of shareholders, held at the chief office, Finsbury Square, London, E.C.2, on June 21, 1950, in the course of his speech said:—

During the past year the Industrial Life Offices faced the gravest threat in their history. In the first place there were the proposals, to which I referred last June, that their entire business should be nationalised. At least that was what the proposals amounted to and no one tried to deny the fact. The use of the word "nationalise" then became politically inexpedient and a new name was substituted. The nation was told that we were to be "mutualised."

MUTUALISATION EXPOSED

I need hardly say that we were not deceived by this change of name. We are convinced that nationalisation and mutualisation would, in practice, amount to the same thing. They both involve a politically controlled State Board and neither seems to hold out any advantage for the policyholders or the employees in the industry.

Over £2,750,000 was paid during the year in respect of more than 100,000 policies which fulfilled their purpose by becoming claims either by death or survivance of the lives assured. Nearly all of these claims were handled by our field staff as part of their service to policyholders, a service which is so characteristic of our business.

ALLOCATION OF SURPLUS

The rate of bonus allocated to ordinary branch with-profit policies has again been increased—this year to £1 6s. per cent. on the sum assured. The cost of this bonus is £412,970. The industrial branch policies have been granted bonuses on the same bases as in the preceding year. The cost is £283,307. It was over 20 years ago that we first admitted industrial branch policyholders into profit-sharing. A start was then made in a small way and, as our economies in management increased, so did the proportion of surplus allocated to policyholders. It is interesting to note that in the short time since the war ended, industrial branch policyholders have been allocated only a little short of £1,500,000.

After setting aside £67,500 for the staff's pension fund and transferring £123,498 to the profit and loss account, the balances of the valuation surpluses have been carried forward in the ordinary branch and the industrial branch life funds respectively.

INVESTMENTS

At the end of the year our holdings of British Government Securities, including the securities guaranteed by the British Government, amounted to £22,152,774 showing an increase of £1,469,434 and representing 54 per cent. of our total assets. A part of this increase arises from the conversion of our holdings of gas companies' stocks into British Government Guaranteed Securities. This change is reflected in the totals of the items "debentures and debenture stocks and bonds" and "preference and guaranteed stocks and shares" which are somewhat less than a year ago. Ordinary stocks and shares increased by some £160,000.

The report and accounts were adopted.

UNION INSURANCE SOCIETY OF CANTON

ASSETS EXCEED £11,600,000

The annual meeting of this Company was held on May 25 at Hong Kong, Mr E. R. Hill presiding in the absence of the chairman, Mr M. H. Turner.

The following are extracts from the report and accounts and the chairman's circulated statement:

Marine.—The net premiums for the year amounted to £2,364,626. After providing £65,000 for taxation, releasing £200,000 to profit and loss account and increasing the additional reserve by £50,000 transferred from profit and loss account, the Marine Fund stands at £3,013,730.

Fire.—The net premiums for the year amounted to £1,769,848. £97,685 has been transferred to profit and loss account. The additional reserve has been increased by £82,000 by a transfer from profit and loss account and the Fire Fund now stands at £996,432.

Accident and General.—The net premiums for the year amounted to £683,835. £48,782 has been transferred to profit and loss account The additional reserve has been increased by £43,500 by a transfer from profit and loss account and the Accident and General Fund now stands at £323,534.

Profit and Loss Account.—Interest and dividends amounted to £227,477 and transfers from underwriting accounts to £346,467. After taking into account unclaimed dividends of subsidiary companies written off, charging taxation paid and other outgoings, and allowing for the minority interests of the outside shareholders of the subsidiary companies, the profit for the year appertaining to the society is £476,315. After deducting profit retained in subsidiary companies £136,380, there remains a distributable profit of £339,935. To this has been added the balance brought forward from the previous year, £309,888. After providing for the dividend and transferring £50,000 to general reserve and £64,400 to underwriting accounts as additional reserve, there remains a balance of £316,048 to be carried forward.

Consolidated Balance Sheet.—The total assets amount to £11,607,048.

CHAIRMAN'S STATEMENT

The revenue accounts reflect a satisfactory distribution of our business between our marine, fire, and accident and general departments.

A matter of considerable importance in the marine insurance world occurred in June, 1949, when the combined marine surcharge system of cargo rating was merged with the basic marine rates. There is no doubt that the combined marine surcharges had a steadying influence on the marine insurance market during recent years, and their discontinuance, with a consequent return to freer underwriting, will not, it is hoped, lead to a general departure from sound underwriting principles and reductions in rates to uneconomic levels. A matter of much wider importance was the revaluation of sterling which occurred in September, 1949. The full effects of this cannot yet be gauged, but the increase in the total figures appearing in our balance sheets is in no small measure due to this influence.

Our experiences in the principal fields of our operations—namely, the United Kingdom, the United States of America, Canada, Australia, and New Zealand—have all proved satisfactory during the year. Business in Hong Kong has also continued good, though that in China, which since the war has never recovered its former proportions, is now negligible owing to the political conditions existing throughout the country and the virtual closure of trade with Shanghai. Elsewhere accounts have been well maintained.

The report and accounts were adopted.

BRITISH INSULATED CALLENDER'S CABLES, LIMITED

DIRECT EXPORTS SOME £16,500,000

The fifth annual general meeting of British Insulated Callender's Cables, Limited, will be held on July 13 in London.

The following is an extract from the statement by the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts:—

As a result of an expansion in both the volume and value of turnover, and the generally favourable trading conditions experienced during 1949, profit on trading of the parent company, investment income and special receipts at £4,828,954 show an improvement of £283,743.

In recommending the continued limitation of the dividend on the ordinary stock to 6½ per cent, your directors are well aware this is hard on stockholders, and they glad to pay a higher dividend on the risk invested in our great business. appear greater

THE ACCOUNTS

The group accounts show ture to that of the parent profit of £2,881,797 show £212,063 over 1948. providing no less a su taxation which may have on future development. fixed level. As we rements and current assets amount £42,500,000. The additions made to have further strengthened the overall position capital and revenue reserves (applicable to B.I.C.C.) now amounting to approximately £10,600,000. ased profits can e completion of the sions has resulted in nomical handling of to report that sales done our best to transferring

Turnover for the B.I.C.C. group shows an increase of over £6,000,000, as compared with 1948. Increased prices of metals account to some extent for the higher value of turnover, but there has also been a real increase in the output volume of some of our main products.

EXPORT AND HOME MARKETS

Turning now to export business, I am sure all stockholders will be pleased to know that the direct exports of the B.I.C.C. group amounted to some £16,500,000, showing an increase over the substantial figures of the previous year.

At home, the past year has been notable for the change from the sellers' to the buyers' market, a change which was to some extent accentuated in our industry by the cuts imposed by the Government on the capital expenditure of our principal customer groups, the nationalised industries, following the devaluation of sterling. Devaluation itself is no long-term solution without its corollary, namely, the breaking open of the system of controls, of prices, of subsidies and oppressive taxation.

The generation and distribution of electricity is vital for building up competitive expanding production. It surely is one of the projects which should be pressed on and have all the capital it requires. Without a cheap and abundant supply of electricity, neither our industry, nor many others in this country, can hope to produce cheaply and be competitive in the markets of the world.

An active home business is to us as [illegible] so many industries, a pre-requisite to a strong overseas business and the two together are vital to prosperity. This was never more important than it is today. Competition in overseas markets is becoming more and more acute and is being experienced from an increasing number of countries. But given a reasonably balanced load factor from the home market we are prepared to meet this competition and to do our best to maintain and, indeed, improve on our achievement

LAMBERT BROTHERS, LIMITED

ALL ACTIVITIES MAINTAINED

The forty-seventh annual general meeting of Lambert Brothers, Limited, was held on June 22nd in London, Mr R. Ratcliff Steel, the chairman, presiding.

The following is an extract from his circulated statement for the year 1949:—

The consolidated profit and loss account shows a profit of £338,450. After deducting the preference dividend for the year, an interim dividend on the ordinary stock paid last October, and providing for the final dividend of 15 per cent there remains £41,069.

We are glad to be able to repeat once more our payment of 2½ per cent. from realised capital accretions which does not attract taxation in any form. No part of this payment derives from the surplus on sale or loss of steamers. The consolidated balance sheet at December 31, 1949, shows provisions at £526,494 and current liabilities at £3,071,440, a total of £3,597,934, against current assets totalling £4,996,176—a surplus of £1,398,242.

SHIPPING OUTLOOK

All the activities of your company have been maintained over the year. Your subsidiary, Temple Steamship Company, Limited, and the steamship management from [illegible] Cardiff have had a satisfactory year. The Temple Company has continued its postwar policy of reconditioning and modernising its fleet.

Our oil business continues to make good progress. Cargo business continues to engage our attention, and the standing we enjoy in the oil world enables us to view the future with confidence. Our shipbroking department has had an active year, and the chartering agency section has added considerably to the number of shippers who entrust us to charter tonnage to lift their cargoes.

OTHER ACTIVITIES

In spite of severe competition, our aviation department has maintained its lead right at the forefront of the brokers who operate this type of business. Lambert Brothers (Insurance), Limited, still continues to show an increasing turnover and, while values both of tonnage and commodities must be expected to fall, their business is expanding to a satisfactory degree with a more general spread. The underwriting side of their business is shown in the results of the Hull Underwriters' Association. It has now built up a very strong position. Lambert Brothers (Merchandise) Limited, is making slow but steady progress. They are expanding their clientele in both the export and import business.

Our associated company in Trieste is still doing satisfactory business. The same may be said of our associated company, Wallem Lambert Brothers, Limited, of Hong Kong. We have extended our close relationship with Messrs. Wallem by a participation in their newly formed office in Karachi under the style of Wallem and Company (Pakistan), Limited. Our representation of the Middle Docks and Engineering Company is continuing to the satisfaction of both our principals and shipowning clients.

The outlook is unsettled as freight markets influenced by government bulk buying are difficult to assess. Your company is so much bound up with the shipping industry as shipowners and in the other branches of the business that a stable freight market is necessary for prosperity.

Before concluding, I wish once more to express our thanks to the staff, both at home and abroad, ashore and afloat, for their good work and co-operation during the past year.

The report was adopted.

CENTRAL MINING AND INVESTMENT CORPORATION, LIMITED

A CAPITAL ISSUE

The annual general meeting of the Central Mining and Investment Corporation, Limited, was held on June 16th in London, Sir Clive Baillieu, K.B.E., C.M.G. (the chairman), presided, and in the course of his speech said: On the gold mining industry the effect of devaluation has been profound; the increase in the price of gold by 75s. 9d. to 248s. 3d. net per ounce, although in operation for only three months of the year, not only sufficed to offset the rise in the cost structure of the industry, which occurred in 1949, but also allowed a considerable increase in profits and dividends which were on a more generous scale than in any year since 1943. As a result of the lowering of the pay limit, the industry's ore reserves, both available and potential, have been improved. Some millions of tons of formerly unpayable reef have been added to payable reserves, while semi-developed areas of low-grade ore and other areas previously considered too unpromising to justify development may be opened up. The industry required time to adjust itself to the new conditions—indeed, it is still doing so.

LABOUR SUPPLY

Part of the rise in working costs is due to price increases over a wide range of stores and other items, but the major part is due to the increase in wages and benefits both for European and for African employees which came into effect in the last quarter of 1949.

It is as yet too early to forecast the full effect on the labour supply for the gold mining industry of these improvements, but it is to be hoped that last year's upward trend in African labour will be continued and that the number of Europeans, particularly those taking up underground employment, will be increased. At present the African labour force still cannot be employed to the best advantage on certain mines owing to a shortage of the European supervisors required by the mines and works regulations. An adequate supply of labour has always been of the utmost importance to the mining industry, and it is particularly vital now.

The output of gold in 1949 rose by more than 114,000 oz. to nearly 11¼ million oz., and as a result of this increase and of the higher price received for gold during the last quarter of the year the currency value of the output increased by the substantial amount of over £14¼ million to about £110 million.

It must not be thought that devaluation and the consequent improvement in the economic position of the gold mining industry has resolved all the problems facing the industry, but nevertheless the increased price has provided a wider margin of time within which these problems must be resolved if the gold output of South Africa is to be maintained.

NEW CAPITAL

The board recently decided that the time had arrived when they should invite shareholders to provide additional capital. As a preliminary measure the £8 ordinary shares of the corporation were sub-divided into eight ordinary shares of £1 each, and subsequently the board resolved upon the issue of 600,000 ordinary shares in the new denomination of £1, which, in accordance with a notification issued at the beginning of this month, are being offered for subscription by ordinary and preference shareholders alike at a price of 40s. per share. We expect to proceed to allotment on July 8th.

The report was adopted.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

SATISFACTORY YEAR

The following are extracts from the circulated statement by the chairman, Sir Alexander Roger, K.C.I.E.:—

The profit before charging taxation amounts to £1,001,440, an increase of £312,056. The group consolidated net profit at £590,232, after charging taxation (£651,890), compares with £356,117.

Sales turnover continued at a highly satisfactory level, the division between home and export business being 40 per cent. home and 60 per cent. export. In 1945 the British Post Office was faced with an enormous programme of rehabilitation of the country's telephone system.

Within the limits of their powers the B.P.O. have tackled the problem energetically. Unfortunately, however, the government has considerably reduced the Post Office programme, and little can be done to overtake the arrears of waiting subscribers, probably 1,000,000 or more. Overseas sales have been maintained at the same high level as in 1948.

Industry has learnt that only by joint effort and by making known its views as a whole can it hope to answer the criticism of the opponents of free enterprise. I believe that the fair, well-reasoned and public-spirited recommendations issued by the F.B.I. and kindred bodies have done much to show that the motive of those who believe in free enterprise is not the greater private profit of the few, but a fair deal for the invested savings of small and large shareholders and workers alike, centring on the greatest good for the greatest number.

FORESTAL LAND, TIMBER AND RAILWAYS COMPANY, LIMITED

PROGRESS IN AFRICA

The forty-fourth annual general meeting of The Forestal Land, Timber and Railways Company, Limited, was held in London on June 21st.

Mr John B. Sullivan, the chairman, in the course of his speech, said: At our last annual general meeting I reviewed the critical situation in which the Quebracho Extract Industry found itself due to factors beyond our control, and expressed confidence that this was only of a temporary nature and that we could hope for a reasonably early recovery as a result of the comprehensive intervention of the Argentine authorities in helpful collaboration with the manufacturers. Although somewhat more time has elapsed than I had felt would be necessary, the difficulties to overcome became increasingly complicated and required more energetic steps to be taken than were at first contemplated. Meanwhile, our wattle industry not only has continued to be the mainstay of the parent company when needed, but has definitely confirmed its capacity to maintain this position.

In the consolidated profit after charging taxation of £716,286, the amount which represents Argentine profit is £85,24[illegible]. Your other subsidiaries have made profits considerably greater than the amount necessary to pay the dividend which we recommend, a final of 9 per cent., making 12 per cent., for the year.

Turning to our African enterprises, I am happy to be able to report that very satisfactory progress has been achieved during the year 1949.

The report was adopted.

LONDON ASIATIC RUBBER COMPANY, LIMITED

The annual accounts of The London Asiatic Rubber and Produce Company, Limited, for the year 1949 show a profit, before taxation, of £260,289 against £208,568 for 1948. The directors recommend transfers of £25,000 to general reserve and £20,000 to dividend equalisation reserve and a dividend at the same rate—10 per cent.—as for the previous year on the capital which has meantime been increased to £1,115,914, by the issue of one new share for each five held.

The chairman, Mr H. J. Welch, says in his address: Our net capital cost per acre is very low at £22 0s. 3d. Two of our directors, Sir Eric Macfadyen and Mr R. O. Jenkins, have thoroughly inspected all our estates in Malaya, visiting many of them more than once, and Mr Jenkins was able also to visit our property in Burma.

The harvesting of an increased crop and the upkeep of the properties in good agricultural condition represents, in the conditions prevailing, a very remarkable feat performed by the Supervisory Staff, European and Asian, with the loyal support of the labourers.

I have not heard of anyone who anticipated in the Autumn of 1949 that in the middle of 1950 the price, for No. 1 sheet, would be over two shillings per pound: or of anyone who believes he can foretell the price at which the commodity will stand when the last of our 1950 output comes to be sold. But it need not be doubted that the 1950 crop will average considerably better prices than the 1949 crop for sheet, for latex and for the ordinary crepe grades.

We must allow, however, for a somewhat higher cost of production; the recent great improvement in the price of rubber gave rise to a general increase in the wages of labourers.

ENGLISH & CALEDONIAN INVESTMENT COMPANY

MR HENRY S. LOEBL'S STATEMENT

The twenty-third annual general meeting of English & Caledonian Investment Company, Limited, was held on June 16th in London, Mr Henry S. Loebl (the chairman) presiding.

The following is an extract from his statement, circulated with the report and accounts for the year ended March 31, 1950:

Turning to the parent company's balance sheet, it will be noted that the investments at March 31, 1950, stood in the balance sheet at £1,005,224, compared with £1,025,381 at the end of the previous year. The value of the investments at March 31, 1950, however, was £1,293,445, which showed an appreciation over the book figure of £288,221 or of 28.67 per cent., compared with 31.66 per cent. at March 31, 1949. There was, therefore, a fall of only three points in the appreciation during the year, compared with the fall of eight points during the same period shown by the "Investors' Chronicle Securities Index."

During the year certain changes were made in the company's investments, which resulted in a small loss of £3,105 which has been deducted from the contingency fund.

There has been no change in the issued capital of our property owning subsidiary company, neither has there been any change in the properties held during the year. The reduction in the revenue from properties is due to our having sold just before the close of the previous year the property mentioned in my last report, and upon which a full year's income had been included in the accounts of that year. Encal Estates, Limited, has, however, paid a dividend of 3½ per cent., the same as for the previous year, in respect of the year ended March 31, 1950.

LIQUIDITY MAINTAINED

The balance with the company's bankers at March 31st last was £72,630, being £28,000 more than at the end of the previous year. Against this increase of cash should be set off a reduction in the company's holdings of British Government securities. Nevertheless, a substantial degree of liquidity is maintained, which the directors consider to be justified in current conditions.

On the liabilities side of the balance sheet the only change to be noted is the increase in the general reserve from £65,000 to £75,000.

The total investment income for the year was £72,505, £3,342 more than that for the previous year. This increase has been achieved notwithstanding the fact that we have a fairly large uninvested fund, and also large holdings of Government stocks.

The net revenue for the year was £48,411, compared with £46,941 for the previous year. After charging the sum of £21,923 for taxation and providing for the year's dividend on the preference stock, the amount earned on the ordinary stock was £18,238, or 16.58 per cent., compared with 15.90 per cent. for the previous year.

An interim dividend of 2½ per cent. has been paid on the ordinary stock, and your directors now recommend the payment of a final dividend of 5 per cent., making 7½ per cent. for the year. The sum of £10,000 has been transferred to general reserve, leaving a sum of £9,408 to be carried forward.

At the present time it would be unwise to attempt to forecast the course of events beyond the immediate future, but your board is fairly confident that the income of the company for the current year will not be less than that of the year under review.

The report and accounts were adopted.

OLYMPIA LIMITED

IMPROVED RESULTS

The twenty-first annual general meeting of Olympia Limited was held on June 14th in London, Mr H. Oliver-King, the chairman, presiding.

The following is an extract from his circulated statement:—

The halls of Olympia have been well let during the whole of the year, and the year in general has been a fairly satisfactory one. There is a tendency for exhibitions to be larger and to occupy more space, which is a satisfactory state of affairs. Exhibitions also are brighter and more attractive, and exhibitors and organisers are to be congratulated on the very effective and efficient exhibitions presented to the public.

Last year the chairman mentioned that the profits of the standfitting and electrical contracts department showed an increase; I am glad to report that these departments are showing continued development and our contracts department is now engaged in various parts of the country in addition to the work it undertakes at Olympia. There is also, in addition to expansion of turnover, development in the technique, and we look forward to a gradual expansion in these departments as a profit-earning section of Olympia's activities.

Shareholders will remember that the board with some caution estimated future profits as averaging £150,000 before charging debenture interest and taxation. For the year ended December 31, 1949, the profit, after providing for depreciation and other charges, including deferred repairs, is £158,667, as against £124,431 last year, a figure which shows some improvement on the estimate made. After the most careful deliberation and consideration of all the circumstances, the directors recommend a dividend of 4 per cent. on the ordinary shares, which they hope may prove to be a modest beginning to a successful trading era.

The report was adopted.

NOTICES

FINANCIAL institution, well known and progressive, with large staff and nation-wide branch organisation, seeks one or two men (age 30-40) of outstanding ability, with professional qualification and good business experience, for training with a view to later appointments of responsibility.
Adequate salary will be paid from commencement of service.
Applications in first place to Box 445.

YOUNG Graduate in Economics or Statistics required as assistant in Statistical department of large industrial organisation with world-wide interests. The position offers opportunity to gain experience of many aspects of statistical work.—Write fully to Box E.906 at 191, Gresham House, E.C.2.

THE Renold and Coventry Chain Co., Ltd., require at Renold Works, Didsbury, Manchester, an individual for the Economic Survey and Central Statistics Department.
Candidates should be 28/35 years of age with good University Degree in Economics and/or Statistics, and experience in Industry of the practical application of Economic and Statistical Techniques.
Commencing salary £550/£600 per annum, depending on qualifications and experience.
The post includes participation in the Company's Pension and Profit-sharing Schemes.
Applications, stating date of birth, full details of qualifications and experience, should be addressed to Employment Manager, Renold Works, Didsbury, Manchester, and quote the Reference A.2.

CHARTERED accountant, aged 39, with many years professional and managerial experience in Latin America wishes to join company or group contemplating expansion in that continent or elsewhere as adviser and/or financial controller for overseas activities. Much experience of formation and operation of overseas subsidiaries of British and American parent companies.—Box 453.

CITY AND COUNTY OF KINGSTON UPON HULL
TOWN PLANNING DEPARTMENT
PLANNING ASSISTANT

Applications are invited for the appointment of a Planning Assistant, A.P.T. Grade III, £450-£495 per annum. Qualifications—Degree in Economics, Geography or an allied subject. Preference will be given to candidates who have had experience in the carrying out of surveys for the preparation of Development and Reconstruction Schemes.
The appointment will be subject to the Local Government Superannuation Act, 1937; and to the National Conditions of Service for Local Authorities' Administrative, Professional, Technical and Clerical Services, to such other conditions of service as have been specified from time to time by the Council and to one month's notice in writing on either side.
Successful candidates will be required to pass a medical examination.
Applicants should state whether or not they are related to any member of the Council or to the Chief Officer of the Hull County Borough Council or Can[illegible]tification.
Forms of application, depending on qualifications, experience and present salary, may be obtained from the undersigned, to whom the names and addresses of two persons to whom reference may be made, should be delivered to H. Aylmer Cunningham, Chief Officer, Guildhall, Kingston upon Hull, on or before Monday, July 10th, 1950.

[illegible]DGE economics graduate (26), now assistant editor of [illegible]de technical journals, seeks alternative post needing a [illegible] economic and political affairs.—Box 448.

[illegible]hand-Typist, City Merchant's office, hours 9.30-5, [illegible]ate qualifications, experience, to Box 447.

Statistical Summary

EXCHEQUER RETURNS

For the week ended June 17, [illegible]0, total ordinary revenue was £43,058,0[illegible] against ordinary expenditure of £58,929,000 [illegible]d issues to sinking funds £120,000. Thus, [illegible]cluding sinking fund allocations of £2,424,000 [illegible] surplus accrued since April 1st is £10,427,000 [illegible]mpared with a deficit of £16,348,000 for the cor[illegible]ponding period a year ago.

HOW MUCH SHOULD YOUR ADVERTISING COST?

The answer *can* be given by a professional organisation. It is a measure of costs and possibilities: an equation between capital, *profit and potential market, short term and long term.* Thirty years of planned advertising have produced the evidence on which to base *your* successful campaign. If you would like to know how we can help you, write for the pamphlet, "How much should your advertising cost?"

ROBERT BRANDON AND PARTNERS, LTD.,
Advertising and Public Relations,
45, Dover Street, London, W.1. REGent 0901/2.

STATISTICIAN

By arrangement with the Civil Service Commissioners the Scottish Home Department invite applications from men and women at least 28 on August 1, 1950, for the post of Statistician to the Secretary of State for Scotland's Departments in St. Andrew's House, Edinburgh. Candidates must have a University degree with first or second class Honours, or a degree of equivalent standard, and must have wide experience of statistical work. Appointment will be for 3 or 5 years in the first instance. Commencing salary between £900 and £1,070 according to qualifications and experience, on a scale rising to a maximum of £1,214. Rate for women somewhat lower. Superannuation System for Universities will apply. Further particulars and forms of application may be obtained from the Establishment Officer, S.H.D. Room 364, St. Andrew's House, Edinburgh, 1, with whom completed applications should be lodged not later than July 8, 1950.

UNIVERSITY OF READING

Applications are invited for the following posts in the Department of Agricultural Economics: an Assistant Lecturer and Assistant Agricultural Economist. Applications should be submitted not later than June 30, 1950, to The Registrar, The University, Reading, from whom further particulars may be obtained.

GENERAL SALES MANAGER, thoroughly experienced, particularly in organisation of sales and advertising campaigns for branded products in home and export markets, seeks new appointment. Very energetic with successful past record with well-known companies; languages; travelled extensively. References available on highest level to principals.—Write Box 225, Pritchard, Wood, 25, Savile Row, W.1.

A YOUNG Scots gentleman, strong personality, well educated, good industrial experience especially in steel, commercial and organising ability, qualified engineer, fluent linguist, widely travelled with valuable contacts, exceptional vision and initiative, seeks administrative appointment carrying direct and heavy responsibility. Present salary £1,575 per annum.—Write Box 444.

IS it better to advertise heavily to "force" distribution? Or is it sounder to secure good distribution first and then advertise to the public? Solving this and other difficult marketing and advertising problems is the business of SAMSON CLARKS, 57-61, Mortimer Street, W.1. MUSeum 5050.
