To long term trends must be added the more familiar hindrances to expanding trade—the American tariff and customs procedures, for instance, or the shipping subsidies. It is true that import duties have fallen from 53 per cent of the value of dutiable imports in 1933 to 14 per cent today. Yet many individual tariffs remain high—in some cases as high as 50 per cent. In face of all these obstacles, the proposal to increase exports to the United States by the Marshall countries by 55 per cent between 1949 and 1952 can only be described as heroic. And, as the report repeatedly points out, this forecast itself depends upon the maintenance of a high level of economic activity in the United States. The brief American recession of 1949 was a sharp warning of the instability with which western Europe may yet be faced. A fall of 5 per cent in the American national product caused a 30 per cent fall in American imports, and for a time last summer threatened to cancel all the progress made in the first year of the Plan.

This is not to say that the Marshall Plan has failed in the task of restoring equilibrium in world trade. On the contrary, it has done very well indeed in reducing the gap to more manageable proportions. But the grant to Europe of $3 billion in the coming year and of perhaps $2 billion in 1951 will not solve the long-term problem of America's commercial relationships with the rest of the world. Nor can the European nations be expected to do more on their own initiative than cut their dollar purchases still further (which, as the current dispute over oil shows, is hardly likely to be popular in the United States), or else pin their hopes to programmes of expanding their American sales in which the element of optimism vastly outweighs that of realism. For the rest, the problem lies in American hands.

*

There remains the third objective—the close political and economic integration of Europe. It is on this point that the strongest American criticism has been aroused. Last October Mr Hoffman asked for "dramatic evidence" of western Europe's will to unite, and it is clear both from the OEEC report and from his own confession of disappointment that the evidence has not been provided. The document refers to a great range of joint activities and to many important instances of effective consultation. One glance at its account of the negotiations connected with European payments or with the efforts to remove quantitative restrictions on trade shows that far closer relations on matters such as these exist between the governments of western Europe than at any previous period in their history and that radical innovations have been made in contact and consultation.

Yet all this falls short of integration. It falls far short of federal union. The payments agreements are still virtually limited to a bilateral basis. The liberalisation of trade is still far from the ultimate goal of freeing 75 per cent of intra-European trade on private account. Above all, sovereignty has in no way been modified. The governments may have been closer to each other than ever before, but they have remained sovereign governments answerable only to their own electorates.

Must the Marshall Plan, then, be condemned as a failure on this last count? Surely only those who believe in the possibility of achieving full federal union in eighteen months will say so. It is only by using such a fantastic yardstick that anyone can justify the accusation of failure. If the more modest aim of political consolidation is accepted, then it should be remembered that the period of the Marshall Plan has also been that of the Brussels Treaty, the Council of Europe and the Atlantic Pact. At any time before 1947 so much progress would have seemed little short of miraculous. It may not be union, but it is a degree of unity never achieved in the Atlantic world before.

Nor should the economic aspect of integration be dismissed as a failure. It has to be recognised that at present the chief obstacle to a further freeing of exchanges and removal of restrictions is the unsolved problem of Europe's balance of payments. Behind the present uncertainty over a European Clearing Union lies the sharp division of opinion between the nations who

are not prepared to risk a large scale settling of debt in dollars or gold and those who wish to make it the condition of any multilateral payments scheme. To press for economic integration before the wider balance of payments problem has been satisfactorily met thus exposes governments to an immediate financial danger that outweighs the potential long term gain of a unified European market. This does not mean that Europe cannot or will not continue the effort to free its trade. It simply means that it can do so more speedily and effectively in a situation of more balanced world trade. Once again, the problem lies outside the effective range of the Marshall Plan.

The balance of judgment on the Plan at this halfway mark must be that in those directions in which it was best suited to produce an effect, it has been a complete success. The restoration of European production could hardly have been accomplished more speedily or with less social and political disturbance. The other two aims—the restoration of balanced world trade and the closer integration of western Europe—have not been completely accomplished because they raised issues beyond the power of the Marshall Plan to settle. Even so, a part of the ground has been covered and the nature of the problems still to be solved is now much clearer than was the case two years ago. The question to ask at this juncture is therefore not whether the Marshall Plan has been a success—it has been a triumphant success—but whether a different emphasis should not be secured and a different objective pursued in the two remaining years of the Plan—or indeed whether the conception of a two-year period still to run in Europe should not be dropped in favour of a longer, more flexible and more many-sided policy for dealing with the full restoration and expansion of world trade?

If, for the next two years, attention is still to be concentrated upon western Europe alone, upon its allocations, its procurements, its records and its targets, the major issues of world economic policy may go by default or may at best be seen from the wrong angle. The specific economic problem that worried western Europe in 1947 is almost solved. The general economic relationship between Europe, the dollar area and the sterling area, between manufacturing nations and primary producers, between competitive economies and complementary economies is most decidedly not solved, and it is to this wider problem that the attention of statesmen should begin to move.

lection Issues—II

Personalities and Policies

THE first article in this series looked backward over the lifetime of the Parliament that is now dissolved and attempted to form a judgment on the performance of the Labour Government. The present article, and one more to follow, try to look forward to the next Parliament. What are the major tasks that will confront the next Government, whatever its party complexion may be? Any attempt to make a selection is necessarily arbitrary. But the following list arranged in four groups, includes, it is believed, the great issues to which any government will have to pay attention. All of them are of fundamental importance to the life of the nation; none of them is a party objective in the sense that either party would dispute its right to a place on a list of objectives, however much they might quarrel about the methods of attaining it.

A. First come a group of overriding issues of personalities and principles:

1. For politicians the primary task, running through all others, must be to give the nation real leadership, to see its problems coming and to ensure that they are not tackled too late and on too small a scale. This requirement can be met only by the personal qualities of the party leaders.

2. A second requirement of the same general character is that the next Government should preserve and enhance the sense of unity and community in the nation, so that the British people do not unnecessarily waste energy in fighting each other, or obstruct necessary measures because of unjustified suspicion of the motives of those who propose them. This feeling of national unity cannot be attained so long as any sizable section of the public has a feeling of suffering from severe injustice, political or economic.

B. The second group of issues consists of those that arise out of Britain's place in the world:

3. The country must be restored to full solvency and independence of the aid of others.

4. It must play its part in defending the peace of the world.

C. The third group is that of social issues, those connected with the prevention of individual poverty:

5. Employment must be maintained at the highest level that is compatible with the general economic health of the community.

6. The welfare of the people must similarly be supported to the fullest extent that does not undermine the foundations of economic strength and progress.

D. Finally—but not last in importance—are the various aspects of the task of building up the economic efficiency of the community on which alone a high standard of living can be supported:

7. The state must decide what degree and kind of intervention—or of non-intervention—in the economic life of the country is desirable. This covers the issues both of planning or control and of public ownership.

8. Everything possible must be done to foster the spirit of enterprise—whether it be private enterprise or public enterprise—so that the economy remains supple and progressive.

9. The state must have a financial and budgetary policy that supports and does not obstruct the attainment of the other objectives.

A decision how to vote depends—or should depend—on a careful assessment of the relative importance of these nine issues, and of which party is the more likely to be effective in confronting each of them.

*

It is impossible to contemplate the public life of this country without seeing the need for leadership—not, that is to say, of a single Fuehrer of unquestioned authority, but of a group of men in the highest offices of state who have not only the vision to see round the next corner but also the force of personality to impose a policy on the governmental machine and to secure its acceptance by the public. Inevitably, a comparison between the parties in respect of the personal leadership they can offer starts with the comparison between Mr Attlee and Mr Churchill—which is no comparison at all, since Mr Attlee, for all his good qualities, is no leader at all, while Mr Churchill showed ten years ago that he knew how to lift a whole people out of itself. The trouble about Mr Churchill is not to know whether he would provide leadership, but in which direction he would lead. Even in foreign affairs, which is his strong point, it is difficult to be quite certain that he accepts an agreement with the Russians, rather than the defeat of the Kremlin, as the goal of his policy. And in domestic concerns, which are chiefly economic, no one knows who would possess his ear. There is, however, in Mr Churchill at least the potential of leadership enough to inspire a great national effort to win back solvency and independence.

Of the other personalities of the Labour Government, two criticisms can justly be made. The first is that they contain very few, if any, second-class personalities ; like the Ruritanian army, the present government consists entirely of generals and privates, whereas the Conservatives have a number of men who, without ever setting the Thames on fire, would make competent and courageous departmental ministers. The second criticism is that of the Labour generals, the ministers of the front rank ; all are tired out by ten years of office and far too many are sick men. If, for instance, Mr Bevin and Sir Stafford Cripps were to retire, the burden on the remainder would be intolerable. By comparison the Conservatives gain both positively and negatively. Positively, they have a fair number of competent personalities. Negatively, they do not suffer from any such compulsion as forces a Labour Prime Minister to take half his ministers from the ranks of trade unionists.

On personalities, then, the vote must go to the Conservatives. But it is a wavering one, because Mr Churchill could be as strong a leader in the wrong direction as in the right.

National unity is often confused with industrial peace —which is perhaps excusable, since nothing gives a stronger impression of internal disunity than a succession of strikes. Industrial peace undoubtedly stands a better chance with a Labour Government than with a Conservative. To say this is not to take seriously the vague threats of deliberate trouble if the Conservatives win the election—nothing would more quickly ruin the trade union cause than the deliberate fomenting of openly political strikes. But with a Labour Government in office, there is a very real restraint upon the unions—or at least upon their leaders—which would not exist with the Conservatives in power. Whether the indefinite continuance of the present restraints is, in the long run, a good thing either for the country—which has to provide the sweeteners—or for the unions themselves, which suffer from growing strain between leaders and followers, is another matter. But, if the test is industrial peace, Labour can offer more than the Conservatives.

But national unity is a far wider matter than industrial peace. It can best be defined negatively, by pointing to the calamities that befall a country when, like France or Italy or Spain, it loses the basic essential minimum of mutual confidence. National unity is the spirit that makes it possible for Mr Attlee to offer birthday congratulations to Mr Churchill, and for Mr Churchill to say that " the things that unite us are far greater than those that divide us "—and for both to be completely sincere. The Labour movement was built up on a revolt against the social injustices of an earlier age, and one of the most disturbing features of their rule is the way in which the hatred seems to have a momentum which long outlives any occasion there may have been for it. It is not only those Labour members who have risen from poverty who seem to be permanently envenomed ; the same can be said of many of the " intellectuals " who have had every advantage of birth and education. The Tories do not suffer from any such defect. Their fathers may have done the working class many injustices ; but it was not done deliberately out of hatred, as are many of the things that the Socialists do and propose.

It is, of course, possible to be psychologically subtle and say that the best way to get the hatred out of the Socialists' bloodstream and to build up a real sense of loyalty to the community—the whole community—of which they are members, is to let them govern a little longer. But this remedy might take a long time, and in that time vindictive levelling-down might have done great harm to the body politic. Most people, on this score, would prefer to have a rest from the tinker's curse and the dismissal of fellow-citizens as vermin. National unity could not help but gain from a demonstration that hatred in public life, like crime in private, does not pay.

*

Mr Ernest Bevin expressed in a speech this week his belief that Britain's stock stood higher in the world than ever before and that the whole world was hoping for a Labour victory. This, he said, was based on the impressions he had garnered at the Colombo Conference, and it may be true of the attitude of the new Dominions of the Indian Ocean—or two of them—who owe their existence to the Labour Government. Elsewhere in the free world the candid observer must record the fact that the opposite is true, even emphatically true. Indeed, it is difficult to remember a time when those who keep in touch with foreign opinion were the recipients of more expressions of foreign hope for a change in the direction of British policy. There can be no doubt that the outside world has little confidence in Labour's conduct of affairs. This is certainly true of the United States, and though it would be wrong to say that American dislike of socialism has hitherto affected the attitude of the United States Government towards Great Britain—the record speaks to the contrary—a renewal of power for the Labour Party would undoubtedly produce a wave of belief in America that " the British are incorrigible," which could not but affect the relations between the two countries. On the Continent of Europe, the criticisms and the distrust are even more vocal ; the

smallness of mind with which Ministers have approached the question of European unity, in such painful contrast to Mr Churchill's largeness of vision, is perhaps more responsible than any other factor for the low ebb to which esteem for Britain has fallen. These disagreements are, of course, largely economic. The disadvantages of a policy that tolerates inflation and seeks to mitigate its effects by physical controls can be very clearly seen from outside, while the benefit of such a policy—that it leaves full employment undisturbed—accrues at home. But politics and economics are closely entwined today, and a lack of confidence that originates in the one quickly affects the other. There are no differences between the parties on the non-economic side of foreign affairs—that is, on the defence of peace and liberty against the Communist threat. But in so far as the execution of the common policy rests on relations of the closest trust with Britain's allies on both sides of the Atlantic, the replacement of Mr Bevin by Mr Eden or Lord Salisbury would be a perceptible advantage.

This, then, is one group of issues in which it is possible to reach a quite definite conclusion. A Conservative victory in the election would, beyond any reasonable doubt, improve Britain's place in the world. It would help the dominant issue of the balance of payments, both by the reinforcement of confidence that it would bring to the pound sterling and by the assistance that it would be in negotiating with the Americans to remove the shadow of ideological conflict. These gains might be short-lived ; foreigners vastly exaggerate the difference, in practical policies affecting trade and the exchanges, that a change of government would bring about ; there might therefore be a reaction in six months' or a year's time, when it was discovered that a Conservative government did not immediately bring about European integration and convertible sterling. But the net gain would still be considerable.

The social and economic issues of domestic policy will be reviewed, in equally summary fashion, in a concluding article next week.

Constituency Moods and Contrasts

From a Special Correspondent

This is the second of three articles presenting the course of the election campaign as seen from the constituencies themselves.

UNLESS there are startling changes in the last ten days before the poll, this may prove to be the most private election of modern times. All over the country the fight is being fought with a minimum of public display. The " Hearth and Home " candidate who is standing for the Western Isles may be unique in the sense in which he employs those terms, but in another sense he might be any candidate anywhere. They all have to make their impact felt within the domestic defences which the Briton throws up against the weather of February. The public will not come to the candidate ; meetings are small and poorly attended, save where some big national name is featured on the bill. Nor can the candidate so easily catch the voter on the wing. There are fewer posters than in 1945. With the new limits on expenditure billboarding is too costly to be widely employed. As a result of the Town and Country Planning Act fly-posting, that cheapest form of election advertising, is now illegal, a fact which may afford some comforting reflections to Mr Lewis Silkin, watching from the sidelines. There is left the window display and the hand-bill, where friendly householders or energetic volunteers will lend their aid. But even these are dear, with the total permitted budget so small, and printing costs so high.

One consequence of this is a greater reliance on the travelling loud-speaker than ever before. It is not universally popular even amongst those who use it ; they fear the protest of an outraged citizenry and they fear also that it may become a short-cut for lazy and inefficient canvassers. But it does reach the housewife and, in the evening, the breadwinner. And it is cheap, even if it is nasty. More powerful still, because more gently insinuating, is the radio itself. It was a powerful agent in 1945, even though that was a fine weather election ; it will count far more in February, 1950. Candidates realise this and very often pay it the tribute either of piping it into their meeting halls or else of concluding their own oratory in time for their audience to get back to the broadcasts at nine-fifteen.

In this transformation of electioneering, from a public display to a private appeal, there is no discernible contrast between different parts of the country. I asked a party official in Aberdeen what differences struck him on

£1,000 ON RETIREMENT . . .

. . . at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12*s.* 6*d.* from age thirty. Only £4 18*s.* 4*d.* more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application

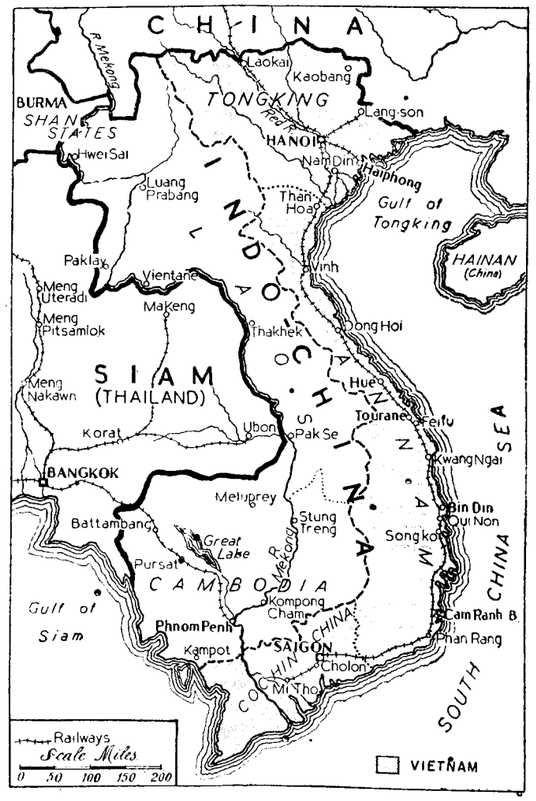
OUTSTANDING VALUE IN LIFE ASSURANCE

coming north from Birmingham, his previous centre of operations, and he admitted that there were practically none which were significant. Canvassing is less popular in Scotland, among either party workers or household victims, but that he attributed, not unreasonably, to the long habituation of the Midlands city to a political high-pressuring as unique as it was violent.

Sometimes this leads to a feeling of frustration. At a time when the arts of publicity and salesmanship have in other fields exploited every novelty, in politics there is a certain sameness. And the fact that the only new device, the radio, is barred to the constituency worker enhances his feeling of frustration. Not every agent would go as far as the Scot who wanted to tow a trailer through his badly under-housed constituency carrying an entire pre-fab with accompanying legends of broken housing promises. But many feel that they are under unusual difficulties in bringing their case before the face of the public or—what is almost as frustrating—in estimating how much of their effort is registering at all.

This has the effect, moreover, of intensifying still further that emphasis on the label, as against the man, which is now a fixed feature of elections. We had been listening to the candidate quote, with rich Welsh cadences, some familiar lines of what he called "the national bard," to prove to his Scottish constituents how far his party's programme received endorsement at the hands of Burns. As we left the meeting one of my neighbours summed up his feelings. "As an individua' I wouldna vote for him. This constituency should be represented by a Scotsman not by a —— Welshman. But as a party mon—that's anither thing." Whether this can be pushed to any length is doubtful; certainly where local residence or nativity can be claimed they are loudly trumpeted. In several rural areas I have seen the candidate sent down from London start off at a certain disadvantage. And when it comes to the island fringes the untranslatables come into their own—"But our man has the Gaelic," said an agent, clinching the argument for victory in an otherwise border-line constituency.

Similarly, it is only in the close fights that the pressure groups are coming into their own. At the national level their efforts may end with the publication of the party manifestos, but in the constituency they may still score a last minute coup. So on every candidate's desk the petitions and the inquiries pile up. Where the petitioner is weak or the candidate feels strong they will cause little trouble. But where a serious and large body of opinion is involved, as with Catholicism over the Education Act, it may not always prove so easy to implement at the local level policies which have been laid down at the top. It is easy to be a Partitionist in Westminster, but it may result in a split in your followers when you get back to Merseyside; nor will the opposition be slow to take advantage of the split and insert a third force of their own. Already the showing made by the Scottish Covenant has affected the programmes of the two challenging parties; Scottish Labour remains confident, inelegantly dismissing the whole nationalist movement as "political dandruff," but if the election proves close the cost of marginal seats will nonetheless be painful.



Not that in the main one comes away from the spectacle of Scottish electioneering with any such adjectives uppermost in one's mind. One encounters colourful figures, such as the Irish Anti-Partition agent whose splendid beard and enthusiastic deviationism alike remind one of Mr Jo Davidson, the sculptor friend of Mr Henry Wallace. Indeed, there is a whole gallery of Abbey Theatre types, from the bright, peaked, libellous, warm-hearted, cloth-capped little man, who cries out to be played by Barry Fitzgerald, to the business man's lady whose vocabulary has a ten-minute limit but whose services to the constituency entitle her to a full half hour of its patience. But behind these is the massive stability of Scottish political habits (Glasgow's "swing" in 1945 was less than any other city's). The problems have a sameness—jobs, houses, cost of living—which stick up through programmes and oratory like mountain peaks through mists. One Labour meeting I attended had all the air of a Scottish church service; the preacher's style was expository, there was no invocation of emotion, but the audience hung in respectful silence upon every word. Nor when the speaker went on to denounce a cut in food subsidies which would be offset by taking sixpence off the income tax did the reverential mood change. "How many of you here in this representative cross-section of the public pay any income tax?" he asked us. We sat in happy silence, as of the elect, and the economic realities of politics became sanctified to our salvation, as once the maximisation of profit had been accepted as the outward expression of an inward grace.

In the Midlands there is, as it were, a more secular air to politics. The Liberals seem to be alone here in arousing a kind of evangelical fervour in their audiences, and for them this is the beginning not the end of their problem; the rub remains—how to keep up the temperature when you take the gospel out of the circle of the faithful into the open spaces of indifference or ignorance? It is a problem to which candidates have each their pet solution; the strength and the weakness of the Liberal attack seems so far to lie in the rich variety of its appeals. The Conservatives are now getting down to the grind of argument and counter-argument. They are making themselves felt at meetings with questions and contradiction. Heckling is not their forte; indeed, it is no one's—but they have done their homework and can stand up in the back of the hall and prick the speaker's claims and refute his allegations. Labour is still holding its fire, consolidating what it feels to be its own rather than venturing into debatable territory.

There is, of course, one notable exception—the rural constituency. Here, Labour has high hopes. The seats in Midland and Eastern England which they won in 1945 were won then and are being contested now by young men of ability, representing the opposite pole from the complacent trade union or co-operative candidate of the solid Labour boroughs. These are in the fight early and vigorously, spurred on by the sheer size of their job—to cover a rural constituency three weeks is little room—but also by a real expectation of success. The inroads made in 1945 on Tory rural acres are not, in their opinion, just the highwater-mark of an exceptional party success; they are a gain, long overdue and now capable of being held or even extended. In their favour, it might be argued that the strength of the new Conservatism lies no longer in the manor, but amid the urban middle classes; against them, there works the natural conservatism of the countryside and a reluctance, social and political, to commit oneself to open endorsement, still less open propagation, of what is still a predominantly industrial and urban movement.

France and Indo-China

THE French Assembly has ratified the French Government's agreement with the Bao Dai regime in Vietnam, and the British and the American Governments have announced their recognition of Bao Dai. Since, at the same time, Russian and Chinese recognition has been given to the rival authority of Ho Chi-minh, the stage is set for a new phase of the cold war which may have the most far-reaching consequences. That a war should go on in a country of the Far East, with great powers ranged even though only non-belligerently on opposite sides, is in itself bad enough, but it has already happened in Greece without any breakdown into general hostilities and with a result which has been so far in favour of the western powers. What makes the new conflict much more serious than the Greek civil war is the manner in which it is being linked up with Communist action within western Europe, for the French Communist party has declared a policy of transport strikes and sabotage to prevent military supplies being sent from France to the French forces in Indo-China, and Communist deputies in the Assembly debates on Indo-China openly incited French troops to mutiny and desertion.

The Communist action in France is a direct challenge to the authority of the state such as no state can endure passively for long without abdicating the essentials of sovereignty, and if the present French Government (or any successor of the same political complexion) fails to meet the challenge in a resolute manner, France will be brought into danger of great internal convulsions. There is good reason to believe that the Communist policy has been very carefully and deliberately planned. The Russians have not only recognised the Ho Chi-minh regime in Vietnam while still in diplomatic relations with France, but they treated the French protest with a studied contempt—to return a diplomatic note in the envelope in which it is sent is the extremity of insult possible in diplomacy. It is thus clear that Russia intends to make Indo-China a special issue for political battle with France, not only in the jungles of the Far Eastern tropics, but in Paris, Marseilles and La Rochelle.

The Kremlin has chosen its ground well, with a sure sense of propaganda. It would be foolish for anyone to deny that the French war in Indo-China is widely unpopular in France, that it is regarded adversely in India and other Eastern countries, and that it has aroused considerable misgivings in Britain and the United States. Of all the current issues on which a trial of strength might have come about between the Soviet power and the western democracies, it would be hard to think of any in which a western liberal can feel so little satisfaction or zeal in the cause which he is now committed to defend. Unfortunately it is in the nature of the present world situation that Russia should be able to select the weakest sector of the defences of the West for its onslaught. Since the Western imperialist war-mongers stand strictly on the defensive, the Communist peace-makers hold the initiative and can choose in perfect security when and where to attack; they can switch their blows from one front to another, and increase or relax their pressure, according to their experience or calculation of the military and moral opposition to their plans. It should be no cause for surprise that they have chosen Indo-China as an issue which enables them to pose as the champions of colonial peoples against imperialism, to take the maximum advantage of popular discontents in France and to drive Britain and the United States into an embarrassing endorsement of a French policy conducted from the beginning on principles widely different from their own.

It is clear, nevertheless, that Britain and the United States now have no option but to support France in the endeavour to consolidate the Bao Dai regime in Vietnam, and it would be well for them not to indulge in any make-believe about what is at stake. In form Bao Dai's Vietnam is recognised as an independent state which France is assisting against internal revolt. Unfortunately there is no possibility of ascertaining how much support Bao Dai would have in Vietnam in the absence of the French army, because the French army has never been withdrawn from the country and Bao Dai's authority is confined to the areas of which the French have military control. He was brought back from exile by the French as the person most likely, by reason of his royal descent, to provide an alternative to the leadership offered by the Viet Minh movement, but for many years before the Pacific war the French themselves had been destroying the prestige of the Vietnamese monarchy by stripping it of all real power. Bao Dai may be, in the words of his own secretary, "*empereur démocrate et sportif accompli*,"

and he has certainly been clever enough to hold out for terms from France which go far to meet Vietnamese national aspirations, but it cannot be said that he is a leader thrown up by a spontaneous national movement. His regime is a *pis aller* made necessary by the failure of all attempts at agreement between France and the Viet Minh.

Opinions differ about the sharing of blame for past failures in negotiation; it may be that if the French at the outset had been willing to concede to Ho Chi-minh some of the things they have now granted to Bao Dai, Ho would not be where he stands today. But he is in fact now in the Communist camp, and even if he had come to terms with France, he would thereby in his turn have been denounced by the Communists and exposed to fresh extremist revolt on the pattern which Communist strategy dictates for the overthrow of all nationalist leaders who make their peace with Western powers. For Viet Nam the Communist threat is particularly overwhelming because it is the country of South-east Asia most accessible by land from China, where Communist power is now established all the way along the Indo-China border.

Indo-China is the key to South-east Asia; if it were once submerged by the Communist flood, there could be no hope of saving Siam with its large Chinese minority, and the position in Malaya would rapidly become critical. Asia's rice bowl in Indo-China, Siam and Burma would be in Communist hands for the blackmailing of India, while vital supplies of raw materials would be cut off from the world market by a power whose destructive political purpose outweighs all consideration for the welfare of the populations it claims to "liberate." There is no reason why Britain, France and the United States should abandon South-east Asia to international Communism because of a formal principle of obligation to renounce colonial sovereign rights which in international law still remain valid. The conscience of western democracy requires that authority in colonial dependencies should be transferred to representatives of the formerly subject people whenever there is reasonable assurance that a stable administration can be set up and the new national independence safeguarded. It does not require that power should be surrendered when it is probable that the result will be either anarchy or subjection to the ascendancy of another foreign power—least of all when the country lies in the path of an aggressive totalitarian system which menaces all free nations. Britain and the United States have shown in India, Burma and the Philippines the sincerity of their will to renounce sovereignty within the framework of a peaceful international order; if they now give their support to the French army fighting in Tongking, it is because that army is holding the pass against the expansion of a power which, though it talks of "national liberation," does not recognise any nationalism but its own. The speeches made at the recent conference of Far Eastern "trade unions" in Peking promised active Chinese Communist support to all militant revolutionary movements in South-east Asia, and it is not to be expected that the Russian and Chinese backing for Ho Chi-minh will be limited to mere diplomatic recognition.

France has burnt its boats and will now have to make a serious effort to bring the campaign in Indo-China to a successful conclusion by a skilful combination of military and political means. It will require more energy and efficiency than any French Cabinet has yet shown in dealing with this "forgotten war"; it will also involve resolute action, not stopping short at the responsible leaders of the Communist party, if that party continues to promote sabotage of the French army. Failure in either direction may mean an acute political crisis for the Fourth Republic. But it is for Frenchmen to see to it that the policy on which their elected representatives have decided is put into effect; the part of France's friends and allies is to give France in the international field such support as may be needed to prevent interference either by Russia or China in a territory which remains in law part of the French Union. If either Russia or China think of "liberating" Viet Nam by force they should know that they will not be confronted by France alone.

NOTES OF THE WEEK

America Looks at the Bomb

The knowledge that the hydrogen bomb will now be manufactured has stirred America's conscience to the depths. The United States, first among nations, dropped the atom bomb and American public opinion is naturally and inevitably sensitive to every question connected with the future use of atomic weapons. Now, with this background of uneasiness already five years old, Americans face the new horror of the hydrogen bomb. Many will share the instinctive reaction of a distinguished group of physicists who have demanded a guarantee that the bomb will only be used in self defence—although the best guarantee is surely the whole recent history of the American nation. There is also general support for the suggestion coming from the Chairman of the Senate Armed Services Committee, Senator Millard Tydings, that President Truman should summon a world disarmament conference in which—under international control—every nation should "disarm—down to rifles."

The most remarkable proposal has, however, come from the Chairman of the Joint Congressional Atomic Energy Committee. Senator MacMahon told the Senate in blunt words that the kind of destruction inherent in the new bomb "might incinerate fifty million Americans in the space of minutes," and urged them to see that in face of a situation so apocalyptic, plans for peace and disarmament could hardly be sufficiently extraordinary, startling or unconventional. His own suggestion fitted his adjectives, for he proposed that in return for a world-wide Marshall Aid programme, stretched over five years and amounting to $50 billion, all nations should accept effective control of atomic energy and a controlled reduction of all armaments by two-thirds. The saving to the United States would amount to $10 billion a year and this money could then be used to finance the new Marshall Aid plan.

* * *

The Administration, however, is not prepared to sponsor anything sensational in the way of a new approach to Russia. Mr Acheson is fully aware of the fact that in dealing with a dictatorship compounded of "imperialism and ideology," strength is as important as conciliation. His definition of American policy

> We are trying to extend the areas of possible agreement with the Soviet Union by creating a situation so strong that out of them can grow agreement.

could hardly be bettered. It is certainly western strength and consistency that will finally persuade Russia that a world settlement is worth achieving. But no one in America or elsewhere in the free world should suppose that "strength and consistency" can be had on the cheap or secured in less than a generation.

* * *

The National Campaign

When nominations close next Monday, the last and most intense phase of the 1950 election campaign will begin. Throughout this week the political leaders have been executing their final strategic moves for the tactical battle which will follow. Mr Churchill has abandoned his skirmish with the official Liberal party, but not before he had wasted a great deal of valuable ammunition and had made the Liberals a present of much useful publicity. Among his lieutenants, Mr Anthony Eden has made a determined effort to bring foreign affairs within the scope of public debate, presumably on the calculation that the Tory virtues—and in particular those of Mr Churchill—can only be properly displayed against a background of world affairs. On the Labour side Mr Attlee has assumed the main burden of the national campaign, and it is noticeable that the members of the awkward squad, Mr Shinwell and Dr Dalton, are not being employed on important duties.

The most disquieting feature of the campaign is the preoccupation of many of the leading speakers with the issues of the past, and not the recent past at that. The elector is being asked to exercise his judgment, not upon the issues of 1950, but upon whether Britain was hell or heaven in the 1920's. Undoubtedly this is due to the Labour Party's decision to make the word Tory synonymous with unemployment—a line of attack which has forced the whole argument back into the realms of history. If it be an accepted canon of democratic government that no party should attempt to make it impossible for another party to rule, then the Labour Party have certainly skated as near the edge of what is permissible in a democratic country as Mr Churchill did in his Gestapo speeches of 1945. Whether Labour is returned to office or defeated, its election tactics have probably driven yet another wedge into the unity of the nation. Moreover, if the Labour Party is basing its main appeal upon the existence of full employment for the past five years, it must surely show by what means it—rather than the Conservative Party—can continue to maintain it in the next five years. Mr Morrison's hecklers at South Lewisham, who interrupted a dissertation on child labour in the nineteenth century with cries of "Let's hear about the future," may reflect the mood of the electorate more accurately than Mr Morrison or his colleagues and opponents realise.

* * *

The Chancellor's Statistics

The use made of statistics by Sir Stafford Cripps in his broadcast last week has been widely commented upon. A certain playfulness of approach to the truth is to be expected at election times, and Sir Stafford was avowedly speaking as a politician. But a scrupulous standard of accuracy is expected of a Chancellor of the Exchequer when he quotes figures, and some of Sir Stafford's statements look very curious when they are set alongside the full facts.

Sir Stafford said that "production is 30 per cent above the prewar level." To this blunt statement at least two important qualifications should have been added. First, it was presumably based on the interim index of industrial production, which is published by the Central Statistical Office. This index excludes agriculture, transport and communications, the distributive trades, commerce and public administration—that is, getting on for half the working population. Secondly, the official index does not show a comparison with prewar figures, and the problem of linking it with the prewar index is a difficult one statistically, which can give very different results by different methods. The index of production of the London and Cambridge Economic Service gives an average of industrial production per working week in the first nine months of 1949 of 25 per cent higher than in 1935, but only 15 per cent higher than in the average of 1935-38. To say that "production" is 30 per cent higher than "the prewar level" is more untrue than true.

"The real value of the dollar has fallen by 23 per cent—5 per cent more than the fall in the real value of the pound." Sir Stafford gave no period for this comparison, and no doubt there is some period over which a crude comparison of consumption price indices can be made to give this result. But if so, this "real value" is singularly unreal. To prove that the value of the pound has risen relatively to that of the dollar is one that is beyond even Sir Stafford's dialectical powers.

"Actually we have provided to other countries just about as much help as we have received ourselves." This turns on what is meant by "help." According to a parliamentary answer given on November 29, 1949, the sums received by the United Kingdom from the end of the war to September 30, 1949, in gifts, loans, ERP aid and drawing rights was £1,647 million, while the sums of strictly equivalent character given amounted to £958 million. To make the two sides "just about" equal, it would be necessary to bring in such things as "capital investment overseas" (which may merely mean the flight of capital) and the repayment of sterling balances. The Chancellor's statement is true only if "help" is defined in a way that would certainly not come naturally to the minds of his radio audience.

* * *

Peace, Retrenchment, Reform

The Liberal Party's manifesto, "No Easy Way," which was published on Monday, begins with a determined effort to paint a realistic picture of the contemporary economic scene and to avoid cheap methods of vote catching.

> Crisis after crisis comes upon us, because we are living beyond our means. The Liberal Party believes passionately in full employment in a free society, and in maintaining the social services. But unless we practise thrift and get full production, lower rations and mass unemployment are inescapable when American aid ends. A government governs best by example and not by exhortation: Liberals in office not only would demand thrift, but would practise it.

After this heartening beginning, however, the realism and importance of the programme diminish. It is true that the manifesto comes out even more bluntly than its Tory counterpart for a reduction in food subsidies. It is also true that, unlike the Tory manifesto, it does not promise both increased economic stability and tax relief as an immediate result of a policy of retrenchment. But it propounds the possibility of achieving economies in government expenditure by a pyramiding of the functional government departments on the Haldane pattern without explaining the limitations in function which alone can make any important inroads on administrative expenditure. It is not, nowadays, the methods by which the Government does its work that pile up the expenditures so mountainously, but the amount of work that it sets out to do.

Most of the other proposals suffer from bearing too close a resemblance to the Tory proposals, a defect accentuated by the misfortune or miscalculation of the Liberal Party in producing their manifesto a fortnight after the Tory one. Thus the restoration of private international marketing and the revival of the Liverpool Cotton Exchange, the reduction of controls, the supervision of monopolistic tendencies, opposition to iron and steel nationalisation, the freeing of road transport are almost identical in each. But equally it is hard for the independent votor to feel that those proposals

which do differ radically from those of the larger parties are successful Liberal contributions to political and economic thought. The enthusiasm for co-partnership and profit-sharing in industry overlooks certain harsh but fundamental facts about the organisation of industry. Could a Land Bank really be fitted into the financial structure of a highly developed industrial nation? A party which opposes peacetime conscription must, at this dangerous moment, elaborate the methods by which it would eliminate its necessity. Is it wholly honest to promise categorically the introduction of equal pay into the civil service? Is it realistic to advocate free trade for Britain in 1950?

*

These criticisms are not set down in any spirit of carping or superiority (those readers who are determined to classify *The Economist* as either for or against the Liberal Party may take their pick of two letters on page 313 under the heading "Non-Intervention"). They are rather regrets at a missed opportunity. There is a profound irritation among the British electorate with the two major parties. Whether this arises mainly from their insistence on harping on the past rather than the future, or from their timidity in handling the grave issues, or from a desire to be treated as adults rather than as children being promised candy sticks, it would be hard to say. The Liberal Party—30 years out of power—attracts little of this irritation to itself, and in a recent Gallup Poll 38 per cent of those questioned indicated their willingness to vote for the Liberal Party if it had a chance of getting a majority. But for the votes to be garnered by the 450 candidates, it is surely necessary for the Liberal Party to offer a challenge on the highest and broadest ground of principle and morality, not a set of nostrums with a fairly crankish air. The trouble about the manifesto is that one can be a convinced Liberal and passionately in agreement with every general statement in it, and yet dislike a clear majority of the proposals in it that are both specific and distinctive.

* * *

M. Bidault Hangs On

It is tragic that at a time when France is in the front line of the cold war—in Viet Nam in Asia and under sustained Communist fire at home—the parliamentary system should be reaching new low levels of incompetence and frustration. The friendly observer looks on bewildered. Here is a country whose spiritual and intellectual resources are unrivalled, which has achieved a remarkable economic revival in the last year, which can feed itself amply and probably is neighbours as well, which is well advanced in a well-thought-out and skilfully managed plan for renewing its basic industrial equipment, and whose population, after years of stagnation, has suddenly entered a new phase of dynamism. Would not all this seem to add up to a promise of vitality, energy, certainty and leadership—not the papier mâché leadership offered by a de Gaulle, but a genuine renewal of national self-confidence and strength?

Yet the truth is that the present parliamentary spectacle is even more dreary than usual. The Socialists, fearful as always of their working-class support, have used M. Bidault's reluctance to grant the whole of the proposed bonus to lower paid workers as an excuse for withdrawing from the Coalition. True, the other member-groups of the Ministry have agreed to remain with M. Bidault and he has persuaded Radicals to fill the empty Socialist posts. The Socialists have also decided to continue to vote for the coalition—a policy they term *soutien sans participation*. But the total result is lamentable enough. M. Bidault must govern without a majority. The Socialists lose even more prestige as a result of their irresponsibility, and everyone begins to talk of elections as a *pis aller*, although probably only General de Gaulle really stands to gain from such a move.

* * *

Sterner Line in Germany?

For some time past, there has been some uneasiness, particularly in France, over the supposed attitude of the American High Commissioner in Germany, Mr McCloy. The belief was widespread that the fate of Germany had warmly engaged his sympathy, that he had a very high degree of confidence in Dr Adenauer and that, as a result, he tended to underestimate the unregenerate side of the German people. These fears came to a head in France when at the time of M. Schuman's visit to Germany, the Germans raised the issue of the Saar, and Dr Dehler, the Minister of Justice, went so far in a public speech as to exonerate Germany from responsibility for both world wars. This, the French felt, could not have happened without some German reliance upon American complaisance.

No doubt all such fears and rumours have been grossly exaggerated. The fact remains, however, that on his return from a visit to Washington for consultations with the President and the State Department, Mr McCloy has delivered one of the sternest speeches given by any American official on German soil since the Occupation began. He told the Germans that their only hope of democratic revival and political regeneration was to abandon "foreign diversions," to give up attempts to manoeuvre between the great powers and, above all, to put an end to all official statements attempting to exonerate Germany from past misdoings. He reminded the Germans that he was in Germany not only to assist their economic revival but also to see to it that a German democracy came into being. It was, therefore, very much his business to see that the Nazis were not allowed to creep back into public office, or that political corruption did not go unchecked.

*

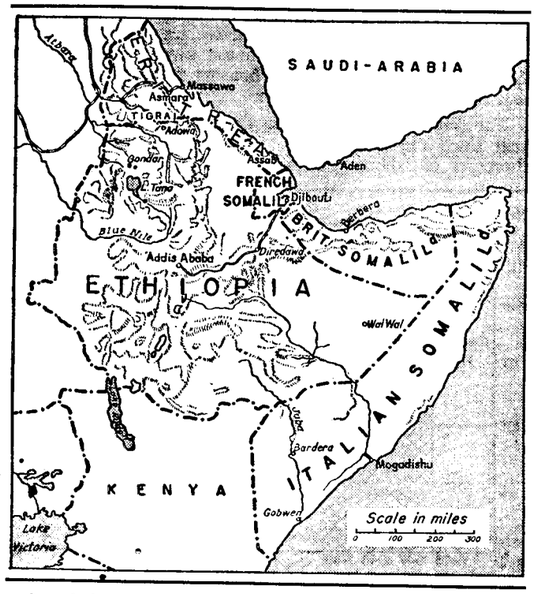
It may be that the desire to take a stronger line in Germany underlies the Allied decision—also announced this week—to ban export of all steel from western Germany to the eastern zone. If so, this example of the strong hand seems rather less fortunate—and indeed, judging by subsequent denials that they intended a ban, the Allies themselves have had second thoughts. Deliveries of steel would, in any case, have come to an end shortly, since, under the present trade agreement, neither side may run a deficit of more than 15 million marks. That sum has been reached on the eastern side. By imposing a ban, the Allies not only increase German anxiety over possible outlets for their steel production, but they deliver one more blow in the tiresome tit-for-tat that is going on between the eastern and western Occupation powers in Germany. The present round began with the American attempt to seize a building used by the Soviet Railway Administration in the American zone of Berlin. As a half reprisal, the Russians have since interfered in an irregular fashion with traffic coming into Berlin. Now the ban on steel has been announced as a reprisal, and, presumably, some counter measure will be taken by the Russians. Is it really Allied policy to slip in this way into a new blockade?

* * *

It Has all Happened Before

After Dr Schumacher's grave warning of a German Communist plan to concentrate formations of the "German Youth Federation" in Berlin during May from all over the Soviet Zone of Germany, and his advice to the Western Powers to station tanks on the approaches to the western sectors of Berlin to prevent mass entries of Communist demonstrators, Allied officials are reported to have said that it was more probable that they would throw open the streets to Communist marchers and that

> at this time the trend of thinking is to build no "police wall" around west Berlin. Instead we might shake the Communists' fanaticism by showing them that things here are better than in the Russian sector.



In the circumstances of Germany today it would be impossible to imagine anything more fatuous than such an attitude. The German democrat, with his memories of long years of Nazi terror and tyranny and the spectacle of a ruthless dictatorship now functioning before his eyes in nearly half of Germany, looks to the western powers for assurance that they have both the capacity and will to protect him against totalitarian pressure. What then is he to think of an administration which proposes to allow, within the only refuge of political democracy in East Germany, mass demonstrations of hostile forces assembled from afar for the purpose of making a show of irresistible strength? What can he think except that the western Allies are no longer in earnest about staying in Berlin? Certainly anyone who remembers how the Nazis developed the technique of mass parades and processions, and knows how the Communists have taken over their methods, even in quite small details, will not suppose, for a moment that what is in question here is the exercise of a democratic right of free speech. The open-air demonstrations and street marches of totalitarian parties have nothing in common with free democratic politics; they resemble, and are intended to resemble, the invasions of conquering armies, complete in every respect except for the arms which will later be added to them. If the western governments have no will to keep their sectors of Berlin free from such intrusion, they might as well pack up and depart.

New Trustees in Somaliland

The eight hundred Italian soldiers who have been waiting in Italian ports until the Italian Parliament voted the necessary funds for their expedition are now on their way to East Africa in the new role of trustees for the United Nations. They are returning to one of the regions from which Mussolini launched his Abyssinian adventure in 1935 in order to carry out the General Assembly's decision of last November that the former Italian colony of Somaliland should be placed under Italian trusteeship for ten years as a preliminary to independence. Two weeks ago the terms of the trusteeship agreement were settled by the Trusteeship Council, and last week during his visit to Rome Mr Bevin made a contribution to the settlement of the problem of the frontier between Somaliland and Ethiopia which had looked as though it might hold up the transfer of authority from the British to the Italians. This frontier has never been properly defined and since the Trusteeship Council has decreed that the procedure for fixing it must be approved by the Assembly, which does not meet until September, some provisional arrangement is essential if friction between the Italians and the Ethiopians is to be avoided—especially since Ethiopia refuses to recognise Italy's right to hold the trusteeship.

If the British have done their best to facilitate the fulfilment of the Assembly's decision on Somalia, the Italian Communists and the Nenni Socialists have done their best to hold up the Italian return to Africa and to present it in the worst possible light. But they have not gone beyond a spate of vituperative oratory and muddled manifestos; the rumours of active sabotage at the ports proved

unfounded. Nevertheless their attitude provides one more example of the efficiency with which the Cominform obtains support for the somersaults of Soviet policy. The same men who a short time ago were complaining about Italy's exclusion from Africa now complain about its "frivolous" return. At the same time, in preparation for future reversals, they have borrowed a page from the book of the MSI (the neo-Fascists) and have proclaimed that they do not in principle object to the Italian return to Africa but only to the humiliating manner in which it is being carried out. Their assertion that Italian soldiers will expose themselves to the peril of guerrilla warfare in Somaliland is perhaps a veiled warning that the Cominform plans to make use of nascent African nationalism through such organisations as the Somali Youth League. Moscow may be all the more tempted as it has been thwarted in its attempt to gain a respectable foothold in Africa through a trusteeship.

*

It was unfortunate that the Communists should have had one genuine weapon put into their hands by the appointment of General Nasi as temporary military administrator in Somaliland. The reactions of Count Sforza to the revelations made by a Communist deputy about the General's past history during the Abyssinian campaign clearly showed that he had been misled by his advisers. The Government has since taken quiet steps to disembarrass itself of this controversial figure as rapidly as possible. Of much more significance than the Nasi episode is the Prime Minister's announcement that the Ministry of Africa is to be abolished

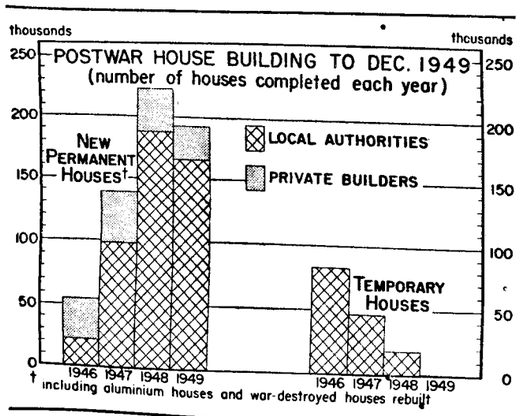
Personal Incomes, 1938-1950

A series of three articles on this subject has appeared in The Economist:

Redistribution of Income	(*Jan.* 21)
Changes in Wages	(*Jan.* 28)
Salaries and Profits	(*Feb.* 4)

These articles have been reprinted as a pamphlet which is now available. Copies of the pamphlet (price 6d.; by post 7d.) can be obtained from

The Economist, 22 Ryder St., London, S.W.1.



as a symbol of the new spirit in which Italy is returning to Africa and as proof that the Government, although opposed to all international adventures, believes in "an Italian contribution to a better world."

* * *

Labour's Housing Record

The publication of the most recent housing returns* brings the record up to December 1949. This will be the last return before the election, and to all intents and purposes a chapter in the story of the Labour Government's postwar housing programme is brought to an end. The balance of the programme will—it is to be hoped—be altered even if the present Government is returned; but the Conservatives have pledged themselves to do much more for the private builder and house owner, and under a Conservative Government the housing programme is likely to assume a very different shape.

The diagram below compares the achievements of each full year since the last election. After a slow start, due to shortages of labour and materials and due even more to

the misjudgments which permitted the resources of the industry to be spread far too widely, output has settled down to about 200,000 houses a year. Under the Labour Government's capital cuts this year's programme will be cut to some 175,000 houses. Unless a Conservative Government decided to allocate more capital resources to housing, at the expense of other capital development, or unless productivity rises and costs fall, it seems unlikely that there will be a great change in the present level of building. It might indeed be arguable that private enterprise would build more quickly and therefore more cheaply. But this remains to be proved, and it can be equally well argued on the other side that a larger proportion of middle-class houses will diminish the total number of families rehoused.

Up to December 1949 the Labour Government had to its credit 623,000 new permanent houses and 157,000 temporary ones, making a total of 780,000. Of the permanent houses some 130,000 or nearly one in five had been built by private enterprise. On the basis of four and a half years' output this gives an average of 173,000 a year. This average compares very favourably with the years after the 1914-18 war. In the four years 1920-23 (the first for which figures are available) the annual output of houses averaged some 92,000 a year, and it was not until 1927 that output reached the level of 1948, although it should be remembered that the political and administrative effort put into the housing programme between 1945 and 1949 was certainly much greater than in the early nineteen-twenties.

* Cmd. 7871, 7872.

The Humanitarians Reply

Until last week most of the evidence given in public to the Royal Commission on Capital Punishment has been in favour of retaining the death penalty for murder, and against any attempt to limit the penalty by the establishment of different classes of murder. An exception was Lord Justice Denning, who attempted to divide culpable homicide into three categories—murder, manslaughter and unlawful killing. He, however, was mainly concerned with the offence. The evidence submitted last week was mainly concerned with the offender. But the Howard League for Penal Reform surveyed the whole question of the death penalty because, being convinced that total abolition is the only justifiable policy, it was unable to recommend limitation or modification.

The consideration of abolition is, however, outside the terms of reference of the Royal Commission, and of more practical interest than the Howard League's powerful case is the evidence of the doctors. They presented scientific evidence to show that so far from there being, as the Lord Chief Justice had maintained earlier, too many reprieves, there are not enough. Their memorandum was mainly concerned with making the McNaghten rules more complete in the light of modern psychological knowledge, and in substance was a plea for the introduction into the English courts of the Scottish doctrine of "diminished responsibility" for a crime. Under the usual interpretation of the McNaghten rules at present, an accused cannot establish a defence of insanity if at the time of the crime he knew what he was doing and knew it was wrong. The psychiatrists' evidence showed that many murderers are aware what they are doing and aware that it is wrong but are quite unable to control their actions because of their abnormal mental state—an abnormality of which, in some cases, there may have been no apparent signs before the murder was committed.

It should not be thought that the British Medical Association, whose special committee drafted this proposed extension of the McNaghten rules, believes that a person suffering from a mental abnormality is necessarily absolved from all responsibility for his criminal actions. Nor does it want the decision of the jury about a murderer's criminal responsibility to be supplanted by a decision of psychiatrists—although it favours the retention of the statutory medical inquiry into a condemned murderer's mental state in order to prevent a miscarriage of justice. But it believes that if its proposed revision of the McNaghten rules were accepted and put before juries, far fewer murderers with a mental abnormality would be sentenced to death, with a consequent reduction in the number of times a jury's verdict is reversed by administrative action. And of those who might be sentenced, some who, under the present formula, would be hanged, would have their execution stayed.

* * *

Silver Lining for Critics

Miss E. Arnot Robertson's long legal battle with Metro-Goldwyn-Mayer Ltd. ended this week in an adverse judgment for her in the House of Lords. Miss Arnot Robertson complained that she had been libelled, and slandered, by the film company when, in 1946, they protested to the BBC against her broadcasts as a film critic. Miss Robertson was awarded damages on the original hearing. That judgment was reversed on appeal, and the House of Lords has affirmed the judgment of the Court of Appeal. The basis of the Lords' decision is that they found that the letter and telephone conversation on which the action was based were published on privileged occasions and that Miss Robertson had not produced sufficient evidence to show that the defendants were motivated by "malice," or wrong motive, on these occasions.

There can be little personal satisfaction for Miss Arnot Robertson in the result of this battle—there rarely is for the individual in actions that run their full and expensive course to the House of Lords. But there are two points of general interest in the result. First, it was established to the satisfaction of the Court that the BBC did not drop Miss Robertson as a film critic because of MGM's protest. The only safeguard for any critic must be the strength of character of the proprietor of the publication, or means of publication, which he or she uses. The second point is that the House of Lords, in its judgment, has strengthened the position of all critics who hold honest opinions. After all, on this occasion, MGM was a critic of Miss Robertson. The company had a legitimate right to make critical comment on her broadcasts. It has been protected in the exercise of that right because there was no evidence of "malice," and the Lords made it clear that a great many defects in a critic, irrationality, stupidity, obstinacy, may still be present and yet leave the critic with an honest opinion which he is free to express. The law has not been changed by this case, but the Lords have added their emphasis to the fact that a critic, to defend a suit for libel successfully, is not compelled to satisfy a jury that he is fair-minded as well as honest.

* * *

Economic Prospects in Italy

The sixth De Gasperi Government includes three Ministers without Portfolio all intended to act as coordinators of economic policy in various spheres. Professor Pella, a hard money man who urbanely denies that the Keynesian theory is applicable to Italian conditions, remains at the Treasury. Sir Stafford Cripps, when in Rome last spring, formed a high opinion of his capacity. Dr. Vanoni, author of the projected tax reforms which have not yet reached Parliament, remains at the Finance Ministry. The chief political advocate of expansionist economics, Amedeo Fanfani, has, on the contrary, left the Government to take a seat with the small "Left wing" Christian Democrat group which now glowers at De Gasperi from the top (or backmost) benches of the semi-circular chamber. The three coordinators without portfolio are Pietro Campilli, a wealthy Catholic banker, Ugo Lamalfa, of the Republican Party, who has presided for some years over the Finance Commission of the Chamber, is author of a capital gains tax which has got on to the statute book if not into practical application, and has headed various economic missions including one in 1949 to Moscow; and finally Raffaele Petrilli, a jurist. The three Ministers without Portfolio have been labelled "the troika," and their appointment signifies the new government's acceptance of a policy of bigger investments and wider employment such as has repeatedly been demanded by the ECA administrators, while leaving Signor Pella the last word as guardian of the currency.

One of the first acts of the new government has been to instruct Signor Tarchiani, ambassador in Washington, to proceed with negotiations for what is here described as a treaty concerning private loans and investments. The way was prepared by conversations in some of the big banking offices in New York when Count Sforza with a small suite visited America in September. An officially inspired article in the Turin *Stampa* remarks that all recent American commercial treaties have included clauses safeguarding American capital investments in the other countries. The article suggests that Italy will have to modify regulations which at present forbid the repatriation of dividends in excess of 6 per cent on foreign capital, and will have to permit also the repatriation of capital gains. Compensation in lire must be guaranteed in the case of the American investors, Italian property being nationalised. The new treaty would incorporate clauses now dispersed in the ECA agreement, the Trade Treaty of March, 1948, and other instruments. It is believed here that the prospects of private dollars becoming available to offset the threatened shrinkage or stoppage of ERP dollars in 1952 are bound up with the position for which Italy may qualify in respect of Point 4 of the Truman programme.

* * *

Dr Malan and the Press

During their twenty months of office the members of Dr Malan's Cabinet have shown themselves surprisingly sensitive to criticism in the press, both at home and abroad. They have, therefore, welcomed a motion tabled by a private member of the Nationalist Party last week to set up a Commission of Inquiry into the South African press. In several public speeches, Ministers—notably Mr Erasmus, the Minister for Defence, and Mr Eric Louw, the Minister for Economic Affairs—have repeatedly claimed that a number of their policies, particularly that of *apartheid,* have had an unfavourable reception abroad simply because correspondents tend to send false or misleading reports to the newspapers which they represent. The Ministers have accused South African reporters of being "unpatriotic" for failing to support Government propaganda and for writing critical accounts of political events; they have usually gone on to suggest various methods by which the press in general and reporters in particular should be controlled. Indeed, in the debate which followed last week's motion, Mr Eric Louw went so far as to suggest that foreign correspondents who were not South African nationals and who sent "slanderous messages" abroad should be deported.

Little harm can come to the South African press from a straightforward Commission of Inquiry. It may clear the air of a number of the wild allegations which are usually made about the newspaper world and may even increase the prestige in which the South African press is held. But the sponsors of the motion have shown by their speeches that they have something more in mind than an investigation into monopoly and fair reporting. They are concerned with the honour of South Africa and its government; they have implied that reports, whether they are true or not, which show the country or the government in an unfavourable light should be suppressed.

If Dr Malan really intends to abolish such a fundamental right as that of a free press, he could hardly do anything more calculated to destroy his credit, which has never been strong, in both Britain and America. It would be more harmful than any number of false or slanderous reports could conceivably be; rumour would take the place of news, and Dr Malan would find that he would have far more to contend with abroad than he has at present. He would be well advised to frame the terms of reference of the Commission of Inquiry much more carefully than his colleagues seem inclined to do.

* * *

American Aid to Tito

For four years the Americans have been told by their Government and their representatives in Congress that the United States is unalterably opposed to Communism and to dictatorship. Yet with surprising facility, without a word of debate, the American Government has for almost one year been lending ever-increasing economic and moral support to the Communist dictatorship in Jugoslavia. Now the National Security Council has gone so far as to commit itself to the idea of military aid in the event of aggression, while the new American Ambassador, Mr George Allen, has hinted that "aggression" might include internal revolt fomented by a "certain foreign power."

The reasons for this change of front are obvious enough. The United States has clearly demonstrated in Jugoslavia that it is not opposed to Communism *per se.* It only resists Communism when it becomes, in Mr Acheson's phrase, "the

subtle instrument of Soviet foreign policy." The main problem for the State Department and for the western world in general is to contain the Soviet Union, which until the heresy in Belgrade was synonymous with "Communism." The State Department holds no illusions about the completeness of the dictatorship in Jugoslavia and its lack of democratic freedom, but the decisive factor is that it is no longer a satellite dictatorship bound to the Soviet juggernaut.

The policy has already paid its dividends. Political convulsions produced by the Belgrade-Moscow struggle in Bulgaria and other satellites ; the loss of prestige suffered by the Russians at the last General Assembly of the United Nations ; the splitting of "front" organisations and the defections in western Communist parties over the "Titoist" issue ; the removal of Trieste as a danger spot from the international agenda ; the end of the Greek civil war ; the solution of the Carinthian problem in Austria—these are the rewards of the policy forwarded by the State Department. And it should be remembered that no concession or *quid pro quo* was sought. The pressure of the Soviet Union did the work of western diplomats. Moreover, the interest accruing from this policy has far exceeded the principal expended. In fact, it has been the cheapest and most rewarding of all western investments so far. The United States Export-Import Bank has lent $25 million ; the World Bank some $11 million ; and the British Treasury a credit of £8 million. And if western policy is accused of cynicism, its exponents can reply that external trouble-making, not internal politics, is the proper subject of foreign policy.

* * *

Montagu Norman

With the death last week-end of Lord Norman, another of the great personalities of the "years between" passes from the stage. In 1944, when ill-health compelled his retirement, retrospects of his quarter-century of rule at the Bank seemed to emphasise the contrast between the new age and the old and to heighten the abiding confidence that the world in its second postwar reconstruction would escape the mistakes of its first. Now, after five disillusioning years, even the contrasts are in doubt ; and honest critics of the regime which Norman helped to create may shrink from reaffirming the harshest of their prewar judgments. The gold standard of the late 'twenties may have been an anachronism in a world of growing rigidities, the decision to restore the pre-1914 parity an act of blind folly, and the clinging to it for six years a piece of wilful obstinacy ; but the man who pursued these policies was not in them, as in some others, an autocrat who swept the clamorous dissentients aside. The truth is that, among the ranks of statesmen and bankers, there were virtually no dissentients—and even among economists few voices were raised in protest. If industry was "crucified on a cross of gold," it was the world, and not any Roman dictator, who did the crucifying.

So, too, though to a less degree, with the policies of the 'thirties. When the gold standard crashed, Norman quickly bowed to the fast-changing opinion—especially Treasury opinion—loyally launching the War Loan conversion on a flood of cheap money, sustaining it by new techniques of monetary management, and plunging enthusiastically into a new task of rehabilitation. These policies—some quickly, some not so quickly—won widespread approval. Only much later was it generally perceived that the new system of reconstruction by cartellisation and high costs was merely extending and crystallising those very rigidities which had laid the earlier system in ruins. So, finally, in the matter of aid for central Europe ; financial appeasement was the natural accompaniment of a political appeasement which affronted only the few until it was too late.

But it would be wrong to write of Montagu Norman as if he were a mere symbol of his age. Few men have had more personality and were better able both to charm and to command his fellow-men. The iron autocracy he established in the City is already beginning to soften ; what will linger much longer is the memory of that poetic figure with its blend of authority with simplicity, of an old-world courtesy with an entirely new-world impishness.

Mr Menzies Redeems A Pledge

Mr Menzies has carried out his election pledge to abolish petrol rationing earlier than was generally expected. His decision was announced last Wednesday after some weeks of consultations with the British Government, who clearly opposed the Australian proposals but who equally clearly had no right to interfere and could do no more than stress the arguments against such an action at such a time. If the Australian Government want to spend more dollars on petrol, even though the expenditure might decrease the value of the sterling area dollar pool, it is entirely their own affair. In fact, however, the actual cost in dollars will be small—the figure of $4,000,000 to $5,000,000 has been mentioned, though it must be speculative. Perhaps the chief point of the British case at the moment is diplomatic rather than economic.

In the past two months the British Government have been trying to save dollars on oil by obtaining oil imports from sterling sources. The co-operation of other Dominions was needed as well as delicate negotiations with American oil interests, and from the British point of view it was unfortunate that the Australian Government should have chosen a critical moment in the working out of the British scheme to make it clear that they were not, apparently, going to take part in it.

The Australian case for importing more petrol is strong. The large distances to be covered, the extensive use of motor rather than rail transport, the restrictive effect—even though slight—which petrol rationing has had on the development of Australian industry called at least for a modification of Mr Chifley's policy. The buoyancy of the Australian economy, together with the comparatively small amount of extra dollars involved, was an added encouragement to Mr Menzies to carry out his pledge as soon as possible. Nevertheless, from a purely domestic point of view, Mr Menzies may find that the abolition of petrol rationing will be a mixed blessing. It is only a small outlet for the pent-up purchasing power which exists in the country, and unless he finds other means for relieving the pressure fairly soon, the least that can happen is that the price of petrol will soar and will diminish the value of the other benefits which were expected to follow from the abolition of rationing.

Joint Consultation

The Ministry of Labour's recent supplement* to its Industrial Relations Handbook enlarges and brings up to date the section dealing with the formal machinery for co-operation between employers and employees in the factory. It contains a good deal of information about the official drive to have some form of "consultative committee" set up in each firm in all the main industries, and the extent to which it is succeeding. It is plain that before long the Ministry's ambition will be realised, to make every firm with a "substantial number" of employees feel obliged to have a formal works parliament going through the motions of consultation on every topic from training to tea-breaks and from output schedules to overalls—or to show good reason why not.

On its face value, this attempt to democratise industrial

WANTED in Canada

"CANADIANS WANT BRITISH BUSINESS MAN" — yes, this means *you!* Canadians want to buy *your* goods and they want to see *you* — in person, in Canada. You'll never have a better opportunity than you have *now!*

Fly to Canada yourself by Trans-Canada Air Lines, the most frequent direct service. It's important to *get in first* in this valuable hard-currency market—and in the U.S. market, too.

In Montreal — tomorrow!

STEP aboard one of T.C.A.'s luxurious North Star pressurised Skyliners at London or at Prestwick—in less than a day you'll be in Montreal, within an easy flight of every important Canadian and U.S. city. There are frequent connections with all major U.S. airlines, and U.K. passengers can save dollars by booking T.C.A. right through to their final destination beforehand. Fast T.C.A. services leave Britain for Canada daily. Let T.C.A. take you there—and *you* will take the orders!

DOLLAR-FREE! HOLIDAYS IN BEAUTIFUL WEST INDIES

Let T.C.A. Skyliners fly you to carefree sunny holidays in the beautiful West Indies — famous for their all-the-year-round climate! U.K. passengers can make *through* bookings at special rates. You fly via Montreal to Nassau, Jamaica, Bermuda, Barbados and Trinidad. No dollars needed —T.C.A. pay overnight expenses in Montreal.

TRANS-CANADA *Air Lines*

Full information and reservations from your **Travel Agent** or from 27, PALL MALL, LONDON, S.W.1. Telephone: WHItehall 0851 (Passengers and Air Cargo)

IT'S ONLY A DAY BY TCA

Picture Post in 1950

Picture Post continues to head the list for many nationally-known firms with big advertising plans. From the spring campaigns onwards, others will be sharing its unique influence and prestige, as well as its resources in hard salesmanship.

This salesmanship is solidly based on a really national, all-class **circulation,** close on 1¼ million now, and steadily rising. Picture Post **readership,** again, includes one out of every four men and women in the country.

Turn to its advertisement pages and you get real **impact.** Picture Post now offers really large spaces—two-page spreads, for example—in full colour. This is the most powerful space in British advertising. And Picture Post will always make special arrangements on request, as far as current supplies of paper, etc. will permit.

The editorial authority of Picture Post continues to win **confidence.** Consumers and retailers both know that the goods and services advertised in Picture Post share its name for reliability. For Picture Post is not just Britain's leading weekly picture magazine. Picture Post is already an integral part of British life.

Nor does the responsibility of Picture Post end with publishing. Picture Post also offers its advertisers a tested merchandising **service.** This enables them to make full use of the resources and influence of Picture Post, to 'follow through' from its advertisment pages to the actual points of sale. This service will be continuously developed and extended throughout 1950.

PICTURE POST

F. A. Gray: Advertisement Manager, Hulton Press Ltd., 43-44 Shoe Lane, London, E.C.4. Central 7400

management is irreproachable. What is much less credible, however, is that joint consultation will ever amount to anything so long as it remains chiefly an end in itself.

> While practical suggestions for improvements in methods of production . . . will be in themselves of the greatest value, the most important and permanent value to be gained from successful joint consultation is the improvement of relations between management and employees within the undertaking,

says the pamphlet. Yet this is no sort of encouragement to either side to take the committees seriously. The only spurt in the development of joint consultation occurred in the production committees set up during the war when workers and management stopped trying to promote good relations by means of good relations for the sake of good relations, and were drawn together in deadly earnest in pursuit of a common end. This experience shows that people are willing to forget their suspicions and *amour propre* in order to play their full part in making a good job of something they believe worth while and the present crying need for efficiency and higher productivity constitutes just such a challenge. Nothing, however, more readily invites cynicism than the suggestion that workers and management are being invited to play this solemn rigmarole of secret ballots, quarterly meetings, agendas and resolutions for no better purpose than to sweeten their own tempers.

* * *

Opera Subsidies

In 1945, as the result of experience gained during the war, the British Government committed itself to the policy of state patronage for the arts. The opening of Covent Garden as a national opera house was also decided upon and since, at that time, no opera company had been formed, Lord Keynes proposed that the Governors of Sadler's Wells —an organisation formed some fifteen years earlier by Miss Lilian Bayliss to perform both opera and ballet—should transfer their flourishing young ballet company to Covent Garden. No financial compensation was given to Sadler's Wells, although the ballet at the time was earning £15,000 a year, since it was agreed that both Covent Garden and Sadler's Wells would receive grants from the state through the medium of the new Arts Council, and that compensation to Sadler's Wells would, therefore, be no more than a book-keeping transaction.

Unfortunately for Sadler's Wells, the arrangement has not worked out as simply as this. Opera in repertory, as every continental opera company knows, is an expensive business, and although Sadler's Wells now receives from the Arts Council an annual grant which has risen to £40,000 in the last two years, the aid has been insufficient to offset its losses. In the course of four years of opera giving and of training a new ballet company, all its reserves—some £75,000—have been eaten up.

This situation has led many critics to suggest that Covent Garden, which in addition to the income drawn from ballet, receives no less than £140,000 a year from the Treasury and the Arts Council, should receive a smaller grant and that Sadler's Wells, which not only supports an opera company and a junior ballet company but also with very little assistance from Covent Garden, the Ballet School, should receive part of the money now paid to Covent Garden. It is difficult to believe that a solution on these lines is really desirable —although, *faute de mieux*, a readjustment might be necessary. In equity, the claim of Sadler's Wells to a greater share of the national opera subsidy is a strong one, but an opera house on the scale of Covent Garden and with its traditions cannot be maintained on much less than the present sum. Indeed, continental subsidies are considerably bigger. The only solution compatible with both equity and sound musical policy is that the government should make a larger grant available to the Arts Council for opera and that a larger share of it should be allotted to Sadler's Wells. As a contribution to the maintenance of Britain's international prestige, a case could be made for this, even in a period of retrenchment.

* * *

Secret Awards

The Spens Committee recommended that distinction awards should be made to consultants and specialists working in the national health service whose work and qualifications deserved them. The recipients of these awards, which in accordance with the Spens Committee's recommendations are limited in number, may receive sums additional to their salaries varying from £500 to £2,500 a year. The *British Medical Journal* now reveals that the first awards, to consultants in Northern Ireland, have been made, but in accordance with the advice of the Council of the British Medical Association and the Central Consultants and Specialists Committee, the list of recipients is not being made public. The journal is right to criticise this secrecy. Presumably, the organisations concerned have good reason for their advice—undesirable publicity in the lay press would obviously be embarrassing to the doctors concerned. But it is infinitely worse that sums of public money should be distributed in secret—even if, as is likely, the secret leaks out.

Colonial Policy

> The clear distinction which at once suggests itself, between the powers to be conceded to colonies and those to be retained by the home government, and which same distinction may be applied to their expenditure, is so far as local and imperial interests can be separated. It would appear desirable that every freedom should be given to each colony to manage its own purely local affairs—and that it should be called upon to defray whatever cost is required for such purposes; while all that concerns the interests of the empire at large, should be still left to the sole management of the Imperial Government; and which should therefore incur the cost of defending the colonies from external aggression. . . . [But] . . . although it might safely be conceded that in all matters purely local, no interference should take place with the acts of the colonial legislatures and authorities, yet it will be found in practice very difficult to dispense with the veto of the Crown on such acts, chiefly from the impossibility of determining by any general rule what acts refer exclusively to local objects which would be embraced within the principle of local self-government, and what involved, in part or in whole, imperial interests. . . .
>
> But . . . the power so vested in the home authorities should never be exercised except when it was plain that the acts passed by particular legislatures were prejudicial to the general interests of the empire at large. Whether under such circumstances, each colony legislating for itself in all local affairs, would always act most wisely, is not so important a consideration as the fact that they would at least be more satisfied; and, moreover, whatever errors they might fall into in the first instance, they would not be slow to discern, or to apply a suitable remedy. It is, perhaps, not less important to the tranquillity and prosperity of a free community, that it should feel itself possessed of the power of improving and changing its laws, if necessary, than that they should in reality enjoy the best that could be contrived.

The Economist

February 9, 1850

Letters to the Editor

Non-Intervention

SIR,—I am sure that I am not alone among your regular readers in feeling a profound sense of disappointment on reading the first of your series of articles—"Election Issues."

I will not argue the point about whether political independence in a journal really means refraining from guiding its readers in the exercise of the suffrage. What is much more startling is that you should admit that the manifestoes of the Labour and Conservative Parties offer only a choice of evils—how true that is—while stating at the same time that "however much one may admire the gallantry of the Liberal fight, the effective choice of a government lies between the Labour and Conservative Parties." This can only mean that you consider it the duty of voters to support the candidates of one or other of the latter.

I can assure you that those who are fighting for Liberalism are not doing so in order to receive a pat on the back for "gallantry." To hell with gallantry! The Liberal Party is asking for votes—and by all accounts is going to get them. You may say that people should not vote Liberal because their policies are wrong; you will find it difficult, because so many of them are those that your columns have been adumbrating for years; above all a determined policy of telling the voters the truth about our position, nationally and internationally.

Nevertheless that would be at least a legitimate and constitutionally correct proceeding. But to say that the Liberals are right, but that you should not vote for them, because the other parties are more likely to win, is to attack the very fundamentals of the British political system.

It is, Sir, incredible, that at this moment when the country is turning to a Party devoted to precisely those policies which *The Economist* has traditionally upheld that you should participate in a mean attempt to stab it in the back.—Yours faithfully,

MAX BELOFF

Oxford

SIR,—In your editorial "Five Years of Labour" on February 4th, the opening sentence reads:—"A journal that is jealous of its reputation for independence would, in any event, be foolish to compromise it by openly taking sides in a general election."

If by the word "independence" you mean freedom from political bias, I wonder why you assume you have a "reputation" for such. A well-known Socialist MP described one of your recent articles as the finest Socialist propaganda that had yet appeared outside the columns of the *Daily Herald*. You often criticise the Government, but invariably in the same articles, and for no apparent reason, you go out of your way to say that a Conservative government would not have done better, and would probably have done worse.

As a close reader of *The Economist*, I should describe your politics as Left-wing Liberal. It is a mystery to me why you pretend they are otherwise.—Yours faithfully,

Bradford ROBERT F. COOK

Pakistan and India

SIR,—When I was in England recently you were good enough to publish my letter regarding the economic controversy between India and Pakistan which has arisen since devaluation of the Indian rupee. On arriving here there are some further facts which I feel I should bring to the notice of your readers.

The price of un-ginned cotton in Pakistan is Rs. 23s. per maund and in India it is Rs. 40s. per maund. The price of raw sugar in Pakistan is Rs. 8s. per maund and in India it is Rs. 30s. per maund. The price of cottonseed in Pakistan is Rs. 10s. per maund, in India it is Rs. 21s. per maund. The price of wheat in Pakistan is Rs. 10s. per maund and in India it is at least Rs. 20s. per maund (in Delhi I am told it is Rs. 40s. per maund). I am giving you the average prices. India has boycotted all trade with Pakistan under the excuse that our rupee is valued high but you will see from the prices quoted above that the prices in India are far more than is needed to offset the disadvantage of devaluation.—Yours faithfully,

5 Danepur Road, Lahore FIROZ KHAN NOON

Parliament and the Law

SIR,—Your comments upon my letter which appeared in *The Economist* of February 4th do not make my point any the weaker. What I strove to emphasise was that the condition of administrative law in this country is not as malignant as is widely supposed.

It is of course in the nature of delegated legislation that it is not subject to amendment by Parliamentary Committee: its very purpose is to avoid the expenditure of valuable parliamentary time upon the scrutiny of administrative minnows. But this does not mean that the larger legislative fish escape. Time and again in the last Parliament controversial items of delegated legislation gave rise to Motions and Prayers to annul, and not infrequently the discussion in the House took the form of a full-dress debate: witness the storms which raged about the control of engagement and petrol rationing.

You go on to say that "there is neither the opportunity nor the obligation to give such legislation the publicity accorded to statutory legislation," citing for support the judgment of Lords Justices Scott and Asquith in Blackpool Corporation *v.* Locker.

But surely the criticisms of the learned Lords Justices must be taken as restricted to *sub*-delegated legislation, for the publication of which there is admittedly no general statutory provision. Neither am I thus praying in aid of a narrow technicality: by far the greater part of delegated legislation is not of that kind, but is subject to the exacting publicity requirements of the Statutory Instruments Act, 1946, and (ironically) of regulations made under that Act.

Sub-delegated legislation (the delegation of legislative power by one who himself holds it only as a delegate) should certainly be published, and to that extent I heartily agree with you. Also I agree that there is an argument for stricter parliamentary control. But I feel I must once again affirm that the overall picture of delegated legislation is not nearly as dark as you have painted it.—Yours faithfully,

New College, Oxford MAURICE H. SMITH

Industrial Assurance

SIR,—In *The Economist* of January 28th you appear to endorse the conclusion in the Labour Party's pamphlet on Industrial Assurance that the high rate of lapses and surrenders necessarily indicates that the public are being over-persuaded by agents to buy insurance they do not want, and that the process involves great waste.

No research as to the real reasons why Industrial Assurance policies are discontinued has, to my knowledge, ever been carried out. Many families are constantly lapsing and re-entering insurance. When premiums remain unpaid, a policy-holder usually receives fourteen or more weeks' cover after his final payment, during which time he has the right to pay the arrears and make a claim. If the average mortality rate is taken as 12 per 1,000 per annum, then approximately three claims would be made and met on every thousand of

such policies. Long periods of cover are obtained cheaply by lapsing after making a few payments and subsequently taking out new policies, repeating the process once or more every year. The practice is discouraged by the offices, but many agents feel that people of this type, although they find money for football pools, cinemas, alcohol and tobacco, have little savings and are greatly in need of insurance protection.

When premiums have been paid for a longer period—one or two years, according to the office concerned—lapsing results in a free policy being granted automatically for a reduced sum assured. If arrears have mounted up, it is frequently better to take advantage of this concession and to make a fresh start with new policies. The cost or waste of this process is trifling.

Technical reasons prevent loans being granted by the offices on industrial policies (in contrast to the facilities in the "Ordinary" Branch). Cash may be obtained, however, when there is a surrender value, and it is a common practice to obtain cash by the surrender of a policy. Far from being overpersuaded in such cases, policy-holders often desire immediate re-entry into insurance.

There is urgent need for an investigation into the many and varied reasons for discontinuing Industrial Assurance policies. Three categories have been indicated above; there are many more. Lapsing, I suggest, is not due to over-selling—but the data of actual reasons has yet to be collected and analysed.—Yours faithfully, RONALD PACKMAN

49 Park Hill Road, Otford, Sevenoaks

Industrialisation

SIR,—Might I venture to suggest that your criticism of the industrialisation of agrarian nations in your leading article on January 14th was perhaps a little severe?

I would suggest the following points for consideration:

1. It is extremely difficult to modernise the agriculture of an agrarian land without first carrying out considerable industrialisation.

2. The modernisation of agriculture, apart from the long and difficult process of improving seeds, depends on more modern implements, irrigation canals, building of roads, water storage, electrical generating stations, new road and rail transport systems.

3. The materials for such work must be, in large part, manufactured at home if the change is to be made with even a moderate degree of rapidity and not be dependent on usually very scanty surpluses of foreign currency.

4. Modernisation of agriculture raises the peasants' standard of living and activates an urgent demand for more consumer goods, which, for the same reason as given above, must in large part be manufactured locally.

5. To modernise agriculture generally means to reduce the manpower employed. The process, therefore, of siphoning off labour to the new industrial areas is necessary.

6. The industrialisation is likely to lead to greater and not to fewer imports, although the character of these may change. Which nation is most likely to buy heavily from abroad: Sweden or Bulgaria?

—Yours faithfully, AMATEUR ECONOMIST

Definition of Profit

SIR,—Mr Colin Hurry requests an alternative to the word Profit, to help him to acquire terminological respectability. Why not go to the French and come back with the sound English word Benefit?

Think of the pleasant derivatives: Beneficial instead of Profitable; Unbeneficial instead of Unprofitable. An institution earning Profits might eventually be termed Beneficent, while its unsuccessful counterpart became Maleficent.

Incidentally, it has always seemed to me that your invention of the word Disinflation was the righting of a great wrong done to the English language by the original inventor of Deflation. Did he not know that the opposite of Infection is Disinfection (*not* Defection); of Inter, Disinter (*not* Deter), and of Incline, Disincline (*not* Decline).—Yours faithfully, H. W. AUBURN

Palace Hôtel, Bruxelles

Books and Publications

Inadequate Whitewash

"Rommel." By Desmond Young. Collins. 288 pages. 12s. 6d.

IT is already some little time since one noted, hearing a familiar tune with altered words, that Lili Marlene had been made an honest woman. Now comes Brigadier Young's engaging biography to make Rommel himself respectable. To do both author and subject justice the attempt is less desperate than it might be for many another German general: Rommel was a clean enough fighter as fighters go and the length and equilibrium of our long struggle with him induced in most soldiers the kind of sour affection one feels for a formidable opponent. But, even so, one is tempted to wonder how far it would have been plausible to make him such a Bayard had he fought on the bitter Eastern Front and had he had to face the moral problems the presence of SS troops there would have raised.

The book is well constructed. The first chapter sets the stage in the Middle East for Rommel's appearance. The next three take us back to the man himself, his origins, his career in the 1914-18 war and between the wars, and his brilliant performance in France in 1940. A fifth chapter gives the background of his despatch to North Africa. The next four cover his fortunes there. His role in *Festung Europa* is dealt with in the tenth chapter, and the last brings us to the sinister circumstances of his death. The writing is throughout agreeable and moves at the pace of an armoured column. Though the author at times appears in person he does not intrude and the reader is pleasantly aware, even when he disagrees with an attitude, that he is in civilised company.

Since the events related have a dramatic curve—an ending wholly tragic for the protagonist, but for the British reader mellowed by victory—a book with these qualities of structure and style will hardly fail to be popular. But "popular" can be pejorative praise; and in this case it implies an absence of sterner virtues. While it would be unfair to Brigadier Young to blame him for not having written the kind of book he evidently did not intend to write, it would be unfair to the reader not to glance at the book's shortcomings.

There is, for example, its partisanship. A more discreet admirer of General Wavell might have inquired more closely into the reasons for his transfer from the Middle East command in 1941. Had Brigadier Young done so, he could hardly have suggested that the reason for it was his "having failed to do the impossible in Greece." Again, while he is right in stressing the feats performed by the Eighth Army in the desert before General Montgomery's arrival, one is left with the impression that he is unduly niggardly with his praise of the victor of Alamein.

Then there is a disposition to whitewash Rommel by omission. Even if we accept the author's account of differences with the SS—and it would be much easier to consider them as evidence if we were given chapter and verse in each case—we still have to reckon with the fact that Rommel stayed and prospered in the German army in the years after the Nazis came to power. In those years the concentration camps filled up and the Jews were persecuted as never before. Rommel must have known something of this. His biographer ought to face the question of what was his attitude. He does not.

It may be the case, moreover, that where a man is not a skilful dissimulator his friends are better witnesses than his foes. But one would have liked the biographer to have drawn a little less uniformly on the evidence of survivors well disposed to his hero; and would feel more comfortable also if the German words quoted did not by their bad spelling—though this may be the fault of the proof-reading—suggest a less than adequate knowledge of the language.

But it is the inadequacy of the documentation that deprives the book of any pretensions to being more than "popular." Rommel's book, *Infanterie Greift An,* is often quoted and at least once the suggestion is made that the Nazis had interfered with later editions. But the reader is never told when the first edition appeared. Quotations from other sources are constantly given without the sources themselves being specified or without a reference by which the context of the quotation could be checked. In sum, it is Rommel the stainless general who is purveyed to us here. We should have been better served if we had been given the man—warts and all.

The Death of Democracy

"Czechoslovakia Enslaved." The Story of the Communist Coup d'Etat. By Hubert Ripka. Gollancz. 339 pages. 18s.

"East Wind over Prague." By Jan Stransky. Hollis and Carter. 244 pages. 10s. 6d.

Two Czechs who went into exile during the war to carry on the fight for their country's independence against Nazi Germany, and are now in exile for a second time since Czechoslovakia's subjection to a Communist dictatorship, have written books about the *coup d'état* of February, 1948, and the events leading up to it. Of the two, Mr Stransky's book is the more readable; written by a younger man who was not primarily a politician (though the son of one), it is full of vivid personal touches and of anecdotes and conversations which reveal very clearly the process of Communist conquest and the strange mixture of propaganda and intimidation employed by the party for making converts. Of particular significance is Mr Stransky's account of the behaviour of the Red Army in Czechoslovakia in 1945-46, which goes far to explain why the mere threat of its return—and during the February crisis the Communists with the backing of the Soviet press and radio made full use of the threat of Russian intervention—was enough to scare so many Czech democrats into submission to Communist demands or even nominal endorsement of them.

It is Dr Ripka's book, however, which provides the weightier evidence for what went on in high places, for Dr Ripka was a Minister in both the Government-in-Exile in London and in the Fierlinger and Gottwald Cabinets in Prague up to the time of the February crisis. In his story he shows in detail how the Communists made use of their hold, within the coalition Government, of the Ministry of Interior (with control of the police) and the Ministry of Information (with control of the radio). It was the protests of the other parties at the Communist packing of the police force which precipitated the crisis, and it was the special armed police units recruited entirely from Communists which then "occupied" Prague. During the crisis the radio, legally in Communist hands, was exclusively devoted to Communist propaganda. The Communists thus already held the key positions of executive power before they took steps to establish their dictatorship and obtain for themselves a faked electoral majority.

Dr Ripka does not pretend to solve the mystery of President Benes's capitulation to Gottwald on February 25th after his declaration to representatives of the non-Communist parties that he would resign rather than submit to the Communist demands. Dr Ripka is evidently reluctant to criticise the dead President, but indirectly his account reflects adversely on Benes. "To this moment," he writes, "we have never been able to find out what happened in the Hradcany during that fatal morning of February 25, 1948, and no explanation which has seemed valid to us has ever been given on that subject."

It seems probable that it was the last-minute defection of the Social Democrat party executive to the Communist side which finally broke the President's resolution and at the same time enabled him to persuade himself that he was not signing the death warrant of Czech democracy. At their party congress in November, 1947, the Social Democrats had displaced the fellow-travelling Fierlinger from the presidency of the party and elected Lausman, the candidate of those who desired resistance to Communist dictation. At the outset of the February crisis, the Social Democrats stood with the other non-Communist parties in oppostion to the Communists' misuse of the Ministry of Interior. But when the Communist pressure mounted, with police arrests and violence against workers who would not join in Communist-organised demonstrations, Lausman suddenly changed sides and persuaded his party executive to join the Communists in the revolutionary "action committees" they were setting up. For the time being he saved both his skin and his job; he was included in the new Communist-nominated Cabinet after the *coup*. More recently he has fled from Czechoslovakia to the American zone of Germany, having discovered by experience that Communists have only distrust and contempt for political opponents whom fear makes their accomplices.

Help with the Law

"Mercantile Law." By Dr J. Charlesworth. Stevens. 396 pages. 15s.

THIS book, the seventh edition published since 1929, is intended to be a textbook for students. It therefore states the law as it is—mainly the law of contract—and does not attempt to discuss in detail the principles on which the law is based nor to reconcile those judicial decisions which seem to be at variance.

CURRENCY & CREDIT

NEW EDITION

By R. G. HAWTREY

This well-known work on monetary theory, unobtainable for some years, now re-appears in its fourth edition, extensively revised and re-written. A new chapter has been added, on early experiments in exchange standards; and the account of the inter-war years has been brought up to their end in 1939.

by GUY EDEN 7/6

HUTCHINSON

Largest of publishers.

But the book has a wider value than that. It is inadvisable for a man to be his own lawyer, but there is no reason why he should not take steps to avoid the need for a lawyer at all. The bank manager will find the chapters of bills of exchange and on cheques of considerable use. The insurance broker will find the chapters on life, fire and marine insurance very helpful in his business. This book is a general guide to the avoidance of trouble.

A Study of Jewry

"Hostages of Civilization." By Eva G. Reichmann. Gollancz. 281 pages. 18s.

IN approaching this book the reader's appetite is stimulated by an outstanding tribute from Dr G. P. Gooch, and by the author's acknowledgment of her debt to Morris Ginsberg. This initial expectation is fulfilled, for the study is carefully planned, compactly argued, and convincingly concluded.

The author examines the failure of German Jewry—the leading Jewry of the epoch—to achieve integration within the Reich, and enquiries whether or not it was due to a coherent and well-founded decision on the part of the German Gentile that co-existence with Jews had become unbearable. This is the core of the investigation, since on the answer to it depends the security, and even the existence, of the Jews throughout the world. Dr Reichmann maintains that the hatred exploited by the Nazis was artificially stimulated and did not spring from genuine hostility to a community whose alien eccentricities had already been merged into the natural pattern as a result of four generations of emancipation and absorption.

To arrive at this conclusion she sets the protagonists in the framework of 19th-century Germany, against the larger background of a secularly enlightened Western world. There is nothing new in the tale of the German psychosis: the late political and industrial evolution, complicated by a time lag between the outward achievement of a capitalist organisation and the inward acceptance of the real theory of capitalist economy; the reactionary force of Prussianism which prevented a genuinely democratic climate of opinion; the frustrations arising from postwar economic chaos, and the sense of injury built up around the Versailles Treaty, culminating in the need for a scapegoat; all this is familiar ground. But the treatment of the facts is marked by unerring distinction between the inevitable and the fortuitous—between the real obstacles to Jewish integration and the manipulated hysteria which destroyed it and which was brought about by unique coincidence of circumstance.

In dealing with the wider world background, Dr Reichmann raises some provocative questions. If the ideal universalism of the Christian mediaeval era and the era of secular enlightenment could have been carried over into the modern age of practical world-wide intercommunication, could war have been prevented? Are the social obligations of democracy more than the common man can support, bereft as he is of a spiritual authority for an ethical code which is still indispensably part of his make up? Is the natural love of man for the member of his own group the best basis for achievement?

> If man, instead of being taught to regard his fellow man as a brother, is permitted to regard only his "brother"—viz., the member of what may be called his national family—as his fellow man, then the progress of humanity towards ever wider spheres of mutual responsibility has been reversed at a decisive point.

Over-emphasis is the common failing of enthusiasm, and the present study is sometimes open to this criticism; but Dr Reichmann has achieved the rare feat of bringing perspective to bear on contemporary happenings, and assessing their significance in the setting of an epoch. She raises questions that are of essential importance to Jew and Gentile alike.

Children of Europe

"Children of Europe." By Dorothy Macardle. Gollancz. 312 pages. 21s.

THIS ambitious book deals with an appalling and urgent subject—the moral, mental and physical effect of the Nazi regime on Europe's children; those of races to be enslaved and destroyed, and those "racially acceptable." In the last section, "After Liberation," two chapters are devoted to the satellite countries and one to Germany. There is little to suggest that the eastern form of "liberation" differs from that of western Europe.

The author acknowledges help from a formidable list of experts, and many authoritative documents have been consulted. Yet concrete facts do not stand out clearly from a bewildering mass of individual stories. It is, as stated in the foreword, "a jigsaw picture with many gaps."

The record is confined to Nazi atrocities (any references to those of Communist origin, e.g. the abduction of Greek children, are soft-pedalled). However familiar the sickening details of Nazi cruelties may be, the obstinate question arises as to how Hitler found enough executives for such work. The first chapter outlines the "creation of a Nazi youth" in Hitler's words, "from which the world will shrink back. It must be indifferent to pain." Twelve drawings by a Jewish boy illustrate scenes which are still horrible memories to countless surviving children.

Some outline is given of the work of international voluntary organisations and those of the United Nations, in particular of UNICEF. The need is vast. In Europe alone thirteen million children have been orphaned by the war, and an appeal is made for "godparents." Between twenty and thirty million depend on international help. So far governmental and voluntary contributions have been quite inadequate.

The **cold facts** are published in

ASHER LEE'S

decisive and accurate new estimate of the

Soviet Air Force

As a senior Air Ministry intelligence officer during the War, Asher Lee had unequalled opportunities for assessing the worth of Soviet military and naval aviation. In this book he reviews Soviet air achievements during the war and answers our questions about present and future capabilities. How far does USSR aviation depend on technical assistance and supplies from abroad? What help of this kind is the USSR now getting? How good is her defence against strategic bombing? What use could she make of the atom bomb? What is the Soviet aircraft industry worth? His remarks on these subjects include many revealing observations about the Russian character and aims in general. *Illustrated.* 8s. 6d. *net*

AMERICAN SURVEY

Confusion About Big Business

(From Our American Staff)

FOR at least three-quarters of a century the United States has been concerned about "monopoly." It has passed laws against monopoly and restraint of trade to try to ensure competition; the most important of these were the Sherman Act of 1890 and the Clayton and Federal Trade Commission Acts of 1914, still the prevailing statutes. It has made exceptions to the laws, one of the most notable being that which benefits corporations engaged in foreign trade. It has recognised and specifically regulated certain natural monopolies, chiefly in the fields of transport and the public utilities. But some aspects of the problem still remain ill-defined, and there has never been marked clarity in the interpretation or the application of the laws themselves.

Concern about monopoly is as great today as ever, and perhaps greater. The present extensive activity of the Anti-Trust Division of the Department of Justice includes far-reaching investigations and suits in the courts against numerous businesses, amongst them such prominent firms as the Du Pont, American Telephone and Telegraph and the Atlantic and Pacific Tea companies. A subcommittee of the House Judiciary Committee, led by Representative Celler, is investigating monopoly, and the Joint Congressional Committee on the Economic Report, headed by Senator O'Mahoney, has an eye continually on the subject. The Federal Trade Commission keeps up a running fire on unfair trade practices. Major labour disputes always bring a flood of proposals for making trade unions subject to anti-trust laws, and the current troubles in the coal, telephone and automobile industries are having the usual result. This widespread concern has not, however, cleared up the legal confusion. The problem of estimating what the courts may decide from the maze of statute and precedent baffles all interested parties, but there are many who hold that, under the present law, anti-trust action could probably be brought against almost any business in the country.

Both concern and confusion are caused by two instincts that are all but universally held in the United States. The first is distrust of economic power, based on belief in the classical merits of competition as the *sine qua non* of progress. It then often proceeds to question the value of bigness in any form and sometimes looks favourably on equalitarianism. Its offshoots are a wide variety of proposals for encouraging small and new businesses, and restricting large businesses and business groups, including trade unions.

The second instinct is respect for accomplishment. It is fostered by the technological advantages, in many cases, of large-scale operations, which permit greater specialisation and spread overhead costs over a larger volume of production. This point of view assumes that success breeds size, that size enhances stability and supports the research laboratories which bring cheaper and better products, and that competition is just as keen and adequate between, for example, three large firms as between three hundred small ones.

The professional economic theorists have contributed far more to confusion than to clarity, and just as most academicians prefer the luxury of theorising, so do most business men prefer the luxury of letting their emotions play without the limitations of fact. They have therefore been singularly slow in getting down to the hard work of assembling the evidence needed to define the optimum sizes for business undertakings. There are, it is true, a number of interesting studies, especially of the relationship of profit to size, but they contradict each other, and are seriously lacking in detail or scope, or in both.

*

During the early nineteen-thirties many people in America felt that competition was, or could be, too excessive and many Acts were passed to curb it. At the same time the term "fair competition" became widely used; whatever it may mean, it certainly contemplates limiting competition at least to some degree. It is not yet clear to what, if any, extent these limitations modify the activities of the Anti-Trust Division of the Department of Justice.

In any event, the nature of competition itself is changing with scientific and technological advances. The question whether there was competition or restraint of trade by makers of steam locomotives becomes irrelevant with the competition of diesel, electric and oil-turbo-jet engines; rayon and nylon have altered the textile situation entirely, and the natural monopoly of the railways has been at least impaired by cars, lorries, pipelines, aircraft and long-distance electrical transmission.

Prices have, to no small extent, lost their importance as the basis of competition; ever-growing emphasis is being put on differences between the products themselves, and competition now focuses on sales promotion and advertising expenditure. On the other hand, price making in many cases is becoming a quasi-political process; government policies are directly or indirectly a major factor in both the level and the trend of many prices. Something like the idea of the "just price" appears from time to time.

Any concept of an optimum size for business units must be flexible. What might have been the most efficient size for a life insurance company in the days of hand book-keeping and actuarial calculation is very different with mechanical accounting devices, while dependable airmail, and virtually instantaneous telephone, connections with all parts of the country alter the economics of selling and service. Television and air transport are examples of quickly developing industries in which rapid changes in the optimum must now be occurring.

The broadest aspect of the question is the relationship of business structure and organisation to employment, output and economic progress. What is desired is that relationship between prices, wages and profits which will ensure the maximum output and consumption, and will thus keep employment and living standards at the highest levels attainable. This relationship can hardly be static. Because the government is concerned with employment, stability and expansion as never before, the nature of the economic organisation and its functioning is of unprecedented public interest. The Council of Economic Advisers has quite appropriately, in its latest report, urged a reconsideration of both concept and approach, in order to clarify government policy and procedures, and work is being done in this direction. Therefore business will be forced to give attention to the problem. It is high time for all interested parties to devote themselves to facts instead of to emotions.

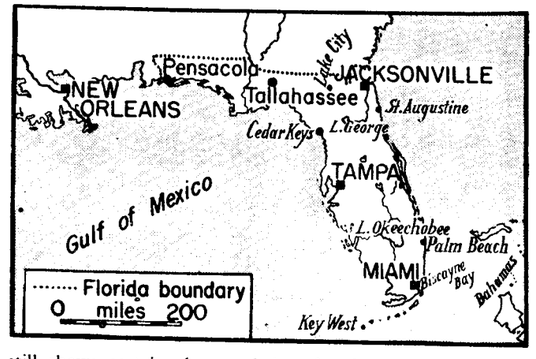
Florida's Place in the Sun

[FROM OUR AMERICAN STAFF]



EVERYTHING that has been said about Florida for four centuries is to a greater or a less degree still true. Oysters and orchids still grow on trees there, heron and ibis and those winged snakes, the anhinga, still haunt the swamps. Flamingoes make themselves at home in the gardened centre of the Hialeah racecourse, parrots in a "jungle" whose other claim to fame is that Mr Churchill painted there. On the beach at Miami the northern houris oil themselves in the pervasive sun, and place their racing bets by telephones set beside the expensive sand. The caravan camps, where living is reputed to be so cheap, simmer under the same sun, but at the inland edge of town. But in the last analysis, the landscape, or the lack of it, dwarfs what humans do. So flat is this State that the eyes of a man standing upright are further above sea level than are thousands of its square miles.

Florida's geography commands not only the eye, but also the economy. Tourists and their demands still furnish its most important source of income—$770 million gross in 1948, which is said in Florida to be fifteen times as much as tourists spent in Britain that year. What encourages those who have watched tourists go as well as come is that subsidiary sources of income seem more firmly established than they used to be. Manufacturing in Florida out-distanced fruit and vegetable growing in 1948—its $305 million revenue came in part from the local clothing trade, which produces vacation raiment in keeping with the tropic skies. Airline operation and repair occupies a prosperous fourth position, and the cattle industry with over a million beef animals, fed in part on treacle and grapefruit skins, now makes it possible for Florida to call itself "the second cattle State east of the Mississippi."

Even so, the tourist dollar still leads. The popular island community of Miami Beach, reached by causeways that connect island after island in Biscayne Bay, has 365 hotels, "one for every day in the year," crowding each other for frontage on the sea. With the aid of economists at the University of Miami, the local Hotel Owners' Association recently analysed the habits of that dollar. At the height of the winter season (January 15th to March 31st) the average tourist spends $16.58 per day. A little less than half of this goes for food and lodging, a quarter for transportation, and 11.1 per cent for "night clubs, movies, races and miscellaneous items." In 1948 this amusement fraction amounted to $24 million. An equal amount goes for adornment of the kind that would have delighted both Solomon and the Queen of Sheba. The rest (6.2 per cent) is spent on presents to take home.

Hyperbole is the common language in Florida, and it is fitting that the State should be shaped like a flattened exclamation point hanging off the country's south-east corner, and hinged to the mainland by a narrow strip which is almost as long as the peninsula. Seen from an airplane, the land is spangled with lakes like blue mirrors, and so close to the surface is the water table that any shallow quarry dug in the porous limestone sub-surface becomes a pond. Thousands of square miles are given over to swamps, where rare and beautiful water birds are protected from hunters and where the native Indian, also protected, still carries on his amphibious life.

This is the only State in the Union which reaches into the tropic zone. Thanks to the Gulf of Mexico on the west and to the Gulf Stream swinging around the southern tip and up the east coast, its breezes are so soft that farms can produce three crops a year for the northern markets. Yet for all that, its population has barely passed two million. Partly because it came so late to enduring settlement, Florida

still shows certain characteristics of a frontier State. The railroads did not reach it until the eighteen-nineties, and then they came accompanied on both coasts by handsome houses, big hotels and citrus orchards. An independent working population arrived only with the automobile invasion of the nineteen-twenties, when humbler but more mobile folk came at the beckoning of the estate agents. The pavements marking the ghostly real estate subdivisions, where they expected to grow rich by buying and selling land, still stretch toward the swamps.

On a precarious surface, so thinly covered with soil that in certain sections one can plant a tree only by blasting into rock, Floridians have established over the years an economic pattern of quick boom, high temporary prosperity and sudden collapse. In the memory of residents, the State has had a timber boom, a citrus boom or two (the present popularity of frozen orange juice has given new life to ancient groves), an hotel boom and an intermittent series of real estate booms, most of them regional rather than state-wide. It is the airplane in combination with recent scientific discoveries which gives Florida its present hope that the prevailing boom will last. Not only does the airplane make the State quickly and easily accessible (four hours from New York in place of twenty-six by train), but it also makes Florida, for the first time, a cross-roads, with all the economic advantages which that implies. Since the war 48 per cent of the nation's airborne imports and 58 per cent of its airborne exports

have been handled by local airport staffs, a record which means that Florida is now the foremost international transfer point for passengers and freight moving between the United States and the countries farther south.

The growth in population and prosperity since the war (there were 35 per cent more people in the State in 1949 than in 1940, and 65 per cent more in Greater Miami) has certain substantial features. In the first place, it is a building boom—one house of every three in Greater Miami has been built since the war. In the second place, it is shared by the entire group of south-eastern States. In the third place, it seems to be part of a world-wide trend on the part of white men toward the tropics, a trend from which Brazil, Queensland and Central Africa are also said to be profiting. The hurricane-proof new houses in Miami are to a surprising extent occupied by the working young who met tropic conditions during the war in the South Pacific, and learned to like them. Science has taught them how to prevent tropic fevers, to build houses which harness shade and moving air for the cooling of their homes and the sun for the heating of a hot-water supply. They use refrigeration to keep their food and their dispositions from spoiling, they know how to deal with insect pests and wandering crocodiles, and how to supply the minerals, lacking in this rain-drenched soil, to the plants they grow, the animals they raise and the food they eat.

Not all the scientific experiments have worked well. The draining of certain swamps has upset the balance between soil, usable water and the surrounding sea. Many people are concluding that, having dynamited natural dykes and dug canals at great cost, they must now build artificial dykes and instal locks lest the land parch and the sea come in. At the moment, the cattle growers of central Florida, who persuaded federal authorities to let them lower the level of Lake Okeechobee in order to increase their grazing area, are unpopular with the farmers of southern Florida. The latter point to springs that have dried up, and land that is threatened with brackish incursions because the pressure of sweet water is no longer strong enough to hold back the salt. But more difficult problems than this have been met in bringing the State to its present position. So long as the national supply of optimism holds up, Florida will prosper in season, if not out. Its present preoccupation is to make the sun shine on its economy all the year round.

American Notes

After the H-Bomb

President Truman's announcement that the Atomic Energy Commission is working, and will continue to work, on the hydrogen bomb was received with almost universal approbation, since it is generally believed that the decision to make the bomb was inescapable. But there is a noticeable lack of enthusiasm about reactions to Mr Truman's refusal to recognise that the decision offers an opportunity for a new attempt to reach a general agreement with the Soviet Union. Even though Mr Acheson has now made it even more clear that the Administration considers such suggestions unrealistic, their political appeal is shown by the approval expressed for Senator McMahon's imaginative proposals for a world-wide Marshall plan by such unimaginative Senators as Mr Bricker of Ohio. (These proposals are more fully discussed in a note on page 304.)

Senator McMahon is not, however, as unrealistic as his plan may appear. It is an integral part of it that a determined onslaught be made on the Iron Curtain with American propaganda, that the plan be used to prove to the Russian people "the profundity of our desire for peace" and to encourage that self-criticism in the Soviet Union which, in Mr Acheson's view, would bring peace much nearer. But there is a growing feeling that the American people are themselves being prevented from exercising their democratic right of self-criticism and from grasping the implications of the hydrogen bomb, since they are not being given the evidence needed to form an opinion. The President's ban on information about the bomb, apart from the bare fact that the AEC is working on it, has led to as much criticism as has his failure to make a special effort to solve the problem of world peace.

As a result there is a demand for an authoritative and independent study of the broad effects of the new bomb on defence and international policies originally conceived in terms of the now out-moded atomic bomb. The advocates of such an inquiry, headed by Mr Walter Lippmann and a group of leading physicists, do not, however, suggest that security regulations on technical aspects of the bomb should be relaxed. The case for these has been strengthened by the shock of the charges brought in London against Dr Fuchs, who worked on atomic development in America at one time. His arrest, unfortunately, provides useful Congressional ammunition not only for those who insist that the Administration has been lax about atomic security, but also for those who assert that the British are untrustworthy and not fit to share atomic secrets.

* * *

Lewis Invites the Lightning

Mr Lewis has succeeded where Senator Taft and other Congressmen have failed: he has forced the President to invoke the Taft-Hartley Act in the ten-month-old coal strike. Mr Truman, reluctant to use the Act he is pledged to repeal, offered last week to send an independent fact-finding commission into the coal fields if both the miners and owners would agree to resume "normal production" for 70 days. The operators, making no headway in their negotiations with Mr Lewis, agreed; Mr Lewis declined, and in his highly coloured reply to the President, left no doubt that he realised that resort to the "Taft blackjack" must shortly follow. Coal supplies are now below the danger limit; further cuts in train service and restriction of steel production are imminent and will swell the 4,500,000 of unemployed. With Mr Lewis's rejection of the President's offer, the bulk of the bituminous miners joined the "spontaneous" strike staged during the past month by 100,000 of their work-mates.

The commission of inquiry appointed by the President is limited, by the terms of the Taft-Hartley Act, to reporting on the facts of the case. It may not make recommendations. Its report, expected within about a week, can be used as the basis for obtaining an injunction requiring the men to return to work for 60 days. If no agreement has been reached by that time, the board makes another survey. A secret vote of the miners is then taken to determine whether they wish to accept the operators' final offer. If the majority refuse, the injunction is withdrawn, and the dispute goes before Congress. In the meantime, however, Mr Lewis has agreed to resume negotiations and it seems possible that a settlement will be reached before the time for a Taft-Hartley injunction arrives.

The chief issue between the miners and the operators is the control over production exercised by Mr Lewis, by virtue of certain clauses in the previous contract, and his ability, when there is no contract, to force his men to abide by a reduced work-week. This was the rock on which past negotiations foundered. The reluctance of the miners to return to work without a contract, and with this and other issues unsettled, is understandable. By April the period of intense demand for coal will be over, and they will have lost their trump card. But to refuse the President's first offer knowing it would be succeeded by an injunction, was to invite the lightning to strike where it has done great damage before. Heavy fines were inflicted upon the union when it defied a previous injunction, and the plea that the strike in 1948 was "spontaneous" received short shrift from the judge. It is nevertheless too soon to say that Mr Lewis has regretted his temerity.

* * *

The Watches that Stopped

Watches and watch movements have become the most valuable single item exported by the Marshall countries to the United States, and there is, therefore, more than a merely domestic interest in the news that the Waltham Watch Company, largest of the three surviving American manufacturers, has had to close its doors. The Watch Makers' Union accuses the Administration of betraying the industry by permitting Swiss "dumping" (that is, competition) and failing to supply the company with more loans. Unless some other method of reviving the company can be found, there will remain, as the union and industry are fond of pointing out, only two American jewel watch companies capable of turning out timing mechanisms for weapons. The Waltham failure also throws over 1,200 skilled men out of work in a town with no other source of employment.

It was this prospect that led Massachusetts Congressmen to persuade the Reconstruction Finance Corporation to bail the company out last spring with a $6,000,000 loan. Unfortunately, the company used nearly $4,000,000 of this to pay off old debts, and needed more working capital. But the RFC, whose lending policy is already under hostile Congressional scrutiny, has refused to allow the remainder of the loan, reserved for the new equipment the company badly needed, to be used for day-to-day operations.

Internal mismanagement, over the years, has been the undoing of the Waltham Company. The industry, however, prefers, understandably, to attribute its ailments to Swiss competition; in 1948, nearly 8,000,000 jewelled movements were imported, compared with approximately 2,000,000 manufactured in the United States. To allay the clamour last year, when Waltham first was in difficulties, the State Department put pressure on the Swiss to place a "quota" on watches exported to the United States. What may come out now is that the quota was fixed sufficiently high to have little or no effect. To double the duty, as the industry would like, would protect the inefficient, but it would run directly contrary to the policy of encouraging Europe to pay its own way, and probably would force the Swiss, already running a heavily unfavourable balance of trade with the United States, to curtail their purchases of, for example, American farm products. The Waltham story is an extreme example of the embarrassments and real perplexities the Administration is likely to encounter in case after case as it pursues its policy of encouraging imports.

* * *

Senators in the Constitutional Wood

The 1948 Presidential election drew the attention of even the unstatistically minded to the need for clearing a path through the system by which Americans choose their President and Vice-President, a system planted by the Founding Fathers and only once thinned out since then—and that nearly 150 years ago. At present the President is selected by a clear majority of votes in an electoral college, composed of electors from each State in numbers equal to the State's Congressional delegation. But by tradition the total electoral vote of each State goes to the Presidential candidate having a popular majority, however small, in the State. Thus, whichever candidate gets the largest popular vote in New York State—be his lead only 61,000 out of 5,000,000 (which was Mr Dewey's lead over Mr Truman in 1948, when the smaller parties polled 653,000 in the State)—

gets the whole of New York's 47 votes (out of 531) in the electoral college. This makes it possible (though it rarely actually happens) for a successful candidate to have fewer popular votes than his leading opponent.

The Senate last week opened up a new way through this undergrowth: it approved by 64 votes to 27, only three more than the necessary two-thirds majority, the Lodge-Gossett amendment to the Constitution. This would abolish the electoral college and provide that in future the electoral votes of each State should be allotted to the Presidential and Vice-Presidential candidates in proportion to the State's popular vote for them. The amendment must now be approved by the House of Representatives, where its chances are good, and by 36 of the 48 State Legislatures. There its chances are difficult to assess, but they are certainly better than they would have been if the proposal of reform had taken the straightforward shape, which many political theorists would have preferred, of providing that the President should be elected by simple nation-wide popular ballot. Under the Lodge-Gossett proposal the small States will still have an influence out of proportion to their population, since each of them, however small, will have at least three electoral votes.

*

Under the new proposals, all States and groups will, it is thought, carry political weight, since every vote will count. At present voters in such safe Democratic or Republican States as Georgia or Vermont hardly feel that it is worth going to the polls, and their interests are not consulted when candidates and policies are chosen. The party counsels are dominated by the key States and key groups in those States—Jewish voters in New York and Negroes in Illinois, for example. On the other hand, it is argued that the new system would be a form of Proportional Representation

which would encourage "splinter" parties, such as the American Labour Party in New York, and might make the election of the President by a minority of the voters a rule rather than the exception which it now is. Senator Lucas answered this objection by stipulating that, if no candidate has more than 40 per cent of the electoral votes, both Houses of Congress, sitting together but voting as individuals, will choose a President from the two leading candidates.

However, it was its hoped-for political advantages that won the amendment its majority. The opposition, led by Senator Taft, is convinced that the Republicans would be giving up reliable blocks of electoral votes, obtained from such populous States as Ohio, for the sake of a doubtful handful from the hitherto solidly Democratic South. Senator Lodge, the Republican sponsor of the amendment, replies that these supposedly safe States have often flown out of the Republican hand recently, while the new proposal would introduce a real two-party system to the South and enable the Republicans to take advantage of the growing dissatisfaction with the Democrats there. Liberal Democrats from the North and West agree with Mr Taft's analysis of the amendment's probable effects and are therefore in favour of it. So are the conservative Southerners, since, in their opinion, it will be the liberals' downfall. They believe that the new method of electing the President would increase the Southern influence in the Democratic Party and weaken its enthusiasm for civil rights, since it would no longer have to pander to the Negro voter in the North.

* * *

Steel on the Stand

Steel used to be content to be the "prince or pauper" industry, but the steel leaders in Washington last week, facing union leaders who have taken to arguing from balance sheets, protested that even princely profits hide a wasting industry. The executives of the big steel companies were summoned to justify the increases in steel prices that went into effect in December, after pensions were won by their workers. The Steelworkers' Union and many Congressmen believe the industry should have dug into its own profits, instead of passing "inflationary" increases on to steel consumers. This was the view of the Presidential board that investigated the steel strike last autumn. Since then, despite the strike and the recession, the US Steel Corporation has announced profits of $166 million for 1949, the highest figure in 20 years; the Bethlehem Steel Corporation, the second largest producer, reached an all-time profit peak of $99 million.

Senator O'Mahoney, chairman of the Joint Economic Committee, provided a Fair Deal setting for the hearings. Pointing out that eight companies produce 80 per cent of the steel used in the United States, he argued that the public has a right to demand that their decisions on prices and production, which affect the whole economy, are taken with a proper regard for the public interest. But the steel witnesses refused to consider themselves in the dock; instead they launched a prosecution of their own. For US Steel, Mr Fairless pointed out that the price increase, which he put at $3.82 a ton, failed, by a few cents, to cover the increased costs of pensions, social insurance, coal, and transport. Joined by spokesmen for other companies, he argued that the industry was not earning a return for its stockholders adequate to attract new capital, and that meagre dividends should not be reduced further to subsidise steel consumers. Even higher steel prices were advocated by some witnesses. Figures for profits were completely illusory, they argued. The tax allowances for depreciation were so unrealistic that the lion's share of earnings had to be used to replace worn-out or obsolete equipment, at prices two or three times the prewar level.

Spurred on by New England, which, like the West before the war, wants a steel mill of its own, Senator O'Mahoney revived another charge against the industry: that by refusing to expand fast enough, it may choke off economic progress and create unemployment. But the steel industry, while apparently agreed that a New England mill would be unprofitable, because of the smallness and diversity of the market, has expanded steadily elsewhere, financing the new facilities out of those same "illusory" earnings. Capacity is now 99 million tons a year, an increase of 17 million since 1940, and the companies are continuing to place new mills near the consuming centres, such as Detroit, to be ready for the day when sharp competition returns. Only the emergence of some great new steel-using industry could, in the view of steel-men, justify further substantial expansion. The real threat to steel supplies and costs, and thus to economic expansion, has been the approaching exhaustion of the Mesabi iron-ore deposits. But this has been averted, first by the discovery of a new field in Labrador, and now by US Steel's rich find in eastern Venezuela.

Shorter Notes

Mr James Byrnes, who was President Truman's first Secretary of State, has announced that he will run for nomination as the Democratic candidate for Governor of South Carolina. The present Governor, Mr Thurmond, was the Dixiecrat (dissident Democrat) candidate for President in 1948. Mr Byrnes was one of President Roosevelt's staunch supporters in New Deal days, but President Truman's Fair Deal has been too much for him. He has not, however, severed his connection with the Democratic Party, and it is doubtful whether Mr Truman, who is far from enthusiastic about Mr Byrnes' candidature, will feel it advisable to work against him in a State where the Democratic Party is already split.

Residents in Washington, D.C., can now obtain a baby sitter from the local labour exchange, which undertakes to find one for any period from an hour to a week, speaking a language to suit the baby's nationality. But parents must remember to call them "child monitors."

*

A new method of making synthetic mica from quartz, magnesite, bauxite and a fluorosilicate compound has been developed by the Bureau of Standards. The synthetic can withstand higher temperatures than natural mica, but the cost of commercial production has not yet been worked out. Domestic production of natural mica is negligible and in 1948 the United States imported over 10 million tons, valued at about $15 million, for use chiefly as an insulator in electrical equipment.

*

By the end of last year, American aid to foreign countries since the end of the war amounted to nearly $30 billion, including the $3.4 billion subscribed to the World Bank and Monetary Fund. This amounts to about $200 for every man, woman and child in the United States.

*

A New York restaurant is now tempting its clients with a "Viend Visualiser" a stereoscopic device in which they can see life-like, three-dimensional representations of the dishes on the menu, instead of having to make their choice only from the printed word and the waiter's description.

*

The Rural Electrification Administration, which looks forward to the time when every farm in America will have electricity, reports that already over three-quarters of them have been provided with service. In 1949 four new subscribers were added each minute of each working day. A 400-acre farm is said to use ten times as much electricity as the average city home.

THE WORLD OVERSEAS

Four-Power Farce in Japan

(From Our Tokyo Correspondent)

AFTER months of "empty houses" the Allied Council for Japan is playing to capacity again. Instead of shopping on the Ginza, the wives of top-ranking American officers are cramming the conference room, the nondescript Tokyo diplomatic corps is insisting stiffly on precedence, and even the press are lining up ten minutes before the Council opening to make sure of a seat. The Kleig lights are back again and there is wild talk of experimental television.

For months members of the Council, each with his comet's tail of advisers and camp-followers, have been ponderously assembling at 10 a.m. each second Wednesday. The four delegates—for the United States, the Soviet Union, Australia (representing Australia, Britain, New Zealand and India) and China—have adjusted themselves in the seats at the wide square of gleaming tables. The American delegate, who is chairman, has called the meeting to order, has announced that, if there were no objections, he would approve the minutes of the previous meeting (which lasted 34 seconds), has pointed out that there are no subjects for discussion on the agenda, has adjourned the meeting, and the delegates and their entourages have made a majestic exit. The only real interest in each performance—which some occupation official has estimated costs 2,000 dollars in salaries and expenses to stage—has been the length of the proceedings.

But now mounting public interest is riveted on when and how the Soviet delegate, handsome, broad-chested General Derevyanko, will announce his enforced withdrawal from the Council meeting, will rise imperiously, line up his ten advisers like a stern musical comedy chorus, and then stalk, stride, lumber or storm out of the meeting.

International Histrionics

This recent manifestation of Soviet diplomatic mobility in the Far East has coincided with the arrival of the new Australian delegate, Lieutenant-Colonel W. R. Hodgson, a Canberra diplomat, who has observed Vyshinsky and other Soviet delegates in similar "ham" acts of restlessness in the west. Colonel Hodgson, who revels in disputation and who has learned some of the new footlight tricks of international histrionics on the United Nations' stage, stole the show from Mr William Sebald, the chairman and permanent understudy for General MacArthur. By coincidence, Colonel Hodgson made his bow at the Council meeting at which Mr Sebald had prepared on behalf of General MacArthur a lengthy and emotional tirade against the Soviet Union for mislaying approximately 370,000 Japanese prisoners-of-war. No one knew better than Mr Sebald that General Derevyanko would refuse to sit at the table to listen to this half-hour attack on Russia (one hour, allowing for translation), but he was prepared to close the show once General Derevyanko had accepted his cue and walked out.

Then Colonel Hodgson began. He raspingly questioned procedure. Why say that discussion on a subject had been ended, he demanded, when the subject was still in the air. Carry it forward, he insisted, to the next meeting automatically.

Mr Sebald objected. The Council had always closed a subject at the end of a meeting unless a delegate specifically requested in writing that it be placed on the agenda of the next meeting. Even the Chinese Nationalist delegate, General Chu Shih-ming, brooding over his ambiguous position on the Council since Britain's recognition of Communist China, was stirred to indignant protest. He wished Council "procedure" to be observed. Thereupon Colonel Hodgson ingeniously agreed to a "compromise," whereby he then and there gave notice that he would place the subject of prisoners-of-war on the agenda for the next meeting.

Everybody was delighted—except, perhaps, General Derevyanko. Precious procedure had been preserved. And, when the next meeting was held, General Derevyanko, after some set procedural sparring, again made his grand exit. Colonel Hodgson again placed the subject on the agenda.

Dual Role of Australian Delegate

There has, of course, been another complication on the Council. Colonel Hodgson represents Australia and New Zealand, who have not yet recognised Communist China, and the United Kingdom and India, who have. Whenever General Derevyanko chooses to raise the question of the eligibility of sad General Chu to sit on the Council, he can presumably expect one-half of Colonel Hodgson to support him and the other half to postpone judgment. Where this will lead to—with Mr Sebald insisting on General MacArthur's right to keep any undesirables out of Japan, especially representatives of Red China—is a guess which keeps half the occupation diplomatic observers in a frenzy of nail-gnawing.

Fundamentally, most of the blame for this organised buffoonery in an international body, which might have helped greatly in the administration of occupied Japan, is attributable to the American occupation authorities. General MacArthur has always resented the existence of the Allied Council for Japan, which was set up as a compromise by the then American Secretary for State (Mr Byrnes) at the Moscow Conference on December 27, 1945. The role of the Council was envisaged as a local one—acting as ears, eyes and tongue in Tokyo for the Far Eastern Commission in Washington, which represented all the eleven powers which suffered under, opposed or even fought against Japan in the Pacific. General MacArthur made it clear in first-hand public statement and by indirect quotation that the Council's role was purely "advisory." At his only appearance at the Council—the initial meeting (April, 1946)—General MacArthur even warned the Council against "ill-conceived criticism of our occupation policies." At no time has he advised the Council delegates of his occupation decisions or reasons for these decisions. His right-hand man, General Courtney Whitney, head of Government Section, went out of his way to insult the Council at an early meeting at which he was requested for information about Japanese who had been removed from office.

At least one member of the Council (and certainly one of the ablest), Mr W. Macmahon Ball, the Australian delegate who resigned after difficulties with Dr Evatt, believed that the Council was originally intended to have more actual power than General MacArthur admitted or allowed.

Article VI of the terms of reference of the Council reads:

> If, regarding the implementation of policy decisions of the Far Eastern Commission on questions concerning a change in the regime of control, fundamental changes in the Japanese Constitution structure, and a change in the Japanese Government as a whole, a member of the Council disagrees with the Supreme Commander (or his Deputy), the Supreme Commander shall withhold the issuance of orders on these questions pending agreement thereon in the Far Eastern Commission.

Mr Macmahon Ball always believed that this article was—and still is—"the main authority" of the Council and gave any Council member the right to invalidate any important action by General MacArthur by his disapproval until the Far Eastern Commission had reached a decision on the difference of opinion. But this vital issue has never been raised. On a long view, the overall results of the occupation would have been far worse if Russia had been given the same scope for interference in Japan as in Germany.

The outcome, however, has been to reduce the Council to impotence. It has become no more than a propaganda platform for the Russians and the Americans. The only contribution it has made to the occupation has been the admirable recommendations for land reform laws tabled by Mr Macmahon Ball and substantially accepted by General MacArthur, despite attempts at sabotage by the Japanese Government. Council proceedings, before they broke down in the sequence of farcical 30-second assemblies, had degenerated into abortive scuffles between General Derevyanko and the American chairman, with the British delegate occasionally switching sides and the Chinese delegate almost invariably siding with the United States. But it may be that the most persuasive argument against the continued operation of the Allied Council for Japan is that the Soviet so strongly wishes it to continue even if only as a fake "advisory" body from which the Soviet can continue to walk out.

Moscow and the Southern Slavs

[BY A CORRESPONDENT]

WHETHER or not the Russians have accepted defeat by Tito, and whether or not Greece is to be left alone by the Communist guerrillas, Macedonia will remain a centre of anxiety in Balkan politics. It touches the interests of independent Jugoslavia, of Greece protected by the Americans and of Bulgaria controlled by the Russians. The Kostov trial and recent polemics between Sofia and Bucharest throw interesting light on some of the ambitions and jealousies that have been working in the area.

Kostov was accused, among other things, of having supported the idea of a federal union of Bulgaria with Jugoslavia and, when that proposal failed, of having favoured the incorporation of Bulgarian (Pirin) Macedonia into the Jugoslav Republic of Vardar Macedonia. The prosecution alleged that this was part of a plot hatched as far back as 1942, when Mr Churchill contemplated the idea of a second front in the Balkans. The ultimate object was that Tito, now portrayed by the Cominform as having always been a tool of Anglo-American policy, should gain control over Bulgaria and, failing that, over Pirin Macedonia. Thus the Southern Slavs would be mobilised in the interests of the western Allies against Moscow.

The rigmarole of assertions offered as evidence at the trial showed no proof that Kostov ever pursued a policy of federation with Jugoslavia differing from that of Dimitrov and the Bulgarian Politburo. In 1944 Jugoslavia proposed that there should be union between Bulgaria and Jugoslavia and that the Bulgarian army should be placed under the command of Marshal Tito. In view of its importance, this proposal was submitted to Moscow. "In the end we made proposals for a federation of the two countries, but on our own conditions," Kostov said. He also referred to negotiations in 1946 about Macedonia, and said that the main difference between the two countries then was that the Jugoslavs wanted to annex Pirin Macedonia from Bulgaria, whilst Bulgaria wanted to exchange it against country ceded to Jugoslavia at the end of World War I.

The Jugoslav version of these negotiations has been made public recently in official speeches and articles in *Borba*, the most detailed account being that given by Moshe Pijade to the Jugoslav National Assembly in Belgrade on December 28, 1949. Pijade confirmed Kostov's statement that both Dimitrov and the Soviet Union knew of the 1944 negotiations; the Bulgarian draft agreement, he said, was drawn up by the Bulgarian Politburo after it had received a telegram from Dimitrov, who had not yet returned to Bulgaria from his wartime stay in Moscow. The Bulgarians suggested "a kind of defence pact" which fell short of the original Jugoslav proposal "to undertake measures for the earliest union of Bulgaria and the federal states within Jugoslavia into an integrated federal state, even before the end of the war." Although these words were not included in the agreement, some sort of understanding was reached between the two countries, according to Pijade, who asserted that the Jugoslavs at present hold a draft agreement signed for them by Kardelj, and endorsed "Draft agreement after talks with Comrades Kostov and Vladimirov December 23, 1944, Sofia." Pijade then made the startling revelation that Vladimirov was a pseudonym for Velko Chervenkov, the present virtual master of Bulgaria.

Pijade also explained why this agreement for federation was never achieved. The agreement was to have been signed in January, 1945, in Belgrade; but before this could take place both Jugoslav and Bulgarian delegations were summoned to Moscow by telegram from Molotov. "As soon as we arrived in Moscow, it became clear that the time was not yet considered ripe for the establishment of a federation. Instead, it was decided to draw up a treaty of political, military and economic co-operation. The final draft treaty was approved by the Soviet Government, and endorsed "Seen, Zorin 27th January." Pijade then states that the Bulgarian delegation, whilst in Moscow, received the news that Great Britain had protested to Bulgaria (still at that time an ex-enemy power) about its projected plans of federation with Jugoslavia, and about both the proposal to cede Pirin Macedonia to the Jugoslavs, and any suggestion of union of Greek Macedonians with either group. After this, apparently, both delegations left Moscow, the draft treaty was never signed, and the whole idea of federation was allowed to drop. Pijade's explanation is that if alone Britain had opposed it, it would have been accepted. But the Russians also were against it because they wanted:

> To prevent the grouping of small socialist states to safeguard jointly their independence and sovereignty which they, isolated from each other and without mutual support, should then place in the hands of the Soviet Government.

This account by Jugoslavia's official spokesman corroborates the story put forward by Kostov; the version also has the stamp of truth, and is borne out by such news as was made available at the time of the negotiations. It is clear that Tito did make an attempt to gain a federal union with Bulgaria at the end of the war which, if successful, would have made him ruler of a Balkan state of 23 million people and controller of one of the most important strategic areas of Europe.

Undaunted by his setback on South Slav federation, Tito went ahead after 1945 with his plans for Macedonia. There were negotiations between Jugoslavia and Bulgaria over Pirin Macedonia in 1946 and again at the time of the Bled agreement in 1947.

Inside Jugoslavia, Vardar Macedonia, with its capital Skoplje, became a constituent republic. For the first time for centuries Macedonians governed themselves; they were guaranteed cultural rights with the use of the Macedonian language in government and education. They soon had their own schools, university, radio station, theatres and newspaper. As Jugoslavia was the only country to give these rights to its Macedonian subjects, most of the people in Vardar Macedonia accept the Tito regime and feel more satisfied than their relatives in Greek or Bulgarian Macedonia.

After 1945 Tito also began to develop the economic resources of the region which, before 1939, had been the most backward part of Jugoslavia. Vardar Macedonia, with its population of one and a quarter million, its timber and water power, lead and zinc mines, and potentially productive soil for crops like maize, tobacco, cotton and vines has greater economic potentialities than either the sterile mountainous region of Pirin Macedonia (population 200,000) or the limited agricultural possibilities of Aegean Macedonia.

Tito had not abandoned his aim and the subject came up again in the 1947 Bled Agreement when, under Jugoslav pressure, the Bulgarians agreed to give "cultural autonomy" to the inhabitants of Pirin Macedonia. They agreed to allow teachers and "cultural experts" to be sent from Vardar to Pirin Macedonia to aid cultural development. Jugoslavia quickly followed the agreement up and teachers, actors, books and newspapers streamed into Pirin from Vardar Macedonia. The experiment did not last a year. The Cominform denunciation of Tito came in June, 1948, and the Jugoslavs and their literature were sent back home.

There are also signs that Tito's policy has had its influence on Slavomacedonians in Greece. As long as the Jugoslav frontier was open, Tito was of great assistance to the Greek rebels, and Macedonian guerrillas must have known of conditions in Vardar Macedonia. Although Greek Macedonians were fighting for the guerrillas, it has been uncertain what rebel policy was on the future of Macedonia. At first it was stated to be "equal rights" in Greece, now it is said by Zachariades to be the right of self-determination, but it is not clear what this means. Certainly it does not mean the right to join with Tito's Macedonia. Since the Cominform dispute, all those suspected of being Tito supporters amongst the guerrillas have been gradually liquidated by Zachariades and the Cominform supporters. This is believed to be one of the reasons for Markos' removal, and in recent weeks the two prominent Aegean Macedonians, Rakovski and Mitroviski, are said to have been arrested whilst in guerrilla camps in Albania.

Tito is playing for big stakes, and it is unlikely that he has abandoned his plans. It is equally unlikely that the Russians have lost interest in what is one of the most important strategic areas in Europe.

Australia and the Communists

[FROM OUR MELBOURNE CORRESPONDENT]

THE new Australian Federal Government was elected on a policy of uncompromising opposition to Communism in general and to Australian Communists in particular. Mr Menzies, the Prime Minister, defined his Government's policy to Communists in the following words:

> Communism in Australia is an alien and destructive pest. If elected, we shall outlaw it. The Communist Party will be declared subversive and unlawful and dissolved. A receiver will be appointed to deal with its assets.
>
> Subject to appeal, the Attorney-General will be empowered to declare other bodies substantially Communist; to follow the party into any new form and attach illegality to that new association.
>
> No person now a member of the Communist Party shall be employed or paid a fee by the Commonwealth; nor shall any such person be eligible for any office in a registered industrial organisation.
>
> The laws with respect to sedition or other subversive activities will be reviewed and strengthened. Conviction under such laws will disqualify from employment under the Crown or from office in a registered organisation.

The new Government is thus pledged to take no half measures against Communists in Australia, but the Prime Minister has not yet indicated if the Government is going to act immediately to implement its pledge. It is thought, however, that any action will be done by special legislation, which is probably safer and more watertight than the employment of the existing provisions of the Crimes Act. The new Parliament is expected to meet on February 22nd.

The pledge will probably be one of the most difficult to carry out. Endowment of the first child of every family, abolition of petrol rationing and the repeal of the Bank Nationalisation Act are likely to be much simpler than banning the Communist Party because of the legal, political, industrial and civil rights issues which such drastic action would involve. The industrial implications are likely to be the most serious, and already statements have been made by responsible union leaders that they regard with great disfavour any attempt by the Federal Government to say who shall or who shall not occupy official positions in a trade union. And what is most significant about these statements is that they come from bodies which are politically anti-Communist in their outlook.

Mr R. R. Broadby, secretary of the Australasian Council of Trade Unions, says that the trade union movement in Australia will resent any attempt by the Federal Government to remove a union official from office merely because he is a Communist. Experience showed that workers elected leaders who, they believed, rightly or wrongly, would bring results. If union leaders used their office in pursuance of some ulterior aim, they would, sooner or later, be replaced by others. That, he added, was democratic trade unionism which a responsible Government would be wise to recognise. The ACTU attitude was supported by Mr C. G. Fallon (who has since died), Queensland State Secretary of the Australian Workers' Union, the largest and one of the most influential unions in Australia. This union is violently anti-Communist. Mr Fallon said that to ban the Communists would merely force them underground where they could not readily be recognised.

Mr Menzies is clearly aware that just to ban the Communist Party, as he did in June, 1940—the Curtin Labour Government lifted the ban in December, 1942—would be of little use unless steps are taken at the same time to prevent Communists or near-Communists from occupying key positions in trade unions and so prevent the party from operating on its most effective sector—the industrial front. Despite the ban in 1940, the two maritime unions—the Seamen's and Watersiders'—the Ironworkers' Union, the Miners' Union, and the Australian Railways Union continued to be led wholly or partly by Communists, which meant that banning had little or no effect on the party's industrial activity. It might well have strengthened it.

It is to prevent a recurrence of such a situation that Mr Menzies pledged his Government to take anti-Communist measures of a severity which has not even been seen in the United States. The Government appears unlikely to have any Communist-banning legislation blocked by the Senate (which still has a labour majority) as this issue could hardly be counted as sufficiently important in Labour's eyes to court the risk of a double dissolution of both Houses of Parliament.

Australian Communists in Peking

Mr Menzies is, however, almost certain to meet with violent opposition from the trade unions, whether they are sympathetic to Communists or not, if attempts are made to dictate whom they shall elect to office. He is also likely to meet opposition from the large stratum of liberal-minded people who, while abhorring Communists and all their ways, would regard the banning of a body because of its political beliefs the very negation of the democratic ideal. If persons of Communist sympathy are to be debarred from Commonwealth or trade union office, they will necessarily have to be disqualified as a result of inquiry by the Commonwealth Security Service on the well-known lines of the Federal Bureau of Investigation in the United States. People might well be entangled in a net of espionage with a premium on the worst type of informer—the anonymous one.

The activity of the Communist Party on the industrial front has been brought into prominence by the imprisoning last year of Communist union leaders at the time of the general coal strike. Later, a leading Communist union leader, E. V. Elliott, Federal Secretary of the Seamen's Union, was an Australian representative at the Communist-led W.F.T.U. Conference of Asian and Australasian trade unions in Peking in November. Because the Australian Council of Trade Unions is no longer affiliated to the World Federation of Trade Unions, Mr Elliott attended the conference in his capacity as vice-president of the Seamen's and Dockers' section of the W.F.T.U. Mr. Harry Bridges, the Californian longshoremen's leader, an Australian, is president of this section.

It is impossible to determine if the Australian Union leader brought back from Peking specific "directions" on future strike policy in the Commonwealth. The indications are that union policy was laid down in Peking in terms of general resolutions only and that in keeping with usual Communist procedure, policy in a particular area will be developed in accordance with local needs. Nevertheless, since the Peking conference, two major strikes on the Austra-

14 NEW IDEAS

Applicable to Every Type of Business Activity

FULL DETAILS ON REQUEST

YOU, as a progressive business executive, need to keep pace with every modern innovation in business.

Below are listed 14 plans for helping modern business men—of all types—in all departments—of both factories and offices.

They are all based on the one system . . . the shannographic system of full-vision files.

Briefly, these files are made rather like slim boxes, with flat tops extending the full width of the files. They are suspended metal on metal. They fit into any standard cabinet.

The flat tops provide room for a great deal of information, apart from means of identification. They are colour-coded to make misfiling impossible. They carry sliding signals for indicating dates, or "progressing" (ready-printed slips numbered 1 to 12 and 1-31 are provided for this purpose).

On the front of every file is provision for slotted-in record cards—either for purposes of transfer and cross-reference or for annotating the file and its content.

In effect, then, you have a visual record for immediate identification; a means of filing correlated correspondence, invoices, plans, costings, etc; a foolproof filing system *and* a visual means of signalling unseen information.

This system is far more than a mere filing system. It is widely used by hospitals, local authorities, many Governments, big businesses, and smaller organisations—not merely for filing but for performing various *extra* duties possible with no other system. It represents a very effective and economical method of VISUAL CONTROL.

Details of any of the plans below will be sent you by return, free and without obligation. Just tick the plan in which you are interested and attach this advertisement to your letter-heading.

Shannon Systems

10. Architects-Surveyors.
11. Property.
12. Printing.
13. Plant & Maintenance.
14. Textiles.

lian waterfront have been threatened and averted, temporarily at least. Communist organisation of these disputes is suspected, and the Stevedoring Industry Board is planning to take action through the Arbitration Court to prevent the Waterside Workers' Federation from restricting any but Communists from joining the Union. The Stevedoring Industry Board licenses waterfront workers, but the Federation decides who can join the union. The Communist-led executive is attempting to make sure that new members are mainly Communists or supporters of the present militant policy. Australia came specifically into the picture with the setting up at the conference of a liaison bureau for Asia and Australasia composed of representatives of China, India, USSR and Australia. Because the ACTU is no longer affiliated to the WFTU, the Australian representative will be nominated by the trade departments of the WFTU to which individual Australian unions, such as the Seamen's, are affiliated.

This liaison bureau will enable Australian Communist-led unions to keep in close touch with broad Communist policy, particularly that in relation to the Pacific area. The new triumph of Communism in China will no doubt galvanise Communist activity in a renewed effort to discredit capitalism in Australia and where necessary to employ the strike weapon. It remains to be seen how effectively Mr Menzies will be able to circumvent this.

The Economic Work of Uno

[FROM A CORRESPONDENT]

UNO'S highest economic organ, the Economic and Social Council, assembled for its first meeting this year on February 7th. The Council, unlike the Security Council, has advisory powers only and no member has any right of veto. In consequence, the Council's economic discussions, which are acidulated rather than passionate, do not make front page news, and its important role in international economic collaboration is not widely understood. Few, however, who have attended any recent meetings of the Council can have been impressed by the content or the level of the economic discussions which it conducts. The absence of the Russian delegates—who have walked out of the present session—should at least reduce recrimination.

But the Council's disappointing record in the economic sphere has deeper roots. The Council is largely, if not entirely, a co-ordinating body, whose practical function is to energise and keep in step a varied collection of subordinate commissions, sub-commissions, committees and specialised agencies, most with wills of their own and some even with money of their own. The subordination of the International Monetary Fund and the International Bank, for example, is quite nominal, and both these institutions have independent budgets. The subordination of the ILO, founded some twenty years before the United Nations was ever thought of, looks to the former very much like teaching a grandmother to suck eggs. The Regional Commissions of the Council, in Geneva, Santiago and Bangkok, work in direct contact with the local Governments—in Geneva with notable success—and their independence is practically absolute in their own sphere. Even the "functional" Commissions, like those on Employment and Statistics, which contain experts appointed in their personal capacity, are often dominated by academic prima donnas who tend to steal the show. Unless the Council members are persons of known standing in the economic field and possess the full confidence of their Governments, it is woefully easy for the cumbrous Uno machinery, which the Council is supposed to control, to work in fits and starts or to stall altogether. Even if the principal Governments could somehow be prevailed upon to send such persons, the Council would still be quite unable to exercise the powerful influence in international economic affairs which its founders undoubtedly intended without firm guidance and strong support from the Secretariat at Lake Success. It is an open secret that the performance of both the Council members and the Secretariat falls short of what is desirable.

It is perhaps too much to expect improvements in the quality of the delegates sent by Governments while all the supervisory bodies of Uno are split along East-West lines and the members thereof are condemned to do duty at Lake Success as animated gramophone records which appear to have been cut some time in 1946. But the creeping paralysis of the "political" bodies should provide an opportunity for the permanent Secretariat such as was seized by the economists of the League of Nations during the war, who in the enforced absence of their political masters turned out some of the most useful work of their official careers. Seen in relation to this standard, the present economic work of Uno is a severe disappointment.

Apart from the output of the Monetary Fund, the International Bank, and the other agencies, the published economic work of Uno divides itself into the periodical reports of the "political" bodies, principally the Council and its Commissions, and the studies and reports of the Secretariat. The first are generally tedious, wordy and ambiguous, carrying plenty of internal evidence of fierce but inconclusive East-West battles at the drafting stage. These efforts are probably beyond salvation until the East and the West stop using Uno for propaganda purposes and consent to get down to real business. The second are, with some exceptions, dull, unoriginal, superficial and ill-written. They could and should be improved quickly.

The reason for the undistinguished bureaucratic performance typically found between the grey covers of a Uno publication explain but do not justify the present arrangements. Working conditions at Lake Success are always said to be bad, and this is perhaps why the work at Geneva, notably the competent and informative annual Economic Survey of Europe, is much better. On the other hand, the Regional Secretariats in Bangkok and Santiago do not do noticeably better than the headquarters at Lake Success, where the work in some sections (in the Monthly Statistical Bulletin, for instance) is good and useful. One serious and obvious limitation is undoubtedly the fact that the research field of the specialised agencies is now so extensive and the few gaps in it are filling so fast that there appears to be no identifiable economic territory which the staff at Lake Success can call its own.

Flood of Words

But the important and appropriate task of periodically synthesising the economic work of the specialised agencies into a world economic survey is the most conspicuous and regrettable failure of all. A real need exists for a few industrious and clear-headed economists to save the profession from being drowned in its own output by absorbing the best of the present deluge of comment on the current economic situation and distilling from it an intelligible and plausible account of what is going on in the world. It ought to be obvious that in a world of conflicting economic and political ideologies, which are (and certainly should be) well represented in the Secretariat, an ordinary scissors and paste job, while convenient for side-stepping the charge of bias, will simply not do for public consumption on either side of the fence, since no one who does not have to, will ever read the results.

A somewhat provoking standard of comparison in these matters appeared in the report on "National and International Measures for Full Employment" written at the invitation of the Secretary-General by five well-known "outside" economists under the chairmanship of Ronald Walker of Australia. The full-time staff economists of Uno ought not to be content to shine with such reflected glory. In the present state of the East-West deadlock, their best course seems to be to earn some glory for themselves in the same manner; that is, to build up independent international views of their own and to aim at a wider audience than the frustrated and frustrating committees of the Council.

GOING UP TO TAKE IT DOWN

SCALE IN INDUSTRIAL WATER SYSTEMS can cause any amount of trouble. Choked pipes must be dismantled, seized valves freed, and water heaters cleaned — there is never any lack of work for the maintenance staff. Many of these troubles can be avoided before they start simply by treating the water with Calgon (which is Albright & Wilson's sodium metaphosphate). A few parts of Calgon in a million of water will prevent scale or stop corrosion. A copy of our technical booklet "Threshold treatment with Calgon" will make everything clear to you.

CALGON

a very little Calgon prevents a lot of scale

SIMON ENGINEERING GROUP

Two important innovations—the by-product coke oven and automatic roller flour milling—were introduced into Britain seventy years ago by the late Henry Simon, founder of the Simon Engineering Group. To-day Simon-Carves are among the largest international coke oven builders, and Henry Simon—the world's largest milling engineers—have been called by a Canadian miller "the recognised world authority on the art of modern flour milling practices." In their other specialities—notably power stations, coal cleaning plants, sulphuric acid plants, granaries and grain handling equipment—the Simon companies have likewise done much pioneering work and are among the acknowledged international leaders.

THE BUSINESS WORLD

Selling for Dollars

THE second report from the Organisation for European Economic Co-operation declares that the expansion of exports to the United States is the most urgent task confronting the participating countries. The conclusion is inescapable and the end of Marshall Aid in two years' time will bring home its full force. But it cannot be said that British industry, though it would acknowledge the truth, has yet been prepared to do much about it. Its main incentives, and its traditional markets, are to be found in the soft-currency countries. Some branches of British industry—such as the motor industry—have made an attempt to establish themselves in the American market, but they have found the going tough, and the expectations of profit distinctly low by comparison with earnings in other markets. There are others—such as the toy industry—which see in recent actions by their American competitors all their fears of trade antagonism coming true, despite anything that Mr Paul Hoffman may say. Seattle has made many would-be exporters of capital equipment doubt whether any door can be opened to the American market and kept open.

It is, of course, always easy to rationalise the fears of jumping into icy water, and if the American market seems disagreeable, it is largely because other markets have been too comfortable for years. To get a footing in the American market, the British manufacturer has to grapple with a dozen unfamiliar problems, undertake a series of risks, and be prepared to make considerable changes in his product or his production programme for a reward which will be contingent and modest. The national need to earn as many dollars as possible does not always coincide with his desire—and his manifest ability—to earn as many pounds as possible. He is not to be blamed for the all too frequent fact that his incentives to sell point away from the dollar market towards the sterling market—that is a reflection on economic policy, and not a proof of selfishness on his part. Devaluation may have modified the relative pulling-power of the hard and soft currency export markets, but it has certainly not reversed their magnetic poles. And although British exports have become more competitive in the North American markets, devaluation has reduced the dollar earning power of each unit of exports.

Three main factors determine the effectiveness of the dollar export effort. The first, exhortation, has been tried and has largely failed. The second, special incentives, has been contemplated, but bristles with difficulties. The third, knowledge of the market and guidance towards overcoming its many difficulties, is now being provided in a practical way. The latest contribution is the guide to the distribution and marketing of British goods in the North American market issued this week by the Dollar Exports Board.* This is a document full of simple and practical advice to the British exporter who seeks to enter a market almost unlimited in size but forbiddingly able to look after its own needs without benefit of imports. It asks, by way of introduction, five questions of the British manufacturer. The first step is to make certain that the product is suitable for the North American market. British goods will not sell there merely because they are British or because they slavishly imitate American or Canadian products. American taste can be satisfied by attention to design, styling, colour, and packaging, and a distinctive character in a British product is often an asset. Beyond the range of consumer goods, there are engineering and electrical standards which must be observed. And the experience of the British biscuit manufacturer whose "custard creams" fell foul of the U.S. Food and Drug Administration, on the literal ground that they contained neither custard nor cream, is a reminder of the force of the food and drug regulations.

The second question is the incidence of American and Canadian Customs duties—complex even to summarise in their broad effects, though an attempt will be made in a subsequent article. The third is all-important. Is the British manufacturer's price competitive? This is a matter which must be put to the test for each individual product. Many manufacturers assume too readily that their products cannot compete in the American market, after meeting the exactions of the American customs and the cost of American distribution. Neither of these oncosts is aimed deliberately at the British exporter, though he is often inclined to think so. In particular, the size of the "mark-up" in American retailing, of which many British suppliers complain, is a reflection of different ideas of merchandising and consumer service in that market. It certainly owes nothing to any restraint of competition—which is more than can be said of some British margins between wholesale and retail prices—but is rather an index of the cost of service which the American consumer wants and is prepared to pay for, always presuming that the goods appeal to him.

The booklet makes its point about prices in simple terms:

> There are two fairly fixed and easily known items, namely your ex works cost and the American (or Canadian) price level set by competition. The sure way to find out how you stand is probably to make two separate calculations, one from each direction, and then endeavour to reconcile them.

A rough example of this kind of calculation can be provided if dollar prices (quoted in the recent report of the National Dry Goods Association in the United States) at which specified British exports would find a ready market are compared with the average export prices of goods as nearly comparable shown in the British trade returns. These figures are roughly linked in the two accompanying tables. Comparison of the first two columns in Table I shows the difference between maximum landed cost and the corresponding retail price range—a difference which often represents a 100 per cent mark-up, from which agents' expenses and profit, local sales promotion, and the wholesalers' and retailers' margins have to be provided. The last two columns of this table show the maximum landed cost in the American market for these selected lines, converted into sterling at the old rate of $4.03 and the new rate of $2.80 to the £.

The second table shows, as far as possible, the average sterling export prices of similar goods during the four quarters of 1949. Such comparisons are full of difficulties regarding specifications, qualities and style. Moreover there is a gap between the two tables represented by ocean freight over 3,000 miles and American customs charges. But with all these serious reservations, the end-results of the two tables do suggest that a range of textiles which might formerly have been excluded on price considerations from the American market has now been brought within the sphere of practical competition as a result of devaluation. It is for the exporter to make the price test with each of his products; all that this comparison does is to suggest that he need not approach his task with anything like despair.

The fourth preliminary question asks whether the exporter can set aside sufficient production to meet American demand. There have been cases where supplies were insufficient to meet the demand; it is useless to fall back on the alibi—which even now satisfies many customers in the British market—that deliveries are delayed because of a high level of demand. American dealers demand, and get, prompt and regular deliveries. This, in turn, poses the fifth question: whether the firm which seeks an American outlet has sufficient working capital to finance higher output and wider trading operations. On this, the Export Credits Guarantee Department, among other bodies, offers useful service to the exporter.

*

If the exporter survives these tests, his next and main task is to decide how to distribute and sell his goods in the American market. There are almost as many different methods of distribution as there are products, each known intimately to specialists in the American market and each aimed at the rapid identification of, and efficient service to, the ultimate consumer. The golden rule that the British manufacturer should seek a distributing organisation which affords the closest contact with the ultimate consumer is a sound statement of principle, but considerable effort may be needed to find the right channel. Reliance on an export merchant or the American buying houses in this country saves the manufacturer all the trouble of shipping, customs clearance and transport to the point of sale. These outlets offer real convenience to the smaller manufacturer whose scale of business would not support an independent selling effort in the American market. Such organisations as the Hambro Trading Company and Drake (America) have greatly extended the services provided by the

export merchant; their own trading organisations are in close contact with the American consumer in the United States and Canada and are equipped to provide purchasers in those countries with the service they get from American manufacturers as well as to keep manufacturers in this country fully informed about changes of demand, style and price in the American market.

A second outlet is to sell to an import merchant across the Atlantic. For certain commodities, including such traditional British exports as textiles, pottery, and leather goods, the import houses are valuable. They suffer, however, from the limitation that they are generally concerned with reselling the goods in the most convenient market, and do not follow the goods through to the ultimate consumer. They may, therefore, fail to test the widest potentialities of the goods in the North American market. And the fact that they are mainly concerned with "traditional" exports is itself a limitation of real importance, for it is quite certain that the dollar gap cannot be closed by reliance on "traditional" exports alone.

The task, indeed, calls for the use of specialised agents suited to the particular products and the scale of their potential markets. For some products, it may be particularly important for the British exporter to exert control over the marketing of his product in the American market. For this purpose he may resort to indent agents (mainly useful for selling batches of a product for which the market is small but the demand continuous) or to distributive agents (who can sell direct to retailers, or through the wholesale jobbers, and are prepared to carry stocks). This latter type of agency is usually essential for a manufacturer who aims at mass sales of consumer goods, but it needs to be carefully chosen, and continually refreshed with assistance and backing from the manufacturer. When the volume of business reaches a sufficient scale to justify the step, a branch selling office or subsidiary selling company serving the American market may be set up. Indeed, a branch organisation may be necessary from the outset to market a product that requires considerable service after sale.

All these problems of discovering if a product will sell and then how to sell it are difficult, time-absorbing and expensive. Whether it is a simple or a complicated product which has to be sold, and whether the choice of an appropriate selling method is a direct agency or a group scheme, the fundamental task remains—to sell and not merely to distribute, to create demand and not merely to expect it, to use specialist services in selling and advertising in the full recognition that apparent costliness may be a cheap price to pay for opening a mass market. The mental attitudes which are needed are put very fairly in the Dollar Export Board's pamphlet. They demand no qualities of which British exporters, with a century's experience of trading, are incapable. But because the American market is large, highly competitive, virtually self-sufficient if need be, and assertive of consumers' choice, it will be opened to more British exports only by specialised methods and the most carefully planned commercial policies.

Are Stocks too High?

AN article in *The Economist* a fortnight ago showed that the great inflationary rise in profits, which had lasted practically two whole decades, had come to an end. Total profits, before taxation and provisions, are still high, but they are no longer increasing. This turn of the tide is bound to have important consequences for industry. Despite heavy taxation (including the levy on industrial capital known as the Profits Tax, increased last October for "rough justice") industry has hitherto been able to find out of its own earnings an important volume of new finance. On a true reckoning, it is doubtful if this annual accretion of new funds has enabled industry even to maintain its real capital, much less to increase it; for the inflationary forces which have been the mainspring of higher profits have simultaneously produced a dramatic increase in the cost of capital replacement. The picture of industry flush with surplus funds which have been earned at the expense of labour is one on which some trade unions love to dwell; but it is essentially a false picture.

It is clear from the terms in which the engineering trade unions recently presented their case for a wage increase of £1 a week (the rejection of which is discussed on page 339) that there is room for a serious campaign of education about the true nature of profits and capital. Part of the confusion arises from the fact that some of the capital which is needed to pay for the economic commitments of industry—the replacement and expansion which are the price of national survival and full employment—is shown in company accounts as apparently unattached surpluses. But they are not "surpluses" over and above what is required to keep industry's capital assets intact and to expand them. The notion of "surpluses" in company accounts is something for which the accountants (with their eyes trained on the purely legal construction

of balance sheets) must bear some responsibility. The engineering unions also made much play with the notion of surplus liquid assets (by which they meant net current assets) and assumed that these were excess assets, contained by an arbitrary dam set up by industry, which should be allowed to over-spill into the employee wage-packets.

The engineers' claim is the first in this country to have been argued on what purported to be the facts about productivity and finance of a whole industry. In

United States, cases are argued in this way between the unions and employers on a much more secure basis of fact and of common agreement about the underlying nature of the statistics. There is, for example, a much wider knowledge among American trade unions and their economic advisers of the anatomy of industrial balance sheets. This article presents the sixth quarterly analysis of industrial balance sheets in a series which began just over a year ago. Recent articles (those in particular of November 19th and August 13th last year) have already emphasised the rising burden of stocks which British industry is now carrying. They have emphasised also the strain which this rise is imposing on industry's financial resources (a strain which is the more seriously felt because it coincides with large-scale re-equipment programmes in many industries) and have drawn attention to the risks to which some sectors of industry with uncomfortably large stocks are exposed on a plateau of high prices. The main table which accompanies this article (detailed figures for individual industries are to be found as usual in this week's issue of *Records and Statistics*) shows that the building up of stocks continues. For 690 companies whose reports were issued in the last quarter of 1949, stocks show an increase from £316.0 million to £338.3 million. The balance sheet date to which these figures apply (allowing, that is, for the time lag in the publication of reports after the close of the financial years) is roughly mid-July last year—a period when output was running satisfactorily but when exports had been checked by fears of devaluation. This rise in stocks of 7 per cent is more moderate than the rise shown by the companies whose reports appeared in the third quarter of 1949, for they revealed an increase of no less than 16 per cent, from £318.8 million to £368.8 million. Perhaps as much as half of the latest increase reflects the rise in prices during 1948-49, so that the real increase, after allowing a discount for the price factor, can hardly be called immoderate.

For the 690 companies as a whole, stocks now represent just over 90 per cent of their net current assets, (that is, the total of stocks, debtors, investments and cash, less current liabilities such as bank loans, creditors, taxation reserves and other provisions). But for certain of the industrial groups, stocks absorb the whole of the net current assets and appreciably more. This is not illegitimate or dangerous, so long as the holding of stocks is kept within the normal limits which past experience has proved to be safe for the trade concerned. The difficulty is that so long a period has elapsed since experience could be said to be normal that even recollection of the limits of normal safe trading tends to be dimmed.

The figures which are given in the smaller table should not be construed as reflecting critically on the particular twelve industrial groups which are represented. These twelve groups in their latest balance sheets showed stocks amounting to £259.7 million (approximately 77 per cent of the total of £338.3 million for all companies); their stocks increased during the past year by £17.3 million compared with an increase for all companies of £22.3 million. They are, therefore, a representative selection of the industrial groups, with a bias towards those which are accustomed to holding large stocks. Two of the groups—entertainment (which means largely film production and exhibiting) and electrical manufacturing—showed a fall in stocks in the latest year. In the first case, of course, this fall reflected changes in policy regarding film production by the Rank group. The next column of the table shows the net current assets for each group, and the proportion which stocks bear to these net current assets, both for the latest year and the preceding year. In all cases except iron and steel (an industry which did considerable re-stocking last year) and food the proportion which stocks bear to net current assets showed a fall. But in only two cases (miscellaneous manufacturing and cotton) were stocks less than 100 per cent of net current assets. There are some cases where stocks look distinctly high, judged by a comparison with net current assets. These include clothing and footwear, entertainment (a special case), shops and stores, iron and steel (though a large element of the increase here is in raw materials and intermediate products), wool and food.

For two reasons, industry is likely to be increasingly concerned with defining the limits of normal stocks in coming months. The first is the pressure of finance, which is bound to result from the end—as it now appears to be—of the prolonged inflationary rise in profits. The second is the future outlook for prices. It is far less certain than it was, even twelve months ago, that economic forces throughout the world will support a further rise in the prices of raw materials and basic foodstuffs; indeed, there are many pointers in the opposite

direction. What may happen in the British economy in the short-run is something of a special case, for the full effects of devaluation have yet to work themselves out. But if the broad presumptions now favour a fall, rather than a further rise, in world prices, and some setback of effective demand as the more pressing postwar wants are increasingly satisfied, the consequences at particular points of industry might be quite sharp. Comparison of the ordinary earnings shown in the table (out of which, be it remembered, all net additions to reserves as well as dividends have to be provided) with the latest figures for stocks reveals several cases in which a relatively moderate fall in prices, or the liquidation of a modest proportion of stocks at sacrifice values, might have a painful effect upon earnings.

Replenishment of stocks and working capital has been one of the signal features of the postwar boom in new investment. But the evidence of these latest figures suggests that it can hardly go much further with safety. Indeed, a sudden change in the economic climate might demonstrate that it has already gone too far. These articles have already made the point that new investment activity is unlikely to be swollen in future by a further increase in industrial stocks and work in progress. Before the war (when facts about stocks and current assets were unknown) many economists and businessmen would have regarded the first sign of over-expansion of inventories as a cautionary signal. The evidence now seems to be pointing in that direction.

Business Notes

Europe After 1952

The kernel of the second report of OEEC is the chapter on the balance of payments of the participating countries, with its exceedingly frank comments on the problem of closing Europe's dollar gap after Marshall aid has ended in 1952. The estimates of balances of payments for 1950-1951 and 1951-52 must be regarded as giving only general indications of orders of magnitude, but the broad comments on the dollar balance of payments appear well founded. The participating countries (excluding Switzerland) expect to have in 1951-52 a dollar deficit of $2,250 million, of which just over $2,000 million is to be financed by ERP and special help to Germany and Greece, the balance being met by drawings on gold and dollar reserves. That is an immense improvement on the figures for the current year, which show a gold and dollar deficit of $4,373 million, of which $4,202 million is being financed by ERP and GARIOA. These figures, it should be noted, include deficits that will have to be settled in gold with countries outside the dollar area and also the net gold and dollar transactions of the participating countries' overseas territories and associated monetary areas. The remaining deficit at the end of the Marshall era shows that "a serious problem will exist after 1952." It is true that the break in Marshall aid will not be as sudden as would appear. In 1952-53 some of western Europe's imports will still be financed by 1951-52 ECA allocations. The question remains, nevertheless, whether the balance that must inevitably be secured between Europe and the dollar world after 1952 will be achieved at a high or at a low level of reciprocal trade.

The programmes show in great detail what the individual countries propose to do to expand their dollar exports in the next two years. From $1.22 billion for 1948 the exports of participating countries to the United States and Canada are expected to rise to $1.5 billion in 1951-52 after a deplorable dip to $1.04 billion in the present Marshall year. This is a modest enough goal, but even so its achievement plainly cannot be taken for granted. The participating countries' main difficulty in increasing their exports to the United States market lies in the fact that whereas these exports are mainly manufactures, the US economy depends to an almost negligible extent on this type of import. The report cites a number of actions required by western European governments to encourage exports to these desirable markets and among them mentions the possibility of allowing exporters to retain part of their dollar earnings. Where this system has been applied it is said to have had undoubted success.

* * *

OEEC Tells America

The report has a great deal to say about the need for financial stability and some measure of disinflation in order to divert resources in Europe to the required export channels. In this context it makes some interesting comments on Britain's external sterling liabilities, pointing out that releases from these accumulated balances have provided an important source of external finance for the creditors in a period of great political change and economic upheaval. It is, however, in its references to American policy that the OEEC report becomes really forthright. The height of the US tariff, despite its recent reduction, is given as a continuing strong deterrent to imports from western Europe. Telling illustrations are given of the sabotaging of imports through the administration of the tariff. Mention is made of other barriers to US imports such as the fact that all repairs to American ships carried out abroad are taxed at the rate of 50 per cent unless it can be proved that the vessel is so badly damaged as to be unable to return to the United States. There is a "Buy American Act" which makes it difficult for public authorities to purchase foreign material for the construction of public buildings.

The process of instruction in the two-way nature of international trade has made great strides in the United States lately, but it has still a considerable way to go. The responsibility rests on both sides of the dollar balance of payments equation. "Europe has a clear responsibility to adapt her industry and trade to the needs that other countries manifest or can be induced to indulge; while the United States can ease and accelerate the process of adjustment by the liberal import policy appropriate to a great creditor nation." If only this twofold advice were heeded, no undue anxiety would have to be felt about the ominous figures which the OEEC's estimates of balances of payments reveal.

* * *

Argentina's Sterling Shortage

By end-June next the current Anglo-Argentine Trade Agreement will have dragged through its first unsatisfactory year; under the terms of the agreement, the meat price and trade schedules for the second year are to be reviewed not later than the end of this month. Mr E. J. Joint, the British Commercial Minister at Buenos Aires and leading representative on the Consultative Committee set up under the pact, is now in London to give advice and receive instructions for the bargaining bout which lies ahead.

By all accounts the bargaining this year is to be dominated by one new and important consideration—Argentina's desperate shortage of foreign exchange. Although the returns of the Argentine Central Bank continue to show foreign exchange holdings of $600 million or more, these holdings are arrived at only by sweeping into the statistics large credits granted by Argentina to Spain some years ago (the thesis apparently being that Franco's promise to repay can be considered "as good as gold"). Behind this façade, the debilitating effect which Señor Perón's postwar policy of inflation and attempted industrialisation has exerted on the country's agricultural production and exportable surplus has reduced Argentina's dollar and sterling holdings almost to vanishing point.

When the Central Bank's net sterling holdings were reduced from £152 million to £2,000,000 by the railway purchase in February, 1948, it was confidently expected that Argentina's surplus with the sterling area on current account (thanks to its large surplus on trade with the United Kingdom) would allow these balances to rise to over £100 million again by the end of 1949. (In fact, as an interim measure, the agreement laid down that Britain should pay in advance for her first £110 million worth of supplies—in order to keep Argentina's working balance of sterling at this figure.) As it has turned out, the excess of British imports from Argentina (valued c.i.f.) over British exports to Argentina (valued f.o.b.) in the twenty months from February, 1948, amounted to only £70 million; and this surplus seems to have been very nearly wiped out by Argentina's purchases (chiefly of oil) from the sterling area and the invisible payments it has made (quite apart from liabilities outstanding in the shape of remittances of profits to British firms which it has so far been unable to honour).

* * *

What Brief for Britain's Bargainers?

This alarming trend of Argentina's balance of payments has led to a significant change in the nature of the pressures on the Perón regime—a change which some responsible quarters in this country (reduced, perhaps, to a not unnatural irritability at the intransigence shown by the regime in the past) have perhaps not yet fully appreciated. Immediately after Señor Miranda's unlamented departure from office twelve months ago, there was some sign that his successors were attempting to tackle Argentina's overspending crisis at its roots. The very first attempts at such an approach—exemplified in the pruning of subsidies, the attempted switch of resources from industry back to agriculture and an apparent effort to cut military expenditure—led, however, to such sharp reactions from trade unionists, industrialists and (above all) the army that the would-be reformers retreated very quickly into their shells. Since that time Argentina's economic policy has been devoted to one objective alone—that of scraping into the coffers of the Central Bank, in the short term, every peso's worth of foreign exchange which the country has been able to acquire. Each unit of foreign exchange so acquired postpones for a little longer the moment when complete exhaustion of the exchange reserve will compel the country to face the severe contraction in its standard of living which spending within its means will involve. This objective explains Argentina's continued willingness, despite all grumbling, to deliver meat since September at the pre-devaluation price; it also explains, but does not excuse, the Central Bank's continued refusal to grant sterling for profit remittances and for inessential imports.

Given this situation, what brief for Britain's bargainers should Mr Joint carry back with him to Buenos Aires? There seem to be three possible policies which Britain could pursue at the forthcoming talks. First—as some quarters have recently suggested—Britain could take advantage of Argentina's weak bargaining position to insist on continued deliveries of Argentine meat at or near the present prices and also perhaps upon more extensive purchases of other Argentine products at favourable prices. Secondly, Britain might risk a more constructive long-term approach designed to secure an increase in Argentine export production—an increase which the world most urgently needs; such an approach need not necessarily involve a substantial increase in the meat price, but it might involve the granting of a credit (or perhaps an advance payment) to Argentina again. Thirdly, taking its stand on Argentina's refusal to honour commitments for sterling remittances and for inessential import licences (and resting, too, on the inflated level of Mr Strachey's meat stocks), Britain might threaten to hold up coal and oil exports to Argentina until the terms of the original trade agreement are carried out in full. Each of these approaches has something to be said in its favour—each one, by itself, might in fact be preferable to a makeshift dilution of all three.

Finance and Banking

The Surplus and the Debt

Tax gatherings last week again well surpassed the yield of the corresponding week of last year, with the result that the Chancellor's above-line surplus has already risen above the £470 million for which he budgeted last April. Last week's surplus of ordinary revenue amounted to nearly £117 million, raising the surplus for the fiscal year to date to £518 million, compared with £738 million at the corresponding date last year. In the first five weeks of 1950 the net inflow to the Exchequer has amounted to £540 million, or some £75 million more than last year. During this period, too, the rate of net expenditure "below-the-line" has been slackening, so that the total for the year to date is a little over £470 million (compared with about £425 million at the same stage in 1948-49). This big inflow of funds has, of course, been accompanied by the customary seasonal repayment of floating debt; but, somewhat unexpectedly, the rate of repayment has not been any greater than it was twelve months ago.

During the past five weeks the total floating debt has been reduced by £404 million to £5,743 million, its lowest level since the autumn of 1944; in the similar period of 1949 the debt declined by an identical amount, to £5,951 million. More surprisingly, repayments of the so-called "active" portion of the debt—"tender" Treasury bills and Treasury deposit receipts—have actually been a little smaller this year. The principal explanation of these disparities between the movement of the debt and of the revenue surplus seems to be that in the corresponding period of the fiscal year, 1948-49, expenditure shown in the Exchequer return was over-stating the true expenditure—in order to compensate an understatement for the period when actual expenditure was rising but when no supplementary estimates had been presented to Parliament. This technical distortion of the Exchequer return last year also helps to explain, of course, why the revenue position has improved in the past five weeks so much more rapidly than most people expected. For this reason, it would be unwise to expect this rate of gain to continue—or even to assume that there will not this year be any further supplementary estimates. If, however, the net revenue inflow in the coming eight weeks were to be the same as in the concluding period of 1948-49, the year would close with an aggregate above-line surplus of just over £630 million, and with an "overall" surplus substantially larger than the £14 million for which the Chancellor budgeted. To date, the overall surplus stands at £47 million.

* * *

Central Banking in Australasia

Two days before the death of Lord Norman, Government pronouncements from New Zealand and Australia revealed that two of the most powerful central banks in the British Dominions, whose fostering had always been his special care, were to swing back towards the codes of conduct which he himself would originally have approved for them. The Reserve Bank of New Zealand was a direct product of the Norman dynasty; its original constitution was drawn up by Sir Otto Niemeyer in 1930. This constitution, which tied the credit policy to be followed by the Bank to the usual automatic signpost of the proportion between its liquid assets

and its liabilities, was, however, never really put into effect. The Labour Government which came into office in New Zealand in 1935 transferred to the Government the power of appointment to the Board of the Bank and then, by regulations issued under successive Finance Acts, in effect gave the Government the power to guide credit policy directly by decree. For the budgetary year which ends on March 31st next the Fraser Government apparently intended to use these powers to secure an advance of £26 million to the Government—a proposal which has so shocked the orthodox mind of the new Prime Minister, Mr Holland, that he has decided to amend the Reserve Bank Act so that "the issue of currency and credit be determined by economic considerations and not by ministerial direction."

The preliminary announcement of the proposed banking reform in Australia does not presage such a radical turning back of the clock; all that is proposed here is that the 1947 Banking Act—the abortive Nationalisation Act, which was riddled through by successful legal appeals by the commercial banks—is to be repealed and that control of the Commonwealth Bank is to be removed from the hands of a Governor responsible only to the Federal Treasury and restored to those of a Board (subject to the authority of Parliament in the event of any major disagreement between the Board and the Government of the day).

These changes can mean much or little. The original constitutions of the Dominion central banks were drawn up in the image of the old Bank of England at a time when it was believed that the economies of the countries concerned were still sufficiently flexible for it to be possible to decree that the external value of their currencies should be fixed and to allow everything else (including the level of employment and incomes) to fluctuate about it. That belief is dead (as Montagu Norman, in later life, was not unwilling to recognise); when Governments take over completely from central banks, however, it is apt to be replaced by the no less dangerous belief that the level of employment should be fixed at a point of permanent inflation and that everything else should be allowed to fluctuate around that. Whether the way to avoid either of these extremes of policy is to grant central banks an appreciable—but not unlimited—freedom from Government interference is, however, a question to which no definite answer can yet be given.

The European Payments Union

The section in the second report of the OEEC dealing with future European payments arrangements is, as was expected, a general statement of principles which now remain to be filled in as a result of further discussions at the "expert" level in Paris. On the success of these discussions depends the future not only of the payments scheme but also of the trade liberalisation proposals, since these will not be implemented until a satisfactory payments scheme is in operation. Five major conditions must be satisfied if the scheme is to achieve the objectives which its OEEC framers have in view. The first is that it must provide for complete transferability among participating countries of currencies earned by them on current account. Every country must be in a position to ignore its balance of payments with each individual participating country and to concentrate solely on its balance with the group as a whole. Secondly, the system must provide sanctions and incentives which will help to maintain balances of payments within Europe in reasonable equilibrium. Thirdly, any institution set up to supervise the new arrangements must have the right and duty to consult continuously with members on their economic and financial policies. Fourthly, the credit facilities are not intended to be used to finance structural or exceptional deficits. Finally, whatever credit margins are allowed under the new system must not be predetermined by forecasts of creditor and debtor positions as they have been in the first two versions of the intra-European payments scheme.

In the light of these conditions the following sketch of how a European payments union might function is given in the report. Each participating country would open with and receive from the EPU two lines of credit, one short-term and one medium-term. The former would be used to finance seasonal and other temporary trade and payments movements. The medium-term lines would be available to cover unpredictable deficits of a semi-permanent rather than seasonal nature. Technical arrangements would be made to compensate intra-European credits and debits at regular intervals and to determine the net position of each member country *vis à vis* the EPU. In establishing these net positions, account would be taken of the desire of any country to use credit arrangements outside the system or existing resources in order to settle its deficit. The crucial problem of whether to sweep existing payments arrangements into the new system has thus been carefully blurred and left for later definition. The short-term credits available in accordance with quotas granted to each member would be used automatically to settle the net debit and credit positions. The net creditor would in fact give a short-term credit to the EPU and the EPU would give a short-term credit to the net debtor. All creditor-debtor relationships would be channelled through the EPU.

* * *

Provision for Gold Settlements

Whenever any part of the short-term credits had been utilised for more than an agreed period, it would be converted into a medium-term credit. There is general agreement that during the use of medium term lines of credit the debtor should pay dollars to the EPU in proportion to his liability and, similarly, that net creditor positions of medium-term would be settled automatically by partial payment of dollars to the creditor.

As the rate at which dollar payments are made by the debtors would by no means necessarily be the same as the rate at which dollar payments are made by EPU to the creditor, a special fund of dollars will be essential to set the EPU in motion. These, it is hoped, would be provided by ECA. The management of EPU would have the duty to consult with members to avert the exhaustion of medium-term lines of credit. If such exhaustion was deemed to be due to undesirable monetary or economic policies, it would be the duty of the EPU to place conditions on further access by the member concerned to its facilities. It is agreed that if a debtor country were suffering an undue drain on its gold reserves, it might be necessary for it for a limited period to resort to restrictions upon current payments. The EPU will maintain close links with the Council of OEEC. It is intended to invite the Bank for International Settlements to carry out the operations of the EPU under the direction of a management which will be in the hands of a small board composed of persons of high standing who would be empowered to take majority decisions. It is finally provided that the matters falling within the scope of the EPU are of great interest to the International Monetary Fund and that close co-operation and consultation with that organisation will be desirable. That is the outline of the new EPU scheme. It may prove even more difficult to fill in the details than it was to draw up the framework. Yet the work must be completed at latest by June 30th, when the present IEPS expires.

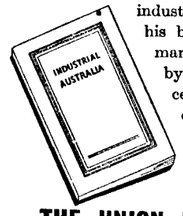
INDUSTRIAL AND COMMERCIAL
I. C. F. C.
FINANCE CORPORATION LTD.

I.C.F.C. was set up in 1945 by the English and Scottish Banks, with resources of £45,000,000, to supplement existing facilities by providing an accessible source of share capital and long term funds for well conducted businesses of small or medium size. It applies to all proposals the usual canons of sound finance and is not averse from supplying risk capital. I.C.F.C. so far has made available over £19,000,000 for British Industry, divided among more than 290 concerns of many kinds.



Full particulars of the facilities offered may be obtained from the General Manager,

7, Drapers Gardens, E.C.2.

Site for the new branch?

There may be in Australia room for the profitable expansion of your own business. You are invited to read 'Industrial Australia,' published recently by The Union Bank of Australia. This provides authoritative information for the industrialist who contemplates an extension of his business into the expanding Australian markets, by setting up a branch factory or by acquiring an interest in an existing concern. On all such matters The Union Bank of Australia offers complete and up-to-date service and information covering the whole Commonwealth. Ask for a copy of "INDUSTRIAL AUSTRALIA."

North of Scotland Bank Limited was amalgamated with The Clydesdale Bank Limited on 1st January, 1950, under the name of

CLYDESDALE & NORTH OF SCOTLAND BANK LIMITED

Belgian negotiators Britain has offered to go some way in providing more foreign exchange for tourism in Belgium. The ceiling on tourist expenditure of £1,100,000 for 1949-50 has been lifted and between now and June 30th an unlimited number of British tourists may spend their annual £50 holiday ration in Belgium. Hitherto, the Belgian authorities, anxious to attract as many tourists as possible within the £1,100,000 limit, have rationed each traveller to a maximum of £35. Since the "tourist year" opens on May 1st, the new arrangement overlaps by two months into the 1950-51 year, and tourist allowances in the summer season will still have to be agreed. For the present the practical implications of the new agreement are limited, since between now and the beginning of the new season few tourists are likely to avail themselves of the larger allowances. The more generous approach is of significance rather as a pointer to the official plans for tourism in 1950-51. The Belgian relaxations are politic, for they follow closely upon the removal of all limitations upon travel allowances for Scandinavia, which aroused uneasy complaints on the score of discrimination. Perhaps these and other indications suggest that a more liberal policy for tourist allowances is contemplated for the coming season.

Details of the trade agreement remain to be announced, but restrictions on a number of less essential imports from Belgium have been all but removed. The impression is that nothing very ambitious has been attempted, nor was this expected while Belgium's sterling holdings—despite Britain's welcome immunity from gold losses since the devaluation—continue to be perilously close to the £15 million gold point.

* * *

IMF Doldrums

The International Monetary Fund transacted business to the amount of $101,480,000 in the whole calendar year 1949. The latest monthly statement of its transactions shows that no business at all was done in December. The currency purchased from the IMF over the year consisted entirely of US dollars. The buyers were Brazil, $37,500,000; India, $31,680,000; Australia, $20,000,000; Jugoslavia, $9,000,000; Egypt, $3,000,000 and Ethiopia, $300,000. The amount of business transacted in 1949 brings the total of all IMF transactions to $777,283,000. The big reduction in the scale of the fund operations last year must be explained largely in terms of the virtual ban on purchases of dollars by countries in receipt of Marshall aid. While the new sales of currencies by the fund have fallen, the earning power of the institution is not necessarily declining. This is because the transactions of the fund are being left outstanding rather longer than was the intention of the founders. In the latest fiscal year, i.e. from May 1st to December 31, 1949, members' re-purchases of their own currencies from the IMF, i.e. the liquidation of earlier facilities obtained from the IMF, amounted only to the equivalent of $3,569,000. The tendency has been to maintain outstanding those facilities of the fund which involve little or no cost, i.e. the amounts equivalent to each member's gold subscription. That part of the sales of dollars made by the fund is beginning to look uncommonly like a medium or long-term loan. This is out of keeping with what should be the normal character of IMF transactions.

Industry and Shipping

Engineering Wages

The leaders of the Confederation of Shipbuilding and Engineering Unions, who last week had their claim for a general increase of £1 a week rejected, expressed their "disappointment" at the employers' reply, but it can have come as no surprise to them. Even before the negotiations had been opened, Sir Alexander Ramsay, director of the Engineering and Allied Employers' National Federation, had sent a letter to the unions (and communicated its contents to the press) urging them to "think twice" in the national interest. The claim, it has been estimated, would have added £120 million to the annual wages bill, thus greatly increasing costs. A detailed report of the employers' reply was issued this week. Mr H. G. Brotherton, the president of the confederation, has spoken of the bad impression the rejection of the claim will make on his members. The executive of the confederation meets this week to discuss the next steps, and, while decisions may be postponed until after the election, it is not expected that the unions will be content to let the matter rest.

The unions' claim was based on two main contentions: that the desired increase had been earned by increased productivity; and that it could be met out of the present level of profits. The employers replied that increased productivity did not come solely from the workers' efforts, but was brought about also by improvements in production technique, and that earnings in the engineering industry had risen relatively more than in other industries. According to Ministry of Labour statistics, earnings in the metal, engineering and shipbuilding group in April, 1949, had increased by 1s. 8d. an hour since October, 1938; this compares with an increase in all industrial groups of 1s. 6.6d. Average hourly earnings in a week of 46 hours were now 3s. 2.8d., compared with 3s. in other industries.

The union arguments on profits and their interpretation of statistics was described as "fallacious" by the employers, who pointed out in their reply that the unions had included a wide range of costs (including rents, rates, advertising and selling costs, telephones, insurances and postage) in their figures of gross profits. The engineers had sought to prove from the Census of Production returns that the gross profits

being made in their industries ranged from £3 to £4 or more a worker each week, and that this left a wide margin for a wage increase. The employers also referred to the general increase in operating costs and in re-equipment and renewal of plant at postwar prices, and pointed out that no firm could possibly carry on without retaining profits in the business. Their final and perhaps most powerful argument was the effect that still higher costs would have on stability and employment in the engineering trades. An increase of the size demanded would cause many firms—and not merely those which can fairly be described as "marginal"—to be squeezed out of business, and a surplus of labour would inevitably arise. Thus the increase would be likely to recoil severely, at first on the men in vulnerable situations, but later on the collective standards of the engineering workers as a whole.

* * *

Transport Command Cuts Aircraft Orders

The Bristol Aeroplane Company and Handley-Page Ltd. have protested to Mr Attlee about the Air Ministry's decision to reduce its outstanding orders for military transports. Two transport aircraft are built in this country, one by Handley-Page Ltd. and the other by Vickers Ltd., and the Bristol Aeroplane Company builds the engines for both. The men who become redundant at Vickers as a result of the reduction can be found work in other departments, but the other firms have no option but to dismiss a substantial number of men.

In spite of rumours, no other branches of the aircraft industry are affected. The reduced orders are the direct result of the cuts of £30 million which were ordered to be made in defence expenditure. The proportion of the cut to be borne by each of the services was not announced; if it were divided in proportion to the services' share in total defence expenditure, the cuts to be made by the Air Ministry should not exceed £7,000,000 to £8,000,000. Some of these economies will presumably be made by reducing the size and therefore the running costs of Transport Command, but there has to be some reduction in the number of new aircraft ordered. It is not inconceivable (since these transports, or variants of them, have already been in use for some years) that the development of new military transports may now be left to the United States aircraft industry. So far as is known, no development work on exclusively military types of transport aircraft is being done in Britain at the present time.

It is not clear yet how many men will be dismissed, but the number is likely to be moderate in relation to the size of the total labour force in the aircraft industry, which is estimated to have risen during 1949 from 140,000 to 152,000. The calculation has been made that 1,000 men might become redundant for every £1,000,000 of orders cancelled. This amount of labour could be absorbed without hardship if the cuts were distributed over the entire industry, but firms specialise in one or two types of aircraft only, and a reduction in the demand for particular types falls on the few firms which produce those types. A parallel, though separate, case is that of the flying-boat specialists, Short Brothers and Harland Ltd. This firm has had to lay off numbers of men at a time when employment in the industry has been rising. There is no demand for flying-boats at the present time and only three, the 100-seater turbo-prop Princesses of Saunders-Roe, are under construction in Britain.

* * *

Rising Wool Textile Output

Since the Wool Control was wound up, the wool textile industry has been responsible for compiling its own statistics. For this purpose the Wool Textile Delegation at Bradford set up a Bureau of Statistics on November 1st. The change means that returns of stocks, wool consumption, output and other matters which were formerly collected under compulsory powers are now voluntary. It therefore touches the industry at a sensitive spot, for the wool textile manufacturers, in so far as they like to be organised at all, have a rooted preference for voluntary as against statutory forms of organisation; it is this preference that has brought them into conflict with the Government over the question of a development council for their industry. To them, therefore, it can be presumed to be a matter of importance to demonstrate that collective action can be effectively taken by voluntary means—for an argument that applies to the assembly of statistics might apply to other common tasks as well.

There seems to be no doubt that the efforts of the Wool Textile Delegation to organise its statistical service have been a success. Their first product was a monthly summary, the first number of which, covering November, appeared early in January. This is amplified by a printed *Monthly Bulletin of Statistics* dealing with the same month, but appearing some weeks later. With the cessation of rationing, certain information which used to be collected is no longer available. But the general claim is made that "the coverage has been fully as comprehensive as under the Wool Control," and this claim seems to be if anything on the modest side. Summary figures are given below:—

WOOL TEXTILE ACTIVITY IN UK
(adjusted for number of working days in each month)

	Nov., 1948	May, 1949	Sept., 1949	Oct., 1949	Nov., 1949
Wool consumed.....mn. lb.	39·3	40·9	42·8	44·0	45·6
Wool tops produced..... "	21·2	22·0	24·2	25·2	25·4
Wool tops drawn..... "	17·6	17·5	17·2	18·6	18·9
Worsted yarns delivered..... "	15·3	16·0	17·7	17·5	18·8
Woven wool fabrics delivered.mn. yds.	22·8	23·0	23·4	24·8	25·8

Source: Wool Industry Bureau of Statistics, Bradford.

The physical performance which the November issue has to record is impressive. Production of wool textiles is usually high in the autumn, and in November—measured by wool consumed, tops produced and drawn, and deliveries of worsted yarn and of woven wool fabrics—it reached the highest point since the war. The figures in the accompanying table are expressed in terms of a "standard" month of 20¾ working days.

Canadian Ships for UK Registry

Tramp shipowners on this side of the Atlantic are anxious about the consequences of a decision by the Canadian Government to transfer, and by the Ministry of Transport to accept, the registry in the United Kingdom of 123 ocean-going dry-cargo ships of about 7,000 tons gross and 10,000 tons deadweight each. These vessels were built in North America as part of the wartime emergency shipbuilding programme. They are not normally regarded as well suited to operate in competitive commercial service, and the high dollar costs of operation in Canadian registry are prohibitive in the face of falling freight rates and dollar scarcity. The Canadian Government, anxious to retain a strategic reserve of merchant ships for use in the event of war, but unwilling to follow the United States example of heavy subsidy, therefore proposed the transfer of these ships to UK registry, to be manned by British crews and managed in Britain. The ownership is to be retained by Canadian companies. Profits, after charging expenses and management fees, would presumably be returned to Canada in dollars; but it is not known what the position would be if the ships failed to earn sufficient dollar freights to cover their unavoidable dollar running costs.

While British tramp owners would not have liked to see

CHUBB
took no chances then

In 1922 the S.S. 'Egypt' was sunk off Ushant, and with her sank £1,000,000 worth of gold bullion. Her strong-room door being made by Chubb, divers had to cut through three deck-levels and breach the strong-room roof before they could salvage the gold.

takes no chances now*

* Ships' bullion rooms by Chubb were in wide use before the first World War. And today it is standard practice among many of the world's best known shipping lines to commission from Chubb their bullion rooms, ships' safes, locks and security installations in general. Goverments, banks, insurance companies and commercial undertakings are among the many others who recognize that Chubb designers and craftsmen overlook no conceivable risk. A Sensible Policy for Process Steam—3

Do You Get Full Value from Your Steam?

BY SPIRAX

Theoretically a process man needs a precise amount of steam heat to do a particular job. These heat requirements can be worked out with reasonable accuracy.

But there will be a difference, possibly a big difference, between the amount of steam needed by the process man and the amount drawn from the boiler. The difference between the two amounts is waste.

It is not improbable that 75 per cent of the heat in the steam drawn from the boiler could be wasted. Who would tolerate a 75 per cent waste of any material drawn from the general stores?

The waste may be due to ignorance, outmoded process habits, thoughtlessness, or plain carelessness.

Hidden waste and misuse will stay hidden until you have a system of "storekeeping" steam, with the steam supply to each main department measured by meter.

DICTAPHONE PRESENTS THE TIME-MASTER

a new conception of dictating machines!

New plastic MEMOBELT gives clear, uniform recording on smallest-ever machine!

THE DICTAPHONE TIME-MASTER, with its plastic MEMOBELT, is an entirely new kind of dictating machine.

So easy to use! Just think out loud — and the TIME-MASTER does the rest — lets you take full advantage of those moments between phone calls, interviews and conferences. You *instantly* record your thoughts without calling for secretary and notebook.

Records on Plastic Memobelt! The tiny plastic MEMOBELT marks a new advance in recording. It records clearly and uniformly — carrying on the Dictaphone principle of cylindrical recording. This makes possible constant speed, constant quality recording *and* uniform back spacing.

Each MEMOBELT takes 15 minutes' dictation. And you can post them in a standard envelope — as many as 10 at a time for 2½d.

Dictaphone Time-Masters are now manufactured entirely in England. This means a speeding up in deliveries.

Only the Time-Master offers all this!

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back spacing, and rapid place finding. 4. Simple, automatic operation. 5. Mailable, filable, expendable MEMOBELTS, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd. (Dept. O), 107 Kingsway, London, W.C.2.

these ships transferred to Greek or Italian registry, for example, to increase foreign competition for freights, they are a little perturbed by this sudden accumulation of low-cost tonnage on a falling market—and particularly of a type of tonnage of which, relatively to other types, there is already too much. It is true that fifty of the ships concerned are already being operated by British companies on bareboat charter from the Ministry of Transport, but these were due to be returned to Canada this year. Their return would have improved the prospects of the remaining sterling ships in the dollar-earning market. Now, it appears, there will be another 65 ships competing for freights.

If it is doubtful that seaborne trade will increase in proportion, at least it is some consolation that the Canadian Government might have insisted on a more harmful plan of action—that of heavy subsidy and other discriminatory measures to keep Canadian ships in service. That is the policy of the United States, where measures are now being urged to extend the "differential" subsidies on building and operation to tramp as well as to liner companies on "scheduled trade routes." There is also talk of measures which would make it compulsory for 50 per cent of all US foreign trade—not merely ECA and Mutual Defence shipments—to be carried in American ships. This policy has the double effect of wastefully inflating the amount of tonnage available and of discriminating deliberately against the dollar-earning capacity of the shipping and shipbuilding industries of western Europe, against which on a simple cost-for-cost basis the Americans cannot compete.

* * *

Timber Chartering Difficulties

For some time there has been a belief in the shipping industry that the Timber Control would shortly restore to private traders the right to purchase and charter ships for the transport of their own timber cargoes. An announcement at the end of January, however, has made it clear that Timber Control will operate for at least another season and will continue to control the chartering of softwood from the Baltic to the United Kingdom. At the same time it announced important changes in the terms on which charters have been fixed in previous years. In the first place, owners instead of charterers will be expected to pay for discharging costs, which are reckoned to be about 20s. to 25s. per standard on the basis Southern Finland/London; and in the second place a new scale of differentials for various discharging ports has been introduced. The scale of differentials is not considered satisfactory from the owners' point of view. Further, if discharging costs, including all extras, are for owners' account, freight rates will require to be adjusted accordingly, but it is doubtful whether Timber Control chartering committees will be disposed to make full allowances for the risks involved.

During the last season, it will be recalled, the British owners of suitable tonnage were dissatisfied with the Timber Control terms, which (they claimed) would have involved them sometime in losses of up to £20 a day. The Timber Control was able to fix a large number of German and other foreign ships, although not without improving its freight rates as the season advanced. The renewed failure to come to agreed terms is likely to postpone the beginning of chartering once more; this, if too long delayed, may lead to port congestion and consequent waste at the latter end of the season. In any event, owners are unlikely to press for fixtures until after the General Election, in case the result might have some bearing on the future status of the Timber Control.

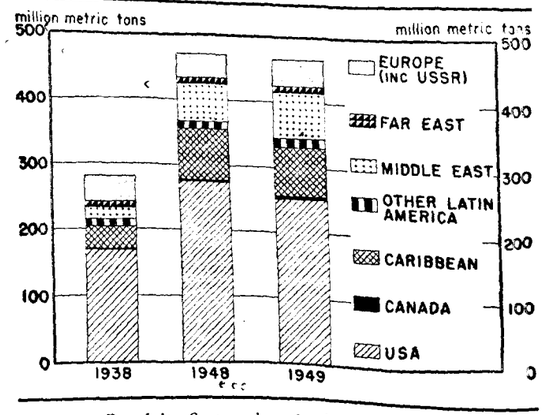
British Engine for US Small Car?



Discussions which have been taking place between the British Standard Motor Company and the Nash Corporation of America are unlikely to reach a conclusion until the American company knows the results of its recent market survey. The discussions concern the possibility of the Standard company supplying engines, and perhaps entire transmission units, for a proposed Nash small car—a two-seater which would be produced at the rate of 100,000 a year to sell at about $1,000. Both General Motors and Ford have in recent years designed small cars for the American market, but neither was ever put into production. Market surveys then indicated that most Americans would prefer to pay the same price for a larger second-hand car than for a small new one.

The Nash Corporation has therefore approached the matter cautiously, and has been exhibiting a pilot model in order to get first-hand comments. It has also sent out a quarter of a million questionnaires, the answers to which are now being analysed. Not until this evidence is complete will the corporation decide whether or not to go ahead with its plans. Besides the Standard engine, units built by Fiat have also been considered, but the Standard rear axle and gearbox at present being made for the company's new Triumph fit the dimensions of the Nash design, and this has weighed in the British company's favour. The decision to use a foreign engine was taken to keep down the cost of developing the car, since its production is planned on a small scale by American standards.

Commodity Trends

World Oil Output in 1949

A survey of world crude oil output last year which appears in the *Petroleum Press Service* for February gives evidence of the continuing change in the relative positions of the United States and the rest of the world as oil producers. The United States, with a production of 253.2 million metric tons, still produced more than half the total world output (467.7 million metric tons). Its lead was, however, substantially reduced. World output had been 471.0 million tons in the previous year, and the United States had produced 277.2 million tons of this. Thus in 1949 United States oil

output suffered its first major check, except for some temporary setbacks in 1938, since the great slump year of 1932. The reason for this was no lack of capacity to produce, but a recession of demand; American domestic requirements for all the major oil products except gasoline were well below their 1948 level. Restrictions were imposed on output by the Texas Railroad Commission—primarily, no doubt, to avert a threat to the level of prices.

The net effect was a slight reduction (1 per cent) in world output. But, while American production fell by 24 million tons, production in the rest of the world rose by 20 million tons (from 194 million tons in 1948 to 214 million last year).

Aggregate production in Latin America did not change greatly. Output in the Middle East rose by 13 million tons (23 per cent), and Kuwait, which increased its production from 6.4 to 12.4 million, was the most notable contributor to this change. Kuwait oil is exploited by a British and American partnership. In the other Middle Eastern countries, American and British companies shared in a general though not spectacular increase.

The oilfields of the Far East achieved a net increase of 2.5 million tons, which was shared by Indonesia and Borneo; the attempt at reconstruction in Burma has produced no results yet. Oil production in the Soviet Union is not easy to assess, but the conclusion is reached that Soviet oil production rose by 4.1 million tons (14 per cent) to 33.2 million. This represents some over-fulfilment of the Russian plan. But plans to increase oil output in the remaining countries of eastern Europe, and notably in Rumania, met with disappointment.

The improvement in Canadian production is more significant than the accompanying chart would suggest. The increase in Canada was from 1,691,000 tons in 1948 to 2,930,000 tons in 1949. This, though already a useful contribution to the economy of western Canada, is trifling compared with what can be achieved when the pipelines and other transport facilities have been constructed to take the output of the Alberta oilfields to the Great Lakes and more distant markets. Alberta output will be doubled this year.

* * *

Oil Prices since Devaluation

The countries which devalued their currencies in September have handled in different ways the consequential problem of adjusting the prices of petroleum products. Most of them have by now taken a decision of some kind, and the *Petroleum Press Service* considers that the position "has now crystallised sufficiently to allow an assessment to be made of the broad changes which have taken place."

In fact, however, the position now reached can hardly be described as settled. In Britain itself the Government, in raising the maximum permitted prices, "requested" the oil companies not to raise their prices to the full extent pending further discussions; those discussions are still going on, and the actual prices now in force (for example, 2s. 3d. for petrol at the pump, compared with a formal maximum of 2s. 3¾d. and a pre-devaluation price of 2s. 0½d.) do not express the whole effect of devaluation. Most of the sterling area governments took their cue from the British Government, though New Zealand has so far avoided raising the price of motor spirit and has made only small increases in other oil prices.

Outside the sterling area, three of the countries which devalued are considered not to have increased their oil prices in consequence. These are Portugal, western Germany, and Italy. The German case is a special one and not easy to follow. The price of a litre of motor spirit in the Federal Republic was raised on January 1st from 40 to 60 pfennigs—the equivalent of 4s. 7½d. a gallon. The price of gas oil was also raised. But these changes were made for reasons quite distinct from the rate of exchange, and the federal government has become heavily involved in its attempt to release road transport fuel from rationing; its intention is to make the price system do the work of rationing, but there is uncertainty whether the present prices—high as they are—would suffice. The Italian Government has approved a partial increase in ex-refinery prices, but has refused to allow retail prices to rise. But the Italian price for motor spirit is already 5s. 8½d. a gallon. The Portuguese price, which is also unchanged, is just over 5s. 2d. a gallon.

A number of governments have thought it advisable to soften the impact of devaluation, at least on the motorist, by reducing their taxes on motor spirit. Belgium took this step although the Belgian devaluation was relatively slight; the price remained at 3s. 11½d. a gallon. Ceylon and Trinidad did the same thing. Other countries have sought temporary relief by insisting that current stocks should be sold off at the old price; but, since there is no evidence that stocks had been inflated in anticipation of devaluation, this expedient cannot last long.

* * *

Boom in Rubber

The boom in rubber continues, and the spot price in London in the past week has risen close to 1s. 4d. a lb. On Wednesday the official quotation was 1s. 3 13/16d., the highest for more than twenty years. The recent announcement by the ECA Mission in London that it would shortly buy rubber with sterling counterpart funds has undoubtedly strengthened the market. But supplies last year were by no means overabundant. World production reached 1,482,500 tons, which was 37,500 tons less than in 1948. World consumption increased by 7,500 tons during the year to 1,427,500 tons, The consumption figures include estimated exports to Russia of 105,000 tons, but they take no account of purchases for the American stockpile.

Production in Malaya amounted to only 672,000 tons compared with 698,000 tons in 1948. Output from the estates declined very slightly owing to unfavourable weather, but smallholder production fell by 24,000 tons to 271,000 tons. Indonesian output was 431,000 tons—1,000 tons less than in 1948. Production from the estates continued to expand, from 102,000 tons to 167,000 tons, and almost regained the 1938 level. Smallholder production, however, declined sharply, from 331,000 tons to 264,000 tons. These latter figures are calculated from known exports and since the indigenous producers feared some alteration in the currency, they shipped less rubber than they produced, preferring to hold rubber rather than cash. The supplies hoarded last year

THE "N.P.I." POLICY

not only creates capital out of income, but at a chosen retirement age the fortunate policyholder can apply this capital to provide an income for the rest of his life, without the anxieties of investment. And for fifteen years this income is tax-free.

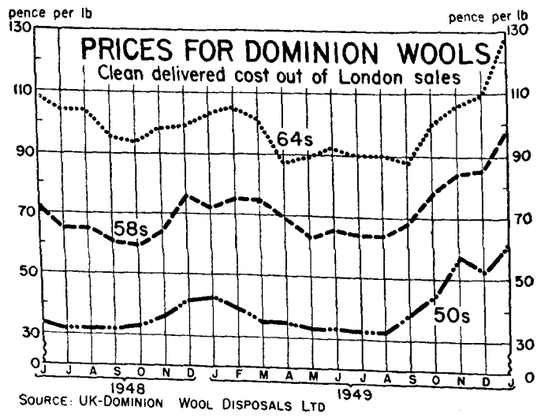
will thus be marketed in 1950, and Indonesian deliveries might, therefore, reach 500,000 tons during the current year. On this basis world deliveries of natural rubber could easily total 1,550,000 tons in 1950.

The modification made last September to the American law governing the minimum proportions of synthetic rubber which must be used in the manufacture of tyres and inner tubes gave a fillip to the consumption of natural rubber. In the last quarter of the year consumption averaged 51,900 tons a month compared with 43,300 tons in the previous quarter (when the price of natural rubber was well below that of synthetic) and 49,900 tons in the first quarter. If this new rate can be maintained throughout the present year, American consumption of natural rubber might increase by at least 50,000 tons.



But what of stockpiling purchases? These figures are not published, and can only be inferred from other statistics. Last year, net imports of natural rubber into the United States totalled 652,000 tons. Consumption was 576,000 tons. But since commercial stocks fell by 36,000 tons during this period, purchases for the stockpile must have amounted to 36,000 tons *plus* the excess of net imports over consumption (76,000 tons): that is 112,000 tons. If the market can count on stockpiling purchases of at least 100,000 tons and the purchase of 100,000 tons by Russia, total purchases this year might exceed world production by some 40,000 tons. In 1949, total purchases exceeded world production by 57,000 tons.

Setback in Wool

Wool prices have begun to decline after reaching almost record levels last month. The first indication that the peak had passed came from the London sales which opened towards the end of January. Prices during the first week of the auction were not supported up to the levels previously attained in Australia. Since then, prices have fallen both in Australia and in London. Merino wools are now 10 to 12½ per cent below the peak of last month and crossbreds some 15 per cent lower. In each of the past two seasons wool prices have tended to fall in March and April. If the latest setback is to be dismissed as a seasonal adjustment, it has certainly come somewhat early.

The explanation for the setback, however, is not hard to seek. British and European wool manufacturers had bought heavily in Australia, New Zealand and South Africa during the first half of the season and these purchases have now arrived or are due to arrive; hence there is no longer any urgency for "spot" supplies. A further factor is the growing resistance to and concern about the high level of prices. Few manufacturers have sufficient confidence in the theory that supplies of raw wool are likely to be short for some years to continue accumulating stocks at current prices—even if they had the liquid capital to do so.

SOURCE: UK-DOMINION WOOL DISPOSALS LTD

Delegates from the Dominions are at present meeting in London to discuss the future of the Joint Organisation now that its wartime stocks have been almost liquidated. The Dominions are apparently still anxious to institute a Commonwealth marketing scheme for wool based on buffer stocks. Unfortunately, commodity schemes before the war taught the same lesson: that they can afford some measure of relief to producers for a short period but only at the expense of their own long-term interests. If wool is kept dear, all the advertising in the world that "there is no substitute for wool" will not prevent substitutes being sought and developed.

* * *

Capital for Free State Geduld

The raising of capital for the mines of the Orange Free State this year has so far largely hinged on the requirements of Free State Geduld. This mine is the richest in the whole OFS field, judged by borehole results. The famous Geduld No. 1 borehole on the property assayed the outstandingly high value of 23,037 inch-dwts. It is expected to be in production early in 1953, and it is estimated on present values that the mine will show a recovery of 15 dwts of gold per ton. Hence it would be as rich as the Blyvooruitzicht mine on the Far Western Rand. Further funds are required to advance development towards the production stage. The next step will be to bring the No. 2 shaft to a depth of 4,200 feet and then to proceed with underground development towards the position of the Geduld No. 1 borehole. Share-

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk — and all that it means to your dependants — *without* this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon.

Reflection

Your Board Room or Office is a reflection of your efficiency and should be a forceful part of the business of selling, whether it be sales or services. You will find this efficiency in Catesby Office Furnishings and we offer you our full experience and tradition of service. We invite your enquiries for a single item or complete new office to our Director of Contracts.

Your enquiries for floor-coverings, and for any assistance are cordially invited.

From Captain Cook's Journal May 26th. 1769

"Some flying showers again. This morning we hauled the pinnace a Shore to examine her bottom, and had the Satisfaction to find that not one worm hath touched it, notwithstanding she hath been in the water nearly as long as the Long Boat. This must be owing to the White Lead with which her bottom is painted .... for no other reason can be assigned why the one should be preserved and the other destroyed, when they are both built of the Same sort of Wood and have been in equal use. From this Circumstance alone the bottom of all boats sent into Countrys where these worms are ought to be painted with White Lead ..."

TWO CAPTAINS ON WHITE LEAD

From a letter to
ASSOCIATED LEAD
MANUFACTURERS
September 3rd,
1949

"For many years I was Deputy Conservator of the Port of Rangoon and had under my charge four unattended light-ships. They were anchored off the mouth of the Rangoon River and were subject to rigorous climatic changes and sea conditions ...

In March 1942 the Port fell to the Japs. At the time all our light-ships were on station, with the exception of one relief. In May 1945 I returned to Rangoon and it was evident that none of these craft had received any paint attention during the Jap occupation but I found the *lead-painted* decks as intact and in as good order as the day we left them and some had not been painted for four years."

Yours faithfully,
H. C. Granger-Brown,
Captain M.N.

holders will be asked on February 14th to approve the issue of 3,000,000 5s. reserve shares ; 1,000,000 shares would be offered immediately to shareholders, at 70s. a share, on a one-for-five basis subject to Treasury consent for the proportion offered to shareholders in this country. On subscription this would bring the issued capital up to 6,000,000 5s. shares. At the present price of 4¾ the present market capitalisation of the company would be just over £20 million.

Since Blinkpoort Gold Syndicate, the original vendor of F.S. Geduld, still owns some 825,919 shares in the company, it is natural that it should wish to take up its allotment of the new F.S. Geduld issue. Sanction of the shareholders is to be sought for an issue to shareholders of 500,000 5s. shares at 27s. 6d. in the proportion of one new for four old, with the further option, up to June 30, 1951, on one share at 35s. for each share subscribed.

Similarly, Anglo American Corporation has made its dispositions to take up its share of the new finance. It is doing this through its control of Orange Free State Investment Trust, which at December 31, 1948, held 1,257,729 shares in F.S. Geduld. Anglo American is to subscribe for 1,000,000 10s. shares of "Ofsits" at £3 per share in return for a 10 per cent interest in Witwatersrand Extensions (reducing Ofsits interest in Wit Extensions to 45 per cent). In view of the recent rights issues made by St. Helena and Western Holdings (Ofsits holds more than 1,000,000 shares in each of these companies) it is clear that the present deal is calculated to replenish the depleted resources of Ofsits so that, *inter alia*, it may take up its share of the new F.S. Geduld issue. With two flotations of Wit Extensions as possible future commitments for finance, Ofsits will be relieved of part of its responsibility in a second direction.

Shorter Notes

Britain's "ECA counterpart fund"—the Treasury special account at the Bank of England—rose by another £8,500,000 in the week to February 8th. It now stands at no less than £131.7 million, owing to the hold-up of ECA permission for releases. Until early November, when the last release was sanctioned, the released credits were being applied to formal redemption of the specially-created category of Treasury debt held by the Bank of England. The reasons for this hold-up were discussed in a Note in *The Economist* on December 31st last.

*

Negotiations for a new payments agreement with Israel have been concluded. No official statement had been made as this issue went to press, and the report that some £12 million is to be released from the Israeli sterling balances had not been confirmed. Talks to determine the claims and counter claims arising out of the closing stages of the Mandate are continuing.

*

Swedish shares quoted in London have risen this week close to parity with prices on the Stockholm Stock Exchange. The rise is a natural consequence of the relaxation of restrictions on capital transfers between Britain and the Scandinavian countries which forms part of last week's "Uniscan" agreement. Swedish Match "B," S.K.F. and Elektrolux have benefited in particular from this partial restoration of normal arbitrage facilities.

*

Coal output last week was 4,088,300 tons from the mines and 194,100 tons from the opencast workings. The total of 4,282,400 tons is some 100,000 tons less than in the preceding week. More than half of the reduction is accounted for by opencast output, which was restricted by bad weather and other difficulties. In the mines, it is beginning to appear that the shrinkage of the labour force has been resumed since the Ministry of Labour removed the prohibition on leaving the industry. The number of workers on colliery books fell from 708,200 on January 21st to 707,300 on January 28th. This is probably not unexpected ; the prohibition was removed in the hope that its removal would encourage recruitment, but it will not be surprising if the number of men who take the opportunity to leave the industry exceeds for a time the number of new recruits. But if the shrinkage were to go on at the present rate for more than a few weeks, it would begin to cause serious concern.

*

Iron and steel output made a good start in 1950. Output of pig iron in January was at a weekly average of 187,400 tons ; this represents an annual rate of output of 9,742,000 tons, as compared with the rate of 9,262,000 tons in January last year. Weekly average production of steel ingots and castings was 305,300 tons, equivalent to an annual rate of 15,873,000 tons, compared with a rate of 15,002,000 in January, 1949. This is the highest British steel output ever recorded in January. The total level of activity for the month was to some extent limited by the Scottish holidays, but the output of 328,100 tons in the last week of the month was the highest ever reached in any week by the British steel industry.

*

The Ministry of Food has agreed to pay Commonwealth sugar producers £30 10s. a ton c.i.f. United Kingdom during 1950. Last year, and in 1948, the agreed price was £27 5s. a ton. The long-term contracts between the Ministry and Commonwealth sugar producers are due to expire at the end of 1952 ; they provide for prices to be negotiated annually. No general agreement has yet been reached for the subsequent five years.

*

As a result of devaluation, sterling prices of edible oils have been brought into balance with dollar prices. Last summer edible oils from dollar sources were markedly lower than supplies from the sterling area. American cottonseed oil is now selling at £104 a ton compared with £80 a ton for whale oil and palm oil from the sterling area, while copra from dollar sources is £70 a ton against £75 a ton for sterling supplies.

COMPANY MEETINGS

NORTH OF SCOTLAND BANK

AMALGAMATION WITH CLYDESDALE BANK

The annual general meeting of the North of Scotland Bank, Limited, was held on February 8th at Aberdeen.

The following is an extract from the circulated statement by the chairman, Captain John S. Allan, D.L., on the report of directors, balance-sheet and profit and loss account for the year to December 31, 1949:

The profit for the year was £147,754, a decrease of £3,372 compared with the previous year. During the past year the business of the bank has been well maintained. Current, deposit and other accounts, including provision for contingencies, at £59,055,164, show a slight increase of £291,638 on the year. Our highly liquid position has been preserved.

As announced in the press on September 14th last, arrangements have been made for the amalgamation of this bank with the Clydesdale Bank on January 1, 1950. I feel sure that the local and personal associations built up by the North Bank will not only be continued but extended in the larger institution. For over 100 years the North Bank has served a variety of industries characteristic of the Scottish economy, and especially the industries of agriculture and fishing upon which the prosperity of the North-East has been built.

Of the future, I have every confidence that the banking services which we render to the community will not only be maintained but developed by the Clydesdale and North of Scotland Bank through the larger resources at the disposal of the combined institution, now the largest banking unit in Scotland with a widespread network of over 360 branches. We are specially anxious to assist, technically and financially, exporters and potential exporters of Scottish products, and we shall continue to have a specially trained staff to deal with, and advise on, problems incidental to export business.

MARTINS BANK, LIMITED

ANNUAL GENERAL MEETING

The one hundred and nineteenth annual general meeting of Martins Bank Limited was held on February 7th at the head office, Liverpool. Mr. R. V. Buxton, D.S.O., a deputy chairman, presided in the absence of Mr. A. Harold Bibby, D.S.O., D.L., who is abroad.

The notice convening the meeting and the auditors' report were read.

The report and accounts for 1949 were adopted and resolutions were passed re-electing the retiring directors and fixing the auditors' remuneration.

Mr. Buxton, in acknowledging a vote of thanks, expressed a warm tribute to the general management and staff.

The chief general manager, Mr. James McKendrick, suitably replied.

Orders for Company Meeting reports to be addressed to :—
The Reporting Manager,
The Economist,
22 Ryder Street,
St. James's, S.W.1

THE CLYDESDALE BANK, LIMITED

BENEFITS OF AMALGAMATION

The one hundred and twelfth annual general meeting of shareholders of The Clydesdale Bank Limited was held at Glasgow on February 8th.

Sir Harold E. Yarrow, Bt., C.B.E., the chairman, in the course of his speech, said: The outstanding event of the year, so far as the bank's internal arrangements are concerned, was the decision to amalgamate with the North of Scotland Bank. After very careful consideration of the proposals, the directors were satisfied that such an amalgamation would be in the best interests of the clients of both banks, and following agreement between the two boards a petition was presented to the Court of Session to give effect to the fusion. The sanction of the Court was obtained on December 6, 1949, and the amalgamation became effective on January 1, 1950. The step is probably the most momentous in the history of our bank, resulting as it does in an unparalleled extension of our sphere of influence in Scotland.

We are very conscious of the justifiable pride which Aberdeen has in the history of the North of Scotland Bank, and I know that the former directors of the North Bank who have been appointed to the board of the Clydesdale and North of Scotland Bank will bring with them the business acumen and intimate knowledge of northern affairs which will ensure the success of the amalgamation. A northern area board has been formed, consisting of former North Bank directors, and this board will meet in Aberdeen. In your name, I extend a cordial welcome to those directors in their respective spheres. I am confident that the good relations which have existed between the two banks and their staffs will continue under the new arrangement, and I have no doubt that the improved services which the combined bank is able to offer will alone justify the decision to amalgamate.

As you can appreciate, the amalgamation has placed us in a very strong position, both in resources and in branch representation. The combined assets of the two banks at December 31, 1949, amounted to £183,760,637, and we have now 360 branches in Scotland and three in Cumberland. In London both banks have carried on an active business, and we now have two offices in the City and three in the West End.

BALANCE SHEET FIGURES

Turning now to the balance sheet figures, you will observe that our deposits amount to £99,071,558. This is £2,976,895 less than our record figures of the previous year, but, as I pointed out at last year's annual general meeting, the 1948 deposits included certain transitory and non-recurring items. Our basic figures thus show steady progress and at this juncture it is of interest to note that in the post-war period our deposits have increased by over £30 million.

Advances, at £22,035,817, are up on the year by £3,749,839. Included in this figure however, is an overdraft of £1,300,000 on a rotating account which came to us in the closing days of the year and which, by arrangement, fell to be shared equally among the Scottish banks in the first week of January. After allowing for this item, the actual increase of £2¼ million is sufficient indication of our bank's consideration for the growing requirements of trade and industry. I need hardly say that all applications for business purposes falling within the scope of Treasury regulations receive the full and sympathetic consideration of your directors and of the management.

You will observe that we have continued our policy of maintaining a high degree of liquidity in the distribution of our assets, the liquid resources aggregating £35,723,649, being equivalent to over 33 per cent. of our deposits and notes in circulation. Of the £51,703,914 in investments, consisting principally of British Government securities, a high proportion is represented by short-dated stocks which have not been appreciably affected by the serious fall in gilt-edged securities.

The net profits, at £275,113, show an increase of £5,063 on the results for 1948, and are arrived at after the usual provision for bad and doubtful debts and after meeting increased costs in general expenses, including the costs of the amalgamation with the North of Scotland Bank. After adding to net profits the sum of £119,357 brought forward, £394,470 is available for distribution, out of which the directors recommend a final dividend at the rate of 8 per cent. actual, less income tax, making 16 per cent. for the year.

I am sure you will agree that these results are highly satisfactory, particularly when viewed against the background of the recurrent economic difficulties which confronted the country during the summer months and which forced the Government to devalue the pound sterling in September. On the whole, 1949 was a year of uncertainty, and, while employment continued at a high level, there was a fairly general tapering off in industrial orders during the year, with a consequent undercurrent of apprehension for what the future holds in store.

ESSENTIALS FOR NATIONAL PROSPERITY

Although it has become somewhat of a platitude, there is no doubt that the nation's future prosperity as an exporter is dependent on three factors—increased production, competitive prices and reduced taxation. The true yardstick of production is not a comparison with what was done in previous years, but what can and should be produced by wholehearted endeavour on the part of management and workers alike, by intensive mechanisation, improved methods of production and the abolition of restrictive trade practices. Increased production in itself, however, will not ensure expansion of our export trade, unless the goods which we produce are offered at prices which can compete favourably in the world's markets. The means of achieving the third factor, reduced taxation, have been tackled only half-heartedly by the Government. The economies announced a few months ago were merely palliatives, and did not face up to the serious situation which will arise when Marshall Aid comes to an end in 1952—a grim eventuality which must be anticipated now. A reduction in the general level of taxation would provide that incentive which is so essential in stimulating the efforts to achieve competitive prices and fixed delivery dates as international competition grows in intensity.

In the basic industry of agriculture, with which we are so closely associated, the past year has been one of progress. While there has been a decline in the tillage area, considerable increases are reported in milk production and in breeding stock, supplying further evidence that Scottish farmers are returning to their traditional technique. I am pleased to report that our loans to this most important industry have shown a marked increase, not only in amount but also in numbers during the year under review.

The report was adopted.

BARCLAYS BANK LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The fifty-fifth ordinary general meeting (being the annual general meeting for the year 1950) was held on February 9th at the head office of the bank, 54, Lombard Street, London, E.C.3.

Sir William Goodenough, Bart., LL.D., (the chairman), presided.

Mr H. G. Tickle (the secretary), read the formal Notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present, the report and accounts and also the statement by the chairman, which had been previously circulated, were taken as read.

The chairman moved:—

"That the report of the directors of the company now produced, together with the accounts annexed as at December 31, 1949, duly audited, be received, approved and adopted, and that a final dividend of 5 per cent., making 10 per cent. for the year, on the "A" stock, and a final dividend of 7 per cent., making 14 per cent. for the year, on the "B" and "C" stock respectively, less income tax in each case, be declared, payable on the 25th instant to the stockholders registered in the books of the company on January 16th last."

Mr A. W. Tuke, a deputy chairman, seconded the motion, which was carried.

The retiring directors were re-elected, and other ordinary business was transacted.

A vote of thanks to the staff and a vote of thanks to the chairman for presiding at the meeting were unanimously accorded and the proceedings terminated.

F. W. WOOLWORTH AND COMPANY, LIMITED

A NEW RECORD

The forty-first annual general meeting of F. W. Woolworth and Company, Limited, will be held in London on March 3rd.

The following is an extract from the circulated statement of the chairman, Mr B. E. Uffindell.

I have much pleasure in placing before you the directors' report and accounts for the year 1949 and feel sure you will be satisfied with the results. The proposed final dividend of 1s. 4½d., making 1s. 9d. or 35 per cent. per unit of stock—now totalling 60,000,000 units instead of 30,000,000 units—accords exactly with the amount distributed as final dividend and bonus for 1948.

The volume of business during 1949 easily created a new record over the peak year of 1948. This was achieved by giving the consumer public outstanding value and satisfaction. Had it been otherwise we should naturally not have received the support they gave us. I should say here that these improved values were possible only by the loyal support of the entire staff of the Woolworth organisation, with a special word of praise to the company's buyers and many suppliers for their co-operation during the past year. It may interest you and the consumer public to know that during the year over 1,500 retail prices were reduced without affecting the value of the goods concerned, from which you will also gather that your company, as a matter of policy, reduced its profit margin, and the consumer public were not slow to appreciate this.

There will no doubt be problems to be solved during 1950, but with the marvellous teamwork which you have in your company, and all those associated with it, continuing in 1950, I have every confidence that your company will continue to progress.

ASSOCIATED MOTOR CYCLES LIMITED

RECORD TURNOVER

The twenty-first annual general meeting of Associated Motor Cycles Limited was held on February 9th in London, Mr S. R. Hogg, D.S.O., M.C., F.C.A., the chairman, presided.

The chairman, in the course of his speech, said:

The total profits of the group after taxation for the year under review are £135,354 as compared with £146,007 for the preceding year. After bringing in the balance of undistributed profit brought forward—£183,987, there is a total available profit of £319,341. In arriving at this figure of available profits full provision has been made for income tax for the year now under review.

Your directors were asked if they were prepared to give an undertaking to the Chancellor of the Exchequer to restrict gross dividends to the same total as the previous year, and after very serious consideration your directors decided that they would not give this undertaking; but they did give an undertaking to follow a policy of moderation and restraint. Provision has been made for the interim dividend, 5 per cent. less tax, which was paid to shareholders on July 11, 1949, and for a final dividend of 12½ per cent. less tax now recommended. The total dividend, namely 17½ per cent., is thus, in effect, at the same rate as for the preceding year.

BONUS ISSUE

An extraordinary meeting of the company is to be convened for the purpose of proposing the capitalisation of approximately £47,000 out of the £50,000 standing to the credit of the capital reserve account. The capitalisation will take the shape of an issue to the shareholders at par of 187,590 new ordinary shares, credited as fully paid up, that is to say, ordinary shares of a nominal value of £46,897 10s. The effect will be to increase the issued capital of the company to £281,385. The extraordinary meeting will be held on Monday, March 6th, next.

During the year under review your company still further consolidated its position as one of the leading motor-cycle manufacturing organisations in the world. Technical leadership was maintained by the new spring-frame Matchless and A.J.S. motor-cycles, production of which was commenced last spring, these models providing a standard of comfort, road-holding and superb steering qualities which has not previously been approached by other design.

The company's factories continued to work to capacity throughout the year, a record turnover being achieved, while I am proud to report that in spite of continuing and increasing restrictions in many foreign markets, over 70 per cent. of the Matchless and A.J.S. and over 55 per cent. of the Francis-Barnett motor-cycles produced were exported, our contribution to the export drive reaching a value of over £1,250,000 for the trading year.

The Clarendon Pressing and Welding Company Limited also continue to make progress in the output of parts for our three makes of motor-cycles, and also of pressed and fabricated parts for the motor-car industry and of internal factory transport equipment. These satisfactory conditions remain unaltered up to the present moment. The demand for our motor-cycles continues to be in excess of our productive capacity, so that unless there is a sudden recession in world trade we may expect satisfactory results from the current year's trading in spite of the continuing increase in manufacturing costs, due to causes beyond our control.

The report was adopted.

PATERSON, LAING AND BRUCE, LIMITED

GOOD PROGRESS

The forty-eighth annual general meeting of Paterson, Laing and Bruce, Limited, was held on February 7th in London.

Mr A. K. Graham, vice-chairman, presided and in the course of his speech said:—The progress of the business has been good as far as sales have been concerned, but the decline of profits on an increased turnover is not so satisfactory and is a matter that is receiving the closest attention by the board and executive. The obvious reasons are the great difficulties which are facing us in the shape of government controls, and more directly the narrowness of the margins under state price control and the upward trend of overheads, especially wages as enforced by the Arbitration Court and Wages Board.

We as a corporate entity have no politics and it is our business to do the best we can for our shareholders under whatever government is in power, and presumably it is any government's ambition to enable every trader to make the largest profit possible for the benefit of the whole country. There are times when the restrictions and difficulties make one wonder if whoever is in power fully realises this.

The outlook for Australia as a whole is distinctly good, and although one points out from time to time, as one must, that there are side winds that make things more difficult and even at times take cover, yet I do not think I should be unduly optimistic to anticipate a reasonably successful year. This is our hundredth birthday—a fact not only of interest but, I suggest, of value with the goodwill and reputation that it has built up.

The report was adopted.

FIRST GARDEN CITY LIMITED

SIR ERIC MACFADYEN'S ADDRESS

The forty-sixth annual general meeting of First Garden City Limited, was held on February 2nd in London.

The following are extracts from the statement by the chairman (Sir Eric Macfadyen, M.A., J.P.) circulated with the report:—

The accounts disclose a further contraction in the balance sheet totals. If we go back to September, 1946, our fixed assets were then shown at a book cost of £1,898,318 —against which a "depreciation and renewals account" had been built up on the liabilities side amounting to £537,490. In 1947 fixed assets were higher by £95,507—the net figure of £1,456,335 being given. At September, 1948, this was down to £825,258, the large difference being attributable to electricity nationalisation. We realised our compensation stock before the slide in gilt-edged values and had a surplus to show over the book value of the electricity assets as written down, which was absorbed in the repayment of loan capital. There will be further substantial adjustments next year in both assets and liabilities.

The prime need of Letchworth at this stage is more housing. The U.D.C. strives to satisfy the demand for homes: it is playing its full part along with ourselves in opening up the Grange Area—the new neighbourhood which was being planned when war broke out. One finds it difficult to restrain one's impatience over the slow pace at which this development is proceeding. In planning the completion of the town, scope for the expansion of established industries will have to be provided for as well as space for any newcomers.

The report was adopted.

BOLTON EAGLE SPINNING COMPANY

HIGH ACTIVITY MAINTAINED

RELIABILITY OF COMPANY'S PRODUCT

LORD BARNBY'S SPEECH

The annual meeting of the Bolton Eagle Spinning Company, Limited, was held on Wednesday, February 8, 1950, at Eagle Mill, Bolton, at 3 p.m. The chairman (Colonel Lord Barnby, C.M.G., C.B.E., M.V.O.), in the course of his statement, said: The combined profits of your company and its wholly-owned subsidiaries after providing for all expenses, reserve for bad debts (£2,500), depreciation (£9,809), are £110,406. The profits of the recently acquired subsidiary—J. and W. Bastard, Limited, are included for the period from July 7, 1949, date of acquisition, to October 31, 1949, only. Of the aggregate earnings, taxation provision absorbs £74,839.

The consolidated balance sheet shows that capital and revenue reserves now aggregate £225,918. The fixed assets at £92,673 are very materially less than replacement values.

The excess of current assets over current liabilities is £268,245, compared with £152,985 a year ago.

The carrying of stocks at their high price levels is an increasing financial burden on industry. Our aggregate stock in trade at £283,148 compares with an issued capital of £135,000, and prices have tended to rise again since stocktaking date.

SATISFACTORY TRADING RESULTS

The result of the trading year under review is, in the opinion of your directors, satisfactory. High activity was maintained throughout. Our first aim has, of course, been to supply our regular customers. We have been fortunate, in addition, to receive inquiries from a wide range of new directions.

It would appear that there is a great demand for worsted yarn, including dry-spun yarns which are our speciality. We feel that the reliability of our product has contributed much to the strength of the demand we have experienced. Good quality is a vital part of the satisfaction we can give our customers. In this, the important contribution that our operatives can make has been good.

We still have not found it possible to extend all our operations to the two-shift practice which is conventional in most other countries, and in some directions in England. This, of course, has an impact on the cost of production. Potential export is, meanwhile, being lost.

EXPORT BUSINESS

We have aimed to achieve all export possible as our contribution to the national picture. However, earlier in this year we found that in certain fields we had to meet keen competition from Continental countries where wage rates are lower.

In this connection we feel that a vigilant eye should be kept on imports of yarn into the United Kingdom from Continental countries. This, in spite of the small tariff existing, has already attained substantial proportions for the first six months of the current calendar year. Imports of wool yarn were nearly equal to exports—this seems an unusual situation.

Again in this connection misgiving might be expressed as to the propriety or wisdom of the strong support given to French industry through London banking accommodation for facilities to import wool to activate her industry, which in turn must indirectly as well as directly be competitive with ourselves.

It should be borne in mind that if the expansion of our exports were to attain proportions which would further endanger employment in North America, it would seem inevitable that political reactions might be stimulated. This in turn, in the long run, would act disadvantageously to the United Kingdom.

The overall aim to expand exports would seem to call for some incentive. This applies both to the worker who should have tax remission in the lower income brackets, and to the employer to redirect exports from conventional markets to "dollar" markets.

TAXATION AND NEW EQUIPMENT

Efficiency can only be maintained by continued installation of new and up-to-date equipment; this is the policy of your board. Difficulties are imposed in this matter by high rate of Government taxation, coupled with the meagre permitted rate of depreciation of existing equipment.

The latest concession of higher permitted rate in the first year of its life carries no real relief on the official "life" of the equipment. Costs of all textile machinery are now three times more than before the war. To put in equipment of such high cost unless it is run two or three shifts is almost impractical today.

Your business is owned by some 2,908 shareholders with an average nominal holding of £46. Many of these are people of small means. This disproves any suggestion that your company is a capitalistically-owned enterprise in the ordinary sense of careless thought that such enterprises are owned necessarily by wealthy people.

Reference should be made to the impractical policy of the Government in continuing the low "utility" price ceilings so far beyond their realistic relationship to actual conditions. Such conscious regulation when not kept up to date with changing conditions in an industry where raw material is subject to fluctuations from influences without, rather than within the United Kingdom, is clearly more idealistic than practical.

Overall economic conditions are strongly influenced by Government policy. Before devaluation, the Government announced an energetic policy of disinflation. This disappeared following devaluation. This was followed by suggestions that internal prices would not rise. Official statements have indicated that within six weeks of devaluation, most internationally-used sterling-origin raw materials rose by between 15 and 30 per cent.

The present position of our "unfilled order" book promises high activity for the first six months of the current trading year and at satisfactory prices, and so gives encouraging hopes.

A NEW ACQUISITION

We acquired as a wholly-owned subsidiary J. and W. Bastard, Ltd., of Leicester, on July 7, 1949. There has followed a marked increase of output with a full maintenance of established reputation for good quality yarns. I am glad to report very happy relationship between management and labour. This company promises good contribution to the profits of the Group.

Your other wholly-owned subsidiary, the Seamless Axminster Company, Limited, has had a successful year with full activity at satisfactory prices and a record of satisfied customers as to quality and service. New equipment, long on order, has been installed, and additional equipment on order will in due course follow. Recognition has recently been given by the Board of Trade to constantly increasing raw material and other costs by granting a 7½ per cent increase on certain classes of goods. The chairman added that the current weekly volume continues to record the progressive increase over previous production in all three units.

The report and accounts were approved.

The retiring directors were re-elected and the auditors' remuneration was fixed.

NOTICES

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Economics tenable at the London School of Economics and Political Science (salary £1050-£1250-£1450). Applications (10 copies) must be received not later than February 25, 1950, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

OPPORTUNITY occurs for man at present Chief Accountant to change to similar position in established and progressive engineering Company in S.W. London. Good prospects for the right man, who should be a competent Accountant (preferably qualified) and able to take control of financial accounts and costing. Salary in mind £750 p.a. plus generous annual award and pension scheme.—Write giving full details of age, education, experience, etc., to Box "Y.T.," c/o J. W. Vickers and Co. Ltd., 7/8 Great Winchester Street, E.C.2.

BUSINESS man (43), with wide accountancy, secretarial and managerial experience, seeks executive, administrative, or secretarial position.—Write Box 331.

GRAMMAR Schoolmaster (35), Honours Graduate, seeks more remunerative occupation with prospects. Faultless French; good German, Italian. Willing to reside abroad. Present salary: £533 (pensionable).—Box 333.

UNIVERSITY OF BIRMINGHAM

CHAIR OF SOCIAL SCIENCE

Applications are invited for the Chair of Social Science. Candidates should possess some knowledge and experience of voluntary and statutory social services. Duties include the initiation and supervision of research projects.

Particulars of qualifications, publications and appointments held, together with the names of three referees, should be sent to the undersigned, from whom further particulars may be obtained, not later than March 8th next.

C. G. BURTON, Secretary

The University, Birmingham, 3. January, 1950.

SWISS citizen, Ph.D., specialised in international law and relations, full command of English, French and German, with some business experience, widely travelled, seeks interesting and responsible occupation, preferably with large firm or corporation, willing to go anywhere. Dr A. Roth, 132, rue de Lausanne, Geneva.

THE Berger Group of Companies requires for its main U.K. Trading Company, a General Sales Manager preferably with experience in Decorative and Industrial paint markets, but in any case with proved ability in large scale sales administration and in the application of modern methods of sales management. Advertising and Export Sales experience are not necessary qualifications. In confidence, please send details of age, career and salary required, to Box 340.

Investment Statistics

Company Notes

F. W. Woolworth.—Trading profit increased from £10,250,694 to £11,266,935 in the year to December 31, 1949. Total profit amounted to £11,458,322 (£10,425,716). Taxation absorbed £5,802,247 (£5,292,677) leaving net profit at £5,020,060 against £4,487,247. Stocks have risen from £6,009,773 to £6,690,754 and net current assets (excluding £4,141,135 gilt-edged investments in each year) from £14,063,679 to £16,321,055. Fixed assets, less written off, have declined from £10,808,920 to £10,724,981. Reserves, excluding future tax, are lower at £5,286,073 (£11,052,032) following the free bonus issue of 100 per cent in 1949 capitalising £7,500,000.

Westinghouse Brake and Signal.—Consolidated trading profit rose from £467,601 (for 53 weeks) to £491,213 in the 52 weeks ending October, 1949, after providing £110,393 (£98,864) for depreciation. Net profit of the group amounted to £214,480 (£230,879) after bank interest of £27,350 (£11,679) and taxation £238,935 (£220,892). A dividend of 14 per cent is recommended (same).

Liebig's Extract of Meat.—Group trading profit declined from £1,420,760 to £1,351,768 in the year to August 31, 1949. Net current assets were £5,802,000 (£4,872,000 at the year end); stocks increased from £4,622,000 to £5,236,000 and liquid funds fell from £2,154,000 to £1,793,000.

Stead and Simpson.—Profit in 1949 amounted to £507,717 (£526,550); net profit was £216,500 (£230,380) The dividend is unchanged at 10 per cent for the year. Net current assets were £1,155,648 (£1,013,186).

R. E. Jones.—Consolidated profit declined from £203,856 to £139,220 in the year to October 31, 1949. Net group profit was £64,728 (£98,596). The proposed dividend for the year is 7½ per cent (same).

Savory and Moore.—Group trading profit declined from £195,508 to £171,456 in the year to March 31, 1949. Net current assets were £335,000 (£337,000) at the year end.

John White Footwear.—Group trading profit fell from £273,636 to £236,356 in 1949. The dividend of 50 per cent is repeated.

British Industrial Plastics. — Group trading profit declined from £383,448 to £340,515 in the year to September 30, 1949. Net profit was £90,087 (£90,240). A dividend of 20 per cent (same) is recommended for the year.

Jute Industries.—Consolidated trading profit for year to September 30, 1949, was £864,986 (£754,863) and net profit £283,534 (£286,079). Dividend of 10 per cent (8 per cent) recommended on the non-cum. part. preference and 5 per cent (nil) on the ordinary for the year.

John Crossley and Sons.—Trading profit for the year to December 3, 1949, was £326,089 (£410,870) and net profit £179,239 (£207,779). A dividend of 20 per cent is recommended for the year.

West Riding Worsted and Woollen Mills.—Consolidated trading profit increased from £1,378,527 to £1,474,220 and net profit from £639,249 to £667,879 in the year to August 31, 1949. A total dividend of 40 per cent is proposed for the year absorbing £80,676 (£69,878). The ordinary capital was increased from £462,000 to £508,200 by a bonus issue on July 5, 1949.

Bell and Nicolson.—Group trading profit rose from £368,378 to £471,067 in 1949. Net profit was £189,224 (£148,761). The dividend of 15 per cent is repeated. Net current assets at the year end were £670,000 (£568,000).

Capital Issues

Calcutta Electric Supply.—Lists will open and close on February 14th for the offer of £3,000,000 five per cent. debenture stock, 1970, at £98 per cent. A simultaneous offer is being made in India of Rs. 2,66,00,000 (approx. £2,000,000). Share capital consists of £6,162,646 in £1,900,000 five per cent. cumulative preference stock and £4,262,646 in ordinary stock.

Quartons (Holdings).—Shareholders registered on January 23rd are offered 160,000 5s. ordinary shares at 5s. 6d. per share in the proportion of 8 new shares for every 25 shares held.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (n) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 14 years 4 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (h) Assumed dividend 18½% after capital bonus. (l) To latest redemption date. † Free of tax. (m) Final dividend on increased capital. Yield basis 35%. (n) Yield basis 26⅔% after capital bonus.

Statistical Summary

EXCHEQUER RETURNS

For the week ended February 4, 1950, total ordinary revenue was £181,223,000, against ordinary expenditure of £64,302,000 and issues to sinking funds £660,000. Thus, including sinking fund allocations of £14,160,000 the surplus accrued since April 1st is £504,170,000 compared with £724,369,000 for the corresponding period a year ago.

UNIVERSITY OF CAMBRIDGE

UNIVERSITY LECTURESHIP OR UNIVERSITY ASSISTANT LECTURESHIP IN ECONOMIC HISTORY

The Appointments Committee of the Faculty of Economics and Politics give notice that they intend to appoint either a University Lecturer or a University Assistant Lecturer in Economic History to take office from October 1, 1950. The appointment will be subject to the Statutes and Ordinances of the University. Further particulars can be obtained from the Secretary of the Faculty, the Marshall Library, Downing Street, Cambridge, to whom applications should be sent to reach her not later than March 15, 1950. Eight copies of the application should be sent, and, if so desired, one copy of any published work. Testimonials are not required, but a candidate may give the names of two persons to whom reference can be made.

ASSOCIATION representing major industry of primary importance to Sterling area economy has vacancy for an Economist/Statistician, academically qualified, and with experience of advanced modern statistical techniques. Post is based on London, but may involve occasional travel abroad. Substantial remuneration will be offered to a man of the quality required. Write Box 940, Dorland Advertising, 18/20, Regent Street, London, S.W.1.

GENERAL Sales Manager of the leading Company in its own field (proprietary product) with Home and Export turnover approaching £2 million, built up within last 4 years (patents acquired and Company formed 1944/45), having resigned on a fundamental sales policy matter, seeks similar appointment, directorship or managing directorship or opportunity to build up new product. Limited personal participation available with genuinely world-wide knowledge and experience in most phases of commercial management with a sales and advertising background.—Box 336.

SALE OF GROUND RENT. A well-established Property Company of fifty years' standing propose to create a Ground Rent of £8,000 per annum on one of their properties. It will be well secured, and the Directors invite inquiries from Trustees or Institutes requiring a gilt-edged investment. The best offer above twenty-five years' purchase will be accepted, subject to the proposed purchasers' full investigation.—Apply Box 338.

Agreement through Strength

HEART searchings in the western world continue. After Senator MacMahon, Professor Einstein, after Senator Tydings, Mr Churchill, have returned to the subject of the new bomb, seeking a way to mitigate its fearful dangers and to secure "some more exalted and august foundation for our security than this grim and solemn balancing power of the bomb." Mr Churchill's own tentative proposal is "a parley at the summit"—in other words, a new meeting of the heads of state. Professor Einstein's appeal is less specific. In a statement which has undoubtedly had its impact on American public opinion—and which appeared in the headlines of every French newspaper—the Professor denounces the "militarisation" of American life which, he claims, is coming about as a result of atomic policy and pleads for a general renunciation of violence and the setting up of at least an embryo world government.

It is difficult to quarrel with the aims of these two eminent men. Every responsible statesman in the western world can have only one objective—to achieve lasting peace by agreement with Russia. To end "the hatreds and manœuvres of the cold war" and to avoid the inconceivable horrors of a hot one are the overriding aims of western diplomacy. The real question is not one of aims but of methods. Would a direct approach to Russia, designed to secure, by mutual concession, an agreement on atomic weapons or possibly on all armaments, in fact bring genuine pacification nearer?

The fallacy in the idea of a limited agreement at this stage lies in supposing that the Soviet Union is interested in friendship. It is, on the contrary, concerned with the creation of a Communist world order, and agreements and failures to agree alike are regarded simply as stepping stones to this final end. The only obstacle the Communists recognise is, apparently, force—and the world may be thankful that Stalin recognises at least this restraint. Like some natural cataclysm, Soviet power erupts into the outside world, breaking through where the dams are weak, contained only where they are strong. An agreement based upon trust and mutual concession is not in the least like a dam or a containing wall. It is an act of faith—but who makes an act of faith with a river in spate?

This view of Soviet intentions does not mean that agreement is impossible, but simply that, as Mr Acheson has pointed out, agreements can come only after the walls and the dams have been built. An agreement based upon the recognition of strength—for instance, the agreement to reopen the road to Berlin—will be respected. Understandings based on the fact of weakness—for instance, the Pact of Friendship signed in 1945 between Russia and the Nationalist Government of China—will be violated on the very day of signature. Agreement through strength is the only possible diplomacy for the western world. The important question to ask, therefore of the present proposals for agreement with Russia is whether they strengthen or weaken western diplomacy. Mr Churchill perhaps is the one man

in the world with such personal stature and so firm a record of opposition to all forms of appeasement that he could be sent to Moscow without risk. But even he could hardly hope to secure from the Kremlin that sincere, comprehensive and trustworthy treaty of friendship, covering the whole range of matters at issue, that is alone worth having. Any other mission to Moscow would undermine the western position—as it is, Mr Churchill's proposal has left Mr Acheson and Mr Truman looking rather foolish, which is hardly helpful.

The danger of a mission lies in the degree to which the western conscience is upset by the issue of atomic weapons. Dr Einstein's complaint that atomic policy in America is leading to "the militarisation of youth, supervision of the loyalty of citizens, intimidation of people of independent political thinking" is only one example of the uneasiness which besets the western mind. A moment's reflection is, of course, enough to show how unbalanced such a reaction is. The very conditions of which Dr Einstein complains exist in an absolute degree in Russia and are indeed one of the chief reasons why agreement is impossible. The responsibility for refusing all forms of effective atomic control rests squarely with Russia. Yet if the western powers now make a new overture—outside the normal channels which would exist in the United Nations if Russia had not walked out—they run the danger of fixing in the popular mind the illusion that they bear some special responsibility for the continuance of the atomic arms race. Such illusions obviously weaken western diplomacy.

Another danger in premature negotiation was mentioned in these columns two weeks ago, but it can hardly be repeated too often. Any limited agreement which lulled the western world into the belief that special exertions or continued defence on their part had become unnecessary, would make war in the long run more certain. The western powers are by disposition neither determined nor vigilant. Given any reasonable excuse —and an apparent agreement with Russia would be such an excuse—they would no longer feel the compulsion to build up their own defensive strength. They would become a prey to the very weakness that might tempt the Soviets to new expansion.

This risk of western over-confidence is not confined to the specific question of military preparedness. Behind the hopes of a quick agreement with Russia lies more than a trace of the belief that peace can really be had quite cheaply, by a single bargain, and not, as is the grim truth, by an intelligent, costly and sustained political effort lasting over a generation. Repeated talk of settlements and agreements and pacts can divert the attention of both statesmen and peoples from the fact that the only possible diplomacy for the western world —that of agreement through strength—is about the most difficult diplomacy that democratic nations can be asked to sustain. It means that for years to come a measure of military preparedness and a high degree of economic stability will have to be maintained throughout the non-Communist world. Yet in the past western democracy has been more notable for its freedom than for its stability and for its pacific preferences than for its military vigilance. A policy of strength thus demands a reversal of some of the most deeply ingrained political and economic habits of the western powers. Can it be said that they have fully faced this implication of Russian pressure and are attempting to evolve jointly a policy to secure both military vigilance and economic balance?

This is perhaps the chief reason why talk of meetings and peace gestures and limited agreements may weaken the west. Concentration on the short-term possibilities distracts statesmen from the much more formidable task of building up and sustaining western stability. The diplomatic achievements to which Mr Acheson referred as evidence of the effectiveness of agreement through strength—the Truman Doctrine, the Marshall Plan—have already had their effect. The President's Fourth Point is a year old and still uncertain. What are the next steps? Where can the west increase and deploy its resources with greatest defensive effect? These are more urgent questions than whether or not the Communists are ready to sign—and break—a limited atomic pact.

Election Issues—III

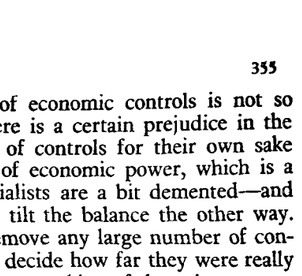
The Economic Argument

THE two preceding articles have left over for discussion in this concluding article of the series the group of intertwined social and economic issues which form so large a part of the subject-matter of politics today. The campaign has shown that by far the most important of these, from the political point of view, is that of full employment. It has also abundantly shown that there is no subject on which politicians are willing to talk so much unadulterated rubbish. Each party is trying hard to pin upon the other the responsibility for prewar unemployment and to claim for itself exclusive possession of the secret of preventing it in future. The fact is, of course, as every fair-minded person knows without any research into the records, that neither of the larger parties showed any ability at all to control unemployment in the years before the war. As for the future, it is still an entirely unproved hypothesis that governments now know how to prevent or cure unemployment. Perhaps they do; more probably, when the time comes to put theories to the test, they will find that they can somewhat moderate it, but by no means completely control it. But in any event there is no reason at all to suppose that there is much, or any, difference between the capacities of the parties in this respect. If the test of a full employment policy is simply the crude one of being willing to do anything to prevent any increase in unemployment anywhere at any time, then Labour may have a slight advantage over the Tories, through being under much greater pressure from its immediate supporters—but it is a very slight advantage.

This crude test should not, however, be the real basis of full employment policy. The maintenance of a high level of employment must doubtless be the primary economic objective of any democratic government. But no one in his senses would set it up as the exclusive objective of all economic policy, with an overriding priority over all others—if only for the reason that nothing would be more surely calculated (as we may discover in Britain before long) to lose the prize of full employment than an attempt to pursue it to the exclusion of other objectives—such as monetary stability, confidence in the currency, elasticity in industry or solvency in foreign trade. The proper question to ask is which party is likely to ensure the highest average level of employment over the years, consistent with a rising standard of living and the preservation of a free society. Unfortunately, even when the question is so rephrased, there is, on their present protestations, very little to choose between the parties. The hour has not yet struck when any candidate can safely tell the electors that they will do better to face the risk of a little unemployment now than the certainty of a great deal of it before long. But until one or other of the parties will dare to say this, there cannot be any basis for choosing between them on the issue of full employment.

Much the same comment can be made on the general policy of the welfare state. If the question is who will be the quickest to increase the multifarious forms of benefit that the poorer citizen now draws from the state, in national insurance, social security and subsidy schemes, and the slowest to reduce them, the answer is doubtless the Labour Party—though the Conservative manifesto offers some stiff competition. But here again the crude test is obviously dangerous. The sound policy, for those who believe in the welfare state (who are the great majority in this country) is that the state should seek to maintain for its citizens the highest standard of individual welfare that it can reasonably afford and that does not undermine the economic efficiency or the political liberty of the community. One may suspect that when the time comes to pay some attention to the qualifications, the Conservatives will be more responsible than the Socialists. But that must remain an act of faith; no evidence for it has been laid before the electors.

*



Finally, there is the great issue of National Efficiency. Of all the domestic issues, this ought to be regarded as paramount—not perhaps at all times, but certainly in the present predicament of the British people. The economic efficiency of a nation depends in part upon the organisation and ownership of its industries, on the manner and degree of the Government's interventions in economic affairs, on the financial and fiscal policy of the state. But most of all it depends upon the premium or the discount that public opinion and public policy together put upon productive enterprise.

It would certainly be a great relief to be quit of nationalisation schemes. This is not because the principle of public ownership is necessarily hostile to economic efficiency, but because the Labour Party has made it abundantly clear that greater efficiency is not its primary object in nationalising. If that was not clear from the nationalisation schemes of the past Parliament, it ought to be quite apparent from the list proposed for the next. To go on nationalising one industry after another for no economic reason that will survive a moment's examination but simply in order to satisfy a thirst for capitalists' blood has nothing to do with efficiency. On this score, a clear vote for the Opposition.

The vexed question of economic controls is not so easily disposed of. There is a certain prejudice in the Labour Party in favour of controls for their own sake —they are an assertion of economic power, which is a subject on which all socialists are a bit demented—and the Conservatives might tilt the balance the other way. But before they could remove any large number of controls they would have to decide how far they were really prepared to restore the free working of the price system. That, in its turn, involves asking how far they are prepared to incur the odium of "rationing by the purse." A free market is based on the assumption that those who can offer money have a social right, as well as the economic power, to acquire the goods. The Conservatives doubtless believe that; but how far will they say so in public, and act upon it? Moreover, the liberation of the price system would be most dangerous unless the inflation had really first been squeezed out of the economy. This would require radical cuts in expenditure. How far would the Conservatives really go in this? Would they really reduce the food subsidies when they discovered (what they seem to have forgotten) that a very large part of them are subsidies to the farmers? Would they really face the risk of increasing unemployment that is inseparable from determined disinflation?

It would be unreasonable to expect them to answer these questions upon the hustings. Every observer must make up his own mind about the extent to which the Conservatives have thought through these questions and have screwed up their courage to the necessary sticking points. Unless this process has gone very much further than any visible indication has suggested,

A Fifteenth Century Fire Extinguisher

A Couvre-feu taken from an old print.

Few probably realise that 'Curfew' derives from the French 'Couvre-feu'—an appliance for extinguishing fires shaped like a Dutch Oven. At sundown, it was placed over the embers to exclude air and the fire soon died away.

The hardship of having no fire in the evening led to a 'raising of the Curfew,' but as not all citizens were careful, disastrous fires occurred.

When in 1710 the Sun Fire Office came into being it gave active service in the limitation of fire damage as well as providing insurance cover for which it is famous to-day.

SUN INSURANCE OFFICE LTD. FOUNDED 1710

The Centuries-old Sign of Public Service

Head Office: 63, Threadneedle Street, E.C.2
Branches and Agencies throughout the World

the economic policy of a Conservative government would differ from that of the present Cabinet in degree only. After all, when it comes to the crux of economic policy, the Conservative and Labour philosophies have for a generation run side by side. There cannot be any significant return towards economic efficiency until the British economy once more becomes a competitive one—not competitive without limit, but sufficiently so to put the necessary premium on efficiency and the necessary penalty on waste and inertia. At the very centre of Conservative economic philosophy lies the belief in protection for the producer, which resembles the Labour principie of security for the worker infinitely more than it differs from it. There is no convincing evidence that the leopard has changed his spots.

*

On these domestic issues, then, there are some differences between the two large parties and most of them tell in favour of the Conservatives. But if any preference results from this analysis, it is of the lukewarm and negative kind based on the belief that the Conservatives would be guilty of less positive foolishness than the Labour Party. In spite of the red herring of nationalisation, it is difficult to discern any radical difference between the two parties' probable policies. In this, of course, they are faithfully reflecting the circumstances of the time. The British public is not yet ready for a change of economic policy. It is still convinced that it can live soft. Though individual members of either party may see the fallacies clearly enough, as politicians seeking votes they can do nothing but conform. Not until the circumstances change will there be any possibility of real divergence. If, as is highly probable, the long-awaited change in the world's economic climate comes within the lifetime of the Parliament that is to be elected next Thursday, then the patriotic elector will try to cast his mind forward to that time and ask himself, not only how the parties' present policies compare, but which of them, in the long-term national interest, had better be in office when the change comes.

A sound approach to economic policy is today obstructed by a number of deeply cherished sentimental delusions—that a nation can be richer after an exhausting war than before, that even if the nation is poorer the great majority of individuals can be better off, that consumption and capital investment can both be increased, that full employment can be guaranteed by Act of Parliament, that the state can spend the people's money better than they can themselves, that men are as naturally efficient as they are naturally virtuous and need neither incentives nor sanctions to be so, that penalising the successful is the best way to assist the unfortunate. These delusions, though they are now fully shared (at least in public) by the Right, came originally from the Left. Indeed, they are a sort of sentimental ivy that clings to, and is slowly throttling, the great basic principles of the twentieth century Left—that man can be rich as well as free, that he can master his economic and social environment as he has mastered the material. Before a sound start can be made with the task that confronts Britain in the second half of the century—that of reconstructing its material strength on a basis of freedom and justice and security—it is imperative that these delusions be swept away. Yet if the Conservatives are in office when the clouds thicken, the effect will be to confirm some at least of the prevailing mythology. It will seem to be proved that there is something called "capitalism" that leads to national disaster and individual misery, as against which the alternative myth called "socialism" will become the magic formula that guaranteed high real wages and full employment between 1945 and 1950. If British politics are to get back upon a basis of solid fact—and if, moreover, the British people are to continue to have an effective choice between two or more parties—it can be argued that it is essential to keep the Socialists in office until they have to face some of the realities that the accidents of the times have, to their great good fortune, obscured in this period of post-war transition. Better Attlee for five more years this time, the argument would run, than Bevan for twenty-five years next time.

But this very largely hypothetical argument cannot be accepted without question. For one thing, is it certain that the next five years will be such an inexorable educator? And if it is true that hard times are ahead, those who believe that Conservative policy, actual or potential, really is very different from Labour's, will be all the more anxious to have it applied. Moreover, what is the price that the country would have to pay for the education of the Labour Party? That depends on the answer to another of the great unknowns: how would a Labour government react if it got into serious trouble and started losing support in the country? Would the Socialists, as in 1931, drift into helplessness, or would they turn nasty? Would they wring their own hands or other people's necks? A small parliamentary majority, contrary to the general belief, is no guarantee of moderation; it might put a Labour Cabinet at the mercy of its potential rebels on the extreme Left wing.

*

This series of articles began with the warning that it would reach no conclusion. Indeed, we confess ourselves genuinely puzzled by the problem of deciding between a Conservative or a Labour government for the next five years. It is not simply a question of deciding which of the two parties one "likes" better than the other—though that is itself not so very simple—but of which would in the long run be better for the country.

The essential elements of the matter, in our view, are these—

> How important is the external problem relative to the internal? Will a restoration of the world's confidence in Britain lead to a solution of the economic problem, or must Britain, on the contrary, put its own house in order first before any restoration of confidence in Britain can be more than momentary?
>
> Is it better to have a slightly more sensible policy in the immediate future, or to concentrate on the possibility that a really sharp economic crisis may lead to a radically better policy a little later?
>
> If the success of democracy depends upon the ability of the people to reach sound conclusions on a clear view of the facts, is it better to put into office a party that dares not say in public what it believes in private, or one that really believes in private the nonsense it talks in public?

No two electors, even of those who share the general approach of this journal, will give to these questions both the same answers and the same relative weight. The only dogmatic statement we will make ourselves is that these should be the decisive issues.

Into Battle

(From a Special Correspondent)

This is the last of three articles presenting the course of the election campaign as seen from the constituencies.

SOUTH WALES shares with Durham the right to be regarded as the Solid South of British Labour politics. Here, where fully one-third of its population have known what it is to be ill-clothed, ill-housed and ill-fed, a Labour organisation resting on a strong trade union base can be relied upon to return to Westminster a regular quota of voting fodder for the division lobbies. Here are the indestructibly safe seats which, if Parliament were Congress, would lead to the committee chairmanships; here, too, is the oratorical tradition which can flower in the Huey Long of Mr Aneurin Bevan or the Alben Barkley of Mr Jim Griffiths.

However, the very stability of this one element in South Wales politics makes it easier, in this area, to observe the motions and behaviour of rival parties which often become obscured in the total flux of more typical constituency contests. The Conservatives here are fighting with the determination of long-starved Republican ex-postmasters. They hardly hope seriously to recover their long-lost ascendancy. There is little in the Welsh political tradition to which they can make appeal—no Cardiff Chamberlain, no Cardiganshire Baldwin. Only Mr Churchill can compete with the memories of Lloyd George, and he selected the theme of Tonypandy with which, in the words of one Conservative, "to wipe out in an hour all the gains our work had made in a month." The best hope of Welsh Conservatism lies indeed in an emphasis on the purely anti-Socialist front into which a generation of Labour domination of local government has driven much of the once Liberal middle-class. Hence the sedulous cultivation of such hyphenated Conservatism as the assorted "Liberals" in Gower, Swansea West and Pembroke. Only in Carmarthen, however, have the Conservatives been ready to allow an unhyphenated Liberal a straight fight with Labour—and this in a country where the tradition of a radical nonconformist, anti-squirearchy Liberalism remains more lively than anywhere else in Britain.

Yet it would be idle to deny that Welsh Liberalism is fighting the election under terrific disabilities. It is poorly organised, short of funds, often having to rely even at this stage of the campaign upon part-time agents, and generally bereft of the backing of a once Liberal local press. Even the timing of the election, usually impartial in its incidence, falls especially heavily on a party which lacks either the funds of the Tories or the ready-to-hand organisation of a trade union movement.

In Wales, as elsewhere, Liberals and Conservatives alike can at least console themselves with the reflection that little apathy surrounds their steps. Whatever the size of their forces, they are imbued with a keenness that derives from the seriousness of their plight and their tactical advantage as the attackers. All over the country, Labour fights from prepared positions. This is not always a disadvantage; but when one finds a Labour Chancellor of the Exchequer, in his own constituency, speaking to fewer than 250 in a hall that would seat over 300, it is tempted to speculate whether the crusaders of 1945 may not have become the *embusqués* of 1950.

*

From this point of view, if from no other, Labour should welcome the intrusion of the Communist suicide squad. These gadflies may sting old Buttercup into the effort he needs for victory. I paused in the Rhondda by the porch of a gaily redecorated Salem whose nonconformist baroque was first stuccoed when Midlothian was election news, and read the list of nominations which included the name of Pollitt, Harry, Boilermaker. "He'll get the biggest hiding he's ever had in his life," said a youthful voice at my side. "Not so sure," said a miner old enough to have seen not only the close contest of 1945 but also the Rhondda Communist militancy of the thirties. In the converted cottage, one room deep, where Pollitt makes his headquarters, I found no incautious optimism. Here, in a room not big enough to swing a deviationist in, the champ renewed himself between bouts of loudspeaker oratory. He tends to concentrate on the patent inadequacies of his "wheelhorse" Labour opponent and to pad his brief but frequent orations with stock Communist abuse, such as gibes at James Forrestal's suicide (in which particular instance, however, an American in the audience discomfited the speaker and won the applause of the crowd by being able to provide a more authentic version). Foreign affairs and the Hydrogen Bomb come nowhere so near the forefront of the Communist appeal, either in Wales or England, as the *Daily Worker* would sometimes lead one to suppose. The immediate grievance, not the ultimate menace, is the target of their oratory—the wage-freeze, housing, the cost of living. Success, even with these devices, is not to be commanded; but the party will not mind a century of defeat if, in the process, it can secure publicity for its faith and teach "the betrayers of the working-class" the costliness of their anti-Communist crusade. The Communist candidate who has been "purged" from membership in the Labour Party, and the Communist agent who has been "purged" from his job as trade union organiser, represent, each of them, an embittered combination of martyr, missionary and avenger.

One of the few, well-worn, jokes which enlivens the election campaign casts the rank and file of Labour's supporters for the role of the children of Israel on their forty years' wanderings through Sinai. Speaker after speaker stands up before his Labour audience and reminds them, like Moses encouraging the faint-hearted, of the days of bondage under Pharaoh. The dole, the means test, the hunger marches, the queues outside the labour exchange—these are the evils from which the 1945 crossing of the Red Sea has rescued the chosen people. No doubt the fifties still find them in the wilderness; the promised land of unrationed food, cheaper tobacco, tax-free goods and adequate houses lies still on the further side of speculation. Indeed, at this very moment the rigours of their pilgrimage impose new hardships on the faithful. But before they desert

the leadership which has brought them out of Egypt, let them just pause and remember all that they suffered along the banks of the Nile.

This is effective campaigning ; it touches a responsive chord. But, compared with 1945, it has two drawbacks. In the first place, it is defensive. For the first time Labour leaders have to appear on election platforms as defenders of the *status quo*. Moreover, since this is a government of planning and controls, it must defend all the *status quo*. "W'y are yer buildin' a concert 'all w'en we ain't got no 'ouses ?" asked an East End woman voter. To this no answer, not even one ingeniously and remarkably couched in terms of tourist dollar earnings, could have the electoral adequacy of the promises of 1945. Secondly, there is much less of the idealistic appeal which has historically run through British Labour propaganda. There is much more evocation of fear, much franker appeal to the evidences of material betterment, and a stimulation of consumers' appetites more appropriate to an acquisitive than to a socialist society.

This creates an opportunity by which, to some degree, Liberal campaigners have profited. Many a Liberal election address stresses the idealistic approach. But the organ voices which such a theme requires are seldom available ; there are too few of them, and those that there are are necessarily chained to their own constituencies. And the practical policy needed to give body to any such appeal is often lacking on Liberal platforms. There is much intelligent, reasonable, well-informed exposition, but from an average Liberal meeting the audience does not come away with a clear notion of what this party is proposing to do.

Conservatives, by contrast, have to fight an all-too-clear notion, in many minds, of what a victorious Conservative party would do when once again in power. They do so with pertinacity, ingenuity and a limited measure of success. Their difficulty is that "the myth of the thirties" is not something which can be knocked out by argument or rebuttal ; if it were, "the myth of 1940," or the year when Mr Churchill saved Britain, would have done it. It is probably something which can only be lived down, and perhaps 1950, even with the aid of the Industrial Charter, is too soon for memories to fade. Any running after stunts, any cosseting of the marginal voter, sets back public confidence in the responsibility and maturity of Conservative leadership. Yet without it can the scales be tipped ? That is the dilemma. When the canvassers have done their best, when the gleaners of the postal and the proxy votes have swept the last corner of the field, will it be enough ? And if to the eye of Conservative strategists it is not, what else can be tried which will not imperil the slippery gains already won ?

It is this awareness of the perils of a rashly won success which has partly been responsible for the peculiar mood of this election—a mood in which all the normal passions of political rivalry have often been muted to an undertone. Memories of 1945 have burnt deep into the thinking and planning of electoral strategists. Those strategists moreover, are almost to a man, the same teams, on each side, as fought the earlier contest—the same, only five years older.

But also there hangs over the election the persistent shadow of the new electoral laws. Politics, the most conservative of professions, is adapting itself with difficulty to the peculiar inhibitions and ambiguous provisions of the new Act. As the campaign swings into its last stage, many an agent fears that he may have failed after all to pull off the miracle that the law requires of him —to cut his expenditure by a third when costs have risen by a half. Whatever his success or failure, there can be no doubt that the new restrictions have left their mark on the campaign. To an unprecendented degree the press and the radio have carried the burden of the argument. To an equally unprecedented degree the newspapers have become forums, leasable pulpits, as it were, rather than advocates and propagandists. Especially is this true of the provincial press, whose impartiality has bordered close on an abdication of the instructive function of journalism. Few candidates have made an independent impact by their own literature, posters, favours or stunts. No doubt this has kept to a minimum the emotional, irrelevant and merely eye-catching tricks of the campaign. But it is worth asking whether it may not have gone too far. An election is not merely an appeal to reason ; it is also the political activation of the entire community. If it is pitched so low that the marginal voter's interest or imagination is not caught, or is only caught in the last hours by that party whose polling organisation has the finest net, something has been lost. February 23rd will see no Eatanswills, but it may well hold rather too many Sleepy Hollows.

Agriculture and Politics

AGRICULTURAL policy is not an important issue in the election tussle. The reason is that the main parties are committed to maintaining the system of guaranteed prices and assured markets and to raising the output of British agriculture as a means of saving dollars. They all promise to the farmer security and prosperity, and assistance in increasing his production ; and they all dwell, in gentler and vaguer terms, on the need for raising his efficiency.

This agreement over general objectives does not inhibit politicians from wooing the agricultural vote. Traditionally, the English countryside votes Conservative and did so (save in East Anglia) in 1945. Yet paradoxically, it has fallen to a Labour government to introduce the comprehensive measure of support which British agriculture has always wanted. Farmers are conservative, politically as well as temperamentally ; but if any group has good reason to be grateful for the policies of the Labour government, it is those, farmers as well as labourers, who make their livings on the land.

In these circumstances, both the Conservative and the Liberal parties are cultivating side issues as a means of wresting the initiative in the agricultural constituencies from Labour. The Conservatives say that they will encourage the formation of producer-controlled marketing boards on prewar lines and protect market gardeners from foreign "dumping." Since both these measures would almost certainly put up the cost of food, comparison with the party's main plank of reducing the food subsidies reveals a strange inconsistency. All the same, this approach will be popular with the farmers —all the more so as the Labour party is suspect as an urban and working class movement, whose support is derived very largely from the poorer housewives. This makes it less willing to cut down imports of cheap fruit and vegetables except at the height of the home season, and even then the Government reserves its own right to import apples and pears. It is also the reason for Labour's vague proposals to rationalise the system of food marketing and distribution—proposals which are viewed with deep suspicion by farmers since they are connected with the unpopular Lucas report. These proposals are really to Labour's credit—but they may lose it rural votes.

The Conservatives would also separate the advisory work of the county agricultural committees from their executive duties ; they would adjust farm prices to put a greater emphasis on quality (these are both sound points), and they would utilise Marshall dollars to procure more feeding-stuffs. The Liberals would make a point of fostering rural industries and providing more smallholdings. They would also have the Government set up an agricultural bank to act as a source of cheap capital and credit. Labour's agricultural manifesto contains few novelties, apart from its hint of marketing reforms and its proposal to reclaim large areas of marginal land, if necessary under public ownership. This proposal over marginal land is poles apart from the nationalisation of the land ; but it is not only the more fanciful Tory candidates who view it as the shape of things to come. Otherwise the Labour party is apparently content to rest on the laurels of the prosperity enjoyed by agriculture over the past five years.

*

The differences in the approach of the three main parties do not add up to very much. Some of the proposals in the party manifestoes are interesting and some are obnoxious ; but in any case the similarities far outweigh the differences. The truth is that all three parties have dodged the real issues of agricultural policy. Everyone is agreed on maintaining prosperity and expanding output ; but everyone is also agreed (Labour more reluctantly than its rivals) on curtailing government expenditure and in particular on limiting or reducing the cost of the food subsidies. The reconciliation of these two objectives presents, to put it mildly, a severe test of statesmanship. The first objective, if pursued along the same lines as at present (and no alternative suggestions have been forthcoming), is bound to add to the taxpayer's burdens ; but the second promises to reduce these same burdens.

This issue is especially important at the present time. The four year programme of agricultural expansion has reached the half-way mark in point both of time and of achievement. The index of net agricultural output (prewar = 100) has risen from 123 in 1946-47 to 135 for 1948-49 (this latest advance has had the help of favourable weather). The second half of the programme, which aims at getting an output 50 per cent over the prewar level by 1952, will be much harder to achieve. The effect of the first dose of price incentives, with whose aid the programme was launched, has now worn off. There is bound to be a demand for higher guaranteed prices as the condition of further agricultural expansion.

At the same time, any party which forms a government is pledged to reduce public expenditure. The first instalment of cuts announced by Sir Stafford Cripps last autumn included a saving of some £37 million on the feeding-stuffs subsidy and other savings on the agricultural vote of about £6,000,000. This is the contribution towards economy which British agriculture is called on to make. But will it be made ? And can it be made without upsetting the drive towards higher production ? This is the crucial issue to be faced at the annual price review which is shortly to take place.

It is fortunate for the Government that it will not have to announce the new schedule of farm prices before election day. By tacit conspiracy, the subject is being ignored in the election campaign. Whichever party is returned, however, will have to reach an early decision. Either it must send the farmers empty away—thus disrupting the harmonious relations which have so far prevailed between the Ministry of Agriculture and the National Farmers' Union. Or else (and more probably) it must underwrite a higher bill for British agriculture and find means of collecting payment from the nation.

*

This ought to make politicians of every colour stop and consider whether the agricultural policy which they are lightheartedly endorsing is, after all, the right one. Is it really wise to go on trying to get higher production by offering guaranteed prices that are high enough to persuade the less successful and the less efficient farmers to grow more food ? The continuation of this policy is open to three grave objections. In the first place, it means paying a very high price indeed for an extremely modest increase in output. Since all farmers receive the same prices for their produce, the fixing of prices at a level which covers the costs of the marginal farmer means presenting the better-placed or more efficient farmer with windfall profits at the nation's expense. Every extra unit of food which is secured in this way has to be paid for several times over, since all farmers, those who do not need the inducement as well as those who do, get the benefit of the higher prices. The Government's repeated raising of farm prices over the last few years has been a principal reason for the monstrous swelling of the cost of food subsidies. It can be argued that most if not all of the increase in agricultural production which has taken place over the same period would have occurred without the benefit of price incentives. Farmers have been only too anxious to expand their livestock production, and the chief limiting factor has been (and still largely is) not the absence of financial incentives but the shortage of feeding-stuffs. Some cynics would even go so far as to say that it is not higher but lower prices which would now do most to stimulate production. Even without going as far as this, may there not, after all, be other ways of stimulating British agriculture than that of doctoring it with further doses of the same costly medicine ?

In the second place, it is necessary to ask who is going to pay the mounting cost of agricultural policy. Since the taxpayer has now been milked to the limit of his capacity, and since in any case all parties are committed (in various degrees) to curtailing Government expenditure, the only possible victim is the food consumer. Any pruning of the existing food subsidies which the next Government is brave enough to carry out will, in any case, involve the consumer in paying higher prices for his food. Any further increase in the prices paid to the farmer will mean still dearer food. But this shifting

of the burden on to the food consumer will only intensify the dilemma of agricultural policy. For every rise in the price of basic foodstuffs will ram home the need to reduce the costs of agricultural production. Indeed a rise in the prices of some commodities (such as milk) which are at present protected by substantial subsidies might in a very short space of time produce an unsaleable surplus—a situation which (especially were it to exist side by side with shortages in other directions) would act as an ironic commentary on the economics of the expansion programme.

In the third place, the possibilities of importing more food from overseas (however remote they may seem) ought never to be forgotten. At present, most of the surplus food in the world can be bought only for dollars ; and Britain's extreme shortage of dollars means that it will have to buy less, not more, food from the dollar area. It is this fact which provides the urgency behind the expansion policy for British agriculture. But the situation may after all change. In the course of time, increasing quantities of food are likely to become available from overseas which can be paid for in sterling. Supposing that the cost of such food is (as on present trends it certainly will be) substantially lower than the prices being paid to British farmers, what course will the Government of the day pursue ? Will it stand by the promise to purchase the whole output of British agriculture at whatever the cost ? Or will it plead a prior duty to keep down the cost of living, and force on British agriculture a sharp and unpleasant adjustment ?

There is nothing sacrosanct about a politician's promise. If hard facts, or the will of a majority of the nation, force it to be broken, broken it will be. The hard fact in this case is that, badly as Britain needs more food, it has no bottomless purse with which to pay for it—and this goes as much for the domestic producer as for the overseas supplier. The main political parties, not content with promising a continuation of the present agricultural policy, are bidding for the rural vote with additional favours. This is dangerous dishonesty—for it is certain that whoever wins the election will have to think more realistically about agriculture's future. The farmer, who traditionally has a long memory, should reflect that he who promises most is likely in the end to perform least ; and he could do worse than cast his vote on this assumption.

Soviet Pattern for Peasants

WHEN President Gottwald seized power in Prague in February, 1948, the political pattern of Soviet domination in eastern Europe was complete. Economic and cultural assimulation has taken rather longer but during 1949 the process gathered speed.

In 1949 Czechoslovakia and Bulgaria finished their two-year plans of recovery and embarked on new five-year plans of construction. This year Poland and Hungary begin their construction plans—of six and five years respectively. Rumania will reach the same stage a year hence. The essence of the new plans is a great expansion of industry, on the foundations laid during the reconstruction period—foundations already very different from those of the prewar years—and the collectivisation of agriculture.

The purpose of collectivisation is the same as it was twenty years ago in Russia: to control the peasantry politically in order to ensure a growing supply of food for the towns and of labour recruits for industry. Through the Communist-controlled managing committees of the collective farms, the government can obtain a steady flow to the towns of grain and workers If, as the leaders hope, mechanisation of agriculture raises the output of grain per acre, there will be more for everybody. If, however, increase of output is slow, then the Communist hierarchy will see to it that the first claim on an inadequate supply of food lies with the urban population.

It is no coincidence that the pace of collectivisation is quicker in the industrially backward countries, Jugoslavia and Bulgaria, than in the advanced countries, Poland, Czechoslovakia and Hungary. Three factors are needed for industrialisation—raw materials, skill (including both machines and skilled men to handle them), and a labour force. The three northern countries are moderately well supplied with the first two factors. They produce some industrial equipment themselves, they have a considerable 'skilled working' class, and their exports can buy raw materials in world markets. Their industrial labour force must greatly expand, but they can take in recruits from the villages without intolerably reducing the proportion of skilled and semi-skilled to unskilled workers. Their labour armies will have just enough officers and NCOs.

In the Balkan countries raw materials are not easily obtainable in international trade, and both skilled workers and equipment are miserably deficient. Therefore, the Balkan Communist governments have to rely proportionately far more on the third factor—bare pairs of hands—than do their northern neighbours. More unskilled workers are needed for every factory and building project, and these must be recruited from the villages and directed to whatever part of the country the planning authorities wish, whatever working conditions and living accommodation may be available there. At the same time, this exceptional growth of the non-agricultural labour force requires the extraction from the villages of a much greater total supply of foodstuffs. It is true that in the past the east European villages have been grossly overpopulated, that the same food output could be obtained from a much smaller agricultural labour force, and that that output could be greatly increased by comparatively simple technical improvements. But all these things need time. Meanwhile the peasantry must be forced to disgorge. The instrument of coercion is the collective farm, with its Communist-controlled management. These considerations apply to both Bulgaria and Albania. They apply most of all to Jugoslavia, whose economic plan was from the first the most unrealistically ambitious in all eastern Europe, and which has been severely hit by the Cominform boycott on all trade with its Communist neighbours.

The pace of collectivisation in agriculture in 1949 has, therefore, been quickest in Jugoslavia and Bulgaria, and slowest in Poland and Czechoslovakia. In the autumn it was officially stated that about one-fifth of Jugoslavia's agriculture was collectivised, while in the richest grain-bearing region, Voivodina, the proportion was over 30 per cent. In Bulgaria the share of collective farms in agricultural land seems to be between 10 per cent and 20 per cent, and by 1953 it is to be 60 per cent. In Rumania progress is very cautious: only 55 collective farms existed in October. In Hungary, the pace is much quicker. According to Rákosi, by November, 1949, there were to be 1,500 in Hungary. In Poland, 170 collective farms had been formed by the autumn. In Czechoslovakia the preparatory stage does not yet appear to have been completed.

The economic structure of Hungary resembles that of Czechoslovakia and Poland rather than that of the Balkan states. It thus seems rather surprising that its collectivisation should be so much more rapid than that of its northern neighbours. One reason is perhaps that the ravages of war and the subsequent depredations of the Red Army so reduced the supply of agricultural equipment—including even simple instruments—that there was a strong incentive to common use of those which remained. Another reason may be connected with the postwar land reform. In prewar Hungary, as in pre-1917 Russia, a large part of the agricultural land belonged to big landowners and was cultivated by landless labourers. The labourers ate little, and large supplies of food were available for the cities and for export. Redistribution of the big estates, which transformed the labourers into small peasant farmers, had two economic effects. The first was to lower production through the confusion caused by the transfer of land. The second effect was that the new owners, the small peasants, began to eat more and better than ever before, thus leaving a smaller proportion available for the cities. This problem caused much trouble to the Bolsheviks in Russia from 1920 to 1929, and was only " solved " by the mass collectivisation of the 1930s. The soil of Hungary is so rich that it could probably feed its population even at a higher standard of consumption—which seems in fact to have been attained after the harvest of 1949. But whether export needs can be satisfied with the peasants eating a much larger share of what they produce, is less certain. This problem exists also in Poland, Czechoslovakia and Rumania, where land reforms took place after the war. But in Rumania the amount of land transferred was relatively small, while in Poland and Czechoslovakia the main transfers took place in the western provinces from which the Germans were expelled, and it is still the policy of both governments to give the colonists in these provinces favoured treatment.

It would be wrong to assume that because the pace is quick in the Balkans and slow in the north, the peasants are always better treated in the north than in the Balkans. Though the Polish, Czech, Slovak and Rumanian peasants are not at present being forced into collectives, the " class war in the villages " is being vigorously propagated by the Communists, through their committees, cells and nuclei in the rural authorities, the co-operative shops and the " machine tractor stations." The last two organisations monopolise the exchange of goods between town and country and the supplies of farm machinery. They have been firmly held by the Communist Party since their creation two to three years ago. The " class war " is represented in official propaganda as a spontaneous movement of the " medium and poor peasants " to liberate themselves from exploitation by the " kulaks." The Communist Party agitators who come from the towns to incite hatred are represented as " workers " voluntarily " helping " the peasants to strengthen the " fighting alliance of the urban and rural proletariat." In practice, however, the definition of a " kulak," and the methods used to oust him from influence in the village, depend very much on the local agitator. The Communist press of both Poland and Hungary admits that there have been acts of violence against kulaks. Rákosi found it necessary to warn his party last spring that abuse of power and abandonment of the " voluntary principle " plays into the hands of the kulaks, uniting the medium peasants with them and turning the majority of the peasantry against the party's policy. Rákosi was, of course, thinking of the catastrophic results of " dizziness from success " in the persecution of kulaks in the Soviet Union in the early 1930s. So far there is no sign that horrors on the Soviet scale are imminent in eastern Europe. But the sum total of misery, fear and injustice is great and growing.

*

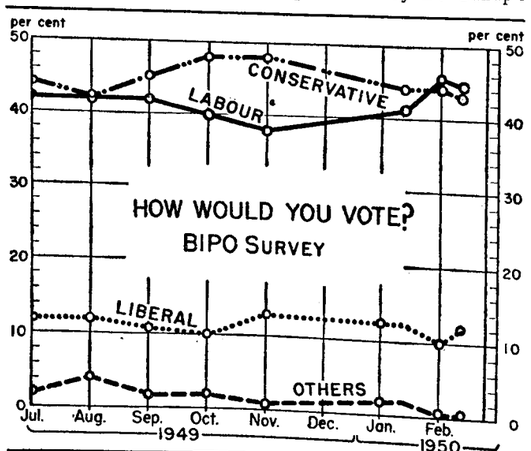
In Jugoslavia collectivisation is more rapid than elsewhere, but persecution of kulaks is less severe. Kulaks are not, as in the other " popular democracies," excluded on principle from the collective farms. If they accept the rules and discipline, and bring all their property into the farm, they can become members like any other peasants: only those who oppose the idea of a collective farm suffer repression. This " deviation " from the Muscovite line has earned Tito Cominformist abuse as a protector of kulaks. Communist doctrinaires regard attempts at the collectivisation of agriculture without first liquidating the kulaks much as a dentist would regard the filling of a tooth without drilling away the decay. Tito's reason for this policy is, however, simple. His policy has already won him enough hatred ; if he is to maintain his regime against the Soviets and their satellites, he must at least abstain from antagonising the whole upper layer of the peasantry.

Thus, with differences of degree, the eastern European economies are being adapted to the Soviet model. The decisive phase in this process, the collectivisation of agriculture, has begun. The peasants are being left in very little doubt about their intended fate. The more successful the expansion of industry, the more urgent will be the demand for foodstuffs and labour recruits, and the greater the pressure to speed up collectivisation. Eastern Europe will in a few years suffer from the danger which has long plagued the Soviet planners—insecurity of food supply. The Soviet Union still exports food in years of good harvest, and will even do so in bad years, at the expense of part of its people, if political needs require it—for instance, to help the French Communist Party's prestige in 1947, or to popularise the Czech Communists before the coup of February, 1948. But Soviet Russia is no longer, as was Imperial Russia, a great grain exporter, and it has growing difficulty in supplying its urban population. The same is happening in eastern Europe. The Anglo-Polish trade treaty gives the Polish government an interest in going slow with collectivisation, for the pig and poultry products which Britain is buying are the first to be disorganised if the " class war in the village " gets out of hand. But this interest is not necessarily decisive. If the international situation seems to the Kremlin to require a different policy in Poland, the agreement with Britain will be broken. And even if this agreement is faithfully observed until it expires, the long-term prospect is that eastern Europe will be a far less important exporter of food to the west than it was before 1939, and will be less so every year. This is a factor of which British trade policy must take account.

NOTES OF THE WEEK

Concert Pitch

The full field of candidates has been nominated, the party leaders are stumping the country, and within a week either Mr Attlee will be back at Downing Street for another term of office or His Majesty will be summoning Mr Winston Churchill, Mr Clement Davies, or Mr Harry Pollitt to form a new government. The most important development of the last week has been the production of two very live rabbits from Mr Churchill's capacious but curiously shaped hat—a hint that petrol rationing could be abolished by a government not wedded to controls, and a suggestion that a personal approach to Mr Stalin should be made in an effort to end the cold war. The economic and diplomatic implications of these suggestions are examined elsewhere. There is no doubt that the latter idea is a clever political move—however injudicious it may be to undermine the attempts of the present government to present a strong front to Russia and however dangerous in lulling the public into thinking there is an easy road to international harmony. It can do much to remove the stigma of warmongering from Mr Churchill's name and play upon the latent uneasiness and unhappiness of the British electorate about developments abroad. By comparison the rebuttals which Mr Attlee and Mr Bevin made on Wednesday sounded unimaginative and thin and that of Sir Stafford Cripps merely shrill.



As far as the other campaign issues are concerned, the roles of 1945 are directly reversed and the Conservatives are now the attackers and Labour is on the defensive. The most effective counter-offensive weapon in the Labour armoury—their attempt to associate Tory government with unemployment—seems to have proved less serviceable than Transport House had hoped; but there are few indications that the Tories in their turn have pierced the Labour armour on this subject, or on the cost of living, fair shares, or nationalisation. Dr Charles Hill, the Radio Doctor, broadcasting as a Liberal and Conservative candidate, seemed more likely to put heart into staunch Tories than to make converts from the Liberal or Labour ranks. On the other hand, Miss Margaret Herbison, broadcasting for Labour about the food subsidies, made assertions about the justice of British food policy and the anti-social wickedness of the unrationed systems of the Continent which are calculated not only to infuriate Frenchmen and Germans of every political faith, but to alienate the support of any British elector with the smallest opportunity for discovering the facts. It remains to be seen whether Mr Clement Davies, Mr Churchill, and Mr Attlee broadcasting on the last three days of this week can raise the campaign on to a higher and clearer level.

* * *

Measuring Public Opinion

The latest division of public opinion as recorded by the British Institute of Public Opinion (the Gallup poll) and published in the *News Chronicle* of February 17, shows the Conservatives as having 42½ per cent, Labour 45 per cent, the Liberals 12 per cent and others ½ per cent—that is to say, the slightest possible gain for Labour. (The "don't knows" are excluded.) As can be seen from the chart reproduced below, which gives the figures up to February 10th, the division of opinion as between the two major parties has been becoming more and more even in recent weeks. How useful then are these figures in "spotting the winner?"

In 1945 the Gallup poll predicted the percentage vote for each party with an average error of only 1 per cent, but an election is an exacting test of any public opinion poll. Although the question "How would you vote?" is unambiguous enough, the election poll is expected to show not merely present opinions but future actions. It may register what people are thinking today with almost complete accuracy, but to go on from there, to predict how they will act tomorrow or next week can never be infallible, and it is well known to be more difficult with some kinds of electoral systems than with others. In the United Kingdom in 1945, Canada in 1948, and Australia and New Zealand in 1949 conditions favoured an accurate prediction by Dr Gallup's

affiliated organisations of the actual voting from the opinions expressed. By way of contrast, the American Presidential election of 1948 presented a tougher problem. The preceding months had yielded opinion polls showing great fluctuations; the issues at stake were complex, and only a narrow margin divided the protagonists, while the exasperating "don't knows" turned out, in the event, to sharpen beyond all precedent the drift back to the Democrats which the pollsters thought had been taken into account.

	Dewey	Truman
Crossley estimate	49.9	44.8
Gallup estimate	49.5	44.5
Roper estimate	52.2	37.1
Actual vote	45.1	49.5

Opinion polls were promptly denounced as either incompetent or dishonest. But what made the critics so shrill (apart from irritation with the *ex cathedra* pronouncements of the pollsters) was not the 5.5 per cent inaccuracy in the forecast, as the failure to spot the winner; had Mr Truman's victory been foreseen, the polls might have been twice as inaccurate and the irrational public would scarcely have noticed it.

It is worth remembering therefore that the present British election is just such another teaser for the interpreters of opinion polls. The danger of missing a minor but decisive swing in opinion between the taking of the poll and the casting of the vote—which was what upset the forecasts of the American polls—is being avoided in Britain by continuing the poll until the last possible minute. But given the present state of the major parties, and the peculiarities of our electoral arithmetic as they were pointed out in *The Economist* of January 7th, even an error as low as 3 per cent in forecasting next week's votes may lead to a wrong guess about which party will win.

Tsardom. It indicates both that the Chinese leaders have played their hand with great resolution and self-confidence and also that the Kremlin has learnt something from its experience with Jugoslavia.

The section of the treaty which deals with Manchuria will undoubtedly strengthen the political position of the Communists in China. It will remove from them the reproach of tolerating a foreign encroachment on Chinese sovereignty and will enable them to present the Russians to the Chinese people as their true friends. Economically the bargain does not look so good; $300 million is a large sum, but it will not go very far to assure China a rapid industrialisation unless credits from other sources are also forthcoming. It is likewise not yet clear how far Chinese trade, especially Manchurian food exports, is going to be earmarked for Russia. But these are not matters which directly affect sovereignty, and for Chinese popular feeling the recovery of Port Arthur will be far more significant than any obscure economic arrangements which may be to China's detriment.

Apart from economic terms, the Soviet Union gets military alliance with China, based on the formula already used for such treaties with the East European satellites, which names Germany or Japan as the potential enemy but is also applicable against the Western Powers in any general war involving the Soviet Union. China is thus formally and definitely aligned in the Soviet power *bloc*, but has succeeded in exacting for the commitment a price which suggests that Peking will be for Moscow a friendly but not a satellite capital.

* * *

Missing Component in Indo-China

A conference of American envoys to the Far East has been held in Bangkok under the chairmanship of Dr Jessup, the US Ambassador at Large. The mere fact of its convening shows that United States policy in the Far East, which hitherto has been occupied—and very fully occupied—with Japan and China, is now beginning to take within its compass the debatable lands of South East Asia. The need to keep Communism from the doors of India and Australia and to maintain western access to the Asian rice bowl is obvious enough. The problem which America has to decide, and which will no doubt be uppermost at the Bangkok Conference, is whether the basis for such a policy exists in South East Asia.

Mr Acheson has defined the general outline of American policy for Asia. It is to give American assistance, provided there exists a local political structure stable enough to ensure that that assistance will be well used. America cannot give aid effectively if this precondition is absent. The policy is logical. American aid to Greece has had satisfactory results. The very much greater sum of aid given to China could not fend off the final catastrophe. In the former case American dollars were the "missing competent"; in the latter, everything was missing—even the will to resist. The question therefore is whether the political organisations in South East Asia offer any such promise of stability, and the question must be answered in the first place in Indo-China, for it is here that Communist pressure will begin at once. An Indo-China-Chinese Friendship Association has already been set up and help will soon begin to cross the frontier.

In practice, however, no definite answer can be given. It is true that the Bao Dai regime is little more than a gamble, but western policy is offered no alternative. The Americans appear, therefore, to have accepted the logic of the situation. The French have already presented to them a list of the arms that they will need to scatter the forces of Ho Chi-minh. Some of the dollar aid voted by Congress for the Far East—a figure of $75 millions—will be allocated to Indo-China and the Bao Dai Government obviously hopes that it can follow Indonesia's example and

suitable Africans had been trained to take their place. But the result is that one is left with an uneasy feeling that an opportunity has been missed of examining British policy in a wider setting and that consequently the disturbances may be repeated.

* * *

The Case of Seretse Khama

It is nothing but bad luck which has led the Commonwealth Relations Office into the difficult dilemma caused by the marriage of Seretse Khama, the principal chieftain in Bechuanaland, with a London typist. On the one hand, the British Government has never objected to mixed marriages and, at the present stage in the political development of the colonies, it would be extremely foolish to begin doing so now; on the other hand, the Government can hardly ignore the fact that some 40 headmen of Seretse's tribe, led by the redoubtable Chief Tshekedi, have gone into voluntary exile as a protest against the introduction of a white queen into the tribe.

Briefly, the history of the case is that at a tribal meeting called in January last year, when the marriage was first made known, Seretse was given the choice of resigning his chieftainship or giving up his wife. He refused to accept the choice, and in June a second tribal meeting overwhelmingly supported a motion to allow both him and his wife to be reinstated as the tribe's rulers. There were, however, some suspicions about this second meeting—the decision of which has sent Tshekedi into voluntary exile—and in the autumn the British Government appointed a Commission of Inquiry into the whole matter. The report of the Commission has not yet been made public, but Seretse has arrived in London this week for consultations with the Commonwealth Relations Office, and the report is presumably now in the Government's hands.

Even if the affair were confined to Bechuanaland, it would be a difficult problem to solve; but behind it all there lurks the far more serious question of British relations with South Africa. The South African Government is anxious to take over the Protectorates at an early date; it is bitterly opposed to mixed marriages, and it objects to Seretse's marriage could, therefore, become an excuse for direct South African interference or at least for an awkward *démarche* by the British Government, backed, as it can be, by the action of the other leaders of the tribe. The crucial question is whether a majority of his tribe genuinely support Seretse. Only if they do not can a very awkward and far-reaching division of principle be avoided.

Personal Incomes, 1938-1950

A series of three articles on this subject has appeared in The Economist:

Redistribution of Income	(*Jan.* 21)
Changes in Wages	(*Jan.* 28)
Salaries and Profits	(*Feb.* 4)

These articles have been reprinted as a pamphlet which is now available. Copies of the pamphlet (price 6d.; by post 7d.) can be obtained from

The Economist, 22 Ryder St., London, S.W.1.

Tsardom. It indicates both that the Chinese leaders have played their hand with great resolution and self-confidence and also that the Kremlin has learnt something from its experience with Jugoslavia.

The section of the treaty which deals with Manchuria will undoubtedly strengthen the political position of the Communists in China. It will remove from them the reproach of tolerating a foreign encroachment on Chinese sovereignty and will enable them to present the Russians to the Chinese people as their true friends. Some of the dollar aid voted by Congress for the Far East—a figure of $75 millions—will be allocated to Indo-China and the Bao Dai Government obviously hopes that it can follow Indonesia's example and secure a large loan from the Import-Export Bank. Few officials either in France or America are optimistic about the chances of making Indo-China into a new Greece and winning the battle; but the only alternative is the abdication of French power and the opening up of the way to Malaya and Siam.

* * *

Bait for the Ruhr

Now that Communist successes have forced Asiatic affairs into a position of at least equal importance with those of Europe, it becomes important to watch how Moscow will co-ordinate its policies in the cold war on two fronts. There are already clear lines of connection between France and Indo-China and between Britain and Malaya. Less well-known and less clearly drawn is the line that is beginning to appear between Soviet policies in Germany and in the Far East.

It has been known for some time that the Russians were using the promise of the Chinese market as a bait for the industrialists of the Ruhr. On February 9th Herr Ulbricht, Premier of the East German Republic, announced that his minister of trade, Herr Handke, now taking part in trade negotiations with Mao Tse-tung in Moscow, "has been instructed in the negotiations to take into account export possibilities of the west German enterprises." In other words, Herr Ulbricht has had the impudence to appoint Herr Handke, as far as China is concerned, minister of trade for all Germany.

This is a direct, and effective, challenge to the Americans, who were responsible for the recent ban on the export of 78,000 tons of steel rails from the Ruhr to China. Eastern Germany is ready to offer itself as the indispensable go-between for the western Germans. It will create very bad feeling in the Ruhr if, as is possible, British rail manufacturers agree to accept the Chinese contract, at a time when their order books, unlike those of the Ruhr, are full. And if the east Germans persist in their efforts to offer outlets to the Ruhr factories, similar incidents and embarrassing political consequences can be foreseen.

The crucial test for east-west trade policy, as it is affected by American economic and strategic views, is clearly coming in Germany; and, if there is to be any effective check on exports from the west which would build up the military potential of the Soviet Union's allies, the list of banned goods should be made specific, small, and enforceable without an army of officials. Even then the tug-of-war between the American export licensing system and the efforts of the German planners to sell and buy beyond the Elbe will cause many headaches to the occupation authorities.

* * *

Mission to the Cameroons

The report of the Trusteeship Council's visiting mission to the British Cameroons has been hailed as a very different document from that of the mission to Tanganyika. The members of the mission came from Iraq, Belgium, Mexico and the United States. They spent roughly a fortnight in the Cameroons, and the first part of their report reads more like a journalist's travel diary than an official account for the United Nations. They journeyed by air, by road, by "a small, rambling railway train," on horseback and on foot. They were feasted and petitioned to their hearts' content. In short, they thoroughly enjoyed themselves. They were also impressed.

The mission was particularly impressed by the complete freedom of speech enjoyed by the people of the Cameroons.

> Everywhere it went it found evidence of that. Whether in public meetings or private interviews people expressed themselves with the utmost freedom, many times in the presence of members of the administration. . . . The Mission is glad to observe that this freedom of speech is a matter worthy of commendation.

It was impressed, too, by the importance which the Africans attached to its visit. Sometimes this was due to a misconception, the Africans thinking that the mission could take immediate decisions on any subject. More often they had a fairly clear idea of its functions, and it can be taken for granted that even uneducated Africans get to hear of it when matters concerning them are discussed at Uno. It is consequently necessary that those who discuss them should do so with a due sense of responsibility. The mission found that the aged Fon of Bikom was deeply hurt by the ribald discussion of himself and his 110 wives in the Trusteeship Council, as indeed were the wives themselves. It recognised that this custom of plural marriage, as elsewhere in the Cameroons, has firm social and economic roots, and it fully endorsed the British administration's attitude towards it.

The mission also reports favourably on the activities of the Cameroons Development Corporation, which manages the ex-enemy plantations and is making large profits—a point worth making as public corporations in the colonies are at present under a shadow. In fact, its criticisms of British policy and administration in the Cameroons are very few and on minor matters. Hence, presumably, the welcome given to the report. It would, however, be unfortunate if the impression were given that Great Britain will accept reports of Uno's missions, however short their visits, whenever they approve of British administration, but will reject outright every report that is critical.

* * *

The Uganda Riots

The report of the commission of enquiry into the disturbances which occurred last April in the Buganda province of Uganda was published at the end of last week. It is not altogether a satisfactory document although it will doubtless satisfy any British consciences that may have been troubled when the disturbances broke out. The report commends the police force and the troops for their behaviour in suppressing the riots, places the responsibility for them squarely on the shoulders of an African in this country called Semakula Mulumba, and declares that with one exception none of the grievances alleged by Mulumba and his supporters had any substance. The commissioner, Sir Donald Kingdon, found that the disturbances were a result of a planned rebellion against the Kabaka of Buganda and his Government. Although Mulumba is known to have Communist contacts, there was no evidence of Communist financial or moral aid.

All this is satisfactory as far as it goes, but it does not go far enough. What one would have liked to find in the report is a deeper explanation of what has transformed Uganda from a protectorate which was considered a highly successful example, if not a model, of British colonial rule into one which appears to be becoming increasingly restless and suspicious of British intentions. The disturbances of 1949 were, after all, not the first. There had been serious disturbances in 1945, which culminated in the deportation, without trial, of the ringleaders and had as a sequel the assassination of the Prime Minister of Buganda, Martin Luther Nsibirwa. The intervening years have, moreover, been ones of growing unrest—as witness the enthusiasm with which the Buganda people received the news that Mulumba had presented their grievances to Uno through Mr Gromyko, the Soviet representative.

Doubtless the commissioner's terms of reference precluded him from investigating last year's riots against a wider historical background—although he mentions the blunder of 1944 when the supervision by the British administrators in Buganda was very greatly relaxed before suitable Africans had been trained to take their place. But the result is that one is left with an uneasy feeling that an opportunity has been missed of examining British policy in a wider setting and that consequently the disturbances may be repeated.

Reprieve for the Third Force

There have been second thoughts in Paris about the prospects of elections and a final break up of the Third Force coalition. General de Gaulle's latest cautious offer of help in preparing such a *dénouement* has been the usual cold douche; and his interventions have much the same stiffening effect on coalition ties as the intervention of Soviet policy have on European co-operation. Indeed, it looks as if the Socialists may after all return to the government. By refusing to support M. Bidault's reconstructed cabinet and by supporting the grant of a second allowance to underpaid workers, they have made a gesture to the voters of the left which will look good on the record. This done, they will probably now prefer to return to office, where they can at least prevent any tampering with nationalised industries and the social security system.

Within the ranks of the Socialists there is, however, bitter dissension dating back to their successes in certain municipal elections last October. There is a section which opposes the Third Force veterans M. Blum and M. Ramadier, and the strong man M. Jules Moch, and hopes to create in the Chamber a Socialist opposition which will steal thunder from the Communists between now and the date when parliament dies a natural death in 1951. There is perhaps more faith than good judgment behind this view, but to many Socialists the alternative seems to be gradual extinction.

There is probably sufficient discipline in Paris to ensure that no major changes take place before President Auriol returns next month from his visit to London. But if there is to be a return of the Socialists to the Cabinet, they will want as Prime Minister not M. Bidault but someone like M. Queuille or the present defence minister M. Pleven. The technique of making such changes quickly and smoothly is improving, and its use is made easier by the reluctance of everyone, save General de Gaulle, to have an immediate dissolution. French politicians are likely to remain for a year or so prisoners of a party system which makes strong government impossible and victims of a constitution which there can be no hope of changing until the political struggle becomes more like a boxing match and less like a football scrimmage.

* * *

Belgian Referendum

Both Houses of Parliament in Belgium have now passed the law for the holding of a referendum on the question of King Leopold's return to the throne. The ultimate decision rests with Parliament but it will be guided by the popular consultation which is to take place on March 12th, with voting compulsory for all electors.

King Leopold has announced that he will not return if less than 55 per cent of the electorate vote for him. It is impossible to say at this stage what the likely percentage will be. In an electorate of about 5,500,000, more than half a million did not vote or spoilt their papers in the last election, and the Liberals are divided upon the issue of the King. It is these uncertainties that make the voting percentages of the 1949 election an unreliable guide. At that election the Christian Socialists obtained nearly 40 per cent of the votes. Added together, the Socialist and Communist vote—that is to say the anti-Monarchist vote—was just over 27 per cent, and the Liberals secured between 13 and 14 per cent. If half the Liberals were to vote against the King, a tentative estimate could be made that about 34 per cent of the people reject the idea of his return, and that the highest proportion of votes that he can hope for is between 60 and 70 per cent. Such a percentage would apparently be enough to fulfil his own conditions for a return to the throne, and it remains to be seen whether, at this very latest hour, he will show sufficient wisdom to realise that a monarch to whom 30 per cent of his people are bitterly and hopelessly opposed is hardly a symbol of constitutional unity.

The Teachers Give Notice

The National Union of Teachers has now announced that it will instruct its representatives on the teachers' panel of the Burnham Committee to give a year's notice to end the present agreement on salary scales. This decision follows on similar decisions made by the four teachers' organisations which represent the profession in the secondary schools. It is now virtually certain that new negotiations will begin in the spring with the local authorities' side of the Burnham Committee.

Last year the teachers made a bid for a flat-rate increase of £150 a year as a cost-of-living bonus. The local authority panel turned this down last November on the grounds that such a demand was contrary to government policy. The teachers simmered and seethed during their annual New Year conferences and are now returning to the boil. In comparison with other salaried occupations (as set out on page 247 of *The Economist* of February 4th), the salaries of non-graduate teachers had by 1948 risen by about 50 per cent since 1938 and were about 17 per cent behind the general level of salaries. Graduate teachers were much worse off, since by 1948 the maximum of the scale had increased by only 30 per cent, and they were about 37 per cent behind the general increase in salaries. On these grounds the teachers, and particularly the graduate teachers, have a good case. A correspondent on page 369 emphasises this point.

The two main difficulties in the schools are the supply of university-trained teachers, particularly for the grammar schools, where the shortage is now really serious, and the supply of women teachers in the infant schools. A generous graduate allowance would help the former. The latter is a much more obstinate difficulty, since the schools are now competing for a diminishing number of girls who are wanted for an increasing number of professions, nursing being one of the foremost rivals. This is a difficulty which would not be solved by raising salaries, since it would merely set the professions outbidding each other.

Care of the Aged

Two important points are made in the second annual report of the National Corporation for the Care of Old People. The corporation was set up in August, 1947, with grants from the Nuffield Foundation and the Lord Mayor's National Air-Raid Distress Fund, to act as a central body from which financial aid and advice might be available to all those concerned with the care and comfort of old people. The provision of accommodation for old people in communal homes and hostels is now a duty of local welfare authorities under the National Assistance Act; but it was never intended that local authorities could, or should, supplant all voluntary effort in this sphere, and so long as shortages delayed the provision of homes and hostels by the local authorities it was hoped that they would contribute towards the cost of voluntary provision. The first point, made with some emphasis in the corporation's report, is that this co-operation between public money and private philanthropy has not been forthcoming to the extent that was hoped. Obstacles spring up from both sides. Voluntary bodies are inclined to resent the conditions imposed by local authorities before a grant is made, forgetting that those who give away public money are accountable to the ratepayers. Local authorities are inclined to overlook the peculiar advantages of voluntary bodies, such as the speed with which they can purchase the necessary property once their funds are assured, and their

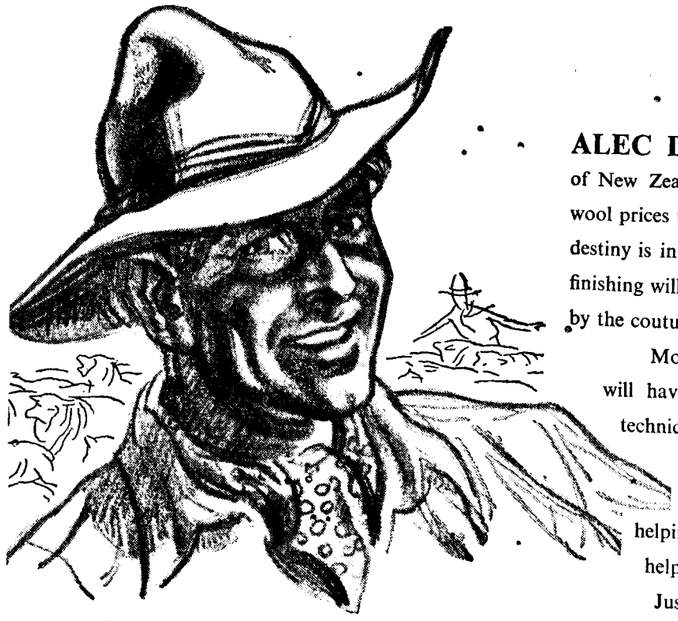
Horse Sense

Whether horses can learn to obey the coloured lights of traffic signals — whether, indeed, they can even distinguish one colour from another — may be debatable points.

There is no indecision however when it comes to assessing the value of A.T.M. Electro-matic vehicle-actuated signals for the control of street traffic and the safeguarding of pede-trians.



Electro-matic control delays nobody longer than is absolutely necessary for safety, and the flexibility of the system renders it capable of adaptation to every type of road layout and every form of traffic. Police not required for regulating traffic are released for duty elsewhere.

Monsanto makes nearly two hundred chemicals of vital importance to British Industry. If you have a chemical problem it is highly probable that Monsanto will be able to assist you

ALEC DUNCAN raises wool in the South Island of New Zealand. He hasn't much to grumble about on wool prices today; but he realises that, in the long run, his destiny is in other people's hands. Weaving, dyeing and finishing will determine whether woollen goods are chosen by the couturiers, demanded by the public

Monsanto has evolved new textile chemicals which will have a remarkable effect on worsted spinning techniques, and may materially increase the value of Britain's exports of woollen goods. At the same time, Monsanto is directly helping Duncan maintain his livelihood, and is helping to provide you with the goods you need. Just one more example of the way Monsanto is 'serving industry, which serves mankind'

MONSANTO CHEMICALS LIMITED 8 WATERLOO PLACE · LONDON · SW1

ability to recruit voluntary help. The corporation is right to urge that, at a time when all possible accommodation for old people is badly wanted, both sides should renounce their parochial attitude and co-operate with each other.

The second important point made in the report is the effect which the division of responsibility between the hospital authorities and the welfare authorities is having on old people. Those who are sick are the responsibility of the regional hospital boards, and those who are able-bodied but unable to live in their own homes are the responsibility of the local welfare authorities. But in old age the border line between sickness and health is very indeterminate, and the large class of infirm people seems to be nobody's responsibility. For the time being, therefore, the corporation is to concentrate its financial aid on homes for the infirm old. It also expresses the belief that new legislation may be necessary to settle the question of divided responsibility, and hopes that if voluntary effort can, with the corporation's help, work out a practical system for looking after the infirm, the amending legislation will have a sound basis.

Postponement in Kashmir

The Security Council has now heard arguments by the Pakistani and Indian delegates (in speeches of record duration for this institution) over the deadlock which has been reached in the dispute over Kashmir. Meanwhile, as shown in an article from a correspondent which appears on page 380 of *The Economist* this week, tension between India and Pakistan remains dangerously high, and both countries are having their military strength diverted, at great expense, to maintaining their positions in the mountains of Kashmir, while all around them in Asia are occurring events of momentous importance by which the interests of both may be gravely affected.

Whether Kashmir is to belong to India or to Pakistan is not a matter which involves the interests of any country outside the Indian sub-continent, nor, without a plebiscite, would any serious person venture to assert with confidence what the majority of the people of Kashmir want. But the whole world can see that India, which claims the support of this majority—including, that is to say, most of the Kashmir Moslems, since Hindus are in any case a minority—has been obstructing the holding of an internationally supervised plebiscite. From this world opinion can only conclude that, in spite of its declared willingness to let the dispute be decided by a plebiscite, India really has no confidence that the vote would go in its favour. India has, it is true, tried to defend its refusal to allow the Uno plebiscite arrangements to go ahead—detailed preparations have already been made by Admiral Nimitz and his staff to ensure its fair operation—by arguing that "normal conditions" must first be restored in Kashmir. By this is apparently meant that areas in the north now held by Azad, that is, pro-Pakistan, Kashmir forces must be taken over by Indian troops. But the whole point of the procedure which was to be adopted was to get a settlement without further alteration of the zones of military control held by each side, for it was clear that neither side would give up what it already had in advance of the plebiscite without further fighting, and to stop the fighting was the Security Council's first concern. Of course conditions in Kashmir are "abnormal" as long as external forces control any part of it, but there is no sense or reason in pleading this as justification for postponing the plebiscite, for if the fate of Kashmir is to be decided by plebiscite, the sooner it is done the better, and it cannot matter who holds what for the interim period. If, however, India maintains that a fair plebiscite cannot be held as long as Azad forces hold any part of Kashmir—though the bulk of the population is in the Indian zone—then let Uno provide an international force to supersede all existing armed elements in Kashmir for the time of the plebiscite. It can be done and it must be done, for if Uno shirks this issue, it will have to confess to utter failure as an instrument of peace.

Monolith in Eastern Germany

Those leaders of the Christian Democrats (CDU) and the Liberal Democrats (LDP) in eastern Germany who were unrealistic enough to believe that participation in the east German Government gave them the right to speak their own minds are now being bowled over like ninepins. A charge of "undemocratic conduct" (which means criticism of Communist policy) is generally enough to make the victim resign immediately and, in most cases, flee to western Berlin. This purge of the non-Communist parties, which began with a number of politicians and ministers in the *Land* parliaments and governments, has already spread downwards to such smaller fry as the party chairmen of the local branches, who are being denounced for pursuing an "undemocratic policy" or even, in one case, for possessing unsuitable books.

Distrust of the "bourgeois parties" has now reached the point where the police are carrying out an enquiry into the political past of all Germans in the eastern zone. Present Communist orthodoxy, it appears, will not in itself be enough to wipe out the stain of former lapses. The Communist drive against the CDU and LDP will, in fact, deprive them of all their most talented members and frighten away potential recruits. They will be driven helplessly into the National Front, where they will act as flattering chorus to the dominating lead of the Communists. The National Front committees, developed by the Communists as the instrument for unifying Germany when it became obvious that the non-Communist parties would not perform that function, are now thought sufficiently advanced in eastern Germany to be given the dignity of a national council in Berlin. This council has already started upon its allotted task by issuing a ten-point programme which sets forth all the familiar arguments in favour of a united Germany and against the "western imperialists."

One of the tasks allotted to these committees is to help track down the spies and saboteurs (many of them said to be members of the LDP and CDU) who are allegedly trying to hinder the economic recovery of eastern Germany. The Government has issued surprisingly frank and circumstantial accounts of this economic sabotage; organised arson, for instance, is said to have reached "frightening proportions." These somewhat blood-curdling reports are probably designed to startle or stun the Germans into acceptance of the new Ministry of State Security which will combat these activities with far-reaching and inquisitorial powers. No reflections are cast on morale inside eastern Germany, for all espionage and sabotage is conveniently attributed to the Anglo-American imperialists and their stooges, Dr Adenauer and Dr Schumacher.

By encouraging these familiar methods the Russians may hope to achieve two results simultaneously: real economic improvement in the eastern republic and a monolithic political structure which will ensure overwhelming Communist success in the elections next autumn.

The Merchant Navy

Dutch seamen, Danish seamen, and Norwegian seamen, we have always understood, are not addicted to the vices and recklessness attributed to English seamen. On the character of the latter, our naval victories have had, perhaps, a sinister influence. They have been the parents of much arrogance and presumption, and some contempt for the peaceful art of a carrier. No men have a better opportunity than seamen of saving a little money. Provided with lodging and food, without the power for weeks or months of spending money, their wages accumulate and amount to a little fund at the end of a voyage. No men are naturally more impressed than they are with the uncertainty of life and health. Their occupation exposes them to many injuries, and to sudden destruction. Captains of merchant vessels and naval officers are not deficient in prudence; and we are inclined to conclude that were the sailors treated like men bound to take care of themselves, they would be as saving, or more saving, than many of the other labouring classes. . . . Certainly our present system of taking ships into wet docks on their arrival, and instantly discharging all the seamen, leaving them without employment or engagement of any kind, is injurious to them. . . . Promiscuous crews are not much to be confided in, and the cargoes of English ships are worse stowed and taken care of than those of the ships of other nations. . . . To have good servants, the employers must remove their men from the influence and power of crimps, instead of hiring their abominable services, and they must show their servants how they can advantageously invest their hard won earnings. They must do this for their own sake; we believe they will do it, and that the men having the means, will, in the majority of cases, take care to lay by for themselves. Such reforms are not effected in a day; but they are already begun—they are sure to continue—and at no distant day they will at least make English seamen as moral and provident as those of Holland and Denmark.

Obstacle Race for Examinees

The examination system has often been criticized on the grounds that it unduly favours a sponge-like memory, absorptive and easily squeezable, a superficial gift of the gab, and a narrow capacity for swotting. These criticisms should not be applied to the Higher Schools Certificate. Preparation for this test, as sufferers and their relatives know, involves the study of a number of set-books, ignorance of which cannot be atoned for by any other quality whatever. It might be thought that this rigidity would intensify the very faults cited; but so to conclude would be to underestimate the ingenuity of the Oxford and Cambridge Examinations Board. In practice, the set-book requirement turns what might have been a mere milestone in the Swot's Progress into a first-rate test of initiative, worthy to stand by those which require candidates to obtain hairs from the tail of the tallest giraffe at Whipsnade or a band from Mr. Churchill's cigar. This aim is achieved by the simple device of setting books which are, and have long been, out of print, and which can, therefore, be obtained, if at all, only by frantic rummaging in Charing Cross Road and such places, by detective work in public libraries and among acquaintances, and acquaintances of acquaintances, known to possess well-stocked bookshelves, and by high diplomcy in the negotiation of loans from the more fortunate. So far the Board has never risen, as did a certain Dominion examining body, to the heights of setting a book which, announced for publication on the eve of the War, had in fact never been printed at all. Perhaps that crowning achievement can be expected next year. Perhaps, on the other hand, protests from those who prefer initiative tests to be set frankly as such may induce the examiners to scrutinise their lists of set-books more carefully.

Letters to the Editor

Five Years of Labour

SIR,—In your issue of February 4th (page 245) you appeared to criticise the administration of the Education Act of 1944 by Mr Butler's successors.

May I make a few points in the Labour Government's defence.

True, some parents, who might formerly have got their children admitted as feepayers to grammar schools, may now find that an examination, which has to be taken by all candidates for admission, lets in other children but not theirs. For those who get in, however, no fee is payable.

The salaries of most teachers in grammar schools have not risen so much as those of their former "elementary" brethren, but a higher proportion of the additional allowances goes to grammar school than to other teachers.

The present administration is not responsible for making grammar schools free, nor for the constitution of the Burnham Committee, which negotiates teachers' salaries. For these actions, as also for the enactment that the school-leaving age should be raised to 15 not later than April, 1947, the Coalition Government was responsible. The present administration was not responsible for the initial mistake of ignoring the need for more women teachers brought about by the higher birth rate.

The present administration has issued too many circulars and has been slow in revising the building regulations. Some think its attitude to possible new forms of secondary education too rigid. Some think its policy about boarding schools too timid. Its policy on the General Certificate of Education is about equally opposed and supported. But in many ways the people have greatly benefited, for instance: the vast expansion of public aid to students at universities and other institutions for advanced training: the growing expansion of technical education and a liberal attitude to adult education: a great and beneficial influx of ex-service teachers: the growing expansion of special schools for handicapped children and a merciful provision by which teachers visit very seriously handicapped children in their homes: more and better school meals: and, recently, the tactful, but none the less valuable, inspection of private schools, a safeguard for children and parents.

No administration has ever given education so large a slice of the cake. As an education officer, who has no party politics and remembers the government's attitude to education in 1939, I find the present Minister's policy on the whole wise and fair, and I doubt if a Conservative Minister would have been wiser or fairer in the very difficult postwar conditions.
—Yours faithfully,

COUNTY EDUCATION OFFICER

[Our criticism was directed solely to the "levelling down" tendencies of the last few years. We did not express a general criticism of Labour's educational administration.—EDITOR.]

Teachers' Salaries

SIR,—May a grammar-school master be allowed to comment briefly on the details of teachers' salaries in your third article on personal incomes? You state that "the maximum salary for the university graduate with four years' training has increased by about 30 per cent since 1938." In fact, as your Table III shows, it has increased in the provinces from £480 to £615, which is 28 per cent, and in the London area from £528 to £663, which is about 25½ per cent, if he is teaching in a grammar school. But if he is teaching in a non-grammar

school it has increased from £366 to £615 (i.e. by 68 per cent) in the industrial and semi-industrial areas and from £408 to £663 (i.e. by 62½ per cent) in the London area. In the face of an 80 per cent rise in prices it is the grammar school master's standard of living that has been so grievously reduced.

Further, you point out that the maximum salary in a limited number of assistant posts with special responsibilities may be increased to at the most £800 a year. It is true that an assistant master in the provinces may have a maximum salary of £810, but he must:

(1) have spent five years in full-time approved study or training after the age of 18,
(2) hold a first-class honours degree, and
(3) receive a special allowance of £150.

The number of grammar school assistant masters receiving special allowances of £150 is very small, and consequently the percentage of masters with a maximum of about £800 is too low to affect the general picture.

From the grammar school master's point of view the most interesting feature of your article is the close but presumably unintentional juxtaposition of the following facts:

(1) The four-year trained graduate master's maximum is about two-thirds of that of the assistant school dental officer.

(2) The same master's assured maximum (£615, reduced by 5 per cent for superannuation) is lower than that of the civil servant of the clerical class, who enters the service at 16 or 17 on an examination of school certificate standard and is normally promoted to the grade of Higher Clerical Officer with a maximum (London) of £650, which is not reduced by superannuation contribution.

(3) Even the very rare assistant master who receives a maximum of about £800 (reduced by 5 per cent for superannuation) is only about level with the civil servant of the executive class, who enters the service at 18 or 19 on an examination of higher school certificate standard and is normally promoted, several years before he reaches the maximum of the Executive Officer grade, to the rank of Higher Executive Officer (London maximum £800 without reduction for superannuation) with good prospects of promotion to still higher grades.

Yours faithfully,

9 *Birchwood Road, S.W.*17 FRANK T. SMALLWOOD

[While we agree with the substance of this letter it should perhaps be made clear to readers less familiar with this topic, that in his first paragraph Mr Smallwood is to some extent comparing incomparables. Prior to the 1944 Education Act graduate teachers were rare in the elementary schools and received no graduate allowance at the maximum of their scale. The entry of a large number of graduate teachers into the non-grammar secondary schools is a postwar phenomenon due largely to the equality of salary scales.—EDITOR.]

Bank Salaries

SIR,—In the very informative article, "Salaries and Profits," printed in *The Economist* of February 4th, brief attention was devoted to salaries paid in banks.

The percentage figures given, showing the difference between prewar and postwar salaries, might lead your readers to suppose that bank staffs have been treated with singular generosity.

Whilst I have no access to figures covering the whole of the banking industry, I have close knowledge of the position in one of the "Big Five," and I also know that this particular bank, in the context under consideration, is superior to most banks and inferior to none. Therefore, the figures I give below should be, if anything, in excess of the average relating to the whole industry. Most emphatically, however, they do not exceed the figures given in your columns.

Your article states, "For appointments senior to clerical ones, salaries are today roughly 50 to 60 per cent above their prewar level." The parallel figure in the bank I speak of, as far as it can be brought to an average, is something less than 35 per cent.

Your article goes on to say, "Bank clerks have, on the average, increased their pay by about 60 per cent for men and 80 per cent for women." In this particular bank the figures are more like 50 per cent for men and 75 per cent for women. Moreover, all of the above increases include a cash payment at the rate of 15 per cent per annum (paid half-yearly), with an explicit proviso that it is not necessarily recurrent.

I make these points, not in order to air a grievance, but with a desire to establish the facts and demonstrate that bank clerks have not in fact been treated with undue liberality.—Yours faithfully,

35 *Shawfield Park, Bromley, Kent* L. J. FILEWOOD

[The figures referred to in our article were given to us as representative of the salaries of bank staff. There was no suggestion that bank clerks have been treated with "undue liberality." Although the junior posts have generally seemed the largest relative increases in salary, our figures showed that the average pay of the bank clerk has risen appreciably less than the average wage-packet.—EDITOR.]

SIR,—We have read with considerable interest your article on salaries. The figures that you quote for bank clerks are not contested, except to say that the present-day figures would appear to include a cost-of-living addition of about 15 per cent which would not necessarily be repeated.

It is, however, a fact that beyond the range of the scales the increases over 1938 fall very far short of the percentage which gradually reduces in the higher ranges. It is also true to say that there is real hardship, particularly from the age of about 28 onwards, and that the number of competent personnel receiving promotion is very considerably limited in these days, due to larger numbers in the particular age group eligible for promotion than hitherto.—Yours faithfully,

T. G. EDWARDS,
General Secretary

The National Union of Bank Employees

Parliament and the Law

SIR,—Having every sympathy with the libertarian spirit and the substance of your article of January 28th, I have read Mr Maurice H. Smith's criticisms with some interest. If I understand him aright, he is asking us to infer that *because* the Select Committee on Statutory Instruments has made no report to the House (since 1944) of any Statutory Instrument having been "made in pursuance of an enactment containing specific provisions excluding it from challenge in the Courts," *therefore* no such Statutory Instrument has come into being.

Since there certainly are Statutory Instruments which have come into effect since 1944 which cannot be challenged in the Courts, e.g. Nos. 1189 and 1309 of 1948, it would be nice to know just what Mr Smith thinks is meant by the phrase I have quoted from his letter. Does he read it as meaning that it is only where a Statutory Instrument alone and (unaided by its enabling enactment) itself contains such a provision, that it must be reported by the Select Committee? If this is the meaning, then it is not very surprising that no such Instruments have come up for notice; for a Government Department to legislate itself outside the control of the courts solely by means of a regulation would be serious indeed.

Alternatively, Mr. Smith's phrase (I realise that he is himself only quoting) may be read to mean that provided a Statutory Instrument is made in pursuance of an enactment which, so far as it concerns the field covered by that Statutory Instrument, contains a specific provision excluding that field from challenge in the courts, there will be no need for the Select Committee to report on such a Statutory Instrument. At first sight this may not seem so bad, if only because where Parliament has already laid it down that certain matters shall be matters of administration and not subject to challenge in the courts, that is Parliament's affair. But the doubts of the libertarian arise on examination of Statutory Instruments themselves, for it is sometimes very arguable (when it surely should never be capable of argument) that when dealing with matters which are not (by virtue of their enabling enactments) subject to challenge in the courts, the Statutory Instruments in themselves go beyond the wording of the Section or sub-section in the Act to which they owe their life. It is, for instance, arguable that the particular instruments referred to above stretch the wording of their enabling Act to the limit, and beyond what was anticipated and the subject of debate when the Act was only a Bill.

Unlike Mr Smith, but nevertheless in good company and for what I believe to be good reason, I prefer to associate myself with the sentiments of your original article.—Yours faithfully,

FRANK HELLINGS

79 *Cannon Street, E.C.*4

Profits

SIR,—I have read with interest the article on Salaries and Profits in *The Economist* of February 4th but note with regret that the writer omits any reference to the fact *that during periods of rising prices* the profits of trading and industrial companies as computed by conventional methods are totally at variance with the true economic profits.

This is due to two defects in the conventional method of computing profits. (1) It ignores the fact that the customary item for depreciation of fixed assets is inadequate for the replacement of these assets at the end of their useful life if prices have risen since the date of purchase. (2) It ignores the fact that every pound in the company's accounts representing current assets such as stocks, ledger and bank balances, is worth less in terms of commodities at the end of the accounting period than it was at the beginning.

During periods of rising prices, any company that paid out its profits as computed by conventional methods of accounting would find that its assets in terms of money remained at a constant value, but that its assets in terms of commodities dwindled as the years passed.

It is of interest to note, for instance, that a company that traded, say, in wheat during 1900 and year by year paid out its profits (as computed by conventional methods) would find (assuming that the price of wheat was rising at the rate of 3 per cent per year) that at the end of 50 years it was only able to finance something less than one quarter of the quantity of wheat that it was able to finance in 1900.

Such a company would never have fallen unwittingly into this decline if for every 1 per cent advance in the price of wheat during each accounting period it had included an item on the expenses side of the Profit and Loss Account equal to 1 per cent of the value of its current assets (i.e., stocks of wheat, ledger balances and bank balances) as a provision against this inflation as it occurred.

In a recent memorandum issued to their members by the Federation of British Industries it is stated, "There is general agreement that high rates of tax, combined with the rules for computing profits which ignore the effects of inflation, have turned a tax on profits into a tax of more than 100 per cent computed after deducting the cost of preserving the productive capacity of the business."

I do not doubt for one moment that dividends distributed during the period 1939-49 were paid, to a very large extent, out of capital rather than out of true economic profits.

Should not considerations of this kind be taken into account when comparing the amount paid out in wages and salaries with the profits made by industry?—Yours faithfully,

JOHN P. BIBBY

King Edward Street, Liverpool, 3

Books and Publications

Textbook and Tract

"Male and Female; A Study of the Sexes in a Changing World." By Margaret Mead. Gollancz. 463 pages. 18s.

MISS MEAD has an unrivalled knowledge of seven South Seas societies, ranging from the civilised culture of Bali to the cannibal Mundugumor of New Guinea. From it she has taken a cross-section; she has selected material showing the attitudes taken in these various societies towards the roles of the male and female in childhood, adolescence, courtship and marriage and towards their respective contributions to religion, to home-making and to work. By contrasting these cultures with one another she is able to distil what is inherent, constitutional or biological from what is acquired, environmental or culturally imposed.

To those with a western background who are ignorant of social anthropology it will come as a surprise to find how slight are the inherent psychological distinctions between the sexes and how rich and elaborate are the cultural variations that can be imposed. The author is prepared to regard a woman's desire for children as biologically determined, but she finds that a man's desire for children is learnt.

In the second part of her book Miss Mead tries to submit American culture to a similar anthropological analysis She puts an unerring finger on some of the paradoxes and sources of strain in the American attitude towards the male and female roles in society. There is a wealth of shrewd and telling criticism of the American attitude to careers for women, to adolescent relations between the sexes, to "success" and to divorce. But does not the very heterogeneity of "the melting pot" make it impossible to define an American attitude to anything? Are any generalisations about the behaviour and ideals of American men and women yet valid? The author naturally appreciates this difficulty; in an appendix she discusses the propriety of applying anthropological methods to modern societies, but concludes that such attempts should be made.

The reader will find however that in the earlier chapters dealing with primitive societies the language is cool, reasoned, and unemotional and even contains some jargon—for all branches of science need new concepts and most require new words. In contrast, in the later chapters dealing with America the tempo increases, the author turns critic and becomes partisan. She is clearly on a hobby-horse and riding hard. To make her points she is compelled to overpaint the picture to the point of caricature as, for example, in her description of the birth and infancy of a modern American baby. The book begins as a textbook, but turns into a tract.

The New Arm of Warfare

"Secret Forces." By F. O. Miksche. Faber and Faber. 181 pages. 15s.

NAPOLEON once wrote that "the whole secret of the art of war lies in making oneself master of the communications," and so well was this lesson learnt by his enemies that the decisive battle of Leipzig was fought with most of the French cavalry tied up in guarding those very communications against guerrilla attack. It is with the doctrine and technique of such attack that Lt.-Colonel Miksche is concerned in this modest but highly stimulating little book; and he has right in the foreground of his mind the possibility—indeed the certainty—that Soviet strategy, whether in cold or weapon war, will give a decisive role to the secret forces of "people's war." Yet he has written little more than a prolegomena to a wider and deeper study of modern developments in the use of force and ideas—developments which seem still to be dangerously neglected both in the staff colleges of Britain and western Europe and in their peacetime defence preparations.

The author points out that Marx and Engels made contributions to the theory of proletarian war which have turned out remarkably prescient, that these ideas deeply influenced Lenin and Stalin, and that the defensive role played by the Soviet partisans during the German advance into Russia was thoroughly organised before the war and directed by the Communist Party from special headquarters. The Nazis, too, made the most elaborate and successful use of cold war techniques, not only in Austria and the Ukraine but also to the west of Germany; and the German attack of 1940 found the British and French not only unprepared for such tactics but slow—and very cautious—in adopting them and applying them through the resistance movements.

What Marshal Bulganin, former Soviet Minister of Defence recently called an "entirely novel doctrine of strategy" rests on three outstanding facts: the dependence of modern armies on extensive lines of communication and concentrations of industry vulnerable to technical sabotage and civilian attack; the development of air-lift and radio communication methods; and the ideological and revolutionary nature of the conflict—which is already in process on several fronts. Lt.-Colonel Miksche overstates his case a little by comparing the strategic importance of irregular warfare with that of the atomic bomb: both, he claims, have the effect of "disintegrating normal strategy into small individual actions," both can crack the thin cement of social institutions and habits and induce the anarchy which destroys the soul of a nation; but the comparison is a useful one if it awakens attention to the vital importance in western defence strategy of civil defence (in the widest and fullest sense of the word).

This book has enough historical asides to start many hares and to show that the problems of cold war may have novel aspects but are not new. Lt.-Colonel Miksche would like to see this country have ready in peacetime a central command for irregular warfare, air transport and landing fields allocated, guerrilla supplies ready for distribution, and centres ready for the instruction of agents, liaison officers, parachutists and wireless operators. Those who regard such measures as playing at defence, as a wasteful dispersion of effort, should read this deeply interesting book and reflect on the faith which Lenin showed in its basic doctrines and the use which Stalin is making of them now.

America Adjusts to Reality

"The Atlantic Pact." By Halford L. Hoskins. Public Affairs Press, Washington. 104 pages. $2.50.

THE guiding principle of United States foreign policy has always, in Dr Hoskins's opinion, been the safeguarding of the country against aggression. He is therefore not surprised that the United States has adjusted itself to the reality of the air and atomic age, in which the Atlantic Ocean is no longer a reliable protection, and has entered into a defensive alliance with European countries. To those who take a less historical view, however, the Atlantic Pact and the Mutual Defence Programme seem to be the climax of a new development in American foreign policy, one which began less than ten years ago.

Such people, and Dr Hoskins has met many of them in his work at the Library of Congress, will find his essay a useful and well-documented study of the background of the Pact, in which economic, political and military threads are almost inextricably woven, of its provisions and of the questions that still remain unsettled. Dr Hoskins rightly emphasises the idealism which was as important a factor as self-interest in inducing the American people to accept a military alliance, in time of peace, with countries outside their own hemisphere. He recognises, too, that the most difficult problem the American Government has to solve is that of striking a balance between its obligations under the Pact and its obligations to its own people, of maintaining its strength abroad without undermining its prosperity at home. It is a problem which has become more urgent since Dr Hoskins wrote, for he was still able to hope that time might be gained for its solution through exclusive possession of the atomic bomb.

"Leg. Co."

"The Nigerian Legislative Council." By Joan Wheare. Faber. 265 pages. 18s.

MRS WHEARE'S study of the Nigerian Legislative Council is based chiefly on government publications, in particular on the Council's debates. A Legislative Council of the customary Crown Colony type was first set up for Southern Nigeria in 1922, the Northern Provinces remaining under the legislative control of the Governor. Until its reorganisation in 1946 this Council had the usual official majority. The Governor presided; and as the determination of policy, especially in the crucial matter of finance, lay with him and his Executive Council, the most that the council could do was to plead, expostulate—or of course approve. The council was, in short, primarily a platform for the Government. That it worked as well as it did was due to the skill with which the convention of "persuasion and mutual confidence" was upheld by successive governors.

Mrs Wheare concludes with a discussion of the constitution enacted in 1946, which provided for an African majority and for regional bodies to bridge the gap between the central government and the native administrations. But the movement towards making government more democratic is so fast in Nigeria that this constitution is now being revised. Mrs Wheare's book gives a very useful background for an understanding of these changes.

This is the fourth of a series of studies of colonial Legislative Councils edited by Miss Margery Perham. It is, like its forerunners, competent, judicious and admirably factual. But it suffers from the too conscientious restriction of its scope as well as from the pains taken by the writer to show up everybody in the best possible light. Mrs Wheare passes over too tactfully the fact that outside the small coterie of Lagos literates the 22 millions of Nigerians were both ignorant of and totally indifferent to the activities of "Leg. Co." Even among the rank and file of officials, absorbed as they were in the tactics of indirect rule and the struggle for revenue, it was the possible nuisance value of the council which loomed largest. Given its constitution, these public attitudes were enough to condemn the council to the narrow and unrealistic stagnation to which Mrs Wheare draws attention. In fact it may be that the main service rendered by the Legislative Council to the political development of Nigeria in the twenties and thirties was in serving as a target for the criticism of the would-be demagogues who became such a thorn in the flesh of the administration.

The General Election -and after

A PRACTICAL HINT TO INVESTORS

WHATEVER the result of the Election, it is bound to have a profound effect on investments. During the days following February 23 it will be imperative to keep shareholdings under daily review. Rapid but vital decisions may have to be made.

STATISTICS FOR ECONOMISTS

R. G. D. Allen, O.B.E., M.A., D.SC.

Professor of Statistics in the University of London

"STATISTICS are a department of applied mathematics and cannot, unfortunately, be studied to best advantage without some prior knowledge of elementary algebra. Yet the author has succeeded in compressing into some 200 pages a comprehensive outline of his subject which should be intelligible to the reader without mathematical equipment."
THE STATIST.

". . . Professor Allen's usual brilliant control of material and clarity of exposition. There are some excellent sections on statistical sources and plenty of illustrations from economic data. A very useful appendix consists of illustrative tables with notes on their nature, their purpose, and the conclusions that can be drawn from them."
OXFORD MAGAZINE.

DISTRIBUTIVE TRADING

AN ECONOMIC ANALYSIS

Margaret Hall, M.A.

Fellow and Tutor in Economics at Somerville College, Oxford

"THE book is packed with information. . . . The author's conclusions are interesting." THE TRIBUNE.

"A concise and useful introduction to the study of a field in which both the pure and the applied economist have still scope to contribute much to the statesman's—and the housewife's—guidance."
Aylmer Vallance in the NEW STATESMAN.

"It is a book which should be included in every technical library." CO-OPERATIVE NEWS.

LABOUR

P. Sargant Florence, M.A., PH.D.

Professor of Commerce and Dean of the Faculty of Commerce and Social Science, University of Birmingham

"WITH Professor Sargant Florence's study—factual, statistical, theoretical and human—of labour and its problems, Hutchinson's University Library more than maintains its past high standards. . . . This book is important for all students of economics who want to keep their feet on the ground." THE ECONOMIST.

"Every personnel officer and every factory welfare worker will benefit by reading it; but most of all it should be read by employers and trade union officials."
Professor G. D. H. Cole in NEW STATESMAN AND NATION.

"All can easily and profitably read his masterly book. The highly practical side of his outlook is soon revealed . . . no one who reads this book could find a bias towards any particular party's idea on the most effective use of labour." FORTNIGHTLY REVIEW.

SOCIAL SURVEYS

D. Caradog Jones

Formerly Reader in Social Statistics in the University of Liverpool

"A GOOD guide for the man who wants to know what a survey is, the amateur who wants to survey his local parish, or the student with examinations to pass."
NEWS CHRONICLE.

"We can recommend the book not only to statisticians, but to all who are interested in social problems."
THE GUARDIAN.

AMERICAN SURVEY

Hydrogen Jitters

(From Our American Staff)

THE sudden case of "jitters," which has blown up in Washington out of an apparently cloudless sky, is attributed by one experienced correspondent to the mistaken belief that security and secrecy are the same, and by another to the tardy realisation that bombs can be dropped on America as well as by it. Why the nation's capital should have been so late in arriving at that realisation is as puzzling as why France thought she was safe behind a Maginot Line which was incomplete at both ends. Nor is it clearer why this enlightenment (if that is what now prevails in Washington) came when it did. The immediate cause seems to be President Truman's order to proceed with work on the hydrogen bomb. But, if the bomb was intended as a terror weapon to bring Moscow to terms in the cold war, it has backfired and produced most curious disturbances in the American capital.

The present tensions come at the end of a long series of happenings insufficiently relieved by adequate public discussion and understanding. Until September 23rd, when Mr Truman told the country that the Russians, too, had split the atom, the United States had hidden from reality under a comfortable cushion of official assurances that it would take Soviet scientists three to five years to produce an atomic bomb. Most people kept on repeating those assurances regardless of the passage of time so that, whatever the calendar said, they still thought of themselves as safely sheltered behind that same period of years.

The Soviet explosion sent a shiver of fear throughout the country, and stirred distrust of the future. The two Hiss trials, with their hint of treachery in high places and their acrid after-taste of truth still concealed, were used to impugn good faith in the past. The success of the European recovery programme tended to be obscured by the failure of the Chinese policy to hold the Communists in check in Asia. The antagonistic clatter surrounding hearings on the Armed Services, the error in judgment which landed the battleship *Missouri* on a mud-bank, helped to undermine confidence in the dependability of Army, Navy and Air Force. Nor was this counter-balanced by confidence in the Atomic Energy Commission, repeatedly under attack by one politician or another, and unable, for security reasons, to explain itself. As for the Russians, not only did they take the Chinese into camp, but they walked out of the United Nations and therefore could not be reached even at quarrelling range.

All these factors of distrust had done their work by January 31st when the President gave the go-ahead signal on the hydrogen bomb. That a design for this horror existed had been known since November, and discussed as much as was possible, given the prevailing paucity of information. Mr Truman's decision contributed little light. What the new bomb might cost, where it would be made and how long the making would take, what risks its manufacture would entail for the civilian population, how it could be stored and how transported—none of these reasonable questions were answered. All the public knew was that a new nightmare had been approved.

★

For a day or so the matter lay quiet. No clamour came from a people used to taking horror "comics" with their morning coffee. Then Congress, about to address itself to budgets and feeling the need for public support, began to sound the alarm. Senator Brien McMahon, chairman of the Joint Congressional Committee on Atomic Energy, professed himself so appalled by the discovery that "fifty million Americans might be incinerated in the space of minutes" that he proposed spending fifty billion of the nation's dollars ($1,000 per incineratable man) for good works the world around, if all the nations would agree to a plan for atomic control. Senator Millard Tydings, chairman of the Senate Armed Services Committee, asked for a world disarmament conference to ban every weapon bigger than a rifle.

Between these two trial balloons came the sombre announcement that Dr Klaus Fuchs, loaned by Britain for work in America on the atomic bomb during the war, had been arrested on suspicion of espionage. The Army said quickly that this was none of their fault, as they had accepted him without question, on Britain's recommendation. Minds not too well hinged began asking if Britain, Socialist and known to be seeking a share in bomb secrets, could really be trusted. Dr. Fuchs' alleged confession, which came later, did not change the currents set up by his arrest.

The scientists added their straws to the incendiary pile. Twelve of the gravest and most respected asked the United States earnestly not to be the first to use the new bomb—which is presumably still on the drawing board. Assembled physicists were told that the work of the Atomic Energy Commission had been impeded by partisan attacks on its members, and that the result was as serious as though planned by well-placed Russian agents.

It was this complex state of funk and mutual distrust (dubbed by certain Senators "the great fear") which confronted Mr Acheson at his press conference last week. Whether his confident voice asserting that the Soviet approach is incompatible with "the maintenance of peace and freedom," his warm reminder that the nation must continue calm and steady, because "the consequences of not being calm and not being steady are even more terrible than they were before," can quiet Congress and the press remains to be seen.

Perhaps the most curious thing about the present tempest is that it seems not yet to have extended far beyond the teapot of Washington. This is perhaps one more proof of that isolation from the rest of the nation which recent visitors to the capital have noted. The important question is, which is isolated, the capital or the country? If security regulations have kept so many things secret in Washington that citizens lag in understanding what the national dangers really are, the fault can hardly be said to lie entirely with the uninformed.

The result of the unhealthy secrecy which has prevailed for so long may be far more serious than the well-meaning withholders of information intend. However wise the "fear-ridden men in Congress" may think themselves after listening to testimony in closed committee rooms, however clever the exploiters of fear for politics or profit may seem, the damage they do the country is considerable. Nor can they use as excuse the dilemma of honest men faced with the need for deciding how much they can reveal to their fellow Americans without endangering the national defence. This is not enough to explain the persistence in a period of relative peace of a war psychology, exaggerated by scientific progress kept out of reach of a curious people, and thus degenerating into a monstrous myth which threatens to paralyse both thought and action.

When power resides in the people, as it does in the United States, the people must understand both the weapons which their power can build and pay for, and the extent of the need for using those weapons. Not since the fighting ceased in 1945 has the secrecy been so great in areas still dominated by the military mind. Citizens of a democracy are willing to acknowledge the need for secrecy in a hot war, but not in a prolonged cold one. Congressional representatives who are cut off from the roots of power by security regulations find themselves thrown off balance by rumour and deprived of the steadying influence which comes from consultation with their constituents. Hysteria is engendered, and the public morale is damaged beyond years of repairing.

The extent of the danger was analyzed by Dr Vannevar Bush, head of the Carnegie Institution, in observing that the nature of the democratic process and the achievements of science

> are intimately intertwined, for science does not operate in a vacuum, but is conditioned by the political system that controls its operations and applications. . . . If the democratic process will work to foster an effective government, if science will cure our ills and not merely provide means by which an aggressor can suddenly destroy us, we have a rosy outlook and can quarrel with minor things without fear. [If not], if the application of science has finally doomed us all to die in a holocaust, there is little use in arguing about the drought or the next strike.

The present fear is that with the democratic process frustrated by too much secrecy, and with science operating in a vacuum for security reasons, both will suffer and the people with them.

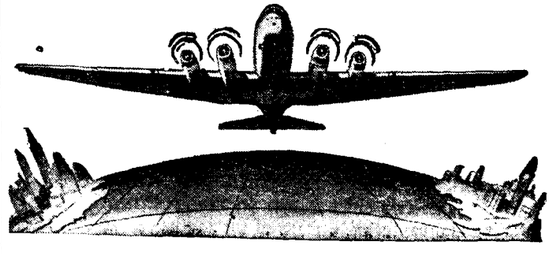
Sin in the Mid-West

[FROM A CORRESPONDENT IN IOWA]

LIKE the legendary preacher of the Calvin Coolidge story, Americans are against sin. Reckless driving of motor cars—by someone else, at any rate—is regarded everywhere as a sin. Intoxication and gambling are sins in some parts of the country all the time, and intermittently so in others. Now that the motor car is rivalling clothes and manners and the home as the prime visible index of a man's social standing,

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

THE NATIONAL CITY BANK OF NEW YORK



Incorporated with limited liability under the National Bank Act of the U.S.A.

Founded 1812

Head Office: 55 WALL STREET, NEW YORK

London Offices:
117 OLD BROAD STREET, E.C.2
11 WATERLOO PLACE, S.W.1

A Banking Link between Britain and the U.S.

THE CHASE NATIONAL BANK
OF THE CITY OF NEW YORK
A United States Corporation with Limited Liability
LONDON — 6 Lombard Street
51 Berkeley Square Bush House, Aldwych

now that the motor car has become the chief means of transport to work and pleasure, the chief site of courtships, family outings, and illicit love affairs, it is no wonder that reckless 'teen-agers use it to show off their skill and daring.

Budding young mechanics and playboys rebuild decrepit vehicles, streamlining the outer shells and "souping up" the motors to make them "hot rods," and test them out on lonely beaches or deserts, or busy highways and city streets. Farm boys roar around quiet country lanes, playing motorised variants of follow-the-leader, tag, hide-and-seek, and king-of-the-mountain. The worst show-offs play "wrinkle fender" and "chicken," when sufficiently egged on by carfulls of double-dare-you adolescents. In "wrinkle fender" the idea is for one speeding car to pass another, sideswiping it gently as it does so. "Chicken" is even more a test of suicidal nerve: the two cars race at each other, and the first one to swerve to avoid a head-on collision is "chicken" or cowardly.

Skill and daring like this helped storm the beaches and hedgerows during the war, but they also help to make over-confident 'teen-agers four to six times more deadly, as drivers, than persons over 40, and boost the rates for drivers' liability insurance for motor cars which minors are permitted to drive. Their elders' record is good only by comparison. Adult speeding and driving too soon after drinking intoxicants keep the annual slaughter in traffic accidents above 30,000 each year. The National Safety Council, a private body, takes some comfort in a falling *rate* of traffic deaths per vehicle-mile travelled, but the absolute number remains staggering after 25 years of increasingly elaborate efforts to reduce them through education, law enforcement, and better road engineering.

Intoxicants, which Americans tried to legislate out of existence, are consumed in great quantities even in towns, counties, and States that are nominally "dry." The motor car makes "local option" illusory. The hip flask of the nineteen-twenties is less common now, but only because the more capacious "fifth" (of a gallon) is so readily available, in public and private places. The pre-prohibition "bar-room" or "saloon" is known today as a "bar" or "tavern." It now has a television set instead of "free lunch," and women use the front door instead of the "family entrance" at the rear.

*

Gambling *mores* are changing, too. Nevada is a deposit from the wave of gambling that followed the Indian frontier west; the anti-gambling areas of the central United States are a legacy of the reaction which came with settled farming. The new wave of gambling that followed industrialisation is still strongest on the two coasts. Since liquor became legal in 1933, gangsters in pursuit of easy money have turned to gambling. So has much of the public nagging at legislatures and police to "do something" about open violations of the law.

The struggle against the gangsters who moved into gambling takes two chief forms: legalising certain kinds of gambling and capturing a share of the profits; or attempting to drive out "commercial" gambling altogether. True, the laws themselves rarely make a distinction between commercial and amateur gambling; the lotteries at the church social, at the fraternal lodge benefit, and in the employees' shop are as illegal as the smoke-filled pool hall with a wire to the race track. But administrators and the public do see a difference. The law calls it gambling if there is a legal "consideration" paid for the chance to compete for winnings. Hence cinema "Bank Nite" prizes and wireless give-away programmes are safe, and church Binzo games hover on the border of legality, depending on how the money changes hands.

Half the States, mostly in the last decade, have legalised pari-mutuel betting on horse races, with the State taking a handsome cut of the receipts (10 per cent in New York State, plus 5 per cent for New York City). Bookmaking remains largely illegal, and doubly so the bookies' extra-territorial empires in telegraph-linked betting rooms all over the country. Toleration of these outside the law leads frequently to police corruption, and to gangsters fleecing the public and murdering one another for the privilege of doing so.

"Wide-open" States such as Nevada permit nearly any kind of gambling, but tax and regulate it closely, assimilating it as nearly as may be to a respectable local business. States such as Wisconsin, Minnesota, Nebraska, and Iowa attempt to prevent gangsterism by rigid anti-gambling laws, vigorously enforced against commercial establishments. Wisconsin has been doing this with some success for years, Minnesota for two years, Iowa only during the past few weeks. Under the laws of Wisconsin and Minnesota, the toleration of illegal gambling on licensed premises means the loss of the licence to do lawful business.

In all this, the Federal Government plays rather a passive part. There are well-enforced federal anti-narcotic laws, but liquor, gambling, and reckless driving are up to the States and their subdivisions. The Department of Justice has been fishing for evidence of violation of federal laws by means of grand jury investigations into the operations of gambling "syndicates" in Los Angeles, Kansas City, Chicago, and Miami. Since the fabulous Al Capone was sent to prison for income tax evasion, gangsters and gamblers have been forced to an unwelcome frankness about their occupations and incomes in federal tax returns. Federal licences reveal the location of coin-in-the-slot machines for any States which really care about enforcing their laws against mechanised gambling with these "one-armed bandits." But by and large, sin is a state and local matter, regulated in a wide, and not always mutually helpful, variety of ways.

American Notes

Stretching the Defence Dollar

The Joint Chiefs of Staff did not visit Formosa on their ten-day tour of American bases and occupied areas in the Pacific. Yet even with this omission, everywhere they went they heard the same cry for more military and naval strength. There have been some increases in the Pacific Fleet, in response to the belief that the Russians have a quarter of their 270 submarines operating from Pacific ports, but General MacArthur's commanders were apparently unanimous in asking for more and in urging that the Pacific should no longer be treated as an area of secondary strategic importance. The Joint Chiefs themselves were shocked by the military housing they saw; while in the Philippines the opposition has joined the government in criticising the backwardness of American preparations to defend the archipelago. Governor Gruening has been painting the usual bleak picture of Alaskan vulnerability. Yet, as General Bradley insisted, even General MacArthur realises that he must accept his share of the general defence reductions.

Actual spending on defence in the fiscal year 1951 will, as the table shows, be about $400 million larger than in the present year, and remains the largest item in the budget. Mr Johnson, the Secretary of Defence, boasts that but for the economies made possible by more determination and more unification, it would have been at least a billion and a half higher. Economies, moreover, take time to bear fruit, and spending in 1951 will be affected by commitments made last year. The results of this year's painful pruning should be apparent by 1952. There is one school of thought in Washington, perhaps not altogether disinterested, that contends Mr Johnson is being penny wise and pound foolish, and that the economy campaign will end by leaving the United States defenceless and forced to abandon the eastern Pacific. Mr Johnson believes, however, and the President supports him, that the "balanced forces" now emerging will provide more military effectiveness, at a cost the nation can afford to pay. With fewer men, the Services will have more in combat units, while the budget for 1951 allows for the first substantial purchases of new and modernised equipment since the end of the war.

US SERVICES

	Strength		Budget ($ Billion)

Source: President's Budget Message.
* Items may not add up because of rounding.

The brunt of the economies is to be borne by the Navy and the Marine Corps and it is a sign of the changing times that Admiral Sherman—confirmed, after a final flare-up of Congressional suspicion, as Chief of Naval Operations—nevertheless agrees that the defence budget has been distributed "about in consonance with the responsibilities of the Services." The old Adam of competition for Congressional favour has not been completely suppressed, however; Mr Symington, purely on security grounds, still openly sighs for a 70-group Air Force, though on economic grounds he accepts the President's restriction to 48 groups.

The greatest single economy in this year's spending—which is almost $1 billion less than was expected a year ago—was the President's refusal, last year, to be tempted by Congress into extravagant aircraft purchases. The impounding by the President of this $615 million of Congressional largesse still rankles, despite the budget deficit and signs that efforts will be made to cut all new appropriations by 10 per cent. The same suspicion of the Executive can be seen in the reluctance to extend the conscription law, which expires in June, unless the power to authorise inductions under it is transferred to Congress. This selective Service machinery has not been used for over a year, but the Administration argues that to retain it in being would save four months' time in an emergency, while to scrap it would cause alarm in friendly countries and rejoicing in Moscow.

* * *

Taft-Hartley Shows its Teeth

Once the President was finally forced to invoke the Taft-Hartley Labour Act, the coal dispute moved with exemplary speed through the preliminary stages of the legal procedure. The fact-finding board, after a futile attempt to reopen contract negotiations, reported that the national health and safety were threatened with irreparable injury by the stoppage in the soft coal mines. The Administration immediately asked for an injunction against the strike and Judge Keech announced that he would hold hearings on February 20th. Until then he ordered the miners to return to work for ten days and the employers and the union to resume collective bargaining in good faith.

Mr Lewis, who knows from past experience how much damage the Taft-Hartley teeth can do, at once arranged to meet the employers and negotiations are in progress as *The Economist* goes to press. The fact-finding board considered that both sides had been to blame for the failure to reach an agreement, that the real issues in the dispute had never been joined, and that the fundamental question was one of dollars and cents, however much it had been obscured by arguments over such matters as the union shop, eligibility for welfare benefits or the miners' insistence that they should work only when "willing and able." But Judge Keech also ruled last week, at the request of the National Labour Relations Board, that such demands constitute unfair labour practices. He issued an injunction against them and the negotiators may, therefore, at last be forced to concentrate on the basic issue of wages and welfare payments.

Meanwhile, however, coal stocks have been reduced to ten days' supply, less than they have ever been during the thirty years that Mr Lewis has led the United Mine Workers. State Governors are preparing emergency measures, industry and transport are now seriously threatened and it is becoming vital that the men should go back to the mines, with or without a contract. Mr Lewis, complying with Judge Keech's order, directed them to do so last Saturday, but as yet they show no signs of obeying him. This may be the spontaneous revolt which he foretold against the "slave labour law"; it may arise from the belief that any return to work would delay the signing of the much-desired new contract; or it may be due, as the coal operators maintain, to Mr Lewis's failure to instruct local union officials to pass his orders on to their members.

The government is waiting as long as it can, in the hope that the men may gradually drift back, before taking legal action against the strikers for contempt of court. Mr Lewis has tried to protect himself by carrying out Judge Keech's orders and it begins to look as if it may come to individual charges against 370,000 miners. But even if they can be driven back into the mines, the Taft-Hartley teeth are not

CENTRAL HANOVER BANK AND TRUST COMPANY UNION FIDE ET FIDUCIA

An American Banking Connection in London

Many companies engaged in international business find it to their advantage to have a connection with Central Hanover, an old established New York bank. Our offices in London and New York are strategically situated in the two leading world trade centres.

CENTRAL HANOVER
BANK AND TRUST COMPANY

NEW YORK . . . 70 Broadway

sharp enough to force them to dig coal with enthusiasm once they are there. And President Truman not only has no power to seize the coal mines but has also said that he does not intend to ask Congress for such power.

* * *

Mr Gabrielson Blows His Trumpet

The dollar-a-head box suppers which replaced the traditional $100-a-plate Republican dinners on Lincoln Day this year were as novel as the numbers which attended them —12,000 in Washington alone—and the shortness of the two-minute speeches. But the blast blown on the Republican National Committee's trumpet by its chairman, Mr Guy Gabrielson, went back to pre-Dewey days, apart from the modern flourish of "Liberty against Socialism"; this is the substitute for the battle-cry of "statism" which last November's senatorial election in New York showed to be off-key. Mr Gabrielson's tune was the statement of principles on which the Republicans propose to fight next autumn's election; its theme is the threat to basic American liberties of "the Administration's programme for a planned economy modelled on the Socialist governments of Europe."

The statement is very definite when it is condemning the Administration for its failure to give Cohgress adequate information on foreign affairs, for its extravagance, for its "Brannan plan" for agriculture, for its softness to Communists in government service. But the Republicans' "fundamental proposals" for rebuilding a prosperous and progressive America are no more than vague promises to balance the budget, reduce government expenditure and taxation, ensure a basic minimum of social security and improve the Taft-Hartley labour law. The most positive achievement of the platform drafters was a negative one: they refused almost unanimously to repudiate the bi-partisan foreign policy, although they criticised the way in which the Democrats had administered it.

Mr Gabrielson's music was written jointly by the National Committee and the party's Congressional representatives. But a number of the latter, led by Senator Lodge, followed the Young Republicans and a group of Republican Governors in urging the policy makers to produce a simple, specific and constructive challenge to Mr Truman's Fair Deal, that might attract independent voters to follow the Republican band. This influential left-wing of the party is particularly disgusted at the new statement's hedging on civil rights for Negroes. It promises only that the Republicans will continue to sponsor legislation to protect the rights of minorities; this retreat from the party's 1948 platform is regarded as a concession to its Congressional alliance with the Southern Democrats.

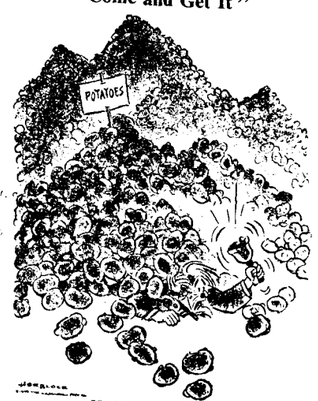
Mr Gabrielson may have hoped that all Republicans would rally to his call, but the note he sounded was primarily designed to loosen the purse-strings of the "Old Guard" on whom his bankrupt party is dependent. To their conservative ears the "me-tooism" of Senator Lodge and his friends sounds like the knell of doom, but the tune to which the Republicans are now marching in order to please its die-hards will strike little fear into Democratic hearts.

* * *

Time to Watch Out?

Dr Edwin Nourse, former chairman of the President's Council of Economic Advisers, recently remarked that when, as at present, all the forecasters agree that the business outlook is good, "that is the time to watch out." Such sceptical caution is strengthened by the Department of Commerce's report on employment in January. Not only were there 4,500,000 out of work, more than at any time since 1941, but this figure represents 7 per cent of the labour force of 62.8 million. There were 1,300,000 more persons in that force than in January, 1949, and 450,000 fewer jobs available. The official explanation of the increase in unemployment is the usual seasonal combination of after-Christmas lay-offs in retail trade and service establishments with declines in construction and farm work because of bad weather. It is, nevertheless, at least arguable that this is the beginning of a steady if gradual rise in unemployment, which could have an appreciable effect on the national economy before the year is out.

The Department of Commerce would, however, reply that industrial employment is keeping up well and would point to the satisfactory rise in industrial activity during January and to the favourable prospects for business in the coming months. These prospects are much more promising than at this time last year, provided that the coal strike is settled before it does any lasting damage. Inventories are reassuringly low and most manufacturers' order books comfortably full. Makers of automobiles and electrical appliances are hoping to set new production records during the year, although they admit that their dealers will have to do some "hard selling" to dispose of this output. The disquieting decline in investment in new plant and equipment which became marked towards the end of 1949 is expected to continue, but will not be accelerated as far as can be judged from present plans for capital expenditure.



The decline might, however, gather ominous speed should business confidence be dashed, as it is claimed it will be if Congress grants the President's request for higher taxes on corporations earning more than $119,000 a year. He hopes to get $1.7 billion in additional revenue from these and from revised estate and gift taxes, but it is improbable that Congress will allow him to raise much, if any, money by these means. Nor is it likely to prove any more ready to close the various loopholes in the revenue code, which would give the Treasury the $590 million needed to offset the $655 million of annual revenue which will be lost by the suggested reductions in excise taxes. That loss may be over $1 billion by the time Congress has finished with the Tax Bill. The Secretary of the Treasury asked only for reductions in excises on transportation, telephone calls and telegrams, furs, luggage, jewellery and toilet preparations. These are the items about which there have been the loudest complaints, but a number of other vociferous luxury and semi-luxury businesses also suffer from these taxes and Congress will be unwilling to lose this opportunity of pacifying them.

* * *

Potato Blues

The Department of Agriculture is busy this month dyeing some 25 to 40 million bushels of potatoes blue, and thus ensuring red faces in Congress. For the responsibility for the four-year potato avalanche belongs to Congress; it has refused to take potatoes off the list of commodities whose price must be supported by the government; and it has fixed the price support level high enough to pay growers to increase their production. The agreement to reduce acreage proved only a polite fiction; growers who complied still managed to grow more potatoes than ever and there is no effective penalty for non-compliance. Even Canadian growers have profited; for after paying freight charges and a tariff of 75 cents a bushel, the Canadian grower can undersell the American in the latter's own artificial market.

"Come and Get It"

Herblock in the *Washington Post*

After feverish efforts to sell off its surplus abroad and to industrial users at home, the Department of Agriculture still had a 50 million bushel mountain of potatoes to dispose of. By law, it is forbidden to pay freight on potatoes given to relief agencies, and they cannot afford the handling and carriage charges. To pay the fares of the potatoes to industrial plants would have cost $15 million. Between 25 and 40 million bushels therefore will be coloured blue (to prevent farmers from selling them for human consumption or using them to collect another payment from the government) and sold, at one cent for a hundred pounds, for fertiliser or livestock feed. These potatoes cost the taxpayer, on the average, $1.25 a bushel. Eggs and milk are not yet being coloured blue, but early this month the Department of Agriculture offered to give away free $115 million worth of dried eggs and milk for school lunches and other relief purposes. Stocks are deteriorating and the hens keep on laying.

To Mr Brannan, the Secretary of Agriculture, the potato scandal is a heaven-sent opportunity to demonstrate to Congress the superior virtues of his own plan for solving the riddle of plenty. In fact, the loss on the 1949 potato crop is expected to be only half that incurred on the 1948 crop, but given suitable publicity, Congressmen fear it may bring the whole system into disrepute. The Brannan scheme, on which the Administration counts to reconcile the interests and secure the votes of both the farmer and consumer in the big city, would permit the price of perishables to fall to their natural level, and recompense the farmer by direct government payments. To avoid being buried under an avalanche of surpluses, or forced to swallow the Brannan plan, Congress is eyeing means of expanding consumption; Republicans as well as Democrats are showing an interest in reviving the food stamp plan, a scheme that from 1939 to 1943 enabled surplus foods to be distributed free to needy families. The alternative of imposing stricter controls on production, never very successful, stands a poor chance in election year; Congress shows more of an inclination to soften the existing restrictions on cotton and wheat.

Shorter Notes

In January the House of Representatives expressed its resentment at the Administration's piece-meal approach to its almost non-existent Far Eastern policy by refusing to authorise $60 million for aid to Korea during the first six months of this year. To help the House to change its mind, the Administration amended the Bill by including in it an extension, to June 30th, of authority to spend money already appropriated for economic aid to the Chinese Nationalists. There is over $100 million available, but it is doubtful if more than about $10 million can be spent in Formosa during the permitted period. The House passed this amalgamated Far Eastern Assistance Bill on February 9th, by 240 to 134 votes, and the Senate followed suit next day.

*

The women of America have achieved their first major success in their 27-year battle for liberation "from legal concepts of the outworn feudal order of Europe." The Senate has approved the Equal Rights Amendment to the Constitution, providing that equality under the law shall not be denied or abridged on account of sex. But a rider was added stating that the amendment should not impair any rights, benefits or exemptions conferred by law upon persons of the female sex. This meets the objections of many women's organisations to the amendment, but other equally vociferous ones insist that special legal protection for women is as objectionable as any other discrimination. The amendment has still to be approved by the House of Representatives and at least 36 State Legislatures.

...the Barclays Group can help

IN THE UNITED STATES

With a coast to coast network of correspondent banks, a New York office of Barclays Bank (Dominion, Colonial and Overseas), and a representative in San Francisco covering the West Coast, we can:

- Get information for you on United States markets;
- Introduce you to agents who can handle your goods;
- Provide all the necessary banking services:

IN CANADA

Barclays Bank (Canada), a Canadian Chartered Bank, with branches in Montreal, Toronto and Vancouver offers the same services in Canada.

IN THE UNITED KINGDOM

Ask any Branch Manager of Barclays Bank Limited to explain to you how easily exporters can make use of these facilities, or write direct to 54 Lombard Street, London, E.C.3.

THE WORLD OVERSEAS

Storm Clouds Over South Asia

(From Our Karachi Correspondent)

THERE is a sullen look in the sky over South Asia, and Kashmir is the epicentre of the storm which threatens to deluge the sub-continent. While loose talk of war between the Dominion and the Republic is to be deplored—and in fact there is very little of it—it would be unwise for the world to close its eyes to the possibility that war may break out before the end of the year, if there is no change of heart or circumstances. Fortunately, it is a fairly big "if," for experience has shown that, when things look too black, the Governments of India and Pakistan tend to get round a conference table and attempt to resolve some of their differences. Already there have been some more hopeful signs: the dispute over the canal waters of the Punjab is to be referred to a negotiating commission, both sides appear to have accepted the award of the Bagge Boundary Commission with a good grace and, better still, there seems to be a strong probability that, as a result of Mr Ghulam Mohammed's recent private visit to New Delhi, a conference will shortly be arranged to discuss ways and means of bringing the trade war to an end.

Crisis in East Bengal

The news from the Eastern province, on the other hand, seems to become progressively worse and, if the primary depression is over Kashmir, the secondary one is certainly over East Bengal. This province is the main pressure point in the trade war and, since it contains about 12 million Hindus, is a fruitful breeding ground of communal incidents. For these reasons, the East Bengal situation must be regarded as more immediately disturbing than even the Kashmir deadlock. The disputes over the rupee ratio, over jute and over coal have embittered relations between the closely connected populations of the two Bengals, and the stoppage of through booking of passengers and goods from Indian stations to or across East Pakistan has further aggravated the situation. These affairs primarily affect commerce, but the virus seems to have spread to the day to day life of the people and there have recently been wild allegations in the Indian press of atrocities against Hindus in certain districts of East Bengal, followed by counter-accusations in the Pakistan press of equally harrowing events affecting the Muslim community in West Bengal. These incidents have obviously been greatly exaggerated, but, if the consequent nervousness should give rise to a large scale exodus of refugees from East Bengal, the powder magazine might be touched off.

Rising Feelings on Both Sides

The spirit of conciliation is conspicuous by its absence. The Muslim League organ *Dawn*, for example, in an editorial liberally strewn with italics, affirmed that: "any gesture, action, or carelessly spoken word which may be interpreted as signs of weakness is a grave and unpardonable disservice to our country's cause." This is typical of the present excitable tone of the Pakistan press—a tone which, however, was matched by Pandit Nehru in his recent press conference. He described the whole of the Frontier Province as "one vast prison" and said that the whole of the tribal areas had been in a state of unrest. (Actually, despite, or even perhaps because of, the withdrawal of the garrisons from Waziristan, they have been quieter than for many years past.) He went on to declare that "every step I have taken in the Kashmir matter was dead right and I stake my reputation on it, all that I have lived for and all my ideals." Will the world agree, ask Pakistanis, that he was dead right in rejecting the proposal that the differences over the Kashmir truce terms should be referred to the arbitration of Admiral Nimitz, a proposal which was backed by personal appeals from President Truman and Mr Attlee?

Leading men in Pakistan have also unburdened themselves on the topic of Indo-Pakistan relations in provocative terms, but the Prime Minister, Mr Liaquat Ali Khan, made a reasonable and constructive statement in the Pakistan Constituent Assembly in January. Explaining why his Government was unable to subscribe to Pandit Nehru's proposal for a joint declaration that the two Governments would in no case resort to war for the settlement of their disputes (a well-meant proposal which the Karachi press, no doubt remembering 1938, described as "Hitlerite"), he stated that such a declaration would not carry any conviction unless accompanied by some concrete evidence that the two countries were attempting to reach some settlement of the main points at issue. He then proceeded to define those points and to put forward proposals for their settlement. He advocated three stages: negotiation, where there is still room for it; then mediation; and, if that fails, arbitration. He made it clear that both sides must agree in advance to accept the decision of the arbitrator, and that differences regarding points of procedure should also be referred to arbitration as well as the main issues.

No Alternative to Arbitration

In the case of Kashmir, of course, the ultimate issue is, as agreed by both parties, to be decided by plebiscite, and the arbitration would cover only the intermediate points of dispute. Indeed, when two conflicting points of view are so irreconcilable that prolonged efforts at mediation have already failed, it is clear that there is hardly any alternative to arbitration. If India refuses to accept this method, the responsibility for what may follow will surely lie squarely on its shoulders.

Hopes are centred on the Security Council which, as these words are written, is debating the Kashmir issue at Lake Success. It must regretfully be recorded that Pakistanis have little faith in the deliberations of this body, but their cynical attitude would rapidly melt away if the Council showed any real determination to settle the dispute. It should either insist on the differences which are holding up progress towards the plebiscite being referred to arbitration—whether India likes it or not—or should go straight to the root of the matter, and insist on the armed forces on both sides being removed and replaced by an international police force which would maintain order while arrangements for the plebiscite were being concluded. There is still time to stop the rot, but the eleventh hour is near. The Hindu Mahasabha is reported to be gaining influence in India at the expense of the more moderate Congress Party; the Mahasabha has openly declared that it stands for the reclamation of Pakistan (obviously by force) as an integral part of India. Meanwhile, both countries are incurring ruinous expenditure on armaments, while plans for peaceful development and progress are being starved for want of funds.

Greece Prepares for Elections

[FROM A CORRESPONDENT]

THE breath of elections is in the Athenian air once more. Politicians are rallying their followers, probing for alliances, and even marshalling a few arguments with which to assert their indispensability to the future of Greece. This is the time when constituencies see their fleeting representatives, when parties spawn like mushrooms, and when the *politikos kosmos* of Athens obscures all fundamental issues in the quest for personal promotion.

This is the second general election since the liberation. More important, it is the first since January, 1936, to be free of the constitutional issue, for the position of the king is today unchallenged. Yet it finds the political parties totally unprepared. There are, admittedly, a sufficiency of them, for over a hundred confront the Greek electorate. But the majority of these are one-man parties and are indicative of nothing more than the desire of every Greek to be a party leader, and the facility with which registration at the Areopagus can gratify this desire. Among them are the Party of Greek Crusaders, the Greek Christian Socialist Party, the Party of Greek Christians, the Orthodox Christian Party of Adherents to the Old Calendar, the Constructive Orthodox Christian Party, and the Humanitarian Party.

The manœuvres of six weeks ago, that ended with the fall of the three-party coalition, are still not fully explained. Possibly an early election might benefit the Populists, who are strong in the Peloponnese, the only area of the mainland to which all refugees have returned and in which security has been established for any length of time. Perhaps it might forestall the formation of any strong opposition to the two main parties of Populist and Liberal. But the fall of the government was inevitable sooner rather than later, and the immediate cause of it is unimportant.

More important than the disruption of the coalition and the appointment of Theotokis' caretaker government in its place was the fixing of the election date. Constitutionally this parliament ends its term on March 31st; elections must then follow within forty-five days. February 19th was a date fixed in haste, and it has been postponed a fortnight to March 5th after pressure from the leaders of the smaller parties. But even so, an election in early March reflects more the desire of the politicians than the needs of Greece. In March much of the north may still be under snow. About a third of the refugees (though no two estimates are the same) have still to go home, and those who may have returned are fully occupied with the struggle for existence. The electoral rolls of the whole country will need revision. Many have been destroyed and must be started afresh, and there are very few which do not need correction because of death or flight or absence. In 1946 it was feared that men might vote for their dead relatives as well as for themselves. Now, after a shifting of a tenth of the population and the imprisonment and death of many thousands, the danger is greatly increased. Soldiers and civilians on Makronisos are to be given the chance to vote, but it is doubtful whether a vote under detention can be considered entirely free.

Many Blank Votes Possible

The Army will take part in the elections; provision is being made for them to vote where they are stationed for the candidates in their own constituencies, and military discipline will have at least some hold over their activities. But the numerous civilian home guards, whose sympathies for the most part lie with the Right—many with the extreme Right—might well try to "prove their doctrine orthodox with apostolic blows and knocks."

To these physical difficulties are added psychological ones. The only definite factors in Greek political life today are negative: a hatred of Communism which understandably does not allow the Communists to participate in the elections; and a widespread antagonism in the provinces against the inefficiency and selfishness of Athenian government and against the centralisation that forces all business to be conducted there. The resulting disillusion brings talk not of active opposition, but of abstention, or at least of casting blank votes to avoid the charge of abstaining.

For Athens has nothing to offer Greece. Political programmes, where they exist, are no more than a thin cloak for personal ambition, and parties stand rather by the names of their leaders than anything else. The Liberal Party, despite internal dissensions, still fights under the name of Venizelos, and the Populists, though weakened by desertions retain Tsaldaris as their leader, though both these men live on the reputation of their fathers rather than on their own achievements. Greek politics centre round these two main parties which fight with the weight of inertia as their weapon; their programmes—vague statements about reconstruction and social reform—are irrelevant to their actual behaviour and have no fundamental points of difference. The opportunism that guides them is shown in their readiness to unite against any rival who threatens the position of both. For many months such a rival seemed to exist, in the person of the Commander-in-Chief, Field Marshal Papagos, whose victories in 1940 and 1949 have brought him immense popularity. There was little doubt that if he entered politics he could secure a majority of votes in the country. There were men who declared that only his candidature would prevent their abstaining. There were others who discussed a dictatorship under him. Markezinis, leader of the New Party, conducted a newspaper campaign urging the formation of a caretaker government under the Field Marshal's premiership, probably hoping that he himself would wield the power.

Mutual Party Antagonisms

But everyone reckoned without the man himself. After a brief moment of hesitation involving twenty-four hours resignation, Papagos resumed his position as Commander-in-Chief and appears now to have vacated his position as dark horse of the *politikos kosmos*. Politicians who had hoped to sail in his wake have now turned to other alliances, and the Populists and Liberals, who in a moment of panic had planned to unite, have now reverted to mutual antagonism as they see no other comparable rival on the horizon. The recent formation of a democratic front consisting of the left-wing parties of Svolos and Sophianopoulos and a group of left-wing liberals under Hadjibey is a manœuvre calculated to capture sympathy abroad rather than votes at home. Papandreou, the best orator in Greece, who has the third largest party in the chamber, may increase his following, but not sufficiently to gain a majority except in alliance. Kanellopoulos' Unionist Party, the third leg of the government coalition, though led by a man of experience and integrity, will probably remain small. Hopes of the creation of a third force to challenge the Liberals and Populists have now faded. In the event the Populist Party will probably return to power with a smaller majority. Its following has diminished during the four years of office and within the last few weeks its chief rival, the Liberal Party, has been strengthened by the return to the fold of General Styliaros Gonatas and his National Liberal Party.

The most important need for Greece is reconstruction with the help of American aid. But no party shows any realisation of this by presenting a concrete programme to further it. The Americans are the most vital force in Greece today, and this in itself brings a feeling that perhaps their influence is greater in the formation of government than the opinion of the Greek electorate. But what is needed is the leadership and guidance which will ensure that reconstruction can be carried on where the Americans leave off.

The Troubles of Tibet

IF an Englishman can imagine that the secular government of England were vested in the Archbishop of York, and that the Soviet Union were backing the claims of the Archbishop of Canterbury to superior political power, he will be able to form an idea of the situation which now exists in Tibet. There is no doubt but that the Buddhist religion has a very strong hold on the inhabitants of this strange mountain land, and a system of government which combines spiritual and temporal power in a divine incarnation should provide a powerful and stable form of political authority, proof against internal disruption if not against external military aggression. Unfortunately ecclesiastics have a way of quarrelling among themselves no less than ordinary secular politicians, and Tibetan Buddhism, with all its scriptures, oracles and incarnations, has not been able to resolve the rivalry of its primates to the satisfaction of all concerned.

The institution of priest-kings in Tibet is very old; it probably antedates the introduction of Buddhism. At any rate after the break-up of the unified mediæval kingdom of Tibet, power passed more and more into the hands of the Buddhist abbots, for the great monasteries were the centres of social and cultural life in a country of sparse population and great distances. Doctrine, as developed in Tibetan buddhology, recognises a number of incarnations of divine beings—buddhas and so-called bodhisattvas, each being reborn on the death of his mortal body as a child who might be recognised by certain signs as the destined successor. Theoretically the most holy of the incarnations is that of the Buddha Amitabha—who is also worshipped, but without incarnations, as O-mi-to in China and Amida in Japan; he is the Tashi or Panchen Lama, who has his proper residence at Shigatse, a small town to the west of Lhasa.

Associated with Amitabha is the Bodhisattva Avalokitesvara, who, curiously enough, has been transformed in China and Japan into a female and is worshipped in those countries under the names of Kuan-yin and Kwannon, respectively. In Tibet she—or rather he—is manifest as the Dalai Lama residing in the beautiful Potala palace on its rocky hill above Lhasa. In a world arranged according to Buddhist doctrine alone, the Dalai Lama should be secondary in dignity and authority to the Panchen, though not very much so, as the spiritual functions of Avalokitesvara are very important. However, worldly politics sometimes impinge forcibly on ecclesiastical organisation, and a Mongol king who invaded Tibet in the seventeenth century made the Dalai Lama of the day his secular viceroy for governing Tibet—a position which the see of Lhasa retained through various vicissitudes and had confirmed by the Manchu emperors of China who finally obtained suzerainty over Tibet.

This state of affairs has never been fully accepted by the Panchen Lamas, who have claimed at any rate a semi-independent territorial jurisdiction over the territory in which Shigatse is situated. The Manchu rulers found this rivalry useful for keeping the Tibetans divided, and after the Chinese garrison in Lhasa was expelled by the Tibetans in 1912, intrigue with the Panchen was China's only device for exerting influence in Tibet in the absence of any military control of the country. Owing to the conflict which developed, the Panchen was at length forced to leave Tibet—that is, Tibet proper, over which the Dalai Lama had, and has, effective control; he could not be kept out of the border provinces of Sikang and Chinghai, which are mainly Tibetan in population, but have remained under Chinese rule.

After remaining in exile for several years, the Panchen in 1937 tried to return to Tibet with an expeditionary force of Chinese troops, but was held up at one of the high mountain passes by the Dalai Lama's forces and died shortly afterwards. Some years later his reincarnation was discovered under Chinese Nationalist auspices in Chinghai and preparations were made for enforcing his claims. The Communists, having taken over Chinghai, have now also taken over the holy cause of the Panchen Lama, which has become identified with acceptance of the Chinese supremacy over Tibet repudiated by the Dalai Lama. It may seem odd that convinced Marxist-Leninists should interest themselves in such matters as the proper precedence of buddhas and bodhisattvas. But buddhas and bodhisattvas, like all progressive people, must be against the warmongers of Wall Street, and if they provide such a good pretext for the march of a Chinese army, who can blame a Marxist-Leninist for taking advantage of it?

Denmark's Defences

[BY A CORRESPONDENT]

THE conclusion of the Military Aid Agreement between the United States and Denmark and the recent publication of the first parts of the report of the Danish Defence Commission give topical interest to the measures Denmark is taking to put its defences in order. This is a difficult task. Denmark, indeed, except that it was not materially damaged during the war, provides only too vivid an illustration of most of the problems that face a small power in this field. Its strategic position is important—it virtually controls the entrance to the Baltic and has become, as the Norwegian Defence Commission's report implies, a stepping-stone to the invasion of its Norwegian or Swedish neighbours. But its small population, slight war potential and awkward terrain, consisting mainly of flat islands, render it impossible to defend without outside help.

These difficulties are aggravated by the fact that the only possible enemy possesses such vastly superior resources. So it was in 1914 and 1940, when Denmark was "written off" by the only Powers likely to help it in dire need. Indeed Denmark was "written off" as early as 1864, when Bismarck seized Schleswig-Holstein from the Danes, and both the other Northern States and England from whom some support had been expected, proved unwilling to provide it. The knowledge that their country was considered by potential allies to be so vulnerable that it was too risky to help it has had a profound influence on the policy of the Danes. But the guarantees provided by the Atlantic Pact open an entirely

Hoover in England

The main Hoover factory and headquarters are at Perivale, Greenford, Middlesex. This is the largest factory in the country concerned exclusively with the manufacture of Electric Cleaners. A smaller factory at High Wycombe makes Shaded Pole Motors, Plastic Commutators and Switches.

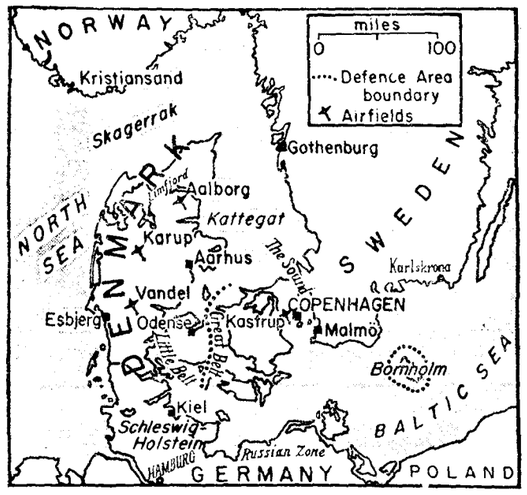
Hoover in Scotland

At Cambuslang, near Glasgow, in a Government Development Area, Hoover are producing Fractional Horse-Power Motors, which are being delivered in considerable quantities to manufacturers of industrial, agricultural, domestic and commercial equipment. Although a post-war factory, extensions have already become necessary.

Hoover in Wales

At Merthyr Tydfil a new Hoover factory was opened in the Autumn of 1948. This factory is for the production of Electric Washing Machines and is the largest in Britain to be devoted exclusively to this purpose.

Thus, in each of the three countries, there is a Hoover factory working at full pressure to supply both home and fifty-six overseas markets and also providing large scale employment for British workers.



HOOVER LIMITED

new chapter in the country's military history—not least because they will be backed by sufficient force to make them firm.

The need for arms was an important factor in the Danish decision to join the Atlantic Pact. As they admitted at the time, a well-armed neutral *bloc*, consisting of Norway, Sweden and Denmark, would be their ideal defensive arrangement. But this is merely a dream—if only because, quite apart from the very slight chances of such a group remaining neutral in any future war, it could not provide itself with enough arms to maintain the level of military strength considered necessary to deter an aggressor. Thus, when Norway decided to join the Atlantic Pact, Denmark had to follow suit.

By this act both countries abandoned all chances of neutrality, though not of peace. For in return, they are to receive equipment and advice which is intended to fit them

into a defensive structure so strong that it will discourage all attacks. And Denmark's need of equipment is dire. All the country's prewar military equipment, even the mattresses from the barracks, was used or destroyed by the Germans with the exception of a few ships. After the war the considerable amount of arms and stores left in the country by the Germans was meticulously destroyed by the British Military Mission in obedience to the disarmament clauses of the Potsdam Agreement. The result is that apart from a few light AA guns, fewer heavy guns (borrowed from the Norwegians) the odd Bren-gun carrier and a quite insufficient number of small arms, the Danish army has no equipment. The navy has acquired some corvettes from Britain, some E-boats from Germany and a couple of new torpedo boats from the Danish yards where they were hidden during the war. The air force, after a slow start, is now re-equipping itself. It has Spitfires and Mosquitoes and is now getting the jet-propelled Vampires. The home guard, too, is receiving especial attention.

From this it has been deduced that the role of Denmark's fighting services is similar to that which the recent report of the Norwegian Defence Commission allots to Norwegian forces—to hold out until help arrives from the outside. This would explain the concentration on modern fighters and, as was reported last summer, the proposal to build a chain of radar stations. While the fighters, assisted in a matter of hours by machines of the same type from Denmark's allies, fought in the air to break up an airborne invasion, the re-equipped army, with the collaboration of a large home guard, would try to hold the land frontier and protect airfields and other centres vital to the arrival of allied help. To facilitate this Denmark, according to the second recommendation of the defence commission, should be divided into three military areas—a western command (west of the Great Belt), an eastern command (east of the Great Belt) and the Bornholm region. Each area will be divided into regions. Naval and air commands should follow similar lines.

The leadership of this system is the subject of the first part of the defence commission's report. It proposes the creation of a new post of chief of defence, the holder of which would be responsible to the Minister of Defence for the state of efficiency of the services and for executing the Minister's directives on policy. He would be assisted by a defence board and a defence staff. The work and staffs of the three fighting services would be limited accordingly and would be concerned mainly with discipline, training and so forth.

Rise in Defence Estimates

These recommendations are the first public fruits of the establishment of the defence commission in April, 1946. It is to be expected that other proposals will soon be published. The commission has not had an easy task. The Communist *coup* in Prague in Februry, 1948, the attractions of the strong Swedish bid for a neutral Scandinavian defence system, and the decision to base Denmark's defence on the Atlantic Pact must all in turn have complicated its work.

Meanwhile, and particularly since the Prague *coup*, considerable progress has been made in rebuilding Denmark's depleted strength. In June, 1948, a home guard of 100,000 men was authorised. Arms and equipment have been bought from abroad. More are on order. The defence estimates rose in 1948-1949 to 316 million kronen and for the current financial year have risen again to 353 million kronen—about 17 per cent of the budget—and with the likelihood of large supplementary estimates may finally be more. But it would take a much bigger outlay than this and a much bigger outlay than Denmark can afford to bring its forces up to a satisfactory standard of equipment. The agreement signed in Washington on January 27th will achieve this fairly quickly —but not, it may be remarked without more effort being put into the Danes' own production of material than they seem to realise. But in the long run, its most important aspect may turn out to be that, for the first time since Napoleon's day, it made Denmark a member of a larger military partnership.

The Economic Work of the Specialised Agencies

[FROM A CORRESPONDENT]

ON the model of the old League Economic Committee, the architects of the United Nations could certainly have centralised most of the powers and responsibilities in international economic matters in one place. There is some evidence that this arrangement was at one time considered but was abandoned for the one-step-at-a-time approach on the ground that anything more ambitious would be too much for post-war public opinion to swallow. In consequence, the Food and Agriculture Organisation, which was founded before Uno itself, was only the first of a series of autonomous international organs given responsibilities in the economic field, and the International Trade Organisation, which the President is now trying to persuade the United States Congress to launch, will not necessarily be the last. Russia, though a member of Uno itself, is not a member of any of these so-called specialised agencies.

The three agencies created in this way whose functions may be said to be mainly economic are the FAO, the International Bank for Reconstruction and Development and the International Monetary Fund. The International Labour Organisation, which is really a creation of the Treaty of Versailles, has been taken under Uno's wing and is now regarded as one of the family, while the Bank for International Settlements, which—allowing for changes of fashion in monetary theory—was supposed to do after the First World War what the Fund is doing after the Second, is the ugly duckling of the brood, showing a surprising amount of vitality in spite of a somewhat chequered past but still with no constitutional links to Uno at all. Of these five bodies it is no exaggeration to say that they swarm with professional economists, whose effective contribution can be appraised to some extent by the studies and reports published in the names of the employing agencies.

At the outset, a distinction should be made between "operating" and "advisory" agencies. The distinction is somewhat arbitrary because all of them have operating responsibilities of some kind, though in the case of FAO and ILO these responsibilities are minor while for the International Bank and the Fund they are the *raison d'être*. The operative business of distributing dollars in the post-war world is clearly important enough to require the best obtainable economic advice before decisions are taken, but for fairly obvious reasons it is impossible to make the advice public. It is well known, for example, that the Bank has completed some excellent studies on the economic problems of undeveloped areas and the reports of some of its numerous economic missions to would-be borrowing countries are said to be of high calibre. But any published appraisal by the Bank of the economic situation of a particular country would certainly be liable to misconstruction. Even the innocuous and informative study of the banana trade of the world which the Bank is said to have undertaken would, if published, undoubtedly be used by certain Central American countries as a basis for new loan applications if it were favourable and as the ground for indignant protests against damage to their credit standing if it were unfavourable. For the same reason, the economic work of the Fund, which is voluminous and competent, cannot be allowed to get into the hands of unsatisfied borrowers and therefore cannot be published. Critics of these two financial agencies are therefore practically restricted to the annual reports—short but telling documents (in contrast with the annual report of the Bank of International Settlements, which is long and informative but somewhat discursive and individualistic in its approach) written round a central theme, which in 1949 was the wisdom of devaluation, and showing much evidence of a thorough research background. It is true that carefully-worded statements on policy are made from time to time to Congressional and Uno Committees, and high officials occasionally write articles for the press on the restrained and decorous lines of the annual reports, but the quality of the basic economic work behind these efforts is not so clear.

Recently, the economists of the Fund have shown signs of attempting to break through to their colleagues outside and to the non-official world. The Fund's balance of payments yearbook, giving figures for most countries up to 1947, appeared a few months ago and is a worthy successor of the similar League publication well known before the war. It naturally does not contain the confidential information about their balance of payments which member countries regularly submit to the Fund. Most notable perhaps is the publication announced for this month of "Staff Papers," a high quality economic journal, containing articles signed by members of the Fund's staff written mainly on problems of monetary theory. The Fund disclaims responsibility for the personal views of its experts; it is entitled to considerable credit for allowing them to be so freely expressed.

The "advisory" agencies are not so inhibited in their publications programmes and (perhaps for this reason) fly to the opposite extreme. The numerous statistical publications

of the ILO and the FAO maintain on the whole a high standard. FAO's annual review of the "State of Food and Agriculture" is generally competent and the studies of production and trade in staple commodities (wheat, rice and fibres, notably) are good. An FAO "Economic Review" was started in 1948 somewhat on the lines of the American *Journal of Farm Economics* but was discontinued after a few months without making much impression. The reports of FAO missions sometimes show more valour than discretion, as for example the mission to Greece, which threw a decided strain on the Uno co-ordinating machinery by publicly recommending the Greek Government to apply to the International Bank for a loan of $100 million. The ILO output is huge and of distinctly mixed quality. The ILO monthly review which, before the war, must have made the world's record amongst official publications for monumental dullness, has shown every sign of successfully maintaining that standard ever since. With some exceptions (the report by Professor Higgins on Public Investment and Full Employment, for instance) the published economic work of the ILO lacks sharpness and clarity. "Social justice" and economic analysis is an awkward mixture, even in the most skilful hands. And the ILO official style has a certain timeless quality which might have been appropriate to the language of bureaucracy twenty years ago but is lifeless as well as timeless by present-day standards.

On the whole, in so far as the Uno specialised agencies can be served by economists, they appear from the published results to be relatively well served. It is clear that there is considerable overlap in the work done, though on some subjects (the "dollar shortage" for instance) this may be an advantage. The volume of work undertaken probably rules out any major economic contribution except by accident, but most of the agencies, having their reputations to make, inevitably accept too much work. It would be reassuring to learn that the economists in each agency know what their colleagues are doing and frame their own programmes of work accordingly; and it would probably add much to the reputation of those in the Bank and the Fund if more of their work, on whatever abstract plane may be thought desirable, could be exhibited at judicious intervals to impress the public.

The Koweit's Millions

THE Sheikh of Koweit died recently. Glittering riches are, by tradition, a feature of Arab fable. But the wealth, or rather the potential wealth of this Persian Gulf ruler is a matter of fact, not fairy tale. The dimensions of the fortune that is about to accrue to his successor can be judged from the following figures. The Sheikhdom has an area of approximately 6,000 square miles. It has only about 100,000 inhabitants. They have hitherto been very poor, making their living chiefly by pearl fishing, and as shipwrights. They build a famously seaworthy three-master called a *boom* which can be recognised at a glance as far east as Bombay and as far south as Zanzibar. In 1934, their fortunes took a turn for the better. Their Sheikh leased a concession to prospect for oil. This was taken up jointly by the British Anglo-Iranian Oil Company and the American Gulf Oil Corporation. The resultant joint company, the Koweit Oil Company, realised the immense potentialities of its new field only as the result of its war operations. It extracted 800,000 tons from one field—Burgan—in 1946. By 1951, it will be extracting 24,000,000 tons per annum from the same field. By 1956, it hopes to be extracting 36,000,000 tons.

To gain an idea of the future that these figures represent to the local ruler, should be compared with comparable figures for two large adjoining areas, Saudi Arabia and Persia:—

	Estimated Population	Estimated Oil Output 1946	1951	1956	Area
	(000,000)	(000,000)	(000,000)	(000,000)	(sq. miles)
Koweit	0·1	0·8	24·0	36·0	6,000
Saudi Arabia	6·0	8·0	25·0	38·0	927,000
Persia	15·5	19·2	32·0	42·0	628,000

Nor is this potential fortune in royalties all that promises to flow into Koweit's royal treasury. The Sheikh also owns a half share in the so-called neutral zone of desert which he shares in undivided sovereignty with King Ibn Saud of Saudi Arabia. Since July, 1948, the Sheikh has leased a 50-year concession in his half of the zone, to the American Independent Oil Company, at a dead rental, it is said, of $600,000 per annum plus a royalty rate of $2.50 per ton produced. The Sheikh also participates in the operating company. Considerable further profits, of course, accrued from the trade brought in by these companies and from their workers in local wages.

It is scarcely surprising to learn that there are several aspirants to the dead Sheikh's shoes. Son need not necessarily succeed father; the practice is to elect the successor from among the members of the reigning family. The late Sheikh was his predecessor's nephew. This time,

there are three aspirants to power, a son, an elderly nephew, and an uncle of 35, who enjoys the considerable advantage of having, for some time past, been chief of police. The competition between them is keen.

What does such a ruler do with so much money? There is no fresh water in Koweit. To a foreigner, therefore, the first and most worthy target for expenditure would be improvement of the local lot by the installation of a fresh water pipeline from the neighbouring Shatt-el-Arab—the mouth of the Tigris-Euphrates. At present, all water comes thence by clumsy tanker. But the aristocracy of Koweit is conservative. It is also, by tradition, anti-Hashimite. It would rather not be beholden to Iraq for services at the source end of an immovable pipe. The late Sheikh, when he received his first instalment upon the neutral zone concession, is said to have lodged an immense sum on sight deposit in New York. He belongs to a part of the world in which royal treasure is still kept in vaults or spent upon splendour.

Here, in microcosm, is the social problem created whenever immense wealth suddenly accrues to an eastern despot. A scene that is the same, though less highly coloured, is discernible in Saudi Arabia. How are the oil companies, or the western governments concerned, to explain to such people the folly of aristocratic hoarding and the advantages to be derived from investing these new millions in improving the lot of the common?

NO SOONER SAID . . .

So clear are they in transcription that a good typist will get a "Recordon" letter back in half the time that it takes with old-fashioned dictation machines. This is the secret of Recordon's success with modern business men and their staff. The result of new electronic magnetic principles which afford a clearer and more permanent recording.

Nor is this all, for on every other count "Recordon" takes the honours . . . economy, convenience, versatility and simplicity . . . these are all advantages which "Recordon" can claim with equal justification. Why not permit us to demonstrate all of them in your own office or—to start you thinking —may we send you our descriptive leaflet.

THE BUSINESS WORLD

Rationing and the Oil Talks

NO doubt the rationing of petrol was an inevitable election issue. A series of incidents overseas has, however, drawn extra attention to it in the past few weeks. The new Australian Government abolished rationing last week. The German Federal Government has made an attempt to do the same, and has, for the moment, been restrained until it can be settled whether or not the price of 4s. 7½d. a gallon is enough by itself to keep consumption down. A letter from the Colonial Office to the Government of Kenya stirred up American indignation by implying, tactlessly, that the American Government was not putting up any determined opposition to the new British policy of "substituting" sterling oil for dollar oil in the sterling area markets. Finally, the talks on sterling-dollar oil relationships which have been going on quietly in Washington for many months have emerged into the open with a set of British proposals.

In political life (and especially at election times) petroleum tends to mean motor spirit and motor spirit alone. Fuel, gas and diesel oils, kerosene, and other products tend to be forgotten, but it is worth while to remember that they are playing a bigger immediate part in the present Anglo-American talks than petrol itself. It is also worth while to remember that the oil trade is not a straightforward national interest; "sterling" oil is produced mainly outside the British Commonwealth, and—as the Government has pointed out from time to time—it costs dollars to produce.

Mr Churchill, when he spoke at Devonport last week of "the enormous amount of petrol produced in the sterling area," appeared to overlook this point. He did, however, take care to make no rash promises, merely observing that it seemed strange that Britain should be almost the only country in which petrol is rationed, and expressing determination "to put an end to it at the earliest possible moment." His words were dismissed a little sharply by Mr Bevan ("He should be ashamed") and Mr Attlee ("It is obvious that he hasn't given a moment's thought to the matter"). The Minister of Fuel and Power, who has given thought to the matter, said at Harrogate on the following day that the prospects of a bigger ration were not bad "if the dollar position improves steadily." He added, to everybody's surprise, that talks were now going on in Washington "to see if we can get extra petrol without spending dollars."

Both Mr Churchill and Mr Gaitskell seemed to be agreed on one point: whatever happened to the ration, the price of petrol was very nearly sacred. Mr Churchill pledged himself not to deration any basic commodity "until we are certain that it will not only confer benefits on the great mass of the people but will protect the lower income groups from hardship." Mr Gaitskell spoke bitterly of the high prices charged for petrol in "some of these so-called paradises on the Continent."

From Mr Gaitskell's description of the purpose of the Washington oil talks—"to see if we can get extra petrol without spending dollars"—it is fairly clear that they have taken a new turn in the last week or two. The talks were brought about in the first place not by British anxiety to expand British oil consumption but by an American initiative, prompted by the American fear that dollar oil might be pushed out of some of its markets by sterling oil. The recent British decision to reduce imports of dollar oil has sharpened this American fear and has opened a new and more lively phase.

The American oil companies, like other Americans, have a strong theoretical devotion to free competition. Their complaint is not so much that they run the risk of losing trade to British firms, but that they run the risk because of currency restrictions—which, in their code, fall into the category of "discrimination." Dollars are scarce, and the British companies, which sell their oil in many countries for sterling and other non-dollar currencies, have been expanding their output more rapidly than their customary share of the markets can absorb it. It was over the possible loss of their soft-currency markets outside the sterling area that the American companies first became really alarmed.

★

This made the American oil trade anxious to secure two things from Britain: a rough co-ordination of world oilfield and refinery development, and a set of trading arrangements which would permit them to conduct more of their overseas trade in sterling. The latter suggestion was made at least as early as last July, and the British response has been extremely guarded. Arrangements of this kind are full of possible loopholes for eventual dollar claims against sterling, and the precedent of the Films Agreement is not a happy one. This is a proper and reasonable attitude, but no one, up to a week or so ago, would have thought of describing it as a British attempt to get extra petrol. As things have turned out, however, the pace has been suddenly accelerated by the British measures announced on December 20th to reduce imports of American oil. These measures brought home to the American oil trade that its markets in the sterling area (not merely in third countries) were threatened. They amounted in substance to a new policy: sterling oil was to be "substituted" for the imports normally taken from American companies, to the extent that the growing output of the British-controlled companies would permit.

"Substitution" was to begin with the new year, and was to displace in 1950 some 3,800,000 tons of dollar oil products, having a value of $70 million; the consequent net dollar saving would be between $50 and $60 million. The following figures show the apportionment among different products and presumably express the quantities from sterling sources which would be seeking a market if substitution did not take place:

Motor spirit	750,000 tons
Kerosene	150,000 „
Gas and diesel oils	500,000 „
Fuel oil	2,400,000 „
	3,800,000 tons

The British Government, as its memorandum to the Americans has shown this week, is not prepared to abandon this programme. It is standing firmly on the necessity of saving dollars, and has told the American companies that no other proposals have appeared—and the Government itself can think of none—which would achieve a comparable immediate dollar saving. It has offered certain assurances to allay the excitement. The policy will not be extended to the purchase of crude oil. Three months' notice will be given of the "substitution" arrangements for each year. The expectation is held out that fuel oil (the most embarrassing surplus commodity to Americans and British alike) will be less heavily affected in future years, and a surplus of motor spirit is expected to replace it. If any considerable British surpluses arise beyond what is expected, they will not be used to take still more trade away from the Americans. Instead, the effort will be made to absorb these surpluses by relaxing restrictions on consumption in the sterling countries. But this situation is thought unlikely to arise. A general assurance has been given that the idea behind the policy is simply to save dollars—not to squeeze the Americans out of their trade, or manoeuvre the British companies into a better position than they might be able to earn by their own efforts.

Up to this point, the British memorandum is a reply to urgent American protests on the immediate matter that has arisen, the stop-gap policy of "substitution." While it cannot give the Americans any pleasure, it does offer them some safeguards and some limitations on their loss of trade. But when the talks opened the American companies were hoping for concessions; the menace of "substitution" had not yet appeared. What is the British reply to their original proposals?

★

So far as ordinary trade with soft-currency countries outside the sterling area is concerned, the American companies have been turned down. Not surprisingly, the Treasury has refused to underwrite this trade by allowing it to be carried on in sterling. To accept this would evidently mean sooner or later a fresh series of dollar claims on sterling (or if it did not, would it be worth the American companies' while?) and if there are to be dollar claims (the Government argues) they may as well fall on the countries which buy the goods. Certain American companies which trade extensively outside the United States have expressed a desire to be recognised as sterling companies on the same footing as, say, the Anglo-Iranian company or the sterling members of the Royal Dutch Shell group. Applicants for such treatment are to be subjected to almost prohibitive tests: not only must the arrangements be designed to reduce substantially the dollar cost to Britain of the applicant's operations, but also the operations from which the products flow must be carried on mainly in the sterling area—a definition which it might not be altogether easy to apply to the recognised sterling companies themselves. Further, the applicant companies must actually be resident in Britain and liable to United Kingdom taxation. This (one might suppose) would discourage anybody.

As an alternative, the British memorandum suggests that there might be an "incentive scheme" for companies which do not elect to join the sterling club under these forbidding conditions. It is here that the room for manoeuvre and compromise appears to lie, and no doubt it is this scheme that the American companies have thought it worth while to explore in the discussions which are now going on. The purpose is to encourage American companies to reduce the dollar content of their oil by procuring equipment, stores, and services in the sterling area—and in proportion as they spend dollars in these ways, their sales in the sterling area could be allowed to expand. Further, if the American companies wished to buy goods or services from a soft-currency country, they could do so and use those purchases as a lever to extend their sales to the sterling area—provided that they accepted the British definition (at the time of the transaction) of what a soft-currency country might be, and provided that they paid for the goods in dollars through the United Kingdom. It may, perhaps, be asked how the soft-currency countries (presumably debtors of Britain on their current trading account) would react to a policy which offered them sterling when they might hope to earn dollars.

This "incentive" scheme is in some ways ingenious, but it does not go very far and it has not been very well received. No one can take for granted the success of the detailed talks between the British Government and the American companies in which the scheme is now being explored. It is in any case still extremely tentative, and many things are not known about the way it would work if it were to be adopted at all. If all went well it might, as Mr Gaitskell has suggested, prove a way of "getting extra petrol without spending dollars," but the motorist would be well advised to doubt it. In any case, as the programme of substitution stands at the moment, it is fuel oil (much more than motor spirit) that is in question; and it is fuel oil, rather than motor spirit, that the American and the British companies are finding it really difficult to sell. Large-scale substitution of British for American motor spirit is to come later when the cracking units of the new British refineries come into operation.

★

The Americans are reported to have found the British memorandum complicated, but one lucid and unbroken thread runs through it. This is that the necessity of saving dollars has been placed before the charms of a quiet life and has been given priority over the claims of increased consumption in Britain and the Commonwealth. This priority does not apply only to the oil supplied by American companies, which (without the substitution policy) was expected to cost in dollars $350 million, or about $27 a ton, in 1950. It applies also to the "sterling" oil supplied by British companies, though here the average dollar cost is only $6.70 a ton, and a good deal of it is recovered in foreign sales. Where a surplus of sterling oil arises, it is to be used either to save dollars at home or to earn foreign currency abroad—even if the "surplus" merely expresses restricted consumption at home.

It seems to follow that consumption at home will have to be in some way restricted so long as the dollar shortage

lasts, and in spite of the increasing supplies of oil which are physically available. The only possibility of getting rid of petrol rationing seems, therefore, to be through using the price mechanism in one way or another. Both Mr Gaitskell and Mr Churchill seem to find such an idea abhorrent. But the ration is abhorrent too, inequitable, and wasteful.

One difficulty is that no one knows what the price of petrol would require to be in order to keep demand within the limits of what the national balance of payments can afford. Mr Gaitskell, in his speech at Harrogate, suggested that it would have to be 6s. or 7s. a gallon; and this may well be not merely his personal opinion, but the considered view of his advisers. If his estimate is correct (and there is no way of judging whether it is or not) then it argues a remarkable amount of loose purchasing power in the motorist's pocket. If, however, disinflationary measures were undertaken in other ways (and it is not yet a settled Government policy to have inflation for ever) the necessary price could be brought down very sharply. If the purchase, or the prices, of some other commodities were allowed to go free, motorists would quickly become less willing to pay fancy prices for petrol.

No doubt they would still have to pay more than they pay today. But it is perhaps too tempting to allow the heart to bleed, as Mr Gaitskell's bled, for the poor motorist being squeezed out because "he could not afford to pay." Plenty of people cannot afford to have a car, even with petrol at 2s. 3d. Those who can, find that it now costs them between 1s. 3d. and 1s. 6d. a mile to own and run a 10 horse-power car, assuming that their car is on the old tax basis and that they have to content themselves with the basic ration. It is true that petrol is little more than a penny a mile out of this; the remainder is tax, insurance, garage, oil, maintenance, repairs, and the eventual replacement of the car. But if the price of petrol went up, and the permitted mileage went up, too, then the cost per mile would come down.

More would need to be known about the matter before anything could be done. How great would the change need to be? Should it be done by commercial or fiscal means? Should public transport undertakings, and other users whose charges affect the general level of costs heavily, receive some exemption or rebate? At least the subject needs to be explored. The only other course is either to hope for miracles, or to accept the rationing of petrol as a permanent institution.

Through the American Tariff

LAST week's report from OEEC did not mince words on the American tariff. Its examples of difficulties and delays, and its analysis of protection at work in a country which is wedded in principle to the idea of free international trade and contemplates officially a large expansion of imports from European countries make a now familiar story. But it has lost nothing in the telling. Nothing is easier, of course, for Europe's manufacturers to set up the alibi of the tariff to explain their failure to export, and this danger was frankly recognised:

> With so many difficulties and uncertainties, it is hardly surprising that European manufacturers, especially the small ones on whom so many speciality exports depend, should be reluctant to embark on trade with the United States.

Customs procedures, as the Washington communiqué admitted last September, create psychological as well as actual obstacles. The would-be exporter, seeking an American market for the first time, must make a big psychological adjustment for himself. If he thinks that the American tariff needs only one good shove on his part to open the door to his product, his business and his digestion will quickly suffer. If he is prepared to take on the tariff in the manner of a rather cynical sporting contest, in which the rules allow full resort to "gamesmanship" on each side, he may succeed in doing business and keeping his health.

His first need is to face the facts of American fiscal life. He must recognise that the American tariff law is obsolete. Its framework is laid down in the Hawley-Smoot Act of 1930 and most of the complications derive from that Act. He will discover, if he has not already done so, that some tariff duties are high, and many of them tricky. And he may find that the biggest impediment is not the height of a particular duty, but the complexity of procedure of the American Customs in dealing with his product. His may be a case in which American Customs officials think it necessary to conduct intensive chemical examination. Tariff theory is one thing, and its practical application quite another; the reform of these tariff procedures may be desired (and perhaps may even be imminent) but meanwhile the tariff and its administration are facts of life with which British exporters seeking a market in the United States must learn to live. Their main problem is not to attempt a single-handed attack upon it—that way frustration lies—but to get the best guidance of those who know their way, after long experience, through its labyrinthine complexities.

*

An appendix to the pamphlet published last week by the Dollar Exports Board gives a factual summary of American tariff law and procedure. The first problem is that of classification. Description is the language of classification, and if the exporter describes a commodity in terms which put the goods into a higher tariff rate than might otherwise be applied, he is bound by his own description. A processed cereal biscuit was burdened with an impossible tariff; but when the offending word "biscuit" was struck off the label, the product was admitted at a much lower rate after reclassification and enjoyed tremendously increased sales. A car speedometer, first classified as a "scientific instrument" was priced out of the market; after representations by a customs lawyer, the product was reclassified as "automobile parts," at a lower duty which made it readily saleable. On bicycles and motorcycles the rate varies according to the size and weight of the machine, and is in no case high enough to proscribe trade; but to ship them as unassembled components (to save packing and freight costs) puts the goods into a new classification as "parts" on which the duty is prohibitive.

The lesson from these examples is that ingenuity and competent advice are the first conditions of a successful assault on the American tariff. Not every British exporter needs to consult an American Customs lawyer.

His first need is to find an American agent or an established import and distribution organisation which knows the ropes. A competent agent will know the right Customs brokers to use (many of them specialise in particular classes of imports) and it is only when the question of "classification" is critical either because the product is new and has not previously been classified or because the tariff hurdle is in cold fact too great to surmount, that a Customs lawyer may be needed. "Let me write the Administrative Act," an importer's representative has said, "and I care not who writes the rate of duty." The function of liberalising the findings of the US Customs Court is the essential professional interest of the American Customs lawyer.

The rate of duty imposed on goods entering the United States is laid down in the Tariff Act (as modified by the Reciprocal Trade Agreements) and depends on "classification." The average rate in 1930-33, after the passing of the Hawley-Smoot Act, amounted to 53 per cent of the value of dutiable imports. By 1939, the average rate had fallen to 37 per cent, and it is now about 14 per cent. The 1930 rates have been reduced by about 50 per cent, and the incidence of specific duties has been greatly reduced by the rise in import prices, now more than twice as high as they were in the early thirties. Nevertheless, rates of more than 50 per cent are still common, and they are based on "values" as defined in the 1930 Act. These values are determined at the port of entry by the Customs authorities on one of the following bases, in order of priority:

(1) The *foreign value* or the *export value*, whichever is the higher. The former is the price, at the time of export, at which the product is freely offered for sale for home consumption in the country of origin. A product made specifically for export can have only an export value.

(2) Failing a foreign or export value, the *United States value*, that is, the price at which similar merchandise is offered for sale, packed for delivery to all purchasers in the United States.

(3) *Cost of production* in the country of origin, plus general expenses (not less than 10 per cent), cost of containers, and profit (not less than 8 per cent of production cost plus general expenses).

(4) The *American selling price.*

These definitions are in practice much more complicated than a summary suggests. They are explained in fuller detail in the Dollar Exports Board's booklet, and in the "Guide for United Kingdom Exporters to the United States" prepared by the British Empire Chamber of Commerce. Doubtful cases can be discussed with any number of authorities, including the American. It rests with the British exporter to secure, through "informed manipulation" or through the conduct of his selling arrangements in the United Kingdom and the United States, the basis of appraisement which is most advantageous to him and best suited to his goods. He must not, for example, agree to supply goods at a certain price and then accept a later order at a higher price before the first has been shipped. He will, if he is wise, delay any increase in price until outstanding orders to the United States have been filled; otherwise the duty on the goods will be based on the new and higher price.

Beyond classification and rates of duty, there remain the problems of marking and "liquidation." Before 1938, a consignment of goods for the United States which was not strictly marked according to its class and classification (the designers of the Hawley-Smoot tariff Act preserved a cunning distinction between the two notions) were subject on arrival to penalties as severe as were exacted by any large mercantile country. In some items, such as cutlery, the penalties are still severe; but in the last twelve years the marking requirements have become as liberal as any in the world. Here again the marking requirements can readily be met provided only that there is prudent inquiry in advance; there are any number of sources of information about them, including the British commercial consulates in the United States. The bugbear of "liquidation" is less easy to surmount. "Liquidation" means that the goods have been finally classified, the duties assessed and paid, and that the American Government is satisfied that there will never be any recourse against the importer. Cases have been known in which "liquidation" has been so long delayed that goods admitted into the United States under a provisional classification for dutiable purposes have been sold and dispersed to the ultimate consumers before the tariff was finally assessed—and the final assessment was so large, when it at length was determined, that the importer was bankrupted. But even granted the delays which a trial shipment of new goods may involve, "liquidation" is still far quicker in some ports than in others. The average time for final clearance in Philadelphia is two months; in New York it rarely takes less than nine months. New York is often a convenient port of entry into the American market But it is not the only one. And there is also some element of rivalry among customs officers at different ports—within the discretion which the Tariff Act affords—to encourage the flow of entries through their ports and so to enhance their relative importance. There are certain ports which are known for their rigidly technical inter-

pretation of customs administration, but, in general, customs rulings are now about as liberal as the present law permits.

*

The British exporter is entitled to make the most of these opportunities which differential administrative practice affords. But he will not suppose that administrative flexibility, so far as it emerges, provides more than an opportunity for getting satisfactory decisions in marginal cases. Nor will he anticipate a general revision of the American tariff which rides high and free over the hundreds of local issues and interests which, in fact, determine the nature of the tariff law. It is the separate industrial and economic regions of the United States which, in the last resort, write the American tariff ; it is the conglomeration of the several self-regarding policies of these regions, rather than a grand fiscal philosophy of the State Department, which decides the issue. Hence the task of the British exporter is not merely to direct his energies to satisfying the particularities of American wants and tastes, but also to do so within the variegated pattern of opportunity which the customs law presents. In some commodities, there is no hope ; tariff rates exclude such products from the American market. An example at the other extreme is Scotch whisky, on which the tariff is not protective but pure excise ; the duty on "Scotch" is in this sense incidental, for no reduction can be expected nor is any needed in the interests of the trade. Between these extremes, there are intermediate examples, such as British cars. These attract a relatively low duty of 10 per cent. It is arguable whether more British cars would be sold in the United States if the tariff were abolished, or less sold if the tariff were doubled. The dominant feature of the market is not so much price, but the meeting of American standards of style, size and performance.

All these difficulties argue themselves. Whether there is a chance of a more liberal tariff in future remains to be seen. But the fact that British exporters in many lines of production have succeeded in finding their way through the maze of American customs procedure disproves the common argument that the present difficulties are too great, and the risks of trouble intolerable. Sound methods of merchandising, the shrewd selection of an American agent the timely use of customs brokers and lawyers, prompt resort to the advice furnished by British and American trading organisations and embassies —all these are obvious steps to reduce the practical difficulties and to eliminate the psychological burden, which seems to afflict so many exporters, of taking on the American customs single-handed. The notion that the American tariff is highly protective and anti-British is absurd. But the tariff is a fact, important and technically complex, a compound of law and procedure which cannot be knocked down or taken for granted, but can, in many cases, be penetrated by skill, perseverance, and good advice.

Business Notes

No Mourning for Electra

Three main points emerge from the revised capital reorganisation scheme announced by Cable and Wireless (Holding) just before this issue of *The Economist* went to press. First, the idea of liquidation is as far as ever from the mind of Sir Edward Wilshaw and his board. And evidently he has persuaded the opposing Stockholders Committee of the wisdom of the compromise proposals now put forward. "Independent advisers," it is stated, have also approved, while the verdict of the Committee of the British Insurance Association, though still dissenting on the treatment offered to the existing £16,766,591 5½ per cent preference stock, is that the scheme is in the best interests of the ordinary stockholders.

The second feature of the scheme is the opportunity it provides for ordinary stockholders, if they so choose, to realise under prevailing conditions approximately £295 for each £100 ordinary stock now held. There can, in fact, be little doubt that such terms would represent a fair outcome for ordinary shareholders for the protracted proceedings since nationalisation of the group's cable interests. It compares with the value of £256 placed on £100 of their stock under the first scheme of reorganisation and with the market price of 268 prior to the announcement of the new scheme ; but in addition the scheme offers for them one decisive advantage. The new scheme, like the old, would allot to them £125 (nominal) of 3 per cent Savings Bonds 1965-75, but instead of offering them £75 4 per cent cumulative preference stock in the reconstituted company plus £75 ordinary stock, it would entitle them to £180 ordinary stock of the company as increased by the bonus distribution of £80 ordinary stock still to be approved by the CIC. The distinctive advantage of the new scheme is that it gives ordinary stockholders the right to take, in lieu of the whole or part of the £180 ordinary stock, 3½ per cent unsecured loan stock to be issued by the company. The terms of the unsecured loan stock will be fixed so that stockholders will be able to realise their holdings at par. It is this facility which must have swayed the advocates of liquidation—and on this the board is to be commended on its ingenuity, if not diplomacy.

At the end of the period during which provisional letters of allotment of the new loan stock are renounceable, the company intends to redeem by drawings any portion of the first five-eighteenths of the stock (i.e., £50 per £180 stock) not previously redeemed by purchase in the market. The balance is to be redeemed at the end of 3½ years. Hence by purchases in the market, drawings and the prospect of ultimate redemption the company means to hold the price of the unsecured loan stock. These mechanics seem sound, and should enable the ordinary stockholder to get his £295 per £100 of his stock by selling his allotment of gilt-edged and unsecured loan stock in the market (or by taking his place in drawings and redemption). Or, if he chooses, the ordinary stockholder may stay with the company in its career as an investment trust.

* * *

Position of Preference Stockholders

Thirdly, an option is now given to the preference stockholders to go with Sir Edward on his new journey. Previously, the preference were offered the alternative of repayment in cash at par or £65 in cash plus £40 nominal 3 per cent Savings Bonds 1960-70 for each £100 of stock. They are now provided with two further alternatives. They can opt to convert their holdings in whole or in part into ordinary stock of the reconstituted company to the extent of the difference between the amount elected to be retained by ordinary stockholders and the present issued ordinary capital of £6,883,103. Alternatively, they are offered an allotment of 4 per cent 10-year unsecured loan stock within the maximum issue of £4,000,000—the price of this stock would be determined by market conditions at the time of issue. It is difficult at this stage to appraise the value of this new choice. But apparently it does not satisfy the British Insurance Association whose championing of preference stockholders may well have a tangible result for Scottish Motor Traction preference holders.

Sir Edward Wilshaw was not prepared, at his press conference on Thursday afternoon, to offer a revised figure for the administrative cost of carrying on Cable and Wireless (Holding) as an investment trust. But it was evident from his remarks that he has had second—or third—thoughts on the subject since he gave his original estimate of £100,000 a year.

* * *

Record January Exports

British exports in January reached a new high record of £175.8 million. This provisional figure is £27 higher than the monthly average for 1949 and £15½ million higher than the previous peak reached in November. The daily rate of exports was 10 per cent more than in either December or November. This sharp rise is indeed encouraging. Although it must be attributable to some extent merely to the back-log of customs' entries from the Christmas period, there is evidence of the stimulus given to the export drive by devaluation. Dollar earnings, however, have not increased correspondingly. Valued in dollars, exports to the United States and to Canada were both above their average levels of the last and third quarters of 1949, but were still running below their averages of the first quarter. Over the past three months, however, the general trend has been upwards, thanks chiefly to the expansion of exports to Canada ; exports to the United States have tended to fall somewhat since their sharp rise in November.

BRITISH EXPORTS TO USA AND CANADA
(Monthly Averages—Million $)

Destination	Unit	1949							1950
		1st Qtr.	2nd Qtr.	3rd Qtr.	4th Qtr.	Oct.	Nov.	Dec.	Jan.
USA	US $	21·2	13·4	15·1	18·7	15·6	20·5	20·0	19·2
Canada	Can. $	26·7	26·5	25·2	22·1	19·7	23·0	23·5	26·0
TOTAL	US $	47·9	39·9	40·3	38·7	33·5	41·4	41·3	42·7

Imports last month were also high, amounting to £201.2 million, or only £500,000 less than the peak touched last June. Re-exports have been provisionally valued at £5.8 million. Thus the excess of imports (valued c.i.f.) over total exports (valued f.o.b.) amounted to £19.6 million; this is 45 per cent below the monthly average for last year and 7 per cent below the average for the first quarter of 1949. These figures suggest that, for the moment at least, the "overall" trade gap is being bridged. The dollar gap, however, remains.

* * * *

"Imps" Bumper Profits

The City's surprise at Imperial Tobacco's large increase in profits in the year to the end-October, 1949, was measured on Tuesday by the rise in the £1 units from 5$\frac{1}{32}$ to 5$\frac{9}{32}$ (and subsequently to 5$\frac{7}{32}$ ex dividend). The consolidated net profit has risen from £7,931,276 to £9,085,433—a proportionately bigger jump than that recently shown by Carreras (whose trading profit rose from £2,520,584 to £2,749,891 over the same period). During these twelve months home consumption of tobacco, according to the official figures, expanded from 209.17 million lb. to 212.66 million lb. From the limited details of the "Imps" preliminary statement, it is not possible to gauge the precise

improvement in trading over the period ; neither trading profit nor tax provision is shown.

Similarly, there is no information yet on the level of stocks ; these, with advances to overseas leaf-buying organisations, amounted to no less than £87,493,802 at October 31, 1948. Tobacco stocks in bond for the whole country increased from 382.95 million lb. to 392.22 million lb. during the ensuing year. Hence it is possible that the physical stocks of "Imps" also rose during the year. Though there has been no further increase in the tobacco duty to increase the group's commitments, it has had to face the new influence of devaluation, and the preliminary statement shows that £1,500,000 has been set aside from profits to provide for additional commitments arising therefrom. No doubt Sir Robert Sinclair will explain this provision in due course, but it clearly relates to the increase in sterling costs of supplies bought in the dollar area. The accounts of Carreras, like those of "Imps," were made up only six weeks after the devaluation ; they showed an increase of only £192,971 in the group's stocks to £9,282,597 over the year.

Finance and Investment

"Hiving-off" in Paint

A proposal made this week by one of the big paint manufacturers has set the city wondering where the process of "hiving-off" will stop if Labour triumphs at the polls. An inevitable step, in appropriate cases, for companies already scheduled for nationalisation, and a prudent one for those in industries on Labour's short list of prospective victims, it has not so far been taken by any concern beyond this range. Now it is proposed by Lewis Berger and Sons by a scheme designed to segregate the Berkeley Square property and overseas interests of the group which it is considered would not fall within any future nationalisation proposals for the paint industry. This plan, it is stated, is also intended to decentralise and simplify the administrative structure of the group. Three new subsidiary companies would be formed to acquire the interests of Lewis Berger and Sons in exchange for shares. This would leave overseas and home "producing and distribution" interests in two separate groups of companies and the Berkeley Square property in a third. If nationalisation appeared inevitable, the plan would be to place the parent company in liquidation and distribute the shares in its three subsidiaries to stockholders. The board is presuming that the State would seize only the home paint interests, thus segregated, and would leave stockholders in possession of the group's interests in overseas enterprises and of Berger House. Timid investors may welcome such precautionary moves. But the group is trying to cross the bridge before it gets to the stream.

* * * *

Exchange Auction in Argentina

According to the Argentine Government, the value of the pound sterling in Argentina ranges from 9.40 pesos (when it is used by Britain to buy Argentine meat) to 25.27 pesos (when it is bought from the Central Bank by someone in Argentina who wishes to make a financial remittance to this country). According to Argentine importers (and therefore presumably to the schedule of comparative costs) the pound sterling is worth 33.47 pesos when it can be used for purchasing "category A" inessential imports and 37.22 pesos when it can be used for purchasing "category B" inessential imports. These values, moreover, are averages for the categories concerned ; for the purpose of buying particularly scarce commodities within these categories—commodities such as British textiles—the value of the pound is almost certainly higher still.

This is the absurd picture revealed by the announcement of the results of the second exchange auction held in Argen-

tina for prospective importers of "inessential" British goods (for some reason the results of the first auction—which was chiefly for prospective importers of British cars—are still being kept secret). These auctions, it seems, are being held now merely because this is the season when Argentina is engaged in negotiations for renewal of her complex structure of bilateral trade agreements; it was decided some time ago that it would be good policy to make some show this January of lifting the curtain which has been brought down on almost all imports of "inessential" goods into Argentina, and of thus carrying out some part of the commitments entered into last year. Since the inflated Argentine home market, which has been starved of foreign goods for so long, is certain to gobble this ration up at high prices, the Government decided to keep to itself the greater part of the profits to be earned—hence the decision to put the quotas of foreign exchange up to auction among importers. The amount of each separate foreign currency auctioned, and the uses to which such currency can be put, have been determined partly by the size of Argentine holdings of each currency, partly by the dictates of diplomacy, and partly by the strength of the opposition of local manufacturers to the import of certain goods. For British "inessential" goods, for example, some £2,000,000 has been allotted (against £15 million envisaged in the Trade Agreement); the allotment at the recent auction was for tiles, wool, cotton and linen fabrics, codfish and herrings. For Spanish inessential goods, on the other hand, the allotment was apparently so generous that Argentine importers have been unwilling to buy all the pesetas offered at any price; the news that Argentine importers consider at least one foreign currency to be less desirable than their own is perhaps one crumb of comfort which those who have been responsible for debasing the once dollar-hard peso can derive from this auction's results.

* * *

Twelve Millions for Israel

There is little in the new Anglo-Israeli agreement to suggest that Britain has become less open-handed in the treatment of its sterling creditors. During the current year Israel is to be permitted to draw rather more than £12 million from its sterling balances; allowing for various other financial transfers some £15 million may be available. The releases proper comprise a straight release of £3,000,000, a further £4,000,000 freed to augment working balances, and a release of some £5,200,000 in twelve monthly instalments of £435,000 for the financing of oil imports. Under the first agreement, covering the six months to October 31 last, the total release under these three heads was £7,500,000 Additionally, £500,000 is now made available to cover the cost of oil purchases for the period between the two agreements, while the limit on the remission of charitable funds has been raised from £1,500,000 to £2,250,000.

In assessing the new burden these releases impose upon the British export trades two factors have to be borne in mind. Part of Israel's London funds originates from prewar working balances and exchange reserves, but the bulk arose from special transactions during the war, when American Zionist organisations agreed to place nearly £35 million in dollars at Britain's disposal and in return received sterling credits in London. Secondly, the need for the Israelis to use sterling reserves to finance their heavy trade deficit would not be so pressing but for the continued blockade of the Haifa refinery. If the refinery were reopened Israel's position would be considerably alleviated. When the releases now sanctioned have been drawn, Israel's sterling balances will have run down to about £17 million. The future of the remaining balances will largely depend upon the outcome of the present negotiations upon the claims and counter-claims submitted by both parties as part of terminal settlements arising from the final stages of the Mandate. It rather seems that the accounting will go against the Israelis, and that at least part of their remaining funds will be absorbed in settling these debts.

* * *

Egypt asks for Gambling Money

To anybody but an Egyptian there must surely be something incongruous in the news which has come out of Cairo this week. On the one hand, Egyptian negotiators are still trying to persuade Britain to give them dollars from the sterling area central pool; since Egypt did not make any net contribution to this pool during its period of sterling area membership, this claim must presumably be based on need rather than merit. On the other hand, Egypt has now bought $25 million of gold and $22 million of American Treasury bills in New York, and is also believed to be hoping to buy some $5,250,000 of gold from South Africa in 1950. These purchases, ostensibly designed to provide a solid basis for the currency, are evidently almost entirely speculative. Egypt hopes to make a substantial profit if the dollar price of gold is raised and, also, it is reported, to make a profit in barter deals in the meantime by exporting the gold (at fancy prices) in the slightly ludicrous form of large gold ash trays. There is no need now to rake over the old controversy about premium gold sales by members of the International Monetary Fund; but it must be stressed that Britain has a positive duty to refuse point-blank to make any release to a country which asks for dollars to use for speculative purposes.

* * *

Exchequer Bonds and Floating Debt

This week's experience in the money market throws additional light upon the rather unexpected trend of the floating debt since the turn of the year. A note in these columns last week pointed out that the rate of repayment of "active" debt in this period had been slightly less than in the similar weeks of 1949; it explained that one reason for this was the overstatement of true expenditure in the Exchequer returns of January, 1949. A further reason, previously suspected in the market and now confirmed, is that the authorities had been active in buying up the "un-assented" 1½ per cent Exchequer bonds in advance of their maturity date on Wednesday of this week. The confirmation came from the news that the Treasury was again refraining from calling funds from the banks against Treasury deposit receipts, despite the fact that £41 million of these were maturing and despite the large Government dividend payments falling due on the same day as the Exchequer bond redemption. This made it plain that most of the bonds must already have found their way into official hands. Even so, the money market prepared itself for a glut of money on Wednesday, only to find that earlier official purchases of bills maturing on that day had been so comprehensive that the net release of funds to the banking system was relatively small. Some discount houses, indeed, actually had to sell bills to the authorities before they could balance their books.

This week's net repayment of Treasury deposit receipts will have reduced the outstanding total to only just over £500 million—less than one-quarter of the peak figure touched in 1945, and less than half the total outstanding at this time last year. Of this reduction, £370 million has occurred since the turn of the year, whereas over the same period the volume of tender bills outstanding has been reduced by only £60 million, to £2,930 million—compared with £2,210 million twelve months ago. Last year there was a further reduction of just under £50 million in the active floating debt between February 18th and the mid-March nadir. Evidently, the banks' holdings of TDRs, which were down to only 10 per cent of their deposits

"It is a melancholy consideration indeed, that one's chief comforts often produce one's greatest anxieties, and that an increase of our possessions is but an inlet to new disquietudes."—GOLDSMITH.

at the date of the January statement, will shortly sink to a very low proportion indeed.

*

As for the discount market, some of the effects of the switch in floating debt borrowing were brought to light by Mr Ronald Gillett in his statement circulated with the accounts of Gillett Brothers Discount Company this week. This company, which increased its capital by the issue of 250,000 ordinary shares of £1 each at 54s. a share last March, has had an excellent year. Its turnover of both bills and bonds was nearly 50 per cent higher than in 1948-49, and its net profit rose from £81,889 to £132,314. Thanks to the bigger turnover and slightly higher discount rates, Mr Gillett was able to report that the return on bill business now more than covers total expenses; three years ago less than one third of expenses was covered by such business.

* * *

Foreign Bonds in 1949

In its annual report the Council of Foreign Bondholders is obliged to write off 1949 as "a year of disappointment," despite the fact that the only addition that needs to be made to its long list of foreign bonds in default has been the occasional failure of Bulgaria to adhere even to the pitifully inadequate payments agreed to in December, 1948. The Council's main concern in the past year has been to improve the prospects of foreign creditors of Germany and Japan; in this field, despite the rise in prices of these bonds, it has "little progress" to report. For the rest, much of the Council's work in 1949 was devoted to negotiations with Poland and the City of Saarbruecken, negotiations which have not so far yielded any concrete results. The Council is in full accord with City opinion when it writes of the "entirely unwarrantable attitude of the Polish government towards its foreign bondholders." Settlement of the Saarbruecken's indebtedness is said to be still "under consideration," a fact which the repeated visits of the City's mayor to London had already indicated; the relatively narrow price movements of Saarbruecken bonds may perhaps signify confidence that a satisfactory settlement will eventually be negotiated. Service of the Austrian Guaranteed Loan has continued to be a problem; but for the pressure exerted by the Council on the Italian government to stand by its obligation, the Italian share in the guarantee would almost certainly have gone by default. Czechoslovakia, despite repeated representations, persists in repudiating its share.

After this dreary tally, it is good to have the Council's reminder that there are other live birds in the coop; it recalls that even today foreign bonds produce an annual income in foreign exchange of £13 million on a capital sum of about £220 million.

* * *

Progress in Potash Pay-out

In the past two weeks German Potash Bonds have been rising again—the seven per cent Bonds, which stood at 65½ at the beginning of the month, have now risen to 70. This rise reflects a thinning of the legal obstacles still to be surmounted before bondholders can be paid the £2,280,000 in guilders and the £275,000 in dollars which the Dutch custodian of enemy property released last year. Originally it was believed that payment could not be made until a Court approval of the transfer agreement had been obtained and a Court ruling given on the form in which repayment should be made. The latter ruling is now no longer necessary; under the powers given by a private members' Bill introduced into the House of Lords at the beginning of December, the form of repayment can be decided by a meeting convened by a specially formed bondholders' committee. This seems to remove any lingering fear that the Courts might decide that the repayment, once authorised, should be made in the form of repayment of interest arrears, in which case it would be subject to tax, instead of in the form of repayment of capital, in which case it will be tax free.

Meanwhile the slow—but necessarily prior—job of obtaining Court approval of the transfer has progressed one stage further. After some delays in preparing the case, the hearing was postponed, as the Americans would not grant an exit permit to the German lawyer who was to hold a watching brief for the former Potash syndicate. This obstacle has now been overcome by serving a summons on the German lawyer. If—as is likely—he does not present himself in this country within three weeks of the summons, the case can apparently be heard without him. Even so, this is unlikely to take place before the Easter or Trinity terms. If all goes well, bondholders should therefore receive their money during the summer, but they would perhaps be wise not to count upon this. The trustees have met with unexpected legal snags in the past and there may be further pitfalls yet.

* * *

SMT Preference Premium

The persistence shown by the preference shareholders of Scottish Motor Tractor in pursuing, against legal odds, their claim to repayment at a premium may, it seems, bring some reward. That, at least, seemed the clear implication of the announcement by the company at the end of last week advising holders of the 6½ per cent preference stock not to dispose of their holdings until a further announcement was made by the directors. The company's capital reorganisation scheme providing, *inter alia*, for repayment of the preference capital at par, was approved by the ordinary shareholders last September. It was then pointed out that preference shareholders would have a final opportunity of opposing the terms of repayment when the scheme eventually came up for court sanction; and in the interim they have been very busy. The promised official announcement has not yet appeared, but spokesmen for the company are reported to have said that proposals are being considered which might be acceptable to both classes of stockholders. Any revision of the original capital reorganisation scheme to provide a premium for the preference stock would, of course, require formal authorisation by the ordinary shareholders.

Pending an application for court sanction, the implementation of the whole scheme has been held up and with it the distribution of £8,047,836 3 per cent Transport Stock 1968-1973 received in payment of SMT's assets acquired by the Transport Commission. The chairman stated some time ago that if no settlement had been reached with the preference stockholders by April, some distribution would be made to the ordinary stockholders from interest received on the compensation stock. Now that there are strong hopes of a settlement with the preference, a distribution of the compensation stock itself may soon be forthcoming.

Industry

The Motor Industry in 1949

The British motor industry produced 412,290 cars and 218,375 commercial vehicles during 1949—altogether 100,000 more vehicles than in 1948. The increase was made possible by an expansion of steel supplies, assisted by the import of certain types of steel from the United States for rolling in Britain. A note in *The Economist* on February 4th outlined the sources from which it is hoped to obtain steel for an even higher volume of production during 1950.

At the beginning of 1949, the industry was set an export target of a monthly rate of £5,500,000 in cars and £3,500,000 in commercial vehicles, to be reached by the

end of the year; in the event this was reached considerably sooner. Total exports came to 57,922 cars and 93,087 commercial vehicles, valued at £73 and £42 million respectively, so that the rate intended to be reached at the end of the year was in fact achieved as an average over the year as a whole. The accompanying table shows the leading importing countries.

In spite of these exports the industry supplied far more vehicles to the home market than the Ministry of Supply had laid down as the maximum at the beginning of the year. The home market was to receive not more than 110,000 cars and 50,000 commercial vehicles. The figures show that in fact 154,000 cars and 125,000 commercial vehicles must have gone to the home market during 1949.

The reasons were twofold. Production was greater than had been expected, and in the spring and summer manufacturers had great difficulty in selling to some of their best markets. A blind eye had, therefore, to be turned on the selling of "frustrated exports" at home. The difficulty

BRITISH CAR EXPORTS IN 1949
(Provisional Figures)

Destination	Number of Cars	Value £
Australia	84,670	23,256,718
Canada	31,213	7,808,602
South Africa	18,584	5,051,496
Belgium	11,628	3,277,767
New Zealand	11,553	2,688,471
Brazil	7,882	2,579,909
USA	6,716	1,853,541
Eire	7,183	1,853,223
Netherlands	6,376	1,830,328
Switzerland	5,285	1,738,429
Others	66,832	20,860,485
TOTAL	257,922	72,798,869

seems now to have come to an end for the present. Indeed, the Austin Motor Company has recently announced that in order to meet its export commitments neither of its most popular models will be sold on the home market at all for some months.

The treatment given to the commercial vehicle trade seems to have been more severe than to the car trade, Although commercial vehicles have to meet more sales resistance abroad, their manufacturers have been told that deliveries to the home market in 1950 must not exceed 73,000 and if the balance of the output cannot be sold abroad, then the volume of production itself must be reduced.

* * *

Car Exporters

The share taken by individual manufacturers in total exports to any one market can be gauged from the number of new cars of each make registered. This shows the number of sales made during the period; because of the stocks carried, it does not necessarily correspond to the number of cars dispatched to the market in the same period, but it can be regarded as more significant. Full returns from the leading car markets have not yet been completed, but the accompanying table shows fairly clearly the leading exporters last year in the four countries covered.

Import restrictions on American cars made the Australian market during 1949 an almost exclusive British preserve, but towards the end of the year the Australian-built Holden car, which is sponsored by General Motors, was brought into production. Nearly 7,000 of these were registered, and since the car is designed for Australian conditions it is expected to be a serious competitor.

Canada is almost as purely an American preserve. The returns, since they cover only the first nine months of the year, give no indication of the stimulus to British sales which followed devaluation. But they do show that British sales might be doubled or trebled without giving the American companies really serious cause for alarm. In South Africa, British sales were handicapped during the summer by the lack

NEW CAR REGISTRATIONS IN 1949

Make of Car	Australia (12 months)	Canada* (9 months)	S. Africa (9 months)	Switzerland (12 months)
British	*68,926*	*12,357*	*10,118*	*5,753*
Of which:—				
Austin	16,924	5,476	3,538	854
Ford	11,638	1,376	523	320
Rootes	5,990	1,899	902	1,618
Nuffield	11,127	2,233	2,394	1,522
Standard	9,919	339	689	475
Vauxhall	8,624	477	1,814	1,101
American and Canadian	*8,271*	*93,079*	*20,387*	*6,333*
Of which:—				
General Motors	2,776	28,455	8,926	2,434
Chrysler	2,252	23,219	6,348	815
Ford	2,703	20,532	2,105	608
French	*1,064*	*85*	*1,035*	*6,230*
Italian	*881*	*31*	*370*	*2,726*
TOTAL NEW REGISTRATIONS	86,117	105,604	31,925	24,980

* The four western states, containing about 30 per cent of the car population, do not send in returns.

of assembly facilities within the Union. It should be noted that the Ford assembly plant (for both American and British Fords) did not come into operation until the middle of the year.

General Motors is the leading American exporter. Among individual makes of American cars, Ford and Chevrolet, with a substantial lead, are followed by Dodge, Plymouth and Pontiac. Among British makers, Austin are clearly the largest exporters (the A40 is their best selling model). Renault appears as the leading French exporter, as Fiat is among the Italians.

An appreciable number of Volkswagen is beginning to appear among the new registrations in European countries. Of the 3,589 German cars sold in Switzerland during the year, 1,926 were Volkswagen and 1,349 Opel. Of the 629 German cars sold in Sweden, 348 were Volkswagen and 135 were Opel, out of a total of 13,785 new cars registered. About 4,459 of these cars were Swedish built, 3,064 were British, 1,832 were American and 2,664 were French.

* * *

A Swiss Locomotive Arrives

The Western Region of British Railways has taken delivery of the gas turbine locomotive built by the Swiss firm of Brown Boveri. It was ordered in 1946 by the Great Western Railway at the same time as a similar order was placed with Metropolitan Vickers, Ltd., in this country. The power plant of this second locomotive is due to start bench tests in April or May, and the complete locomotive

BAYERISCHE VEREINSBANK

Correspondents in all important places of the World

should be ready for test runs by September. Work has been slower than in Switzerland; Metropolitan Vickers were originally to build only the power plant, and the rest of the locomotive was to be constructed at the GWR's own workshops. It was later decided that Metropolitan Vickers would build the entire locomotive, and the designs were at the same time modified to include developments made since they were first drawn up.

The economic advantages of a gas turbine over a diesel locomotive will rest not on the thermal efficiency of the gas turbine but on economies which may result from a lighter locomotive and lower running costs. Trials carried out in Switzerland show that the Swiss gas turbine locomotive will pull an express passenger train of 350 tons (the equivalent of 12 coaches) at 90 m.p.h. on a level track. The locomotive itself, which develops 2,500 horse power, weighs 118 tons. A diesel unit, with roughly equivalent horse power, would usually require a pair of locomotives, together weighing 230 tons.

An important advance has been made in substituting heavy bunker oils for the diesel oil usually considered essential for gas turbines. The disadvantage of heavy oil is its ash deposit. The Swiss turbine avoids this by the shape and spacing of the blades. The difference in price between heavy and diesel oil is expected to outweigh the lower thermal efficiency of the gas turbine. Diesel engineers have also to add about 12 per cent to the fuel bill for lubrication, a negligible factor in gas turbine running. On the cost of maintenance there is room for argument and experiment, but the balance of current opinion appears to favour the gas turbine.

There are some fundamental differences of opinion between British and Swiss engineers on the principles of gas turbine locomotive design. The British development stems from work on aero-engines, while the Swiss starting point was large-scale turbines primarily for industrial use. This difference in approach has a profound influence on design; the British argue that the Swiss lose the peculiar advantages of the gas turbine, and the Swiss that the British designs are not practical. American designs are based on master patents from both Britain and Switzerland. Trials of the two gas turbine locomotives side by side should settle this difference of technical opinion.

* * *

Tees-side

It has become a little difficult to remember Tees-side, the boom district of north-east England, as an old depressed area which had 68.9 per cent unemployment in 1932. Unemployment on Tees-side was 2.5 per cent last year, and at Darlington, Middlesbrough, Wilton and elsewhere vast new industrial installations are rising and will provide employment for 35,500 more workers. The area, through its industrial development association and its chamber of commerce, has drawn attention to itself this week; these two bodies have issued a brochure, "Tees-side Enterprise" (published by the Bemrose Publicity Company, Derby), setting out its industrial activities and attractions. The brochure shows that what was a decaying industrial community is now productive and expanding on a fantastic scale.

No doubt this is the combined result of enterprise and of the boom in the heavy industries. The area is, for example, the greatest centre of iron and steel production in Britain; works in the north-east produced 3.2 million tons of steel ingots last year, and fully half of this came from the Dorman Long establishments at Middlesbrough. The great chemical plant at Billingham has been working hard. Shipbuilding has been booming. It should, however, be said that the Tees-side shipyards have even now not experienced any of the decline of employment which has begun to overtake other shipbuilding and ship-repairing centres in the north-east; nor have they much cause as yet to worry about declining orders, for their berths are still fully booked for probably two years ahead. The sums spent on modernising and improving the Tees-side yards may account for this.

An area with such terrible experiences from the slump years still in its memory is naturally concerned to attract new industries and restore the diversity of economic life which the heavy industries had overweighted. Efforts have been made to attract light and miscellaneous manufactures, and the brochure states that some 43 factories are planned to produce an assortment of products: telephone equipment, toys, fluorescent lighting, penicillin, buttons, and the rest. The development area policy has been at work, and is doing, no doubt, what can be done in this line. A glance at the employment pattern of the area shows, however, that employment is still strongly weighted by iron and steel (13.6 per cent), mining and quarrying (8.5 per cent), engineering, shipbuilding and electrical goods (9.2 per cent) and chemicals (8.2 per cent).

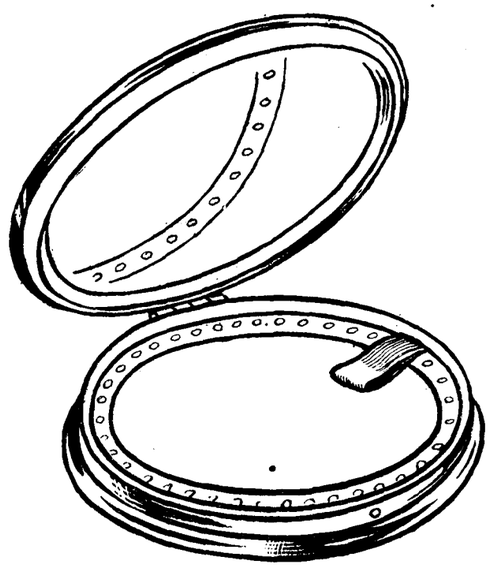
* * *

Paradise for Heavy Industries

Tees-side is getting a big share of the capital investment programmes today; indeed, the concentration of new industrial investment now going on there is claimed to be greater than any area of comparable size in Britain. It amounts to something like £100 million. But will this, on balance, modify the weighting of employment in favour of heavy industries which has been noted? It appears not. The industrial development association has given the following as the main heads of new investment (i.e., presumably of schemes in progress or approved):

	£
Iron, steel, shipbuilding, engineering	23,900,000
Chemicals	32,126,000
Other manufacturing industries	11,163,000
Service industries	31,650,000
Total known investment	98,839,000

It is not hard to see that this investment consists mainly of large units, and very largely of heavy plants. The first head reflects the iron and steel expansion programme, and the new open hearth steelworks of Dorman, Long and Company at Lackenby must be the largest single item in it; there is also some shipyard improvement. In the second head, the Wilton project of Imperial Chemical Industries presumably accounts for about £22 million out of the £32 million. In "other manufacturing industries" one plant, the Patons and Baldwins knitting-wool factory at Darlington, represents £6,000,000 out of less than £12 million.



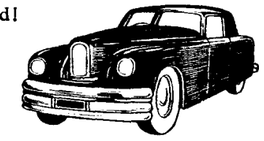
Of the £31 million to be spent on expanding the service industries, about £16 million is the contribution of the British Electricity Authority and the Area Electricity Board. The remainder is principally river, dock, and water services, and

Commercial History and Review of 1949

This week's issue of the *Records and Statistics* Supplement to *The Economist* includes the first part of the Commercial History and Review of 1949—the 87th of the series which began in 1863.

Part I provides a general review of British economic developments last year, and special articles on finance, investment and overseas trade. Part II, to be published on March 4th, will contain articles on all important British industries, and Part III, consisting of overseas economic reports, will appear on April 1st.

The *Records and Statistics* supplement is obtainable by subscription only, at £2 10s. a year; a combined subscription to *The Economist* and *Records and Statistics* costs £5 a year.



COSMETICS AND CARS NEED US

We make the zinc oxide that helps to make face powder pure, smooth, white and close-clinging.

We make the Mazak zinc alloy that makes the many die-cast parts of a car—from carburettor to control knobs, from direction indicators to door handles, from shock absorbers to radiator grille.

Those are two of the ways in which we help to make the world go round. In fact there's hardly anything you use to which we haven't somehow, at some point, contributed!

IMPERIAL SMELTING

WE MAKE ZINC, ZINC ALLOY, ZINC PIGMENTS, METALLIC ARSENIC, ZINC DUST, HIGH PURITY ZINC AND CADMIUM SULPHIDES, CADMIUM, SULPHURIC ACID, VANADIUM CATALYST, FUNGICIDES AND FLUORIDES

IMPERIAL SMELTING CORPORATION (SALES) LIMITED 37 DOVER STREET LONDON W1

SAME ACCURACY—LESS TIME

Instrument cams moulded to eliminate machining

A better job because of BAKELITE

A large number of instrument cams was required quickly. They needed to be accurate and tough, but production time had to be cut. Moulding in Bakelite materials proved much quicker and no less accurate. Just one case of many where engineering problems have been solved by moulding. Perhaps you have a particularly tricky machining job—some component that costs too many man-hours. Bakelite moulding materials offer dimensional accuracy, good finish, durability and speed of production. Why not write to us to see whether we can help? Or ring SLOane 9911.

includes the new oil berth and the lay-by berth which are approaching completion at Middlesbrough. But the Tees Conservancy Commissioners have not yet been able to get Government permission to proceed with their main scheme for extending the Tees docks and deepening the Tees channel.

Tees-side industry grew up not because of any proximity to a market but because of certain conspicuous natural advantages—notably its proximity to coal, ironstone, limestone, salt and anhydrite deposits and to the sea, and its good navigable river with level banks. To these advantages others —and notably an adaptable labour force singularly untroubled by industrial disputes—have been added by human intelligence. But the basic advantages are of a kind to encourage the heavy industries above all, and there is no reason to suppose that Tees-side is on the way to changing its industrial character.

* * *

Textile Dyeing Redundancy Scheme

Surplus capacity has existed in the dyeing and finishing section of the cotton industry since before the war ; the Cotton Working Party recognised this, and supported the necessity of a scheme to reduce it. Such a scheme has now appeared, following not long after the similar action by the printing and bleaching sections, and taking broadly similar lines. A new company, Dyeing Industry Reorganisation Limited, has been formed on the initiative of the Confederation of Textile Dyers and Finishers ; it is limited by guarantee and has no share capital. Its purpose is " to eliminate in an efficient and orderly manner business premises, plant and machinery " which are considered surplus to the industry's needs ; and, where this task requires it to buy up properties which come on the market, it may do so.

The Quarterly Statistical Review of the Cotton Board showed the level of activity in the piece dyeing industry (i.e. output as per cent of existing normal capacity on a single-shift basis) to be 74.9 per cent in the third quarter of 1949. Even so, the plant working has been more than able to deal with the output of the British weaving mills ; it has also been carrying on a considerable business in the dyeing of imported grey cloth, mostly for re-export, and this trade is likely to continue to the extent that restrictions on the import of grey cloth permit.

* * *

French Precision Instruments

The exhibition of French precision and scientific instruments at the Science Museum at South Kensington contains much of industrial interest. Most of the exhibits have been developed by the various French Government research organisations. Their common feature is the thought that has been given to simplification, both in the use of the instrument and in the operation which it is designed to assist. One exhibit is a very small and simple tool used for gauging the smoothness of a surface coating. Another is a piece of equipment designed to simplify the handling of biological specimens under a microscope ; its working parts are themselves visible only under a microscope, and a special tool has been developed for their machining. Among the instruments for industrial control are a gas analyser designed to give continuous measurement of the proportion of a specific gas present in a mixture, and another which will measure continuously each of the gases present. Another equipment gives a continuous reading of the amount of solids present in a liquid. Devices of this kind render unnecessary the intermittent sampling which has to be practised in so many industrial processes. An apparatus which might commend itself to the Ministry of Health is a particularly rapid and fool-proof method of testing eyes and at the same time determining the type of optical lens which may be needed.

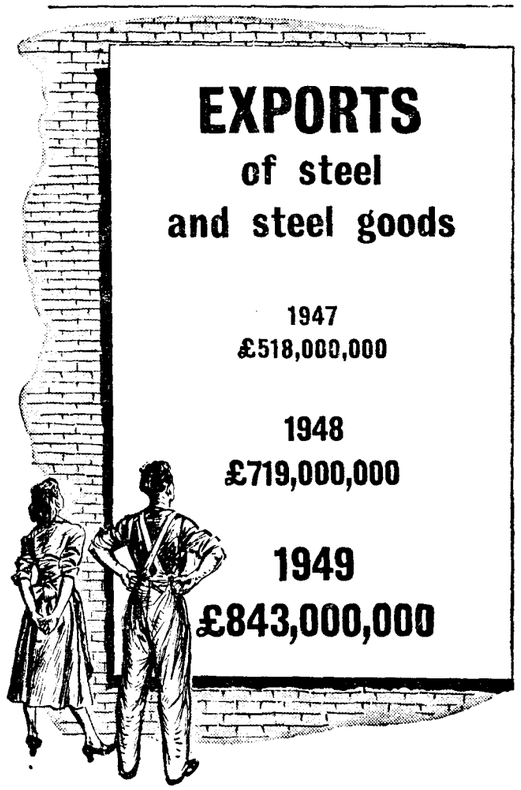
A mechanically perfect form of coupling which is shown has already been adopted for the front-wheel drive of the Citröen car, and is intended to replace older forms of joint coupling which by their nature are incapable of being mechanically perfect. There is one domestic appliance (though it can have industrial uses)—a gas producer—in which a slight electric current (afterwards used for water heating) is passed through such waste material as coal dust, spent sugar cane or virtually any kind of organic matter. The bulk of this material is converted into gas which is said to have a thermal value not lower than that of town gas.

The measuring instruments for scientific purposes include one which measures the change in the weight of a solid under variations of temperature. There are a number of instruments for the nuclear physicist. A technique of high-speed photography is demonstrated ; pictures taken at speeds of a billionth of a second (the fastest known in practice) show the deflection of sound waves caused by the passage of an object travelling at supersonic speeds. No doubt these 200 exhibits are the cream of French postwar developments in this field. They show, in many devices for industrial use, a high order of accuracy together with conspicuous sturdiness of construction and simplicity in use.

Trade and Commodities

German Trade Talks Open

After two false starts negotiations were opened in Frankfurt last Wednesday for a new Anglo-German trade pact. The talks will be conducted in a very different climate from that prevailing in German trade and government quarters only a short time ago. For some months western Germany has been on a foreign spending spree and neither German or Allied authorities much like the look of the bill. Import licensing has been discontinued for a wide range of goods since allied control of exports and imports ended, while many other goods—even goods which are strictly controlled in Britain—are licensed in Germany without difficulty. Imports into the Bizone have risen from an average value of DM. 412 million in the first quarter of 1949 to DM. 796 million in October and to DM. 694 million in November. The value of exports for the same three periods was only DM. 280 million, DM. 343 million and DM. 370 million respectively. The sharp fall in the foreign exchange holdings of the Bank Deutscher Laender reflects this further widening in Germany's adverse trade balance. In December alone the central bank's foreign exchange assets fell by DM. 150 million to DM. 834 million, while Deutsche Mark balances of foreign central banks rose by fully DM. 100 million to D.M. 180 million. A large share of these claims on Germany is said to have accumulated in the accounts of the Netherlands Bank. Holland has been particularly forward in recapturing its former place in the German market.



The Germans have evidently found it hardly less difficult to meet their rising sterling bill. Only last September the United Kingdom had to make a gold payment of $7,000,000 to Germany to discharge its sterling holdings in excess of the " gold point " of £7,500,000 ; now, however, the holdings are appreciably below this point. The British negotiators should therefore have more elbow room in the talks than they seemed likely to have a short while back ; it may even be that the Germans are now more concerned than the British to widen the " swing " of payments to be permitted before settlements in gold become due. Both sides profess that they are anxious to free at least 60 per cent of trade from all quota restrictions, but in view of past dollar losses Britain is evidently still feeling rather cautious. It should be remembered, however, that Germany has ceased to receive the occupation subsidy of £17,500,000 a year, and it is not easy to see how it will be able to finance the large slice of its sterling imports which it previously received free.

Antiseptics

Britain has led the way in the development of antiseptics ever since Lord Lister used carbolic acid in 1865. Lister soon saw that carbolic acid has a destructive effect on living tissue, and he, himself, began the research for antiseptics which would kill bacteria without injuring the patient. Recent years have seen great strides towards this goal, with chemical laboratories producing a range of vastly improved antiseptics. Of these new materials, iodine has been used in hospitals and homes all over the world, and from it the newer, less irritant iodoform has been evolved. Research has also focused attention on the antiseptic properties of chlorine and the quaternary ammonium compounds, such as " CTAB " (cetyltrimethylammonium bromide), while an important group of antiseptics—including acriflavine, proflavine and gentian violet—has sprung from the dyestuffs industry. The general availability of so many reliable antiseptics today owes much to the efforts in research and production of the scientists and chemical workers of Imperial Chemical Industries.

ICI

Another record to make you think

This remarkable increase year after year shows how much the export drive owes to an efficient steel industry.

Already the quantity of vehicles, machinery and other steel goods exported is more than double pre-war, earning nearly half the nation's income from overseas trade.

The great efforts of our exporting industries are backed by the record output and low price of British steel.

STEEL
is serving you well

BRITISH IRON AND STEEL FEDERATION 49

It is possible, therefore, that Britain may be underrating the favourable prospects for its future balance of payments with Germany.

* * *

Radioactive Materials

The Ministry of Supply, reviewing the results of the first year's operation of the larger of the two atomic piles working at the Atomic Energy Research Establishment at Harwell, said that production of radioactive materials was started at the end of last February. The pile has been in operation since July, 1948, but the intervening months were taken up with tests.

While much of the work with the pile is part of the general research programme, a growing number of radioactive materials are being produced specifically for use outside the establishment. In November, when 338 samples of these materials were produced in the pile, only 65 were used at Harwell. The bulk, 173 samples, went to the hospitals; 57 were exported; 30 went to the universities for further research and 13 were sent to industrial users. Since November the number of samples which the pile can produce has risen considerably, and it is believed that a much higher proportion is going to industry than the November figure would suggest. There are hopes of building up a considerable export business in radioactive materials. While the materials can be produced in the cyclotrons possessed by many universities, the quantities obtainable in this way are very small, and the Harwell piles are the only important source of supply in Europe.

At present the radioactive materials are being used only as research media—in medical research, to follow the course of chemical changes in the body, and in industrial work to observe the reactions which are the basis of many processes. When regular supplies of isotopes can be guaranteed to users, it will be possible to use them as a control mechanism in those processes themselves. One new company has already been registered as an industrial consultant in this field and another company is proposing to undertake the same work.

* * *

Trade Difficulties with Communist China

It would be premature to conclude at this stage that the effort by the British merchanting community in China to continue trading under the regime of the People's Government has definitely failed. But it is becoming increasingly clear that the hopes of the more optimistic British merchants there have been disappointed. Many of the smaller traders have been forced out of business and it seems that even the doyens in Anglo-Chinese trade are living on their capital and on the profits yielded by that part of their business which is not directly dependent upon trade with China. It is true that the major obstacle to trade—the Nationalist blockade of Shanghai—is not of Communist making; but the fact remains that there is hardly a discriminatory weapon (short of expropriation) that has not been employed by the People's Government. In Shanghai, for example, firms are not allowed to dismiss labour without paying one year's wages in advance, although the blockade has made it almost impossible to sustain wage bills which are soaring with the cost of living (rice now costs 50 per cent more than at the end of December). To keep going and to meet local taxes the foreign companies are forced to remit sterling and US dollars to Shanghai at highly adverse rates—now pegged at 56,000 and 23,000 People's dollars to the £ and US dollar respectively. If they do not meet these taxes or if they are forced into liquidation for other reasons, the companies know that they will be promptly taken over. These chaotic conditions are reflected in the fantastic level of interest rates in the city. Credit facilities cost 39 per cent per month. Call money is 27 per cent per month and the rate on seven-day deposits is 28 per cent per month.

Conditions in Shanghai, fortunately, are not fully representative; in other parts of China it has proved possible to maintain trade in a rather more encouraging way. Cargoes are to some extent being diverted to Tientsin and Tsingtao, which now handle some 70 per cent of all the cargo leaving Hongkong for China, and to Swatow in the south. In all these centres the Communists have established local monopolies to handle exports and imports—notably the export of eggs, wood oil, bristles and soya beans in which trade has been reviving. Payment is usually made either by a barter arrangement or in gold or dollars or by payment into so-called Hongkong two-way accounts. Since the blockade was imposed on June 26th last, 500,000 tons of cargo has left Hongkong for ports controlled by the People's Republic, one half conveyed in British ships and one quarter in Russian bottoms. This may be more than at one time seemed possible, but it is still a mere trickle by normal standards.

* * *

Buffer Stocks for Wool?

The dominion wool conference in London has completed its third week of deliberations, but its work has not yet been concluded. The purpose of the conference was to review the operations of the Joint Organisation now that its stock of wool accumulated during the war years is almost liquidated. The J.O. scheme, however, was more than a stock disposal; the current clips were sold as well, and a minimum or reserve price was set for each different type of wool offered. Dominion wool growers have thus been guaranteed a minimum return for their produce. At the present time actual prices are nearly double their reserve levels, but should the wool market develop a serious weakness, the growers would find at least some protection. The financing of this present scheme is borne jointly by Britain, Australia, New Zealand and South Africa.

Not unnaturally, the dominions wish to preserve this feature of guaranteeing minimum prices to their farmers in an organisation to follow the J.O. The favourite method seems to be some form of buffer stock. When market prices fell below the reserve prices, stocks would be accumulated and when prices were a certain distance above them, the stocks would be marketed. This rather simple method of regulating supply has much, at least in theory, to commend it. No one denies the need to introduce some element of elasticity into the supply of a commodity which tends through the character of its production to be inelastic. Wool growers cannot control their output to meet changes in demand except after a time-lag of some years. On the other hand, if farmers are to be protected from too low a price, have not consumers an equal right to be protected from a price which is too high? A marketing scheme which pretends to be equitable should protect buyers as well as sellers.

The dominions' proposal gives rise to many objections. In the first place to institute a marketing scheme which is not international is against the spirit, if not the letter of the International Trade Organisation charter. On this ground alone, the United States could object, particularly as it has since the war become a large importer of raw wool. A marketing scheme ought to include wool producers and consumers outside the Commonwealth. Secondly, could a buffer stock in fact serve to regulate the wool market? The stock accumulated in the war amounted to 10½ million bales—the largest ever known. It was expected to take thirteen years to dispose of in an orderly fashion. But in the event the stock has been liquidated within five years and even this rapid marketing did not prevent prices from reaching high—sometimes, indeed, absurd—levels. If that quantity could not stabilise the market will a smaller stock do so now? And how can even a smaller stock be accumulated, if the demand for wool persists at its current rate?

In Australia and New Zealand

With total assets of over £300,000,000 and with over 800 branches and agencies throughout Australia, New Zealand, Fiji, Papua and New Guinea, this Bank is better equipped to facilitate trade with these countries than any other institution there.

Consultation Rather than Action

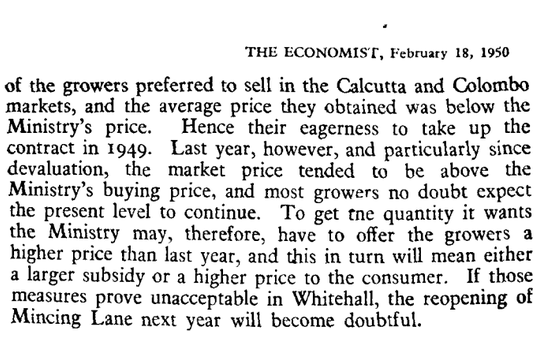
If the three southern dominions wish to protect their domestic wool growers, they might each separately institute a support price scheme similar to that operated by the United States. Their own taxpayers would then be responsible for financing it and they could decide for themselves whether such a burden was justifiable. Britain's interest in wool is mainly that of a consumer, and to ask British taxpayers to pay to maintain prices for dominian wool growers would be as unfair as to ask dominion wool growers to help to pay for British social services. Admittedly wool is also a dollar earner, and in certain years an important one. But more recently the United States has been buying its raw wool from Argentina and Uruguay because their prices were lower than those ruling in dominion markets. A commonwealth marketing scheme designed to support the price of wool is, therefore, more likely to reduce the sterling area's dollar earnings than to increase or even maintain them.

Finally, would such a scheme help wool growers in the long run? Perhaps, if it could induce a greater elasticity into the supply; and that should theoretically be possible. But the prewar experience of rubber, tin and even sugar has shown that in practice a market cannot be externally regulated within the fine limits required by a price mechanism operated by free consumer choice. If the minimum price is too high, substitutes will be sought and developed. Moreover, substitution is not confined to discovering a material with attributes similar to those of the original product; it can also include economy in use, especially where blending is practicable.

Most of the wool consuming countries of the world are pursuing policies of full employment; if they are successful the main changes in demand are likely to be of a secular kind. People might, for example, prefer cloths made of synthetic fibres instead of pure wool. To bolster up the wool growing industry in such circumstances would be a waste of resources. This is not to suggest that the present conference may not serve a useful purpose. Mutual consultation is needed to clarify ideas and to prevent misunderstanding between producers and consumers. If its result is no more than this, it is preferable to a hurriedly devised scheme which might antagonise such wool consumers as the United States and the countries of western Europe, and which might not, after all, further the long-term interests of the wool industry as a whole.

* * *

Contracts for Tea



This year's tea contracts with India, Pakistan and Ceylon will present a special difficulty for the Ministry of Food. A mission headed by Mr F. Sheed Anderson, an Under-Secretary of the Ministry, left London this week for India and Ceylon to discuss the possibility of reopening Mincing Lane next year. If the London market is allowed to function once more, the Ministry will require first to build up adequate stocks and also keep the ration at a level which approximates to normal requirements. During the past twelve months stocks have been increased by more than 55 million lb. But from the beginning of December the tea ration was raised from 2 to 2½ ounces a week. To maintain this rate of consumption the Ministry must ensure an import this year of approximately 480 million lb.

Here is the difficulty. The governments of India, Pakistan and Ceylon fix a maximum quantity which the Ministry of Food may buy from each country; these quantities are still being discussed for the new contracts. The Ministry then announces the price at which it will buy the tea, and the growers offer the quantity they wish to sell up to the agreed maximum. Last year was one of the few occasions when the full quota was offered—but only because the price seemed reasonable to the growers. In 1948, most of the growers preferred to sell in the Calcutta and Colombo markets, and the average price they obtained was below the Ministry's price. Hence their eagerness to take up the contract in 1949. Last year, however, and particularly since devaluation, the market price tended to be above the Ministry's buying price, and most growers no doubt expect the present level to continue. To get the quantity it wants the Ministry may, therefore, have to offer the growers a higher price than last year, and this in turn will mean either a larger subsidy or a higher price to the consumer. If those measures prove unacceptable in Whitehall, the reopening of Mincing Lane next year will become doubtful.

* * *

Jump in Wholesale Prices

Wholesale prices last month showed their sharpest rise since devaluation—rising by 1½ per cent. The combined index is now fully 6 per cent above its level of last August and nearly 11 per cent above that of twelve months ago. During the month the biggest increase again occurred in the raw material group. This rose by 4 per cent, making a total increase of 14 per cent since devaluation. Intermediate products rose by 2 per cent; they are now 8 per cent above their pre-devaluation level. Prices of manufactured goods rose only slightly. The rise in raw materials costs last month was mainly attributable to the strength of wool prices, which have since receded a little. Hides and skins, timber, sisal, silk, cotton and rubber all rose appreciably. The movement of the combined index since devaluation is shown in the accompanying chart; it should be noted that part of the rise has undoubtedly been due to renewed inflationary pressure in the United States. Needless to say, the full effects of this movement cannot yet have been felt even in industry; sooner or later the rise will be reflected in retail prices, though not necessarily to the same extent.

Among the food items, the price of tomatoes rose sharply and onions were also dearer, whereas prices of apples and potatoes fell. In industrial materials and manufactures the main increases occurred in the fibre group. Raw cotton rose by 5 per cent, yarn by up to 2 per cent and cloth by 1 per cent. Raw wool was 8 per cent dearer, tops between 12 and 14 per cent, yarn 11 per cent and cloth 1 per cent. Japanese and Italian raw silk and sisal rose by 12 per cent. The importation of hides and skins reverted to private hands on January 1st, and prices rose by about 6 per cent during the month; domestic hides and skins rose by between 11 to 17 per cent. Price control on hardwoods was removed on January 16th when private importation was also resumed; prices of the three varieties included in the Board of Trade index rose on the average by about 10 per cent. Rubber rose by 4½ per cent.

COMPANY MEETINGS

BRITISH TYRE AND RUBBER COMPANY, LIMITED

DIVIDEND MAINTAINED

The twenty-sixth annual general meeting of this company will be held at Caxton Hall, Westminster, S.W., on March 10th.

The following is an extract from Sir Walrond Sinclair's circulated statement:—

During the year the volume of turnover declined somewhat sharply, due mainly to the transition from a sellers' to a buyers' market. A bright spot was the steady and encouraging progress made in the export markets, despite the various restrictions imposed by importing countries. But this was wholly insufficient to offset the lower turnover, which was further aggravated by the higher cost of materials and of labour, both direct and indirect, with a marked tendency towards keener competition both at home and abroad. The effect of all this on a falling turnover, with little or no increase in selling prices, was that the profit ratio declined.

The profit for the year after expenses but before taxation fell to £874,925, as against £1,471,791 for the previous year. Having regard, however, to all the circumstances, your directors consider the results of the year's trading satisfactory. The heaviest charge on our profit is, of course, the income and profit taxes, £425,903, which absorb nearly half of the profit.

There is a net surplus in respect of the year's working of £334,820, which with the amount brought in £124,052, gives a disposable total of £458,872. This enables the board to maintain the ordinary distribution at 20 per cent. for the third year in succession, to transfer £100,000 to general reserve, £75,000 to plant replacement and stock reserve and £30,000 to employees' benefit reserve, after which the carry-forward is increased by £18,445 to £142,497.

There is one point I would like to mention before passing from the subject of the year's profits. The amount shows a considerable decrease on the previous year, which was recognised to be quite exceptional, but figures I have had taken out show that it is up to average over a long period of 10, 15 or 20 years. It is of more than passing interest, however, in view of the popular misconception about big company profits, that the figures show that over the same periods, while there has been an increased turnover of a substantial amount, our ratio of profit to turnover is markedly lower.

Although, as I feared, we have not been able to add much to our reserves as a result of the past year, I think you will agree that the consolidated balance-sheet shows a very strong position. Our current assets exceed current liabilities and provisions by the substantial total of £2,663,218.

EXPORT PROSPECTS

As regards the outlook, we are back to the keen competitive conditions of prewar markets, rendered much more difficult, however, by the continued presence of many of the wartime restrictions and controls. As I have said, we made considerable progress in the export markets last year, though here again business is becoming increasingly competitive and the staff work involved in keeping account of the individual requirements of each market, and the particular Government restrictions and controls concerned, is very exacting.

The devaluation of sterling, however, has presented new and interesting prospects in a number of directions of which we shall endeavour to take fullest advantage. On the other hand, much of our essential raw material comes from dollar sources, and so far our efforts to keep down costs are constantly nullified by steady increases in the price of raw materials.

LLOYDS BANK LIMITED

ANNUAL GENERAL MEETING

The ninety-second ordinary general meeting of Lloyds Bank Limited was held on February 10th at the Head Office, 71 Lombard Street, London, E.C., The Rt. Hon. Lord Balfour of Burleigh, D.C.L., D.L., the chairman, presiding.

With the concurrence of the members present, the report and accounts and the statement by the chairman, all of which had been previously circulated, were taken as read.

The report and accounts were adopted, and the usual business was transacted, and tribute was paid to the past services of the retiring directors, Sir Alexander R. Murray, K.C.I.E., C.B.E., and Mr R. C. Chapple Gill. The chairman referred with deep regret to the loss to the board of Mr L. D. Williams, who died on February 4th.

A special resolution was passed, adopting new articles of association of the company.

Votes of thanks were passed to the chairman and directors and to the staff

THE NATIONAL BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and fifteenth annual general meeting of the proprietors of The National Bank Limited was held on February 9, 1950, at 13 Old Broad Street, London, E.C.2.

Mr Michael J. Cooke, the chairman, presided.

The secretary read the formal notice convening the meeting and the report of the auditors.

The directors' report for the year which had been previously circulated was—with the approval of the proprietors present—taken as read, and the chairman commented on the principal movements in the figures in the balance sheet. Reference was made to the transfers from profit and loss account of £30,000 to the reserve fund, £100,000 to staff pensions fund and £5,624 to staff provident funds, and to the provision for a final dividend of 5 per cent., making 10 per cent. for the year, leaving the sum of £53,891 to be carried forward.

The chairman moved: "That the profit and loss account for the year ended December 31, 1949, the balance sheet as at that date and the directors' report be adopted by the meeting and entered on the minutes."

The Rt. Hon. The Viscount FitzAlan of Derwent seconded the motion, which was carried unanimously.

The retiring directors, William A. Acton, Esq., Hubert Briscoe, Esq., Edward H. Walpole, Esq., and Sir Evan M. Jenkins, G.C.I.E., K.C.S.I., were re-elected, and the remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Company and Messrs Stokes Bros. and Pim, was fixed.

OROVILLE DREDGING COMPANY LIMITED

The annual general meeting of the Oroville Dredging Company Limited, was held in London on February 10th, Mr Robert Annan presiding.

The following are extracts from the circulated statement of the chairman, Sir Joseph Ball, K.B.E.:—

The results for the year to September, 1949, will, I think, be regarded as satisfactory. The asset position is well maintained; the dividend is continued at 1s., and the carry-forward on profit and loss account has been increased by £10,484. In addition, the carry-forward of the subsidiary has been increased by £5,946.

A considerable drop in the dividends received on our large holdings in Pato Consolidated was to a large extent made good by the receipt of two dividends from Bulolo and two from Asnazu. The consolidated profit and loss account shows £50,820 available net profit of the company and its subsidiary. Investments of Oroville and the subsidiary remained unchanged during the year apart from the sale of 1,550 Bulolo shares on which a profit of £3,796 was realised.

With regard to the companies in which we are interested Pato Consolidated's workable reserves at December 31, 1948, stood at the satisfactory total of approximately 310 million cubic yards of an average value of 22.3 cents per yard with gold at $35 an ounce. Two dividends totalling 20 cents were received during Oroville's year, and a further dividend of 10 cents has been received since. Operations are progressing satisfactorily.

The operations of Asnazu are also continuing satisfactorily. Two dividends totalling 10 cents were received during the year and a further 5 cents has been paid recently.

OPERATIONS OF BULOLO

The yardage handled by Bulolo during their year to May 31, 1949, was roughly 30 per cent. less than anticipated, due to difficult digging conditions. The gross recoverable value of the gravel reserves as at May 31, 1949, was estimated at $23.3 million with gold at $35 per ounce, but it is not possible to estimate with any degree of accuracy the profits to be expected from these reserves. On July 28, 1949, one of the Bulolo dredges was permanently closed down, having exhausted the gravel for which it was designed, and for the same reason two more will be closed down in about three years, and a further three in about five to six years from May 31, 1949.

The recent devaluation of sterling will bring a substantial benefit to Oroville and its subsidiary company in the increased value of Canadian dividends when converted into sterling at the new rate of exchange.

The report was adopted.

NOTICES

LITERARY Editor wanted for old-established weekly review. Experience of magazine production and intimate knowledge of the publishing trade are essential qualifications. State salary required.—Box 337.

ADMINISTRATIVE assistant required for senior Sales Executive in well-known London pharmaceutical house. Must have University degree and experience in marketing and sales administration.—Apply, giving full details of age, education, experience and salary required, to Personnel Manager.—Box 339.

TRAVELLING Representative, British, experienced in overseas sales and appointing of foreign agents, seeks similar position or Export Manager. Languages, widely travelled, also fully versed in accountancy and shipping procedure.—Box 335.

MERCHANT BANKERS require services of qualified accountant to work in their New York Office. Knowledge of shipping accounts an advantage, and age preferably not more than 35.—Full particulars of past experience and salary required to Box 966, Dorland Advertising, 18-20, Regent Street, London, S.W.1.

CHIEF ACCOUNTANT, B.Com. (Lond.), aged 36, experienced in costing and office organisation in steel industry, with sound knowledge of mechanical engineering, and some metallurgy, seeks work with more scope for initiative. Would start at £1,000 p.a. if work is interesting. Preferably Cardiff or West Wales.—Box 346.

RESEARCH ENGINEER (37), Hons. Graduate, familiar heat transfer, combustion, gas flow and kindred problems, seeks change to London area.—Box 345.

WANTED—Economic History of Mod. Britain, Clapham.—Hickman, Cleveleys Hydro, Blackpool.

Investment Statistics

Company Notes

Imperial Tobacco.—Consolidated net profit amounted to £9,085,433 (£7,931,276) and net profit of the parent company was £731,647 higher at £8,852,215 in the year to October 31, 1949. The dividend for the year is held at 32 per cent, including the recommended final dividend of 18½ per cent. A provision of £1,500,000 has been made towards additional finance required due to devaluation; £217,019 is transferred to general reserve.

Decca Record.—Group trading profit, excluding Decca Navigator, its two subsidiaries and five subsidiaries in the U.S.A. and Canada of Decca Gramophone, rose from £284,627 to £309,808 in the year ended March 31, 1949. Balance carried to group appropriation account was £169,574 (£179,477) before taxation of £74,880 (£92,916). Capitalised net losses and excesses of expenditure and depreciation over income of companies not consolidated amounted to £315,627 (£247,224). The dividend of the parent company is maintained at 112½ per cent. Net current assets were £672,395 (£494,499) at March 31, 1949; stocks totalled £985,541 (£881,764).

Ilford.—After charging new issue expenses of £28,871 (nil), taxation £548,598 (£549,346) and setting aside £150,000 (£200,000) for replacement of fixed assets net profit amounted to £312,388 (£304,710) in the year to October 31, 1949. The dividend of 25 per cent for the year on the increased capital absorbs £155,833 compared with £116,875 in 1948-9. General reserve is allotted £150,000 (£100,000); no transfer is made to contingencies reserve compared with £25,000 in the previous year.

I. and J. Hyman.—Group trading profit fell from £285,361 to £200,149 and net profit from £107,417 to £74,584 in the year to November 30, 1949, after taxation of £79,634 (£119,424). A dividend of 75 per cent is recommended for the year (same). It is proposed that £40,000 of general reserves be capitalised by way of a distribution of two new ordinary shares for every three ordinary stock *units held*.

Lotus.—Net profit after charging taxation of £226,336 (£307,601) amounted to £302,579 (£342,952) in the year to December 31, 1949. A dividend of 20 per cent for the year has been recommended absorbing £74,840 (same); £210,385 (£250,900) has been transferred to reserves.

Braid Group.—Consolidated losses in the year to September 30, 1949, amounted to £44,315 compared with a profit of £30,807 in 1947-8. Group net loss after taxation and losses realised or anticipated on the sale of assets was £171,477 against a net profit of £2,851.

Fielding and Johnson.—Net profit amounted to £203,879 (£164,884) in 1949. A final dividend of 25 per cent is recommended on the ordinary stock, making 30 per cent for the year (same).

J. and E. Hall.—Trading profit increased from £293,462 to £452,028 and net profit from £90,051 to £113,831 in the year to September 30, 1949. A total distribution of 10 per cent is recommended for the year.

Inveresk Paper.—Consolidated net profit attributable to the parent company declined from £549,932 to £345,894 in the year to September 30, 1949. The total distribution for the year is held at 15 per cent.

Car Mart.—Profit before taxation for the year to November 30, 1949, was £336,380 (£302,190). A final dividend of 22½ per cent is recommended, making 30 per cent for the year (same).

Achilles Serre.—Trading profit increased from £132,559 to £150,924 in 1949; net profit was £47,944 (£40,847). A dividend of 15 per cent is recommended for the year (same).

Gillett Brothers Discount.—Profit increased from £115,298 to £167,389 in the year to January 31, 1950. A final dividend of 7 per cent is recommended, making a total of 12 per cent for the year. Bills discounted increased from £38,271,057 to £57,224,836 and investments from £15,769,330 to £18,371,954.

Smith's Dock Company.—Trading profit declined from £916,216 to £774,168 in the year to September 30, 1949. Net profit fell from £369,210 to £317,451. A dividend of 10 per cent is recommended on the ordinary stock (same).

Borax Consolidated.—Trading profit amounted to £809,686 (£1,037,785) in the year to September 30, 1949. Net profit declined from £408,667 to £267,597. A proposed final dividend of 6 per cent plus 2½ per cent bonus makes, with the interim of 4 per cent, a total of 12½ per cent for the year.

Capital Issues

Calcutta Electric Supply Corporation.—Underwriters have had to take up 85 per cent of the £3,000,000 Five per cent debenture stock offered at £98 per cent on Tuesday. A simultaneous offer made in India of £2,000,000 in rupees has been fully subscribed. Opening price of London issue was 1¼ discount, later 2¼ discount.

Government of Northern Ireland.—Holders of £1,859,689 Ulster loans 5 per cent stock, 1950-60 are offered by way of conversion 3½ per cent Northern Ireland loans stock, 1968-70.

(1948 Accounts)

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER IN SOCIAL ADMINISTRATION in the Faculty of Economic and Social Studies. Duties to commence September 29, 1950. Salary scale £150 to £500 per annum with membership of the F.S.S.U. and Children's Allowance Scheme. The person appointed will be expected to pursue research in some field related to the administration of the social services, and to assist in teaching. All applications must be sent not later than April 15, 1950, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

VICTORIA UNIVERSITY COLLEGE

WELLINGTON, NEW ZEALAND

Applications are invited for the Macarthy Chair of Economics. The salary will be at the rate of £1,300 per annum (New Zealand currency). Allowances will be made for travelling expenses.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is May 31, 1950.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with Limited Liability)—DIVIDEND NOTICE—ORDINARY CAPITAL STOCK—At a meeting of the Board of Directors held today, a final dividend of Three per cent (seventy-five cents per share) on the Ordinary Capital Stock in respect of and out of earnings for the year 1949, was declared payable in Canadian funds on March 31, 1950, to shareholders of record at 3 p.m. on February 24, 1950. The Directors point out that while there has been a slight increase in net earnings from rail operations for the year 1949, these earnings are still insufficient for the payment of any dividend. The dividend paid is attributable solely to the Company's income from other sources. By order of the Board, FREDERICK BRAMLEY, Secretary. MONTREAL, February 13, 1950.

GENERAL MANAGER WANTED, age over 40, for large manufacturing organisation. Must have had practical experience of home and export trade, accountancy, administration and a wide general commercial and industrial experience in a high executive capacity. Only letters giving fullest information will be considered.—Apply Neish, Howell & Haldane, 47, Watling Street, London, E.C.4.

ACCOUNTANT, preferably Chartered or Incorporated, with good professional background, aged 30-35, with some years of commercial experience and with practical knowledge of costing, required by manufacturing company in Great Yarmouth. Commencing salary £1,000-£1,200 per annum according to experience, and there are good prospects for the right man.—Write Box "T.A.", c/o J. W. Vickers & Co., Ltd., 7/8, Great Winchester Street, London, E.C.2.

THE Rhodes-Livingstone Institute, Box 195, Livingstone, Northern Rhodesia, invites applications for the following posts: social anthropologists, urban sociologists, demographer, and historian. Starting salaries from £560 to £660, depending on experience. All research expenses paid, as well as passage to Northern Rhodesia. Applicants should state age, academic training, previous experience, and should submit list of referees as well as a medical certificate stating physical fitness for work, in the tropics

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894) : moderate fees payable by instalments, if desired

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER IN ACCOUNTING in the Faculty of Economic and Social Studies. Duties to commence September 29, 1950. Salary scale £450 to £500 per annum with membership of the F.S.S.U. and Children's Allowance Scheme. All applications must be sent not later than March 2, 1950, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

COMMERCIAL or general management appointment required by young executive (37) now in charge of complete distribution function (home and export sales, marketing, public relations) of major undertaking in the synthetic textile fibres industry. Has had previous experience, in both cases with internationally known firms in the pharmaceutical and paint and varnish industries, and possesses a good all round acquaintance with the chemical and textile industries in general. Chief assets are: a sound knowledge of modern management techniques; strong creative imagination to see new possibilities; the ability to choose good men and to lead them by example. Has had considerable experience of negotiations with government departments and trade bodies at all levels. Widely travelled, with a good knowledge of the five principal European languages. Excellent general background including university education (1st class honours) and war service (lieut.-colonel). At present earning over £2,000 p.a. but salary is entirely secondary to the performance of useful and dignified work. All replies will be acknowledged and treated in the strictest personal confidence.—Write Box 334.

URWICK, ORR AND PARTNERS seek additional staff for the Control Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:—

1. Professional qualification in Accountancy.
2. Some years' executive experience in responsible industrial appointments.
3. Knowledge and experience of modern techniques of Cost Control.
4. Sound general education and wide interest in contemporary affairs.

Applications should be addressed in writing to the Company's Offices at 7, Park Lane, London, W.1, quoting Reference C.1031.

FACTORY MANAGER WANTED for large precision instrument factory. Must have had wide practical experience. A knowledge of manufacturing and business methods in the United States is desirable. Must have B.Sc. or equivalent qualification. Salary by agreement after consideration of qualifications.—Apply Neish, Howell & Haldane, 47, Watling Street, London, E.C.4.

A NEW angle is often the right angle in modern advertising! SAMSON CLARKS can possibly provide a new selling approach for any product or service. It is worth investigating.—57-61, Mortimer Street, W.1. MUSeum 5050.

WANTED.—Copies of The Economist dated December 3, and 31, 1949; also Records and Statistics Supplement, January 7, 1950.—Box 347.

Economist, 1948-49, complete. Offers.—Box 344.

EXPERIENCED NEGOTIATOR, just returned from U.S.A., thorough knowledge all aspects American business (financial, management and sales), available on consultation or other basis to those interested in the American market.—Box 342.

CHIEF ACCOUNTANT required by old-established sterling company in India. Emoluments Rs. 2,000 a month, free bungalow, medical attendance, provident fund, leave, passages.—Write details of experience and qualifications to Box "B.E.", c/o J. W. Vickers & Co., Ltd., 7/8, Great Winchester Street, E.C.2.

A New Start?

THESE words must be set down before the polling booths have closed; by the time they are read the result of the general election will be known. In these circumstances, any attempt at prophecy would be even more foolish than it usually is. It seems fairly safe to say that the popular vote will be very closely divided between the major parties. But which side will have the slender margin of votes, and whether the majority of seats will go the same way, are matters on which the available evidence would not permit a judgment, even if there were still time to pronounce one before the event.

It may be, then, that this election will hardly reach an enforceable decision even in the narrow matter of choosing who shall be the King's Ministers. It is already clear that it will not have decided much else. The campaign has added little or nothing to the political enlightenment of the nation. Mr Churchill's proposal of a new approach to Russia on the subject of atomic energy, whether or not it was wholly responsible, has certainly been politically effective, mainly through the incredibly inept handling of it by Labour speakers. But with this single exception, the campaign seems to have been conducted on the assumption that Britain is an enchanted island removed from the world's troubles, and that full employment and a high standard of living are to be had for the asking. Yet if one thing is more certain than another, it is that the conditions of national life in the next five years will be almost wholly different from those of the past four and a half. It is very remarkable that the period of immediate postwar readjustment, in which the world is still manifestly living, has lasted as long as it has already. It certainly cannot last much longer. The most unusual combination of circumstances which, in Britain, produced a record high level of employment and a record high level of real wages at one and the same time was not deliberately created by any government—least of all by the Labour Government which did not take office until those conditions already existed. They have been quite exceptionally lucky (no perceptible skill has entered into the process) in maintaining the precarious equilibrium so far. But the thoughtful voter who has looked for indications of what either party would do when the tide inevitably turns has looked almost wholly in vain. If he has not chosen decisively, it must be because there was nothing decisive to choose.

If it is the Labour Party which has the small parliamentary majority and the responsibility for governing, no major change in course can be expected. It is true that Mr Attlee will have some very difficult personal problems to solve. The campaign has revealed to the country what spent forces both Mr Bevin and Sir Stafford Cripps are, and it has provided no comfort at all for those who, with the memory of Lloyd George in mind, have professed to see a potential statesman in Mr Bevan. It is true also that not even the shadow of an honest "mandate" for proceeding with nationalisation can be found in the campaign. But the Labour Government will continue their present course [illegible] because they clearly have no idea at all of anything else [illegible] could

do. They will continue to tinker with inflation, the balance of payments, with economic efficiency and with national defence, while presenting to the rest of the world a face of obstinate complacency which cannot fail still further to estrange Britain's friends abroad. The only comfort that it will be possible to derive from this prospect will lie in the reflection that it is the surest way of bringing on the day of reckoning with the maximum slaughter of illusions and the best chance of a return to reality.

But if it is the Conservatives who win the toss, there is at least the possibility of a change of course. To judge by the way they have fought the election, the possibility must be accounted very small. They would be faced at once with the problem of reconciling their pledges to reduce taxation and curtail inflation with their no less binding promises to support and extend the welfare state. They might well find themselves caught in as tight a net of conflicting rigidities as the Socialists. The only way in which they could escape would be by determining from the very first day to pursue a policy of the utmost audacity. It may be that a Conservative victory would create a wave of sentiment towards Britain in most of the countries of the west which would provide enough working moral capital for a sharp change of course. It is true also that great occasions often call forth great qualities, and it may be that there are hidden reserves of wisdom and daring within the Conservative ranks which only the pressure of responsibility would extract. But one cannot help doubting it. At election times, politicians must, of course, try to be popular. But would a Conservative government, even after the election is over—and especially if it results in an exiguous majority—have the courage to take a long-term view of popularity? Would it not be much more likely to take the easy and cautious course of fitting in with the mood of an unaroused electorate rather than run any risks in the effort to arouse it?

This article has not, after all, been so difficult to write in advance of the essential information on which it ought to be based. For, whatever the result may be, it will not be one to arouse any enthusiasm. Those of our readers who see in this simply the patronising condescension of those who have held themselves aloof from a human struggle, are, of course, entitled to their opinion. It is certainly much more pleasant to be able to take sides with a clear conscience. But the facts are that this country faces problems of the utmost difficulty and that they cannot be solved without a very much greater readiness to face the realities of a cruel world and draw their logical consequences, than either of the major parties has yet given any indication of showing. Since the appeal was to the people and the people are still deluded it may be that no one, up to and including February 23rd could be a realist and a successful politician at one and the same time. From Friday morning, February 24th the case is altered. Even from the narrow political viewpoint, it is the next election that then becomes important. Whoever has to assume the responsibility of governing he cannot begin too soon to face the bitter facts that, by then, the electors will have discovered for themselves that nations must earn their livings, that only a secure and wealthy state can guarantee security and welfare to its citizens, that the cost of safety and independence for Britain will fall heavily on its citizens. The events of the next few years should show which party will meet the challenge that so far both have avoided.

Defence Line in Asia

SOME time ago the American Secretary of State, when pressed for a declaration of his Far Eastern policy, spoke of waiting "until the dust settles." Dust, however, does not always settle; as many Americans have cause to remember, it may envelop the landscape for long periods of time while the wind blows the topsoil off a once fertile countryside. The political dust-cloud in the Far East was particularly thick during the long fraternal embrace of the Russian and Chinese leaders in Moscow beginning with the celebrations of Stalin's seventieth birthday. But the announcement of the Russo-Chinese treaty of alliance has brought a rift of light in the murky haze which surrounds Communist activity, and it is possible to take stock of the situation in Asia as it presents itself to the western world.

After all the turmoil and excitement of recent months the decision in China has been less clear-cut than was at one time expected. The Nationalist blockade of the ports of southern China has not relaxed and the air attacks on Shanghai have not diminished, but increased in intensity; even during the Pacific war China's largest city was not so depressed and derelict as it is today. This outcome is profoundly disappointing for those foreign merchants who hoped for a revival of trade after the Communist victory, but it must be even more distressing to the innumerable Chinese who have rallied to the Communist side, not from belief in Communism, but in order to re-unite their country and make an end of civil war. The craving for peace has been the strongest of all motives in ravaged China, and nothing has been s destructive of Chiang Kai-shek's popularity since 194 as the belief that he chose to pursue the civil war *outrance* when he could have had a reasonable con promise. But now, even while the pall of smoke whic hangs over Shanghai after each fresh bombing is reminder of unfinished strife between Chinese, has con news of the treaty which aligns China, whether for pea or for war, in the larger conflict which divides the worl

Whatever they may think of its concessions to nation pride, or of the protection it is said by Communis to afford, it is hard to believe that any intellige Chinese can imagine that the published terms of t Russo-Chinese treaty represent a great economic bene for China. It is true that China is a country which very nearly self-sufficient at a low level of agrari economy and has less need to worry about the balan of trade and dollar shortages than many nations of more advanced productivity. But is has not been t purpose of modern-minded Chinese to stagnate in t backwardness of a pre-industrial era; for ma years they have been possessed by the dream of rapid industrialisation whereby China would bre out from its old weakness and poverty and take place among the nations more in keeping with vast population and considerable natural resourc There is, indeed, no sign at all of a great programme industrialisation to be carried through with Russian ai the idea seems rather to make China's economy m

"colonial" than before, so that it can provide foodstuffs and raw materials for the new industrial areas of Siberia.

The more fanatical of the Communist leaders may be content with this, but it must bring a bitter disillusionment to many progressive Chinese who have supported the Communists against the Kuomintang in the belief that the new revolution would clear away obstacles to China's economic development. The new rulers of China have deliberately cut off their country from the possibility of American economic assistance which would have been forthcoming for a united China on a far larger scale and with fewer strings attached than the loan now received with so much official gratitude from Moscow. If any Chinese really thought that Peking could obtain an unconditional and unstinted bounty by turning from Washington to Moscow, the experience of Jugoslavia might have warned him that there are more kicks than halfpence in dependent association with the Soviet empire.

*

In time the process of disillusionment in China may produce a discontent which even a highly competent propaganda machine and a ruthless apparatus of police power will be unable entirely to suppress. Meanwhile the political momentum of Communist victory in the Far East remains very strong and is deeply affecting countries beyond the borders of China, especially Japan to the east and Indo-China to the south. In each of these areas there is now a direct challenge to a western power represented by a local authority and armed forces—in Japan, to General MacArthur and the American occupation troops; in Indo-China to the French army which is fighting there in accordance with the agreement concluded between France and the Bao Dai regime in Vietnam. In both cases the situation is such as to be well suited to the basic themes of Communist propaganda. For the Chinese public the Americans in Japan are represented as conniving at the restoration of Japanese militarism and at preparations for fresh Japanese aggression against China, while Russia will be their reliable protector against Japan. With regard to Indo-China, Chinese opinion needs little encouragement to be anti-French; the Chinese see here a classic example of European colonialism which severed by a war against China the old tributary relation which had bound the kingdom of Vietnam to the Chinese empire. In China therefore the Communist political offensives to get the Americans out of Japan and the French out of Indo-China can count on strong popular support. Within Japan and Indo-China the spectacular triumph in China makes the local Communists infinitely more formidable than they could possibly have been if a Kuomintang government were still installed in Nanking.

It is only too clear on which side time is working in and around China. There may develop, in a matter of years and in ways not now predictable, important fissures and strains in the Sino-Soviet front. There certainly will develop, in a matter of months and in ways already predictable, a landslide in the border states of southern Asia towards co-operation with Communist China, unless they are told clearly and quickly where the stop-line of the western governments is to be drawn. Already in the key rice-producing area of Siam the voice of appeasement is being heard; in adjoining Burma there is a state of political anarchy such as agitators dream of; there, as in Tibet, the door to India is on the latch, waiting to be kicked open.

This is the situation that Dr Jessup, the American Ambassador-at-Large is discussing with Mr Nehru this week end in Delhi. He has fresh in mind the impressions made on him by the recent conference in Bangkok of American diplomatic representatives in Asia; and Mr Nehru has in mind the arguments and facts placed before the Commonwealth Ministers at the Colombo conference. The immediate task of American and British policy is to try to convince the Indian Cabinet that neutrality in face of the Communist advance is impossible, and that no firm front against it can be held without India and Pakistan as the political and economic base. There has been nothing to suggest either that Mr Nehru will be easily moved from his present attitude or that the various causes of bitter dispute between Delhi and Karachi can be quickly removed. It may, therefore, be unwise for American and British statesmen to await or invite Indian co-operation in every move they make.

Clearly the first requirement is that Mr Acheson and the British Foreign Secretary should work together. The governments of Asia must not be allowed to see yet another divergence of policies such as there was over the recognition of the Chinese Communists. The second is that both governments should define beyond any possibility of misunderstanding the line beyond which they will tolerate no aggression or indirect interference with non-Communist governments. The Soviet purpose in the new treaty with Peking is clearly to divert China's attention and energies southward, to tasks which may at the moment appear to Mao Tse-tung as relatively easy. The western purpose must be to make them look difficult and, in the long run, dangerous. It is true that President Truman has this week given a warning of the right kind. But for Asia to understand it, for the mischief makers to be deterred and for the possible victims to be reassured, the warning must take some regional form such as now gives security to western Europe, Greece and Turkey. What the form should be is difficult to judge. Doubtless a Pacific defence pact would be possible, but hardly before the immense difficulty of making peace with Japan have been overcome; and a Pacific pact would have little significance for Burma and Siam. A general declaration of policy by the United States, Britain and France defining their sphere of vital interest would be a bracing tonic to their friends in Asia, provided that some later agreement between the governments threatened by Communist expansion could be reasonably expected.

*

Whatever form the warning may take, the fact has to be faced that readiness to resist the use of force is the only thing that will make it effective. And unless it is effective in delaying and deterring Communist expansion from its China base, the plans for economic aid discussed at Colombo and now being considered in Washington will prove too little and too late. Asian governments, and their peoples, must have some confidence in the future, some assurance of security and stability before they can be expected to plan vigorously those economic and social improvements which are the long-term answer to the Communists. Containment, as many Americans now point out, is not enough; but containment is the condition without which Marshall Plans and Spender Plans cannot work. In short, Asia must be told where lies the western defence line around China.

Mr Cube's Predecessor

(By a Correspondent)

THE general election of 1950 has been conducted with such demureness that it is difficult to recall that two months ago Mr Herbert Morrison was not on speaking terms with Mr Cube. Mr Morrison was sincerely convinced that Mr Cube was a menace—a menace to freedom and all that the British hold dear in their democratic institutions. Mr Cube's protector, Lord Lyle, was equally certain that he had a perfect right to defend his business against nationalisation by stamping a comic figure on his company's sugar cartons. He insisted that there was nothing political about Mr Cube: that he was merely a symbol of the business man's right to protect his private interests from state interference.

The Lord President retorted, "What about the Peckham by-election and the great Liberal fight with the brewers in 1908?" He plainly regarded this as the classic example of the intervention of big business in politics. But in comparing the hilarious events at Peckham in 1908 with the quiet and solemn political struggle of 1950, he only emphasised the enormous change that has come over the British people's approach to their politics.

*

Nineteen hundred and eight is a long time ago. How many people recall those stirring days when income tax was a shilling in the pound, beer twopence a pint and cigarettes at threepence for ten? A Liberal Government led by Sir Henry Campbell Bannerman had swept the polls two years earlier and the administration included such well known figures as Lloyd George, R. B. Haldane, Winston Churchill, and Herbert Samuel.

It was the year when J. M. Barrie scored his great popular success of the stage with *What Every Woman Knows*, when George Bernard Shaw watched the first performance of his *Getting Married*, at which the acting of Henry Ainley was much praised by the critics. It was the year when Edward Elgar composed his First Symphony, when George Meredith celebrated his eightieth birthday, when Florence Nightingale received the freedom of the City of London, and when Professor Rutherford began a series of notable experiments on the properties of certain radio-active "a-particles" which he had succeeded in separating from helium and believed to be "veritable atoms of radium."

On the political front there is a striking resemblance between the hostility to the Liberal Government of 1908, and the criticisms levelled at the Labour Party today. The structure of social security, which has now been almost completed, was being founded amidst great opposition. In those days, the great Liberal measures of reform were constantly described by their opponents as "socialistic" and "confiscation." The rise in taxation to pay for these social services evoked the same animus and fear in the minds of the comfortably off as it does today.

All these emotions played a part in the Peckham by-election, but it was the Licensing Bill, recently introduced by the government, which, as the campaign developed, dominated all other issues. The Bill sought to reduce the number of public houses in the country and to strike at the monopoly in licences which had grown up over the years. The private brewery interests were enraged. A "Brewery Shareholders' Defence League" was formed and a circular was issued which attacked the Liberal Government in terms which would surely bring a blush of recognition to Mr Attlee's cheek.

After referring to the House of Commons and its large Radical-Liberal majority as "Keir Hardie and Co." (which was as ripe a compliment then as it would be to describe the Parliament of 1945-50 as "Willie Gallacher and his Boys") the circular added:

> When it is remembered that the present Prime Minister and his fellow Scotchmen based their claim to come in and rule England on the ground that they would secure economies the hypocrisy of the whole business is shown. With an income tax of a shilling, with war taxes still levied, and with a rise in the price of bread of thirty per cent, there is little for which to thank the collection of persons now extracting £150,000 a year from the British public in order to bring England to the level of a fourth class Power.

At the election of 1906, the Liberal party had captured Peckham by a majority of 2,300. As soon as the vacancy caused by the death of the sitting member was announced, the liquor trade concentrated its attentions there. On the day after the Liberal candidate was adopted, the *Daily News*, the forerunner of the *News Chronicle*, announced that the liquor interests "are pouring their organised forces—horse, foot and artillery—into this particular area of South London. They will spend money like water (*sic*); they will flood the constituency with canvassers; every public house will become a Tory committee room." On the same day the paper reported that the trade proposed to spend £5,000 in the constituency.

*

The Liberal candidate was a respected figure among the London schoolteachers, Mr Thomas Gautrey. The Conservative candidate was Mr H. C. Gooch, who described himself in his election address as an "abstainer and strong advocate of temperance." Mr Gautrey strove hard to keep Free Trade and Social Reform to the fore. Mr Gooch on the other hand was clearly unhappy in his allies, although he opposed the Licensing Bill as an unjust enactment. But no matter what the candidates did or said, beer held the day.

The first real sensation of the election—which threw the Liberals into a frenzy of rage—was the following announcement made at a meeting of Meux's Brewery:

> The directors have decided to send a cheque for £50 to the Conservative agent in the Peckham Election, the money being sent by them, not in the capacity of brewers, but of property owners. The directors will also send a personal gift of £21, and offer to send canvassers from their staff.

Mr Gooch promptly returned the cheque with a severe snub to the directors.

The scenes on the Rye reached a fever pitch never known in modern elections. The number of electors on the roll was less than fifteen thousand, and a contemporary report asserts that there were more canvassers than electors. A crowd of forty thousand gathered on March 14 to listen to an endless stream of oratory. On this chilly day there were four waggonette platforms occupied by pro-beer orators while the suffragettes, who were acting as light but deadly skirmishers in the fray, also had four platforms. The Socialists (who were not running a candidate) were represented by "a donkey's barrow or two" of propagandists. There is no record whether young Mr Morrison was among them.

*

Great tides of oratory swirled and eddied above the deep undertow of beer. The Conservatives brought down no fewer than five front benchers. But the chief feature on Tuesday, March 17, was a visit from that dazzling junior minister, Mr Winston Spencer Churchill. Mr. Churchill was a Liberal then—and, indeed, in his more reflective moments, he might still be so described today. But even he, perhaps, might be a little startled were he to read again the fighting speech which he made to the electors of Peckham in 1908, when he stood up for the teetotallers, lashed out at the embattled brewers, and denounced the House of Lords.

A contemporary reporter quotes the present leader of the Conservative Party as follows: "I appeal to you men of South London not to be misled by beer-fomented froth and rhetoric, but to raise your strong right arm and smash, smash, smash this hereditary barrier which stands between you and progress." In a characteristic Churchillian peroration he added, "I ask you to look behind the weaklings and the worldlings and to march on and on to obtain a victory that will be spoken of in England for years to come."

His reference to "the hereditary barrier" was prophetic. The Liberals did not win Peckham and, encouraged by this, the House of Lords indulged in a wreckers' orgy. One Liberal Bill after another was thrown out or mutilated beyond recognition. The climax came in the following year when Lloyd George's budget, proposing mild increases of taxation to pay for social reforms, was rejected by the angry peers. Two general elections were fought in a single year on the issue of "Peers versus the People" and out of that struggle was born the Parliament Act of 1911.

But the more we progress, it seems, the more we return whence we began. Once again the Left is seeking to reduce the powers of the House of Lords. And Mr Cube takes over from Mr Bung in the defence of the rights of private property.

But there is an important difference in method. This year's general election has been a vicar's tea party compared with the campaign at Peckham forty years ago. In those days people took part in politics with much more gusto. Even Mr Aneurin Bevan would have been in his element.

Listen to Lord Samuel, now leader of the Liberal Party in the House of Lords, then Mr Herbert Samuel, Under-Secretary to the Home Office. Rallying to the hard pressed standard of Mr Gautrey on March 19, he said

> We are told that the licensing bill is a great Socialistic attack upon property and that if a measure of confiscation of this sort is proceeded with no one's property is safe. At any rate if we are robbers we are robbers in good company. The Archbishop of Canterbury and seventeen bishops are Socialists and confiscators with us.

This sally—shades of Mr Morrison—was received with loud laughter and tremendous cheers.

*

The battle of the newspapers was as vigorous as the battle of the hustings—or the waggonettes. "We feel the utter inadequacy of words to convey a due sense of the magnitude of this issue," said the *Daily Telegraph* in one of its leading articles on the Licensing Bill, but as the *Daily Chronicle* acidly pointed out, the *Telegraph* had delivered itself of the following expressions in the article in which it confessed its verbal bankruptcy:

Utter iniquity.
Sheer brigandage.
Fanatical legislation.
Socialistic confiscation.
A gigantic act of public theft.
A raiding expedition of partisan blackmailers.
The sum of hypocrisy with the maximum of wrong.
A measure of plunder.
A measure of fraud.
Positive brigandage.
Progressive and cumulative plunder.
An act of financial slaughter.
A tremendous scheme of plunder and confiscation.
A profligate imposture.
A scheme of despotic plunder.
A colossal sham.

On its side, the *Daily News*, which bore the brunt of the fight for the Liberals, replied to the violent attacks of the trade in these terms:

> The Government will take no heed of these bullyings and ravings. We will have the Bill if every by-election were lost over it. We will have the Bill even if every other item of this Session's programme has to be sacrificed for it. It

OUTSTANDING VALUE IN LIFE ASSURANCE

£5,000 . . . .

. . . at age 65, or on previous death, may be assured now. The normal annual premium for a man aged 30 next birthday is £125.12.6. A further £24.11.8 secures the right to reversionary bonuses. If they are maintained at current rates, over £3,000 will have been added to the sum assured by age 65.

Further details, or quotations for other amounts, ages, or terms of years, may be obtained without obligation.

ESTABLISHED 1844

LIFE ASSURANCE SOCIETY
20, LINCOLN'S INN FIELDS, LONDON, W.C.2

has ceased to be a demand for the community to regain control over the national drink traffic. It has become a fight by the community against the despotic dominance of a gigantic Trust and Monopoly.

On the morning after polling, the *Daily News* sorrowfully recorded "Bung has triumphed at Peckham!" The Liberals were out by a majority of 2,494.

Mr Gautrey, the defeated candidate, lived on in comparative but blessed obscurity. He lived, in fact, until just eleven weeks ago when he died at the age of 97. Reporting his death on December 8 *The Times* noted that he had an "unusually long association with education" and that "he was one of the founders of the Safety First Movement." Of his memorable fight at Peckham there was no mention. The issues which made Mr Gautrey's name a household word all over England forty years ago were smouldering into life. But the man —the symbol—had been forgotten.

Tax and the Theatre

EVER since the Entertainments Duty was introduced in 1916 some allowance has been made for concessions to the "live" theatre and since 1935 these concessions have been sufficient to give the theatre an advantage which seriously irritates the cinema proprietors. A further relaxation was granted to the live drama on September 3, 1939; the date was quite accidental, and the Government proceeded to close the theatres down completely for several weeks. From then until 1946 the duty was increased in successive budgets to provide more revenue. The present position, which has not changed much since 1946, is that cinemas, horse racing, dog racing and some other forms of spectacle pay the full scale of duty and provide between them a revenue (in 1948-49) of £42,390,000. Theatres and music-halls, football, cricket and other sports, charged on a reduced scale of duty, provide £4,430,000. An odd £330,000 comes from unclassified receipts and the total for the year is £47,154,000 from a tax which produced only £8,153,771 in 1938-39. A solitary crumb of comfort tossed to cinema owners is that under the 1948 budget they were granted a complete tax exemption (shared with all other forms of taxable entertainment) in rural areas.

What are regarded by cinema owners as serious "anomalies" arise from this differential rate of taxation. Anybody paying 1s. 9d. to see Sir Laurence Olivier's *Hamlet* at the local cinema contributes 8½d. in tax. In a theatre where there were 1s. 9d. seats the tax on a live performance of *Hamlet* would be 2d., and on a 2s. 6d. seat it is 4d. The same scale of difference applies, fiscally if not artistically, to Danny Kaye as a music-hall artist and Danny Kaye as a film star. To the cinema owner these "anomalies" seem scandalously unfair; to the Treasury they are a deliberate device calculated to draw the heaviest receipts from where the heaviest earnings are made. As long as the cinemas are capable of producing something like £40 million a year in tax while the theatres and music-halls produce less than £3,000,000 the Chancellor of the Exchequer will seek to preserve these "anomalies."

Certain other advantages granted to the theatre have caused some distress recently not only in the cinema trade but among some theatre-lovers too. They were first granted in 1946 to regularise the position about exemption from tax on "educational" stage performances. Up to then exemption was granted on "educational" grounds to individual plays at the discretion of the Customs and Excise authority, and occasional freedom from tax could be won by clever manipulation of private theatre membership. Under this system there was ample scope for the philistinism of individual civil servants, though they often proved to be sympathetic and—within the limits of the relevant Finance Act—even enthusiastic when it came to choosing the plays to be blessed by tax exemption. It was, no doubt, a Customs and Excise officer who first thought of labelling *Charley's Aunt* as "educational" in its general tendency. But this was a method which made encouragement of the modern play and the new dramatist virtually impossible because of the lack of precedents by which they could be shown to be "educational." So the new scheme was designed to give much greater artistic freedom to producers. It was no longer to be the choice of play which won the exemption, but the general objects of the production management, and about 7,000 exemptions are granted annually—though not all of them are for commercial managements since the privilege was extended to amateur societies last July.

*

Under the 1946 Act, if it could be shown that the management was "non-profit-making" (a loose phrase which really means "non-profit-distributing") and that its aims and objects were "partly educational," then all its productions were automatically exempted from entertainments duty. Some precautions were taken to ensure that any profits actually made would be put back into new production and that there would be no calculated inflation of dramatists' or actors' fees where these were determined as a percentage of the takings at the box-office. It was immediately pointed out that there was nothing to prevent the theatre-owner from demanding a higher rent or a greater proportion of the gross takings. Complaints have been made, too, that certain plays which have enjoyed exemption—including two Restoration comedies and *A Streetcar named Desire*—are unworthy of it, because far from being educational, they are (it is held) immoral and degrading. But is was just to provide a way out of this no-man's-land where artistic or moral values were unsuccessfully weighed against Treasury policy that the non-profitmaking system was designed. Those who criticise certain plays as unfit for exemption on such abstract grounds are asking, in effect, for a Treasury censorship to add to that of the Lord Chamberlain; and, in fact, many people of great respectability can be found to argue that *The Relapse* and *The Beaux' Stratagem* are among the treasures of the English drama and that the *Streetcar* is no more culpable on moral grounds than *A Doll's House*. Much of the criticism aimed at one outstandingly successful organisation in the non-profitmaking line (Tennent Productions Ltd.) was answered when the Select Committee on Estimates investigated the Arts Council last year.

If the list of plays produced by non-profit-distributing companies is scrutinised it will provide plenty of scope for argument about what is the meaning of "educational" or even of "partly educational." One company's list includes two revues and an Irish farce, but it also contains works by Euripides, Shakespeare, Chekhov and a variety of young modern dramatists, British, American and continental. This list alone goes far to justify the 1946 exemption policy, for the successes in it were used to subsidise the "failures"—failures, that is from the box-office point of view—and if there are errors of judgment in some of the choices of play they are the sort of error which a producer must be free to make if he is also free to find good new plays. But such lists hardly answer the doubts which exist about whether the 1946 policy goes far enough in encouraging the "live" theatre. It costs the revenue £750,000 a year, of which about £75,000 is for production in the West End of London, staged in association with the Arts Council.

*

Mr Priestley, who is no enemy of state paternalism, complains of the non-profitmaking principle because its original intention to encourage purely artistic enterprise "may be twisted to add to unearned profits and to tighten the control of the drama by speculators in theatrical property." It remains still to be proved that theatre proprietors, as opposed to production managements, have not done better out of the non-profitmaking scheme than the Treasury ever intended. Mr Priestley also makes more serious complaints about the depressing effect of entertainment duty on theatrical productions which are outside the non-profitmaking class. He speaks of a production which paid £850 in tax during its first week, leaving a profit to the producer of £100 while production costs of £3,000 remained to be covered; and of a "smash hit" making a week's profit of just over £300 while paying £1,000 in tax. These plays are the successes, but each season's crop of failures pays its tribute of taxation, and sometimes it seems clear that the failure is caused by the tax and that the Treasury loses more than it gains. The high rate of tax makes the "nursing" of a new play almost impossible. It must be a "hit" immediately or not at all. If it fails the Treasury gets two or three hundred pounds a week for perhaps a month, but if that money had been available to keep the play going a little longer the tax might have been payable for the whole of a longish run. The theatre is full of such speculations which can be proved only by trial, and there is no comparable situation in the cinema, which can use publicity to "push" a film in hundreds of places at once. The play must make its mark quickly and in a single theatre.

Without any loss of revenue the Entertainment Duty might be adjusted to give the "live" theatre outside the non-profitmaking scheme a better chance of prosperity. The Theatres National Committee proposes that the tax should be abolished on live productions. This is going too far, perhaps, but need plays pay quite such a high rate of taxation while their original cost of production remains unpaid? If they are losing money at the beginning of their run, need they be charged the same rate of tax as the "smash hit"? Could not the play which runs for several years pay a gradually higher rate of tax to help in equalising any loss of revenue on the less successful enterprises?

Without going out of its way to reinforce failure at the expense of success it does seem possible that the Treasury might devise an entertainment duty less crippling than the present one though it would need to be designed so that the benefit went to the players, producers and dramatists rather than to the landlords and gamblers in theatre property.

*

Before this could be done it might well be necessary to inquire into "tendencies towards monopoly in the theatre industry" which would turn up some facts at least as striking as those which the Palache Committee turned up in 1945 about monopolistic tendencies in the film industry. A high proportion (at least 25 per cent) of the theatres in London and in the provinces are controlled by combines, and it might well prove that this is one of the main causes of the high rents which make it so difficult for unattached producers to make a success of theatrical ventures.

All costs in the theatre have been rising steadily ever since the end of the first war. But in the last ten years the rise has been more serious and the concessions already made on entertainment tax seem inadequate to balance them, especially as the price of entertainment has risen little compared with that of other luxuries. But the tax can be regarded as a drag on theatrical production more directly than it can on film production though the film industry can show much more striking statistics. *The Courtneys of Curzon Street*, for instance, contributed £406,250 in entertainment tax, but the producer says he did not recover his original costs. Mr Harold Wilson affected to see a "sinister unanimity" of opinion in the three principal sections of the film industry during the recent "anti-tax" agitation which was led by Mr Rank and strongly supported by the Plant report. But the structure of the industry itself, so much of it vertically organised, makes unanimity on tax problems—if on nothing else—inevitable; it has existed for at least twenty years. Naturally, more is heard of it when times are bad. More of the same sort of complaint might be made on behalf of the live drama if the producers were organised to anything like the same extent as are the theatre owners.

No industry can be expected to take kindly to the taxation of its product, but although the present Chancellor has done more than any other to make things easier for the theatre there is room for some improvement in the method of assessment, which need not bring any net loss to the revenue. The Government dispenses a small subsidy to the theatre through the Arts Council and it has authorised a grant of a million pounds to the National Theatre which may be built some day, but these are small gestures compared with the highly speculative loans made with relative freedom by the Film Finance Corporation which will, before long, have run through its first £5,000,000.

NOTES OF THE WEEK

The Last Phase

The leaders of the three parties brought the national election campaign to its close at the end of last week with a series of political broadcasts. They contained nothing that had not been said already, and according to investigations among listeners they had little effect upon the loyalties of those who heard them. This week the campaign has returned to the constituencies with politicians, great and small, arguing and cajoling their electorates towards the ballot box, with formulas decided upon ten days to two weeks ago, when the campaign was in its formative stage.

The election campaign has been described as dull—most particularly by foreign correspondents, sent over to find the clue to the great debate between socialism and free enterprise, who have had to content themselves with a meagre collection of human interest stories. In fact it has not been so much dull as quiet. Apart from the effect of a winter election with severely limited campaign expenses, this quietness is, perhaps, partly the reflection of a popular mood wherein most people made up their minds some time ago, either from conviction or prejudice, about which party they would support. It is also partly due to the fact that 1950 belongs historically to the period of postwar illusion—the real issues of peace have not yet made themselves felt among ordinary people—with the result that no party has yet developed a radically new programme. The question whether the British people are politically adult or politically enervated will be answered not in this election but in some future one.

Whatever the outcome of the election, it is clear that the two leaders of the major parties have accepted the view that an election, while seemingly concerned with the return of members to Parliament, is becoming more and more of a plebiscite for a Prime Minister. Both Mr Churchill and Mr Attlee took the main weight of their party's campaign upon their shoulders, and shared the spotlight only with their senior political advisers—Lord Woolton and Mr Herbert Morrison. In Mr Churchill's case this was natural, but it was done in the face of grave qualms in his own party about his political judgment. In the event, however, he and the Conservative party have fought the election not only with a first-class organisation but with great tact and political guile. That Mr Attlee should emerge as the most important figure on the Labour side is more surprising. If Labour has won the election by Mr Attlee's quiet methods, his prestige in the party will be so strong as finally to kill the myth that he is merely a buffer between warring titans. On the other hand if Labour has lost, the control of Mr Attlee and Mr Morrison must be weakened, since there will be a strong case for arguing that Labour must never again fight an election on the defensive, even if it means rattling every radical skeleton in the cupboard.

* * *

Marshall Aid—Third Year

Congressional committees have this week begun their hearing on the US Administration's proposals for a third year's extension of Marshall aid. Mr Paul Hoffman, the Economic Co-operation Administrator, has asked for an authorisation of $2,950 million for the Marshall year June 30, 1950-51. The amount actually required and that which was requested in the President's budget message was $3,100 million, but Mr Hoffman was able to save $150 million from the appropriations for the current year and by carrying this over to next year the fresh moneys needed will be correspondingly reduced. Mr Hoffman was also able to suggest a tentative allocation with the largest share—namely, $687.1 million—going to Britain, Germany taking $552.9 million, France $502.8 million, Italy $290.6 million and Holland $192.8 million. The most interesting of Mr Hoffman's disclosures was the proposal to earmark $600 million out of next year's Marshall aid appropriation to provide a fund out of which to encourage what he termed "the aggressive pursuit of a programme of liberalised trade and payments." It may be assumed that the bulk of this sum will be allocated to the proposed European Payments Union and will be distributed through this in accordance with the surpluses which OEEC countries are able to accumulate in their mutual trade. The size of this allocation—some $200 million more than the OEEC had been led to anticipate—will make it an extremely powerful argument for all participating countries to join the scheme.

It was evident at the recent Paris meeting of the OEEC Council that, after British reservations to the EPU scheme had been made, a number of Continental delegates were inclined to press an alternative plan in which the EPU would be launched without the participation of the sterling area. Discussions of such an alternative have continued in Washington among the OEEC delegates and there are reports that American support for such a truncated EPU would be forthcoming. The size of the American contribution may, however, prove a sufficiently powerful argument to weaken some of the British reservations and objections to the scheme, especially since part of the funds allocated to this $600 million pool has been secured by trimming the British allocation from the amount of $720 million which had been agreed in Paris to the present figure of $687.1 million. Furthermore, the national allocations will certainly have to bear the brunt of the cuts which Congress will inevitably make in the total sum to be appropriated. Mr Hoffman's candid admission of disappointment at the progress of European economic integration makes it fairly certain that, whatever may happen to the total sum allocated for the third year of Marshall aid, he will wish to preserve intact the incentives for further integration.

* * *

Mr Hoffman on the Wrong Tack

Mr Hoffman is doing the cause of European unity a grave injury by laying so much emphasis on its economic aspects. To demand economic integration from a group of countries that have no common political authority and institutions is quite plainly to put the cart before the horse. It must surely be as clear to Americans as it is to a British Labour Government—and to a French coalition government if it is frank—that the major economic decisions affecting a nation are taken for reasons that are largely political. Or, to put the point differently, many acts of policy that would be desirable and useful from the economic and international point of view are put off for fear of their domestic political consequences. If European countries are expected to make, rapidly and smoothly, large-scale economic adjustments of the kind which Mr Hoffman and Congress would admit to be "progress towards unity," they can do so only if they have first achieved some measure of political unity.

No one doubts that disinterested, as well as interested, motives lie behind the American demand that the Marshall Plan should be the occasion for knitting its beneficiaries together. But European unity is obviously a vital strategic and political interest of the United States. It is therefore difficult to see why American opinion has not put military and political—rather than economic—unification first. Europe's military experts are agreed that there is no other way of meeting its defence needs. The politicians agree that the conditions of secrecy in which military representatives

work make such progress towards unification easier—far easier than it is in the political or economic spheres. Why then the present delays and the hesitation? The reply, quite frankly, is that the military planners and defence ministers of western Europe have been held up for months by uncertainty about American intentions, about the form of American participation in the land defence of the west, about the co-ordination of arms production in Europe and America. If Congress has to be convinced of Europe's intention to unite let it press for evidence and action from the military sector, where the difficulties of unification have been most closely studied and most nearly overcome.

Likewise Mr Hoffman can hardly ignore the fact that no European government has yet thought fit to put before its electors in concrete, simple terms the probable—in some cases unpredictable—consequences of "economic integration" now. It can be argued that governments should have done this in order to show their sincere attachment to the cause of unity; but it can also be argued—just as convincingly—that any attempt now to bring home to ordinary men and women those consequences of "integration now" might do irreparable harm to the generous aspiration towards unity. Indeed, it can be argued that "integration now" might do serious damage to the process of recovery stimulated by the Marshall plan. Mr Hoffman should ask Congress to examine the reasons why the olive and vegetable and wine growers of France bitterly opposed the project (now shelved) of a Franco-Italian customs union; to consider the very real difficulties which have dogged the creation of Benelux over five years. They would perhaps then understand how governments that acknowledge no political authority above themselves, that are responsible to no public opinion save that of separate nations with special interests, are bound to get into conflict on economic matters. The problem of averting and settling such conflicts is political—not economic.

* * *

Docks, Deakin and Doubts

The new government, whatever its politics, will have to give prompt consideration to questions of wage claims and industrial relations. Electioneering has lately occupied the energies of trade union leaders and officials, but there are a number of unsettled disputes. The unions concerned with engineering (who recently decided to postpone action on their rejected claim for an increase of £1 a week until after the election), mining, the railways and the civil service have got outstanding wage claims. In addition there has been an indication of renewed unrest in one of the most sensitive parts of the labour force. Last Sunday the unofficial Port Workers' Committee in the London docks, which inspired last summer's strike, decided to demand the immediate presentation of a claim for 25s. a day—an increase of 6s. above the present rate—with a 40-hour week. It also passed a vote of censure on Mr Arthur Deakin, the secretary of the Transport and General Workers' Union, for supporting the TUC's policy on wage stabilisation.

It would be unwise to exaggerate the importance of this unofficial move. It is not certain that the Port Workers' Committee commands as much influence in the docks as it did, and if it is to flourish it must occasionally get some publicity. Most of the London dockers were resentful of being led into a long drawn-out "political" strike last summer. But wages are a live issue among dock workers, and the committee can probably form the nucleus of further agitation.

It is unfortunate that so little progress has been made in overhauling the machinery of industrial relations in the docks, in revising the disciplinary provisions of the Dock Labour Scheme, and settling the confusion over divided responsibility between the various authorities concerned, which contributed to prolonging last summer's dispute. Perhaps the greatest pity of all is the attitude of Mr Arthur Deakin, who appears to regard the affairs of his union as his own private preserve and who ferociously resents any suggestions for improving its structure or ameliorating its relations with the smaller unions in the docks. He committed his union to the support of the TUC's wage policy, but it is apparent that he did not have its full backing. He is not to be blamed for not taking a special ballot before doing so—the National Union of Mineworkers was the only union that did—but he is to be blamed for not having a more delicate ear for the movement of opinion among his followers. It would seem from a speech made at Bristol which was defensive and equivocal on this question, that he is not certain of the support that he can muster. Mr Deakin is proud of his position as a statesman in labour relations, but he is apparently forgetful of the fact that a labour leader's reputation for statecraft is made in his union and not as a figure at national and international congresses.

* * *

More Livestock—Less Labour

The Ministry of Agriculture's return for December shows a steady increase over the last year in the numbers of livestock on British farms. Increases (for England and Wales) of rather over 3 per cent in the numbers of sheep and lambs, of 5 per cent in cattle and calves, of 7 per cent in pigs and of 16 per cent in poultry do not sound particularly impressive as statistics. But it has to be remembered that, while pig and poultry production can be expanded quite rapidly, the increase of cattle and sheep herds is a slow business. Pig and poultry production has also been aided by the improvement in supplies of feeding-stuffs and by a substantial rise in prices. Farmers have had every inducement to supply more eggs and bacon, and—given the feeding-stuffs—they ought to be able to enlarge their output of these products further in 1950 (although there is the possibility of the "pig cycle" taking a downward trend, as is happening in Denmark).

The weakest part of the livestock programme is still the production of beef and mutton. For most British farmers, milk production has become the basis of the farm economy. The numbers of dairy cows continue to rise, and much attention is being given to raising the quality and the yields of dairy herds. By comparison, the breeding of good beef strains is being neglected and too few beef cattle are being raised on the hills. It is more (and better quality) meat production that is now most needed.

It is surprising to find that the farm labour force in England and Wales has fallen by 25,000, compared with the previous December. The reason is a decline in the numbers of women and casual labourers. In part this is due to the early completion of the 1949 harvest, and in part to reductions in the Women's Land Army, which is to be disbanded at the end of this year. The number of regular male workers increased slightly during the year. There is still a labour shortage in some districts—particularly on hill farms. Despite the failure to reach government "targets," British agriculture is not suffering seriously from a shortage of manpower. The real need is to utilise more efficiently what labour there is.

A Chest Complaint

Indignation is being justifiably expressed in the medical press about the Ministry of Health's recent decision that consultant chest physicians are to have a proportion of their salaries paid at a lower rate than that applicable to consultants in general. These chest physicians are replacing the former tuberculosis officers of local authorities. By raising their status and associating them with the hospital and specialist

service it was hoped to improve the standard of recruitment to this specialty, since the old post of tuberculosis officer carried with it little prospects of promotion and consequently did not usually attract doctors of ability. Now, however, the Ministry's ruling that part of the chest physicians' salaries will be on the scale applicable to assistant medical officers of health will set back these hopes.

There are two points at issue in this decision. The first is that the regional hospital boards, who had entered into contracts with chest physicians on the basis that they were rated as full consultants—and are, incidentally, still advertising posts on this basis—have had to cancel these contracts; and legal opinion is that the physicians concerned have no remedy as the contracts have no legal validity. The treatment of chest physicians will, therefore, hardly promote confidence in the Ministry of Health on the part of the medical profession.

The second point is more important. The Ministry's decision to pay part of the chest physician's salary at a lower rate is based on the fact that part of his work is concerned with prevention and aftercare for which, since that is a function of the local authorities, he is regarded as a local authority servant. This attitude is deplorable. Tuberculosis, of all diseases, is the one in which prevention, treatment and aftercare are of equal importance. To assume, as the Ministry evidently does, that prevention and aftercare can be properly undertaken by someone of comparatively low professional standing is to show a shocking complacence about the control of tuberculosis. A correspondent emphasises, on page 424, the low place that tuberculosis seems to hold in the list of priorities for medical resources. This latest action by the Ministry of Health seems to confirm his view.

New Phase in France?

The labour situation in France has deteriorated sharply in the last week. The determined Communist offensive at the ports continues and is expected to grow much more violent when war material begins to arrive—under the Mutual Assistance Pact—from the United States. The Government is preparing legislation to counter the Communist move. The new measures will, it appears, empower the government to condemn to solitary confinement men who instigate or commit "violent and concerted action" against the security of the state. The possible resort to the death penalty in cases of military sabotage is also strengthened.

Direct threats to the security of France are not, however, the government's most serious preoccupation. If all other things were equal, sabotaging strikes might well be confined to the minority of militant Communists. There is a deep instinctive dislike of action that may imperil the lives of Frenchmen fighting abroad, however unpopular may be the war in which they fight. The trouble in France today is that other things are not equal, in particular working class discontent at the cost of living is bitter and almost universal. The Communists can, therefore, cripple the state by wage strikes, backed by all trade unions, Communist and anti-Communist alike and which cannot be brought within the sabotage laws without endangering the right to strike enshrined in the constitution. Strikes are spreading through the motor works in the Paris area. At the Renault factory, the strikers have started a stay-in strike. All unions support the move, which has arisen—ostensibly—because the management has not agreed to a large enough increase in wages. The effect is, however, as unsettling as any strike for sabotage could be.

It seems that the political crisis in France is coming to a head. Talk of outlawing the Communist party is becoming more and more insistent and men of all parties begin to feel that the lack of authority at the centre can only be made good by new elections. All in all, the hostilities between the large Soviet-dominated Communist minority and the French nation seems to be nearing a climax.

Ten-Year Plan for the Congo

The new development schemes for the Belgian Congo which have now been submitted to the Belgian parliament are a model of their kind. The worst extravagances of British colonial development have been avoided; the Belgians have carefully tailored their plan to fit the practical difficulties of the country, neither overloading it with pipe-dreams nor neglecting the principle of learning to walk before trying to run. The Belgian Government proposes to finance roughly half the scheme with loans up to a limit of 20,000 million francs (£142,857,000), leaving the rest to private investment.

The ten-year plan, details of which were described in *The Economist* of July 2nd and 9th last year, allots to the Government the tasks of improving and opening up communications—with an eye to both economic and strategic links east and west, and north and south across the African continent—in conjunction with other colonial powers, of building electrical power stations and of encouraging agriculture. Private capital, part of which may possibly be raised in Britain, France and America, is then expected to take care of the task of expanding the industrial resources of the country, particularly metals and timber.

The chief advantage of the Belgian plan over similar British schemes is that it keeps well to the fore the three basic obstacles to African development: transport difficulties, the lack of good agricultural land and the shortage of labour. The importance of the first is self-evident; the second and third are well enough known but they are only too often left out of the calculations of British planners. Most Africans are tied to the land by their primitive methods of farming. Food is surprisingly scarce, and both facts together make it the first requirement of any development plan to improve the agriculture of the country. Better farming methods will mean a larger labour force and also provide more food. The Belgian Government proposes to achieve this aim by a method something similar to that of the Gezira scheme in the Sudan, whereby land is allotted to separate families who have the use of a pool of farming equipment and who are obliged to maintain a minimum output of their products. At the same time the Government are starting a number of agricultural schools to improve native methods.

There is every hope that the ten-year plan will succeed. It has been carefully thought out, and under skilful administration it should prove of great benefit to Africa as well as to Belgium.

* * *

Riots on the Rand

The violent riots which have broken out during the past three weeks in the non-European townships of Johannesburg and at other mining centres on the Rand are profoundly disturbing. As our Johannesburg correspondent points out in an article on page 434, they are largely the result of the war of nerves which Dr Malan's government has been waging against the Bantu and coloured populations of South Africa. A commission of inquiry into the riots was appointed earlier this year, but it is too much to hope that it will be able to do anything more than establish the facts of what has happened and is still happening.

The immediate cause of the riots seems to have been a spontaneous demonstration against a long-standing native grievance, the pass laws. These laws are almost unenforceable in the grossly overcrowded townships, but from time

to time the police swoop down upon the unfortunate natives in an attempt to ensure at least a token compliance with the law. The raids have often led to minor disturbances before, but in the present inflamed state of racial relations the Bantu are beginning to regard the raids as armed European attacks on the black races—even though many of the police are themselves Africans.

It would be unfair to blame Dr Malan's government alone for the grave turn which events are now taking. The passes—which European children used to, and may perhaps still, sign for their parents' adult servants—and the suppression of the Bantu existed long before his party was even formed. But his colleagues in office have made a bad situation very much worse by a ceaseless flow of vague threats against the Bantu and coloured races. Fear is now beginning to govern the actions of black and white alike; unless Dr Malan can somehow contrive to still that fear, the sporadic riots on the Rand, where more than a million Africans live and work, may easily and rapidly turn into the horror of civil war.

* * *

References—

A local authority recently advertised a vacancy for a typist, and demanded with the initial application no fewer than six references. This is only an extreme instance of a convention that is growing both widespread and out of hand. Many people are feeling an increasing irritation with demands for such numerous testimonials of character and ability made without adequate reason. It is doubtful whether, at their best, references ever constituted a very useful aid to the selection of the right person for the right job, but the growing formality of employment procedures in private firms, and the increasing proportion of official appointments among salaried posts is leading to a wholly unreasonable extension of their use, with the inevitable result that while their nuisance increases their value diminishes.

Very few people are curmudgeon enough to refuse to give a reference, even to a former employee faintly remembered or to a distant relative vaguely disliked, while it is universally understood that anything short of the warmest commendation of the applicant's ability to fill whatever post he happens to have set his mind on, will be worse than useless. Indeed it is commonly agreed that all the best testimonials are composed after asking the applicant "What do you want me to say?"

References may be a nuisance to the person who is asked to write them, but they are a curse to the employee, particularly the salary-earner, in search of a new job. Before he can even apply for one—whatever his chances of getting it—he must solicit this favour of a suitable testimonial from three or four long-suffering "useful contacts." His present employer is more often than not the only person who knows his work, but also the last person he wants to inform of his intentions until he is reasonably sure of success.

Small wonder that so many "first class" references are inevitably granted with the tongue in the cheek. Small wonder again that so many copies of them, attached to "full personal details" are rejected before they are read. Small wonder, in short, that no responsible person, recollecting the people he himself has "thoroughly recommended," regards them as anything but a farce.

This is an abuse which the unscrupulous can evade, the well-connected can ignore, and the successful can forget, but it remains a drag-weight on the mobility of the versatile and the ambitious. A vested interest in formality and officiousness can grow up as rapidly among professional employment managers as in any other calling and one of its many signs is this dictatorial practice of demanding references for their own sake.

Thoughts on Washing Up

Even bishops, the country was informed last week, now help with the washing up—along with university dons and the highest civil servants as well as the rank and file of the professional classes. It might be unwise to rely on even bishops' unsupported statements that they regularly wash up, but fortunately the current issue of *The Lancet* produces some scientific evidence to confirm their claims. It reports a considerable increase in "housewives' dermatitis" of the hands, an increase which is generally attributed to a bigger population at risk; and it is significant for the bishops' and higher civil servants' protestations that the increase is as noticeable in private practice as in the out-patient departments of hospitals.

It is odd, however, that the widespread phenomenon of professional men at the sink should not have been made the object of sociological and psychological study. Why, for instance, should washing up be selected as the most distasteful of household tasks, the chief symbol of the redistribution of incomes and the decline in professional standards of living? The psychological findings should be valuable, for it is obvious that washing up is an excellent personality test that could profitably be added to those set by the Civil Service Commissioners. For instance, there are the washers up who stack and separate before they begin, and then work through the items as methodically as any established civil servant going through his in-tray. Contrast these with the private enterprise technique of those who seize upon anything in reach, fling it into the water and draw everything out haphazard—no use these among the planners. Willingness to tackle disagreeable tasks could be detected in candidates presented with a scrambled-egg or porridge saucepan, and, conversely, a bias towards "passed to you, please" in those who will soak and leave it. Undesirable obsessional traits, which would hold up the machinery of government, are revealed in the dryer up who insists on rubbing every-

thing that has been in the plate rack ; while the sadist, who allows no plate rack at all, should obviously not be given any power over his fellow men.

Mr Aneurin Bevan would think all this nonsense. In an interview last week, he is reported as saying that middle-class housewives do not need help in their homes ; they only want someone to order about. Because of the decent privacy which shrouds the home lives even of famous men in Britain, it is not known what Mr Bevan's domestic arrangements may be. But it is quite certain that if middle-class housewives require domestic help only for the same reason that Cabinet Ministers wish to retain office, to satisfy a lust for power, they could do so as easily by observing their husbands, gaitered, pin striped, or merely trousered, slogging away at the sink.

* * *

Challenge by Polish Primate

Greatly incensed at its failure to bring about schism in the ranks of the Catholic hierarchy, and infuriated by the Primate's firm stand against official interference in Church affairs, the Polish Government has placed under house arrest one of the leading bishops in the country, Kazimierz Kowalski of Chelmno, western Poland. So far he is the only high church dignitary against whom the Communist regime has dared take such drastic action. But to judge by the violent attacks in the Polish press against the "feudal lords of the Church" more arrests are to be expected. Two things seem to have aroused the bitter anger which the Government is expressing through the press. The first was the Pastoral Letter issued last week by the Primate of Poland and signed by the Archbishop of Cracow, Cardinal Prince Sapieha and the 23 bishops. The second was the fact that Bishop Kowalski was the first to act on this Letter by taking disciplinary measures against two priests in his diocese who had declared themselves supporters of the Government. Without asking for the bishop's permission, they had accepted official posts in the new administration of Caritas, the Catholic religious welfare organisation which was last month placed under state control.

The Pastoral Letter was a direct and deliberate challenge to the regime and accepted as such. After exonerating the former administration of Caritas and calling upon the clergy not to be misled by government propaganda into acts of disloyalty against the Church, it brought the dispute to boiling point by announcing the dissolution of Caritas. To crown this defiance the episcopal authorities sent a letter to President Bierut informing him of their decision. The Polish authorities thereupon ordered an intensified campaign against the Church, in which the arrest of Bishop Kowalski is the boldest move.

By dissolving Caritas and denouncing the several hundred poorer priests who were induced to join in the new administration appointed by the Government the Primate has deprived it of support from abroad, especially from the United States, whence much aid has come since the end of the war. Some American welfare organisations have already said they will cease supporting Caritas. To diminish the blow, the Polish authorities have now declared that they will provide state funds to run the organisation.

Bishop Kowalski has now been interrogated by the State Prosecutor, and his trial on charges of "activities against the people's Poland" is expected shortly. Whatever measures are planned against the Church in the new campaign, it is clear that the new Primate is a skilful and efficient opponent. The Communists may have cause to regret their decision to risk an open breach with the Church, around which much peasant discontent and anti-Russian feeling can be rallied.

* * *

Solomon's Judgment for Jerusalem?

The Trusteeship Council, at present sitting in Geneva, is deeply puzzled over Jerusalem. Its dilemma springs from the fact that the Assembly has instructed it to work out plans for the internationalisation of the city, but that this instruction is opposed by both the states in physical possession—Israel and Jordan. The horns of its dilemma are as follows: shall it, in the teeth of Israel-Jordan opposition, work out plans which are unworkable unless someone is ready to oust the possessors by force or other pressure? To do this is to expose the Assembly to the risk of displaying pusillanimity. Or shall it heed the argument (advanced by Israel but no doubt also acceptable to Jordan) that the division of the city is *de facto*, and *de jure* governed by an armistice between the two states, that this armistice has been recognised by the Security Council, and that the Assembly has no powers to behave as if it were a parliament with right to legislate along lines which do not accord with this armistice agreement? If so, the Council must report back to the Assembly that the latter's vote of December 9th (discussed in *The Economist* of December 10th) was at best impracticable and at worst out of order.

Sensing that rocks lay ahead, the Trusteeship Council had, in December, asked its president, M. Garreau of France, to prepare a "working paper"—an unenviable task. He found so impossible the drafting of a paper on the Assembly's wish for total internationalisation that he produced what was, in fact, an alternative plan. His paper set out a scheme for a small international zone containing some of the major Christian sites, plus a grant of the rest of the area to Israel and Jordan, the whole being, the while, demilitarised, neutralised, and placed under a form of "economic union" about which he was none too specific. His compromise, which was not acceptable to either Israel or Jordan, was shelved, with too few bouquets for the spirit which inspired it.

*

As matters stand at present, the Israelis have proposed a third choice—division of the city along the armistice lines, plus international control for the Holy Places, "wherever they may be." Since the major powers of the Christian world (and in particular the United States, which is the only power with a capacity to put pressure on Israel) have failed to stake the claim of Christianity—because, for their various political reasons, they have not wished to put pressure on Jews or Arabs—the third choice is the only way out. If it were to be put forward jointly by Israel and Jordan, the United States and Britain (whose delegates have not so far spoken) would both support it. It would constitute a second Solomon's judgment given in Jerusalem. The first, though proverbial for its justice, met with objection and was never

DO WIVES TALK T.I.?

What do wives talk about? Their children, clothes, husbands? . . . naturally. Their homes? . . . inevitably. At this very moment housewives all over the country are talking TI. That new electric cooker may well be the theme—or the car, which almost certainly owes much to TI. Bicycles? . . . a TI speciality, as are paints, water-heaters, electric irons and fires. And then there are all the important things which depend wholly or partly upon TI products, like aluminium utensils, refrigerators, vacuum cleaners, washing machines, step ladders, garden implements, toys . . . Yes, wives should know TI.

The letters TI mean Tube Investments Limited, of The Adelphi, London, W.C.2 (Temple Bar 0271). They also stand for the 30 producing companies of the co-ordinated TI group, makers of precision tubes, of bicycles and components, of wrought aluminium alloys, electrical appliances, pressure vessels, paints, road signs, metal furniture . . . and essential mechanical parts for a thousand and one things which everybody uses.

THE SURNAME OF A THOUSAND THINGS

A Sensible Policy for Process Steam—4

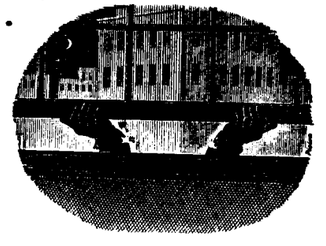
What Steam Costing Will Tell You

BY SPIRAX

How much does steam cost you at the boiler plant? How much steam is used in each machine or each department and what is its cost?

If you had a 100 h.p. electric motor using 75 kW per hour would you for a moment consider running it without an ammeter? Or if you had a department using 750 kW an hour wouldn't that seem to be a major item of cost?

A steam-heated machine using no more than 300 lb. of steam an hour is the energy equivalent of a 100 h.p. electric motor ; and a department using no more than 3,000 lbs. of steam an hour is taking the equivalent of 750 kW hours.



If it is second nature to measure the electrical load is it not just as sensible and necessary to measure the steam load?

A simple system of steam costing, based on the metering of departmental steam consumption, will reveal waste or misuse of steam ; will focus sharply on those points where methods of departmental steam usage can be improved ; will give you a more accurate picture of departmental costs in relation to departmental production.

Budapest Trial

The trial of British and American subjects in Hungary for espionage and sabotage has now come to its expected end. Mr Sanders and Mr Vogeler have confessed everything that they were expected to confess—that is to say, the entire indictment against them; they have been sentenced to terms of imprisonment, and Hungarians accused of being their accomplices have been condemned to death. There is really very little that can be said about such trials, except perhaps to suggest that the word "trial" should be dropped. It carries with it too many associations in the western mind with justice, legality and proper procedure, whereas beyond the Iron Curtain, trials are merely propaganda demonstrations designed to place the spotlight upon some aspect of government policy. The Hungarian people are supposed to believe that all western embassies, firms, commercial agencies and even casual visitors, are part of a network of espionage designed to destroy the People's Democracy. In this way, public opinion is kept in that state of fear and tension which makes it possible for the government to impose restrictions and severities which would be hardly acceptable in times that could be called normal.

The trial and condemnation of Mr Sanders and Mr Vogeler does nevertheless raise some new problems. It is clear that the normal conduct of business activities beyond the Iron Curtain is now virtually impossible; it is equally clear that little by little the usefulness and status of embassies and diplomatic missions are being steadily whittled away. This process is not confined to Hungary; for instance, it is only this week that the Poles have drastically restricted the freedom of movement of foreign military attachés in their country.

Under these conditions, there is a temptation to argue that diplomatic links serve no purpose and that they might just as well be brought to an end. The Americans have followed this argument to its logical conclusion and broken diplomatic relations with Bulgaria. It seems doubtful, however, whether this course is the wisest. The mere fact that Communist governments are so determined to squeeze out western diplomatic representation and to create an impression of diplomatic warfare should make the western powers chary of falling in with their plans. The presence of diplomats from the western world is still a reminder to the ordinary man and woman that war has not yet broken out and may not do so. At this stage in east-west relations, the western powers have everything to gain by preserving some semblance of pacific relations.

Shorter Notes

The importance of the Trusteeship Council's report on Tanganyika, which it adopted this week, lies in the British Government's general attitude towards it rather than in the detailed recommendations made in it. Many of these will doubtless be called either impracticable or unnecessary, and some of them, such as the establishment of inter-racial schools, will cause great indignation among the Europeans of the territory. But the British Government should remember that it is, after all, pledged to the abolition of racial discrimination; it would be unfortunate if, by always objecting on detail in all its dealings with the Trusteeship Council, it gave the impression that it also objects on principle.

*

The advocates of a higher level of teachers' salaries must bear in mind the effect of increased salaries on the cost of education as a whole. In a document just issued by the Ministry of Education (Costing Statistics, HMSO, 1s.) details are given of the proportion of the cost per pupil attributable to teachers' salaries. In 1947-48 the average cost per pupil in primary schools was £18.52 a year, of which teachers' salaries accounted for 77 per cent. In secondary schools in the same year the average cost per pupil was £30.25 a year, of which teachers' salaries accounted for 70 per cent. With these figures in mind, no one can believe that the improvement of salary scales for teachers will be an easy job.

*

The revised development plan for Fiji, which has recently become available, is chiefly of interest because it tries to meet the criticisms of the first plan that the emphasis was on welfare rather than development, and would consequently have led to big increases in recurrent expenditure without providing the means to meet it. The contrast between the two plans is illustrated in the following table, which shows the allocation of expenditure to economic and other development schemes and to social service schemes respectively:—

	Amount £	Percentage of Total	Percentage in First Plan
Production and development of natural resources	1,531,942	36.05	12
Communications and General	1,455,490	34.25	29
Social Services	1,077,507	25.35	59
Reserve	185,061	4.35	—
	4,250,000	100.00	100

A Budget Surplus

WE fear the Chancellor of the Exchequer must be already becoming uncomfortable under his surplus. The candidates for the spoil are already numerous enough, if it were ten times greater. Importers of tea, paper-makers, shipbuilders for their raw material, a long list of other suitors at the moment, besides the whole Income Tax paying public in the prospect of the expiry of that tax in another year, are all candidates for at least a share of the booty. All ask at least to be remembered. But while all these parties are quietly urging their suit at Downing Street, a great and audacious attempt is made prematurely to grasp it all by the dominant party in the House of Commons. The landlords are again at their unwise work. They are again reminding the people of the uses which they have too often, for a temporary interest, made of the great political trusts which they hold. Six weeks before the conclusion of the financial year, they propose to anticipate and absorb, not a part, but the whole of the expected balance. . . . The narrowness of the division which prevented their success, and the curious combination of parties which led to it, will only be an evidence to the country how much of the old leaven is still left. . . . But we will admit that landlords are, probably no worse than others of the numerous candidates would have been had they similar advantages. If we had a Parliament of paper-makers, or of soap-boilers, or of newsmen, or of importers of tea, the chances are that any one of these parties would have thought it better to appropriate the spoil on the floor of the House of Commons, than to trust to the consideration of the Chancellor of the Exchequer. . . . We can fancy the Chancellor of the Exchequer finds his new position with a surplus of two millions little less perplexing than when he had a deficiency of the same amount two years ago, and infinitely less comfortable than it was a year ago, when he was able just to make both ends meet; and that he will say, with Allan Ramsay:—

"He who has just enough can soundly sleep,
The o'erplus only fashes folk to keep."

Letters to the Editor

Economic Work of Uno

SIR,—Having been closely associated with the economic work of the United Nations since the San Francisco Conference, I was astonished to read the account of this work which appeared in *The Economist* of February 11th.

The general thesis of your correspondent appears to be that, for a number of reasons, the United Nations Economic and Social Council and its economic commissions are useless bodies; and that the Secretariat ought therefore to try to make up for these deficiencies by producing high calibre World Economic Surveys. This is an incredibly naïve and parochial view. The idea that the main function of an international organisation in the economic sphere should be to subsidise "independent" economic research is so academic in approach as to bear little relation to the actual needs of the situation. But it is quite another matter to discount completely the positive work that has been done by the United Nations in the economic field, and to advocate the relegation of its functions to that of a research institution.

What the United Nations has to do, and is doing, is to face up to the problems which exist and attempt to resolve them. It cannot afford to skirt the issues, and take refuge in the niceties of academic studies. The Economic and Social Council is confronted with the task, under the Charter, of promoting "higher standards of living, full employment, and conditions of economic and social progress and development." This task raises a complex of fundamental issues which cannot be solved overnight. Even the impatient academicians are not agreed on them. Nevertheless it is true to say that considerable progress has been made in the post-war years towards the achievement of the Council's objectives. The very acceptance of the idea that governments have a solemn responsibility for taking action to promote full employment and economic development is evidence of that progress. Who could have contemplated, before the war, a procedure under which an international organisation would have despatched questionnaires to all Member Governments enquiring in minute and precise detail as to the measures which they proposed to take to maintain full employment? Or who, again, would have imagined that it might be possible, in existing conditions, for the Council and the General Assembly to adopt a unanimous resolution providing for technical assistance on a large scale to underdeveloped areas? Yet this occurred during 1949—and both the constructive character of the scheme and the unanimity of the vote were in great measure due to the careful preparatory work and "honest brokerage" undertaken by the Secretariat.

It would be easy to mention a number of other instances of similar positive and constructive action by the Council.

Your correspondent placed himself on safe ground by attacking the Secretariat in so vague and unsubstantial a manner that it is not easy to get to grips with him. The Secretariat's main task is to serve the Council and its Commissions and provide the impartial approach which is essential in their proceedings. The Secretariat cannot and should not produce economic surveys for their own sake. Most of the Secretariat's reports are produced for a specific purpose in relation to the needs of Member Governments meeting together to resolve particular problems, and it is in this context that they must be considered.

I know the Economic Affairs Department itself feels that a satisfactory solution has not yet been found for some of the problems of producing a World Economic Survey in addition to the regional surveys and those of the specialised agencies. That members of the Secretariat should be self-critical is all to the good, but I hope that they will not be stampeded by academic criticisms into any major change of emphasis in their work. It cannot be overstressed that the production of reports is not their main task. In a growing number of countries the Economic Affairs Department is patiently and unobtrusively at work—to take a few examples—helping to set up or to reorganise national statistical offices, training officials who will be responsible for carrying out the 1950 census, overhauling obsolete fiscal arrangements, advising governments on major economic reforms, organising surveys of national economic resources and prospects. It is these things, and the service of the Council and its Commissions, which constitute the main task of the department. By the general consent of those who like myself have seen them at work, the staff of the department are doing a first-class job under excellent leadership.—Yours faithfully,

A. RAMASWAMI MUDALIAR
Indian Delegation to the United Nations, New York

Selling for Dollars

SIR,—In both your last two issues ("Selling for Dollars," February 11th, and "Through the American Tariff," February 18th) you have stated that American import duties have fallen from 53 per cent of dutiable imports in the early thirties to 14 per cent today. You then go on to point out that notwithstanding this, there are still duties of 50 per cent or more. Despite this proviso is there not a danger of under-assessment of the present level of the tariff in such a bald statement? The main point is that the US Tariff Commission estimates of average rates of duty (from which the above figures seem to be taken) are based on the value and prices of those imports which actually find their way into the United States over the tarfff wall. Therefore, those imports which are severely

restricted by high duties receive little or no weight in the calculation of overall duty rates—and hence the present level of the tariff is grossly underestimated. In fact, an attempt to estimate the current average duty rate on the *marginal* exports from the United Kingdom to the United States, i.e., those goods which could be sold in greater quantity in the United States if there were a reduction in tariff barriers, shows it to be about 35 per cent. It should also be noted that since devaluation the effective incidence of the tariff has considerably increased as so many duties are specific, and hence weigh more heavily on imports which are now cheaper in terms of dollars. And there are good reasons for believing that the particularly high duties to which you refer are levied on precisely those goods for which the price elasticity of demand is largest. But perhaps we may be permitted to refer to our article "The US Tariff" in this month's *Bulletin* of the *London and Cambridge Economic Service* for amplification of these points.—Yours faithfully,

A. R. PREST

Prevention of Tuberculosis

SIR,—Your demand for the provision of the means to combat tuberculosis "as a matter of urgency" will find an echo in the hearts of many workers in this field who begin to despair of that drastic action which alone can stem the tide of tuberculosis, and drive it back. In this country four hundred people die every week from this disease. Waiting lists for admission to sanatoria get longer and longer. Patients in an infectious state move freely among the population.

There is an urgent need to establish a modern chest clinic for every 200,000 of the population. Each must be headed by a chest physician of consultant status. It is imperative to have a complete survey of general hospital and teaching hospital accommodation to discover the number of wards and beds that could be made available. There is a need to make provision of hostels or night sanatoria for the chronic cases who take up hospital beds needed for those in the early stages of the disease, for whom hopes of recovery are highest.

There remains the crucial question, why is nothing being done to mount immediately a major offensive against a disease which takes such a ghastly toll of human life, happiness and usefulness? The fear arises that since the take-over of the hospitals by the Ministry of Health, by some fortuitous circumstance the tuberculosis service has become the "Cinderella" of all the hospital services. Where in fact does it come in the apportionment of the health budget? Is TB being pushed aside by claims and causes with more influence but less priority? Whatever the cause, the present critical situation calls for a pronouncement at the highest level. The Minister has direct powers of direction over all hospital authorities and therefore he has the power over the operation of all TB work which comes within the purview of all hospital and specialised services. In addition he can influence decisively the activities of local health authorities. Has he, however, within his department any team of officials, lay and medical, whose particular function it is to secure an integrated, energetic, and, if necessary, ruthless use of the powers which he has? I suggest, since the TB menace is so exceptional and dangerous, the appointment of a special officer of senior rank, with adequate assistance, to act in direct relation with hospitals and local health authorities in planning a campaign, and where necessary enforcing it at the cost of overriding the normal operation of other health services.—Yours faithfully,

47-51 *Westbourne Grove, W.2* FREDERICK LAWRENCE

Books and Publications

Economic Balance

"The Problem of Employment Stabilisation." By Bertil Ohlin. *Columbia University Press.* 169 pages. $2.75.

THIS collection of connected papers, consisting of lectures given at Columbia University and at Oxford during 1947, affords an interesting example of what can be done in relating the abstractions of advanced economic theory to current events. It is also an example of success in the difficult technique of presenting such matters in a form which is comprehensible to a live audience as distinct from a reading public.

In a sense, of course, all abstract economic theory is apt to be related to current events, if only because economists find it more interesting to investigate live issues. ("It has often been asserted that British economics is a generalisation of British experience through the lifetime of the relevant British economists," says Professor Ohlin—who maintains, with some justification, that Keynes holds the record in this respect.) The relation, however, is sometimes too remote to be realistically set out. Professor Ohlin, being both a distinguished economist and an experienced practical statesman—he is the leader of the Liberal opposition in the Swedish Parliament—is well qualified to make it clear. These same qualifications preserve him from the common failing of relating his abstractions to the events, not of this decade, but of the last but one. "The Problem of Employment Stabilisation" deals not merely with those forces which produce depression but with the problems of "over-full employment" with which Britain is now so painfully familiar, not merely with the economic genesis and nature of these, but also with their political aspects. Attempts to maintain employment permanently at such a level that constant upward pressure is exerted on prices lead to chronic balance-of-trade trouble and also to a gradual impairment of liberty no less serious than to be feared from the collapse of democratic institutions under the disillusioning experience of depression. (It will be noted that on this point Professor Ohlin and some Socialist economists are at one. The latter, however, often do not regard the impairment of liberty as a disadvantage.)

This balanced view of economic stability, with its equal emphasis on the upper and lower ranges of the fluctuations in business activity, enables Professor Ohlin to set a number of subjects in perspective; the question of international trading equilibrium, the use of investment policy as a stabiliser, and the merits and shortcomings of the Swedish anti-depression measures of the thirties. The chapter entitled "Economic Stability and the Structure of Society" has a full book's worth of matter in it.

The Fascinating Corsair

"Byron Letters and Diaries." Edited by Peter Quennell. Two Volumes. 803 pages. 42s.

IT is easy to understand the hold that Byron had upon his contemporaries. He had everything to fix their interest—their horrified interest, perhaps, but interest nonetheless. To birth, wealth, beauty and a tempestuous gift of poetry, he added, in an age of *romantic and* gothic fancies, an atmosphere of mystery, of nameless crimes, of violent debauchery, and yet of a quixotic and heroic attachment to the freedom of man.

What is perhaps less easy to understand is the survival of the myth of Byron to our own days. It would be hard to call our present age a romantic one, with romance arriving in cellophane covers from Hollywood, nor is it an age particularly addicted to the cult of style, of verbal brilliance, or personal flamboyance. On the contrary, the cult of words is overlaid by forms, telegrams and endless telephoning, while style and flamboyance fit awkwardly into the absorbing pursuit of social security. Yet the name of Byron still stirs the imagination,

and those who want an answer to the enigma cannot do better than read the two volumes of his letters and diaries which Mr Peter Quennell has chosen and edited, including among them a number of letters published for the first time. The truth is that for all its regimentation and mass production, for all the decline in popular literature and spread of turgid journalese, the western world can still warm to the spectacle of a vivid human personality and succumb to the magic of words. As a person and a stylist, Byron must still be reckoned supreme. Others have had no doubt greater and more admirable characters, but to a generation which does not see its men in black and white and is most intrigued by the variety of human experience, Byron's character, with its excesses and its modesty, its wild imaginings and its flashes of commonsense, its frank self-revelation and underlying mystery, is probably more fascinating than it was even to his own contemporaries.

Nor could this richness of personality be recognised for what it is, were it not for the man's outstanding literary style. The letters and the diaries seem to pour straight from a molten mind. The words dazzle, the sentences flash, and the few letters which were composed with obvious care and forethought only increase the impression of instantaneous communication conveyed by the others. Byron defined himself as one who "thinks much, rapidly, perhaps deeply, but rarely with pleasure." This may be so, but the pleasure conveyed is extreme. And the delight is not in style alone. Byron's dramatic and poetic descriptions are well known. What has perhaps been less commented on is the shrewdness of his political judgment. It demanded some prescience in 1821 to foresee that America, "the new English Atlantide" would come to dominate the old continent. And is not this a prophetic comment on the modern development of totalitarian technique:—

> It were a difficult point to decide whether religion, education or literature, in the hands of power, would tend most to its stability. It is certain, however, if by any means it could obtain all three, its influence would be unbounded, and a nation so enslaved would enjoy only an automaton existence, following every impulse of its rulers.

A Soviet Novel

"The Factory." By Vera Panova. *Putnam.* 261 pages. 9s. 6d.

MISS PANOVA'S book belongs to the postwar period of Soviet literature, when the Soviet Union was concerned with rehabilitation. Soviet writers, no less than other classes, had their role to play, and this was to pass on in artistic form the call of the hour, and to portray what Soviet criticism calls "the pathos of Socialist construction."

The novel is a picture rather than a story with a plot. It describes a factory and a large number of people, whose lives are centred on it. The purpose of the picture is to show how all these people work joyfully, unquestioningly, and hard for the greater good of the Soviet Union.

The main value of the book is in the glimpses of real Soviet life which it gives. Miss Panova is not propagandising when she describes the toughness and the sufferings of the Russians, the double-shifts of wartime, the Leningrad siege, the disrepair of the workers' hostel, or the everyday administrative questions of the factory. The book's obvious fault is that it is not interested in interpreting human beings as anything more than Soviet factory workers, or human life as being anything more than the fulfilment of Stalin's plan.

In so far as an advertisement poster can be good art "The Factory" is successful. Its broad strokes, its sunny colours, and its confident message contain little that is profound; but it is a well-executed and not unattractive poster, and the artist is sufficiently regardful of truth for one to learn something from her figures.

Credit Revised

"Currency and Credit." By R. G. Hawtrey. Longman. 445 pages. 25s.

THIS revised version of a thirty-year-old classic is, according to the author's preface, "still the same book" in spite of heavy pruning and much new matter. Inevitably, and apart from obvious changes in the historical section, emphasis, exposition and even to some extent conclusions are different; Professor Hawtrey was no crystal-gazer in 1919 and shows himself no Bourbon now. But he finds little difficulty in fitting the "Keynesian revolution" into a setting of monetary theory which is recognisably his own. (The reader owes him gratitude for the beautifully clear signposting of Chapter Five, in which the relation between the Keynesian terminology and his own is expounded.)

The foundation of the whole analysis remains (to quote the preface again) "the function of the credit system as the source of money," credit having logical, even if not historical, priority over cash. The practical conclusion on which theoretical considerations and historical analysis converge is that deliberate credit regulation, "managed money," offers more hope of stability than does any rigidly conceived metallic standard, providing that its managers keep in view a criterion which is genuinely relevant to economic realities. This criterion is nothing other than labour value; the earnings of a representative, not specially qualified, worker. Constant consumers' income, with prices falling as productivity rises, is the monetary ideal. Whether the managers of the currency and credit system could in fact, even were this ideal explicitly realised, resist the political pressures which, under full employment, generate expansion and inflationary pressure, is an all too practical question which Professor Hawtrey does not discuss.

Two Reprints

"The Science of Wealth." By J. A. Hobson; revised by R. F. Harrod. Home University Library (OUP). 211 pages. 5s.

"First Principles of Public Finance." By Antonio de Viti de Marco. Jonathan Cape. 434 pages. 18s.

THE emergence of J. A. Hobson from his place in the underworld of economic heresy to the status of a pioneer discoverer of neglected truth has been a minor but interesting side effect of the Keynesian revolution in economic theory. "The Science of Wealth," while one of the most widely read and frequently reprinted of his works, is not the most characteristic. Its chief theoretical distinction, as against more orthodox presentations of elementary descriptive economics, is its emphasis on an "unproductive surplus" (i.e. payments made to factors of production over and above the amounts needed to call them into existence or activity) which is neither a sufficiently precise nor a particularly useful economic concept. "The Science of Wealth" thus suffers in authority; but it has other qualities of enduring value—a comprehensive view of the economic system as a complex of flow and counter-flow, a realism which both appreciates the merits, and emphasises the limitations, of the "Hidden Hand," and a clear and human style. Mr R. F. Harrod's critical preface and epilogue allow the reader unversed in comparative economic literature to "place" Hobson in the history of economic thought.

Dr Viti de Marco's book was first introduced to the English-speaking world in 1936; it had been written in the previous decade and the germ of its leading ideas dates back to the 1880s. If Hobson's work is prophetic, this is timeless; a truly classical, indeed almost Platonic, statement of first principles, beautifully logical, lucid and sharp-edged. (These qualities are well served by the translator, Mrs E. P. Marget.) The reader will seek in vain for any counterpart to the patient, detailed description and analysis of current practice contained in, for instance, Mrs Ursula Hicks's *Finance of British Government*;

such concrete instances as are given of Italian practice are purely illustrative. On the other hand there is no recourse to mathematical or geometrical abstraction. It is incidentally noteworthy that Dr Viti de Marco was an avowed liberal and active political opponent of Fascism prior to 1922. He was able to write and publish this book, essentially liberal in spirit for all its abstraction and detachment, and receive international acclaim from economists, in Mussolini's Italy. When one reflects on his chances of doing so in Hitler's Germany, or of ever surviving, however gagged and acquiescent, in Stalin's Russia, the advance over twenty years of the claims and technique of tyranny is strikingly illustrated.

A Parent's Guide

"The Child at School." By J. H. Newsom. Penguin Books Ltd. 176 pages. 1s. 6d.

MR NEWSOM has an impish delight in debunking the prejudices of middle-class parents and of educationists. So much was evident from his book on "The Education of Girls." It is a pity that in selecting a more thin-skinned audience he has deprived himself of some of the opportunities both for mockery and criticism. But this book is intended not for teachers, educationists or those who continued their education until or after 18, but for the vast majority of parents who left school earlier and now want to know what happens to their young within the gates of the present day schools.

For this reason a large part of the book is devoted to descriptions of what happens inside infant, junior, secondary modern and grammar schools. In their earlier years most children are inarticulate about their life at school and parents are left guessing about what happens to them between 9 a.m. and 4 p.m. Mr Newsom attempts to fill in some of the gaps by describing a typical day in these schools, by giving one or two examples of time tables, by quoting extracts from "essays" of these children at different ages and by giving the findings of public libraries about the books most commonly read.

In the controversial questions of education Mr Newsom here scarcely embroils himself. But it does no harm to have the educational system of the country put thus quietly into perspective. In particular the chapters which describe the secondary modern and the secondary grammar schools tone down the harshness of the controversy which is now revolving round the competition for grammar school places. As a Director of Education Mr Newsom has an equal responsibility for all the children in his charge, and this enables him to see the modern and grammar schools both as they are and as they ought to be. Whatever real and pretended superiority the grammar schools may have, Mr Newsom claims that it is in the modern schools that the really forward educational experiment is going on and that in the physical sphere the gap is narrowing rapidly. For example, in Hertfordshire, Mr Newsom's county, in 1943 the average expenditure per child in senior elementary schools was £24 as against £40 in the grammar schools: in 1948 expenditure in the secondary modern schools was £40 a head as against £48 in the grammar schools. It may be that in twenty years' time the revolution in secondary education started by the 1944 Education Act will have made the present sharp distinctions seem absurdly rigid and out of date.

American Labour Leader

"The U A W and Walter Reuther." By Irving Howe and B. J. Widdick. Random House, New York. 309 pages. $3.

THE United Automobile Workers' union celebrates its fifteenth birthday this year. The shock of finding that one of America's great trade unions, with nearly a million members employed in the country's most typical mass production industry, is still in its 'teens has additional impact, on the British reader at least, when he realises that the union's president is still in his early forties—and that attempts to assassinate him are becoming regular occurrences in Detroit. Mr Walter Reuther and his union are amongst the most dynamic forces in the American labour movement today. This biography of the pair of them is by a well-known "liberal" writer and by an active member of the UAW, both naturally and confessedly prejudiced in favour of their heroes, but not blind to their weaknesses. The description of labour's complicated factional disputes has little interest for the outside reader, but the account of life in Detroit and of the city's tragic racial problem is of more general concern. The book is worth the attention of anyone who wishes to understand the past and assess the future of the American labour movement.

Those who believe that American trade unionism is bound to follow the example it has been set in other countries, and embark upon independent political activity, look to Mr Reuther to prove their belief. Certainly during the Democratic doldrums of 1948 he was one of the most outspoken advocates of an American Labour Party and he has shown constructive ability in dealing with both political and economic problems. He led the fight against Communism, first in his own union, then in the Congress of Industrial Organisations, and finally in the international trades union movement. He worked out interesting schemes for producing aircraft in idle automobile plants, in 1940, and houses in idle aircraft plants, in 1949. In 1946, he based his demands for wage increases from General Motors on the company's high profits, an argument which has been borrowed by other CIO leaders. Mr Reuther was once a Socialist, and this assertion of labour's right to interfere in the field of management is held by many to prove that he is still a Socialist. But there is at present no reason to suppose either that he wants to lead American labour down the Socialist path or that it would allow itself to be led in that direction.

Picture Post in 1950

Picture Post continues to head the list for many nationally-known firms with big advertising plans. From the spring campaigns onwards, others will be sharing its unique influence and prestige, as well as its resources in hard salesmanship.

This salesmanship is solidly based on a really national, all-class **circulation,** close on 1½ million now, and steadily rising. Picture Post **readership,** again, includes one out of every four men and women in the country.

Turn to its advertisement pages and you get real **impact.** Picture Post now offers really large spaces—two-page spreads, for example—in full colour. This is the most powerful space in British advertising. And Picture Post will always make special arrangements on request, as far as current supplies of paper, etc. will permit.

The editorial authority of Picture Post continues to win **confidence.** Consumers and retailers both know that the goods and services advertised in Picture Post share its name for reliability. For Picture Post is not just Britain's leading weekly picture magazine. Picture Post is already an integral part of British life.

Nor does the responsibility of Picture Post end with publishing. Picture Post also offers its advertisers a tested merchandising **service.** This enables them to make full use of the resources and influence of Picture Post, to 'follow through' from its advertisment pages to the actual points of sale. This service will be continuously developed and extended throughout 1950.

AMERICAN SURVEY

Aid in the Third Year

(From Our American Staff)

HARDLY has the unfortunate Economic Co-operation Administration got its appropriation for one year before it must start preparing its case for the next. It has now begun the third round of the weary circle—the round which, it has always been thought, would be the most difficult. The sense of adventure, the knowledge that it was striking a blow for freedom, that animated Congress during the first year was certain to carry over to the second. When the bill for the fourth and final year is debated, there will not be much disposition to risk the accusation of giving up so near the end by refusing the last and smallest appropriation. But this spring every item will be questioned and every failure on the part of the participating countries to live up to the Congressional ideal will be criticised.

The chief target for criticism will be Britain. There has been a careful and self-conscious silence during the election campaign, but February 24th has long been marked down on the calendar as beginning the open season—and it is expected to be wide open. It is not too easy to complain of British performance up to date, but it is fatally easy to find fault with British promises, or lack of them, for the future. Nobody in ECA thought that Mr Hoffman's visit to Paris would accomplish anything positive at such a moment. Equally, nobody expected him to be told with such painful clarity by the Chancellor of the Exchequer not to count on a more flexible attitude in March or April. Since his return to Washington Mr Hoffman has made no attempt to hide his disappointment and, however discreet he may be in his statements before the Congressional committees, he will not be allowed to leave without questions, some searching, some malicious, being put about what is universally believed to be "British sabotage of European integration."

But the first days of the Senate Committee's hearings suggest that each Senator is interested only in his own particular questions; there has been little excitement and members of the committee have not attended on the scale of previous years. Although the hearings will leave behind some smouldering embers of ill-will, it is not thought that serious cuts will have been made in the year's programme. But there are justifiable fears that so many amendments will be passed to take care of special interests that the European Recovery Programme will be little more than a dumping operation, an Agricultural Surplus Disposal Administration. Senator Brewster, of Maine, for example, is hardly likely to miss the opportunity of trying to persuade Congress that potatoes should be the staple European diet for the next twelve months. So far Mr Hoffman has been remarkably successful in fighting off the lobbyists (though he was well trounced by the shipping interests) but he will find it much more difficult this time.

His task will be harder because he is obviously not very certain of what he wants to accomplish during the next two years. Had the success of ERP not been so embarrassing, and had the increase in production of the last 18 months been spread over the whole four years, Mr Hoffman, and the participating countries, would have been warmly congratulated. As it is, the memory of early achievement may well be swallowed up in bickering over dual pricing, integration and liberalisation of trade. Here Mr Hoffman's infectious enthusiasm is bound to run on to European rocks which he not only cannot see, but the existence of which he resolutely refuses to admit.

★

It is quite certain that there could have been no better man to carry out the first two years of the programme. When he started the job he said that "production, production and more production" would be his motto. It was a subject which he knew well and every European was confident that American advice on increasing production—particularly that of such a successful American as Mr Hoffman—was valuable. The United States could provide example as well as precept.

The Senate, which has a touching and usually totally unjustified belief in the ability of businessmen to do anything and everything, insisted on having one for the job. It got something more; it got an evangelist. His optimism and refusal to allow Congress to lose its enthusiasm ensured that ECA was shorn neither of funds nor of room to manœuvre in using them. But, as the problems become more complicated, it is clear that the United States did not get a man with sufficient understanding of international economics and European politics; he is also handicapped, in preaching to Europe on the later stages of his programme, by the lack of example from the United States.

Dual pricing, the term of opprobrium that he has invented, may be very wrong in an ideal world, but, in a world which has accepted the system of paying subsidies—either to raise or to lower prices, no Government will agree to export at a loss merely because it keeps internal prices below those which the law of supply and demand would dictate. And there have been many examples of American export prices being higher than domestic ones, among them being steel.

ECA is willing to admit that Europe has made considerable progress toward liberalisation of trade during the last two years; its complaint—a very real one—is that progress has not been fast enough in such a critical situation. But it seems too little aware of the impact of what is done or not done in the United States on the pace in Europe. Many speeches have been made—by Mr Hoffman among others—about the need for the United States to become a net importer, but no concrete steps have been taken yet to assist the flow of European goods to American markets. There are plenty of plans for throwing doors open, but so far they are only slightly ajar.

"We want Europe to accomplish in 25 months," Mr Hoffman said a few days ago, "what might, under less compelling circumstances, easily require 25 years." Yet earlier the same day Mr Truman had dismissed a question about his attitude to the proposed Atlantic Union (there is a resolution being considered by Congress calling on him to convene a meeting of Atlantic powers to discuss a federal constitution) by saying that now was not the proper time to press for a thing of that sort. The world situation cannot at the same time call for urgent measures of integration in Europe and nothing in particular in the United States.

"Integrate at once!" Mr Hoffman tells Europe, but the State Department gives a warning that discussion of American participation is premature and might weaken the United Nations. "Sweep away all barriers to trade!" cries Mr Hoffman, while the United States rests on the Reciprocal Trade Agreements and exhorts Europe to "use emergency measures to direct imports to the dollar area"—measures which would be impossible if all barriers to intra-European trade had been removed. The United States has not yet made up its mind whether to lead or to push from behind. Until it does, the future policy of many European countries cannot be decided and Mr Hoffman's arguments will continue to rest on a frail base.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Venezuela's Iron Mountain

[FROM OUR AMERICAN STAFF]

THE discovery in Venezuela of a solid hill of iron ore, covering almost as great an area as does the famous Hull-Rust mine in the Lake Superior region, has implications which go far beyond the fortunes of the United States Steel Corporation whose engineers made and proved the find. The hill called Cerro Bolivar, lying fifty miles due south of Ciudad Bolivar, between the Orinoco and the Caroni Rivers, was found at an opportune moment. Industry is rapidly disproving the legend that the rich iron reserves of the United States are inexhaustible. The Mesabi Range in northern Minnesota, source of most of the bridges, automobiles, machine tools and paper clips of the country since 1900, has nearly all been shovelled into ore boats and hauled to the smelters. There were vast pits where hills once rose even before the second World War, and since then 340 million tons have been taken from the best reserves to meet the military needs of the United States and its allies.

The latest of those controversial estimates, which send shivers down the backs of Congressmen, is that the iron ore remaining in the Lake Superior district, and usable under present methods, will be exhausted by or before 1970. This does not, of course, mean that the United States will then have no ore left, but that the methods and costs of handling ore less rich and concentrated will impose changes on the whole industrial structure. It is this which sent steel men prospecting in many directions when in 1945, for the first time in six years, they were able to lift their eyes from immediate war demands and face the future.

Iron deposits still available within the continental limits of the United States might represent wealth to a land less demanding, but to Americans, used to spooning out rich ore, they present technological problems which are difficult and costly to solve. In the Lake Superior region the Mesabi and Vermillion Ranges, now badly depleted, were the richest nuggets in a stretch of iron-bearing soil a hundred miles long and several miles wide. It is peppered with a primitive iron formation (commonly called taconite) which, reversing the Mesabi proportions, is one-third ore and two-thirds waste material.

The problem of mining, crushing, sorting and converting this into usable form without unduly increasing the price of the product is described by one authority as "comparable in scope, complexity and cost with the war-time synthetic rubber challenge." Using private and public capital the country met the rubber challenge at a time when war had cut off supplies, and costs were less important than results. It is not yet certain that the threats which exist in a cold war will be enough to attract the capital needed to solve the shortage of rich iron ore. If the United States were to depend solely on the development of taconite sources for its ore requirements, the estimated investment needed would be in the neighbourhood of $1.4 billion—a sum which seems large, even to Americans, when wanted as risk capital and for a single industry.

★

The alternative, under active exploration since the war's end, is to find and bring into production new sources of foreign ore so placed as to be profitable when landed at American ports. This potential solution has spurred field crews from a dozen companies to photograph, map, drill and test both new and known deposits in Chile, Cuba, the west coast of Mexico, in Brazil and Venezuela, in Liberia, and in the much-touted Quebec-Labrador-Newfoundland region. This has not yet been fully explored, but already 300 million tons of high grade ore have been proved there.

The Labrador-Quebec discoveries have excited great interest but, though they are relatively close to the United States in point of distance, the problem of getting the iron ore 350 miles across the tundra to tidewater is formidable, and transport difficulties are far from solved. The greatest treasure thus far found is, according to Mr T. W. Lippert of the American Institute of Mining and Metallurgical Engineers, the hill of solid ore in Venezuela. The discovery, called La Parida by the natives but newly named Cerro Bolivar in celebration of its iron strength, was made by engineers and geologists of the US Steel Corporation in 1947. It took two years to test its extent and make reliable estimates of its probable richness and the first public announcement was not made until late in January, 1950.

Three weeks passed before the sceptical daily press showed signs of being persuaded that this was in fact the biggest iron ore find of the twentieth century. Not only is the hill itself of fabulous richness, and so close to the surface that the mere scratching off of vegetation to build a road discloses iron ore of an almost theoretic purity, but the entire region, in which the company has other concessions, contains reserves of the highest quality which are "greatly in excess of one billion tons." The Bethlehem Steel Corporation also has leaseholds in that area, but so far nothing to compare with US Steel's iron mountain.

The process of getting Venezuelan ore out of the ground is simple, and can be highly mechanized. Its transport to the coast is not so easy. Of the two routes under consideration, one, to a deep seaport such as Barcelona, involves a new railroad 275 miles long with a four-mile bridge across the Orinoco, at a total cost of perhaps $113 million. The other

is shorter and cheaper (91 miles and $51 million), but requires the dredging of a deep river channel (to cost $18 million), which must be maintained to permit the unhampered passage of boats drawing as much as 35 feet of water through a shifting delta. Once the ore reaches the coast, it still must travel more than two thousand miles before it reaches Pittsburgh—which explains the excited interest that nearer southern ports like Mobile and Baltimore are taking in the project. The US Steel Corporation has recently announced the purchase of 3,800 acres of flat farmland in New Jersey, near Trenton and Philadelphia. It is safe to guess that this will be the site of a new steel centre for handling the new foreign ores. Barring war and revolutions (a bar always subject to strain in South America), US Steel's Venezuelan ore should begin to arrive by 1953. The Bethlehem Corporation expects to begin shipping ore this year. It already has a suitably situated mill at Sparrow's Point in Maryland.

Despite the difficulty of ocean haulage involved in all the foreign projects, the supposition is that they can be so solved as to bring ore to market at prices comparing not too disastrously with present costs. A table prepared for the *Journal of Metals and Mining Engineering* takes the 1949 Lake Erie price of $7.20 a ton for Mesabi Bessemer ore as a base, and figures that, at Lake Erie ports, the Labrador ores might cost $7.72 a ton, the Venezuelan ores $8.54 a ton. the Lake Superior taconite nodule ores $9.40 a ton. Surprisingly, to the layman at least, the technological advantages of using high grade ores are so great that ores of that type brought thousands of ocean miles can compete with inferior ores mined within the United States.

From the point of view of American defence, it is, of course, essential that high quality domestic reserves be left untouched, and that low-grade sources be developed against future need. On the other hand, the advantages of fine foreign ores in time of peace are obvious. The best guess seems to be that, given American needs and the competitive situation between companies, the smelters will be supplied not from any single source at home or abroad, but by the progressive development of all of them.

American Notes

Mr Acheson's Uphill Road

Mr Acheson has picked out all the pitfalls that line any short-cut to agreement with the Russians with the same remorseless logic with which he demolished the Republican demand for intervention in Formosa. But logic is cold comfort to those engaged in an atomic arms race, particularly when the United States has lost its initial advantage and is having to turn its attention to home defence against atomic attack. Mr Churchill's suggestion of a new high-level approach has heartened those who believe, on both moral and practical grounds, that fresh overtures should be made, even if the hope of agreement is as remote as Mr Acheson declares it to be. Senator Tydings, the chairman of the Senate Armed Services Committee, has renewed his demand for a disarmament meeting, to the accompaniment of Senatorial applause, and he has been joined by Mr Harold Stassen, though the latter's proposal of a bi-partisan "mid-century" conference seems designed almost as much to rehabilitate the Republicans as to convert the Russians. The recent emphasis put by State Department spokesmen on the willingness of the United States to negotiate with the Soviet Union suggests that the Administration now regrets the curtness with which it unveiled the hydrogen bomb.

One of the reasons why the Administration has been so reluctant to authorise a new look at the international control of atomic weapons is the fear that the American public, horrified at the possibilities of universal destruction, may be tempted to trade the substance of the Baruch plan of control for a mess of paper agreements. Mr Truman's past determination to stand on the Baruch plan, which he declared to be "better than ever" after the Russian atomic explosion, has been one more "no through road" sign posted beside those erected by Mr Acheson. However, speaking in Virginia this week, Mr Truman made a concession to those who accuse the Administration of undue rigidity in the matter; he promised that "pride of authorship" would not prevent the United States from considering alternative plans if they provide an effective system of control.

Mr Acheson's problem is not merely to prevent Congress from bolting down a blind alley, but to mobilise its support for the long and expensive uphill effort to strengthen the free world to a degree that will encourage the Russians to come to terms. Mr Truman's speech outlined what must be done: rapid development of common defence plans with friendly nations; speedy application of the Point Four plan to assist undeveloped countries; completion of the European Recovery Programme; encouragement of American private investment abroad; and world-wide reduction of trade barriers. Though Mr Truman did not say so, domestic defence costs must remain high, if indeed the recent revelations of the Russians' strength on land and in the air, coupled with their possession of the secrets of the atomic and hydrogen bombs, do not drive Congress to increase the speed of rearmament. All these heavy and continuing burdens will hardly be assumed by a Congress convinced that the time has come to shed some of the load, unless the Administration can prove beyond a shadow of doubt that there is no alternative path to peace and security. Mr Truman's speech was the first shot in this campaign, which is expected to be carried on by Mr Acheson.

* * *

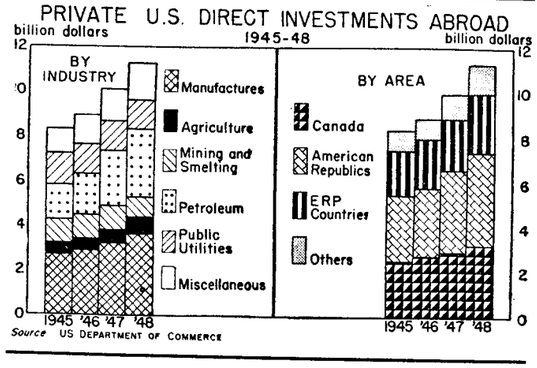
Communism and the Hiring Hall

The Supreme Court, by refusing to review a decision of a lower court, has in fact decided that the hiring hall, as operated by the seamen's unions, is incompatible with the Taft-Hartley Act's ban on the closed shop. Under the hiring hall system, the unions assign men to jobs on ships in rotation, but in practice, although not in theory, preference

is given to union members. The union fought hard and long to establish this system, but it has now become general and even the employers agree that it is an improvement over the old unregulated methods of hiring, unfair and often abused. The ship owners certainly do not want a strike over the hiring hall, especially in the present unhealthy state of their industry. Nor do they want to pay heavy fines for non-compliance with the law. But one or the other seems inevitable should the National Labour Relations Board try to enforce the Supreme Court's ruling, which is, incidentally, its first action on the Taft-Hartley Act. The evil day has, however, been postponed for a few weeks, as the National Maritime Union has asked the Court to review its decision. Meanwhile, Congress is showing interest in legislation to amend the Act as it applies to the hiring hall.

The Supreme Court's decision is particularly embarrassing to the officers of the NMU in their fight against Communism within their union, a point which they have naturally not been slow to make. They contend that, without the hiring hall, it will be impossible to keep Communists off the ships. Of more immediate importance, new arguments have been given to the agitators within the union, who try to discredit the right-wing leaders by alleging that they are unable or unwilling to protect their members' interests. These members have, nevertheless, recently confirmed the measures taken last autumn to drive Communism out of the union.

In Washington, also, Communism is being driven out of the Congress of Industrial Organisations. The CIO has just expelled four more of its affiliated unions, after hearings during which it was shown that their regular adherence to the party line was by arrangement, not chance. The Mine, Mill and Smelter Workers are the most important of the ejected unions; the others are the Food and Tobacco Workers, the Office Workers and the Public Workers. The CIO emphasises that, in expelling the unions, it is not expelling their 84,000 members. About half of them have already applied for admission to the CIO; where they can not be fitted into existing unions, new ones will be specially set up for them. This was done when the United Electrical Workers were driven out last November, and the new International Union of Electrical Workers has already joined battle with the old UE over the right to represent employees of the leading electrical manufacturing firms.



* * *

Private Investors and Point Four

President Truman has always insisted, and he repeated it this week, that his Point Four programme for the development of the world's backward areas depends upon private American investors for its success. Private investment is also supposed to play a large part in filling the dollar gap when Marshall aid ceases in 1952. Under the basic Point Four legislation, under-developed countries are to be helped to improve their health, education, transport, agriculture and so on, in order to create conditions favourable for American capital. Businessmen were not at all satisfied with this legislation in its original form, finding the scheme both too vast and too vague. A compromise version has now been worked out on a bipartisan basis and is expected to pass the House of Representatives with little difficulty. Its Foreign Affairs Committee has, however, fixed a ceiling of $45 million on expenditure under the Bill.

The compromise Bill lays down a number of conditions with which programmes of aid must comply. While it does not stipulate specific safeguards for private investors in under-developed areas, it does state, as a matter of policy, that they must be given confidence that they will receive prompt compensation if their property is confiscated, that they will be allowed to remit their earnings and withdraw their capital and that they will not be subject to unreasonable

interference or discriminatory taxation. Treaties of commerce and development, of the type now being discussed with a number of countries, are one of the best ways of establishing this confidence, although they may need to be supplemented with agreements on such matters as currency convertibility, double taxation and patent protection. Businessmen like this approach better than they do the investment guarantees which Congress is being asked to authorise the Export-Import Bank to undertake. American investors abroad also welcome

the proposals for tax reliefs on foreign earnings which the President, after much urging, has now put before Congress.

Even with these encouragements, it is still doubtful whether anything approaching the hoped-for $2 billion a year will be available for private investment overseas by 1952. Long-term American capital now abroad amounts to about $17 billion, much of it in direct investments, which have gone up by about $1 billion a year, on an average, since the war.

MEMBER OF FEDERAL DEPOSIT INSURANCE CORPORATION

This average includes reinvested earnings and is a good deal better than in 1929, the previous record year. But a large part of this postwar investment has been in petroleum development, now losing much of its attractiveness. An even larger proportion of the money has been provided by about a dozen of the 2,500 American companies with foreign branches, and it has come not from the general public but from internal sources such as uninvested profits.

* * *

One Fourth of a Nation

In 1937, when President Roosevelt made his famous reference to the third of the nation still ill-fed, ill-clothed, and ill-housed, there were over 12 million families receiving an income of less than $1,000 a year. The national income then was between $60 billion and $70 billion a year. In 1949, the national income was $210 billion, only $2 billion less than in 1948, despite the recession. Average family income was at an all-time peak, $3,200 a year, though most families probably were not much better off than during the war, because of high prices. Yet the problem of the under-privileged family, left behind by war and postwar prosperity, still persists. It is the subject of an inquiry by a sub-committee of the Joint Congressional Committee on the Economic Report, partly because such obstinate poverty affronts the American ideal of social justice. But the committee also fears that the low incomes of these families endanger national economic stability, and hopes that, if they can be raised, they will provide a new market for farms and factories, an economic version of the frontier.

LOW INCOME FAMILIES* IN 1948

(thousands)

By Sex and Colour of Family Head	Total	Under $1,000	$1,000-$2,000	$2,000-$3,000	$3,000 and Over
All families	38,530	4,020	5,580	7,950	20,980
Non-farm families	31,810	2,340	3,980	6,570	18,920
Male white	26,460	1,320	2,630	5,360	17,150
Male non-white	2,020	280	550	580	610
Female	3,330	740	800	630	1,160
Farm families	6,720	1,680	1,600	1,380	2,060
Male white	5,700	1,180	1,300	1,230	1,990
Male non-white	640	330	210	80	20
Female	380	170	90	70	50

* Omitting 8 million "single person" families.

A purely factual report, prepared for the sub-committee, finds that nearly 10 million families, one quarter of the whole, received incomes of less than $2,000 in 1948. One fifth of the nation's children are being brought up in this group. The sub-committee did not consider, however, that all these families were in want; it concentrated on the 6,300,000 urban families with less than $2,000 a year, and the 1,700,000 farm families with less than $1,000 a year. Farm families are estimated to have non-cash income of over $500 a year.

Without making any recommendations, the report recognises that poverty arises from a number of factors. Among urban families, old age was strikingly associated with low income; the heads of 1,700,000 families in the poverty group were over 65 years of age. Almost as large a number of the under-privileged families depended on the exertions of women, because of death, divorce, or desertion. These families need assistance of a kind very different from the "hard core" of 2,200,000 suffering hardship because the head of the family was unable to do anything but unskilled, or semi-skilled, work. Negroes, whose earning opportunities are restricted by bias and lack of training, are the support of 800,000 impoverished non-farm families. Non-whites in 1949 received, on the average, only half the income of whites, but this was a striking improvement from 1939, when whites received three times as much. Studies of the diets and housing of these families—2,000,000 of the urban families lacked even running water in 1946—suggested to the sub-committee that any steps to raise their incomes would provide a welcome outlet for farm surpluses and, if the housing boom flags, work for the builders.

The poverty of a quarter of the nation's farm families was closely associated with the smallness of farms, and the South was found to have the highest proportion of these small farms. But while the old South and other agricultural areas depressed before the war still lag behind the national farm-living level, it is noticeable that the Southern States recorded the largest percentage improvement during the war.

* * *

Smog in the Air

For thirty years or more, many American cities have been concerned about the unpleasantness of the smoke in their atmosphere, and the damage done by it to buildings and furnishings. But until eighteen months ago the danger to health had not been realised. Then the modern problem of smog (smoke plus fog) leapt into the headlines, when twenty elderly residents of Donora, Pennsylvania, died while a pall of smog lay over their industrial valley. The subsequent investigation reported that there had in fact been a connection between the two, although the exact pathological relationship was not clear. This may lead to a Congressional inquiry and perhaps to a federal statute on air pollution.

Smog is a problem, far from completely understood as yet, of air contamination not by smoke, but by the fumes and gases—sulphur compounds, chlorine and so on—given off by modern industrial processes such as oil refining, chemical manufacturing and metallurgy. These fumes cause acute physical discomfort, as is well known to the inhabitants of Los Angeles who have become accustomed, although not resigned, during the last few years, to streaming eyes and smarting throats. Lying in a basin between the ocean and the mountains, Los Angeles is covered by a semi-permanent atmospheric "inversion layer," which keeps its ever-increasing industrial effluvia from rising and blowing out to sea.

*

The city authorities, urged on by angry citizens who can no longer boast of their famous sunshine, have long been anxiously seeking a remedy. Corrective practices, such as filtering noxious elements out of plant emissions, are more complicated than those which have been developed for smoke abatement; they must be worked out separately for almost every industrial process and their effectiveness varies with weather conditions. Such installations are often very expensive and are sometimes opposed by industry for this reason. But, just as smoke control brings economy through better utilisation of fuel, so remedies for smog may be profitable; for example, one Los Angeles oil refinery is reclaiming $4,000 worth of sulphur dioxide a day. And just as smoke control means a saving to the general public in laundry bills, so smog abatement is worth a great deal to the community, especially one, such as Southern California, which has a valuable asset in its climate. Hollywood nowadays makes most of its films indoors, so they are little affected, but the smog has been known to obscure the screen at the drive-in movie theatres, and a layer of soot and sulphur can seriously damage fruit and vegetable crops.

Compulsory closing down of industry at times when the weather bureau foresees the likelihood of smog is a suggestion that businessmen do not welcome. The eventual answer probably lies in a better siting of industry to avoid concentration in an area where climatic and geographic conditions make smog likely. Los Angeles may be forced to choose between its past of being a heaven for tourists and old people and its present as America's fastest growing industrial city. The local Chamber of Commerce can, however, take some comfort from the fact that San Francisco also suffers from smog.

THE WORLD OVERSEAS

Soviet Trade with the West

IT has long been obvious that the Russians did not regard foreign trade as an end in itself, but as a means by which to achieve economic self-sufficiency and thereby to eliminate eventually the need for any foreign trade at all. In a *Pravda* article written in celebration of Stalin's 70th birthday, Mr Mikoyan, the Minister of Foreign Trade, recapitulated the Soviet view of the part foreign trade with the capitalist world should play in the Soviet system. He said that the state monopoly of foreign trade which Lenin and Stalin had decreed in 1918 had become the "steel shield of the Soviet economy." It had absorbed the shock of economic blows by which the capitalist states had tried to disrupt and destroy the Soviet socialist economy; it had also helped to accelerate the development of this economy by increasing the supplies of the necessary raw materials and machinery. Its character and volume, therefore, were bound to reflect both the level of Soviet economic development and the Soviet Union's political relations with foreign states. It is perhaps because their foreign trade is so closely linked with their economic and political plans that the Russians are so unwilling to divulge any information about it.

Soviet foreign trade has never comprised more than a very small percentage of world trade. At its peak in 1931 and 1932 it represented only 2.2 per cent and 2.3 per cent respectively of the total volume of world export trade; and only 2.7 per cent and 2.6 per cent of world import trade. By 1937 Russia's export trade had fallen to 1.3 per cent and its import trade to 0.9 per cent of world trade. Since the war Russian trade missions have been extremely active in their search for raw materials and capital goods with which to rebuild the Soviet economy, so that, according to Mr Mikoyan, the volume of the Soviet Union's foreign trade turnover during 1949 was more than double that of prewar. But this increase is entirely due to the growth "on a scale hitherto unprecedented" of the Soviet Union's trade with its satellites which has now swollen to two-thirds of the total volume. Trade with the rest of the world, on the other hand, decreased during 1949; with western Europe it decreased by about one fifth in value during the first half of 1949.

Stockpiling Rubber

Perhaps the most outstanding feature of this trade during the last two years has been the heavy purchases of certain raw materials, especially rubber and wool. In 1938 Russian imports of natural rubber were estimated at 26,811 long tons. In 1946 they amounted to only 9,500 tons; but they have since mounted steadily from 35,000 tons in 1947 to 100,000 tons in 1948 and an estimated 105,000 tons in 1949. By far the greatest part of these imports consists of Malayan rubber. In the autumn of 1948 the rubber world was startled by a Russian offer to buy the whole of Ceylon's 1949 rubber crop as well as all available stocks at a price 4 cents a pound above world prices. At the time this offer was regarded by many as a political gesture designed to placate Ceylon for the recent Soviet veto of its membership of the United Nations. Whatever the truth of this surmise the offer was rejected by the Ceylonese Cabinet. It is believed that Russian rubber imports are larger than are needed for its own immediate industrial requirements, especially as it has a large synthetic rubber industry. The Russians may have decided to build up stockpiles of rubber; or they may have been buying for distribution to the satellites as a counterblast to the Marshall plan.

The Soviet Union has also greatly increased its wool purchases from Australia and New Zealand, which before the war were negligible. During the 1947-48 season it bought 18.9 million lb. from New Zealand and 11.8 million lb. from Australia; and during the 1948-49 season 19.6 million lb. from New Zealand and 45.3 million lb. from Australia. The Russians have been less successful in their efforts to increase their tin supplies. The reference in the Anglo-Soviet trade agreement to "additional negotiations concerning the question of supplies of tin to the USSR" seems to have been a dead letter. Britain has been unwilling to supply tin outside the international allocations of the Combined Tin Committee to which the Soviet Union, unlike some of its satellites, has refused to belong. The signature of a Soviet-Belgium trade agreement at the beginning of 1948 was delayed for some time by the Russians' unwillingness to accept the Belgian refusal to supply them with tin.

Sterling Earned With Grain

Soviet purchases of rubber and wool have been largely paid for in sterling obtained by the sale of grain to Britain. Under the Anglo-Soviet trade agreement of December, 1947, Russia was to supply 750,000 tons of grain by September, 1947, in return for 25,000 tons of light rails and various kinds of machinery and equipment. The Russians more than fulfilled their grain contracts, but professed themselves to be unable to place more than a small proportion of their orders for British machinery and equipment. They were not slow to turn this to good account in their propaganda by comparing their own punctuality in fulfilling their commercial commitments with alleged British dilatoriness. At the same time they had large amounts of sterling with which to buy the raw materials they needed.

Negotiations for a long-term agreement between London and Moscow dragged on during the latter part of 1948 without any success. In March, 1949, therefore, the British Government formally suggested to the Soviet Government that talks should be resumed on a short-term basis. But these talks have so far proved equally unsuccessful; according to Mr Bottomley it has not yet been found possible "to agree on certain basic conditions for a formal trade agreement." A contract for 1,000,000 tons of coarse grains, to be paid for in sterling, as well as two small timber contracts, were, however, signed last August and September. Detailed figures of the Russians' trade with the sterling area are not available, but it is most probable that their purchases have been sufficiently heavy to make them glad to conclude these short-term contracts even if they do not wish to tie themselves to long-term arrangements.

It might have been expected that the Russians would have proved less exacting customers for British machinery and equipment since Russian trade with the United States has made such a spectacular drop during the last two years. In 1947 the total value of American exports to Russia was $149,504,000 (or one per cent of all United States exports). Of this, $35,013,000 was for metal-working machinery and machine tools. American exports also included freight cars, steam, electric and diesel engines. The number of tractors sold to the Soviet Union rose from 624 in 1946 to 1,599 in 1947. (It is believed that this steep rise was due to the Russian decision, after the enunciation of the Truman doctrine, to divert some of their tractor production back to tank production.)

But the American policy of restricting exports to eastern Europe in the interests of security inevitably led to a steep decline in American exports to Russia. During the first nine months of 1949 their value amounted to not quite $6,300,000, and it is estimated that the total for the whole year will not be much more than $8,000,000. In 1947 their value was well over $100 million. Soviet exports to the United States during the first nine months of 1949 amounted to $35,750,000 and their estimated value for the whole year is less than $50 million, compared with $78 million in 1948. The Russians did not at once retaliate against the sharp decline in American exports; in fact, for a time in 1948 they increased their shipments of chrome and manganese—the most important of their exports to the United States. It was not until last April that they started to ban exports of these ores to the United States, with the result that during the first six months of 1949 Russia supplied only 7.7 per cent of American manganese imports compared with 27 per cent during the corresponding period of 1948. Although the ban was lifted after a few months it is now furs, not ores, which earn most dollars for the Russians. Last September, for example, Soviet exports to the United States, which were worth $7,100,000 altogether, included $5,200,000 worth of furs and only $700,000 worth of chrome and manganese. But in November Soviet exports declined to $1,800,000, and its imports from the United States were worth less than $50,000.

The reason why the Russians have not reacted more violently to the American restrictions on exports to eastern Europe is probably that they are anxious to earn dollars, which it is believed they put to a number of uses. There is evidence that they make payments to third countries in dollars; it is rumoured that they exchange them for sterling in black markets; they may find it expedient to loan some to their satellites; and they certainly have very large "political" expenses for which dollars are useful.

(To be concluded)

Racial Tension in South Africa

[FROM OUR JOHANNESBURG CORRESPONDENT]

THE immediate cause of the recent native riots in the slum-like non-European townships of the Rand seems to have been the numerous police raids to enforce the pass and liquor laws. All South African natives, except a specially exempted minority, have to carry "passes" (which most of them cannot read) to prove they are in employment. A single raid may result in hundreds of arrests, because in recent years the populations of the townships have been enormously swollen by an influx to the urban areas in which the pass laws, at the best of times never very effective, have been trampled under-foot. Because racial relations in South Africa are now near breaking point, an arrest may be the signal for an attack on the police, and on other Europeans in the vicinity, by swarms of angry natives. What happens then was amply demonstrated at Newclare on February 13th.

The crowds threw up street barricades, smashed the street lights (which had just been repaired after a previous riot two weeks before), and stoned all passing vehicles containing Europeans. Next day, a strong force of police entered Newclare, like a minor military foray into enemy-held territory, and arrested over 250 natives. That night, the riots were resumed, spreading to adjoining townships. An ugly feature of an already ugly situation was that armed European civilians then appeared on the scene, gravely hampering the already harassed police.

Outbreaks of violence are becoming increasingly frequent on the Rand. A special Riots Commission is already investigating incidents at Newlands, Randfontein and Krugersdorp, and will now extend the scope of its inquiries to embrace Newclare. So far the police have used firearms as little as possible, but obviously this restraint cannot long continue. The Nationalist press is demanding the use of armoured cars.

What are the main causes of the recent sharp deterioration in relations between white and black in South Africa? Social and economic conditions have much to do with it. Urban native poverty is shocking. Enforcement of the hated liquor and pass laws by the technique of sudden raids and mass arrests has brought the law itself, and the Europeans who administer it, into disrepute even with normally law-abiding natives. Native leaders also blame the Nationalists' *apartheid* policy. But it is extraordinarily difficult to point to new repressive measures which might have brought things to the flash-point. The real trouble, so far as the Government's policy is concerned, seems to be that the Nationalists have unwisely echoed King Lear—"I will do such things: what they are yet I know not"—and have thereby created an atmosphere of tension, frustration and fear.

The word *apartheid* does not in itself imply repression. It means separation of races, and is difficult to distinguish from the "*segregation*" which the late General Hertzog invented and which he and General Smuts applied. The main changes proposed by the Nationalist Government are the abolition of the representation of Cape Natives in Parliament by three Europeans, and the removal of the Cape Coloureds from the common voters' roll and placing them on a separate roll. The European representatives of the natives would disappear from Parliament and their places would be taken by three European representatives of the Coloureds (which, incidentally, would enable the Nationalists to win Cape seats at present held by the United Party because of the presence of predominantly anti-Nationalist Coloured voters on the common roll).

But these moves, according to the Constitution, require a two-thirds majority in Parliament, which Dr Malan has not got; and though he now says that this provision was inserted at the time of Union in 1910 under "British pressure," his temporarily indispensable political ally, Mr Havenga, has dissuaded him from taking further action. For the rest, *apartheid* in practice has consisted mainly of pin-pricks. Non-Europeans who at some post offices in the "liberal" Cape used the same counters as Europeans now find themselves directed elsewhere. The same with entrances to railway station platforms. On Cape railway buses, an *apartheid* sign is now hung from the luggage rack. Non-Europeans sit at the back of the bus, Europeans at the front. But the sign is moved backwards and forwards according to the proportion of European and non-European passengers each trip.

Political Awakening

In protest against *apartheid*, the majority of the Cape Coloured Advisory Council resigned. But it was an ineffectual body anyway, much disliked by the politically awakened coloured people. The Government has refused to call together the Natives' Representative Council, a similar body consisting mainly of African intellectuals, and says it intends to replace it with several decentralised councils, "with due regard to ethnic and tribal affiliations." The Nationalists have little time for highly educated natives like Professor Z. Matthews, a prominent member of the NRC, who cannot be classified according to tribe. The whole tribal concept, at a time when hundreds of thousands of Africans are working in factories and forming trade unions, is nonsense.

But even the liquidation of the NRC scarcely alters an existing situation. For the Council went into recess at the time of the gold mine strike involving 50,000 natives in 1946, accused the Smuts Government of "breach of faith," and has since met only under protest and only in order to adjourn itself again. General Smuts offered an enlarged Council with increased (but vaguely defined) powers and the Council said it refused to be "fobbed off with superficial reforms." That is why the Nationalists, in announcing the Council's demise, were able blandly to declare that they "agreed with the Natives' Representative Council's own view that it could serve no useful purpose." And in fact it did not, because though it was supposed to be consulted about native legislation, Parliament never once took its advice from the time it was created in 1936.

But though the Nationalists have so far not done very much to the non-Europeans, they have talked a great deal about them, loudly and in public, and what they have said has seldom been pleasant. Mr J. G. Strydom, the powerful Nationalist leader in the Transvaal, talks about the Africans as if the Voortrekkers were still being attacked by savage tribes. A Ministerial colleague was reported to have referred to "Kaffirs, coolies and Hottentots" (he subsequently denied using the first two epithets but stuck to the Hottentots). Senator Verwoerd, on the day the new Newclare riots began, declared that "a native can be happy in circumstances that would make a European deeply unhappy." During the debates on native school feeding, which the Nationalists have cut down and threaten to abolish, many Nationalist speakers made it clear that they regarded natives as helots who were being ridiculously pampered. Hardly any Nationalist speaker ever fails to refer to the peril overhanging "white civilisation"—the peril is the non-Europeans, who comprise four-fifths of the population. Dr Malan and others have occasionally tried to offset such luckless remarks by protestations of friendship for non-Europeans, but without much success.

Though most natives cannot read, the few who can soon spread word of what is going on. The majority of natives are keenly interested in what the Nationalists and other Europeans are saying about them. There was dissatisfaction under the Smuts Government; educated natives know all about the Atlantic and United Nations Charters and the great shift in race relations taking place in the world. But they also remember that General Smuts told the Natives' Representative Council:

> The situation in South Africa is changing very rapidly and on a very large scale. The Government is not for going backward, but for going forward. There, gentlemen, is where I want you to be helpful. The Government knows that native opinion is advancing as well as European opinion. We must carry our whole population of all colours and races with us in this forward movement. Let us be patient. Let us not get angry with each other. Let us appreciate the good faith of each other. We must work together. There is no other way. Bantu and European came to this country at the same time, you by land, we by sea. It is our country; it is your country. Let us face the future in faith and hope and charity—there is no other way for us. Let us look on each other as friends.

It is the contrast between this spirit and the spirit which has increasingly manifested itself since May, 1948, that is at the root of most of South Africa's race problems today. There was not only a change of Government, but a change in basic philosophy.

Recovery in the Year of the Tiger

[FROM OUR TOKYO CORRESPONDENT]

ACCORDING to ancient Oriental astrology, this is the Year of the Tiger in Japan, a year of violent change, of courage, of savage enterprise, of daring leaps to success. All these mystical portents are certainly supported by the prosaic forecasts of General MacArthur's and Prime Minister Yoshida's soothsayers. There is a buoyant spirit of optimism in governmental and industrial circles. Even the news of a drop of more than $100 million in US aid (from $440 million to $320 million) has not dismayed the democratic bankers, who are eagerly discussing the advantages of a wider geographical range for exports and imports.

Trade contracts were booming in the closing months of last year, the Year of the Ox. Export contracts concluded in November were valued at $65 million, compared with $30 million in October. This brought the estimated aggregate of export contracts for 1949 to more than $500 million, or approximately double the contracts for 1948. So strong has been the demand for cotton textiles that 47 million square yards of the 177 million square yards originally intended for domestic use during January-March were diverted to export markets.

American aid has been progressively shrinking. The proportion of US commodities imported by Japan has dropped from 76 per cent in the second half of 1947 to 58 per cent in the first half of 1949, and the process is continuing sharply. This development, combined with the lifting of most Occupation trade restrictions and the planned diversion of Japanese food imports to sterling and nearer Oriental markets, has widely dispersed Japanese trade. Contracts were signed with the sterling area (£143 million), West Germany ($25 million), Argentina ($80 million), Thailand ($90 million), Sweden ($7,000,000), Burma ($21 million) and Uruguay ($5,000,000), and negotiations are at present in course with Hongkong and Egypt.

Restrictions on Shipping Raised

On the heavy industry side, Japan has successfully contracted to build nine 2,000-ton tankers for Brazil and rolling stock to the value of $4,300,000 for Thailand. Fresh impetus has been lent the iron and steel industry by a contract for 70,000 tons of Kailan coal, released by the Chinese Communist Government at four pounds a ton, or about half the lowest price for American coal. This coal contract was, significantly, negotiated through a British firm which, for the first time since the war, will provide a ship or shipping on charter to the Japanese Government.

Already a saving has also been made of $20 million a year by importing crude, instead of refined, oil for local refining. The development of domestic power resources, with American capital, and the proposed extension of Japanese fishing grounds below the Equator will help greatly, too. Another vital concession has been the unilateral American decision for the reconstruction of Japan's merchant marine fleet, which will be built up to two million gross tons. With the Rising Sun flag on the seven seas once more, further cuts can be made in the cost of handling and shipping foreign imports. The Japanese expect ultimately to gain indulgent Occupation approval for the construction of four million gross tons of shipping. In the textile field, they also expect eventual permission to double the existing maximum battery of four million spindles for cotton spinning.

The transformation of the year will be the gradual shift of food sources for Japan from the United States to south-east Asia, India and Indonesia. This arrangement will be based on barter, although American funds may also be used in the initial stages. The result will undoubtedly mean a great boost to Japanese economy. Exports and imports, mounting and more widely diffused, will need to be dragged into a rough balance, which will have profound repercussions throughout all Japanese industry.

Baldly, Japan needs to make a gain of real purchases from abroad to a value of at least 120 million dollars—representing the decrease in American aid. But actually, as the Japanese well realise, local industry must of course be stimulated to make these purchases, while greater freedom in trade and wider choice of commodities will increasingly develop.

Only experience will show the extent and speed of

co-operative inclination in Japan's prospective new markets. The present prospects are favourable for Japan. But as Mr Acheson said in Washington, "The willingness of some countries to receive Japanese goods has very much contracted since the war. . . . These problems have got to be faced and solved. Whether they are solved along the lines which permit the Japanese freedom—complete freedom if possible—to buy what they need in the world and sell what they have to offer on the mainland of Asia, in south-east Asia and in other parts of the world—this is the nature of the problem and it is a very tough one."

Over and above all these challenges, aims and opportunities of the Year of the Tiger, the Japanese, burning bright, continue to eye the great China market with hopeful appetite, trusting that Cominform disapproval of the local Party does not mean also Chinese disapproval of the local market. And, in the background, rises the growling clamour for devaluation of the yen.

India and Pakistan

[FROM A CORRESPONDENT IN NEW DELHI]

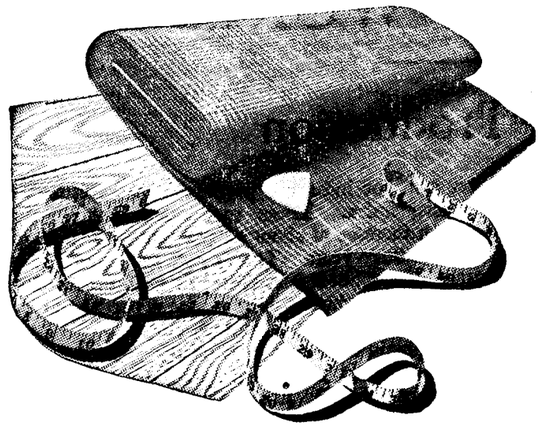
THERE is little hope left in India that Uno will ever be able to solve the Kashmir tangle. Mr Nehru, at his last press conference, could only justify reference of the dispute to the Security Council by saying that, at any rate, it did prevent war in 1948. He was indignant, too, about "attempts being made to bring pressure on us, especially in regard to Kashmir," for reasons not connected with Kashmir.

Three assertions can now be made, with some certainty: (1) the Kashmir solution will be found in private discussions round a table in the Indian sub-continent—not at Lake Success or anywhere else; (2) there is now a greater readiness on both sides, despite public utterances, to regard settlement on the basis of partition of Kashmir as inevitable, with Jammu and Ladakh going to India, Mirpur and Poonch to Pakistan, and the Kashmir Valley by plebiscite (India, having given the impression that it has come to stay, has been gaining ground lately with the Kashmiris, who abhor the prospect of more changes and uncertainty); (3) neither side can afford politically to be the first to suggest solution by partition. Perhaps, after the General Election, a lead in that direction by whoever is then the British Prime Minister would be welcomed by both sides.

Although political estrangement between the countries is now at extremes, and the last slender economic ties are snapping one by one, the omens this month are probably more favourable than for many months past for the settlement both of the main political and economic issues. This paradox is explained by the fact that not far below the surface of mass prejudice and passion there runs a steady current of understanding and friendship between numerous individuals on both sides of the border. When public relations are most dark, it is these personal bonds that keep the possibility of reconciliation just round the corner.

Friends on Both Sides

Recent visits to India of Mr Faruque, Chairman of the Jute Board, and Mr Ghulam Mohammad, Pakistan Finance Minister, both of whom have many friends on this side, have not been in vain. Mr Ghulam Mohammad's private visit to New Delhi may, or may not, have been a follow-up of informal, Bevin-inspired meetings with Nehru at Colombo (at which there was plenty of cordiality, but no business done); but, at all events, it has given rise to hopes that sometime in the next six weeks there may be official talks for a revival of the commodities exchange agreement and talks between the two Prime Ministers to cover the whole range of issues in dispute. Any renewal of the commodities exchange agreement of last May, which would cause even a small volume of trade to flow again, would be a substantial gain. But it should not be assumed that it would involve any recognition by India of the Pakistan exchange rate, or upward adjustment of the price of raw jute. On both these issues India stands firm.



An agreement, if reached, would be a barter agreement. India will probably insist that it should not be limited to an exchange of coal for jute, but that it should cover the whole field of commodities entering into Indo-Pakistan trade. Here India is on strong ground. Supplies of coal were not stopped until Pakistan held up India's own jute, some of which had been bought in East Bengal and some of which was in transit from Assam. Now, a month after Pakistan agreed to release this jute, less than half has been released, and less than one-tenth has reached the Hooghly. Pakistan is feeling the need for India's coal, while India's main difficulty is not the lack of Pakistan jute, but the transport of its own jute to the mills.

Problem of the Two Rupees

It is true that even a barter agreement would require a standard of valuation, which when agreed would itself suggest a practical exchange ratio; but this valuation would have to be based on a rate much nearer to India's than Pakistan's, or there will be no agreement. India could do with some Pakistan cotton and grain but is by no means desperate for them. The only reason for suggesting that India may be prepared to move any distance at all to meet Pakistan in a notional revaluation is this: there is a feeling in some quarters that devaluation of the rupee by 30 per cent was more than was strictly necessary, but that, as in the case of sterling, it was better to go all the way back, and recover ground as occasion offered, than to retreat by a series of short stages. The recent signs of improvement in India's balance of trade may justify a small advance. Also, the economies of the two countries being so closely interlinked (despite a recent tendency to put the accent on self-sufficiency and separate economies), a parity between the two rupees is highly desirable. But parity is not likely to be found at either end of the present yawning gap.

There are two points on which India feels that some misunderstanding exists—both appeared in *The Economist* in the article on "The Jute Quarrel" on December 31, 1949. The first is that, in refusing to recognise Pakistan's exchange rate, India is actuated by some motive of prestige or pique. It is sometimes argued that, when nearly every other country has recognised Pakistan's rate, India is being purely obstinate in standing out against it. But, since 60-70 per cent of Pakistan's normal trade was with India, India stands to lose far more than any other country by recognising a rate which, as it genuinely believes, time will show to be overvalued. Why should Pakistan be allowed to find out its mistake at India's expense? Is there any reason to suppose that, if India had recognised the Pakistan rate, Pakistan would not, in the first few months, have sold dear and bought cheaply all it needed, mainly at India's expense, and devalued later, at convenience?

The other point arising out of the jute price "war" concerns the increase by India of export duty on hessian goods from Rs.80 to Rs.350 a ton, simultaneously with fixing maximum prices for various grades of raw jute. This, it is argued, shows clearly that there is room, by lowering the duty, to offer a higher maximum price, at any rate for the better grades of raw jute, and still produce hessian economically. But hessian is only 30-40 per cent of the product of Indian mills, and nearly all of it goes to hard currency countries, to whom, despite the big increase in duty, the price is still cheaper than before devaluation. The duty, in fact, merely diverts from the exporter to government the greater part of the advantage of devaluation. If Pakistan wants the grower of jute to benefit, the removal of Pakistan's own export duty on raw jute demands attention first.

NICKEL AND CLOTHING

Do you know that nickel plays an important part in the production of our clothing? Take wool, for instance . . . the equipment used on the sheep farms, the plant for producing the yarn, the tanks for dyeing it, the machinery for weaving it into fabrics, even the sewing machines — in all these nickel is present, toughening and strengthening the metals used in their construction, making them staunch against the attacks of wear, corrosion and heat. Thus nickel is contributing to the efficiency of the tools and equipment with which Britain is achieving her recovery.

SIMON ENGINEERING GROUP

This organisation has lived for seventy years not only by first-class engineering but by enterprise in getting and developing good ideas. Simon-Carves introduced the by-product coke oven into Britain in 1880 and the Baum coal washing process in 1900. Henry Simon built the world's first automatic roller flour mill in 1881. Simon Handling Engineers built the first successful pneumatic grain and coal handling plants. Tyresoles Ltd. introduced the "Tyresoles" tyre-retreading process into Britain and twenty other countries. These and other Simon specialities, constantly developed with vision and enthusiasm, have increased efficiency and economy in numerous branches of industry.

Facts about Production

A high standard of economic argument is not to be expected at election times, and there has been no lack of superficiality and irrelevance in the appeals and claims which have been put before the electorate in the past few weeks. In particular, some of the arguments about the increase in British production have been light-hearted. Almost every Labour candidate, from the Chancellor of the Exchequer downwards, produced the claim that "production is 30 per cent above the prewar level"; the President of the Board of Trade is reported to have gone ten better in his electoral address by claiming that "national production is 40 per cent above an average prewar year." Nobody has paused to admit that these are comparisons of figures, or to examine how closely the figures correspond—or can be made to correspond—with real things. The statisticians in the Central Statistical Office have frankly stated that

> it is impossible to obtain an exact measure, and difficult to obtain even a rough idea, of the comparative levels of production before and after the war.

The figures show different results according to the choice of index and the period of comparison.

The danger of this carefree bandying about of figures is that it may bring the index numbers of production, from which the "comparisons" are derived, themselves into disrepute. Unwarranted application of the production indices or unjustified assertions about their properties represent a prostitution of economic knowledge; they also defeat themselves by the sheer strain which they put upon credulity. To say that "production" has increased by *x* per cent involves a definition of what "production" means, how it is measured, and the resources which it has used. The question whether a government is entitled to take credit for what the figures show can then become a matter for sensible debate.

★

There are two indices of production; one is the official index compiled by the Central Statistical Office, and the other is an independent index compiled by the London and Cambridge Economic Service. Both are concerned only with industrial production, and hence each covers, in varying extent, only part of the total output (industrial and non-industrial) of the economy. In fact, more than half of the national output (including farming, transport, distribution, public administration and various services) is outside the purview of the two indices. It is possible to conceive an index of total output (industrial and other) but in practice the compiling of such an index bristles with difficulties. It involves the extension of an index based on physical measurement into a field where the data are incomplete. How does one measure the physical output of the armed forces or of the banking system? Guesses and first approximations can be made. For what it is worth, privately assembled evidence suggests that non-industrial output may have increased by about 2 per cent since 1946, compared with an increase of 29 per cent for industrial production as measured by the official index. These two index figures would suggest an increase of about 14 per cent in total output in the past three years. This is not, and cannot be, an accurate figure; but it does show that claims made about the progress of industrial output give a partial and rosy view of the course of total national output.

But the main argument rests on the measurement of industrial output. Table I compares the course of the official index with the London and Cambridge index, both based on 1946. The movements of the two indices in the past three years have shown the same trend, but an appreciable difference in amplitude. The gap between them is tending to widen, which suggests that a persistent statistical bias is at work. Such a bias might arise from the weighting of the two indices—that is, from the relative importan[ce] which is given to the individual compo-nents in wor[k] on the total result. But examination of the two ir[dices] does not suggest that their divergence is due to differe[nces] in weighting. All index numbers are in the nature o[f a] sample, based on data which happen to be available or [are] chosen in preference to other data. To compile an inde[x of] industrial production involves the selection of indicators which are representative of particular sectors of industry and the weighting of them according to their contribution to total output. The official index uses about 400 separate indicators while the London and Cambridge index uses about 250. The compilers of the London and Cambridge index have estimated that about half of the weight of the official index is covered by indicators which are common to both indices. Another area of common coverage—perhaps one-tenth of the whole—consists of figures of production by value (not physical volume), which have to be corrected by difficult price adjustments to arrive at movements of volume. There are also activities which are excluded by definition from the London and Cambridge index—among them munitions output, repair work of various kinds, and other output. These differences of range and treatment might be expected to lead to differences in the final result. There are grounds for supposing that the London and Cambridge index has a slight downward bias, but that the official index has an upward bias.

The linking of the indices in Table I with prewar figures is a complicated statistical exercise. It is difficult to get comparable and representative figures for the same sectors of industry for both post and prewar years. Then the problem arises of the proper system of weighting to use. Should this be designed according to the relative importance of the component series before the war or after the war? The choice makes a great deal of difference to the result, as Table II clearly shows. The official index (1946 = 100) gives a figure of 88 in 1935 when 1935 weights are used, and 95 when 1946 weights are used. The London and Cambridge index gives 95 and 102 respectively. Thus for each index the choice between 1935 and 1946 weights results in a difference of 7 points

in the reading for 1935. So there is a double set of favourable options for anyone who wants to put the best complexion on the increase in industrial output during the last decade. First, the official index puts prewar output considerably lower than the London and Cambridge index. Secondly, the choice of 1935 weights gives a lower figure for prewar output in both indices than the choice of 1946 weights. This is a statistical result which has no bearing on actual production, and it arises only because the products of which output increased between 1935 and 1946 rose less in price than products of which the output fell. The "30 per cent" school assume that it is permissible to use both the 1935 and the 1946 weights, and they get their result by comparing the average index figure of just over 100 for 1935-38 with the 1949 figure of 129. If they were to use the 1946 weights alone, the increase would be from 104 to 129, or 24 per cent. But if the London and Cambridge index is used (1946 weights) the increase would be from 111 to 124, or only 12 per cent. A comparison of the two indices, using 1946 weights, and a 1935-38 base, is given in Table III. It is of some interest that the averages for 1935-38 and the year 1938 itself are identical; but 1938 can be taken as a "representative" prewar year only at the expense of ignoring the moderately good year 1937. The use of that particular year as a basis of comparison for the increase in industrial production in the twelve years which followed would lead to much less impressive conclusions.

★

If the measurement of total industrial output is beset with difficulty, the accurate ascertainment of changes in productivity is even more hazardous, particularly over a span of years. In the simplest type of calculation, the index of production can be divided by an index of manpower; a residual index is left which for rough and ready purposes gives an index of the trend of output per man year. There are many statistical reservations in the use of such an index of productivity—it can be radically affected by changes in the amount of work in progress (as between 1946 and 1947, for instance) and by differences of the composition of the labour force. For comparisons over a relatively short period, such indices of productivity have their uses, but they are for illustration rather than precise measurement, and they are less reliable than the original constituents of production and manpower. The calculations in Table IV are, therefore, to be regarded as moderately (though not wholly) reliable for the purposes of comparison between 1948 and 1949, but as extremely tentative for longer comparisons, particularly with 1938. It would, for instance, be difficult to argue from the result to which the choice of the London and Cambridge index for this purpose would lead that productivity per man year has actually fallen by two points during the past eleven years. That conclusion is as repugnant to common observation as the opposite conclusions that total output has shot up by 30 to 40 per cent in the same period. The past decade has seen major structural changes in certain industries and a considerable investment in new plant; the advantages of such changes cannot have been wholly thrown away by addiction to old ways and slackness of effort in other industries.

If the official index is used, the results suggest an improvement in industrial productivity per head of rather over 5 per cent last year, and the London and Cambridge index one of rather less than 5 per cent. Given all proper reservations about the calculations from which these estimates are derived, they remain remarkable. Closer examination (on the lines in the latest Bulletin of the Oxford Institute of Statistics) suggests that manufacturing industry has done even better than the average index suggests, mining less well, and that the utility industries have slipped back. But the Bulletin suggests that the industries which scored a major increase in productivity of more than 10 per cent last year (vehicles, precision instruments, wood and cork products and paper and printing) have done so largely because of easing of particular shortages such as wood and steel. The Bulletin's findings list a number of important industries which appear to have made little or no progress in the past year towards higher productivity—among them china, bricks and cement, chemicals, engineering, non-ferrous metals, textiles and the drink and tobacco industries.

On all these questions of measuring production and productivity there is room for endless statistical debate. The two production indices have their valuable uses, properly understood. But they do not lend themselves to the kind of argument which has been a feature of the election campaign. The question is not whether the figures prove that there has been an increase of 30 per cent in industrial output in the last eleven years (which they do not); it is whether British industry can score a genuine increase of this order in the decade of the fifties.

The Development of New Drugs

A LETTER sent in January by the Ministry of Health to all doctors in the national health service aroused some concern among the manufacturers of drugs. It suggested that doctors might bring about economies in the service by using, in their prescriptions, the nomenclature of the British Pharmacopoeia and not the names which manufacturers place on their own preparations. The manufacturers who are disturbed are not those who make "patent medicines" and hawk them to the public by lavish advertisement. They are manufacturers of drugs which are not publicly advertised and are therefore supplied only on a doctor's prescription or instruction. They find the letter disturbing because to them the right to use trade names is their reward for undertaking the heavy risks and responsibilities peculiar to their industry.

About 52 British firms, employing 80,000 people, are engaged in the manufacture of drugs. Probably only ten of them employ more than 2,000 people; among the smaller ones, several are subsidiaries of foreign companies. Some of the larger firms—ICI, the Distillers Company, Monsanto Chemicals, and others—are primarily heavy chemical manufacturers. Others (such as Boots Pure Drug Company, British Drug Houses and May and Baker Ltd.) produce a growing proportion of fine chemicals which are not pharmaceuticals. Many firms have a dual function. They make certain drugs themselves, but buy many others in bulk and apply their specialised knowledge to compounding and packing them. This last branch of the trade arises from the fact that the economic scale on which most drugs are produced tends to be so large in relation to the market that one or two plants are usually sufficient. There are only four British producers of insulin, and although Roche Products are the only producers in Britain of Vitamin B_1, more preparations containing this vitamin are sold under the names of other firms than under the maker's name.

*

A firm anxious to maintain its position in the pharmaceutical industry must be prepared to spend and go on spending very large sums on research, knowing that the odds are weighted against any single research project yielding a return. Average research expenditure per head employed in manufacture works out at about £80 per annum. Each qualified scientific worker employed together with his assistants and equipment, costs between £3,000 and £10,000 a year, and the annual expenditure of an average large firm on research and development runs well into six figures. Those which cannot spend on this scale base their production on a narrow field in which they hope that specialised knowledge will give them an advantage. The British subsidiaries of large foreign undertakings draw on the research of their parent companies.

A firm spending at this rate may expect to achieve one really important development every four years or so. Whether this degree of success is reached in practice depends on the acumen with which research is directed. On several occasions a promising development has been overlooked because it had no bearing on the immediate programme in hand.

When scientific research suggests that a material may have medical possibilities, plans are made for producing it on a scale which will provide enough for trials first with laboratory animals, and later under clinical conditions with human subjects. When (as often happens) the material first becomes known through research in a non-commercial institution, the co-operation of a pharmaceutical firm is sought as soon as the trials start. These stages can take up to five years, and at any time during this period the development can take an unsatisfactory turn through the appearance of "side-effects"—that is, the drug may cure the disease but impair the health of the patient in other ways. Sometimes the Medical Research Council is asked to help with clinical trials or initiates them itself. In other cases the firm prefers to make its own arrangements.

*

Long before the clinical picture is complete, a decision has to be made on the type and size of the plant which would be needed for commercial production. Expensive mistakes can be made at this stage if too sanguine or too cautious an interpretation has been put on preliminary clinical evidence; such interpretations are made in the knowledge that they can at any time be reversed by later findings.

When early clinical trials are successful, manufacturers come under pressure, which is often ill-advised, to go into production at once on as large a scale as possible. In the United States, where the capital resources of manufacturers are far larger than in Britain, managements often feel justified in responding to this pressure. Individual firms can spread their risks sufficiently widely to take chances and the rewards of being the pioneer in a new field are very great. Such a firm gains the prestige which will maintain its reputation. Apart from commercial goodwill, a high reputation increases a firm's chances of being approached by scientific workers when they want help in developing a new project. If the plant is large enough to supply the entire market, and the process well covered by patents, a firm may have no competitors. But such a position of supremacy, once gained, can only be maintained by constant research. Many a firm has lost its predominance in a product because a competitor has developed the drug on the basis of the published scientific literature to a point not covered by the patent, or has found a different, and cheaper, route to synthesis.

This is as true in Britain as in America, but British firms are finding it more difficult to meet the cost of a new plant. If the size of the effective dose or the quantity of raw material needed to produce a given amount of the drug is relatively large, then it may cost from £250,000 upwards to bring the project to the point of commercial production. The ceiling is probably the £750,000 to £1,000,000 spent on each of the two big penicillin plants, because in that case both factors were extremely important. These were exceptionally large expenditures.

The financial risks of delay are as great as those of precipitate action. The managements of big British firms

are worried about a tendency, to which they sometimes give way in spite of themselves, to postpone the final decision until trials have gone on a little longer. If a competitor goes ahead, this indecision costs them what may have been the first opportunity for years to recover some of the sums spent on unfruitful research. Small firms developing a new product of their own have often to bring in other companies to assist in financing it, but in future they may be able to go to the National Research Development Corporation for financial backing in return for their patent rights. Nevertheless, if capital becomes as scarce as some firms expect, there will be a good argument for amalgamation among manufacturers.

*

These problems are in the forefront because trials are now in progress with drugs that promise to bring a series of revolutions in pharmaceutical practice each as dramatic as that caused by the sulphonamides before the war. The sulphonamides themselves have led Burroughs Wellcome Ltd to the recent development of the sulphones, one of which is a cheap, rapid and painless cure for leprosy. Developments have also been made in anaesthetics, sedatives of all kinds, and chemicals for promoting or reducing the coagulation of the blood and for the treatment of various allergic conditions including asthma.

The change now in progress started with the isolation of the antibiotics. The most remarkable feature of penicillin was the range of disease organisms which it destroyed. Chemists now surmise that there is a spectrum of antibiotics which together can destroy any disease organism—unless or until the organisms themselves develop strains resistant to the drug. There is growing concern over the reports of organisms developing resistance to penicillin; when streptomycin was first used against tuberculosis the growth of such resistance organisms was so rapid that it was thought that the drug might become ineffective. Recent experiments with a combined dose of streptomycin and PAS (para-aminosalicylic acid) seem to overcome this difficulty and although the clinical trials are by no means complete, a factory is being built at a cost of £100,000 for the production of PAS. Streptomycin has now been produced on a large scale in Britain for some time.

Streptomycin attacks a number of disease organisms immune to penicillin, and a third antibiotic, aureomycin, is said to go even further. Only very small quantities are available in this country but reports from the United States suggest that it may be as effective against disease as a fourth, chloromycetin, which is in production and a new factory for which is being built by the English branch of the American firm of Parke, Davis. This fourth material not only overlaps the field covered by the other antibiotics, but may also be effective against a range of organisms, including some viruses, which have been untouched by any previous drugs. Of all the antibiotics so far isolated, it is the first to have a simple enough chemical structure to be produced by organic synthesis and not by deep fermentation. The clinical trials of these materials, and the laboratory reports on other and even newer antibiotics, are being followed with great interest because, if they are as effective as first experiments suggest, there will be room for more than one producer. Several British firms were left out of the penicillin market when production changed from surface culture methods to deep fermentation because it took them too long to develop a fermentation process which did not infringe the American patents governing the processes used in the two big British plants.

A growing range of vitamins has been in production for many years, but these were mostly used only to compensate for deficiencies in natural sources of supply. It now appears probable that their use can be extended to the definite treatment of a range of diseases which are or may be caused by various deficiencies. The line of development is not so clear as in the case of the antibiotics because, although it is known that the body requires certain chemicals, it is by no means certain how it uses them. One important step in this new direction was made by the isolation of vitamin B_{12}, the principle which made raw liver an effective treatment for anaemia. British Drug Houses extract vitamin B_{12} from liver concentrate. Glaxo Laboratories produce it by partial synthesis, i.e., neither extracting it from the liver nor building it up chemically, but producing it by fermentation of a natural product. The indications are that in addition to its value for the treatment of anaemia, the vitamin is essential for the absorption of protein by the body. In America this aspect is being developed as a means of accelerating the growth of poultry and pigs.

The hormones offer analogous possibilities. Some of these are produced synthetically; others, like insulin, can only be obtained from natural sources. Among the second class are products of the adrenal and pituitary glands, cortisone and ACTH (adrenocorticotrophic hormone) which promise such dramatic results against rheumatoid arthritis and may be applied to other intractable diseases, which may prove to be caused by functional

CHARACTER IN BANKING

The banking House of Glyn, Mills & Co. has developed over nearly two centuries, and its activities now extend to every part of the commercial world. Its service is nevertheless still that of a private bank, keeping personal and friendly contact with each customer, and ready always to help and advise on the financial problems arising from the technique of modern business.

GLYN, MILLS & CO.
BANKERS
HEAD OFFICE: 67 LOMBARD ST., LONDON, E.C.3

Williams Deacon's Bank, Limited

deficiencies of the body, with equally striking effects. These two drugs are on the way to becoming a classic example of the scale of the gains and losses which can be made in this industry. Since natural supplies are too limited to form the basis of production, work is going on with varying success in many laboratories either to reproduce the drugs by synthesis or to find chemical alternatives to them. At the same time, supplies for trials are so restricted that there is only meagre evidence to show whether the work is following the right lines. In Britain the work is particularly handicapped by the lack of an organised collection of pig pituitaries (needed to make ACTH) at the abattoirs. Organon Laboratories, Ltd., the Dutch-owned firm making ACTH in Britain, estimates that production is "very many times" smaller than it need be. The commercial uncertainties of this work have been brought into relief by recent Swedish reports of the results obtained by using, alternatively, a synthetically produced chemical of the adrenal gland in conjunction with vitamin C. The chemical in question, produced by the same Dutch firm, has been in use for quite different treatments for many years. Until the experiments with cortisone, the hormones had been used (like the vitamins) only for the treatment of deficiencies. It now appears that they have a place—perhaps an extremely important one—in the specific treatment of disease, and the impression is strengthened by the growing realisation of the importance of the control of many chemical processes in the body by the pituitary through the medium of other glands.

In the general interest aroused in the opportunities of these new developments, there is a serious risk of excess capacity. Both British and American firms were encouraged to export in the years immediately after the war, to meet the needs of areas where productive capacity had been destroyed or which were deprived of their customary supplies. Now British firms report that in South Africa American companies are selling drugs such as penicillin at prices well below the cost of production in order to dispose of what has become surplus output. When firms in Germany and other countries are back in full production, serious over-production of some basic drugs is expected. There would be no problem if a means could be found of reducing the administrative costs of giving medical treatment to the populations of backward countries. Drugs exist for adequate treatment of tropical diseases, but the cost of administering them is too high. Therefore the best outlet may well lie in the expanding field of veterinary medicine. Much that is learnt of human disease can be applied to animals, and, as good stock rises in value, farmers are prepared to pay for the immunisation of the young animals, for the treatment of mastitis with penicillin and for hormone treatment to overcome the tendency to sterility in pedigree stock.

Business Notes

"Fooling about with Politics"

This "demure" election has happily been almost free from those irresponsible and malicious attacks on the City and its institutions which Dr Dalton's characteristic outbursts of a few weeks ago seemed to have been foreshadowing. The rash critics apparently saw the wisdom of keeping silent at the hustings. Among the leading spokesmen only Mr Herbert Morrison brought the Stock Exchange into the arena, and this he did wholly without malice and even with tolerance, blundering out of sheer ignorance. Probably no one was more astonished than he at the swift effectiveness of the *riposte* which he drew from the "House" itself. But wild or unconscious disparagement rooted in misunderstanding is far more likely to deceive than all the noisy blusterings and speciously "informed" arguments of a Dalton. Mr John Braithwaite, the Stock Exchange chairman, merits congratulation as much for his decision to retort speedily in this case—after greeting earlier and more flagrant assaults with contemptuous silence—as for the decisive vigour of the retort itself. The City's tributes to this initiative, delighted though they have been, cannot equal those of the Labour spokesman. They have not spoken again.

Mr Morrison had remarked that "most working people tolerantly regard the work of the Stock Exchange as being rather in the same category as horse racing," accepting stockbrokers as they accept bookmakers. No doubt they do; and the cause lies as much in the pitiful inadequacy of the "House" in explaining itself as in the misinformation spread by propagandists, mainly—though by no means wholly—of the Left. Mr Morrison's fault lay not in this utterance, for he does not believe it himself: he "presumes the Stock Exchange has useful functions to discharge" and says "we ought to recognise that in our money and industrial system such an institution may well be necessary." For an election speech, this was tolerant and sensible. But then ignorance betrayed him into saying, more in sorrow than in anger, that the Stock Exchange "fools about being influenced by politics . . . I would urge them not to allow the political straws to affect investments."

* * *

The Animal Defends Itself

This gave Mr Braithwaite his opening, and he seized it with both hands:

> It is quite true that prices are influenced by the ebb and flow of opinion as to the result of the election as they are by every form of news and opinion on domestic or foreign affairs that has any bearing on the investment market. . . .
> What Mr Morrison seems not to understand is that movements of prices are not made by the whims or wishes of members of the Stock Exchange. They are the result of the actions of countless individuals and institutions all over the country and by no means all of one political persuasion who are moved by countless different reasons to send instructions to the Stock Exchange to buy or sell securities. . . . These are the tides of business influenced by economic and political conditions the world over. . . . The Stock Exchange can no more control or influence those tides than King Canute could order the tides of the sea.

That is the real retort to Mr Morrison. But, naturally, Mr Braithwaite could not let pass the allusion to horse racing:—

> Mr Morrison also indulged in a general disparagement of the Stock Exchange and lent the weight of his great office to the ignorant sneer that its work and function is on a par with horse racing . . . Mr Morrison has no need to suppose or presume [the value of the Stock Exchange]. He has at his disposal . . . the Bank of England, who will tell him what the Stock Exchange is and what it does and whether or not it is of value to the nation.
>
> Every ignorant attack upon the Stock Exchange or upon the City of London is itself a damaging attack upon the national credit.

These, perhaps, are the high-lights of the whole carefully reasoned reply; but they sufficiently indicate its telling quality. Mr Braithwaite has done well, but the City will hope that this is only a beginning, and that the "wicked animal" has learnt at last the virtue of standing ready to defend itself.

* * *

Second Thoughts on Cables

A favourable reception has been accorded the revised capital reorganisation scheme of Cable and Wireless (Holding). The price of the ordinary stock, it is true, did not go through the roof on the morrow of the announcement. It advanced only a modest 6 points, to 274, with markings up to 275½ this week. But this price represents a gain of 20 points or so in recent weeks since opposition from the stockholders' committee began to assert itself in earnest. And, although the estimated ultimate realisation value of the ordinary stock is some 20 points higher than the current price, there are good market reasons for expecting the stock to remain at a discount of the present order. For instance, stamp duties will ultimately take their toll; opposition from preference and even ordinary stockholders cannot be altogether ruled out; it will take some time to even out the big bull account in the stock; and finally the market is well inured to the delays and unforeseen difficulties in bringing schemes such as this to fruition.

The soundness of the board's plans to enable the ordinary stockholder to realise £295 per £100 of stock has been generally agreed in the market. One important proviso is that the effectiveness of the proposed arrangements would be prejudiced unless preference stockholders decide in sufficient strength to take up the £4,000,000 issue of 10-year notes. For it is the intention to use the proceeds of this issue (which would in fact come from the preference stockholders' entitlement to cash from the company under the old scheme) partly for redeeming the 3½ per cent unsecured notes to be offered to ordinary stockholders. Another equally important proviso is that preference and ordinary shareholders between them opt to accept not less than £4,955,834 nominal of ordinary stock in the reconstituted company. In this connection the preference are to be limited to an amount of ordinary stock equal to the difference between the amount elected to be retained by ordinary stockholders and £6,883,103, the present issued ordinary capital. But the confident air of the board suggests that it has successfully taken soundings on the likely attitude of some big holders of both classes of stock. And in the case of Globe Telegraph, which holds £3,214,668 of the preference and £1,038,000 of the ordinary stock of Cable and Wireless (Holding), the board has merely been exercised to sound itself. It is perhaps significant that it has not been found necessary to change the original scheme in respect of the rights of the underlying companies of the group such as Eastern Telegraph and Globe Telegraph.

* * *

A £20 million Trust?

An intractable problem arising from the scheme which has so far defied the statisticians is to estimate the size of the rump. The biggest imponderable here is the extent to which both classes of stockholders will opt to leave their money with the company. It is conceivable that many will decide to do so, if only on the argument that reinvestment of their money for equivalent security on a 6 per cent basis—for that, roughly, is the present prospect offered by staying with Cables—would not be easy. Nor can the amount of funds likely to be provided through the offer of 4 per cent unsecured 10-year notes to preference stockholders easily be gauged; even if applications come up to the maximum of £4,000,000 for the issue, it is expected that a big proportion of this amount would be required for the redemption of the 3½ per cent loan stock and to hold the price of this stock by purchases in the market. In any case the residue would be available for only a 10-year period. Yet, in providing these further options for preference and ordinary stockholders, Sir Edward Wilshaw may well have in mind the creation of a bigger trust than he envisaged under the original scheme. If so, he would not be the first to have made capital out of opposition. And in the possible event of the total available funds reaching, say, £20 million, he might feel more confident in facing the persistent critics of his original tentative figure of £100,000 a year to administer the reorganised company. As matters stood at August 31, 1949, the investment portfolio of Cable and Wireless (Holding) was valued at £14,671,269, constituted as set out in the accompanying table. There have been changes—mostly downward—in value since then according to Sir Edward, but he stated last week that the content of the portfolio remains virtually the same.

The Oil Talks

This week's reports of "stalemate" and "deadlock" in the talks in Washington between British government representatives and the American oil companies have been precipitate. It has never been a secret that the American companies do not like the British policy of substituting sterling for dollar oil in the sterling area. Equally, the British memorandum which was outlined in *The Economist* last week turned down firmly the American companies' proposals for using sterling to facilitate their trade in non-dollar markets. The British offer, restricted in scope as it was by the overriding policy of saving dollars, never looked likely to be accepted with a smile. To hear it described as "inadequate" (as a spokesman of the Socony-Vacuum Oil Company described it this week) is therefore no surprise.

It is, however, denied in London that the talks have broken down. The first stage, after presentation of the British memorandum, was for the companies and the British government representatives to discuss it in detail. The second stage was for the American companies to talk over with the State Department the questions raised. This would naturally be followed by some British discussion with the State Department, and then by renewed contact between the British representatives and the companies; and the indications are that this stage has now been reached. If the American companies employ the robust technique of negotiation which was made familiar by the Anglo-American film talks of 1948, the sound of slamming doors can be expected from time to time; but it need not always be taken as final.

* * *

Film Quota and its Observance

The Board of Trade has issued an analysis of the film exhibitors' quota returns for the quota year 1948-49 from which only one conclusion can be gathered: all is well. As is known, the statutory quota of 45 per cent for first-feature films amounts in practice, after allowance is made for reliefs, to an average quota of about 37 per cent for all cinemas large enough to have quota obligations. It now appears that this average quota was actually fulfilled, and 37 per cent of the actual exhibition in the year ended last September was of British films. Some questions may arise about the computation of this figure. It would be useful to know whether the average is weighted for the varying number of seats in different cinemas; probably it is.

But the total effect is impressive. How was it reached? It appears that, out of 4,689 returns received from cinemas, no fewer than 1,474 showed default on the first-feature quota. This is a very large number of defaults. It appears that 77 per cent of them (1,135 cinemas) are accounted for by independent exhibitors who had not been able to obtain any quota relief at all. This group (the "independents" with no relief) attained an average quota of 40 per cent, but about two-thirds failed to reach the average, and more than a third of them failed to reach 35 per cent. It appears, therefore, that there is a group of independents exceptionally well-placed to meet its quota obligations, while the remainder, some two-thirds, are ill-placed. (This interpretation ignores the idea, which may be heard again before long in a new Parliament, that some exhibitors are public-spirited and others are unpatriotic.)

It is to the major circuits that it is necessary to look to see how, with this large body of defaulters, the average of 37 per cent was reached after all. The three large circuits taken as a body achieved an average showing of British first-feature films of no less than 47.6 per cent. These circuits represent for practical purposes the bulk of the exhibiting industry; they own, according to the Plant report, 974 houses with an average seating capacity of 1,471—double the average size of the non-circuit houses. This predominance of the circuits and their close relationships to the producing end need to be borne in mind in considering the further (at first sight) surprising piece of news which has come from the film trade in the past week. The Films Council—a body which has often seemed to be perceptibly weighted, in respect of its representing, in favour of the producing end of the industry—has agreed to recommend to the President of the Board of Trade a first-feature quota of only 30 per cent for the coming quota year, which starts on October 1st.

*

This is by no means a decisive event in itself. Last year the Films Council recommended a quota of 33⅓ per cent, but the President of the Board of Trade, who makes the Order, decided on 40 per cent. But last year's decision in the Films Council was taken on a narrow majority vote, and this year the exhibitors and the producers are reported to have agreed together on the reduced figure which they should recommend. No doubt this reflects the losses which the film producing companies have made on their trading. The exhibiting interests of the major film producing groups have become more vital to them as their producing activities make losses and have to be cut down. The new decision of the Films Council seems to mean an acknowledgment that the producing game, on the scale on which it has been played, is not worth the candle. It is hard to see how the President of the Board of Trade can ignore it—or how, if he does ignore it and sticks to a high quota, he can hope for last year's standard of observance.

* * *

Lancashire, Prices and Politics

To the cotton industry, the end of the election comes as a relief. In recent months, it has had its fill of politics. It has noted with a sharp ear the professions of Sir Stafford Cripps and Mr Wilson to put teeth into the development councils; its own Cotton Board, founded on the principle of voluntary co-operation and successful because it has pursued that principle, has become a development council by adoption. If there were any question of compulsion or arbitrary government interference, Manchester would soon join Bradford in a new, and very different, War of the Roses.

But the main relief which Lancashire expects, now that the election is out of the way, is a decision on prices for utility cottons. That this inevitable rise in prices has not been granted already is a reflection on the political honesty of ministers, and of their reckless disregard of the way in which the utility scheme has been imperilled. That may or may not be a bad thing; but if it was intended to make an end of the scheme, in order to preserve a fictional stability in the cost of living index, the late Government certainly went very far towards this goal. Ever since devaluation produced an immediate rise in raw cotton prices, utility goods have been even more uneconomically cheap than they were before. The equivalent rise is generally reckoned to be a penny a yard on cloth, with consequential changes in margins throughout the various sections of the industry. In Lancashire, of all places, no manufacturer is prepared to give his capital away to a particular class of consumer whom the Government purports to favour. Manufacturers of cotton cloth have therefore resorted, legally but in no spirit of conformity to the notion of stabilised prices, to various devices to improve their average margins—a distorting and disagreeable development in the trade.

They have also been keeping back utility lines until the new prices are announced, or have sold the same goods outside the utility scheme. Utility single bed cotton sheets are fixed at 27s. 6d. a pair; a fair price would now be 31s. But the same sheets sold without the utility mark (when they attract 66⅔ per cent purchase tax) sell quite readily at £3 a pair, or more. The producer is satisfied; so, it seems, is the Government, for the cost of living index remains uncontaminated by contact with the practical world of economic prices. The voter, too, has seemed content, though he may have something to say as consumer before very long. Strangely enough, it was left to the Liberal-Conservative candidate for East Fife, speaking in the county town of Cupar (not, to judge from the assembly of farmers on market day, a national centre of the textile industry), to disclose the course of negotiations between the cotton industry and the Board of Trade on utility prices. The revised prices, Mr Henderson Stewart stated, were now in the hands of manufacturers (perhaps, more accurately, of their spokesmen, rather than the whole trade), and would come into effect early in March. They entail an increase of

10 to 12½ per cent in utility cotton goods and of 6 per cent in utility linens.

Too Much Steel in Europe?

With one point in the recent Geneva report on European steel trends the British Iron and Steel Federation could be confidently expected to quarrel; this was that the European steel industries as a whole are at a disadvantage in world competition with the American industry. An article in the *Statistical Bulletin* for January of the British Iron and Steel Federation takes issue on this point with the authors of the Geneva report, observing that they wrote before devaluation, and this particular conclusion "has been overtaken by events." The *Bulletin* also contends that the statement was in any case incorrect so far as Britain was concerned, and that it was based on scanty and insufficient evidence. To support the rebuttal a detailed and extensive comparison is made of the home prices of certain steel products in Britain and in other countries of the world. The accompanying table gives a selection of the prices published. It sets out the changed position since devaluation and since the recent increases in American steel prices. These are home market prices; no doubt in competitive export business some of the price levels could be brought closer together at need.

Source: British Iron & Steel Federation.

The criticisms of such uneconomic developments are valid (it maintains) whether or not a general European surplus of steel arises on the scale forecast. It accepts the opinion that a full range of standard steel products can hardly be produced under reasonable conditions in an industry having a crude steel capacity of less than 2,500,000 or 3,000,000 tons a year.

Some of the present developments have been stimulated, it adds, by two fallacies. The first is the "misconception" that the real shortage after the war was a shortage of steel-making capacity—"when, in fact, the shortage of those days was primarily due to raw material deficiencies." The second fallacy is that a country can escape dependence on foreign supplies by building a steel industry of its own. In fact—since the sources of supply of coal and ore are even more limited than those of steel—"this means jumping from the frying-pan into the fire."

BEA's New Fleet

Mr Peter Masefield, chief executive of British European Airways, said last week that in 1951 the corporation will

BRITISH WEST INDIES

The table below shows some of the goods that the British West Indies bought from Britain in 1948. There is a market, too, for many other British products. ***Write for our new booklet 'Overseas Markets'.*** **It contains detailed trade tables for the British West Indies and other territories where the Bank has branches.**

TOTAL 1948 U.K. EXPORTS TO THE BRITISH WEST INDIES WERE £19,615,000. THESE INCLUDED

CARS & TAXIS ...	£1,025,000	FINISHED SEWING THREAD ...	£169,000
COCOA PREPARATIONS ...	£204,000	PAINTS & ENAMELS	£241,000
CORDAGE, CABLES, ROPES & TWINE	£119,000	POTTERY, GLASS & ABRASIVES	£1,080,000

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)
HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3.

begin to replace its fleet of Vikings, Dakotas and Rapides (96 aircraft in all) with newer types. The first of the 20 Airspeed Ambassadors are due to be delivered at the beginning of the year. Of the 40 Vickers Viscounts ordered for BEA and BOAC, BEA expect to get between 20 and 30, beginning in 1952. To replace the Rapide, the corporation is about to double the order which it has already given for seven Handley-Page Marathons. The first of these will be delivered in 1951.

The new fleet will be smaller in number, consisting of about 60 aircraft. Its capital cost will be about £8,000,000, and £1,000,000 a year will have to be set aside for amortisation. This is a higher figure than usual and it is therefore essential that the aircraft are flown as nearly as possible at an average of eight hours a day, in order to bring their actual earning capacity close to their estimated earning capacity of £12 million a year. But as Mr Masefield would probably be the first to admit, economies in the operation of the aircraft are not the decisive factor in putting an airline on a sound economic footing. He said on an earlier occasion, before he joined BEA, that the results obtained by various airlines indicate that none can pay their way—whatever their operating costs—until overheads are down to about 33 per cent of total costs. Those of BEA are considerably above this figure.

Nevertheless, it is of the greatest importance to an airline that its aircraft should be designed for the routes on which they are used. This makes it a source of regret that BEA was obliged, against its better judgment, to adopt the Marathon as a replacement for the Rapide. The Rapide, developed many years ago by de Havilland, has been successfully used on short routes where traffic is thin and airport facilities are limited. BEA operates many such services and asked some time ago for tenders for a 12-seater aircraft to replace the Rapide. The Marathon carries 20 passengers and Mr. Masefield says it is "frankly, rather too big for most of our Scottish and inter-Channel Islands routes." But "the Minister asked us to put national interest before our specialised requirements and to go for the modified Marathon," on the grounds that £2,000,000 of government money had gone into its development.

* * *

The Marathon Muddle

The Marathon aircraft was originally developed by Miles Aircraft on the basis of recommendations made by the Brabazon Committee which reported in 1945 on the types of postwar civil aircraft which the British airlines would need. At some stage of the work of development the company obtained an order from the Ministry of Supply, acting as purchasing agent for the Ministry of Civil Aviation, for between 40 and 50 of the aircraft. It is clear from Mr Masefield's comments alone that under no foreseeable conditions could the British airlines find a use for this number of Marathons; the assumption must therefore be that the Ministry placed the order so that the company should have sufficient financial backing to keep in production—gambling on the chance that when the aircraft were ready for delivery, other purchasers would be found. The company became bankrupt before development work on the aircraft was complete, and the Marathon was taken over by Handley-Page Ltd., who have held the Ministry to its original contract with Miles Aircraft. The Ministry of Supply has spent up to now about £2,000,000 on the Marathon, this sum including the three prototypes, one of which has turbo-prop engines. The first "production" machine has recently left for a tour of Australia, India and countries in the Middle East. It is well suited for internal passenger or freight-carrying work in those regions; indeed, it is the only aircraft of its particular capacity and performance to meet the requirements of the International Civil Aviation Organisation and there is no reason to doubt that it will be a commercial success. But the Ministry of Civil Aviation is obviously afraid of being left with large numbers of aircraft on its hands—not so long ago the British air corporations refused to take from it eleven Tudors which the Ministry had first of all ordered as passenger air liners, and which it later converted into freighters. The Ministry persuaded British European Airways to agree to take seven Marathons some time ago, and has now applied pressure to have this figure doubled.

If there were no aircraft actually in production which fitted BEA's requirements better, the action might conceivably be justified. But the Percival Prince, an aircraft for 8 to 12 passengers, has lately received its certificate of airworthiness. If this were too small, de Havilland are going into production with the Heron, an aircraft with 14 to 17 seats, which was among the ten types offered to BEA as replacements for the Rapide. Since much of the necessary development has already been done on de Havilland's smaller and very successful Dove, orders given now for the Heron would be delivered early in 1951 and the first aircraft is due to fly in the summer. Both the Heron and the Prince are private ventures; no public money has gone into their development.

*

If, as this incident suggests, the autonomy in purchasing policy which was recently granted to the corporations is little more than formal, then the men responsible for the conduct of their financial affairs are in an ambiguous position. The efficiency of the aircraft—and in particular their suitability for the route—must have a profound effect on the efficiency of the airline. It will be surprising if BEA does not buy the Heron at a later stage, even though it may be in smaller numbers than when the replacement of the Rapide was originally projected. But this is not likely to be an isolated case. The Brabazon, for example, is being built and developed under the old arrangement between the Ministries of Supply and Civil Aviation, but BOAC has made no move towards ordering the aircraft, and is not even known to have expressed a desire to use it.

Finance

Some Light from South Africa

During the debate on the Appropriation Bill in the South African Parliament last week, Mr Havenga lifted some part of the curtain which still enshrouds the workings of the new payments arrangements between South Africa and the sterling area which were discussed in an article in *The Economist* three weeks ago. Mr Havenga revealed that now that all imports of essential material into South Africa will be paid for in gold, the Bank of England should acquire "certainly not less than 25 per cent—and perhaps even as much as 50 per cent—of the Union's gold output." At the pre-devaluation rate of production this should mean an accretion of between $100 million and $200 million of gold to the sterling area central pool each year; at the present rate of gold production the limits for this annual contribution should be somewhat higher. Moreover, when the present heavy investment in the new OFS goldfields begins to bear fruit in three or four years' time the prospects should be brighter still.

Mr Havenga's statement also removed some of the uncertainties about the accounting procedure to be followed under the scheme. The Reserve Bank of South Africa is to sell gold against sterling to the Bank of England up to the value of 25 per cent of South Africa's current gold output by way of "progress payments" at more or less regular intervals; other sales equal to the value of the sterling area's additional gold entitlement will be made from time to time. Mr Havenga declared that the sterling area's total gold earnings under the scheme would be "the value of South Africa's universal import licences captured in free competition by all sterling area and all other soft currency suppliers." Presumably this means that if South Africa buys essential goods from, say, Holland, she will buy the guilders from the Bank of England against gold; if this is so, all Britain can do to foster this particular source of gold earnings is to stand on the sidelines and cheer Holland on. There is no reason, however, why Britain's attitude towards stimulating its own exports of essential materials to South Africa should be so passive—provided only that a more detailed list is made available of exactly what these essential materials are. One difficulty is that the composition as well as the extent of the list of essential materials will depend on the amount of gold and hard currency which the South African Treasury makes available to the Department of Commerce for honouring "universal" import licences; this, according to Mr Havenga, will depend on what "it appears safe to do from time to time." The fact that the list will necessarily vary from time to time is, however, no logical reason for being timid about revealing exactly how much and what it contains now.

THE ECONOMIST, February 25, 1950

* * *

Savings and the Surplus

The slight improvement in the net receipts from national savings shown by the latest return, after the tiny credits recorded in the previous two weeks, has attracted some attention. In the week to February 11th aggregate receipts from the several national savings media exceeded repayments by £1,577,000. The fact that so small a sum should merit comment is in itself an indication of the dreariness of the savings performance during this fiscal year. Since the peak dis-saving of the Christmas period there has, it is true, been the usual seasonal revival, and for six successive weeks the returns have shown net credits in contrast with net declines for almost every week of the preceding eight months. But the seasonal improvement has been feeble by comparison with previous years. Net receipts for the six weeks have totalled only £13.8 million, in contrast with £36.3 million in 1949 and £57 million in 1948. Thus, in the fiscal year to date, withdrawals and encashments have exceeded new savings by no less than £67 million, whereas in the similar period of 1948-49 there was a net receipt of just over £13 million. After including the interest paid out on encashed certificates, the cash strain imposed upon the Exchequer during the year has amounted to £89 million. On the other hand, the Treasury has not this year had to face any perceptible commitments for redemption of Defence Bonds at maturity, whereas in 1948-49 such repayments absorbed £52 million. Allowing for this factor, from the point of view of the Exchequer the deterioration by comparison with 1948-49 amounts to about £31 million. From the point of view of the savings movement, however, the deterioration has been appreciably larger than this, since the increase in the total of savings remaining invested, after crediting the estimated amount of interest accrued (£109 million in the current year) was only £20 million, in contrast with £98 million last year.

This sorry savings record is at first glance in rather striking contrast to the rising surplus of the budget. But, in fact, it provides yet another indication that the buoyancy of the revenue derives from special or non-recurring influences. The inflationary surpluses which are swelling the above-line revenues have their counterpart in a reduction in personal savings which increases the Treasury's outgoings below-the-line. Meanwhile, the seasonal swelling of the surplus has been arrested. Last week, for the first time since the turn of the year, there was a small "above-line" deficit, owing principally to the big interest payments which fell due on February 15th. With six weeks of the financial year still to go, the above-line surplus stands at £615 million.

Anglo-German Talks

Representatives of the Board of Trade, the Treasury and the Bank of England have been engaged in Frankfurt on commercial and financial discussions with the West German Government. They have before them a comprehensive agenda, and it seems probable that in view of the scope and importance which the discussions have already acquired, the talks may be adjourned for a short time to allow the officials to return to London for consultation. On the payments side the main British objective in the talks is to try to get the dollar sign out of sterling area relations with Germany. At present there is a "swing" of £7,500,000 which each side is prepared to extend as credit to the other before claiming payment in gold or dollars. In recent weeks the sterling area has been extending credit to Germany, and the Bank of England must now be holding a substantial amount of West Marks. The amount, however, is well within the limits of the "swing."

This trend of current payments is largely a result of the recent liberalisation of imports by Germany and in particular of substantial imports of raw materials from the rest of the sterling area. The United States authorities may have something to say to the proposal that all gold or dollar clauses should be removed from Anglo-German payments arrangements. Their resentment at any such proposal may, however, be tempered by the fact that, as these payments are now trending, Germany may soon be losing gold to Britain, which is equivalent to saying that the American taxpayer will be asked to put up the necessary money. The trade negotiations have indicated a readiness on the part of the British to accept from Germany a wide range of manufactured goods which might be expected to compete on the domestic market with British manufactures.

* * *

Imperial Tobacco's Stocks

Each year brings some new exacerbation of Imperial Tobacco's problems about stocks. It is not that these are physically excessive; it is only a year since the company was anxious about its prospective supplies of leaf, and it probably has to make do now with an average year's supply in stock, compared with between two and three years' supply before the war. The difficulties, which have been heightened since the war, arise from higher prices of leaf, far higher duty, and the taxing away of a major part of the capital which the company could otherwise generate each year towards the financing of stocks. The directors' report confirms that devaluation (which occurred six weeks before the end of the company's financial year) "contributed materially to an increase in the average cost per lb. of total stocks." Since dollar tobacco probably represents about two-thirds of the total, and since the six post-devaluation weeks coincided with the most active period of the American tobacco sales, the effect on the balance sheet has been immediate. But the increase of over £6 million in stocks (the total is now practically £90 million) also reflects the higher cost and also quantity of non-dollar tobacco bought in 1948-1949, and there are clear signs of a further rise in price in these types during the approaching buying season. A further increase in stock values is bound to be shown in the next accounts.

The preliminary figures (discussed in last week's issue on page 393) suggested a material rise in trading profit. It has, in fact, been a good year for "Imps"; the group's trading profit is up from £16.7 million to £19.4 million and net profit of the parent company (after charging estimated tax on the year's profit of £7,100,000 against £6,620,000) shows an increase of £731,647 to £8,852,215. How far these favourable figures arise from economies and how far from improved sales it is impossible to guess; probably both factors have made a contribution, for the chairman, Sir

The increase in January was attributable almost entirely to larger shipments of manufactured goods. Exports of food and tobacco fell slightly, while the increase in raw materials reflected heavier sales of domestic grown wool to the United States, Canada, the Soviet Union and European markets. But each item of manufactures (except apparel) showed larger exports last month than in December, and most of them showed an increase, by value, compared with January, 1949. Vehicle exports reached the record total of £35.4 million. Over 26,000 new motor cars were shipped abroad, the largest total yet recorded. Exports to the United States declined somewhat but those to Canada almost doubled ; the Dominion became, in fact, Britain's second largest market—with shipments to Australia (7,840 cars) still holding first place. Exports of tractors and commercial vehicles were about one third above the average of 1949, while those of ships and boats were also very high.

Machinery totalled £28½ million, also a record figure. The increases were spread fairly well among the separate items: the main exceptions were mining, sugar refining and textile machinery. India remained the largest market, followed by Australia and South Africa. The Soviet Union came next in importance, with shipments worth £1,500,000. Exports of iron and steel goods amounted to £12½ million and were the fourth largest export, being only £250,000 less than cotton goods. Textiles also increased. Cotton manufactures reached £12¾ million and wool manufactures almost £10 million, with appreciable increases in quantities sent to both Canada and the United States. Exports of chemicals also reversed their downward trend but were still smaller than twelve months ago.

The export figures for last month at least show a more encouraging picture than those for the last quarter of 1949. Leadership in the export industries is retained by vehicles, machinery and the metal and engineering industries generally. There are signs, however, that the smaller export groups are beginning to expand once more ; if this trend continues, the prospects of improvement in the trade balance in 1950 will be so much the better.

* * *

Firm Market for Sisal

The fibre markets have been particularly firm since devaluation, and sisal has been no exception. Before September 18th No. 1 British East African sisal had been quoted for several months at £96 a ton c.i.f. British ports ; but after the devaluation the price rose sharply and has now reached £125-£130 a ton—an increase of over 30 per cent. During the same period the price of manila hemp rose by 44 per cent—the full extent of the devaluation—from £93 a ton to £134. Wool, cotton and jute have each risen by between 30 and 45 per cent during the past five months.

Production of sisal in British East Africa has increased appreciably in the past two years. In 1949 output totalled 160,300 tons—the highest figure for many years—compared with 156,600 tons in 1948 and 133,000 tons in 1938. But despite the larger supply, growers have been cautious in offering sisal for forward shipment. East Africa has been suffering from a severe drought which might harm the immature plants and reduce the yield of mature sisal besides interrupting the process of decortication. Transport, too, has been affected. Only a single track railway exists, and this has been carrying water to the drought areas and bringing back empty tank wagons instead of sisal. Stocks are beginning to accumulate. Rain has fallen in some growing areas during the past month, but not on a scale sufficient to ensure the new growth against failure.

A keen demand for sisal has been maintained throughout the past year from Britain, the United States and Canada. This has resulted in higher profits for British sisal companies, as evidenced by the jump from £298,633 to £386,515 in the group profit reported by Sisal Estates in the accounts for the year to June 30, 1949, published last week. The company has raised its dividend from 20 per cent to 30 per cent for the year. Moreover, reports that British spinners are fully booked with orders for both rope and twine are a good augury for the future.

Shorter Notes

Coal output last week was 4,358,800 tons, 15,700 tons more than the week before. Of the total, 4,164,900 tons was deep-mined—an increase of 13,400 tons. The total output for the first seven weeks of the year is 29,989,500 tons, compared with 29,423,100 tons in the same period last year. There was a further net loss of 400 men in the week which ended on February 11th, although the number of face workers did not change. The number of men on colliery books was 706,200 ; 291,900 of these were face workers. Since the restriction on miners leaving the industry was removed at the beginning of the year the labour force has shrunk by more than 2,500. In the last two weeks of December the labour force was 708,900 men, of whom between 293,900 and 294,000 were face workers. In the comparable week of February last year the total number on colliery books was 726,900, and the number of face workers was 297,400. Thus, the decline has been mainly, though by no means exclusively, in workers not at the face.

*

The Ministry of Labour Gazette shows that changes in wage rates during January affected 438,000 people and produced a total increase of £106,000 a week in the wage bill. The increases were largely confined to branches of the retail trades—mainly drapery, outfitting and footwear, and the retail furnishing and allied trades. There were small increases in the minimum rates paid in the narrow fabrics industry and in the general printing industry in the London area.

*

Trade negotiations with both Switzerland and the Netherlands have reached a crucial stage. The Swiss are demanding an exchange guarantee on £15 million of sterling balances ; this the British negotiators are not willing to give and the talks have been adjourned. Talks with Holland are now concerned primarily with various trade matters on which neither side seems willing to budge. Thus, Britain appears adamant in attempting to shelter British tomato growers from Dutch competition by trying to keep Dutch supplies out of the British market until later in the season.

*

The International Tea Regulation Scheme is to be renewed for a further period of five years. Permitted exports during the first year will be 130 per cent of the basic quota. As this rate is sufficiently high to allow producers to dispose of a maximum possible yield, it meets the Indian request for a higher quota. Since the war exports from India have increased by nearly 25 per cent. New extensions of tea land will be allowed, but only up to 5 per cent of the permissible acreage.

*

Indonesia is to re-introduce an "inducement plan" for rubber exported to consuming countries. Shippers and producers will in future be allowed to keep 10 per cent of their foreign currency earnings for their own use. The "inducement" will not be applicable to rubber shipped first to Malaya. The previous inducement scheme was terminated last November when the rate was only 5 per cent, having been reduced from 10 per cent in October and 15 per cent in September.

COMPANY MEETINGS

TECALEMIT LIMITED

REVIEW OF A DIFFICULT YEAR

MR S. G. GATES'S SPEECH

The annual general meeting of Tecalemit Limited, was held on February 24th at Winchester House, Old Broad Street, London, E.C., Mr S. G. Gates, C.B.E., presiding.

The chairman, in the course of his speech, said: Ladies and gentlemen, since we last met, we have invited the Managing Director of our Australian subsidiary, Brigadier Arthur Sewell, O.B.E., to rejoin the Board of the parent company, on which he served before the war. Brigadier Sewell paid us a welcome visit in the autumn, but has now returned to Australia. Owing to his duties in the Antipodes, his attendance at our meetings will perforce be somewhat irregular; nevertheless it will be of advantage to us to be able to consult him on matters of general policy.

I have also to record with deep regret the death on September 26th last of Monsieur Emile Piquerez, one of the founders of Tecalemit and a former director of this company. Monsieur Piquerez will be remembered by all who worked with him as a man of exceptional inventive talent combined with indefatigable energy and enthusiasm. Our company owes much to the inspiration and impetus which he gave to it in its early years.

I turn now to the accounts before you. In the parent company's balance sheet the most noticeable changes are a rise of £305,000 in fixed assets and a rise of £117,000 in investments in and advances to subsidiary companies. These increases are due to the building and equipping of our Plymouth factory and financing the continued growth of our Australian subsidiary. On the other hand stock and work in progress has been reduced, as I indicated last year was our intention, by £90,000. These changes are reflected on the liability side of the balance sheet by a rise of £316,000 in our bank overdraft, which on July 31, 1949, stood at £451,093.

It was to meet this situation that, at the extraordinary General Meeting of the company held in August, you authorised the creation of 1,000,000 5 per cent. Redeemable Cumulative Preference shares of £1 each. At that time we contemplated the issue of £700,000 of this newly authorised capital. Subsequently, however, it was felt that £500,000 would suffice for the company's present needs, and it was decided to limit the offer to that amount. I am glad to say that, despite the rather uncertain market conditions then prevailing, the issue proved highly successful, the amount we required being heavily over-subscribed.

At the extraordinary General Meeting above referred to, you also resolved to capitalise the sum of £556,969 out of our share premium account of £564,498 by making a bonus issue of one new unit of stock for every unit held, the object of this being to bring the issued capital more into line with the actual capital employed in the business. These changes, of course, took place after the date of the balance sheet and are therefore not shown in it.

SALES OF BRENTFORD AND BRECHIN FACTORIES

You will be interested to know that, again since the date of the balance sheet, terms have been agreed with the North Thames Gas Board for the sale of the company's main factory on the south side of the Great West Road, Brentford. Possession is to be given by December 25, 1950. We are retaining the freehold land and buildings on the north side of the road. We have also disposed of the Brechin factory, where production ceased at the end of January. The total which we shall receive for these properties is a very satisfactory one and will be of great assistance in meeting the cost of the extensive modernisation of our plant on which we are at present engaged.

PROGRESS OF PLANT MODERNISATION

Progress with this work has continued satisfactorily during the past year. Six production bays have now been completed, as well as a warehouse and other ancillary buildings, so that approximately 50 per cent. of the whole of the company's output is already coming from Plymouth. The main items in our programme for the present year are four more production bays and a boilermaker's shop. To carry out this extensive changeover without interrupting the flow of production is an extremely delicate and exacting task. Thanks to good fortune—assisted by careful planning—we have thus far been able to avoid more than minor disturbances ; but it is not possible to avoid the sharp increase in operating costs which the changeover entails. Not only is there the very considerable direct cost of transferring machines and personnel, but it has also to be remembered that production cannot be allowed to cease in one factory before plant has been installed, and new labour taken on and trained, in another. Thus, during the transition period, there is unavoidable duplication of overheads. I am afraid that this unfavourable influence must continue to affect the results of the current financial year, though I anticipate that its impact will be less severe during the second six months. After that we should begin to reap in earnest the benefits of reorganisation, which I have every reason to believe will come up to our best expectations.

YEAR'S PROFIT

The net profit for the year covered by the accounts now presented, after providing for taxation, is £93,631, which, added to £101,504 brought forward from last year, makes a total available for distribution of £195,135. Your directors recommend that out of this sum £25,000 should be transferred to General Reserve, raising the total of that item in the balance sheet to £100,000, and that a final dividend of 7 per cent. be paid on the increased capital. If these recommendations are adopted, the total sum distributed by way of ordinary dividends will be the same as last year and the carry forward will be left at £108,869 as compared with £101,504 brought forward from last year.

CAUSE OF REDUCTION IN PROFITS

You will have noticed that the consolidated trading profit of the company and its subsidiaries (struck before charging depreciation, taxation and remuneration of directors and auditors) fell from £322,533 to £169,411. The fact that the corresponding fall in net profit was, as I have pointed out above, only £8,000, is due partly to our not having to repeat last year's exceptional provision of £57,454 in respect of redundant stock and partly to the reduced incidence of taxation over the period covered by the present accounts. The principal cause of the decline in trading profit was one to which I have already alluded, namely, the temporary rise in operating costs due to the regrouping of our factories ; but there was also a fall in turnover of about 8 per cent. in comparison with last year's record figures. This was not altogether surprising, having regard to the general conditions which prevailed during the year, and all departments of our business, shared the fall, with the exception of exports, which once again showed an increase. In the field of automobile components, some motor manufacturers were obliged to reduce their monthly delivery schedules against long term contracts during part of the year, while sales of garage equipment were particularly affected by the continuance of restrictions on motoring. The sparing allocation of new cars to the home market, the meagre and uncertain petrol allowance and the difficulty of obtaining building licences—not to speak of the high cost of building and the imposition of development charges—bear as hardly on our customers in the garage business as taxation bears on their customers, the motoring public. It is perhaps not very widely appreciated that, with Vehicle and Driving Licences accounting for £52 million, Petrol Tax for £50 million and Purchase Tax £20 million, each car on the road is bearing an average burden of £40 per annum in taxation.

In the field of Industrial lubrication we are continually searching for new outlets for our products. The system for lubricating textile machinery which we recently exhibited in Manchester at the Textile Exhibition has aroused considerable interest, and our automatic lubricator for chain conveyors has also met with a very good reception.

Our wholly-owned subsidiary, the Coventry Precision Engineering Company, had a somewhat disappointing year, owing once again to the reorganisation of the parent company's production. Since the war and up to last year, we have been forced to divert this subsidiary to the manufacture of Tecalemit products. As capacity has again become available in the parent company's factories, we have withdrawn work from Coventry, and it has naturally taken time to replace that work from other sources. I am glad to say, however, that the Coventry company has now got an excellent order book and I have no doubt that this year's results will show a considerable improvement.

Despite the prolonged coal strike, Tecalemit (Australasia) Pty., Limited, had an outstandingly successful year. Turnover rose by no less than 42 per cent., an achievement for which great credit is due to all concerned. We cannot expect such spectacular progress every year, but we believe that the past year's results will be at least maintained this year.

Our sister company in France, Tecalemit S.A. (in which you will remember we have an interest of approximately 33⅓ per cent.), also enjoyed a very prosperous year, resulting in an increased dividend. Unfortunately, double taxation at present robs us of much of the benefit which we should otherwise derive from this investment.

Inasmuch as, despite the special difficulties of the past year, we have been able to maintain the dividend at its established level, strengthen our revenue reserves by £25,000 and increase the carry forward, I hope that you will regard the result as reasonably satisfactory. As to the current year, the volume of orders to date shows a substantial increase over those of the comparable period last year. Provided we can carry through our somewhat intricate changeover without dislocation, I feel that we can look forward with confidence to the outcome.

The report and accounts were adopted.

CARRERAS, LIMITED

IMPROVED METHODS OFFSET RISING COSTS

The forty-sixth annual general meeting of Carreras, Limited, was held on February 20th in London.

Sir Edward Baron, the chairman, in the course of his speech said:

The events of the past twelve months show that the cautious attitude I adopted when I spoke to you here a year ago was justified. In the first place, the allocation of dollars for the purchase of U.S.A. leaf was not up to our expectations as the pressure of economic necessity compelled the Government to reduce the initial allotment by nearly 20 per cent.

Following this there loomed before us the prospect of devaluation, the possibility of which seemed to be very widely accepted in spite of official statements to the contrary, and which eventually became a reality with unexpected suddenness in September. Fortunately for this company we had accelerated our leaf-buying programme and had secured a large proportion of our requirements before then. Our purchasing organisation once again achieved very excellent results in accordance with our particular needs within the limitations imposed. We were successful in obtaining additional supplies of Rhodesian and other growths from sterling areas but, as I indicated last year, these cannot, under the most favourable conditions, produce enough tobacco in the foreseeable future to make good the shortage from the dollar areas.

EXPORT TRADE

In previous years I have referred to the restrictions and difficulties which have made the volume of our export trade more and more difficult to maintain. Among contributory factors I would mention the import restrictions and exchange controls imposed by certain overseas governments, due to the less favourable economic circumstances of their countries, and the limitations imposed by our own Government on the allocation of dollars for the purchase of leaf tobacco.

As far as the sterling area is concerned, we are hopeful that the Government will take a long-term view in the interests of English trade marks and goodwill. Any further restriction on the amount of tobacco made available for export would jeopardise the efforts and expenditure made over many decades in building up a substantial volume of business.

Our costs, in common with those of other manufacturers, rose in various directions but the results before you demonstrate that we have by careful control, planning, improved production methods and the exercise of the strictest economy, offset these to a considerable degree. You will appreciate that this must have been the case since it was impossible to expand our trade beyond that of the previous twelve months.

You will agree with me, I am sure, when I say that profits must be sufficient not only to maintain our dividend but to provide funds to keep our buildings, plant and machinery in such a condition of efficiency that output can be kept at a satisfactory level and full employment for our workers ensured. The present exorbitant level of taxation renders this exceedingly difficult.

In our business we really do not know what the future holds in store. We have a first-class organisation, efficient management at all levels and loyal and devoted work-people. With these and our excellent equipment which we maintain in first-rate order, we feel we can face the uncertainties of the coming months with a good deal of confidence in our ability to overcome the many difficulties with which we know only too well we shall be faced.

The report was adopted and the proposed final dividend of 22½ per cent., making 35 per cent., less tax, for the year, was approved.

MANCHESTER SHIP CANAL COMPANY

NEW TRAFFIC RECORD

The ninety-second ordinary general meeting of this company was held on February 24th in Manchester.

Sir Frederick J. West, G.B.E., the chairman, in the course of his speech, said: The last year—like its predecessors—has been marked, both at home and abroad, by difficulty and uncertainty in almost every sphere—economic, financial and political.

In these circumstances the Port of Manchester is fortunate in being able to show a new record in the volume of its traffic which, for the first time, exceeded nine million tons.

The net revenue for 1949 was £874,649. Compared with £881,023 in 1948 this shows a decrease of £6,374. As, however, these figures are arrived at after deducting the amounts set aside for the renewal of plant and machinery—and these provisions have been augmented in 1949 by £27,000—the actual result of the year's working represents an increase of £20,626.

There remains £390,071 for dividends and reserve. It is proposed that £35,000 should be appropriated to the reserve for contingencies and repairs and that out of the balance of £355,071 the following dividends, amounting to £330,933, should be paid:—

3½ per cent. on the Manchester Ship Canal Corporation 3½ per centum preference stock.
5 per cent. on the preference shares.
2½ per cent. on the ordinary shares,

carrying forward £24,138 to the next year's account.

RECEIPTS AND EXPENDITURE

Receipts from tolls, ship dues, traffic rentals, towage, etc., increased by £82,991.

The expenditure in the working of the Ship Canal showed an increase of £92,600. Of this amount maintenance accounted for £34,000, towage for £39,000 and Workmen's Compensation for over £10,000. Dredging—one of our heaviest and most unpredictable items of annual expenditure—showed a decrease of £11,000 owing to the absence of floods.

The net receipts of the Bridgewater Canal from all sources were £30,734, as against £24,079 in 1948—an increase of £6,655.

RENEWALS OF PLANT AND SPECIAL MAINTENANCE

Very heavy expenditure must be incurred in the next few years which will be chargeable to revenue or to provisions created out of revenue.

A revised and up-to-date programme has recently been drawn up covering this renewal and maintenance work. All this work is essential and it is important that it should be carried out as soon as possible—at an estimated cost of £2,326,000.

About £698,000 of this expenditure is covered by balances on the provision accounts for the renewal of craft, cranes, dredging plant, locomotives and wagons, and a further £286,000 is covered by the provision for deferred maintenance. This leaves a balance of expenditure of £1,342,000 not yet provided for, some of which will be met out of annual appropriations during the next four years and some, it is hoped, by direct charges to revenue.

With all this in mind your directors have considered it prudent that the £350,000 standing to the credit of the War Damage Contributions Account should be added to the balance of £286,000 on the deferred maintenance provision and form the account shown in the balance sheet as "Provision for Special Maintenance and Other Expenditure £636,463."

The whole of the newly named provision will, on current estimates, be needed towards meeting the balance of the expenditure not at present covered.

The report and accounts were adopted.

FISONS LIMITED

PROGRESS OF EXPANSION PROGRAMME

MR F. G. C. FISON ON IMPORTANCE OF FERTILIZERS

The fifty-sixth annual general meeting of Fisons Limited, was held on February 20th in Ipswich, Mr F. G. C. Fison, the chairman, presiding.

In proposing the adoption of the report and accounts, Mr Fison said:—A full statement concerning the operations of the year has been published with the accounts, but stockholders may like to know something of the reasons why the Board authorised the programme of expansion of the production of fertilisers, and also the extent of the increase.

During the war it was necessary to produce in this country the greatest possible amount of food. There were three principal methods of achieving this, first by ploughing up every acre that could be ploughed and cashing in on the stored up fertility of the land, secondly by ensuring that every acre was used to the best possible advantage to produce the crops most needed by the nation, and thirdly by the increased use of fertilisers.

NEED FOR INCREASED PRODUCTION

The need for increased production from our farms is just as great today when the country is faced with a shortage of dollars for the purchase of food, and the "Dig for Victory" campaign has now been superseded by a new campaign launched by the Minister of Agriculture in January this year under the slogan "Plough for Plenty and do a Sterling Job."

In 1944 the fertiliser industry was asked by the Government to put forward plans for increased production, and our company has made a notable contribution to the target which was set. In response to the appeal we embarked upon, and have nearly completed, the greatest programme of expansion and modernisation ever undertaken by the industry. When our projects are completed in about twelve months' time we shall have increased our annual productive capacity of sulphuric acid by 120,000 tons, of superphosphate by 90,000 tons, of granular complete fertilisers by 450,000 tons, part of which represents replacement of powder fertilisers. We shall also be producing 70,000 tons a year of triple superphosphate, which has not been manufactured in this country hitherto, but which became very popular with farmers during the war, when large tonnages were imported from the United States.

The cost of this programme is £5,500,000, and it has necessitated the raising of a great deal of fresh capital, the plans for which we hope to complete within a short time by the issue of approximately £3,500,000 loan capital.

REMOVAL OF SUBSIDY

Reference has been made in our annual report to the Government's decision to remove the subsidy on fertilisers in two equal stages on July 1, 1950, and on July 1, 1951. With the removal of subsidies we shall be freed from control, except that maximum prices for fertilisers will be fixed by the Government. The rise in the cost of fertilisers to the farmer will be considerable, but the increases will be taken into consideration in fixing the guaranteed prices of farmers' crops, and it is to be hoped, in the interests of food production, that satisfactory prices will be agreed during the next few weeks.

There is no doubt that there is still room for a great expansion in the use of fertilisers on a profitable basis to the farmer, and the National Advisory Service and our own Advisory Service are working in close co-operation to impress upon our customers the profitability of increased usage. Further, the increased use of fertilisers is today the most important method by which agricultural production can be increased.

Our principal subsidiary company, British Chemicals and Biologicals, Limited, have shown much improved results and the trading profits have rather more than doubled. The sales for the present year show continued expansion and some of our new preparations, particularly those used by the medical profession, have shown most encouraging results.

The report was adopted.

R. A. LISTER AND COMPANY LIMITED

EXTENSIVE MODERNISATION PROGRAMME

SIR PERCY LISTER ON THE GRATIFYING PROGRESS

The annual general meeting of R. A. Lister and Company Limited, was held at Dursley on February 20th.

Sir Percy Lister, the chairman, who presided, said:

Ladies and Gentlemen,—The balance sheet and the auditors' statement, together with the report of the directors, are in your hands, and with your permission I shall take them as read. In regard to the consolidated balance sheet, there are points on which I feel some additional elucidation may be appreciated

Last year I referred to the programme of replacement and expansion which we had put in hand in our various factories at home and abroad. In pursuance of that policy we have spent, during the year under review, on buildings, plant and machinery the sum of £420,000, and at the date of the balance sheet outstanding commitments amounted to over £400,000 in respect of orders actually placed. Additional expenditure during the current year will accompany the installation of the machinery and plant comprised in the amount of £400,000, and we anticipate some outgoings on building extensions.

On behalf of the board I wish to express praise to the works executives and all associated with them for the energy displayed and the skill exercised in the immense process of modernisation at all the factories, and I feel that you will share our pride in the fact that, in spite of the complications and handicaps attendant upon the changeover, the output of our chief products has broken new records, and continues to do so.

The reorganisation programme is planned to be completed during the present year.

RISING COSTS

You will have observed that the stocks have increased by approximately £400,000, due, in the first place, to the enhanced cost of buying components from outside sources and in no small measure to increased costs resulting from the operation of the National Health Act and, of course, the increased prices paid for coal and coke, electricity and transport, which are embodied in this figure.

It is, perhaps, timely to emphasise that any increased costs through inefficiency in the administration and operation of state-controlled industries must add to the burdens borne by the ultimate consumers, directly and indirectly, at home or overseas.

There is indeed a serious risk lest the weight of inadequately controlled expenditure in the nationalised and non-competitive industries may before long turn the scales against us in the keener price markets of the world however efficient our secondary industries may be.

The re-establishment of the free convertibility of sterling at the first practicable opportunity is of the utmost importance if freer world trade and travel is to be revived, and in this connection it is important that everyone who can contribute to the closing of the dollar gaps with Canada and the United States should be encouraged by every practical means to do so. Your company engages in this effort with unremitting zeal.

We anticipate having to face keener competition in the world markets both from prewar European competitors as well as in increasing measure from our American friends.

It is to be regretted that "import licence restrictions" erected like barriers round many desirable and potentially important markets abroad continue to hinder and restrain the free flow of trade. It is to be hoped that controls, however necessary and important they may have been in the war, will come to an end at an early date, since they have the tendency of breeding further controls which embarrass and restrict the movement of trade at a time when everything should be done to encourage it to move more freely.

SALES RECORDS

Our sales figures, as I forecast a year ago, for the year under review have established new records, and during the first quarter of the current year the ratio of increase has been fully maintained. As the benefits of our extensive production reorganisation programme "permits of a reduction in costs," it is our intention, compatible with the overall interests of the business, to pass such benefits on to the consumer as we did with our Lister-Blackstone machinery in June last.

It is pleasing to announce that, without exception, your subsidiary and associated companies, covering as they do a number of the major markets abroad, have all made real and gratifying progress.

The future is far from clear, and you will not expect me to indulge in prognostications, especially at this time of political excitement. Until the results of the General Election are known, one cannot foresee clearly the shape of things to come. As a company with no mean history, we go forward to meet the future, whatever the difficulties and perplexities, with a confidence deriving from the knowledge that your companies, those representing them here at home and in the world abroad, and the things we devise and make, enjoy a truly remarkable measure of goodwill. Come what may, the Lister group will give a good account of itself in the spheres of service in which we have specialised.

To the boards, executive officers, staff and workpeople in your employment in all parts of the world, I will express your grateful thanks. Without their efforts and loyal teamwork the record results before you today would not have been achieved.

It is my pleasure and privilege to propose that the accounts for the year ended September 30, 1949, comprising the statement of the auditors, together with the report of the directors, be approved and adopted.

The report and accounts were adopted.

OTICES

NDUSTRIAL CONSULTING.—Production-Engineering, Ltd., are prepared to consider applications from Chartered Accountants, referably with a University Degree. The work is most interesting nd remunerative, and there is an exceptional opening in this ading firm for a first-class man requiring a permanent post with ide opportunities for initiative and constructive development of counting practice and management technique. The salary is high nd there are generous superannuation and profit-sharing schemes. pplicants should be between 27 and 35.—Write in confidence, giving e and full details of education, qualifications and experience, to he Secretary, Production-Engineering, Ltd., 28, Bruton Street, ondon, W.1.

GENERAL SALES MANAGER is required by a large well-known company in a specialised industry and with a high turnover both home and overseas. Candidates must be men with breadth of view o have had a liberal education and wide commercial experience, rticularly in selling, merchandising and advertising; they should able to formulate policy and execute subsequent plans for large le and rapid sales expansion. Only men fit for early promotion the Board and looking for a permanent and progressive appointnt should apply. There is a Company Pension Fund and the rting salary is high. Applications will be considered immediately d treated in the strictest confidence: They should be addressed the Managing Director, Box 349.

OR SALE, *Economist*, 1944 (bound), 1945 and 1949 (both unbound); all with indexes.—Box 354.

CONOMICS Honours degree Cambridge, 23 years, desires job with prospects to learn market research, preferably London ea.—Box 348.

VELL-KNOWN British firm with resident manager covering Middle East and Persian Gulf countries invites enquiries from porters seeking to expand markets in that area.—Please mmunicate Box 343.

SALES OFFICE MANAGER is required by Motor Accessory Manufacturer, Slough. Indispensable qualifications are a detailed knowledge of the motor manufacturing industry, good correspondent and ability to secure co-operation of travellers and staff. The position would offer full scope for an ambitious man who is prepared to work hard. Applicants should give details of education and career, including salary earned in each position and of interests outside business.—Box 352.

WANTED by The Librarian, Agricultural Economics Research Institute, Parks Road, Oxford—the following volumes of the *Stockholm Economic Studies:*

Population movements and industrialisation. *By* members of the staff of the Stockholm Institute of Social Sciences. London, P. S. King. 1941.

Social and economic aspects of Swedish population movements, 1750-1933. *By* Dorothy S. Thomas. London, P. S. King. 1941.

The national income of Sweden, 1860-1930. *By* E. Lindahl *and others*. 2 vols. London, P. S. King. 1937.

LEADING LONDON BANK has vacancy for Italian Correspondent, who must be able to type and correspond in Italian. Familiarity with banking correspondents is an advantage, but is not an essential, provided language qualification is of high standard.—Write Box 3311, c/o Charles Barker & Sons, Ltd., 31, Budge Row, London, E.C.4.

EXPERIENCED Researcher, currently analysing industrial, and consumer market trends in U.K., access to good personal and printed sources, seeks counterparts in Canada and U.S.A. for occasional exchange of information.—Box 350.

ASSISTANT Export Advertising Manager required by well-known pharmaceutical and toilet manufacturers in London. Sound knowledge of advertising and media, particularly in Continental and Colonial markets. Fluent French and German, under 35. Excellent prospects for the right man. Full details to Personnel Manager.—Box 355.

Investment Statistics

Company Notes

English Electric.—After providing £1,045,625 (£729,033) for taxation, £678,241 (£554,009) for depreciation and including nil (£55,513) for non-recurring revenue, net group profit amounted to £709,194 (£595,968) for the year to December 31, 1949. A final dividend of 6 per cent is recommended, making 10 per cent for the year (same).

British Tyre and Rubber.—Consolidated trading profit declined from £1,648,825 to £1,013,377 in the year to September 30, 1949. Total group profit was £1,026,627 (£1,657,550). The dividend of 20 per cent for the year is repeated. Net current assets at the year-end were £2,663,218.

Boulton and Paul.—Total group profit declined from £249,654 to £201,279 in the year to September 30, 1949. The dividend is held at 20 per cent for the year. Net current assets amounted to £617,667 (£527,934) at the year-end.

British Home Stores.—Consolidated trading profit rose from £747,134 to £881,202 and group net profit from £274,257 to £366,835 in the year to December 31, 1949. A final dividend of 9d. per stock unit is recommended, making a total of 1s. for the year compared with 10d. for 1947-48; £250,000 (£150,000) is transferred to general reserve.

Meux's Brewery.—Group profit declined from £251,533 to £196,505 in the year to December 31, 1949. Group net profit amounted to £106,946 (£153,520). A final dividend of 6 per cent (6½ per cent) is recommended, bringing the total to 9 per cent (10 per cent) for the year.

Midland Iron and Hardware (Cradley Heath).—Consolidated profit increased from £264,191 to £302,295 in the year to July 31, 1949. Group net profit was £132,023 (£117,773). The dividend of 6⅔ per cent for the year on the capital as increased to £123,216 absorbs the same amount as for 1947-48. Net current assets were £284,274 (£314,948) at the year-end.

Sisal Estates.—Consolidated trading profit increased from £298,633 to £386,515 and group net profit from £193,266 to £232,095 in the year ended June 30, 1949. It is proposed to increase the dividend from 20 per cent to 30 per cent.

Harrods (Buenos Aires).—Consolidated profit rose from £1,210,268 to £1,561,197 and net profit from £309,575 to £358,386 in the year to August 31, 1949. No dividend has been recommended on the ordinary shares for 1948-49; 5 per cent was paid for the previous year. Present Argentine exchange restrictions rule out the remission of funds to this country.

Barrow, Hepburn and Gale.—Group trading profit has declined from £823,776 (53 weeks) to £635,862 and group net profit from £351,034 to £253,344 for the year to December 31, 1949. The dividend of 20 per cent is unchanged. A sum of £74,989 (£57,883) has been applied to additional depreciation, but other reserves receive nil against £125,000 in 1948. Net current assets were £1,022,338 (£746,817 at the year-end).

Bolsover Colliery.—Net income for 1949 was £133,458 (£200,432). A dividend of 1s. 6d. per ordinary unit is proposed for the year. It is intended to reduce the capital from £4,000,000 to £3,216,250 by returning 19s. in the £ to holders of the first and second preference stocks.

Borax Consolidated.—Consolidated trading profit dropped from £926,185 to £705,237 in the year to September 30, 1949. Total profit of the group, including £329,153 (nil) profits on exchange, increased from £1,114,217 to £1,231,575, and resulted in net profits of £416,602, against £267,597 in 1947-48. Net current assets at the year-end amounted to £2,059,181 (£1,627,495).

Imperial Tobacco.—After deducting £922,773 (£871,136) depreciation, £1,632,089 (£1,306,599) interest and discounts and £19,565 (£119,211) other charges, consolidated trading profit amounted to £16,796,802 (£14,436,858), and group total profit to £19,464,826 (£17,478,890) in the year to October 31, 1949. Group net current assets at the year-end were £86,373,545 (£84,410,379), stocks £93,552,850 (£87,493,802) and debtors £44,990,735 (£43,637,228).

Harrods.—Group profit amounted to £1,456,628 (£1,485,126) for the year to January 31, 1950. After providing £810,692 (£907,725) for taxation and other charges, £117,437 (£115,054) has been retained by subsidiaries and £493,337 (£479,139 including £30,954 non-recurring income) has been dealt with by Harrods Limited. A recommended final dividend of 10 per cent plus a bonus of 5 per cent brings the total distribution to 20 per cent for the year (same).

Capital Issues

English Electric.—Shareholders have taken up 96½ per cent of the recent "rights" issue of 589,789 £1 ordinary shares issued at 35s. in the proportion of one new share for every six shares held.

Robert McArd.—Shareholders are to be offered 604,500 1s. ordinary shares in the proportion of three new shares for every two shares held.

David Whitehead.—Shareholders of Milnrow Spinning (1920), are offered four 1s. David Whitehead ordinary shares plus 4s. in cash for every 5s. share in Milnrow Spinning.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (a) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield.

UNIVERSITY OF LONDON

A course of two lectures will be given by Professor H. Puget (Paris) at 2 p.m. on March 2, and 3 p.m. on March 6, at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. March 2: Recent Changes in French Administration; March 6: The New French Constitution at Work. Admission Free, without ticket.

JAMES HENDERSON, Academic Registrar.

UNIVERSITY OF LONDON

A course of five lectures on "Problems of the Economic Order with Special Reference to German Experience" will be given by Professor W. Eucken (Freiburg) at 5 p.m. on March 6, 10, 13, 17 and 20 at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. Admission Free, without ticket.

JAMES HENDERSON, Academic Registrar.

MINISTRY OF LABOUR AND NATIONAL SERVICE

Applications are invited from men and women for appointment as Personnel Management Adviser in the Leeds area. Candidates must have had extensive experience as Personnel Officers (whole time) in industrial undertakings. They should be able to advise firms on *matters of personnel policy*, on the organisation of personnel departments and the technique of personnel management. In particular, knowledge of modern employment and training methods, joint consultative procedure and industrial welfare is essential. A degree in sociology, economics or some cognate subject or a social science diploma is desirable. Salary ranges for this post are:—

£855 + £25 — £1,024 (men); £710 + £25 — £885 (women).

The post does not at present carry any claim to pension.

Written applications, giving date of birth, education, full details of qualifications and experience (including a list in chronological order of posts held), together with present salary, should be addressed to BD.16, London Appointments Office, Ministry of Labour and National Service, 1-6, Tavistock Square, London, W.C.1, to be received not later than 14 days after the appearance of advert. In no circumstances should original testimonials be forwarded. Only candidates selected for interview will be advised.

GENERAL MANAGER WANTED, age over 40, for large manufacturing organisation. Must have had practical experience of home and export trade, accountancy, administration and a wide general commercial and industrial experience in a high executive capacity. Only letters giving fullest information will be considered.—Apply Nelsh, Howell & Haldane, 47, Watling Street, London, E.C.4.

ECONOMISTS, 1947-49 complete, and indices from July, 1947-December, 1949. Good condition. Offers.—Box 357.

THE Rhodes-Livingstone Institute, Box 195, Livingstone, Northern Rhodesia, invites applications for the following posts: social anthropologists, urban sociologists, demographer, and historian. Starting salaries from £560 to £660, depending on experience. All research expenses paid, as well as passage to Northern Rhodesia. Applicants should state age, academic training, previous experience, and should submit list of referees as well as a medical certificate stating physical fitness for work in the tropics.

FACTORY MANAGER WANTED for large precision instrument factory. Must have had wide practical experience. A knowledge of manufacturing and business methods in the United States is desirable. Must have B.Sc. or equivalent qualification. Salary by agreement after consideration of qualifications.—Apply Nelsh, Howell & Haldane, 47, Watling Street, London, E.C.4.

INDUSTRIAL Psychologist (Woman) required for Personnel Department of large light engineering organisation. Applicants must possess a University Degree which includes Psychology and Statistics, and while workshop experience would be an advantage, training will be given in this sphere. Work will involve testing for all grades of staff and investigations of Job Evaluation and Merit Rating schemes. Apply in the first instance for Form of Application to, The Employment Officer, Hoover Ltd., Perivale, Greenford, Middx.

The King's Government

THE result of last week's general election is a great calamity. It was already clear, long before the formal campaign began, that the election was not likely, whatever its result, to put into office a government both able and willing to take those painful decisions that are necessary if the national economy is ever again to be self-supporting. Very few people, if any, foresaw the dreadful possibility that the election might divest His Majesty's Government of even such power of taking decisions and making policy as they possessed.

Unfortunately the result of the election cannot be regarded as an accident which could be altered by a different set of accidents on another occasion. The British electoral system is not, in general, nearly as capricious as is usually asserted, and in this particular election, so far at any rate as the two large parties are concerned, it reproduced the will of the people with singular exactness. Both of the large parties have shown a desire to pin the responsibility for what has happened upon the action of the Liberal Party in launching so many hopeless candidatures. That action was indeed foolish and the consequences for the Liberal Party, which are discussed in another article, cannot be other than cruel. But the argument that the Liberal intervention did the nation a disservice does not stand up to a moment's examination. The relevant figures are given on a later page. There is no even faintly plausible set of assumptions about what the Liberal voters would have done in the absence of Liberal candidates that would have given a working majority to either of the larger parties. If this is true of February 23rd, it is likely to be still true in June—or even perhaps next autumn.

Nor is there any very convincing reason to suppose that it was some accident of the calendar that produced the result, that the Labour Party would have been either more or less lucky last November than it was in February—or than it would be next June. It is true that the Gallup Poll, whose estimates made in the course of the campaign once again proved to be very accurate, gave the Conservatives a substantial margin of advantage last autumn. But this may be deceptive. It has been a noticeable feature of opinion polls, both in this country and in America, that there is a rally to the Government (of whatever colour it may be) when the election is actually impending.

It is highly inconvenient that public opinion is so exactly deadlocked, but it will have to be accepted as a fact. It is certainly a fact at the moment, and it is much more probable than not that another election in the near future would give substantially the same result. In the framework of circumstances built for them by external events, the British people are equally divided. Until that framework changes, they will remain so. It would be folly on the part of the politicians if they were to precipitate another appeal to the country until there is manifest reason to believe that the circumstances have changed and that a decisive verdict can be obtained on which one party or the other can

pose a policy. Until that time comes, it is their duty to carry on the King's Government as best they can.

It is tempting to jump from this to the conclusion that the two parties should form a coalition. But the Labour party would certainly not tolerate a coalition with the Conservatives and it is therefore hardly necessary to argue the contention that a coalition, in these circumstances, would be a very bad government. But the disadvantages of unlimited party warfare in Parliament should also not be underrated. The real danger that lies in a tiny majority is not so much that it gives the Opposition the power frequently to defeat the Government as that this power has to be exercised quite haphazardly. On the important occasions—the votes of censure, the money resolutions, the second readings of Bills, the votes in committee on the essential clauses—the Government could no doubt scrape its narrow majority together. The times when an Opposition which was doing its best to harass the Government would win would be on the details, on procedure, on all sorts of accidental occasions. This sort of thing could do a great deal to prevent the country from being governed, but it would settle nothing of principle—probably not even if it stung the Government into a fresh dissolution—and would serve no national purpose whatever.

Can there not, therefore, be a limited arrangement between the parties, falling far short of a coalition, for the length of the first session of the new Parliament? This need not involve any formal compacts. On the Government's side it is unnecessary to ask for any promises that controversial legislation will not be introduced, since it obviously could not be passed if it were. Even the highly controversial Iron and Steel Act need not prove an obstacle, if the Government would let it be known that they would not in any case allow the vesting date (which can be postponed by Ministerial order) to arrive before the next general election. Possibly the chief concession that an arrangement would require of the Government would be that they should bring the Conservative leaders into constant consultation on foreign affairs and defence policy, the two subjects which are not, or should not be, at issue between the parties. In return for this, the Opposition should make it clear that they will neither try to defeat the Government on snap divisions nor expect them to resign if such a defeat occurs by accident. Perhaps it would be more important as a practical matter for the Opposition to provide "pairs" for those Ministers who are compelled to be absent from the House of Commons on public business.

In these ways, the King's Government could be carried on. To which party such a breathing spell would give an advantage depends on which side time is thought to favour, and that is a very elusive matter. But that it would be to the nation's advantage hardly admits of doubt. As soon as there is any good evidence that the electorate will give a decided verdict, let there be an election. But, until that time comes, to have another election simply because one party or the other is determined to play the political game for its own sake would be worse than folly—and ought to be judged as such by the electors.

The French Visit

THAT London will be glad to see the French President and Mme. Auriol when they make their visit next week goes without saying. It is time that the British paid tribute with pageantry and hospitality to the Fourth Republic; but it is time, too, that those who form public opinion in France and Britain, or conduct relations between the two peoples, had their attention fixed, if only for a few days, on the state of the alliance. It is not to be expected that such an occasion will move official spokesmen to anything more than the warm and courteous generalisations which are proper to a state occasion; but it will be a pity if nothing is said during the next few days to focus attention on the changes that have taken place in an *entente* of which the cordiality is too often taken for granted.

M. Vincent Auriol is an admirable representative of postwar France. A conscientious, hard-working, dignified President, he has done more than any other statesman to keep moderate men in power and to maintain the authority of the state against the extremists of left and right, who have claimed at various times to speak for well over half the French electorate. He has represented continuity and stability during years of weak government and bewildering party manoeuvres; it is his Socialist President and such Ministers as M. Queuille and M. Moch whom France has largely to thank for its impressive economic recovery and for whatever power of resistance it is able to show in the period of civil and industrial strife that seems to lie ahead. Indeed, President Auriol has been in the thick of a fight more dangerous and more confused than anything that we have known in this country since the war. For France has been the main target of Soviet and Communist attack in the west ever since Mr Molotov swore hostility to the Marshall Plan in July, 1947; it has known real fear and real hatred at a time when the class war has been barely flickering in Britain. M. Auriol, in fact, is something more than head of a friendly state; he is in a quite special way a hero of the cold war.

Failure to understand the role that France has been forced to play in Europe and the Far East; inability to grasp the frustration and bewilderment of a people that asked only for a time of peace in which the deep rivalries caused by defeat and the Resistance might die; irritation at France's impatience to play again the role of a great power while it was still militarily helpless and morally apathetic—these are some of the reasons why the British attitude has often seemed to Frenchmen lacking in sympathy and imagination. There has certainly been at times in London a failure to sense that the well-timed gesture, the Churchillian phrase, may do more for French morale than the meticulous spelling out of what Britain has promised or given in the way of economic aid and military support. For example, when Mr Bevin refers to the danger of the Council of Europe becoming a "talking shop", Frenchmen shudder; not because they have much clearer ideas of how Europe should unite but because political thinking in postwar France—as in postwar Germany—seems intolerable without some romance, some hopes projected into the future.

The welcome that President Auriol will receive from the people of London should help to restore between the two capitals the confidence and friendliness that have been—paradoxical though it may seem—weakened by too much co-operation. For the truth is that Anglo-French contacts have become quite extraordinarily numerous at a time when causes of irritation were bound to be frequent and when the French must feel far less dependent on and grateful towards the British than before. For France at the moment the essential ally is the United States, not Britain. Many Frenchmen who are not Communists look to the Americans for their security, for their economic future, even—in some cases—for their ideology. For them it is the Americans who have the decisive voice in Germany's future, still the main problem of French foreign policy. It is the Americans whose advice is asked when important economic decisions have to be made; it is they who will invest capital in North Africa and perhaps, eventually, pull the chestnuts out of the fire of Indo-China. It is true that many Frenchmen resent this dependence, but it would be a serious error to imagine that those who chafe at it therefore turn their eyes to Britain. On the contrary, they see—or think they see—here a country which is even more dependent on the Americans, and which enjoys with them a relationship which is unique and far closer than any Anglo-French partnership could ever be.

*

Yet, at this very time when the ties with Britain have seemed to some Frenchmen less and less decisive for their prosperity and security, events and policies have multiplied the points of contact. The whole elaborate network of committees under the Brussels Pact brings ministers, high officials and civil servants from Paris and London into a relationship without precedent in peacetime. The European Recovery Programme and the dividing up of Marshall Aid have led to similar contacts in the OEEC. British and French work together at all levels in their own *tête-à-tête* economic committee, in the chiefs of staff group that holds the key position in the Atlantic Pact, in the High Commission in Germany, in the United Nations, in the Council of Europe—generally as comrades but quite often as rivals. In fact, there is almost every kind of detailed, practical teamwork that a Frenchman could fairly demand of the British if he felt real dependence on them. As he does not—thanks to the Americans—feel this dependence, he is apt to question the practical value of the teamwork and to contrast it with the more splendid but vaguer ideas suggested by "united Europe," "Atlantic community" or Mr Hoffman's "integrated market of 250 million people." In short the low morale of the French, their lack of confidence in their own statesmen, and that brilliant scepticism which they confuse with political realism, together lead some of them to nag at a good friend and to disparage the many real concessions that have been made to their point of view.

There are two other characteristics of French postwar attitudes which may baffle but should not be allowed to irritate their British friends. First is the educated Frenchman's habit of presenting a political or economic dilemma with the pride and delight that his wife shows in offering a well-chosen meal. The second is his reluctance to recognise any logic but his own. He seems only too anxious to show the unpredictability of human affairs and the futility of making any strenuous effort to control them. To such a man the philosophy of a Cripps is dangerous fanaticism, planning just a politicians' conspiracy to get more power, and austerity a piece of useless exhibitionism. He does not believe in export drives, bridging the dollar gap, or organised production *à la Russe*. He distrusts strong government because he believes politicians to be both stupid and corrupt. As for his logic, he will speak up for European union as a way of sharing France's burdens with others; but he will not consider seriously those changes in French agriculture which would enable Britain to buy meat and wheat with francs instead of dollars. He will admit that France must make friends with the western Germans while they are weak, but is ready to irritate them with all kinds of demands which he knows only France's allies can enforce.

*

In short the mood and ways of thinking of the men who form opinion in postwar France are sometimes deeply different from those of their opposite numbers in this country. Where we are still doggedly hopeful, reasonably united on foreign policy, and somewhat proud of our sense of purpose, the French give the appearance of being defeatist, divided as a people, and without sense of purpose. Yet for those who have watched the work of such statesmen as M. Schuman, the Foreign Minister, who will accompany the President to London, who have seen the Prefects running France while Paris was without a Government; who have sensed the vigour and alertness of the French conscript and tested the excellence of the French technician—this appearance cannot be accepted as anything more than temporary. And it is the task of British policy in this situation to assist the healing processes that are at work in France by showing

more patience and confidence, and clearer understanding of the limits within which its statesmen have to work.

One thing above all is certain: in whatever directions political and economic events may sometimes seem to be driving British policy, it is completely committed to the defence of French security and independence. On that point there is no disagreement among those competent to judge strategical needs and military facts. On that fact too British policy should be firmly based, for it is the one about which Frenchmen are most concerned. Where British policy has so far failed is in not drawing clear inferences from that fact and in not taking the military and financial measures that would convince the French that it means business.

No Easy Way

THE outcome of the 1950 election may have created grave difficulties for the nation and the government, but it has been a disaster for the Liberal party. Despite the fact that it put forward 475 candidates, the largest number since 1929, despite evidence of great enthusiasm among its organisers and supporters, despite signs of a growing disillusionment among the intelligent electorate with the policies of the other two parties, the revival of Liberal strength in Parliament and in the country did not, when put to the test, prove to have any basis in electoral fact. Only nine members were returned to Westminster, 314 candidates forfeited their deposits, and although the Liberal vote rose from under two and a quarter million in 1945 to well over two and a half million in 1950, its share of the total poll remained constant at about 9 per cent. In short, the Liberals had staked everything upon increasing the size of their parliamentary representation, to a point from which they could one day make a come-back as a major political force. But the bitter truth is that the gamble has failed. However liberal the spirit of Britain may be, the vast majority of voters see in Labour and Conservative the only effective competitors for power. The professing Liberals are spread too thinly across the face of the land to elect more than a handful of members to Parliament, and there is no indication that this situation will alter in the future. For the past four and a half years it may have been legitimate—though it was never very reasonable—to assume that the Liberal party was merely unfortunate in 1945. But only the most unreasonably optimistic Liberal can now believe, in view of last week's happenings, that another major Liberal intervention at the next general election would produce a strong parliamentary party.

*

It is a bitter situation for the guardians of a great political tradition to confront. But politics is a delicate and constantly developing art, and whatever is the right course for them to pursue, the wrong course would be again to put up a large number of candidates and to see all but a few forfeit their deposits at the bottom of the poll. In doing so they would make the name Liberal not only hated by the other parties—which is unimportant—but a subject for ridicule and ribaldry among the electorate, the last thing that anyone who has a care for the Liberal political tradition should want to see. The leaders of the party should have been able to see this before the election; they cannot avoid seeing it now.

Yet two and a half million British electors persevere in their insistence on being and voting Liberal. If any body of electors has a right to feel aggrieved about last week's results it is the Liberals, who are represented by only one member for every 293,000 Liberal voters as against one to every 41,000 Conservative and Labour voters. The constructive course for their leaders and representatives is now to try to secure better representation inside and outside Parliament for this strong and apparently solid body of Liberal opinion. Four possible methods suggest themselves. The first is to concentrate on fighting, at the next election, a limited number of seats in which a Liberal has a sporting chance of success. The second is to demand, and somehow to obtain, the abandonment of direct, in favour of proportional, representation in Britain. The third is to strike some bargain with one of the two major parties. The fourth is to abandon the attempt to represent the Liberal vote directly at Westminster and to transform the Liberal party into an extra-parliamentary body capable of influencing the course of policy by other means.

*

The first course—to concentrate the party's finances and energy on a limited range of seats—would appear to be a product of the same wishful thinking as was the cause of last week's fiasco. Where are the eighty or hundred seats of which the Liberal party could win a fair proportion by concentrating its resources, both of money and of talent, upon them? There were only 18, in addition to the 9 they won, in which the Liberal even came second. There are no Liberal strongholds any more—even Wales returned only five Liberals out of its 34 members and there was no certainty about the election even of those. The four Liberal seats in England and Scotland appear to have been won as a result of a mixture of fortuitous circumstances, and there is no pattern from which the Liberal party can work out a limited but concentrated strategy. The party will be deluding itself once again if it attaches any hopes to this policy of concentration.

As for the second course—the adoption of electoral reform—the Liberal party has a strong case on moral and logical grounds. It is indefensible that one-tenth or more of the electorate—and of its more thoughtful members—should be permanently disfranchised. But there is really very little hope that the course of proportional representation will secure the support of either of the major parties—without which, of course, it is hopeless. The Labour party has never been willing to entertain the idea. Nor is there any reason of self-interest why it should, for even at the crest of its wave in 1945 it polled only 48 per cent of the total vote and PR would put an end to the possibility of Labour majorities in Parliament. For just this reason, it might be expected that the Conservatives would look with favour on the idea. Perhaps their rank and file—who have more to fear from a strong Labour government than they have to hope from a strong government of their own party—would gladly see PR enacted. But the Tory politicians are more attracted, particularly at the moment, by the prospect of a large independent majority of their own.

Proportional representation is not, of course, the only form that electoral reform could take. There is also the system of the Alternative Vote, which enables each voter to indicate on the ballot paper what his second choice would be if the candidate of his first choice is at the bottom of the poll. This has the great advantage over PR that it does not involve the amalgamation into large five-member or six-member constituencies of the single-member seat that is (by now, it was not always so) traditional in British politics. The Liberal party in the past has never liked the Alternative Vote since it is precisely intended to re-allocate to the larger parties the votes first given to the weakest. But though it would give the Liberals fewer seats than PR would, it might nevertheless give them more than they can win under the present system, for if to give one's first preference to the Liberal were not to waste the vote, many more votes might so be given, enough to bring the Liberal into second place in a number of seats and thus benefit (as the party in the middle would) from the second preferences of whichever party was at the bottom. The supreme advantage of the Alternative Vote over PR is that while the latter is certainly unobtainable, it is just faintly conceivable that one of the major parties might be willing to agree to the former.

*

The third course is for the Liberal party to make some arrangement with one of the two major parties, by which in return for Liberal support in the House of Commons Labour or Conservative candidates would stand down in certain constituencies where a Liberal would have a fair chance of success in a straight fight. If the Liberals were to make such a compact with the Labour party their votes would strengthen the Government in the Commons, but that such a bargain could be struck is most improbable. The Liberals are committed to opposing the nationalisation of iron and steel, and to abandon the advocacy of nationalisation would be much too large a price for Labour to pay for so small a measure of effective support. Moreover, the Labour party has always most firmly set its face against any arrangements of the kind—the more firmly since its experiences of 1924 and 1929-31. There is no immediate objection to a compact with the Conservatives, but the long run danger to the Liberal party is obvious. If the Conservatives were to stand down in two score seats in return for Liberal abstention in say one hundred constituencies, the Liberals, because they are the weaker party, would be entirely at the mercy of the Conservatives. At each successive general election the arrangement would be continued only if the Liberals were prepared to remain a Tory tributary. To the great majority of Liberals, this would be far too high a price to pay for thirty seats in the next Parliament, and if the leaders of the party were sufficiently tempted by the bait to swallow the hook, they would find that they could not deliver the vote. Indeed, it is safe to say that the only arrangement with another party that would be ratified by the majority of the 2,600,000 Liberal voters is one which, by a binding promise of electoral reform, guaranteed them both seats and independence. It is certain that the Labour party will not offer that, and highly unlikely that the Conservatives will.

From a consideration of all the courses of political action open to the Liberal party, it is difficult to envisage any method which will increase its strength in the House of Commons. This may be a sad reflection on the state of contemporary British politics, and on the absurdity of the electoral system, but the Liberal party could do no greater disservice to Liberalism than to count upon some miraculous change of loyalties among the British electorate. Hard though it may be on them personally, the leaders of the Liberal party must now ask themselves whether the cause of Liberalism cannot be best served by methods that do not require their own presence in Parliament. If the influence of Liberalism is to be felt in the country, the leaders of the Liberal party must begin to consider whether the time has not come to transform it from an organisation with purely electoral ambitions into an extra-parliamentary movement. Such a movement, working towards defined Liberal objectives and capable of undertaking the kind of research which is outside the range of the ordinary political parties, might come to have an influence far greater than the contemporary Liberal party could ever command in Parliament. The very dispersion of the Liberal millions across the country, which is the source of their weakness when they put up their own candidates, could be turned into a source of strength if the candidates of the larger parties were compelled to compete for their votes. Such a Liberal movement would be capable of representing the interests of those sections of the community too small, too restrained or too impotent to excite the enthusiasm of the two major parties—the professional man and woman, the skilled workman, the enterprising small business man, and, above all, the consumer. It might be capable of exercising a moderating and invigorating influence upon the two major parties without wasting money, energy or prestige in putting up Parliamentary candidates.

*

There are obvious difficulties in adopting this course of action. In the first place, individual voters who sympathised with the Liberal movement, since they would be denied the possibility of voting for it, would have to be given some alternative method of enrolment. At the present moment such strength as the Liberal party possesses rests on the fact that over two and a half million people voted for it. Without parliamentary candidates it would be difficult to prove the existence of this strength in years to come, except by some new method of membership which would be accepted as genuine. In the second place, such a movement would be in constant danger of becoming a mere lobbying or pressure group, a form of organisation which has never been accepted in British politics. Finally, it would lack the glamour of direct political action, which might make it difficult to attract the loyalty of able and ambitious people.

In the cruel dilemma which confronts them, these advantages and objections must already have been apparent to Liberal leaders. But it is now quite certain that there is no easy way to restore the fortunes and the influence of the Liberal party, and that only some bold departure from the policies of the past three decades can continue to make the Liberal voice heard with the authority and respect that its ideas deserve.

The Results Analysed

(By a Correspondent)

The following article is contributed by the author of "Electoral Facts" which appeared in The Economist *of January 7, 1950.*

FEW people can be satisfied with the result of this election. Though the Conservatives have been checked in their victorious advance, the Labour Party has suffered a Pyrrhic triumph. The hopes of the Liberals and the Communists have been even more devastatingly disappointed. Alone, rejoicing in the wreckage, may be found the electoral statistician, granted a new importance by the nicety of the result and provided with rich material to work upon. How were the votes cast and where? What might have happened if some candidates had withdrawn? What is likely to occur in another election? What has been shown about the working of the electoral system?

A formula to explain the relation between seats and votes was put forward in the previous article of January 7th. The formula simply stated that in a fairly homogeneous country with a predominantly two-party system the ratio between the seats won by the parties would be the cube of the ratio between the votes cast for them. With that formula the results of the last three general elections could be calculated with an average error of only 2 seats. At the time it was pointed out that there was no reason why this improbable degree of accuracy should be maintained. It has not been. In this election the formula would have given Labour 18 more seats and the Conservatives 18 fewer than they actually won. The failure of the formula to work does, however, point to a bias now existing in the electoral situation which substantially favours the Conservatives. At the last election this bias was more than cancelled out by a compensating bias in favour of Labour owing to the unequal size of constituencies and the accident that Labour happened to be strong in the small constituencies. Now that neither party benefits markedly from inequalities in the size of constituencies the bias becomes plain. If in every constituency in the country the Labour Party had last week won 1 per cent less of the vote and the Conservatives 1 per cent more, the Labour Party would still have had 0.7 per cent more of the aggregate vote than the Conservatives, but the Conservatives would have gained 17 more seats from Labour and would have had a lead over them of 15 seats. The matter can be put even more dramatically. If in every constituency the Conservatives had won 2.7 per cent more of the votes and Labour 2.7 per cent less, the votes for the major parties would have been exactly reversed. But the result in seats would have been much more than reversed. The Conservatives, with 340 seats, would have had an absolute lead of 55 seats over all parties and editorial columns would now be full of generalisations about "the clear verdict of the British people."

The reason for this bias in the system is probably not far to seek. There are few Conservative constituencies quite as safe as the real Labour strongholds. In this election, although there was only a small difference in the number of seats won, there were 42 constituencies where Labour had a majority of over 20,000 while there were only 10 such Conservative constituencies. Lower down the scale, there were 135 constituencies where Labour had a majority of over 10,000 but only 94 where the Conservatives had a similar lead. This more intensive grouping of the Labour Party's strength, piling Pelion upon Ossa in the strongholds, is bound to count against it in the electoral struggle. There seems little prospect of the situation changing. It is probable that, for the time being, to get a clear majority in seats in a general election, Labour will have to get at least 1 per cent more of the popular vote than the Conservatives would need for the same result.

*

The Representation of the People Act of 1948 presented a major unknown factor in the election. It is worth investigating the effect of the major changes it introduced. Little need be said about the limitation on cars and expenses. Vastly the greater part of electioneering is devoted to getting people to the polls rather than to converting them. The record turnout, 84 per cent, suggests that these new restrictions did not seriously limit the efficacy of the party machines. The postal voting provisions of the 1948 Act, though less noticed when they were introduced, may well have had quite as decisive an effect. Figures are not available for the number of postal voters, but a check in a number of constituencies suggests that the average figure may possibly have been 800 or 1,000. Of these it seems safe to assume that a vast majority were Conservatives. In fairly extensive inquiries few Labour agents were encountered who had done much to get elderly and invalid supporters on to the postal register. Many Conservatives, on the other hand, were very active in securing from doctors and (in some cases) from hospitals lists of likely postal voters and in ensuring that they were duly registered. If the Conservatives gained on the average an extra 500 votes per constituency in this way, it would mean that there were 11 seats which they owed to their alacrity in exploiting this provision in the Act. In other words, if these assumptions are correct (and though they are speculative they are not unreasonable), but for the postal vote Labour's absolute majority might have been 29 instead of 7.

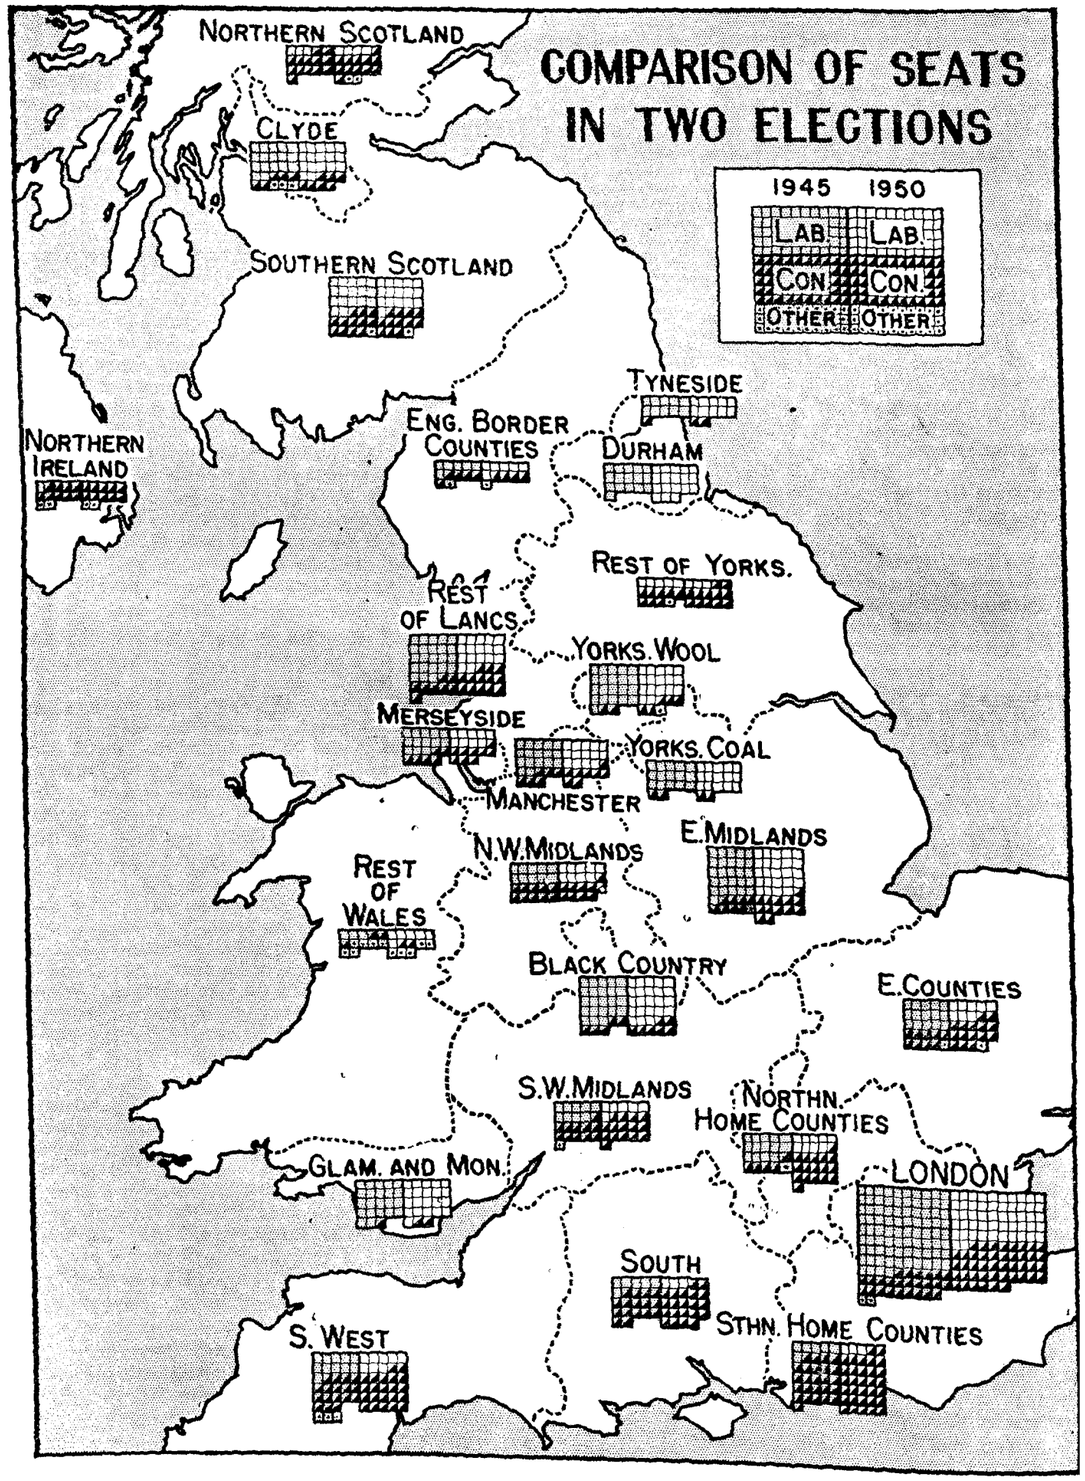
It had long been thought that the redistribution which took place under the 1948 Act would automatically—and quite properly—benefit the Conservatives to the extent of about 30 seats. By 1948 the constituencies defined by the Act of 1918 no longer corresponded closely to the distribution of the population. Labour areas tended to be over-represented and Conservative areas to be under-represented. Redistribution has reduced the discrepancy between the average size of Labour and Conservative constituencies from 6,000 to under 600. The election results seem fully to confirm the estimate that redistribution, quite apart from any swing in votes, was responsible for at least 30 of the Conservative gains. They also offer an interesting sidelight on a question which gave rise to most heated controversy two years ago. During the debate on the Bill, the Government introduced an amendment to create 17 seats over and above those recommended by the Boundary Commission. This amendment was widely attacked as shameless gerrymandering. It is interesting to see the fate of these 17 extra seats. Accurate calculation is not possible everywhere, but a rough check suggests that as a result of that amendment the Labour party have 9 and the Conservatives 8 seats more than they would otherwise have had—which is either not gerrymandering at all or else not a very successful example of the art.

The turnout at this election has surprised many people in view of the quiet campaign and has evoked pæans of praise for the civic consciousness of the nation; 84.0 per cent voted compared with 72.8 per cent in 1945 and 76.6 per cent in 1924, the interwar election which attracted the largest turnout. To some extent this year's increased vote might have been foreseen in an election so long prepared for, so widely publicised and so narrowly contested; but the size of the increase is not quite as notable as the figures suggest. It is in part a book-keeping change. The removal of "dead" names from the register, under the new system of compilation, has, according to the Home Office, reduced the nominal electorate by 3 per cent. On the other hand about 2 per cent who might formerly have been disfranchised have been able to use the postal ballot. The general dislocation in normal life in 1945 and the inefficiency of the means of recording the service vote must further have reduced the proportion of the electors then recording their votes. In the end it may be found that of those who really had a chance to record their votes, only 2 per cent or 3 per cent more seized it this time than in 1945. The regional variations in participation, it is worth noting, are smaller than heretofore. Few areas had a poll of less than 80 per cent. The county divisions of Durham with an average of 88.2 per cent provided the highest average. The business and residential divisions of London, with 75.3 per cent, provided the lowest except for the Highlands, where not unnaturally the turnout fell as low as 55.7 per cent in the Western Isles. Accrington with 91.0 per cent voting apparently holds the record—unless Northern Ireland is considered. There participation seems to have varied directly with the closeness of the Nationalist challenge and fluctuated from 63.3 per cent in South Antrim to the rather suspiciously high figure of 92.1 per cent in Fermanagh and South Tyrone.

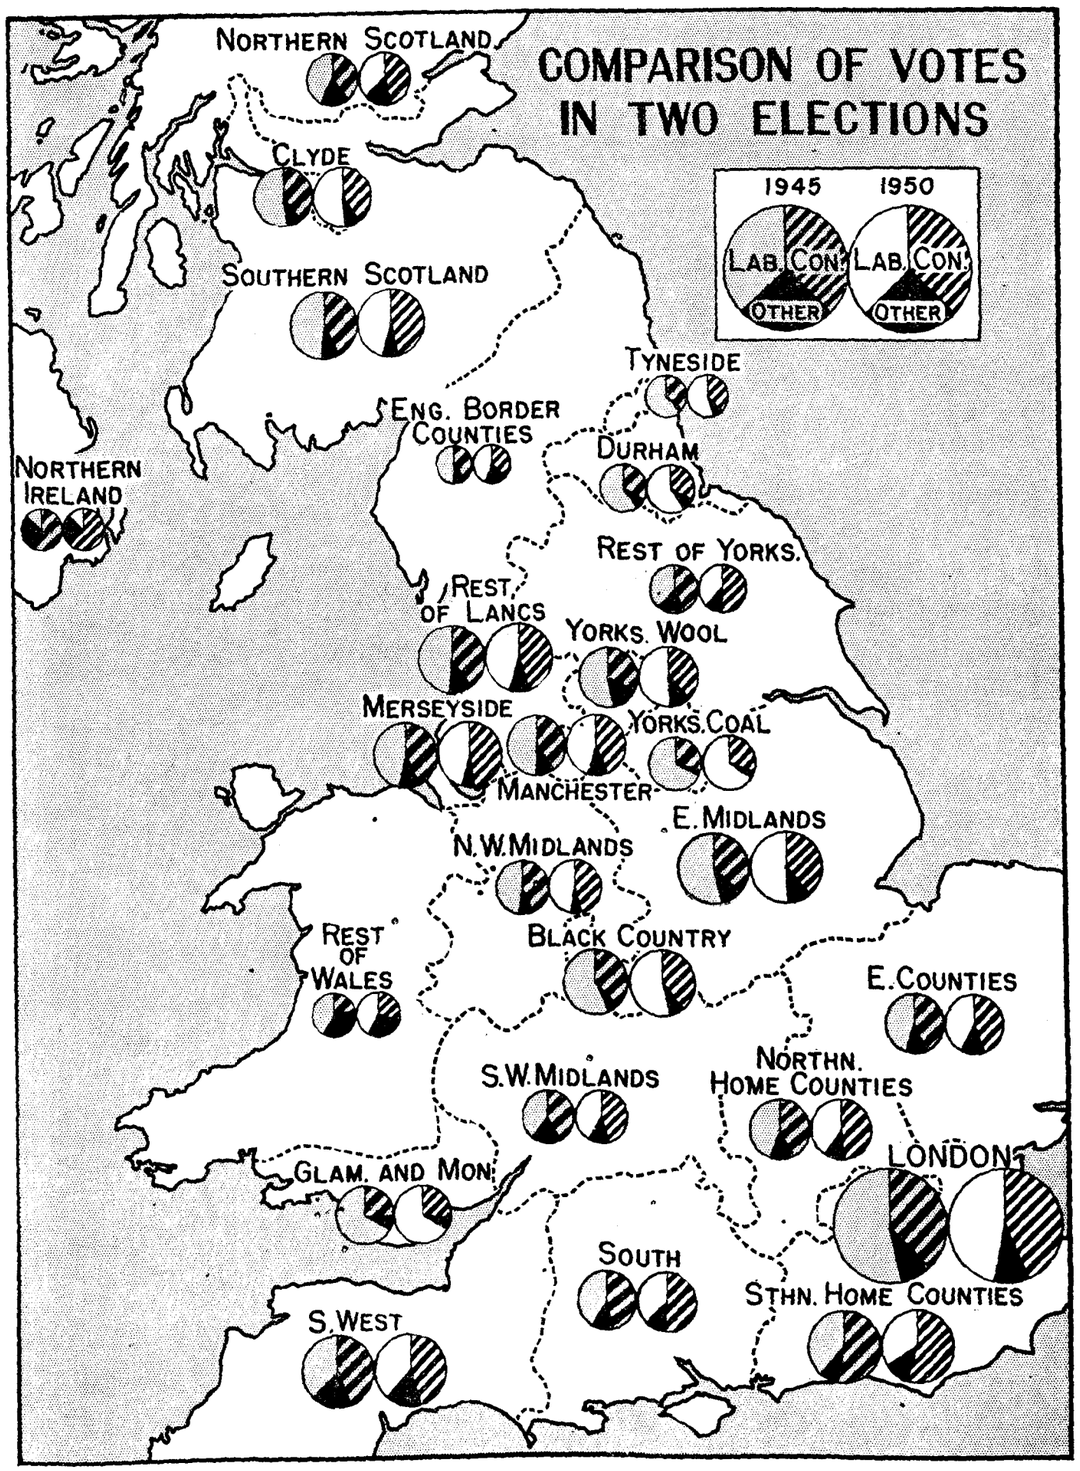
*

The public opinion polls fared reasonably well in this election. They all found the division in votes too narrow for them to commit themselves to prediction about which side would be victorious. The longest established of the polls—that of the British Institute of Public Opinion published in the *News Chronicle* (the Gallup Poll)—proved the most successful, showing an error of 1.1 per cent in the Labour vote, of 0.1 per cent in the Conservative, and of 1.4 per cent in the Liberal.

All but the major parties fared disastrously. Transport House anxiety about West Fife and East Rhondda proved quite unfounded. Mr. Gallacher secured 22 per cent of the poll in his constituency, and Mr. Pollitt and Mr Piratin, the only other Communists to save their deposits, each did so by a mere handful of votes. Only one besides these three secured as much as 4 per cent of the vote, and 80 of the 100 Communist candidates did not even get 2 per cent. The Left fringe proved little more fortunate. The strongly entrenched Mr Pritt polled no more than 25 per cent in North Hammersmith. Mr Zilliacus with 15 per cent was the only other to save his deposit. The independent Independents did a little better percentage wise, but Messrs. W. J. Brown, Kendall, Lipson and King-Hall were all at the bottom of three-cornered fights. If the new House seeks Independents it will, until the next expulsion or resignation, have to turn to Irishmen who may not choose to sit.



*



The Liberals' fate has been much discussed. Both sides have blamed their defeat on Liberal intervention. The evidence about the way in which the Liberal vote would have been divided in the absence of a Liberal candidate is necessarily speculative. Party agents offer widely differing estimates. The best evidence is perhaps offered by the Gallup Poll which suggested that 42½ per cent would vote Conservative, 22½ per cent would vote Labour, and 35 per cent either did not know or else would abstain. Unfortunately, that poll was taken two months ago. There is as yet no means of telling whether the siren call of Mr Churchill beguiled any Liberal voters into the Tory camp—or frightened them over to the other side. It does not seem likely that as many as 35 per cent of the Liberals who were deprived of a candidate did in fact abstain. It is quite possible that on balance Liberal intervention had no effect.

In the statistical tables on pages 466 and 467 the consequences of Liberal withdrawal are examined in detail on the basis of various assumptions about the disposition of their vote. The assumption that the Conservatives, in the absence of Liberal candidates, would have made a net gain of 30 per cent of the Liberal vote seems, if the country is taken as a whole, to be the most favourable to them that it is reasonable to make. The Gallup Poll mentioned above gave a net gain to the Conservatives of 20 per cent, and it may be that in the weeks that intervened before the election some of these near-Conservatives were persuaded by fear of wasting their votes to leave the Liberal ranks. Yet even if the Conservatives' net gains were as much as 30 per cent, they would only have won 17 seats now held by Labour, which would have given them a clear Parliamentary majority of only 2. If their net gain from the Liberal vote had been only 10 per cent or 20 per cent, neither party would have had a clear majority. If, on the other hand, Liberal voters were to have divided more in favour of Labour, the Government might easily have found itself with a working and not a perilous majority. A net gain of 10 per cent of the Liberal vote would have given Labour 11 more seats—a clear majority of 29. A 20 per cent gain would have raised the majority to 45 and a 30 per cent gain to 69. It may be considered unlikely that Labour would benefit more than the Conservatives from the dispersal of the Liberal vote, but at least it is plain that, without a further swing from Labour to Conservative, independent of what the Liberals may do, another general election would not bring the opposition to office.

Whatever the influence of the Liberals' intervention on the fortunes of the major parties, their own fate was sorry enough. Of their 473 candidates, 314 lost their deposits, and only 9 were elected—2 thanks to the absence of Conservative candidates. Of those defeated, only 2 (Sir

Votes and Seats of the Parties

In the tables below and in the maps on pages 464 and 465 (which compare the results of the 1945 and 1950 elections in graphic form), the country has been divided for the purposes of comparison into twenty-five regions, based on social and economic homogeneity, although widely different in size and population.

THE COMPOSITION OF THE REGIONS is indicated on the maps. Some details of the boundaries are as follows: *Greater London* includes all boros. adjacent to County of London. *Northern Home Counties* extends as far as Berks (excluding Abingdon and Newbury), S. Bedford and, in Essex, to Epping, Chelmsford and Southend. *Mid-Southern England* includes the rest of Berks and all Dorset except West Dorset. *South-West England* includes Bristol and S. Gloucester. *Eastern Counties* includes the rest of Bedford, Peterboro', Huntingdon and Isle of Ely. *Black Country* includes Birmingham Wolverhampton, Coventry and adjacent boros. also Cannock, Solihull, Sutton Coldfield and Nuneaton. *N.W. Midlands* includes Salop, rest of Stafford and Cheshire up to Chester, Runcorn, Knutsford and Macclesfield. *Manchester and District* includes Eccles, Middleton and Prestwich, Oldham, Stalybridge and Hyde, Cheadle, Altrincham and all boros. contained within these. *Merseyside* includes Crosby, Huyton, St. Helens, Widnes and all Wirral constituencies. *Rest of Lancashire* excludes Barrow and Morecambe and Lonsdale. *Yorks Woollen District* includes Sowerby, Keighley, Leeds, Wakefield, Colne Valley and boros. contained within these. *Yorks Coal and Steel District* includes everything in W. Riding south of Penistone, Hemsworth, Normanton, Barnsley and Don Valley. *Durham and Teesside* includes Middlesbrough and Cleveland. *Tyneside* includes all constituencies on the River Tyne as far as Consett on one bank and Newcastle on the other. *Glamorgan and Monmouth* includes Llanelly. *Clydeside* includes Glasgow, Greenock, Dumbarton and all Lanarkshire except Lanark. *Southern Scotland* includes everything else south of Stirling and Fife.

THE PARTIES HAVE BEEN DIVIDED as follows: *Conservative* includes Cons. and Lib., Cons. and Lib.-Nat., Unionist, Lib.-Nat., National and Nat.-Lab. (1935). *Labour* includes Labour and Co-op. but not Lab.-Ind. or ILP. *Liberal* includes Indep.-Lib. (1935 only). Under *Others* are grouped all candidates who would not accept or would not be accorded the whip of any of the three main parties if returned to Westminster.

UNIVERSITY SEATS, unopposed seats (2 Conservatives in 1950) and Manchester Moss Side, where the 1950 result is delayed, are excluded throughout.

The Split Vote

The following table shows the numbers of Labour and Conservative members elected arranged according to the proportion they obtained of the total poll in their constituencies.

Winning Votes as Percentage of Total Votes in Constituency	Number of Seats Won	
	By Labour	By Conservative
Between 35 and 40 per cent.	2	3
„ 40 „ 45 „ „	11	23
„ 45 „ 50 „ „	63	79
„ 50 „ 55 „ „	75	71
„ 55 „ 60 „ „	60	68
„ 60 „ 65 „ „	47	31
„ 65 „ 70 „ „	20	15
„ 70 „ 75 „ „	16	1
„ 75 „ 80 „ „	13	2
„ 80 „ 85 „ „	7	1
„ 85 „ 90 „ „	1	—
TOTAL	315	294

It will be seen that 181 seats were won on a minority vote, 76 by Labour and 105 by Conservatives. In all save 8 of these seats (5 Labour and 3 Conservative), the intervention of a Liberal was the sole or main cause. It is most unlikely that, in the absence of these Liberals, the whole of their votes would have gone to either of the larger parties; some would have abstained and some would have gone to each of Labour and Conservatives. Indeed, it is unlikely that either of the larger parties would have made a *net* gain relative to the other (and it is, of course, only *net* gains that could affect the result) of more than 30% of the Liberal vote (e.g., 20% abstainers, 55% Conservative, 25% Labour). The interesting seats are therefore those where a *net* transfer of up to 30% of the Liberal vote would have affected the result. These are as follows:—

Area and Constituency	Conservative would have gained from Labour with *net* addition of following percentages of Liberal vote			Labour would have gained from Conservatives with *net* addition of following percentages of Liberal vote

SEPARATE TOTALS	5	7	5	11	8	12
CUMULATIVE TOTALS	*5*	*12*	*17*	*11*	*19*	*31*

These figures show that even on one extreme assumption the Conservatives could only have gained 17 more seats by the disappearance of Liberal candidates, and that on the other extreme assumption Labour could only have gained 31 seats.

Archibald Sinclair and Mr Byers) came within striking distance of success. The Liberals' victories were notably concentrated in the Celtic fringe. In Anglesey, Montgomery, Merioneth, Cardigan and Orkney and Shetland they braved the prevailing tide and strengthened their hold. Elsewhere, only in Eye and in Roxburgh and Selkirk did they score isolated successes. Otherwise they suffered tragic and universal disappointment, barely a dozen of their failures securing even 25 per cent of the votes. Their average poll in the 473 constituencies they fought was 11.9 per cent.

It is very difficult to say why an election is won or lost or who have changed their minds. It is a subject on which a Gallup Poll can probably give more precise evidence than any analysis of voting returns. Nevertheless, certain conclusions are suggested by regional variations in the turnover in votes—which, over the whole country, was 3.0 per cent. The Labour organisers may have been disappointed in the agricultural vote but, although there was no marked swing towards them in the rural areas, at least they appear to have held their ground in them better than in the country as a whole. In the West of England, in Wessex, in the South West Midlands and in East Anglia the average swing against Labour was under 2 per cent. (Swing is here reckoned as the average of the Conservative gain and of the Labour loss, both reckoned in percentage of the total vote.) The areas which turned most sharply were the London suburbs. There was an 8½ per cent swing in Middlesex and 8 per cent in outer Essex. Leeds, unique in the North, had a swing of 7½ per cent. The Highlands, with a swing of 6½ per cent, were the only other area with a swing of this magnitude. In the big cities, on the whole, the swing was about the same as the national average. In the County of London it was nearly 5 per cent, but in Birmingham it was 2½ per cent, in Glasgow between 2 per cent and 3 per cent. In Liverpool and in Manchester it was about 2½ per cent, in Sheffield and in Bradford 2½ per cent, in Nottingham 3 per cent, in Leicester 2 per cent, and in Bristol 2½ per cent. South Wales held firm with a swing of only 1½ per cent. The Yorkshire coalfield with 2 per cent, Durham and Teesside with less than ½ per cent, and Clydeside with 1 per cent swing were also fairly static politically. Redistribution makes some of these calculations a little uncertain, since, for example, every one of the great cities except London has expanded since 1945 to include a few thousand suburban electors within its Parliamentary boundaries, but the error from that source is probably negligible.

Redistribution and the luck of the draw often produced turnovers in seats in no way corresponding to that in votes. The representation of Liverpool, for example, changed from 8 Labour and 3 Conservatives to 5 Conservatives and 4 Labour with only a 2½ per cent swing in votes, while Leeds, with a 7½ per cent swing, changed from 5-1 to 5-2, the Conservatives merely winning the extra seat granted by redistribution. In general, however, most of the Conservative gains in seats were in the areas of the greatest swing. In the five counties surrounding London, representation changed from 53 Labour and 34 Conservatives in 1945, to 28 Labour and 68 Conservatives in 1950. In fact more than half the seats which Labour lost through the swing in votes, as distinct from the automatic effect of redistribution, were in the Home Counties. Many will profess to see in this some vindication for that old and dubious cliché "the balance of power lies with the middle classes." But there are quite enough agricultural and semi-industrial seats which Labour lost by a narrow margin for it to be possible for them to win a working majority without recovering any of the dormitory areas.

NOTES OF THE WEEK

New Cabinet

The announcement on Wednesday of the new Cabinet and of the ministers of Cabinet rank is an interesting indication both of the balance of forces within the Labour party and of Mr Attlee's personal estimate of the men who will best assist him to maintain the prestige of the Government. The three most important posts remain unchanged with Mr Morrison as Lord President and Leader of the House of Commons, Mr Bevin as Foreign Secretary, and Sir Stafford Cripps as Chancellor of the Exchequer, the last named being assisted by the competent and hard working Mr Gaitskell as a Minister of Economic Affairs. The desire to have Dr Dalton in the inner councils of the Government has been achieved by the curious device of giving him an unimportant department, Town and Country Planning, and bringing it within the Cabinet. There is one important and satisfactory promotion to the Cabinet, that of Mr Patrick Gordon Walker to be Secretary for Commonwealth Relations (from being Parliamentary Under Secretary) in place of Mr Noel Baker, who has been moved outside the Cabinet to the Ministry of Fuel and Power. Outside the Cabinet, at the Ministry of Food, Mr Maurice Webb has replaced Mr Strachey, who goes to the War Office; Mr Webb's training has been political rather than administrative and it is now clear that the Ministry of Food is regarded as one of the most politically sensitive of departments. Most of the other promotions, Mr Kenneth Younger to be Minister of State, Mr Ness Edwards to the Post Office, Mr J. Dugdale to be Minister of State, Colonial Affairs, are rewards for honest toil, and one, that of Mr Richard Stokes to the Ministry of Works, seems to be the result of a belated effort to recruit ministers of some dash and imagination.

Two ministers, Mr Bevan and Sir Hartley Shawcross, who might have expected promotion had the Government been returned with a strong majority and consequently able to disregard the feelings of their opponents, have had to be content with their previous jobs. But three Cabinet changes are extremely disquieting. It is known that Mr Bevin is a sick and tired man who must devolve a great deal of work upon his juniors. What sense was there in removing his Minister of State, Mr Hector McNeil, to the Scottish Office at the precise moment when his other trained assistant, Mr Christopher Mayhew, had been defeated at the polls? It is obvious that Mr McNeil's appointment is based on a desire to placate Scottish opinion, for it will give more satisfaction there than the appointment of any politician in either party, but either he must continue to give Mr Bevin a hand, in which case he will be a bad Secretary for Scotland, or leave matters entirely to his successor, Mr Younger, whose experience has been at the Home Office at exactly the opposite end of the departmental spectrum. Second, the appointment of Mr James Griffiths to the Colonial Office seems most unwise. The Colonial Office now wields a more vital responsibility than at any time since Joseph Chamberlain's day. Mr Griffiths has not had the necessary training for such an office, and his position as a party manager makes it unlikely that he will give it the undivided attention which it deserves. Finally, the appointment of Mr Shinwell to the Ministry of Defence dooms that department to a further period of insignificance and impotence, for only a man of exceptional qualities divorced from party scheming can make the Ministry of Defence serve the function for which it was intended—a function which was never more important than at the present day. All in all, it is difficult to resist the conclusion that the Cabinet changes have been made too much with an eye on the next election, and with too little regard for the most important problems of the day.

* * *

How will the Government Govern?

Despite the Government's narrow majority, the present Parliament may have a longer life than has been generally forecast. The belief that the Government's fate might be settled on a snap division by a Labour member having a cold or an attractive invitation to dinner is more dramatic than accurate. The constitutional position is, of course, that a Government has to resign, not just because it is defeated in the House of Commons, but only when it loses the confidence of the House of Commons, and clearly the test of whether it has this confidence or not must be a division on an issue of policy. One of Mr Attlee's first tasks must be to clarify the type of vote which he will regard as decisive. Mr Ramsay MacDonald, as head of the minority Labour Government in 1924, laid down in the first days of the Parliament the principle that the Government would resign only if defeated on substantial issues. He later somewhat obscured the situation, however, with a very characteristic sentence:

> I can assure the House of this, and about this there need be no fear, that the Government will not remain in office five minutes after a Division in the House has deprived it of its sense of dignity.

In practice in the present Parliament the obvious course for the Government will be that taken by Mr Churchill in 1944 when the Coalition suffered an accidental defeat on an amendment to the Education Bill. He insisted on treating it as a matter of confidence and having a further vote the next day to test this confidence. One can expect the Government, if it were defeated on a motion which could leave any doubt about its standing, to introduce a formal motion of confidence the next day. Perhaps the classic, if now dated, precedent is that of the Whig Government of 1834-40, which was defeated 58 times in the Commons and 49 times in the Lords, and finally gave up office only after a vote of no confidence had gone against it. Mr Morrison has, therefore, a slightly larger margin for manœuvre than his tiny majority would suggest. Even so, it will require the utmost vigilance on the part of the Whips and an even more stringent discipline over the lives of Labour members if the Government is to survive the months ahead.

This discipline will probably be forthcoming. Some of the more restive members of the Labour party's left wing fell by the way at the polls and the dominant members of the "rebel" group are Mr Crossman and Mr Mikardo, who have always been careful not to carry their restiveness too far. The division of opinion in the Labour party on domestic policy between left and right may not arise as is widely supposed on the issue of nationalisation, but rather on the type of economic measures necessary to deal with the next phase of the economic crisis. Pressure by the left wing to retain strong controls, and avoid deflationary measures, may well be the testing point of Labour policy. The date of the next General Election is another factor which may polarise opinion to the left and right inside the party. Mr Bevan is once again reported to be in favour of an early election, just as he was in the autumn. The left wing indeed seem to fear that a long period of governing on a tight rope may mean many compromises on matters of Socialist principle, which they believe would ultimately damage the movement.

There is certainly no sign at present of any move for a coalition from within the Labour party. Attention concentrates rather on the actions of the Liberals. Their support would obviously be at the very least a convenience to either Labour or the Tories. The general character of the Liberals returned to the House is radical, but they had stated in their eve of poll message that they will have no truck with further socialisation. On the other hand, the tone of Mr Churchill's letters to Mr Clement Davies during the campaign surely rules out, if only as a question of dignity, any rapprochement between the two parties in the House.

* * *

Contentious Measures

There are certain measures which the Government could have rammed through in the old House but which may now be expected to be hotly contested. One of these is the renewal of the Supplies and Services (Transitional Powers) Act whose five-year life expires in December, and to whose renewal in some form the Labour party is committed, since it is the source of many of the essential "Socialist" controls. Another is the setting up of a Development Council for the wool textile industry. Under the Industrial Organisation and Development Act of 1947 the order bringing this into effect must be approved by a resolution of each House. An order for this purpose fell by the wayside at the dissolution of the last Parliament and it will be interesting to see if the Government will reintroduce it.

Whether the iron and steel legislation will provide a focus for a political crisis depends on whether the life of this parliament is envisaged in months or years. The earliest date at which the Minister may vest the securities of the firms to be nationalised in the Iron and Steel Corporation is January 1, 1951, but he has discretion to postpone it to any date within the succeeding twelve months. The Act provides that the Iron and Steel Corporation shall not be established before October 1, 1950, but the date of its establishment must obviously precede the vesting date by at least three months. The only immediate obligation on the Minister is to lay before Parliament, "as soon as possible," a statement of the remuneration and allowances to be paid to the members of the new corporation. If the Government intend to seek another general election in the autumn they may possibly let the whole question ride, leaving it to their successors either to repeal the Act or to set the machinery in motion on the basis of a postponed vesting date. If, however, they intend to try to remain in office for a year or more and put the nationalisation of iron and steel into effect (which their more vocal supporters must surely demand) it will soon become apparent through their efforts to recruit the board of the steel corporation by October 1st. The Conservatives are not likely, however, to let the Government pass over the issue of steel nationalisation simply by ignoring it. Their obvious tactic is surely to table an amendment to the Address designed to force from the Government a statement of their intentions.

* * *

Talking Up the Rouble

It would be hardly surprising if many Soviet citizens now believed that their rouble is on the old-fashioned capitalist gold standard, and therefore a model of stability in a world where dollar and pound are said to be steadily sliding. For they have been told that the rouble is worth twice as much sterling as it was six months ago, and that wherever Soviet trade is calculated in terms of dollars or pounds it is now worth 25 cents or 1s. 9d. The real situa-

tion is, of course, quite different. In their international trade, even within the east European area, the official Soviet buyers either negotiate special prices in bilateral bargains or deal at current market prices in foreign currencies, chiefly dollars and sterling. The rouble just does not come into the picture, although it may do so one day when the Russians have their satellites in Europe just where they want them. Moreover, anyone who has lived in Moscow knows that the rouble is in fact worth between 3d. and 4d.—not 1s. 9d.

The future purpose of this move is therefore matter for speculation. What does seem reasonably certain is that it has been coupled with the announcement of reductions in "state retail prices" in order to build up public confidence in the currency. There is no other obvious connection between the two events, because there is no evidence to show that the prices at which Soviet agencies deal bear any normal relation to internal prices and costs.

The new prices for bread, meat, eggs, sugar, vodka, tobacco, ready-made clothing and household goods—representing reductions ranging from 10 to 30 per cent—will be a tonic for the consumer. He has had a hard time waiting for the high prices of wartime to fall, although this is the third reduction in two years. Its timing is probably due to the results of the year's end stocktaking which is part of Soviet planning. Obviously rough estimates of purchasing power, based on wage bills and savings figures, have been compared with estimates of consumer goods production; and it has been found that concessions are now possible. Moscow appears to claim that the people's purchasing power has been increased by 110 billion roubles (at the new rate some £10 billion) or by about one pound a week per head of the population; but such round figures are clearly not acceptable until time has shown what people can actually buy in the shops and how much work their expenditure represents.

* * *

Mr Andreyev Accepts Correction

Mr Andreyev, a member of the Politburo since 1931 holding a brief for agriculture, has been tartly criticised in *Pravda*, has thought things over for ten days, and has now promised in a letter to the editor to reverse the policy he has enforced for ten years. The incident is revealing, but its main significance lies in the further modification of Soviet collective farming. This highly artificial and unnatural system was the product of Stalin's "Marxism" and of his policy for industrialising Russia. Since it was forcibly imposed the system has required endless expedients to make it work. The growing and harvesting of crops, which in most countries proceeds peaceably enough, requires in the Soviet Union several new decrees every year, bureaucratic organisation and Draconian punishments.

During the war collective farming was more loosely enforced. The important thing was to get food grown, and it was neither politic nor possible to ensure that farming was conducted on strictly socialist principles. Since the war, however, orthodox doctrine has been vigorously reasserted in all branches of Soviet life; and in agriculture there has been a series of decrees designed to strengthen the communal activity and interests of the kolkhozes and to weaken the element—still strong—of private enterprise.

Such is the background of the latest change. The point at issue this time was the question of how labour on the farm should be organised. For the last ten years the farms have been encouraged to divide the workmen into groups of about eight and to allot to these groups their own equipment and the responsibility for particular plots of land, so giving the peasants a closer personal interest in the land they worked. Now it has been laid down that such a policy hinders mechanisation and that, at least in grain-farming, much larger groups must be the rule.

The personal aspect of the affair is less significant though interesting. It is an excellent example of how Stalin checks on his subordinates. Although the Politburo is so small and although Andreyev is entrusted with responsibility for agriculture, somebody has apparently been detailed to keep watch on him and his policies, and to reprove him when necessary in *Pravda*. But although one of Andreyev's chief assistants has been replaced, he himself has maintained his position, just as he has survived adverse criticism on several occasions in the past.

* * *

Economic Changes in 1949

The United Nations published last week a study of *Major Economic Changes in 1949*, prepared by the Secretariat to facilitate the discussions of the Economic and Social Council. It is a dreary document. Like many of its predecessors at Lake Success, the report suffers from the attempt to cover too much ground in too great haste, and the result is for the most part an unassimilated jumble of facts.

The 50-page text is divided into four, very broad chapters: production, employment and subsidising inflation; international trade prior to devaluation; devaluation itself; and long-term problems in international trade. For Europeans—whose economic troubles have been far better diagnosed by the Economic Commission for Europe at Geneva and the Marshall organisation at Paris—the sections of greatest interest in the new report are those on the under-developed territories.

Balance of payments difficulties became aggravated in most of these areas during the first half of 1949. Their exports slumped and there was no comparable reduction in their imports, partly because of falling prices for some of their leading commodities and partly owing to the business recession in the United States. The experience has once more underlined for the peoples of these countries the sensitivity of their economies to fluctuations in the economic activity of the more industrialised countries. It is bound to give fresh impetus to their plans for processing their own raw materials, developing consumer-goods industries, and in some cases heavy industry.

"In the light of these developments," the report suggests, "the countries of western Europe are facing the need for adjustments in the structure of their own production and the composition of their trade." By themselves these adjustments will be hard to make, but the process must be an even more painful one unless some mechanism can be found to regulate the present instability in international trade.

* * *

The Amazing Case of Dr Fuchs

The trial of Dr Fuchs, who was found guilty at the Old Bailey on Wednesday of betraying atomic secrets, must have profoundly disturbed all liberal-minded people. The moral aspect of the case is horrible. In this country people tend to wear their patriotism lightly, especially in peacetime. But it must shock them to the core to learn that a man who had just taken the oath of allegiance to the King could immediately decide that he still owed allegiance to another, outside, power and was prepared to place at its disposal information which imperils the very existence of the country of his adoption. But the psychological elements are still more puzzling and frightening. How does it happen that a highly intelligent man, who ought to value his independence of judgment more than most people, can cheerfully surrender it to the Communist party? What is the secret of Communism's power to obtain such an absolute dominance over minds otherwise rational? And how many more such are there, undetected and unsuspected? To find a parallel to such a sinister, pervasive, underground

force, working by unknown methods to undermine all loyalties and decencies, one would have to go back some three hundred years to the fears that seventeenth-century England entertained of the Jesuits—and there could certainly be nothing more jesuitical than Dr Fuchs's self-analysis and explanation of the mental processes which governed his actions.

The material aspect of the case is also disturbing. Is it possible, after the trial of Dr Fuchs, to employ persons who have been members of the Communist party in positions where the security of the state is in question, even though they have renounced their Communism? There is no need to go so far as the Lord Chief Justice who, in passing sentence, said that the right of asylum was now imperilled. Let the refugees continue to come, in the future as they have in the past. But ought they to be permitted to become more than private citizens and to be made into highly trusted servants of the state? The case of Dr Fuchs is no occasion for national hysteria, or for the red witch hunts that mark the national life of America today. Nobody's political past should be allowed to interfere with his right to live a decent peaceable life. But now that confidence and liberality have been so grossly betrayed, and possibly with such grave consequences for Britain, the exclusion from positions of any public trust of all who have ever been contaminated by Communism must at least be seriously considered. For a liberal country like Britain the decision should not be taken lightly. But it may be inevitable.

* * *

The Wages Front

It is surprising that Mr Attlee should not have taken the opportunity of a new government to put a stronger man than Mr George Isaacs at the Ministry of Labour. Presumably, he thought Mr Isaacs's close links with the TUC were too valuable to lose. But his handling of labour affairs in the last Parliament was not conspicuously successful and however short-lived the new administration, labour relations and wages disputes are bound to be of great importance.

The general course of wages is discussed in a leading article on page 494, but it is worth setting down the most important of the outstanding wage disputes. Already, the pre-election lull has passed. The National Union of Railwaymen is now considering what to do about the rejection by the Railway Executive of its claim on behalf of its lower-paid workers. This rejection was expected, in view of the poor state of railway finances; but the railwaymen, who modified their original claim and decided to seek increases only for about 180,000 men earning below £5 a week, suffer from a strong sense of grievance. The Confederation of Shipbuilding and Engineering Unions meets next week to discuss action on the rejection of their claim for an all-round increase of £1 a week. Before this meeting, the Amalgamated Engineering Union, its most powerful constituent body, will decide on its own line, and this must obviously influence the Confederation's decision. The AEU is pressing for an inquiry into profits, which may postpone further action on the claim, although, in the changed political climate, such an enquiry would be most embarrassing for the Government.

The National Union of Mineworkers is likely to refer its claim for a revision of the cost of living allowance to arbitration. This allowance has stood still, at 2s. 8d. a shift, since the retail price index was introduced in June, 1947. The miners have a good claim on paper, though the National Coal Board has pointed out that they have had many compensatory concessions. If the miners succeed, the revision will be adjusted for the benefit of the lower-paid men on the minimum rates.

On the non-manual side, civil servants, teachers, and firemen are all restive. The wage "freeze" has been applied with particular rigour to Government employees, who have been asked by the Treasury not even to negotiate until the application of the general policy can be relaxed. This raises a new trade union principle, and the staff side of the civil servants' Whitley Council is understandably concerned about the effect on their members.

* * *

Disputes Over Shop Stewards

This week two unions have decided to give their support to two strikes which have been going on for some time, one of electrical workers working on a new steel works at Port Talbot in South Wales and the other at the Crossley motor works at Stockport. The firms concerned have had to dismiss some of their workers on grounds of redundancy, and in so doing have followed the time-honoured principle of "last to come, first to go." Among the men thus dismissed have been shop stewards, and the strikes have occurred because of the workers' claim that shop stewards, and particularly a shop stewards' convenor, who is the man concerned in the Crossley dispute, should be among the last to go. In backing the strikers at Port Talbot, moreover, the executive council of the Electrical Trades Union contests the employers' statement that the shop steward was dismissed because he was the last employed, and implies that he was dismissed because he was investigating a breach by the employers of an agreement with the union.

These strikes have more significance than might otherwise be attributed to them because they are only two of a whole series of disputes in recent weeks in which the position of shop stewards has been involved. In January aircraft workers in Belfast ceased work for one day, and then said they would work to rule, in protest against dismissals on grounds of redundancy, which included four shop stewards. A strike notice has been tendered at the Ford works at Dagenham because of the dismissal of a shop steward who, according to the management, was attempting to persuade a worker to restrict output. Employees of a Coventry foundry stopped work because they alleged that the management was restricting the facilities of their shop stewards' convenor and thereby causing delay in the settling of grievances. There has been a token strike at an engineering firm at Birmingham over the appointment of a new convenor of shop stewards. Other disputes in which shop stewards were concerned could be cited.

The point is that the position of shop steward is not a recognised part of the trade union movement, although in many cases he is recognised by the unions concerned as the workers' representative in the factory as opposed to the locality. The shop steward movement first achieved

Personal Incomes, 1938-1950

A series of three articles on this subject has appeared in The Economist:

Redistribution of Income	(*Jan.* 21)
Changes in Wages	(*Jan.* 28)
Salaries and Profits	(*Feb.* 4)

These articles have been reprinted as a pamphlet which is now available. Copies of the pamphlet (price 6d.; by post 7d.) can be obtained from

The Economist, 22 Ryder St., London, S.W.1.

prominence in the war when, in the absence of strikes, there was a need to have workers' grievances settled promptly on the spot. Unfortunately, the movement was partially captured by the Communists, and it is for this reason that it remains a thorn in the flesh of managements and of most of the trade unions. It is significant that there is Communist influence in the union which has backed the Port Talbot dispute. It will be interesting to see what line is taken by the Amalgamated Engineering Union, the union to which most of the workers involved in the Coventry strike belong.

La Prensa under the Hammer

Last week the Argentine government confiscated all but a five-day ration of the newsprint stocks owned by *La Prensa*, the highly respected and independent newspaper published in Buenos Aires. The government is now considering a recommendation that *La Prensa* should be deprived of its authorisation to import, and if this happens the journal will in future have to rely on hand-outs from the government pool of newsprint.

This latest move is the culmination of a prolonged campaign waged against the Argentine press by the Perón regime with the obvious intention of bringing all forms of mass communication under official control. In the past few months Señor Visca, the fanatical chairman of the un-Argentine activities committee, has closed down more than 150 papers throughout the provinces on one transparent pretext or another. In some cases he claims to have unearthed proof that firms importing newsprint have starved certain papers of supplies and that they "apportioned deliveries in conformity with black lists prepared by foreign embassies." *La Prensa* has been under continuous attack, first by Señor Visca, then by Señor Perón himself for alleged insults to his personal honour, and now again because of "irregularities" in its bookkeeping.

In some quarters it has long been popular to split hairs and to speak of the present Argentine government as a "semi-dictatorship." Apologists for the regime are also fond of explaining that Latin American rulers must not be measured by European yardsticks and that Argentine politics in particular are a colourful rough-and-tumble which more sedate peoples cannot be expected to understand. Pleas for leniency are also made on the grounds that Argentine politicians have a difficult course to steer between labour on the one hand and the Army on the other.

It is true that Señor Perón still retains some of the outward forms of a republican government: the last elections were comparatively fair, a judiciary exists, though in a somewhat crippled state, and the opposition is allowed to circulate freely so long as it does not behave like one. How long will the Argentine people be permitted even this show of democracy? Until last year, when prices for the products of Argentine agriculture began to fall, the nation was prosperous, and prosperous dictatorships are by nature less sensitive to criticism than poor ones. But in recent months hardly a week has passed without the few remaining freedoms being steadily eaten away by new encroachments, some petty, but all adding up to the familiar pattern of rule by force and government decree.

It is not yet known to what extent the authorities will press measures against *La Prensa*. Up to now Señor Perón has been restrained, possibly by the fear of unfavourable reactions from world opinion. It will certainly be a test case.

Manœuvres in the Arctic

The ten-day military exercises which ended in Alaska last week seem to have been unusually successful. More than 5,000 troops and airmen, drawn from the United States as well as from Canada, took part. They operated under severe Arctic conditions with the temperature often reaching 50 degrees below zero; no lives were lost and by all accounts the weapons and equipment—particularly motor vehicles and aircraft—stood the test remarkably well. The exercises involved an advance of 350 miles from Whitehorse to Northway, and ended with a paratroop attack at the northern limit of the exercise area.

The chief purposes of the manœuvres were first to provide evidence on a larger scale than hitherto that Arctic warfare was a practical possibility, and, second, to improve the co-operation between Canadian and United States troops and staffs. Both purposes appear to have been achieved. In spite of the severity of the mid-winter weather in Alaska, large military formations were able to advance at the average rate of 35 miles a day and at the same time to carry out the tactical movements of modern warfare. The joint staff work of the Canadians and Americans must have been excellent to have achieved this feat, and, according to Mr Claxton, the Canadian Minister of Defence, the forces of both countries worked equally well together in the field.

The exercises have a wider context in that they are a practical expression of the regional co-operation envisaged in the North Atlantic Pact. Canada and the United States form the North American planning group in the organisation set up by the Pact and they have obviously lost little time in going ahead with defence arrangements on a vulnerable, important but unfamiliar front. It would encourage a feeling of greater security throughout western Europe if the other defence groups could get on with their plans as quickly and efficiently as Canada and the United States have done.

* * *

Complications in Hongkong

An awkward situation has now arisen as a result of the official American protest at the ruling of the Supreme Court of Hongkong, which released to Communist China the 71 grounded aircraft originally supplied by the United States to two Chinese civil aviation corporations, and recently resold by them to an American-owned company formed by General Chennault. Mr Acheson told a press conference on February 24th that the United States was making "vigorous representations" to the British Government over the decision. The American view is that the aircraft are American property located in a British territory and that the British authorities have no right to hand them over to the Chinese Communists. The Americans are apparently challenging the decision on legal grounds and will try to keep the aircraft grounded pending further legal action; if the aircraft were once flown away to China, it would of course never be possible to get them back, and further litigation would be pointless.

The trouble from the British point of view is that, if the aircraft are kept grounded, the Chinese Communists will attribute it not to any requirements of legal procedure, but entirely to American political pressure, and may work up an anti-British propaganda campaign over it. On the other hand, if nothing is done to meet the American protest, some circles in America may take up the cry that Britain is appeasing Communist China even to the extent of surrendering American property in order to [illegible] ck on

This unpleasant incident is typical of the very delicate situation which now exists in the China Seas in consequence of the difference between British and American policies towards China. British trade continues to suffer heavily from the Nationalist blockade operated from Formosa, and the bombing raids on Shanghai have become more severe; both British and American property has been damaged in Shanghai, and the persistent rumours that Chiang Kai-shek is employing Japanese airmen seem to have gained some confirmation from the accuracy of recent bombings. If the United States as well as Britain had decided on recognition of the Peking Government, steps would doubtless have been taken by now by the two powers jointly to restrain the Nationalists from their activity at the expense of foreign interests; but, as things are, the British Government is unwilling to take any decisive action without American approval, and the American Government, though it protests in words against Nationalist "lawlessness," is reluctant to use coercion against the authority which it still recognises as the lawful government of China. It is an extraordinary situation, and there is no end to it in sight.

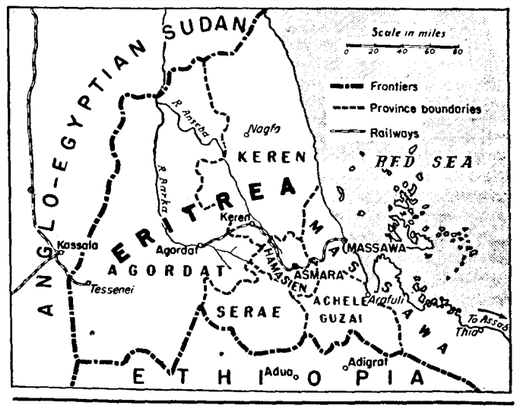
* * *

Test Case for the Unions

Sooner or later the combination of nationalised industry and closed shop was bound to collide with the rights of the individual worker. The latter has hitherto firmly ignored the possibility, naturally enough in view of the tradition that union and socialised state are twin emancipators from the tyranny of the private boss; but the bleak truth is beginning to impress itself. It may be absurd to complain, as certain members of the Transport and General Workers' Union are recently reported to have done, that dismissal from British Road Services means "dismissal from the industry for ever." Many heavy vehicles are still privately operated and, moreover, it is perfectly possible for a driver dismissed by one section of British Road Services to find a job with another. But elsewhere circumstances are different, and the clash has reached the Scottish law courts in the case of John Martin v. the Scottish Transport and General Workers' Union. The National Dock Labour Board having declared redundant 250 workers—not including Mr Martin—the local branch of the union claimed the right to substitute another 250, of whom he was one, and backed its claim by terminating their union membership, asserted to be "temporary," although the form of contract on which this assertion of "temporariness" rested had been signed as long ago as 1940. The victim claimed that he and his fellows were thus barred from dock employment anywhere in the United Kingdom, an effect beyond anything achievable by the most assiduous circulation of private black-lists. Bringing a test case, Mr Martin obtained from Lord Blades, in the Edinburgh Court of Session, a judgment that the union's action in demanding such a form of contract was *ultra vires*, and its resolution to eject a member in good standing was equally *ultra vires*.

This judgment does nothing to cheer the man actually dismissed from an occupation, whether docking or coal-hewing, which is subject to state monopoly. It does, however, lessen the hazards of employment in such occupations; for it establishes the worker's right—in Scotland at any rate—so long as he abides by the rules and pays his dues, to maintain the union status which is essential to that employment. It shuts the door in advance on a readily imaginable list of abuses, ranging from political victimisation to patronage, which are none the less possible to a union executive because they are historically associated with the arbitrarily powerful private boss. There is no evidence that British unions are, like too many of their American counterparts, riddled with abuses of this kind; but one may nevertheless welcome a decision which safeguards their immunity.

Rights of Way



To protect and maintain public rights of way has always been a duty of that *panchayat* of local governments, the parish council. It is not on the face of it an arduous task; but it is likely to cause a good deal of work, and plenty of argument, as a result of the National Parks and Access to the Countryside Act (1949). Under this Act, county councils have to establish what public footpaths and bridleways exist and to show them on a map. The survey work is to be carried out by parish councils. In very many cases, there is uncertainty whether or not a public right of way exists—and the difficulty has been increased by the ploughing-up of many footpaths under defence regulations, an authority which entrenched upon the customary rights of countrymen as much as the old Enclosure Acts. The sifting of evidence, including the examination of parish records, county archives, and enclosure awards, will provide a fascinating essay in local history. But where rights of way are concerned, established usage is nine points of the law; and in this connection that legendary figure, the oldest inhabitant, will come into his own—for his evidence (albeit conflicting) is recognised as vital.

The work of the parish committees, which are to be set up, does not end here. Each is enjoined, collectively, to walk over all the paths in its area—a possible task perhaps in the soft south, but a herculean one on northern fells. They are to record too the "position and condition of all stiles, stepping stones, kissing gates, footbridges and other means of passage" and the whole data will be recorded on a draft map by the county council. After two further stages have been passed, and objections dealt with, a "definitive map" will be produced which will be lawfully binding. This directive to parish councils may well have a startling effect upon the average age of those who wish to sit on them—if, indeed, "sit" will still be the appropriate verb.

* * *

Eritrea Tells the United Nations

In Eritrea—least homogeneous of Italy's ex-colonies—the arrival of the latest United Nations Commission to "ascertain the wishes of the inhabitants" has touched off a

riot. Neither racially, linguistically, culturally nor economically are the Eritreans one people; so that groups of them are keen to impress their rival personalities and desires upon the visitors, and some are inspired to do so by foreign funds.

The visiting commission, which consists of representatives of Burma, Guatemala, Norway, Pakistan and South Africa, held its first meeting on the spot on February 14th. Simultaneously, evidence of more than usual *shifta*, or bandit, activity began to reach the capital. (Banditry is a

local pastime which, according to Count Ciano's diary, once compelled 65 battalions of Italians to "live in temporary fortifications" for a winter. The present British caretaker administration has neither the men nor the money to stamp out the habit). On February 21st, in Asmara, the funeral of a Moslem killed by *Shiftas* became a community demonstration, and led to attacks by Copts—the principal rival community. There followed an affray in which at least eleven people were killed and over fifty wounded. A curfew was imposed and, by the end of the month, all was quiet except for the usual *shifta* activity in the countryside.

The motive behind the violent outburst was chiefly political. The Copts, who are the Christian Eritreans living almost entirely in the three provinces of Hamasien, Serae and Achele Gusai, call themselves Unionists and want union with their relatives and co-religionists of Ethiopia. The Unionists have been putting pressure on Copts who are averse to this, and have been getting moral and material encouragement, including asylum for *shiftas,* from over the Ethiopian border. So strong is their nationalism that they ignore all arguments to the effect that their standard of living will fall if Ethiopia takes over. Their views are opposed by their Moslem neighbours—both by the settled Moslems who live chiefly in Keren province and by the nomadic tribes of the lowlands on the Sudan border. These have usually demanded independence and have been encouraged in this demand by the local Italians. But they have now split into two groups, the larger of which is believed to be going to ask for continuance of a quiet life under some form of British management, possibly through union with the Anglo-Egyptian Sudan.

This last suggestion, while not viewed with any special enthusiasm by the various authorities in Khartoum, would not be unacceptable to Great Britain or to Egypt. But it would be greatly disliked by Ethiopia, which claims that all Eritreans are Ethiopians, and which has so far obtained enough international support to evade the sensible solution, which is partition of the territory. If the pro-Ethiopians behind the recent riots hoped to do their Emperor a service, they were surely mistaken. For the lesson of the bloodshed is that Copt and Moslem ought not to be asked to live together.

* * *

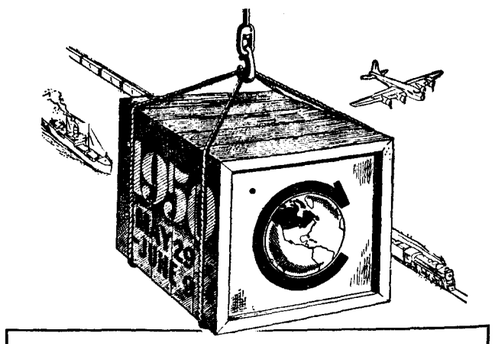
Stalemate at Haifa

Tel Aviv's official announcement that there is no truth in reports of an imminent peace treaty between Israel and Jordan quenches all hope, for the present, of resuming the flow of oil by pipe-line between Iraq and Haifa. If Jordan —broadest minded and least intransigent of the Moslem states inland from Israel—cannot come to terms, no change of heart is to be expected of the far less statesmanlike Iraqis. The southern fork of the Iraq Petroleum Company's pipe, from Kirkuk to Haifa, is therefore likely to remain idle. So is the great Haifa refinery at its sea terminal which the owners—Shell and Anglo-Iranian—were busy doubling in size, seemingly regardless of the political signs of the times, right up to the moment when the Palestine mandate collapsed in turmoil.

As things stand therefore, the Iraq Petroleum Company is forced to waste a substantial asset; the Iraq Government is losing annually £2,000,000 in royalties; even Israel, though financially a far smaller loser than either of the aforementioned parties, is missing something in the matter of local labour, of prestige, and of some other small disbursements. The company and Israel are only too anxious to restart the flow of oil. Only Iraq stands in their way, preferring for national and psychological reasons to lose a big advantage itself than to offer a small advantage to Israel. The choices before the company are three. One is to resume pumping without Iraqi consent. This is unthinkable; it would invite sabotage and disaster. Another is to press Egypt to allow through the Canal tankers bound for Haifa, and to hope that the sight of an active refinery would make the Iraqis grasp what they are missing. A third is to move the pipe some forty miles north into Lebanese territory and to run it over the shoulder of Mount Hermon to a new terminal at or near Sidon. This operation would cost about £2,000,000—a sum recoverable by a few months' pumping. It is, of course, advocated by the Iraqis, but also by the French participants in the company, whom it suits to import as much crude oil as possible from the Mediterranean. Their British and American partners are turning a deaf ear to this tempting suggestion and, at present, they are right to do so. Are companies, with contracts accepted by Arab governments, to waive these in response to the political passions of a postwar period? Are the expensive installations at Haifa to be abandoned? Are there not Israeli as well as Iraqi emotions to consider?

* * *

These thoughts should be weighed when talking of the Haifa conundrum in terms of the sterling-oil versus dollar-oil controversy. Of course, the reopening of the Haifa fork would produce more "sterling oil." Of course, also a British refinery working to capacity in Israel would reduce the dollar content of sterling oil. But it is an open question where this increment would be saleable and how far it would improve the total sterling-dollar position in the oil market. The importance of resuming pumping to Haifa lies less in its potential contribution to the sterling-dollar position than in its significance as the first move back to reasonable trade relations between the needy Arab states and a needy Israel.



English Schooling

It is generally agreed that no civilised people are so little and so ill educated as the English. Nor can there be a doubt that our school system—a mixture of public and private academies, of schools endowed and unendowed, of education gratis and education paid for, of regularly drilled teachers and broken-down tradesmen setting up boarding schools as a means of making a living, is unworthy alike of an organising government, and of the orderly methodical spirit of the nation. It has never, within our recollection, been examined but to be condemned. It has found innumerable accusers and opponents—not one advocate. Those who have been hopelessly at variance as to the means of improving it, have cordially agreed in saying that it was an intolerable disgrace to the community. . . . Nevertheless, it cannot be said that the English stand behind any other people in either intellect or morality. Their achievements in arts, in arms, and in literature, will bear a comparison with those of any other civilised people. Numerous trespassers there are against a code of laws neither simple nor definite in its principles, nor clear in its provisions. . . . the right of property is unfortunately not held sacred; but otherwise great crimes are not numerous amongst us, and all the domestic relations, if not often endeared by living sympathy, are cultivated with decency and decorum. . . . Public order, too, has been preserved here, when it was troubled in countries in which the system of schools is perfect and education universal. . . . We confess, therefore, while no one can doubt that the training of youth is indispensable to the performance of the duties of men, and every one must earnestly condemn our present system, as neither letting alone nor judiciously interfering, that we do not attach so much importance as many of our contemporaries to mere school instruction; nor are we so sanguine as they are in expecting great mental and moral improvements from extending and improving it.

'TOO IMPORTANT TO MISS'

Offerings from five continents—in greater variety and volume—make this year's Canadian International Trade Fair a vital observation post and trading centre for businessmen of all nations.

The revaluation of currencies makes it more important than ever to compare world sources of supply, and see where your money buys the most. Shifting patterns of trade provide many opportunities to explore and establish new business connections.

Truly international—entirely devoted to actual business—packed with industrial goods, crammed with consumer products . . . for men of affairs everywhere, *the C.I.T.F. is too important to miss!*

For full details, and information regarding reduced railway rates in Canada, consult:

Miss M. A. Armstrong, Exhibitions Representative, Canada House, Trafalgar Sq., London, S.W.1. Tel. Whitehall 8701, or your nearest Canadian Trade Representative.

LIVERPOOL: M. J. Vechsler, Canadian Government Trade Commissioner, Martins Bank Building, Water Street.

GLASGOW: J. L. Mutter, Canadian Government Trade Commissioner, 200 St. Vincent Street.

BELFAST: H. L. E. Priestman, Canadian Government Trade Commissioner, 36 Victoria Square.

Canadian International Trade Fair

MAY 29—JUNE 9, 1950
TORONTO, CANADA

DEDICATED TO THE PROMOTION OF INTERNATIONAL TRADE BY THE GOVERNMENT OF CANADA

March

March is a busy month in the home and everyday tasks of spring cleaning often bring reminders of the need for repairs and renewals. In personal business matters, too, regular attention is worth while. Here the Midland Bank can assist you by paying your standing orders for rent, insurance premiums, school fees and similar outgoings and by keeping your valuable papers and documents in safe custody.

MIDLAND BANK LIMITED

Paper roads

Tearing its way through virgin forests a bulldozer clears the way for another road. Every timber-felling camp established in Bowaters forests in the Province of Newfoundland needs its own highway. To service new camps Bowaters engineers construct over sixty miles of road every year. Through dense forests, across rivers and swamps, roads are driven that must stand up to the wear and tear of traffic and extreme changes in climatic conditions. For roads are the only means of getting regular supplies of food, equipment and mail to the camps during the lonely months of preparing timber for its journey to the Corner Brook Mills. That all the formidable obstacles have been overcome in constructing roads through a country well-known for its lack of communications reflects the pioneer spirit of Bowaters. It is such enterprise and resource that has enabled the Bowater Organisation to meet demands for paper and its products in every part of the world.

Letters to the Editor

Kuwait's Millions

SIR,—It distresses me that *The Economist* should have published an article headed "Koweit's Millions" which may be relied upon by thousands of other readers as an objective statement of facts. My quarrel is with the last three paragraphs.

There was no competition for the succession to the late Ruler of Kuwait. The present Ruler, His Highness Shaikh Abdulla Al Salim Al Subah, CIE, a cousin, was absent from Kuwait at the time of Shaikh Ahmed's death. Shaikh Abdulla assumed power peacefully on his return to Kuwait a few days later and has since been recognised by HM Government. His accession to the Rulership was a fortnight old when your article was published.

Without discussing with you the merits or de-merits, political and otherwise, of a fresh water pipeline from Iraq, I think you should know that one of the first objectives of the Kuwait Government is to increase greatly the supply of drinking water in Kuwait town. This it proposes to do within the borders of Kuwait by the installation of a water distillation plant. In doing so, it will spend nearly $2,000,000. This is one utilitarian item alone upon which "royal treasure" is to be expended.

If your correspondent had accompanied me last week around the State Hospital in Kuwait, where money is being lavished on equipment and where everything is absolutely free to the poor, he would have seen another aspect of governmental expenditure. This hospital was opened only last October and, because of its brilliant success, is the delight of the "aristocracy of Kuwait." Plans are under consideration for another hospital to serve distant parts of Kuwait town, for a tuberculosis sanatorium, for a mobile dispensary to serve the villages, and for a home for the aged poor.

Schools in Kuwait for boys and girls are being expanded and increased in numbers as rapidly as they can be. In them, everything is free, including a mid-morning helping of soup, and, before long, free clothing will be supplied to the needy.

There are many other aspects of progress in Kuwait which I could mention to you, and I venture to prophesy that, given a few more years, Kuwait will be praised as an example to other Middle-Eastern communities. It has the means, in money or men with progressive ideas, and it will use them well.—Yours faithfully, H. T. KEMP

London Representative of H.H. the Ruler of Kuwait

The Belgian Monarchy

SIR,—Your very informative note of February 18th on the coming Belgian referendum contains two points which it seems the duty of a Belgian reader to discuss.

Speaking of the 1949 election you write: "Added together, the Socialist and Communist vote—that is to say the anti-Monarchist vote—was just over 27 per cent. . . ." Only a small proportion of the Belgian socialists would declare themselves "anti-Monarchists," in other words, republicans, if the question was raised. The Belgian Parliament recently carried unanimously the motion that neither the principle of the Monarchy, nor the Dynasty, nor the honour of the King was at stake.

It is certainly an important consideration that, as you say, "a monarch to whom 30 per cent of his people are bitterly and hopelessly opposed is hardly a symbol of constitutional unity." On the other hand, the monarch used to be, in Belgian constitutional practice, more than a "symbol"; he used to be a guarantor, not only of unity but also of continuity and stability. He may hesitate to give up that duty, under pressure of a minority of 30 per cent, against the will of a large proportion of his people, quite as "bitterly and hopelessly opposed" to his abdication. I fear you over-simplify the problem when concluding that "it remains to be seen whether at this very latest hour, he will show sufficient wisdom to realise . . ." your point of view.—Yours faithfully, EMMANUEL COPPIETERS

London, W.C.1

Pattern for Poland

SIR,—With reference to your note on the "Pattern for Poland" in *The Economist*, it might interest you and your readers to know that Mr Minc, who is now overdoing himself in subservience to Moscow to make good his previous close association with Gomulka, has started "collectivisation" by re-establishing the former landlords' farming estates.

Peasants, to whom land had been allotted under the "reform," are turned into farmhands and the estates—camouflaged as co-operatives—are actually run by the state. The owners of old private peasant holdings know, of course, that their "stage" is coming next, but many of them have already been "liquidated" as "kulaks" as a reprisal for their active part in the opposition fight of Mr Mikolajczyk's Peasant Party.—Yours faithfully, A. ROMER

11 Eaton Place, S.W.1

Washing Up

SIR,—You lavish this week, in your "Thoughts on Washing Up," some misplaced sympathy on recent middle-class recruits to the sink. But have they anybody but themselves to blame? The riposte of the alert householder to high wages and the shortage of labour which deprives his wife of domestic help and forces him into the scullery should be the mechanisation of his kitchen. That is the advice which would be given to any British business man confronted with like circumstances in his industry. Surely the bishop, the higher civil servant and even the don can still afford the price of a dishwashing machine? Dishwashing distasteful indeed. I think they must like it. Why else do professional men cling so determinedly to their servitude and to the nightly reminder of their decaying material standards when release can readily be bought, and so cheaply? Or can it be that really they still leave the job to their wives and keep this story about dermatitis of the hands for the chapter, the office and the commonroom?—Yours faithfully, GILBERT WALKER.

Books and Publications

Beyond Keynes

"A Contribution to the Theory of the Trade Cycle." By J. R. Hicks. Oxford University Press. Geoffrey Cumberlege. 199 pages. 10s.

MR HICKS'S book confronts the reviewer with a dilemma. It is work of the first importance, done on the frontiers of economic thought, to be appreciated and criticised satisfactorily only by fellow workers on the same frontier; but that is not all. It is a work whose importance lies not only in its content but in the effect which it may be expected to exercise on the development of economic theory and practice—a matter of which even a critic whose intellectual and professional qualifications equalled Mr Hicks's own would find some difficulty in judging at first or second reading.

The Keynesian approach to the problem of changes in industrial activity, illuminating as it is, has the defect of encouraging a rather narrowly exclusive concentration on the monetary side of that problem. Envisaged as the result of changes in the relationship of money incomes, money investment and money consumption, fluctuations may look as though they could be treated or cured by purely monetary measures; and it is only too obvious that that is how they do appear to the experts now concerned with the working out of practical policy. Mr Hicks acknowledges—as anyone concerned with cycle theory must do—a massive debt to Keynes; but he rejects the exclusive view of the role of money. Underlying all monetary influences, and to a certain extent independent of them, there exist forces generated by the very fact of economic growth, demonstrably capable of setting the pendulum swinging. Once disturbance occurs it is self-perpetuating and even in some circumstances self-magnifying. Changes in output demand changes in the volume of investment; the investment process has a characteristic "shape in time"—a "hump" of initial activity followed by a "trough" as each particular project is completed, or a "tail" of lesser fluctuations—and only the chance of a perfect compensation of "humps" and "troughs" between different lines of investment can avoid disturbances in the rate of growth. Nothing in the mechanism of supply and demand ensures that this compensation shall take place. The "Hidden Hand," in this respect, is paralysed; the odds are on disturbance and the consequent upsetting of the balance between output and the stocks and equipment concerned in its production. Mr Hicks's contribution is to elucidate what happens once the balance is upset, a task carried out with that near-mathematical elegance of style which has always distinguished his writing. (There is a thirty-page Appendix for those who prefer their mathematics neat.)

There is nothing dogmatic about Mr Hicks's argument and conclusions. He sets out certain hypotheses about the relative movements of certain real economic magnitudes in time; he rejects some of these as unrealistic; he invites statisticians and econometrists to test others against the recorded facts. He does not, of course, claim that these "real" influences operate to the exclusion of the monetary factor, whose nature and effect he analyses in his last two chapters. It is indeed this factor which can, as in 1931, independently turn an already sufficiently serious normal depression into "the real horrors."

Obviously this double-powered cycle, real and monetary, offers a stiffer problem to would-be controllers than the Keynesian model. What hope is there of using the monetary factor, so much the more amenable to deliberate control, as a stabiliser for the economy? Theoretically, the possibility is clear; the typical boom and slump might be made innocuous, given adequate and above all speedy monetary measures. But they are not all typical; and certain kinds of disturbance seem resistant, even in theory, both to interest-rate changes and almost equally so (quite apart from administrative and political difficulties) to direct control of investment.

Only on the last two pages does Mr Hicks turn the searchlight he has constructed squarely on the full-employment situation of today, to disclose a logical and foreseeable pattern in its defects. (A recognisably similar pattern appears, incidentally, in the fully-planned Soviet economy, which he does not discuss.) If there is a single simple message for the layman in this highly professional work, it is that central control of the main lines of economic development, of the "climate" of economic activity, is both more essential and far more difficult than has hitherto been realised.

Refuge without Safety

"Murder in Mexico: The Assassination of Leon Trotsky." By General Sanchez Salazar, with the collaboration of Julian Gorkin. Secker & Warburg. 235 pages. 9s. 6d.

THIS account of the assassination of Trotsky in Mexico in 1940 is the joint work of the Mexican police official who was in charge of the investigation (and enlarges with great pride on his own skill as a detective) and a Spanish ex-Communist Socialist now in exile in Mexico, who provides a somewhat over-rhetorical political commentary. The interest of the book lies in the glimpse it provides, documented from the Mexican police records, of the great international organisation which hunted Trotsky to his death; this murder took place ten years ago, but the organisation which killed him continues to operate, and if Marshal Tito still preserves his life, it is because he disposes of far greater resources for his protection than the exiled Trotsky could muster.

Trotsky knew that his death had been decreed in Moscow, and he lived in a fortified house with several secretaries, political followers who also served as guards. But one of them, an American named Sheldon Harte, was a secret Stalinist, and on the night of May 23, 1940, opened the gate to a group of armed raiders, who fired a fusillade of shots into Trotsky's bedroom; he escaped death by getting under the bed. Harte left with the raiders and was later found murdered; he had been killed by his Stalinist comrades, presumably because he knew too much, was not fully trusted and, not being a Mexican, was hard to conceal. Police investigation established that the raid was organised by a man who had come from Paris and succeeded in getting out of Mexico again before he could be arrested. As the first attempt had failed, the task was entrusted to a man calling himself Jacson-Mornard, who had arrived in Mexico pretending to be a Trotskyist, with a passport taken by Communists in Spain from a Canadian International Brigadier killed in the civil war. Jacson-Mornard won Trotsky's confidence and finally killed him in his study during a conversation. He was sentenced to twenty years' imprisonment for the murder, but refused to give any information about his accomplices.

The picture given of his history and personality in this book is a fascinating one; it is the portrait of the revolutionary professional agent and killer, without determinate nationality, property or occupation, but always living in luxury and privileged even in prison, under the omnipresent protection of the organisation which he loyally serves. He is a type which, whether for insurrection, espionage or murder, plays no small part in the affairs of our time.

Time and Space

"Empire and Communications." By H. A. Innis. Geoffrey Cumberlege. Oxford University Press. 230 pages. 15s.

THE effectiveness of an army in the field depends largely upon the nature and efficiency of its communications. Similarly it is evident that "the effective government of large areas depends to a very important extent on the efficiency of communication." In this book, which contains the Beit Lectures on Imperial Economic History for 1948, Professor Innis covers the broad canvas which Professor Toynbee and others have painted, and in examining the importance and effect of communications in a number of empires, from Ancient Egypt to the present day, adds considerably to the depth of the picture.

Methods of communication can be divided into two categories; those which, by their durability, emphasise time, and those which, by their portable nature, emphasise space. Paper and papyrus belong to the second category, parchment and stone to the first. Into the structure of the empires which he considers, Professor Innis weaves the history of the various methods—the development of writing and the alphabet, the oral tradition, the replacement of parchment by paper, the growth of printing, the significance of radio—and argues that each of the categories exerts an opposing pressure on the political organisation which it dominates. The methods which emphasise time favour religion and decentralisation, "while those which emphasise space favour centralisation and systems of government less hierarchical in character." The contention is that the growth and continuance of empire depends upon the ability to balance these opposing influences. In our own day the development of radio—and presumably the wide potential of television—operates against "the bias of paper towards an emphasis on space." These lectures are an important addition to the engrossing study of civilisations which, as Professor Innis himself points out, is proving of increasing importance in the present century.

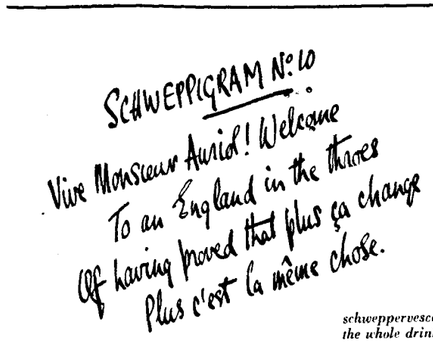
Potted Cobbett

"Rural Rides." By William Cobbett. Abridged and edited by S. E. Buckley. Harrap. 302 pages. 6s.

ABRIDGED Cobbett? Perhaps for schools, but hardly for readers who want the man whole. The skilful sub-editor can leave a framework of fact and description which—since Cobbett was a supremely good reporter—never fails to be interesting. But Cobbett the journalist worked for Cobbett the reformer. Half of the attraction of "Rural Rides" is to be found in Cobbett's meticulous and sober description of husbandry and people ("the Wycombe girls somewhat larger featured and larger boned than those in Sussex—more like the girls of America, and that is saying quite as much as any reasonable woman can expect or wish for"), the state of the rye or the partridges or the virtue of cabbage for winter keep. The other half is the sudden tirade when, with rising gorge, he pours out a passionate interlude denouncing monopolisers, tax-eaters, and their "purveyors and lackeys and harlots" in the wens of Bath and London. "Of all the mean, all the cowardly reptiles, that ever crawled on the face of the earth, the English landowners are the most mean and the most cowardly"—what an opening to a sentence and to the angry paragraphs which follow! Yet after this characteristic outburst, Cobbett is soon reporting on a "very curiously constructed grape house." To cut and select from such varied wealth is difficult indeed. The editor does his best to bridge the gaps which he drives through Cobbett's profuse invective, and he concentrates on preserving Cobbett's reporting on agriculture and the countryside in the years of depression a century and a quarter ago. For those to whom Cobbett is a mere name this may be a useful service, much like extracts from Pepys's Diary. But this leaves only a part of the original; it misses the reforming zeal, the angry impatience and the downright intolerance. And Cobbett without passion seems, for all its interest, strangely devitalised.

A Book for Mr Blandings

"Planning Your Home for Tomorrow." By Morrison Hendry. Faber and Faber. 220 pages. 18s.



IF building licences for houses with five bedrooms, two or three living-rooms and a garage were to be had this would be a useful book to recommend. Until they return the reader must decide how much nostalgia he can put up with for the fun of planning his dream house. As an architect Mr Hendry's ideas are not new or striking: he has attempted a much more modest objective, that of advising the middle-class family about the kind of house that most ordinary middle-class families would probably like to live in. This assumes at the most one maid, and more probably a daily, a car, central heating and an easily-run layout.

Mr Hendry approaches the subject from the point of view of those who do not know how to start nor at all clearly what they want. He gives advice on how to choose a site, raise a loan, select a size and style, and on the importance of employing an architect. He then goes on to discuss the lay-out of the house in detail, and shows by description and by plans the large number of permutations and combinations of kitchen-cum-breakfast-room, living-cum-dining-room, dining-room-cum-study and the type of room most suitable for the modern maid. Some of the ideas are a little fussy, but there is a great deal of sensible advice about costs and economies and the advantages and disadvantages of different types of design, and on labour-saving devices. With this assistance reality, if it ever comes, should prove a less disappointing version of the dreams than it often is.

Doubts on Competition

"Airline Competition." By Frederick W. Gill and Gilbert L. Bates. Harvard Business School. Boston. $5.75.

THIS is a highly specialised study of the benefits and disadvantages of competition in the operation of the American domestic airlines. Competition is afforded both by rival airlines and by the railways, and often has brought about improvements in service. But in the author's view, excessive competition, such as results when three or four airlines are authorised to fly a single route, produces little improvement in the service rendered the passenger and contribute substantially to the surprising inability of the airlines to earn a profit even in the prosperous years 1946 to 1948. This meant that the Government was forced to assume a larger deficit than was necessary. The better financial showing of the airlines in 1949 suggests, however, that more was wrong with the industry in preceding years than a Government-administered overdose of free enterprise.

Russian Thought

"The Spirit of Russian Economics." By J. F. Normano. Dobson. 130 pages. 8s. 6d.

MR. NORMANO'S book on the spirit of Russian economics may be described as a semi-biographical survey of social and economic thought. The amphibious character of many studies of Russia is largely imposed on their authors by the information available or by the nature of the subject-matter itself. Mr Normano is right in asserting that Russian thinkers have always striven to encompass the whole field of social reality rather than specialise on any particular aspect such as ethics, politics, or economics. The range of their interests has mostly been determined by what they wanted to *do* rather than by what they wanted to *know*, and their ambitions have rarely stopped short of a radical transformation of *all* the aspects of social life. Such a habit of mind is more likely to engender attitudes than to give birth to theories in the narrow sense of the word, and attitudes are most readily explained in terms of personalities. The difficulty with which Mr Normano is therefore faced is that of giving a coherent view of trends and ideas, while yet not losing sight of the underlying unity of each separate ideology, grounded as it is in the personality of the thinker.

In the early part of his book he succeeds none too well. Four chapters deal with trends in Russian thought according to their source of inspiration. English, French, German, and native influences are analysed in turn. In so far as these came in clearly defined waves separated in time, such a procedure is unexceptionable and, indeed, highly instructive. Unfortunately the method shows itself at its worst when the separate influences are overlaid in the same period of time, or even at work in one and the same thinker. It seems regrettable, for instance that the ideology of so powerful and coherent a thinker as Herzen should be dissected into a French, a German, and a native strand, thereby losing much of its compelling force.

The last chapter deals with Bolshevism as a synthesis of the past and a reaction against it. This is the best chapter of the book, though the same can hardly be said of its conclusions. The author links the revolutionary movement with periodic revulsions against German spiritual and bureaucratic domination going back far into the past. The sudden violence of the eruption is explained by the emergence of political conditions in which the abstract theorising of generations of Russian intellectuals could at last be applied to the practical problems of the day. It is thus implied that the sudden jump occurred in the field of practical realities and not in the domain of abstract thought, for which an organic continuity is claimed.

This does not seem to take enough account of the hectic preparatory work in the sphere of ideas undertaken by the Marxist political parties. Throughout the quarter of a century preceding the revolution a general quickening of Russian political thinking was clearly noticeable. This subtle and gradual change which came over Russian thought as it became more nearly applicable to practical affairs is insufficiently traced in Mr Normano's book. The reader is left to explain for himself how it came that an *intelligentsia* nurtured in German metaphysical abstractions stood ready to grapple with concrete and tactical problems of immense complexity when the opportunity presented itself.

Despite a certain amount of irritating biographical detail, the book will repay study for the very clear general impression it conveys of many salient characteristics of Russian social and economic thought.

Studies in World Economics

"International Capital Movements during the Inter-War Period." United Nations. 70 pages. 3s. 9d. or 50 cents.

"Relative Prices of Exports and Imports of Underdeveloped Countries." United Nations. 156 pages. 7s. 6d.

THESE two studies, recently published by the United Nations Department of Economic Affairs, throw some light on a critical sector of the world economy. They are inevitably limited by the lack of detailed statistics available, particularly statistics of capital movements which remain the worst recorded part of international transactions. However, the two booklets do bring a great deal of useful information to bear on current problems, and, taken together, give a clearer outline of the economic relations between highly industrialised and underdeveloped countries than is available anywhere else.

Underdeveloped countries between the wars were suffering from the long term downward trend in their terms of trade, and also from erratic fluctuations in the prices of those primary commodities on which their export trade mainly depended. During the Second World War the unfavourable balance of many of these countries was transformed into an export surplus, and as a result they had, by the end of the war, accumulated large credits in their favour—notably the sterling balances. But the postwar rise in the price of manufactured imports meant a depreciation in the purchasing power of these credits. The United Nations economists therefore suggest that the most realistic way to measure the export-import price ratio is to compare the wartime price indices for primary goods with the postwar price indices for manufactures. This, incidentally, is one reason—devaluation is another—why the simple terms of trade ratio should be used with caution in economic analysis. There are two other specific limitations to the United Nations study, which are pointed out by the authors. A price index of manufactures imported into underdeveloped countries takes no account of the high price of food imports, nor does it reveal whether it is the foreign investor or the nationals of the country concerned who benefit most from low prices of imports of capital goods.

The United Nations study of the movement of capital usefully underlines the lessons of foreign investment in underdeveloped countries between the wars. It was the high yield on foreign investments which helped to undermine the balance of payments of countries exporting primary goods. When the terms of trade of these countries deteriorated in the 1930s, the burden of debt was increased, and the difficulty of repatriating overseas capital added to the world financial crisis. The study also points out that foreign investment between the wars tended to flow into the production of primary goods or transport, leaving the native industries manufacturing for the domestic market, in underdeveloped countries relatively neglected. There is a danger that the postwar emphasis on petroleum, raw materials and foodstuffs may continue the prewar pattern.

These two studies by the United Nations provide an excellent basis for further detailed research. Their authors would be the first to admit that so far only the foundations have been laid. One hopes that governments will at least lighten the task of future workers in this field by bringing their statistics of the holdings and movements of overseas capital nearer to the standard set by the United States.

History or Current Affairs

"The European World 1870-1945." By T. K. Derry and T. L. Jarman. Bell. 452 pages. 20s.

THERE is no rigid dividing line to show where history ends and current affairs begin, but in this book, which ends with the Atlantic Pact of April, 1949, the authors have brought history perilously far into the contemporary world. The dust cover claims that it is a "history of the recent past designed to give an understanding of the crowded and often puzzling present." In fact, the "past" is so nearly the present that the authors manage to keep out of trouble only by a strict adherence to bald facts.

The atmosphere of the book as a whole is indeed factual. It breathes of the schoolroom, and of a schoolroom where the teacher should have the capacity to bring facts to life. It is written in a straightforward style unadorned by wit or originality. Its merits are its honesty, its unaffected purpose of giving the reader a useful survey of the events of eighty crowded years in 450 pages and the paucity of other textbooks on the latter part of the period.

PICTURE POST

PICTURE POST stays right at the top of the list for many major firms with big advertising plans for 1950.

For example, over 100 national advertisers are represented in the issue dated 18th March, which is also the biggest issue for ten years.

Experienced business men know that PICTURE POST plays an essential part in planning successful campaigns. For PICTURE POST really goes to the country with a 1½ million all-round circulation. ***It is read by one in every four men and women in Britain.***

PICTURE POST has unrivalled impact on the public. Consumers and retailers both have extra confidence in the quality and reliability of the goods and services advertised in its pages. In PICTURE POST a product shares the added prestige that goes with Britain's leading weekly picture magazine.

And firms who wish to bring their advertising into the nation's shop windows can follow through with the PICTURE POST Merchandising Service. This tested Service links up at point of sale—backing your advertisement with the most powerful sales force in the country.

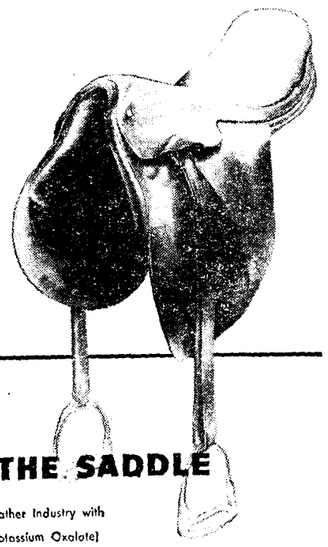
Essays in Monetary Theory D. H. ROBERTSON

The first and longest item in this book consists of an examination of the late Lord Keynes' theories on the rate of interest. The remainder of the book is a series of articles and reviews dealing mainly with the theory of money and the trade cycle. 'The essays . . . are of the essence of the matrix which has shaped the evolution of thought in the role of monetary factors in the process of economic change.'—*Economic Journal*
15*s net*

Central Banking M. H. de KOCK



'The volume . . . has been completely revised and brought up to date, and its present form gives a very extensive view of the modern field of central banking and monetary policy in general.'—*Journal of Institute of Bankers*

'It is probably the most important book on the subject of which it treats which has yet appeared.'—*Accountant*
25*s net*

Wealth EDWIN CANNAN

A brief examination of the causes of economic welfare. 'This is an excellent introduction to economics for the use of students or of other persons who would like to get clearer and firmer notions of the business side of life than they can get by merely casual observation and reflection upon such fragments as within their personal purview . . .'—*Manchester Guardian* 12*s 6d net*

Spin for ends

In power houses, dust cannot be tolerated. So it is disposed of by Dust Collectors. These Dust Collectors include a number of tubes, the ends of which have to be tapered accurately to shape. A difficult operation! The BOC took it in their stride. Flame Spinning was the answer. Each tube, heated by oxy-acetylene blowpipes, was rotated against rollers, which formed it into the required shape. If metal has to be shaped, joined or cut, there's usually a BOC way of doing it. Most often it's the cheapest way, as well as the quickest.

AMERICAN SURVEY

The Course of Prices

(From Our American Staff)

THE continued alarm over both the immediate and the long-term possibility of inflation in the United States is caused primarily by the government's increasing expenditure and its inability to balance the budget, though there are other contributing considerations. An advance of 1.9 per cent in primary market prices in the last four weeks is viewed by some people as the surface symptom of renewed inflation. But it is more than two years since the all-time high was reached by the daily index of sensitive commodities in November, 1947. It is two years since prices received by farmers hit their peak and about a year and a half since all wholesale prices and the consumer price index touched their highest points in August, 1948. Farm land values, urban property and wholesale prices for commodities other than farm and food have all been declining more or less consistently since November, 1948.

The broad wholesale index provides the details that best indicate the nature of this readjustment. Its decline has been almost continuous, interrupted only twice by slight advances in the monthly figures from February to March, 1949, and, later in the year, from August to September. The consistency of this trend stands in marked contrast to the wide swings in the Federal Reserve index of industrial production and its irregularly upward movement from the low point of last July. Closer examination reveals, however, that while the decline from the price peak has been general the continued decline in the last half of 1949 largely reflects a downward movement in farm and food prices. After falling for about eight months, wholesale prices for commodities other than farm and food levelled out after June and now stand only slightly under the June level. Farm prices, which reached their high point earlier, and continued to fall longer and more sharply than other commodities, have borne the brunt of the readjustment. Farm products are down by 22 per cent from January, and by 18.6 per cent from August, 1948. Food prices are down only slightly less. Consequently, the farm price support programme is in serious trouble and has imposed a heavy financial burden on the Treasury.

The average of all commodities other than farm products is down in price by only 5 per cent from the level of August, 1948, and very slightly more from its own peak reached in November, 1948. Even this average conceals wide divergencies, for of the eight major groups only building materials, chemicals and textiles have come down as much as the average, while house-furnishings and metals and their products have fallen hardly at all. Inside the major groups price variations have also been selective. In the chemical group, fertilisers have risen, although other constituent groups are down substantially. Among the textiles, silk (though its low level, by prewar standards, reflects the competition of synthetic fibres) has risen, but cotton goods are down sharply and woollen and worsted goods have come round full circle, moving up steeply in the eighteen months since August, 1948, and then dropping back to their starting point. Bricks, tiles and cement, among the building materials, have risen, with paint and lumber dropping sharply. Among the metals, iron and steel and plumbing and heating equipment are higher than they were eighteen months ago, but non-ferrous metals are much lower. It may be observed that of the seven items whose prices have risen, five are associated with building—bricks and tiles, cement, house-furnishings, iron and steel, and plumbing and heating equipment. Last year's record volume of residential building and high public outlays for construction increased the demand for these products.

Most of the commodity groups whose prices have fallen—paint and paint materials, oils and fats, hides and skins, cotton goods — reflect agricultural developments in one way or another. Crop production in 1949 was at near-record levels and larger marketings of livestock added to supplies of fats. Not only were agricultural supplies increased, but the domestic demand for farm products weakened in 1949, as a result of changing pattern of consumer expenditure that favoured automobiles and other durable goods and, to an even greater extent, the purchase of services. The decline in the prices of non-ferrous metals which occurred after an increase during the summer and the drop in prices of woollens and worsteds in the second half of 1949 are among the few evidences of the effects of lower import prices caused in part by devaluation. So far, however, lower import prices have made little mark on American domestic prices. Finally, those prices which have fallen most are, in general, those that had risen most since before the war. The price picture, then, is one of selective and incomplete readjustment. The prices that have declined least are those still supported by some abnormal demand, or those of commodities whose supply is, or has been, restricted, as steel products

were by the strike of last October and November.

It is noteworthy that demand deposits (adjusted), for weekly reporting member banks of the Federal Reserve system, reached their peak in January, 1948, at the time when the first indications of a downward price movement appeared, and have fluctuated in a narrow range since. A relationship can be seen between the two, even without invoking the pure quantity theory of money. So far, the Federal Reserve has done a good job of stabilising the money supply.

Price prospects for the future hinge on the answers to two major questions, one chiefly concerning the demand for goods, the other the conditions of production. First, will the budget overwhelm the Federal Reserve system? Assuming there are no crop failures, will government expenditures sustain demand sufficiently to halt the downward course of agricultural prices, with its widespread ramifications? Can they, at the same time, prevent declines in the prices of those commodities temporarily profiting from war—deferred demand or restrictions on production in the past? Since all government expenditures account for but one-sixth of the national product, the answer to this question seems to be in the affirmative only if the latest crisis in international affairs produces an increase in armament outlays comparable to those of a full war economy.

The second question is, will the great power of organised labour be used to block any downward readjustment of unit labour costs, or perhaps to force such costs upward in the long run? This same question, it is interesting to observe, was asked for several years after 1918 and, while no proof is possible, there seems little reason to believe that events will not answer it in the same fashion now that they did then. The outlook for better machines, better processes, better industrial organisation seems no less promising now than it was then, and the reductions in cost they make possible have always provided an offset to the pressure for higher earnings.

American Notes

Britain Marks Time

The British voters, failing to make a clear choice between either of their own large political parties, have at least brought comfort to both of the large political parties in the United States. Furthermore, the thrashing given to the Communists should gladden every truly American heart, while to a country as wedded to a two-party system as is the United States, the smothering of the Liberals means only that an unnecessary political extravagance is being abolished. The British, in turning away from the Labour Party, have, according to the Republicans, repudiated the socialism which is being imposed on the United States by the Democrats. To the Liberal Democrats, who spurn the charge of socialism, the British have clearly chosen the welfare state which President Truman offers to Americans and which both parties advocate in Britain. Even Mr Churchill, they add, would seem a dangerous radical amongst the Republicans.

Nevertheless the British voters have brought no comfort to official Washington. Leading members of the Administration, conscientiously refusing to take sides in public, undoubtedly argued in private about the right road for Britain. But they were agreed that Britain must choose a road and follow a strong government along it: from the point of view of America and of the world, marking time at the cross roads would be disastrous. The US Administration already feels that some of the advantage gained in the cold war has been lost while waiting for Britain to make up its mind. The Anglo-American economic talks, which began last September on the British dollar gap, on sterling balances, on stockpiling, overseas investment and so on, are said to have reached the point where the British Government must make unpleasant decisions. Such decisions will be difficult, if not impossible, for a Labour Government which dare not offend its own left wing. Nor is such a Government, in the American view, likely to be able to deal effectively with Britain's economic problems. Further progress towards political, military and economic co-operation in Europe has been held up, say the Americans, in the absence of a strong lead from Britain, a lead which is desirable, probably essential, and may now fail to materialise. Finally, there is the pressing and difficult search for an American policy in the Far East; British help is badly wanted here but may not be forthcoming from an unstable Government.

On second thoughts, however, Washington is beginning to see that perhaps some good can be made of the British voters' bad job. Progress should at least be possible on international political questions, since on these the Conservative and Labour Parties are in general agreement. And maybe the Labour Party's lack of a safe majority will make it more co-operative than in the past—perhaps, hope some wishful thinkers, it may even consent to a coalition government. Just because Britain is marking time at home, there is no need for America to do so abroad, especially when there is no reason to suppose that another British election would give any clearer guidance. And by the time it can take place the United States will be in the midst of its own Congressional campaign.

* * *

European Competition

The British election, since it presumably means the end, for the present, of plans for further nationalisation, weakens the argument that Marshall dollars are subsidising socialism. It is, however, rumoured that the opponents of the European Recovery Programme are hoping to undermine the socialist position and ensure a Labour defeat at the next election by cutting next year's funds for the Economic Co-operation Administration.

But the main pressure for such cuts will be founded on the unsatisfactory state of the American budget and will be applied in the appropriations committees. Hearings on ECA's authorisation for the year beginning next July have been going on concurrently in the foreign affairs committees of both Houses. Mr Hoffman, throwing a bone to the economisers, began by announcing that he had managed to save $150 million from last year's appropriations; he therefore needed only $2.95 billion for the coming year instead of the $3.1 billion allotted to him in the President's budget. In his view and in that of the Secretary of State and of other ECA officials who have been giving evidence, this request is an absolute minimum if Communism is to be kept under in Europe and if the cold war is to be won.

Attention is now being directed not to past efforts but to future promises, and next year there are to be prizes for those European countries which keep their word. Mr Hoffman, although he understands the difficulties better, is as much concerned as is Congress at Europe's slowness in carrying out its instructions to "unify," or "integrate" as the State Department prefers it to be called. About one-fifth of this year's funds, $600 million, is being set aside to encourage reductions in trade barriers and increases in currency convertibility, chiefly through the proposed European payments union. This union is evidently to come into existence with or without British approval; Americans now expect that it may be without.

Not only are Europeans to be rewarded for competing with each other, but Americans may eventually be rewarded, or at least recompensed, for allowing Europeans to compete with them. Mr Acheson and Mr Hoffman both flew, as yet hardly visible, trial balloons, which seem to contain government assistance for businesses and workpeople forced to make readjustments as the result of increased imports. This would in fact mean that after 1952, instead of giving dollars to Europe, the United States would permit them to be earned and would subsidise Americans instead of foreigners. This hope of help to come may do something to answer the complaints of industries, such as Senator Lodge's Massachussets watchmakers and textile manufacturers, which are already suffering from ECA's attempts to foster imports from Europe. But, with unemployment nearing the danger point of five million, these complaints are likely this year to cause ECA more difficulty than even the cries for help from such vociferous producers of surplus commodities as the petroleum companies.

* * *

Johnson Under Fire

The Department of Defence goes to Congress to justify next year's appropriations under a heavy barrage of charges—not that it is asking too much, but that it is asking too little. In the column written by the Alsop brothers, Mr Johnson is accused week in, week out, with a forthrightness seldom encountered even in candid America, of uttering untruths about the adequacy of the nation's defences, and of securing the budget economies of which he is so boastful at the expense of the fighting strength of the Navy and Air Force.

It is charged that Johnsonian economies are responsible, not only for reducing the number of ships at sea in every category, but for so cutting the aircraft replacement rate that even in the Air Force—Mr Johnson's favourite Service—only 10 to 15 of the present 48 groups will possess modern aircraft by 1955. The acquiescence of the Services in this "$13.5 billion disarmament programe" is laid to an artful blend of bullying and favouritism. Mr Symington, the Secretary for Air, is always careful to agree with his chief that the United States must live within its means, but his gloomy insistence that in virtually every arm the Russian war machine built since 1945 "overshadows the combined programmes of all the Atlantic Pact nations put together" has added fuel to the Alsops' fire.

Mr Johnson who, when fresh in office, cheerfully took on the Admirals single-handed, has been visibly shaken by this new assault. Still clinging to his belief that "the best defence is no good if we wreck the economy by too large a military budget," he has authorised the release of certain new facts about Service strength—a sure sign that the attack has stung. Among these are the doubling of anti-submarine funds, the doubling of the number of planes in the B-29 Superfortress groups, and a request to the President to raise the number of Air Force groups from 48 to 50 to allow for new B-36 aircraft. In addition, it is argued at the Department of Defence that an "air group" is an elastic term, and that the present 48 groups, in number and power, are much closer to the 70 groups recommended by the Air Policy Commission in 1948 than would superficially appear.

No outsider can possibly judge the merits of Mr Johnson's defence, but it is possible to deduce that he has failed to make himself universally beloved. The present explosion may possibly be an outlet for the Service steam usually generated when appropriations are being considered, and now being bottled up by Mr Johnson inside the Department of Defence. One highly qualified observer, General Eisenhower, is believed to have told a Congressional subcommittee that absolute security is unobtainable and that the budget for 1950-51 provides a reasonable measure of defence. President Truman himself, whatever amounts Congress may vote, shows no signs of allowing the defence budget to be blown sky-high to appease the press.

* * *

Miners' Revolt

The strike against the Chrysler Corporation is over five weeks old, but at least the automobile workers' union is genuinely negotiating with the company. The threatened strike of railway conductors and trainmen over wages and hours has been postponed while an emergency board investigates the matter, under the special procedure that governs railway labour relations. And even the intransigeant communications workers have agreed to put off their telephone strike for sixty days at the President's request. But neither a Presidential request nor a fact-finding board, neither a court injunction against the strike nor a repeated order from their leader, Mr John L. Lewis (who thus protected himself against contempt of court), can get the 372,000 soft coal miners back to the pits which they left nearly eight weeks ago.

The United Mine Workers' union, answering a contempt of court citation this week, contended that the men are acting as individuals and that the union itself has nothing to do with their concerted refusal to work. It is not known as *The Economist* goes to press how Judge Keech will view this denial by the union of responsibility for the simultaneous action of its members. The UMW paid over $2,000,000 in fines in 1946 and 1948, after convictions on similar charges, and its reserve funds, said to be about $14 million, could quickly be exhausted if it is again found guilty and if the miners continue their defiance. Nevertheless, it is widely believed that they will do so and that nothing will alter their obstinate determination to stay away from work until they have a contract.

The employers and the union are negotiating on a contract, or at least sitting round a conference table, in obedience to the court injunction. Meanwhile, the miners' bargaining position is rapidly growing stronger, helped by the first really cold weather in the east this winter. Industry, having cried wolf about the shortage of coal for weeks, is at last being noticeably affected. Rationing of coal, economies in lighting and other emergency measures have so far protected private consumers from hardship, but it is now three weeks since coal stocks were officially said to amount to only 16 days' supply.

President Truman, accused of dangerous delays in invoking the Taft-Hartley Act and in citing the union for contempt of court, is now being urged to ask Congress for power to seize the mines. He is naturally not unwilling to allow the Taft-Hartley Act plenty of time in which to prove its ineffectiveness as a guardian of the national welfare but, once the court proceedings are finished, the Government may move to take over the mines. This is perhaps what Mr Lewis has been waiting for: he knows from past experience that he is more likely to get a generous contract from the Government than from the coal owners.

Half an FEPC?

The Administration's Bill to set up a commission to fight discrimination against minorities in employment, the FEPC Bill, fought its way to the floor of the House last week after five years in the detention cell of the Rules Committee. But its triumph was short-lived. The Southern Democrats pulled out all the parliamentary stops, including eight quorum calls, and when that failed to halt consideration

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

of the Bill, they were joined by enough Republicans to shelve it in favour of a Bill creating a commission stripped of enforcement powers. Under the Administration's plan, the Fair Employment Practices Commission might appeal to the federal courts to impose fines or gaol sentences on violators. The Commission now proposed would only be able to secure fines for those employers who refused to assist it in establishing the facts. It would have to rely on persuasion and publicity to establish equality on the job for minorities—which means, in most cases, the Negro.

In the North, the substitute Bill is being attacked as a toothless sham. On the other hand, many progressive Southerners, who must practise their creed as well as preach it, have always held that federal compulsion would arouse such resentment in the South that it would set back any hopes of securing a Fair Deal for the Negro below the Mason-Dixon line. Of the ten States that have passed laws against discrimination in employment since the wartime federal Act expired in 1945, eight have authorised compulsion, while two have not. In practice, however, compulsion has been little used ; it has remained the " club in the closet " that Mr Truman said he sought. But none of these ten States, nor any of the 14 others considering the adoption of a fair employment law, is in the South. There the Federal Commission, which is directed to co-operate with State and local agencies, will be dependent on the efforts of its own five Commissioners and their staffs.

The Southern Congressmen who voted for the substitute Bill did so, moreover, not because they believed in a federal campaign of education and persuasion, but merely as a means of killing the Administration's measure. On the final vote, they lined up almost solidly against even a toothless FEPC, in the odd company of those ardent supporters of compulsion who felt that a commission without compulsive powers was worse than useless.

Among the supporters of FEPC who voted for the watered-down Bill was Mr Franklin Roosevelt, Jr., who argued that this was the only hope of keeping the Bill afloat and ultimately strengthening it. But from the Senate, soon to debate the Administration's original Bill, comes the warning that FEPC, with or without enforcement powers, will have to run the gauntlet of a Southern filibuster. It is highly unlikely that 64 votes can be found to shut off debate on this question. Even if Mr Truman has come to believe that compromise is desirable, which is far from certain, the South can probably be relied on to keep the issue alive for the autumn elections.

Shorter Notes

The United States has authorised the Japanese government to set up trade missions in New York, San Francisco, Los Angeles and Honolulu. This action has been taken unilaterally because the Russians prevented the Far Eastern Commission from extending a general invitation for similar missions to other countries. For the Japanese, it was the first step along the road to regaining diplomatic recognition abroad. They have now also been permitted by the occupation authorities to take part in international " technical " conferences.

★

Fear of Communism and fear of infantile paralysis are both strong influences in the United States, which Congress has just recognised by granting special privileges to two famous enemies of these scourges. Immigration requirements for Mr Viktor Kravchenko, once a Soviet official and the author of " I Chose Freedom," have been waived, because without this special legislation his deportation would have been legally necessary. And Sister Elizabeth Kenny, the Australian nurse who has developed a particular type of treatment for infantile paralysis, has been given unlimited and unprecedented privileges for entering the country as a temporary visitor, without passport or immigration papers.

THE WORLD OVERSEAS

Limits of Canadian Power

(From Our Ottawa Correspondent)

WHEN Mr Pearson, the Secretary of State for External Affairs, flew round the world early this year with a small party of officials, his trip symbolised Canada's new concern about Asian and Pacific affairs. By contrast with the United States, Canada has never doubted that it belonged in the North Atlantic community. If the North Atlantic Pact was a historic new departure in United States policy, for Canada it was a step, however big, in a familiar and easy direction. The United States, on the other hand, has always been much more aware of the Pacific. Although Canada, like the United States, fronts both oceans and although the port of Vancouver has always traded with the Orient, Canadians have never felt close concern with Pacific problems. In the late war their efforts were almost entirely (not quite, because of Alaska and the Aleutians) concentrated in Europe. The plans which were being made in the summer of 1945 to turn Canadian forces against the Japanese did not amount to anything very great. Canadians for the most part did not feel the Pacific war to be their affair in the same way that they knew the European war to be.

Mr Pearson's round-the-world trip resulted from the Colombo Conference, and there can now be no doubt about Ottawa's new interest in the east. There is, moreover, nothing lighthearted about this new concern. It would be nearer the mark to say that Ottawa is somewhat dismayed at the great new field with which it feels bound to concern itself. It has neither the knowledge nor the resources to get involved too far, and the government must beware lest its commitments outrun its resources. The new feeling of responsibility coincides with an increasing consciousness of very limited power.

The formulation of definite policies within this difficult framework has still to be undertaken by the Cabinet. Whatever they may be in detail, they will, as always, take into account the two major factors in Canadian external relations —membership in the Commonwealth and close ties with the United States. Ottawa appreciates, perhaps more than Washington, the importance of the Commonwealth as the most intimate remaining link between east and west. There has probably been no time when the Canadian government was more aware of the value of the Commonwealth, paradoxical as that may be when Canada is in so many respects the odd man out as the only " dollar " member. At Commonwealth financial and economic talks, as at Colombo, there must be times when Canada finds itself expressing the sort of views which the United States would express if it were there. This may not always endear Canada to its fellow-members, but it is a unique position which might prove very useful.

The inevitable tensions of the Canadian role would be greatly eased if the United States were fully alive to the value of the Commonwealth initiative in Asian affairs. Commenting on this initiative on his return, Mr Pearson said he thought it would be " very welcome " in Washington. But whether he spoke from knowledge or hope only time will show. Certainly the Canadian government does not exaggerate the measure of help which the Commonwealth countries can give by themselves to the development of Asia. The United States is the only country with resources anything like adequate for the task, and the impression here is that it is not likely to move soon in this matter. If anything is to be done in the meanwhile it is to prepare the ground and provide a framework into which American help could fit.

Scapegoat for America

In considering possible sources of help the Canadian government has to make clear, however embarrassing it may be, that not much is to be expected of it. And this has to be done in two directions. The Asian countries have already been warned pretty broadly that Canada is already too far extended in other directions to have much left to offer. On the other hand, the United States has also to be shown that Canada is not shirking the task. The difficulty which Canada always faces in relation to the United States is that although it is beyond its power to give a positive lead, it can very easily give a negative one. One can hardly imagine the United States Congress rushing to follow a Canadian example simply because Canada had shown the way ; but one can easily imagine it using the example of Canadian abstention to acquit it of doing anything. In many fields Canada feels it necessary to be above reproach, scarcely even hoping that the United States will do the same but knowing that any reproach which it was possible to bring against Canada could be used as justification for US backslidings.

This was probably the sort of situation Mr St. Laurent, the Prime Minister, had in mind when he reminded a New York audience recently that the difference in " developed wealth " between Canada and the United States is even greater than the numerical difference between 13½ million Canadians and 150 million Americans. Canada covers a larger area than the United States and has to use a much larger proportion of its national wealth to maintain essential domestic services like railways and roads and telephones and airlines. Canada, again, is relatively undeveloped. Its new natural resources demand a heavy capital outlay from the fruits of each year's production. Its heavy dependence on foreign trade makes it far more vulnerable than the United States.

Limited Resources for Foreign Policy

" The cold war," Mr St. Laurent added, is not so much a competition in piling up armaments as in the " development of military potential " ; and that potential depends on economic strength. Mr St. Laurent applied this thesis to Europe, saying that " the restoration of genuine economic security to the European partners in the North Atlantic alliance is one of the most effective means of achieving military security," but he was undoubtedly thinking also of Canada. This government's primary task, it evidently believes, is to keep the Canadian economy in the best possible health. This is not a time when Canada can afford over-expensive foreign commitments.

It is true that 1949 improved the country's foreign exchange reserves by $119 million which, added to an improvement in 1948 of $496 million, brought them up to the relatively satisfactory level of $1,117 million. It is true that 1949 showed a favourable balance on merchandise trade of $262 million and that exports to the United States reached a new all-time high. There is enough reason to be optimistic about the coming year, but the margin is not large enough nor the outlook sure enough to permit much running of risks. A closer look at the trade figures shows a smaller balance than in 1948. Exports to the United States were up, but only from $1,522 million to $1,524 million. Exports to the sterling area, which must now be regarded as highly precarious, were up from $979 million to $1,012 million. It is estimated by the Bank of Canada that the price factor in both imports and exports was 3 per cent higher than in 1948. The physical volume of exports was down about 3 per cent, while the physical volume of imports was about the same. But the increase (by value) in imports was $150 million from the United States. Imports from the sterling area were up only from $494 million to $495 million. The trading deficit of the sterling area, that is to say, was increased from $485 million to $517 million.

The budgetary position, like the external trade position, is healthy still but no longer booming. Last year's substantial tax reductions gave a considerable fillip to the domestic economy, and consumer spending was higher than in 1948. But that is a stimulant which cannot be repeated. This year's budget surplus will not be large and there will have to be strict government economy if next year's budget is to be balanced, as it is expected to be. In the government view it would be a very poor contribution to the common cause to overtax the economy by trying to do too much. The military budget, which this year amounted to $383 million or 17 per cent of the total expenditure, will not be increased much—if at all ; but the armed forces are finding it very difficult to live within it. As soldiers, sailors and airmen do all over the world, they see so much to be done and are able to do so little of it. They would like to buy new armaments in the United States, but they are not allowed to add more than the barest necessary minimum to the dollar drain. Nor will they be allowed to until a change of US policy enables Canada to earn " defence dollars " by making arms here for the United States. The hand of the Finance Department lies heavily on them.

It must lie just as heavily on the Department of External Affairs. However vividly the problems of Asia are now brought home to Mr Pearson, and however fully his colleagues accept the urgency of the need, the Cabinet is likely to insist that any new commitments must be strictly confined to the country's capabilities ; and they are not at present in a mood to over-estimate those capabilities.

Fears of a " Little 'Un "

The post-war years have brought to most Canadians a sense of achievement and an even greater sense of the possibilities ahead. It is easy to stir up criticism of the government for not playing a large enough role in world affairs, more difficult to find warning voices. Nearly everyone outside the province of Quebec, and a surprisingly large number of people within it, are proud of the part this country played in bringing the North Atlantic alliance into being. No one in government circles regrets it. But there is some feeling that just as valuable results could have been gained behind the scenes without making quite such a noise about it. Now that the pact is completed and the resources of all its members are under review, Ottawa is becoming painfully aware that this is after all a country of only 13½ million people, relatively undeveloped and highly vulnerable to world economic conditions. Perhaps, it is felt, Canada shouted rather loud for " a little 'un." The current mood favours keping quiet for a while.

This obviously is not the mood in which to embark on great new schemes in the east. But the grim needs of Asia are too clear to be denied. The compromise between what

is unquestionably needed and what Canada can provide is bound to be a painful one. It may now be the diplomats' turn to share the familiar experience of the soldiers and think longingly of all the things they could do if only the parsimonious guardian of the public treasury would give them the money.

Soviet Trade With the West—II

DURING the last two years the Russians have devoted increasing attention to the development of their trade with western Europe in order to fill their urgent requirements for industrial goods. But in many of these countries they seem to have experienced the same difficulties in placing their orders as they have in Britain. One of the chief difficulties is that the Russians insist on guaranteed delivery dates which western governments, not possessing dictatorial powers over their manufacturers, are not able to give. Moreover Russian requirements are often excessive. Soviet Swedish trade has assumed much more modest proportions than was envisaged in the five-year trade agreement signed in October, 1946. This included arrangements for an annual exchange of goods to the value of Kr. 100 million each way, and a 5-year Swedish credit of Kr. 1,000 million to be spent by the Russians on machinery and equipment. In 1947 Soviet exports under the agreement were worth Kr. 53 million, and Swedish (which included steel products, machinery and instruments) to only Kr. 29 million. The Russian demand that Sweden should pay the difference in hard currency came as both a surprise and a blow to the Swedes. A more modest goal of an exchange of goods valued at Kr. 30 million each way was set for 1948. In fact Swedish exports under the trade agreement amounted to about Kr. 25 million and its imports to about Kr. 43,700,000. During 1949 both sides aimed at an exchange worth Kr. 45 million each way. The credit agreement has not compensated for the small amount of bilateral trade. The Swedish Minister of Commerce stated in February, 1948, that Swedish-Soviet trade had reached a much smaller volume than was envisaged in 1946, largely because Russia had refused to accept the prices which Sweden could obtain in other foreign markets. Swedish industries did, in fact, originally offer deliveries almost to the limit of the Kr. 1,000 million credit, but it was reported last November that Soviet orders only amounted to about Kr. 398 million. As Swedish industry is said to be fully booked for the next two years it does not look as if the Russians will be able to make much use of the rest of their credit. It is also true that the development of the Marshall plan has made Sweden much more anxious to develop its trade with western Europe than it was in 1946. Many Swedes then believed that a great depression was imminent in the west and that Sweden must therefore protect itself by increased trade with the "boom and bust proof" Soviet Union.

Search for Industrial Equipment

Early in 1948 a one-year trade agreement was signed between U.S.S.R. and the Belgium-Luxemburg economic union which provided for a considerable increase in trade exchanges. But Soviet orders for Belgian machinery and equipment have not been nearly as heavy as was expected, largely, it is believed, because of the distant delivery dates given by the Belgian manufacturers; and the Belgians have been unable or unwilling to provide the raw materials wanted by the Russians. Although Soviet grain exports to Belgium fell from about 1,200 million Belgian francs in the first half of 1948, to about 400 million francs in the first half of 1949, the Russians still had quite a large favourable balance of several hundred million Belgian francs at the end of the year. A Belgian trade mission which went to Moscow last September returned home three months later without having succeeded in concluding a new agreement. A French trade mission which went to Moscow last summer has also failed so far to produce any results. French trade with Russia has been at a very low ebb since the war. The trade talks which were started in 1947 were broken off by the Russians. But it was on Russian initiative that the present taiks were begun; they are believed to be anxious to obtain machinery, especially electrical machinery, from the French.

Under the Soviet-Swiss trade agreement signed in March, 1948, Switzerland undertook the immediate delivery of a wide variety of goods, including machines and machine tools, in return for Soviet grain, timber, chemicals and petrol, as well as the delivery over a longer period of about 80 million francs worth of heavy machinery and industrial equipment. But here again the trade exchanges have not come up to expectations. A year after the signature of the agreement Swiss imports from Russia amounted to only 40 million francs (instead of the scheduled 120 million) and its exports to 50 million. Under the trade and reparations agreement painfully concluded between USSR and Italy in December, 1948, the Russians agreed to supply most of the raw materials to enable Italy to manufacture for them over a period of three years 60,000 million lire worth of specialised equipment including electric locomotives and turbines. This was in addition to normal trade exchanges which were to amount annually to 30 million lire each way.

Wheat for Whale Oil

In the series of bilateral barter agreements concluded by the Russians during the last two years the strongest bargaining counter in the hands of the Soviet negotiators has been their grain. Before the war Russian grain exports were strictly limited by inadequate transport and port facilities. This situation has now been completely remedied. During 1948 Russia undertook to export more than 3,000,000 metric tons of grain, over half of which was destined for western Europe, Egypt and India. Large grain exports are not due to an existing surplus but due to the fact that in the estimation of Moscow the needs of the Soviet consumer come a long way behind the requirements of economic planning or the exigencies of politics. It is known, for instance, that the Russians are most anxious to obtain Norwegian minerals and whale oil. In 1948 they agreed to send Norway 190,000 tons of grain (of which 170,000 metric tons was wheat) in return for whale oil, herrings and minerals. In December, 1948, in spite of their aversion to long-term agreements with western countries, the Russians signed a three year trade agreement with the Norwegians under which the trade exchanges during 1949 were to be on the same lines as during the previous year. (The wish to keep the Norwegians out of the North Atlantic Treaty may also have encouraged the Russians to make this agreement.) This year it is believed that the Norwegian trade delegation, which has been arranging trade exchanges for 1950, was among the first of the many similar delegations in Moscow to conclude its business because of the Russian anxiety to obtain whale oil. It is also believed that the Soviet Union has been dangling the bait of cheap wheat before the Spaniards in order to obtain uranium, wolfram and other ores.

The Russians have also made use of their grain to develop their commercial relations in the Middle and Far East. Between July, 1948, and April, 1949, three barter agreements were signed between USSR and India in which Russian grain was exchanged for Indian tea and castor oil. Trade between the two countries had hitherto been negligible. Negotiations for a regular agreement were started last August, but have not so far been successful. (The Soviet trade mission which has been in Karachi since last July seems to be in a similar state of deadlock—the scope for an agreement is indeed limited). In Egypt the Russians have shown great eagerness to barter their grain for Egyptian cotton. After the agreement to exchange grain for cotton of March, 1948, nothing further was signed until last May, although in the meantime the Russians had been offering not only grain but timber, tobacco and petrol in exchange for cotton. The reluctance of the Egyptians and the eagerness of the Russians were both explained when it became known that the Russians were not only sending their Egyptian cotton to Czechoslovakia but were also selling it in European markets for dollars and other hard currencies. The Egyptians naturally objected and in the agreement signed last May the Russians had to undertake not to sell their Egyptian cotton to the countries outside their economic system. With such varied uses for their grain it is hardly surprising that the Russians walked out of the Washington wheat talks rather than accept an export quota of only 1,360,000 metric tons.

(Concluded.)

Abolition of Zemindari

[FROM A CORRESPONDENT IN CALCUTTA]

INDIA is creating a property-owning democracy. If Communism is to be avoided in the Indian countryside, the peasant must be given a stake in the land. So today in the half of India where he has traditionally been a tenant, he is being turned into an owner by the abolition of his landlord—the Zemindar.

The Zemindari system was essentially a gigantic British misunderstanding. The prevailing system in India was that a man owned the soil he tilled, subject to his paying land revenue to the state. The peasant was often exploited—in bad times the revenue might rise to half the crop—but he was rarely dispossessed and never foreclosed; and when oppression became unbearable he could migrate to the waste land of a less rapacious master. In the anarchy of the 1[illegible] century the system collapsed. Favourites and army commanders were given, or usurped, the land revenue of great areas. Tribal chieftains and the scions of ancient rulers reasserted their authority. Large tracts passed from direct administration by royal servants to the grinding rule of tax-farmers.

In Bombay and the Tamil Nad of Madras the British Government, on the whole, insisted on basing its rule on the peasant. But in the Ganges Valley and the Telugu area of Madras the romantic belief of men like Cornwallis and Canning in the merits of a squirearchy as leaders and improvers of the land led them to accept a heterogeneous miscellany of ex-rulers, ex-tax-farmers and ex-bandits and to turn them into landlords in the full English sense.

Failure of British Administration

But institutions are not so easily grafted, and over 150 years the most creditable products of Zemindari have been Rabindranath Tagore, the poet, Liaquat Ali Khan, the Prime Minister, and the Maharaj Kumar of Vizianagram, the cricketer; no Cokes of Holkham and no Cecils have emerged, and the majority have been as vicious as Thackeray's Lord Steyne, as idle as Jane Austen's Mr Bennett, and as drunken as a Surtees Squire. Their exploitation of the countryside was such that one English finance member used to say that what he had seen as a young officer in Bihar—a large Zemindari area—was enough to justify anyone in becoming a revolutionary. In some Zemindaris no tenant's daughter was safe; in most evictions, rack-renting and corruption of agents was the rule.

This oppression was partly the result of a British failure to act upon their original ideas. In Bengal and Oudh, for example, the tenant was supposed to get the same security of tenure and rent against the landlord as government had given the landlord against itself. But nothing was done. The first effective tenancy act was passed (in Bengal) in 1885 and in the United Provinces really effective protective measures were adopted only just before the war, by the first Congress Government. The result was that although the land revenue was supposed to be 90 per cent of the Zemindar's recoveries, in fact sometimes the rent was raised until it was several times the revenue, while evictions ran into thousands every year.

Ancestral Memories of Ownership

Every Zemindari area has, therefore, understandably, become a focus of social tension. The peasant had ancestral memories of ownership, and enough sense to realise that the pressure on the land enabled his landlord to squeeze him in a way which neutralised any new law in his favour. The Congress, therefore, made abolition of Zemindari a major battle cry of its 1946 election campaign, and now it is slowly fulfilling its promises. Acts have been passed in Madras and Assam and are well on the way to the Statute Book in Bihar, the United Provinces, Orissa and the Central Provinces. In the ex-states action has been taken only in Hyderabad, but when the States Unions settle down, the example will no doubt be followed—feudal jurisdiction has already been abolished. In West Bengal no proposal has matured to the stage of legislation, but it is understood that there is some proposal for the buying out of all interests in land, the cultivator's included, and the creation of village co-operative farms.

The technique is similar everywhere. First, government issues a notification vesting the Zemindar's estate in the Republic. Then the estate is, generally, settled on the actual cultivator, who is recognised as owner, subject to paying the land revenue. Intermediaries are bought out simultaneously with the landlord, but they and he are allowed to keep their houses and any land they cultivate themselves. In Assam this is subject to a 130 acre limit. Compensation is then assessed by special officers according to elaborate rules which include a provision for appeal to a Tribunal with a High Court judge on it. Compensation can be in cash—the UP Government is raising a fund from the tenants, which has already reached £15 million, but the poor financial condition of most provinces will compel them to pay in 2½ per cent non-negotiable bonds. In Madras compensation will be a multiple of 1/3 the land revenue fixed at the time of transfer, elsewhere it will be a multiple of the Zemindar's net rents. The net rent is calculated by deducting from the gross receipts, income tax, agricultural income tax, and assumed percentages for costs of collection and works for the tenants' benefit. These percentages will vary from 9 per cent on estates under Rs. 2,000, to 32½ per cent on those over Rs. 20,000.

Calculation of Compensation

The same discrimination is shown in the calculation of compensation multiples. Congress is aware of the extent to which these rents are the sole support of multitudes of widows, orphans, charities and the aged and it does not want to alienate the many thousand voters whose fractional shares now add only a few pounds a year to their incomes. Charities will receive the same income as an annuity as they got from rents; the man with under Rs. 500 per year will get 20 times his net rent, the man with Rs. 5-10,000 will get 10 times, and the man with over Rs. 1 lakh (Rs. 3 lakhs in Assam) will get only 3 times. Only in the special case of mineral royalties is compensation to be fixed by negotiation or arbitration. The average compensation works out at 10 times the net rent in the UP, 12 times in Hyderabad; and the Zemindar will have everywhere to pay full income tax on his new income while his rents used mostly to be income tax free. The least justified of India's grosser inequalities will thus disappear, and with it a great source of police and services' corruption.

The Zemindar has not put up a serious fight, he has only

tried to temporise by using the law and governmental overwork. The Zemindar is doomed and he knows it, no party which upheld him could win an election, and he would rather be poorly compensated under the Congress than expropriated under the Socialists or liquidated under the Communists.

Within Congress abolition of Zemindari satisfies all those who believe in the return of ancestral methods of land tenure, all those who have not forgiven the Zemindar his support of the British and all those far sighted enough to see that only by creating a land owning peasantry can the Ganges Valley and the Madras Delta become socially stable like the peasant areas of Maharashtra. The cost of these varied satisfactions is relatively not great; £12 million in Madras, £125 million in the UP.

The abolition of Zemindari is however only one aspect of a wider and more comprehensive programme of which other notable features are tenancy and moneylender legislation. Moneylenders have to be licensed and are restricted to 6 per cent interest; old debts have been widely conciliated. The tenant is given security of tenure and a rent reduction to a maximum of one-third the crop. Some provinces are even restricting the maximum amount of land which may be held by any individual. India has realised that only a solvent and property owning countryside can avoid the widespread frustration which benefits no one but Russia.

Moscow Models for the Polish Press

[FROM A CORRESPONDENT]

In the process of the bolshevisation of Polish life—the army, political structure, industry and education—that of the Polish press has been most radical and complete. Polish newspapers and periodicals today resemble to a startling degree in format and content those of Soviet Russia. Polish Communist party organs, particularly the *Trybuna Ludu*, are on certain days nothing more or less than replicas of *Pravda* in the Polish language.

The most noticeable change in the Polish press took place after the first Cominform meeting in Warsaw in the summer of 1947. Almost overnight the main newspapers began printing on front pages a far greater proportion of news from Moscow than other capitals. Like most Continental newspapers, the Warsaw dailies were in the habit of giving foreign news on their front pages and hitherto items datelined London, New York and Paris, had far outweighed those from Moscow; for every article from Moscow, there were three or four from the western capitals.

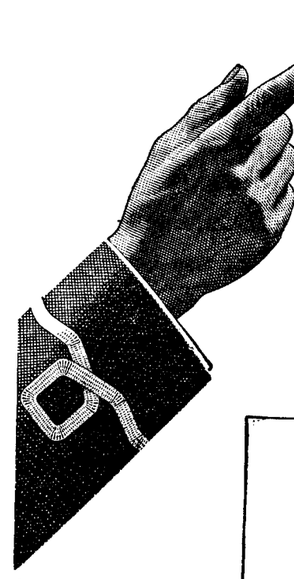
Simultaneously with the switch-over to Moscow as the main source of foreign news, the Polish press began to give more and more space to events in the Soviet Union generally, to publish articles—mostly supplied by Russian propaganda agencies—about the development of Soviet industry, the progress on Soviet collective farms, state co-operative shops and so on. The completion of a new bridge in Chelvabinsk, for instance, was given more space than the opening of a new dock in Gdynia. This change, coincidental with a complete purge of the Polish news-agency service (PAP) in Moscow, inevitably resulted in the rapid exclusion of the long reports from western Europe which had always been a traditional and characteristic feature of the Polish press. More than that, there was a marked diminution of even Polish domestic news.

The bolshevisation of the Polish press was greatly facilitated the next year by the fusion of the Communist and Socialist parties and the merger of their dailies, the *Robotnik* and *Glos Ludu*, into the single *Trybuna Ludu* as the chief Warsaw newspaper. As in *Pravda*, a speech by Vyshinsky would be the leading story of the edition, and, needless to say, a statement by Stalin or the Soviet Politburo would carry all the headlines regardless of events at home. Similar amalgamations took place elsewhere, the Communist papers and periodicals invariably swallowing the Socialist. There was also a vetting and sifting out of editors, reporters, correspondents and even clerical staff, so that only those who could be trusted implicitly and unquestioningly to follow the party line were left. In London, even as in Moscow, the Polish news agency changed its personnel.

Control of Newsprint

The government owns all the paper mills and through a special department rigidly controls the allocation of newsprint. Needless to say, therefore, that other so-called party organs which are still allowed to exist, such as the *Gazeta Ludowa*, one-time Mikolajczyk paper, now run by the Government Peasant Party, or the *Kurjer Godzienny* of the Polish Democratic Party, made no difficulties for themselves by refusing to fall into line.

In this connection, singularly enough, the Bierut regime clashed with the dominating Communist press personality in Poland, Mr Borejsza, head of *Czytelnik*, the largest printing and publishing organisation in eastern Europe. Its daily *Zycie Warszawa*, is the most popular in the country. At the height of his power, Borejsza is said to have declared that next to the head of the Security Police he was the most influential person in Poland. He always travelled extensively in Europe and even in the United States, and, report has it, he objected to being made to stay at home and take his news from Moscow. But, as in other things, Moscow won, *Czytelnik* was thoroughly reorganised and Borejsza is by no means the second man in Poland today.



One of the outstanding characteristics of the Soviet press since the middle twenties has been the almost complete elimination of news of "human interest." A reader of the *Pravda* or *Izvestia*, if he had never been to Russia, might think that murder, except political, does not exist in the Soviet Union, neither does love, jealousy, or infidelity. People do not steal, there are no train crashes and very few floods. Judged from the Polish press, Poland today is the same kind of blessed country. Even motor car accidents have ceased to occur since the newspapers adopted the Soviet system of publishing nothing except reports of undisturbed efforts of a virtuous "peace loving nation," bent on building its Socialist State.

"Revolutionary Realism"

As with the dailies so with the periodicals all emphasis is laid on ideological bolshevisation of the reader. Most of the columns in Polish literary papers like the *Kuznica* are devoted mainly to explaining the Marxist-Leninist viewpoint and to warning the writer, artist, painter and critic to seek inspiration not in the past, but in present-day revolutionary realism, a warning which Russian writers have long learned to obey and Polish writers must obey now. Another strange but characteristic feature, transplanted from the Russian press to the Polish, is to start off an article with a quotation from some leading Communist, safest of all a member of the Politbureau. Literary Polish periodicals start off with some remarkable quotation from Bierut or Cyrankiewicz's speeches and the last issue of the Polish periodical on economic affairs devotes a three and a half page opening to Joseph Stalin, whose teachings about "industrialisation" and economic problems generally were like the "stars showing the way towards victory, towards Socialism and Communism."

Water Sterilisation

The first systematic sterilisation of a public water supply was carried out in 1905 by Sir Alexander Houston. To check a typhoid epidemic which threatened the city of Lincoln, he treated the water with a sodium hypochlorite solution called 'Chloros', manufactured by the United Alkali Company which later became part of I.C.I. The success of his revolutionary experiment so impressed the world that within a few years the treatment was widely adopted, and today practically all public water supplies are sterilised with chlorine. The various methods based on chlorine or its derivatives, such as 'Chloros' or bleaching powder, have provided considerable extra security against the risks of water-borne infection and they have enabled many supplies to be used which would not otherwise have reached the necessary standard of purity. In swimming-pools, a small amount of chlorine used in conjunction with filtration and aeration ensures a clean, attractive and safe water.

Pure water supplies tend to be taken for granted, yet their provision is an outstanding achievement and one of the greatest contributions of the chemical industry towards the maintenance of public health.

Another record to make you think

This remarkable increase year after year shows how much the export drive owes to an efficient steel industry.

Already the quantity of vehicles, machinery and other steel goods exported is more than double pre-war, earning nearly half the nation's income from overseas trade.

The great efforts of our exporting industries are backed by the record output and low price of British steel.

THE BUSINESS WORLD

Economic Policy Now

THE old Government left a whole range of economic, industrial, and financial problems in abeyance; a new Government returns with neither the strength, nor perhaps the conviction, which it would need to work out solutions for these manifold issues. It is generally accepted that the first task of the new administration is to produce a budget; but few would attempt to define, in advance of the King's Speech, the other tasks which it proposes to set itself. It should be safe to assume that further nationalisation is ruled out in this Parliament. It may also be safe to assume that the Steel Act need not become an immediate issue, since although it is on the Statute Book, the first step towards implementing it cannot be taken before October.

A Government which "planned" by using an overwhelming majority in Parliament to secure its economic legislation, and by adapting wartime controls to postwar purposes, must expect, now that it is robbed of its majority, to come under critical fire if it persists in controls beyond the period of scarcity into a period of relative sufficiency. The school which was arguing, immediately before the election for "more and better planning" (which in practice would have meant more, and less effective, controls) has lost face. Their arguments made logic of a kind, though they made no attempt to reconcile the issues of inflation, overfull employment and personal freedom. Equally, the notion of "democratic planning" which has informed a succession of "Economic Surveys" now becomes utterly meaningless—which is to say, more empty than a year ago when the Government could have used its power, if it had wished, to make positive plans instead of leaving economic affairs to drift. Thirdly, the Government has the option, if it wishes to take it, of making at least an approach towards a "liberal" economic policy—a policy, that is, which would allow prices to move instead of sitting on them until they explode, and a policy which, by using the instruments of the budget and monetary policy, would induce a sufficient flexibility in the economy to shift labour and resources where they are most needed and to get a material reduction of British industrial costs. That may be asking too much of a Labour Government which lives in fear of its own left wing.

For these different reasons, the new Government is likely to be least effective in economic policy. Industry and the City will not complain that its teeth have been drawn, but that is only a negative virtue. There may be no compulsory dividend limitation, no stiffening of death duties such as the Chancellor appeared to threaten during the campaign, no development councils with "teeth" in them. But, equally, positive steps designed to let the price mechanism do some of the work of the controls are also unlikely. If it was possible for the Chancellor of the Exchequer to argue a month or two ago that not a penny could be pared off Government expenditure, what will induce him to try to discover cuts now? The possibility of further inflation during the next few months ranks very high indeed, for he would be a bold man who would now claim that the policy of stabilising wages can be preserved, or that the Government is strong enough to fight for it now that its parallel policy of price stabilisation is rapidly crumbling. Indulgence at home is likely to be coupled with a defensive attitude towards the policies of economic expansionism in Europe which seemed, before the election, to be slowly taking root. And there will hang portentously over the whole scene the sign of the dollar and the potential threat of a new balance of payments crisis.

There is just a chance that the King's Speech may reveal that the Government's economic programme will be more realistically attuned to the needs of the times. But until there is proof to the contrary, the best assumption that industry, finance and trade can make is that the Government, lacking real power, will make no effort to forge a real policy. Yet the work that needs to be done, and quickly, is prodigious. On the domestic front, there are the relations of Government with both labour and industry, conveniently shelved since the early winter, but now demanding decision. The budget and home finance would tax the skill of a Chancellor who was fortified with a large majority; Sir Stafford Cripps's predicament, with another election perhaps not far distant, will not be enviable. He and the new Minister for Economic Affairs will have to take early decisions on the role of Britain in the European economy, watching with an ever open eye the behaviour of the pound in foreign markets. They will also watch the flowing tide of higher prices, powerless as Canute.

A "NO CHANGE" BUDGET?

THE first real test of the Government's inclination to tread warily will be the budget. The piloting of the budget next month is not only the main duty of this uneasily poised Government; it is also the one which will present the greatest number of pitfalls unless the proposals are studiously noncontroversial. This must mean that it cannot include any new experiments in doctrinaire Socialist finance. In particular, the threats uttered during the election campaign by Mr Douglas Jay—and even by the Chancellor himself—about intensifying the wealth-equalisation policy by means of still stiffer taxation of capital can now be dismissed. On the other hand, if the risk of tax increases can now be ruled out, there is equally no possibility of any substantial tax reductions, because any large relief would also require large retrenchment. The Opposition might conceivably argue that maintenance of expenditure at its present exaggerated level is in itself a manifestation of controversial Socialist finance; but it is clear that a Labour Government which must not only eschew nationalisation but has also lost the chance to make political budgeting a means of strengthening the hand of the TUC in its effort to maintain the wage-freeze, dare not add yet another affront to its own left wing. The Opposition, for its part, will not be able to press its demand for retrenchment very far, unless it wishes to precipitate an immediate election. Within the limits of a presumed political truce, the most it can reasonably

expect of Sir Stafford Cripps is that he shall give convincing evidence that the drive for economy and efficiency in the public service is being vigorously pursued. In other words, it is entitled to insist that existing services are run without waste but is inhibited from demanding any curtailment in the scope of the major services themselves.

On these hypotheses, it seems certain that this will be a budget of insufficient disinflation. The Chancellor, no doubt, will strongly reaffirm his disinflationary intentions and is likely to cite the large surplus achieved in 1949/50 as evidence of past successes. He will be able, moreover, to offer a large prospective surplus for the coming year, before making any changes in rates of taxation. On the revenue side, prospective losses and gains seem likely to be fairly evenly balanced, so that the prospective above-line receipts for 1950/51 are not likely to be significantly less than the actual yield of 1949/50. On the other side, it seems unlikely that prospective economies will do more than offset the natural growth in the cost of existing services—a growth soon to be revealed by the presentation of large supplementary estimates. If this is so, any tax relief must be limited to mere gestures—such as a penny or so off beer (which probably must be conceded in any case, to prevent the yield of the duty from falling) and minor concessions in purchase tax. On such assumptions as these, it could be made to appear that the budget would give strong support to a disinflationary policy. But it is very apparent that the degree of disinflationary pressure exerted by the 1949 budget was insufficient, and there is no reason to expect a similar budget in 1950 to exert more potent effects. Indeed, from the Government point of view, the very essence of a "non-controversial" budget is that it shall not intensify the degree of disinflation—and, in particular, shall not push it to the point at which it begins to have positive effects by producing the necessary slack in the national economy. For precisely similar reasons, there seems no possibility of any significant further cuts in the investment programme. In both spheres, effective disinflationary action is ruled out by the Government's unwillingness to cause any "dislocation" in industry or to risk even a temporary increase in unemployment.

WAGE RESTRAINT

WAGES stabilisation policy enjoyed a considerable apparent success up to the election; what is its future? The Ministry of Labour's figures showed that the average weekly rate of wages, which rose by 8 per cent in 1946 and 5 per cent in 1947, rose in 1948 by no more than 4 per cent and last year by only between 1½ and 2 per cent. Thus the rate of increase of wages has been declining sharply. Even before the election, however, it appeared quite uncertain that this trend could be maintained. The figures quoted, though they could have meant that the policy of restraint had gained general acceptance, could equally have meant that the late Government by its efforts had succeeded in damming up the pressure temporarily, but no more; and it was in this direction that the other evidence pointed.

It was, perhaps, the special conference of trade union executives called by the TUC in January that provided the clearest sign that the dam was breaking. The policy of restraint urged by the TUC gained acceptance, but only by 4,300,000 against 3,600,000 votes; less than a year before the voting had been 5,400,000 to 2,000,000. In the January vote, two big general unions—the Transport and General Workers and the Municipal and General Workers—accounted for a solid part of the vote on the official side. In opposition were the engineers, the railwaymen, and the mineworkers—three groups which, for this purpose, matter more. So large a minority, so composed, in open opposition meant something very near defeat for the official policy. There seems no reason for believing (as has been suggested) that the discontented unions may now decide to be docile simply out of loyalty and because the Government is weak. On the contrary; Government moves to console the unions for their restraint by stronger action against "capital" are now out of the question. It has, therefore, little leverage with which to hold the unions to restraint.

Substantially, the TUC policy as stated in December was that wages should be stabilised and sliding-scale agreements suspended so long as the interim index of retail prices did not rise by more than six points from its autumn level of 112. By the end of the year the index stood at 113, and clearly there are more increases to come. Already the utility textile schemes have been reduced to chaos by the Government's delay in allowing the higher prices of cotton and wool to be reflected in the permitted retail prices of the finished goods. In general, the price increases consequent upon devaluation have not yet been permitted to reflect themselves in the index; but they cannot be suppressed or concealed much longer. There is room for argument whether those increases will by themselves push the index up above the limit of 118 by, say, the autumn.

But this is no longer the crucial question. The wages stabilisation policy can hardly now be maintained in anything like its full rigidity if the cost of living rises substantially at all. Merely to limit the increase to four points in the interim index—even if this can be done for long—is not likely to keep the unions quiet.

The affair of the utility price cuts showed last August the lengths to which the Government might be prepared to go in manipulating the price system to serve its other policies. Utility prices were reduced on that occasion by order, though other prices were tending to rise. But those cuts, limited as they were, brought the Government into sharp conflict with the trades concerned, and in that kind of conflict a stout Parliamentary majority is needed in the background to make weak arguments prevail. It is unlikely that the Opposition would connive at juggling with the price system merely in order to help conceal the true movemeat of prices.

PRICES AND TRADE

THE extent to which retail prices would eventually be raised by devaluation has been variously estimated at between 3½ and 7½ per cent, and this rise was expected to take six to nine months to become openly apparent. Between September and January, the interim index of retail prices rose by one point. Wholesale prices have already risen by 6 per cent since August, while wholesale prices of raw materials have risen by over 14 per cent. The rise in prices is, therefore, beginning to work its way through the economic system and the public will become more aware of the process in the next few months.

Moreover, the new financial year will see the abolition of subsidies on feeding stuffs amounting to £37 million. Part of this increase in farmers' costs is likely to be passed on to consumers. The annual review of agricultural prices, postponed during the election, has started this week. If two-thirds of this additional cost were to be passed on to the consumer leaving the remaining third to be met out of farmers' profits, the average weekly cost of food would rise by 1⅓ per cent per person or by 3d.—given the same pattern of consumption as last year. This may seem fairly small, but it will be a further factor in the inflationary process.

This inevitable rise in retail prices results from past policy, from which there is no escape. Part of the advantage of lower prices which devaluation has afforded to British exports has already been nullified by the rise in prices of raw materials. If labour costs are also allowed to rise, Britain might well find itself in the same state of drift as last summer.

★

The election has presumably given a further lease of life to government trading. Lancashire assumed that a change of government would mean the re-opening of the Liverpool Cotton Exchange. That would, indeed, have taken time, but the first steps might well have been to close down the Raw Cotton Commission's office in Alexandria and to re-institute the purchase of Egyptian, Sudan and Nigerian cotton through normal trade channels. For the time being at any rate, the Commission will maintain its procurement policy. A change of government might also have restored private trading in cocoa, coffee, tea and possibly grain. But unless the new Minister of Food has radically different views from his predecessor, government trading in these foodstuffs is likely to continue. A British mission, it is true, is at present touring India, Pakistan and Ceylon, discussing the prospects of re-opening private trading in 1951. But even if its report is favourable there is no guarantee that it will be acted upon.

Within the next six months, the Government must decide whether or not it will re-introduce the international sugar scheme and institute a new international agreement for tin. A commodity agreement for wool is also a possibility and, should it materialise, it is likely to be coupled with a scheme for cotton. The prewar tea scheme is legally in operation but, as for sugar, the export quotas have been held in abeyance. Sir Stafford Cripps last year left no doubt that the Labour Government saw in international commodity schemes the salvation of the sterling area. Such a policy is therefore likely to be continued though perhaps less vigorously than hitherto.

The same is true of trade agreements. Since the new plan for liberalising European trade has come into operation, much of Britain's trade with soft currency countries has ceased to be regulated by annual agreements. The new European Payments Scheme will clearly assume greater importance in such circumstances, but the Government's insistence that the scheme should not involve Britain in any additional loss of gold or dollars is unlikely to be challenged by the Opposition. Scope for disagreement will, however, exist in the negotiations with Argentina. Although world supplies of meat have not recovered sufficiently to enable Britain to abolish or even relax rationing, there are two distinct opinions about the methods to be used in procuring meat from Argentina. The one is the maintenance of Government bargaining and the other is the resumption of dealings through private trade channels.

PROBLEMS OF EXCHANGE POLICY

A NUMBER of decisions on sterling exchange policy will have to be taken in the near future. The most important of these concerns the participation of Britain, and possibly of the sterling area, in the European Payments Union. Discussions about implementing in detail the principles of such a Union, recently agreed in Paris, will be in full swing before long. Though they will at first be technical, they will quickly reach a point at which commitments of crucial importance will have to be undertaken. Informal discussions on the scheme have in fact been proceeding in Washington, where a number of OEEC delegates are now to found, to help ECA in presenting the case for another year of Marshall aid to US Congress. In these discussions, ways and means of giving Britain and the sterling area a special position in relation to the EPU have been suggested. They have received a welcoming echo in United States circles, and Mr Dean Acheson, in giving his evidence to the Joint Senate and House Committee, has voiced his opinion that Britain's partnership in the European Payments Union might most fruitfully be given by the elaboration of special rules governing the role of sterling. This presumably would involve the safeguards required by sterling's functions as an international currency, transferable and widely used in payments between non-sterling countries. What the British experts chiefly fear is that accumulations of sterling, which at present carry no gold payment clause, might through the operation of the European Payments Union be converted into EPU credits on which, sooner or later, partial gold payments would have to be made. The fear of losing gold is still the main motivating factor in the British exchange control policy, and there is no likelihood that the results of the General Election will occasion much change in this direction.

★

This is not to suggest that no attempts will be made to extend the sphere within which the transferability of sterling operates outside the sterling area. The success of the recent Uniscan talks is likely to provide an encouragement for making similar arrangements with other countries. The discussions which have been proceeding with the West German government in Frankfurt were designed to extend the idea of payments agreements with non-sterling countries in which all possibility of gold payments either way is eradicated. The success with which this policy can be pursued will depend on the confidence with which sterling is held in Europe, and this in turn depends on the amount of sterling which is held in Europe. On this score there is ground for satisfaction at recent developments. French sterling balances have begun to decline after their unexpected rise last year. The Belgian holding is now well below gold export point. The devaluation medicine is beginning to work on the British and sterling area balances of payments. As yet, however, there has been little evidence of this improvement either in the rates quoted for free sterling or in the administration of sterling exchange control in London. Transferable sterling has this week weakened from $2.54 to $2.50. Instructions have recently been sent by the Bank of England to banks in this country that any transferable sterling received by British banks will lose its transferability unless the payment for which it is intended is made within 24 hours—which is hardly a sign of

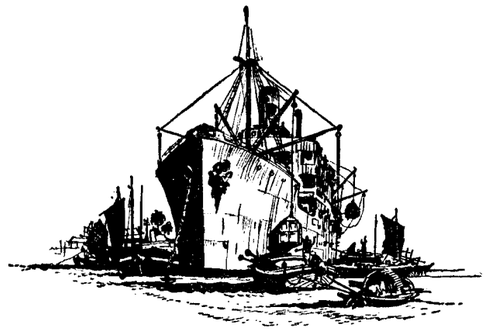
strength or confidence. It is doubtful whether the result of the elections will succeed in imparting courage and vigour where these qualities have so clearly been lacking recently.

THE INDUSTRIAL PROSPECT

If nationalisation can be taken to be in suspense until the procedure of the Iron and Steel Act forces itself upon the attention of Parliament, there are still many other forms of Government intervention in the affairs of industry which may now be in question. Development councils are one of these forms; and here it has to be said that an issue which not so long ago was barely controversial has become decisively sharpened in recent months.

In the early days of the late Government (when the amount of work that one government could do in the lifetime of a Parliament was, perhaps, overestimated) development councils were the Labour prescription for industries which were not to be nationalised. The working party reports favoured them for the lighter industries, and the industries themselves did not appear hostile. But in the process of negotiation certain of the industries concerned came to be more articulate in their doubts, and one of them took the lead in opposition. This was the wool textile industry—which is no infant to be bullied or sheltered, but a strong, shrewd, energetic body. The wool textile representatives put various proposals to the Board of Trade designed to assure the objects at which the Government's policy purported to aim, but designed to avoid a statutory and compulsory council; voluntary organisation and advisory powers were preferred. The Government rejected these suggestions and insisted on its own prescription, in a manner which suggested that practical purposes were of less importance than the establishment of a statutory authority for its own sake. The wool textile industry stood firm because it suspected that the meagre powers of the proposed council were intended to be enlarged as occasion offered. Its opposition was carried to the point of taking legal action when the draft Order to set up the proposed development council was already laid before Parliament and awaiting discussion. In the result the Parliamentary debate was postponed, and when Parliament was dissolved the Order had still not been approved.

*

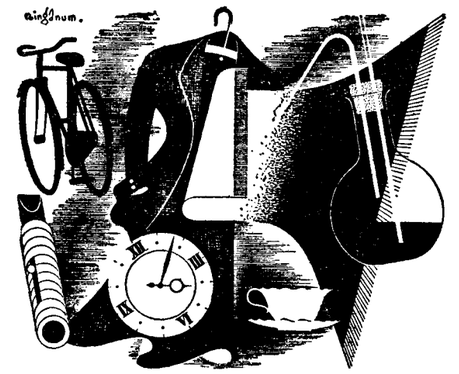


The speeches of Ministers in the election campaign seemed designed to confirm the wool manufacturers' suspicions and sharpen their fears. Sir Stafford Cripps, the author of the Industrial Organisation and Development Act, talked of the essential part of development councils in assuring to the state the "capacity to order and control"; of strengthening the Act and bringing into operation a large number of councils "overriding any political opposition." Mr Harold Wilson talked of new legislation to give the development councils extra powers.

After this sort of talk, it is useless to expect an industry to give in unless it is forced to do so. The Government will now have to decide whether to go to the trouble of forcing the Wool Textile Development Council Order through Parliament to achieve an entirely doubtful result; it can reasonably be expected to decide to forget the whole quarrel for the present, and let the draft Order lie. The case of the clothing industry is more difficult, for this Order was approved and this development council was set up before Parliament dissolved. Its prospects look none too good; legal action was taken to question this procedure also, and influential sections of the industry declared quite recently their intention of refusing to take any part in the council's work should it be set up. One side will have to retreat.

*

Of the surviving physical controls on industry, the most important are those on building and on steel supplies. It is hard to suppose that the essentials of the control on building can go at once; the calls on investment resources are still too great and are competing too sharply among themselves. But one of the most onerous features of it, the use of the building controls as a lever to force industries into the development areas, may well be questioned. In determining the location of new factories there is more than one consideration to be taken into account, but it is foolish to put the economic advantages of the site too far down the list, and there have often been suggestions in the last few years that this was being done. Some industrial projects have been enticed into the development areas by the offer of new Government factory buildings, and services at cut rates. Others have been prevented by the building controls from going anywhere else; firms have been refused permission to extend on their own sites, and this has led either to the placing of a branch factory at a remote spot to suit development area policy, or to a clumsy compromise which met the real interest of neither side. No doubt manufacturers will still have to comply with town-planning and similar requirements; but their hand has been strengthened in resisting conditions which they think wrong.



It may be an illusion to suppose that the steel distribution scheme is one of the central controls on which the Government planning of economic activity rests. Most of the evidence suggests that steel has become, by and large, too plentiful for this to be so. Steel allocation may still be to some extent an effective weapon to influence the division of the output of the motor industry between home and export markets; but then, motor body sheet is still in short supply and may remain so until the Margam rolling-mill opens next year. Most forms of steel are by now in such ample supply that the allocation does not mean much. The steel "paper" is generally thought to be inflated—that is, it appears to cover more steel than really exists—but in spite of this many consuming firms find themselves able to get more steel than their allocation and considerably more than they want. The Iron and Steel Federation argued this question for the second time in an article in its *Statistical Bulletin* for December, setting out the facts (among which is the addition of 1,200,000 tons to stocks in Britain in the last two years) which suggest that the problem is no longer to make an insufficient total output go round, but to balance demand for one steel product against demand for another. No rationing system yet devised can deal better with a situation of this sort than can the mechanism of a commercial market. The federation therefore sought last year "the abandonment of all detailed control over distribution," and no doubt it will now renew its efforts, perhaps more hopefully. If it meets difficulty, this will probably arise not from any error in its economic calculations, but from the conviction, which dies hard, that the control of steel supplies is an indispensable prop of a planned economy.

Where can your goods go?

The world is wide—but economic conditions, currency restrictions and the like exercise a limiting effect . . . It is part of the service of the Westminster Bank to provide the accurate and up-to-date information on trade conditions which must form the background to any discussions of new markets and new business ventures. This facility is included in the wider service which the Bank offers to all importers and exporters and which is described in a booklet called *The Foreign Business Service of the Westminster Bank*. Your nearest branch will be glad to give you a copy.

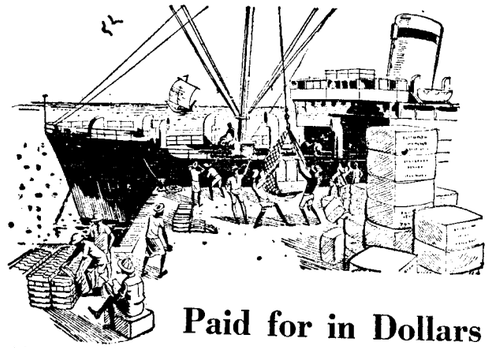
AN EXHIBITION OF

BAKELITE, WARERITE & VYBAK PLASTICS



WILL BE HELD AT THE EXHIBITION ROOMS OF THE
BRITISH COLOUR COUNCIL, 13 PORTMAN SQ., W1, FROM 8th TO 17th MARCH

This display covers a very wide range of applications of plastics to industry. The central feature is the Bakelite Travelling Exhibition which was recently shown in Brussels, Oslo and Stockholm. A number of larger items which it was not possible to send overseas are also included.

The Bakelite Limited colour film 'The Nature of Plastics' will be shown at 11 a.m. and 3 p.m. daily

Admission by ticket only

If you have not yet received one, write or phone: BAKELITE LIMITED · 18 GROSVENOR GDNS · LONDON · SW1
SLOane 9911

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners —there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

Business Notes

No Man's Land

The election has left an aftermath of frustrated hopes in Throgmorton Street. True, the Stock Exchange has taken some comfort from the reappearance of a balanced opposition at Westminster. Compulsory dividend limitation and new nationalisation measures are unlikely to reach the Statute Book and steel may yet be erased from it. But a Labour Government, albeit with the sting removed, remains to harass if not to compel, and the uncomfortable political balance leads nowhere. Uncertainty is anathema to business in the City, as elsewhere. It is doubly so at the present juncture in view of the serious economic situation which still has to be faced. Perhaps this has been the overriding fear in markets this week. At the moment strong Government is most needed; but the immediate future offers only indecision. Such circumstances can only breed market inaction.

The clearest reflection of the prevailing uncertainty is seen in the rush for refuge in the Kaffir market where prices have climbed to new post-devaluation peaks with the producing mines in the lead. Apart from the "shorts," which offer the next best thing to full liquidity, gilt-edged have truly been on edge. and have found no more definite trend later in the week after their shaky start. The fondly anticipated recovery in equities—which surely was based on wishful professional thinking rather than on solid expectations—has failed to materialise even in the new account. The industrial market has shown itself more fearful of the delayed inflationary effects of devaluation, particularly the thawing out of the wages freeze, than of anything else. But it has also been worried by fresh reports of reviving Japanese and German competition, by the possible effect on exports of the strikes in the United States and to a less extent by industrial unrest across the channel. If equities in general have barely held their ground, the "near nationalisation" stocks such as Prudential, Associated Cement and Tate and Lyle have completely failed to enjoy their reprieve, apart from an early frolic on Monday. And with the fate of the Steel Act once more in the political cauldron, steel shares have receded even further from their "take over" prices.

Investors will need all their foresight in this new situation, for indeed they are in no man's land. Institutional investors are holding their hand, in masterful liquidity. Until a strong and stable Government emerges, instability and inaction must be expected in the City.

Argentine Trade Talks Dilemma

The Anglo-Argentine Consultative Committee in Buenos Aires formally resumed its discussions on next year's trade schedules and meat prices on February 28th as arranged. But clearly some days must elapse before the real points at issue come to be discussed for the new Minister of Food will need a little time to take stock. The prevalent British attitude of the last three months has been to defer a politically embarrassing issue for as long as possible. Obviously, it is not less embarrassing now; but, equally, it cannot be much longer deferred.

Meanwhile, more evidence has been accumulating about Argentina's desperate shortage of foreign exchange. Every few days since the beginning of the year, trade negotiators from various overseas countries have been arriving in Buenos Aires with long lists of goods they are willing to sell and buy—only to run against the difficulty that Argentina, with its meat and wheat bespoken and its maize crop ruined by drought, has little except vegetable oils to offer in exchange. In these circumstances, it must be expected that Señor Perón will be more concerned than ever to receive more sterling for next year's meat shipments; but he will be making his increased bid from a hand which holds no honour tricks at all. In face of this bid, the British negotiators (provided they are not merely intent on a compromise and a quiet life) have two choices before them. They can either decide to treat Señor Perón as a tough bargainer who is now at the end of his tether (a threat to suspend British shipments of oil and coal might bring Argentina, after some unpleasantness, to heel about meat prices); or they can treat Argentina as the sick man of South America whose productive capacity should be nursed back to health at some immediate cost to the British consumer or taxpayer under proper long-term safeguards for the rights of British traders and business interests there.

There have been some recent signs that Argentina might now be willing to cooperate with foreign Governments in such an approach. Señor Perón, for instance, has had discussions with the American Under-Secretary of State about the steps Argentina should take to encourage private foreign investment; Argentina is now setting aside 30 per cent of its current dollar earnings to liquidate outstanding commercial dollar debts; the Government has concluded an agreement with France whereby French holders of Argentine Government bonds will obtain payment of coupons in arrear from the proceeds of Argentine linseed oil exports; and the Ministry of Finance has announced its intention of granting more import licences for agricultural machinery and less for the gaudy trappings of Argentina's industrialisation programme. Unfortunately, these incipient signs of a return to economic sanity have been accompanied by a recrudescence of internal political bad faith, which must necessarily make foreign observers doubt the ability of the present Argentine Government to carry through any long-term agreement to which it sets its hand.

London Fares Scheme

An "interim" passenger charges scheme for the London Transport Area has been submitted to the Transport Tribunal. This is the first of a series of charges schemes which the British Transport Commission will submit in the next few years to the Tribunal, and it is generally agreed that such schemes go to the very core of the Commission's responsibility "to provide an efficient, adequate, economical and properly integrated system of public inland transport." The London area abounds in difficulties and anomalies—the product of the separate growth of the constituent parts of London Transport and of the hitherto rough and ready relation between London Transport railway fares and fares on the suburban services of the main line railways.

The London area scheme now submitted in draft applies to all passengers travelling on the rail and road services of London Transport and to all passengers travelling on the services of the Railway Executive wholly within the London area (to which are added for the purpose of the scheme the whole of the London, Tilbury and Southend line). Thus the area covered extends as far as Royston to the north and to Maidenhead to the west. The scheme has three main objects—to secure equality of fares for equal distance by all services, to assist the convenient use of the whole of London's transport services, and to reform the present anomalous system of workmen's fares which, for purely historical reasons, are available to certain passengers and not to others. These are sensible objects, though they will not be expected to appeal to those travellers who will have to pay more if the scheme is endorsed by the Transport Tribunal.

The basis of the scheme is to apply a new standard rate of 1½d. a mile for all services. This involves increases on London Transport fares (other than 1½d., 4d., and 5d. tickets), a reduction in coach fares, and lower cost of travel to "large numbers" who travel by British Railways inside the London Area. The latter will have day return fares, based on the new 1½d. a mile standard, and their season ticket rates (now 55 per cent above the prewar standard compared with 25 per cent for London Transport season tickets) will be reduced by 9 to 14 per cent, whereas London Transport season ticket rates will be increased by 5 to 12 per cent above the present standard rate. These changes will be popular enough for suburban railway travellers, but Tube railway travellers will not welcome them. Nor are the proposals for early morning travel likely to escape fierce criticism. Existing workmen's fares are a mixture of concessions, and most of them are unduly low. It is proposed to raise them on the railways and to introduce a new early morning single fare on London Transport buses to give the same return fare (with the purchase of an ordinary ticket for the homeward journey) as the early morning ticket scales on the railways.

Anomalies cannot be removed without hurting somebody, and the "somebodies" will prove to be vocal when the case comes before the Transport Tribunal. But in essentials the scheme seems basically sound; it is an attempt to get a common basis of charge for a common unit of service. For London as a whole, which is much more inclined to complain about its transport than to admit that it is pampered, the scheme should in the long run prove advantageous. It is not a big prospective revenue-earner, for in terms of gross receipts it is expected to produce £77¾ million in a full year compared with £74¼ million on the present scale.

Finance

Record Fall in Bank Deposits

As expected, the season of heavy tax-gathering has this year produced a record rate of contraction of bank deposits. The clearing banks' return made up to mid-February shows that in four weeks net bank deposits dropped by no less than £246 million to £5,646 million. This is a very much larger rate of decline than was usual even a few years ago, but it is only £14 million larger than in the corresponding month last year. Although the curve of deposits is still relatively flat, the trend has, in fact, lately been deteriorating slightly by comparison with last year. February's larger fall was not sufficient to outweigh the bigger net rise of the two preceding months; and in the six months since devaluation net deposits have fallen on balance by only £92 million, whereas in the similar period of 1948-49 they dropped by £105 million. The impression given by this comparison is reinforced by the movement of Lloyds Bank index of net deposits, which is adjusted to eliminate seasonal influences. Over the past six months, the index has fallen by 1.3, whereas in the similar period of 1948-49 it fell by 1.9.

These differences are wholly attributable to the trend of advances, the curve of which has steepened rapidly in recent months. A substantial increase is, of course, to be expected during the main tax-gathering season, and February's increase of £39 million, though larger than the £22 million of February, 1949, was appreciably less than that experienced two years ago. Over the past six months, however, the expansion has even surpassed the record rate of growth of the period 1947-48. Whereas, in the six months to August last, the increase in advances was appreciably less than in the corresponding period of the previous year, in the latest six months it has amounted to no less than £134 million, or precisely double the increase for the similar period of 1948-49. As a result, aggregate advances now stand at the record level of £1,564 million, at which they are equivalent to 26.8 per cent of deposits, the highest ratio since early 1942.

This accentuation of demands for advances, although apparently aligning so oddly with the Chancellor's renewed exhortations to the banks to exercise restraint, is not in fact unexpected. It reflects the rebuilding of industry's stocks and work-in-progress, and the growing strain upon its liquid reserves; it reflects, too, the accelerated rise in prices, and especially in import costs, since the devaluation. At the same time, the "stickiness" of the new issue market has greatly slowed down the rate of repayment of bank advances by conversion of floating into permanent finance. In all the circumstances, it is perhaps surprising that the deterioration in the trend of deposits has not been more marked. Over the past twelve months, repayments of Government indebtedness to the banking system have been almost sufficient to balance the new demands for loans and advances. Thus, in the twelve-month period, net bank deposits have risen by slightly less than £20 million. The seasonal repayments of the past month are reflected in a decline of nearly £92 million in the banks' money market assets (i.e. bills and call money secured against bills) and one of £156 million in Treasury deposit receipts. The TDR holding has thus been reduced to only £471 million, bringing its ratio to deposits down to only 8 per cent.

Less Sterling in Europe

In the past two months the London balances of many European countries, which rose alarmingly during 1949, have reassuringly begun to fall. In part this is a sign that visible trade between Britain and the Continent, a costly affair last year, is now running more nearly in balance; in part it is merely an indication that some of the factors that turned some of the outer sterling territories into net importers from Europe last year were of exceptional character. Moreover, sterling area receipts are now benefiting from higher raw material prices since devaluation. A third explanation is that the sterling shortage in a number of the Central and South American countries has made payment in sterling by Continental importers highly acceptable to exchange control authorities there. While the immediate effect of this last movement is merely to shift a British debt from one creditor to another, it is welcome in that it transfers sterling from reluctant holders to countries anxious to obtain sterling.

The most marked fall has been that in Holland's sterling balances. A few months ago Holland held more than £25 million; now it holds practically no sterling at all. In place of sterling Holland has accumulated heavy Deutsche Mark credits; the Dutch have evidently been importing against sterling for resale to Germany with the object of earning all the German currency they can while Germany's import spree lasts. Holland, normally a debtor of Germany, apparently looks upon this as a non-recurring opportunity to earn a nest-egg of D-marks.

In the balances of the Scandinavian countries, changes have been much less marked. Sweden, Britain's main Scandinavian creditor, has drawn its holdings down by some £5,000,000 to just under £40 million, mainly by passing its sterling on to other members of the transferable account group. The French, who surprised everyone by finishing 1949 with fully £40 million in the kitty and all their drawing rights unused, have not added to their holdings since, although they are reported to have made extensive purchases from Argentina for re-export against sterling, D-marks and guilders. Italy's sterling balances, over £80 million at one point last year, have lately been run down by at least £10 million. The Italians want to spend more by increasing their purchases of British machinery. Portugal has had to operate on a tight sterling budget for some time, ruling out the danger of gold losses for the present. Although the Portuguese wartime balances of £60 million are still substantially intact, they can be used only for financing ship building and for the import of heavy capital equipment; the days of sterling plenty for Portugal therefore seem to be past. Finally—and this is of course the most satisfactory symptom of less plentiful sterling in Continental hands—there have been no gold or dollar settlements by Britain to Switzerland, Belgium and Germany for the past four months.

Implementing Uniscan

Bankers in this country have recently received the detailed instructions for implementing the general lines of agreement reached between Britain, Sweden, Norway and Denmark for liberating payments between the four countries. Of greatest public interest was the provision in the agreement freeing the tourist expenditure from the customary limitation. It appears from the notices that banks in Britain may authorise tourist allocations for travel to the Scandinavian countries up to £250 per person during any twelve months ending 28th February. Any application in excess of this figure must be submitted to the Bank of England with full details of the purpose of the journey. The release of blocked funds in the names of residents in the Scandinavian countries is achieved by giving authority to banks to transfer all balances on blocked sterling accounts in the names of residents of Denmark, the Faroe Islands, Greenland and Sweden to Danish and Swedish accounts or Swedish transferable accounts. In the case of Norway the transfers may be made to Norwegian accounts or Norwegian transfer accounts provided the holder of the blocked sterling account can show that he has received authority to make such a transfer from the Norwegian exchange control authorities. The instructions to bankers and stockbrokers regarding the purchase, sale and transfer of securities by residents of countries outside the sterling area have been specially amended in the case of sales by residents of Denmark, Norway and Sweden. The customary "Form L" procedure will still have to be followed. As from March 1st, however, capital invested in Britain by residents of Denmark, Norway and Sweden may be repatriated, the new arrangement providing that sterling securities and other capital assets may be sold and the proceeds remitted home. The rules regarding the switching of sterling securities by residents in these countries have also been relaxed.

Reciprocal arrangements have been made with Sweden and Denmark. In the case of Norway the authorities have limited their permission for the withdrawal of capital by residents of Britain to the extent that comparable transfers are made in the reverse direction. Norway has also made reservations on the amount of currencies it will make available to Norwegian visitors to the other Uniscan countries.

Preliminary Profit Statements

The preliminary profits statement of London Aluminium issued last week has drawn attention again to the existing requirements of the Stock Exchange and their adequacy. Appendix 34 Schedule VII Part I of the Rules and Regulations requires companies to notify the Stock Exchange of dividend decisions immediately following board meetings, to give net profit figures with comparison with previous years and to forward "any other information necessary to enable the shareholders to appraise the position of the company and avoid the establishment of a false market in the shares." It is within the company's discretion to decide on the information necessary to cover this last requirement, but it is known that the Stock Exchange authorities have for some time been seeking a more precise definition of the content of preliminary profits statements as a whole.

The statement of London Aluminium furnishes a good illustration of the difficulties. In themselves, the bare figures of net profit, taxation and appropriations given by this company conformed with the "usual" content of such statements. Where there is no wide movement in profit, the "usual" content is often enough for the market and investors to go on. But in this instance, the slump in net profit in 1949 from £270,443 to £112,376 surely needed some further explanation. Although the profit figures in themselves provided adequate justification for the cut in the final dividend from 70 per cent to 10 per cent, the fact that the interim had been maintained at 30 per cent had seemed to indicate no untoward deterioration in trading in the early part of the year.

The course adopted by Thomas Owen of omitting a preliminary statement altogether was also unsatisfactory. To wait for the accounts involves delay, and the trading experience of Thomas Owen in the year to July 31, 1949, was such that shareholders might have been informed about it at the earliest moment. A net profit of £110,809 and an ordinary dividend of 20 per cent in 1947-8 have given place to a net loss of £40,225 (after the transfer of £25,000 from taxation contingencies reserve) and to a dividend of 5 per cent for the year paid as an interim—no final dividend has been forthcoming. The explanation is stated clearly enough in the report. The new equipment of the group has not been fully employed owing to the very restricted quota of imported wood pulp. If these restrictions are removed this year better results are expected. Could not this have been made known at the same time as the passing of the final dividend?

Building Societies in 1949

The important contribution to national savings in 1949 made by the building societies movement is clearly illustrated by figures published in the March issue of the *Building Societies Gazette*. Results for the whole movement are not yet available, but the *Gazette* has based its calculations on the results of 150 societies representing over 88 per cent of the total assets of the movement; the remaining 12 per cent of assets are spread over some 700 other societies. Using the figures for 150 societies, the *Gazette* arrives at estimates of

building society results for 1949 which can be compared with the actual totals for 1948 as furnished by the Chief Registrar.

These comparative figures are set out in the accompanying table. They show that shareholders and depositors have contributed an additional £96 million to the funds of societies in the past year despite the severe restrictions placed on the inflow of new investments. The average holding in the 150 societies was £379 per head of 2,476,033 shareholders and depositors. The Halifax Building Society, whose results are published this week, alone had 90,322 subscription share accounts at January 31, 1950, averaging as low as £149 per account.

BUILDING SOCIETIES RESULTS
COMBINED ESTIMATED BALANCE SHEET FOR 1949
(Compiled by *Building Society Gazette*)
(£ million)

	1948*	1949†	+ or −
Liabilities			
Balances due to shareholders	768	856	+ 88
Balances due to depositors	192	200	+ 8
Bank loans, other liabilities and provisions	15	18	+ 3
Reserves	62	66	+ 4
TOTAL LIABILITIES	1,037	1,140	+103
Assets			
Balances due on mortgages	836	951	+115
Investments	162	146	− 16
Cash and other assets	39	43	+ 4
TOTAL ASSETS	1,037	1,140	+103
Receipts and Payments			
Interest from borrowers	33	37	+ 4
Advanced on mortgage	264	276	+ 12
	000,000's	000,000's	000,000's
Number of Accounts			
Shareholders	2·11	2·17	+0·06
Depositors	0·70	0·67	−0·03
Mortgages	1·38	1·44	+0·06

* Actual. † Estimate based on results of 150 societies representing 88 per cent of total assets of the movement.

New funds, together with further amounts from repayments and other sources, have enabled the movement to expand its mortgage business by approximately £115 million, bringing the total number of mortgages up to an estimated total of 1,440,000, an increase of 60,000 on the year. It is estimated that some £276 million of new advances were made in 1949 compared with £264 million in the previous year.

The increase in new business has been achieved, for the movement as a whole, at the expense of a sharp fall in liquidity; investments have been reduced by £16 million, though cash is generally higher. The ratio of liquidity has fallen on the average from 19.2 per cent to 16.5 per cent compared with 16 per cent ruling before the war and the peak of 29 per cent reached during the war. Figures for the Halifax show that it has maintained a ratio of 25.9 per cent despite an addition of 29,637 new mortgages.

Commercial History and Review of 1949

This week's issue of the *Records and Statistics* supplement to *The Economist* includes the second part of the Commercial History and Review for 1949—the 87th of the series which began in 1863.

Part II provides a detailed survey of British industrial development last year, with special articles on manpower, coal and steel, textiles, transport, and the motor industry. Another section is devoted to articles on primary raw materials.

Part III of the Commercial History, containing overseas economic reports, will be published on April 1st.

The *Records and Statistics* supplement is obtainable by subscription only, at £2 10s. a year; a combined subscription to *The Economist* and *Records and Statistics* costs £5 a year.

Industry

The Film Finance Corporation

Two events this week have drawn attention to the National Film Finance Corporation. An announcement by the Board of Trade stated that the "class of case" in which the Corporation can make loans direct to producers has been extended. It can now cover advances to co-operative and non-profit distributing companies "even though there may be no private investment ranking behind, or *pari passu* with, money lent by the Corporation." This has been taken to mean that the Association of Cine Technicians, which is preparing plans for a programme of co-operative film production, will get its money. In fact, though the matter is not quite such a foregone conclusion—an application from the ACT for a loan will clearly have to be considered on its merits when it comes—it is true that the new ruling is designed to clear the way in principle for such an application to be made.

The other event, a distinctly heartening one for the Corporation, is the good press reception accorded to *Morning Departure*. This is a film for which the Corporation put up the "front money" as well as the "end money"—that is, the project got no support from the banks and the Corporation put up all the funds for the production except those which the producer, Mr J. Lewis, provided himself. Such a decision cannot, in the film business, entirely avoid the character of a gamble, and the confirmation of the corporation's judgment which a real success will provide may well gain it useful prestige at a critical time.

As the new Parliament assembles, the question of the Corporation's financial future is being much canvassed. The funds provided under the Act, though it appears that they are not yet quite exhausted, cannot last much longer, and a new Bill would be required to extend the Corporation's borrowing rights. The probable timetable is, perhaps, best suggested by the fact that the Corporation's first annual statement of account, made up to the end of March, is likely to be submitted to the President of the Board of Trade in the latter half of April. These accounts will be debated as soon afterwards as Parliamentary time permits. If Parliament is to be asked to grant more money, this (late April or early May) will be the logical time for it.

Controls on Oil

Some of the inconveniences and some of the waste which arise from Government controls in the oil trade were mentioned by Mr C. M. Merrick, managing director of Shell-Mex and B.P. Ltd., in a recent address to the London branch of the Institute of Petroleum. First among the controls is petrol rationing itself. The red petrol scheme has, in Mr Merrick's view "been a success in dealing with the black market." But the obligation which rests on the oil companies to dye commercial spirit red before it leaves the depot has "added very considerably" to their operational problems.

The distributing companies cannot but be very apprehensive of the effect on their staffs of the heavy temptations to which they are now subjected because of the scheme.

A further result of a successful rationing scheme, he added, was that the limitation of dealers' orders to the number of coupons they have on hand inevitably restricted the flexibility of dealers' stocks.

The companies still do not enjoy "anything like their prewar freedom" to sell the quality (not only of motor spirit but of other products as well) which consumers would ask for if it were available. This is still essentially a foreign exchange restriction. It affects the motor industry, which cannot increase the compression ratios of petrol engines until motor spirit of adequate anti-knock value can be supplied to run them.

One control which survived the winding-up of the Petroleum Board concerns contracts for the sale of petroleum products; the wartime regulation which limited the duration of these contracts to one month is still in force, and has been relaxed only to the extent of permitting annual contracts for aircraft and ships' bunkers. It is a restriction "irksome to the buyer and the supplier alike." A manufacturer who is thinking of converting his plant to oil burning wants an assurance of continuity of supplies. And the supplier, for his part, finds the lack of such an assurance "an obstacle in the way of effecting operational economies which might otherwise be practicable."

Mr Merrick had a word to say on the Oil Consumers' Council, the existence of which may come as a surprise to many otherwise well-informed people. The council was set up on the dissolution of the Petroleum Board, and "follows the lines of similar councils designed to do something towards safeguarding the interests of the consumers of commodities, such as coal, which are in the hands of a state monopoly." But oil is not a monopoly, and the consumer has the old-fashioned remedy in his hands of taking his custom elsewhere if he is not satisfied. In view of this Mr Merrick wondered whether the representatives of the consumers of oil "will think it profitable to retain the council in existence."

* * *

What is Productivity?

Some of the pitfalls of broad statement about the trend of productivity were discussed in an article in *The Economist* last week. The results of a specific comparison made by the Cotton Board of production per man in 186 cotton spinning mills in representative weeks of 1938 and 1947 were analysed by Mr D. C. Shaw in the January number of "The Manchester School of Economic and Social Studies." In Mr. Shaw's paper the quantitative ratio of evidence studied to conclusions published is probably unusually high, but it still offers more than one conclusion to choose from; indeed, so long as the question "What is productivity?" remains unanswered, such a choice can hardly be avoided. Production per head (in pounds of yarn a week) declined in the mills covered by the survey by 15 per cent between 1938 and 1947, or by as much as 17 per cent if allowance is made for the greater quantity of coarse yarn spun. But all employees are counted in reaching these figures; they include not only engineers and ancillary workers such as winders and beamers, but also the welfare departments, and these have grown more numerous since before the war. Should the ancillaries be excluded, and only those workers counted who are engaged "up to spindle point," i.e. in the direct production of yarn? This, in Mr Shaw's view, "would give a truer picture of the changes in productivity, and would to some extent relieve the gloom caused by the original figures." If this view is accepted, then the decline is brought down to 13 per cent.

Between 1938 and 1947 there was, however, a reduction in the nominal working week from 48 to 45 hours, and in the average week actually worked a still larger reduction from 46.5 hours to 42.6 hours. Ought the figures to be corrected for this? The answer depends on the definition of productivity which is chosen. Mr Shaw's concern is mainly with "output per operative-hour" as the standard of productivity, and on this basis—making allowance for the shorter week worked—the decline in productivity is brought down to about 5 per cent. Various qualifications can still, however, be made. The calculations given allow for the shift from fine to coarser yarns, but they do not allow for changes in the type of cotton or staple fibre used, for the amount of twist in the yarn, or for other factors of quality in the finished product. Beyond that, the author takes care to point out that high output per head cannot in general be equated with "efficiency" in the sense of low costs of production. "Productivity" can be improved by putting in more capital in the shape of new machines (which means in effect that labour outside the mill is brought to the rescue). But the effect may be to raise costs, not to reduce them.

It is really impossible to say whether the conclusions of this paper (precise and carefully defined as they are) give in sum a truer or a less true broad picture of the state of cotton spinning than did the rougher estimates of the Cotton Working Party report. That report said that output per head at the beginning of 1946 was about 20 per cent less than in 1937, and (Mr Shaw observes) on that basis "gloomy statements were made about the state of the industry." It is by no means clear that the estimate of a 20 per cent decline was not right. What if the number of welfare workers has risen? The yarn output has to pay for them all. What if the worker's leisure has been lengthened? This is good, but the yarn output has to pay for it. It may be better, after all, to discard the qualifications and go back to Mr Shaw's own figure of a decline of 17 per cent in weekly output per man between 1938 and 1947. If this stimulates thought, there will be no harm. But whether it is the right figure to take depends entirely on the purpose for which the figures are wanted.

* * *

Cotton Textile Performance in 1949

If there was nothing in Mr Shaw's paper to justify a bright view of the state of productivity in the mills in 1947, the figures for last year's production published by the Cotton Board do not suggest that any great transformation has been taking place more recently. Spinning output in 1949 (cotton, spun rayon, and waste yarns) was 989.8 million lb. This compares with a total yarn output of 962.1 million lb. in 1948; but the statistical year 1948 had 53 weeks, and if allowance is made for this fact the 1949 output represents an increase of 4.9 per cent (3.8 per cent in cotton and waste yarns, and 21 per cent in spun rayon). This increase is not very different from the increase in the number of operatives on the books (4.6 per cent) or the increase in the average number actually employed (4.4 per cent). Thus the year as a whole, compared with 1948, showed no material change in output per worker. The Cotton Board *Trade Letter* points out two facts which make it possible to be slightly more cheerful: sickness and absence in the first months of the year were exceptionally heavy, and the year's production suffered from that; and there was a "substantial" increase, which "may prove to be permanent," in output per worker in the latter half of 1949.

The weaving section has a slightly, but not spectacularly, better story to tell. Total production of cloth, 2,591 million yards, was 8.3 per cent more than in 1948 if (again) allowance is made for the extra week in the 1948 figures. Rayon and mixture cloths had a large share in this increase. Most of the increase in output is explained by the larger number of operatives at work (129,800, or 7 per cent more than in 1948). Output of cloth per worker was 384 yards a week, compared with 379 in 1948 and 363 in 1947. There was a tendency to improve as the year went on, and output in December was 404 yards a week. The output of cloth per loom was 172 yards a week (170 in 1948, and 164 in 1947). Such figures as these can be influenced by changes in the types of cloth woven; there was a falling-off in output of tyre fabrics. The average number of looms running per worker, 2.23, was the same as in 1948; the figure includes all operatives in the weaving section, not weavers alone. No dynamic improvement in productivity—by any definition—can be discerned in these figures.

Trade in Radioactive Materials

Since the output of radioactive isotopes from the two British atomic piles has been increased, the Ministry of Supply has been sending more to countries which lack sufficient supplies of their own. The number of consignments sent by air rose from 17 in September to 65 in January, and the February figure, when it appears, will be higher. Some of the materials deteriorate rapidly, but it is still worth while to send consignments of certain types by sea. If these are included, the January export total is between 70 and 75 consignments at an average cost, including freight, of about £10 each. The destinations include South Africa, India, Ceylon, New Zealand and Australia as well as western European countries. The cost of air transport over such distances is high. A negligible weight of material may require about 30 lb. of packing because of the lead containers necessary to shield passengers, crew and other cargo from dangerous radiation. Air freight charges to South Africa work out at about £25 for small and £100 for large consignments packed in this way.

The South African National Physical Laboratory has devised a method of transport which renders lead shielding unnecessary and which is reducing these charges to about £2 as it becomes possible to apply the method. The Skymasters operated by South African Airways are being adapted to carry the materials in their wing tips, the total package weighing a few ounces. The distance of 50 feet between the wing tip and the fuselage provides the necessary protection from radiation.

Cost has not been a crucial factor so long as the use of radio-active isotopes has been restricted to research; but this situation is changing as the possibilities grow of using the materials in routine industrial processes. The first British firm to offer a comprehensive consultant service in these matters came into being on March 1st. The shareholders in the firm (Isotope Developments Ltd.) are British Celanese, Distillers, Guest Keen and Nettlefolds, Patons and Baldwins, the Prudential, Tootal Broadhurst Lee, and Vickers. The comparatively small initial capital of £25,000 was raised from this number of sources to ensure an independent policy.

Success in a venture of this kind rests on the abilities of the small team of nuclear physicists (recruited from the Atomic Energy Research Establishment) who form the core of the service, and on their being able in turn to recruit more men of sufficient calibre as the business expands. The scarcity of such men is more likely than any want of trade to be the factor limiting expansion. The first routine industrial applications of radioactive tracer techniques will probably be in the measuring of thin surface coatings, the determination of minute quantities of impurities present in a compound and the elimination of static electricity in some handling processes. Isotope Developments Ltd. will supply the necessary instruments, which are being made to its designs and may later be made in its own workshops, and will train workers to carry out the processes inside the factory. A similar service has been operated in the United States for some years by Tracer Lab. Incorporated.

* * *

Problems of the Shipping Industry

The annual reports of the Chamber of Shipping of the United Kingdom are valuable records of the changing conditions in which the industry operates. The report for 1949 provides ample evidence that the postwar period of transition is now giving way to more normal and internationally competitive conditions, but that Government controls and interference with trade and shipping persist. It is true that direct control over shipping was removed at the end of 1948. But the experience of the past year has shown that the return of a free freight market is still handicapped by the retention of control over imports, with chartering of tonnage vested in Government monopoly organisations. To the intervention of governments in the buying and selling of commodities, coupled with the growth of currency restrictions, the Chamber largely attributes the recrudescence of flag discrimination which has been so marked in recent months.

The most serious of these discriminatory measures is the provision which tends to appear in trade agreements that cargoes should be reserved for national-flag ships. Argentina and some other South American countries, which show a fondness for such provisions have, unfortunately, been greatly encouraged by developments in United States shipping policy. The "50 per cent" rule governing the shipment of Marshall aid cargoes is now being extended to other cargoes, such as arms shipments under the Mutual Defense Act, and to "stockpiling" imports into the United States. The United States seems determined to secure the eventual reservation of 50 per cent of all its imports and exports for American shipping, regardless of the economic consequences. It will be recalled that India dissented and the American representative abstained when the International Chamber of Shipping in November reaffirmed its traditional opposition to flag discrimination in all its forms, and called upon Governments to refrain from restrictive legislation or trade agreements requiring commercial cargoes to be shipped by tonnage of particular flags. That resolution did not apply to ECA cargoes, but the Chamber points out that the application of the 50 per cent rule even to ECA cargoes has hampered other nations in their efforts to bridge the dollar gap through invisible shipping exports "and, in principle, is contrary to the general policy of the United States for liberalisation of trade" so forcibly urged on Europe.

The tramp freight index of the Chamber of Shipping, which stood at 100.5 in February (1948=100), declined steadily to 66.5 in November and recovered only to 72.8 at the end of the year. This marked fall in the freight markets, coupled with the procedure adopted by Government departments to cover their shipping requirements, has been watched with concern by the tramp section of the industry and has revived interest in the prospects of securing a measure of co-operation among tramp owners. The study of a possible tramp co-operative pool scheme is now being examined by a new committee. The great increase in tanker tonnage is also causing some apprehension, and the possibilities are being considered of reviving the International Tramp Tanker Pool which existed before the war.

* * *

Shipbuilding Output

The size of the current tanker shipbuilding programme is shown in the shipbuilding returns for 1949 issued by Lloyd's Register of Shipping. Of the total of 3,131,805 tons gross of merchant ships of 100 tons gross and upwards launched in the world during the year, as many as 1,335,528 tons were tankers. Of these 598,233 tons were launched in the United States (representing 94.5 per cent of the total U.S. output), while the British share amounted to 434,230 tons, out of a total of 1,267,467 tons gross. The increase in launchings compared with 1948 was 91,121 tons in Great Britain and Northern Ireland and 730,941 tons for the rest of the world. The American tanker programme largely accounted for this difference, since 633,306 tons were launched in American yards last year compared with only 126,418 tons in 1948. Output in Sweden rose from 245,896 to 323,099 tons gross, in France from 138,260 to 154,859 tons, in the Netherlands from 142,485 to 169,295 tons and in Norway from 46,974 to 59,213 tons gross, while 147,974 tons are recorded for Japan, which was not included in the 1948 totals. Of the tonnage launched in Great Britain, 522,102 tons (41.2 per cent of the total) were built for owners abroad.

The fact that British shipyards launched over 90,000 tons more in 1949 than in the previous year may give grounds for satisfaction, but this must be of a qualified kind. The increasing preponderance of tanker tonnage is a warning of trouble for the industry unless there is soon a substantial flow of replacement orders for cargo liners and tramps. The need for such replacement is urgent enough. But prices remain the chief obstacle. The annual report of the Chamber of Shipping points out that the part of shipbuilding costs which is represented by supplies of steel is always (and sometimes substantially) below that in competing countries. It deduces, therefore, that the continuing high cost of production of ships arises partly from restrictive labour practices in the shipyards and partly from the high cost of the innumerable components which are assembled in the ship. If the British shipbuilding industry is to continue to attract orders and maintain full employment, employers and workpeople, and their sub-contractors, must make more efforts to reduce costs.

Trade and Commodities

Tariff and Trade Discussions

The fourth session of the contracting parties to the General Agreement on Tariffs and Trade (GATT) opened in Geneva last week and is expected to continue throughout March. No tariff negotiations will be undertaken in this session, but arrangements will be made for the next bout of tariff discussions which is due to open next September. The venue has now been settled at Torquay. The Geneva session is being attended by representatives of 24 countries and there are observers representing the International Monetary Fund and the OEEC. The discussions in Geneva are expected to be mainly concerned with the problem of commercial discrimination. Many instances have arisen in which the contracting parties of GATT have applied discriminatory practices under Article 14 of the Agreement, that is, for balance of payments reasons. It may thus be assumed that the whole philosophy of commercial discrimination and of the conditions under which it can be tolerated and sanctioned is likely to receive another thorough airing at this session. One of the instances of such discrimination is that provided by the OEEC trade liberalisation proposals which, being exclusive to OEEC countries, discriminate against the other contracting parties. The tariff concessions which were negotiated in the course of last year's Annecy meeting have for the most part come into operation at the beginning of this year, but it is in only a very few cases, including that of the United States, that they apply without being largely neutralised by quotas and other quantitative restrictions on imports.

* * *

Dollar Fifty Wheat?

The grain market is beginning to weaken, though there is still no evidence of a general lowering of prices. The Canadian "free" market price has been falling gradually for some months past and is almost 10 per cent below the official American quotation, though more recently a slight recovery has taken place. On the other hand, American wheat has lately been sold below $1.80 a bushel, the maximum price under the international wheat agreement. Reports are even current that American wheat has been selling at $1.50 a bushel, which is the minimum price for the present season under the international agreement. But such deals were in all probability very small and comprised sub-standard grades. Nevertheless, the tendency towards easier grain prices exists, and it has even been confirmed by recent sales of Australian flour. Australia is still refusing to sell wheat at other than the maximum price under the international agreement; yet it has sold flour at prices which in terms of wheat would be quite significantly below the maximum.

The demand for non-dollar wheat, however, is so firm that, even given the international agreement and the provision of Marshall Aid, a dual pricing system in wheat might become inevitable. It might be that American and Canadian wheat would sell at the minimum price prescribed by the agreement and Australian and French wheat at the maximum. Such a tendency is already apparent, and it would be further strengthened if Japan and Germany were brought within the wheat scheme. The prospects of the consuming countries in the scheme having sufficient dollars to buy American grain freely are remote. The scheme might work more smoothly if dollar consumers or sterling suppliers were included. But where are they? For some months Britain has been trying, in vain, to get Argentina and Russia to join in.

Shorter Notes

Opposition to the proposed Anglo-German trade and payments agreement from American quarters in Germany has led to unexpected difficulties at a late stage in the negotiations for the new pact. The British and German authorities had evidently agreed that in future any payments deficit in either direction should be covered wholly in either sterling or Deutsche mark. This clause in American eyes would have all the makings for establishing a tighter link between mark and sterling than apparently they would like to see.

*

The Dominion wool conference adjourned on Wednesday for a period of two weeks. The conference was attended by delegates from the United Kingdom, Australia, New Zealand and South Africa, and reviewed the operations of the Joint Organisation in disposing of the 10,000,000 bales of wool accumulated during the war years. It also studied the problems connected with the future of wool marketing and prepared a report containing proposals for a marketing scheme, which is now being submitted to respective governments. The conference will be resumed when opinions of governments have been obtained.

*

Organon Laboratories Limited, which was described on page 442 of *The Economist* last week as a Dutch-owned firm, is in fact owned as to the whole of its shares by a British public company, Zwanenberg-Organon Limited, registered in London. The latest issue of the official *Stock Exchange Year Book* shows the authorised and issued capital of Zwanenberg-Organon Limited to be £900,000 in 400,000 preference and 400,000 ordinary shares of £1, and 400,000 deferred shares of 5s., all fully paid.

*

British European Airways expects to start in June operating a helicopter passenger service between Cardiff and Liverpool. This will replace the air service between the Mersey and South Wales which was suspended last autumn after proving to be exceptionally uneconomic. The service is believed to be the first of its kind in the world and follows many months of experiment with mail delivery by helicopter. Only three passengers will be carried, but larger helicopters due to be delivered in four years' time will take 14 to 16 passengers.

*

The British Electricity Authority has placed an order for about 4,000 low-pressure water valves with three Italian manufacturers. The valves will be interchangeable with those made in Britain. Demand for the valves, which are also being required in increasing quantities for water services, is outrunning the capacity of British firms to supply them, and unless an alternative source could be found an additional cause of delay would have arisen in commissioning of new generating plant.

COMPANY MEETINGS

INDIAN JUTE MILLS ASSOCIATION

OUTLOOK FOR INDIAN JUTE INDUSTRY

INDO-PAKISTAN DEADLOCK INTENSIFIES PROBLEMS

I.J.M.A. CHAIRMAN'S WARNING

In the course of his address to the annual general meeting of the Indian Jute Mills Association at the Royal Exchange, Calcutta, on February 17th, the chairman (Mr J. R. Walker, F.T.I., M.L.A.) said:—

It will be convenient to take last September's devaluation, of all except one of the currencies in the sterling group, as the point at which many of the industry's long standing difficulties were greatly intensified. As a consequence, policy had to be drastically redirected towards the attainment of what I may broadly describe as "self-sufficiency."

NEW PROBLEMS FOR THE INDUSTRY

It is not denied—certainly not by me—that devaluation and non-devaluation created some new and extremely difficult problems for the industry. These events but served to accentuate unfavourable trends started almost immediately after the war: I refer to the trend away from jute to substitutes, to the search for an alternative to India as a source of supply of jute manufactures, to the setting up of new mills in countries which had not formerly thought of manufacturing jute goods which they had previously been content to buy from Calcutta. All these things were possible only because of our inability to secure adequate supplies of raw jute at prices which bear some relation to what the consumer is prepared (not forced) to pay. It is now clear that the survival of the jute industry, as we have known it in the past, depends upon a return to cheaper jute, cheaper goods and the disappearance of everything that stands in the way of their attainment, including undesirable speculation, now I hope with Government legislation banned for ever. With the utmost respect I warn our friends in Pakistan, with whose decision to have a manufacturing industry of their own I do not quarrel, that by the time their mills are ready to begin operations, the world position of jute and jute goods will have been very gravely jeopardised unless a way out of the present impasse is found. Meanwhile, we have had to carry on a "make-do" basis; and it is to this end that our recent actions have been directed.

GUNNY POSITION

After discussing the raw jute position Mr Walker said:—

It is a natural step next to turn to our gunny position. I will say little concerning the internal market supply situation except that the needs of Government whether at the Centre in the Provinces or in the States have been adequately met.

I am glad to be able to tell you that consequent upon representations to the Central Government I have received an assurance that no further requisitioning for their needs can be expected in the next three months as a certainty and perhaps extending beyond that for another three months.

HIGH EXPORT FIGURES

In the year 1948-49—that is to say the jute year July to June—we exported nine lakhs fifteen thousand tons of jute goods to overseas markets; and, I would ask you particularly to note, in the whole of our history as an industry that figure has been exceeded only on three occasions. It reveals higher exports than any of our 10 year averages of trade: it is 13 per cent. higher than exports in the period immediately preceding World War II; and even if the period 1931-32 to 1940-41 is taken—which incorporates the "boosts" given by huge exports at the outbreak of war and the preceding years when mills were engaged in a most active price war of their own—yet our exports in 1948-49 are still higher by 7 per cent.

Monthly exports in 1948-49 averaged just under 76,000 tons. This year—from July, 1949, to January, 1950—they averaged just under 68,000 tons or a fall of 10 per cent. The comparison is between a year of almost record export shipments and a year—this one—in which the industry has had to face unparalleled vicissitudes.

EXPORTS TO AMERICA

In 1948, we exported to America some 228,000 tons representative of 47 per cent. of mills hessian production. That was almost an all time high and above average taken over 10 year periods.

In 1949, there has been a fall to 183,000 tons; but that has not been our fault. When goods were available, America's demands in the pre-devaluation period (the first nine months up to September) were averaging 15,000 tons monthly. In the post-devaluation period, that is to say for the months October to December, they averaged about 17,000 tons. I have no quarrel with America's buying policy: they can have similarly no quarrel with us if their guess work was wrong and therefore landed them in difficulties. The figures quoted are substantial justification of our contentions that no matter how they or we look at their buying policy we have cared for the American consumer in ways perhaps not quite fully appreciated having regard to our many difficulties. That is further borne out by the fact that in the months October to December, 1949, over three quarters of our hessian production found its way to that country.

REQUISITIONING

It has been necessary from time to time for Government to requisition categories of jute goods in satisfaction of certain Government agreements for the import of food grains from the Argentine. The charge has been made against us that we have requisitioned goods which were destined for the United States; and that this amounts to discrimination against old and valued customers of the industry. That is not so. Our American friends were affected to the tune of only 1,000 bales of 40" 10 oz. Hessian. Whilst there was no obligation to replace, that in point of fact has been already done. The American trade wrongly assumed that requisitioning extended to a far greater amount confusing that with delay in performance by the mills of their contracts because the manufacture of Government's orders took first priority. America did suffer from some (in most cases small) delay in performance of contracts, but I submit that this was not due to requisitioning, still less is it discrimination.

That I have particularised in the American situation is perhaps natural, for India obtains 60 per cent. of her total dollar earnings from our activities. Other markets have felt scarcities as also has America; and a reference to the export figures supplied will demonstrate that their interests have been adequately safeguarded.

LILY MILLS, LIMITED

SUCCESSFUL RESULTS — INCREASED PROFIT

The Ordinary General Meeting of Lily Mills Limited was held at the Registered Office, The Mill, Shaw, on March 2nd, Mr S. S. Hammersley, the Chairman, presiding.

The following is the report by the chairman, circulated with the report and accounts:—

The trading profit of the Lily Mills Group for the year ending December 31, 1949, is £222,499 5s. 8d.

The net profit is £86,267 15s. 8d. which compares with a net profit of £73,497 13s. 6d. for the year ended December 31, 1948 (which included twelve months' working of Lily Mills Limited, and eleven months working at Devon Mill Limited).

The advantages anticipated from grouping and modernisation are being realised. A proportion of the new ring frames ordered for the Devon Mill Limited, are now at work spinning Fibro. The remainder of the frames on order for this mill are in course of erection.

New machinery has been installed in the preparatory department of No. 1 Lily Mill and improvements have been made in the layout of the cardroom.

During the current year it is hoped that the modernisation of the whole of No. 1 Lily Mill will be completed. We shall then have a mill completely equipped with ring spindles of the most modern type wholly engaged in the spinning of Fibro and other synthetic fibres.

Toward the end of the financial year the sum of £31,790 1s. 9d. was received from the Board of Trade representing payment of a 25 per cent. subsidy on £127,160 7s. Additional capital expenditure of a substantial amount is expected to rank for subsidy.

PROBLEM OF REDEPLOYMENT OF LABOUR

Since the war technical and technological developments in the textile trades have been considerable. With present day high costs, expenditure on new machinery to try out these new developments may, or may not, be justified. What, however, is abundantly clear is that the full advantages of modern machinery cannot be reaped without redeployment of labour. That is to say, without the readjustment of wage rates to suit the altered work load made possible by new machinery.

The best way to achieve this redeployment, while maintaining harmonious relations with the Trade Unions, is a matter of considerable concern to your directors. We take the view that more harm than good may arise from attempting redeployment with equipment consisting of a mixture of old and new machinery. Now that No. 1 Lily Mill will soon be completely modernised it is in the interest of the trade as a whole—not least of the operatives—that an early attempt should be made to reach agreement with the Trade Unions on the best way to achieve maximum production from our modern plant. We should like the Trade Unions to agree with us on the nomination of independent experts to assess scientifically the work load.

We have the feeling that if this problem is approached in a realistic atmosphere, with a sincere appreciation by both sides of each others difficulties, a solution will emerge which will provide a high level of weekly earnings and at the same time materially help in the maintenance of Lancashire's textile production pre-eminence.

The company's order book is a healthy one. We are fully booked for a considerable period ahead. Attention is constantly paid to the improvement of working conditions, and the social amenities provided at both companies are a well recognised feature of employment at mills within the group.

In spite of the disturbances caused by the replacement of old machinery by new, production has been well maintained, and the directors would like to take this opportunity to thank the management, staff and employees for their loyal co-operation throughout the year.

The report and accounts were adopted.

WEST RIDING WORSTED AND WOOLLEN MILLS, LIMITED

EXPANSION OF TURNOVER

EXPORT SALES REACH £4,500,000

MR. J. H. KEELING ON WOOL PRICES

The twenty-first annual general meeting of the West Riding Worsted and Woollen Mills, Limited, was held on February 28th at the Midland Hotel, Bradford, Mr J. H. Keeling, the chairman, presiding.

The secretary (Mr E. Matthews) read the notice convening the meeting and the auditors' report.

The following is an extract from the chairman's statement, which had been circulated with the report and accounts for the year to August 31, 1949, and was taken as read:—

Ladies and Gentlemen,—From the accounts you will have seen that your company has enjoyed another most successful year, and our thanks are again due in no small measure to the directors, managers, executives and employees of our operating subsidiaries, through whose efforts these fine results have been achieved.

The turnover of the group showed a satisfactory increase over the previous year. Known export sales amounted to approximately four and a half million pounds, of which some three million pounds were sales to dollar countries. These figures do not include indirect exports where the destination cannot be accurately determined.

RECORD TRADING PROFIT

The profit of the group before taxation for the year under review, at £1,380,063, shows an increase of more than £50,000 over the record figure for the previous year. This is particularly satisfactory as the percentage of gross profit earned by our operating subsidiaries was less than for the preceding year. Of the profits of the group no less than £712,184—namely, 51.6 per cent.—was reserved for taxation, £573,591, equivalent to 41.6 per cent., was retained in the business, and the shareholders have received £94,288, or only 6.8 per cent. of the profits, by way of dividends.

As since the close of the year under review the issued ordinary capital of your company has been increased by the capitalisation of reserves, a matter to which I refer in some detail later, it was decided on this occasion to pay a second interim dividend on the capital then outstanding in place of the usual final dividend, which is normally declared at the time of the publication of the accounts. By this procedure we avoided having two classes of ordinary shares quoted on the Stock Exchange for a period of some months. The two interim dividends brought up the dividend for the year to 30 per cent. on the issued ordinary capital. It is interesting to note that this is equivalent to 5.27 per cent. on the capital represented by the ordinary shares and total reserves.

CONSOLIDATED BALANCE-SHEET

There are only a few items in the consolidated balance-sheet to which I think I need refer. Stock on hand and work in progress, at £2,423,078, show an increase of only £81,738 over the corresponding figure for the previous year. The excess of current assets over current liabilities (including provisions for deferred repairs and staff pensions), at £2,399,251, represents an increase of £502,644 over the corresponding figure for the previous year.

Capital reserves and revenue reserves, excluding £559,246 set aside for future taxation, amounted to £1,714,998, an increase of £521,206 over the previous year after appropriating £46,200 by the issue of 46,200 ordinary shares of £1 each to ordinary shareholders during the year under review. These reserves have been built up since August 31, 1943. Of the reserves which we have ploughed back into our business, the greater part has been retained by the operating subsidiaries to finance their capital and current requirements, the latter by no means unimportant in view of the substantial increase in the price of wool. The balance has been transferred to the parent company and has provided the means for us to acquire other businesses.

RECENTLY ACQUIRED OPERATING SUBSIDIARIES

In connection with these acquisitions, you will be interested to know that the physical output of O. B. Lister and Bro's. Succors, Limited, has been more than trebled since we acquired this business, while we have every reason to believe that by the end of 1950 the output of Priestleys, Limited, largely for dollar markets, will be substantially increased.

In September last, subsequent to the close of the financial year, we acquired the whole of the share capital of Wade and Glyde, Limited, old-established and well-known manufacturers of worsted cloth. This company does a very substantial trade with Canada and a large proportion of the turnover is for export.

EFFICIENCY OF PLANT

We continue to reap the benefit of our policy of keeping our plant and machinery in a high state of efficiency, and of replacing existing plant where necessary by the most modern equipment.

During the year under review we spent on capital account approximately £140,000, while there were commitments for future expenditure on fixed assets of some £200,000. It is satisfactory that the profits retained by our operating subsidiaries, in addition to financing increased trade, permit of these considerable sums of money being expended without it being necessary to raise additional permanent capital.

PRICE OF WOOL

The price of wool since devaluation has, in terms of sterling, risen sharply. This is not the case to any similar degree in terms of the dollar and most regretfully it is difficult not to come to the conclusion that the dollar now exerts greater influence upon world prices than does the pound. The present state of the wool market makes it unwise to prognosticate as to the immediate future. Anything written today may well be out of date when it is read. It seems clear, however, that world consumption continues to be high and the supply of wool insufficient to meet the demand. Yet it is, I think, reasonable to anticipate sales resistance on the part of the ultimate consumer of the finished product based on the current value of wool, and that such resistance would increase in the event of another considerable rise in the price of the raw material. Large stocks of wool do not appear to be generally held, so it is possible that any fall in price may be a good deal more gradual and orderly than that which occurred, as is so well remembered, after the first world war.

Nevertheless the position must be regarded as potentially dangerous. Hence our decision to allocate £125,000 further to increase the "Reserves against effect of possible future fall in value of stocks" to the substantial figure of £300,000, all of which has been provided out of taxed profits, equivalent to some £600,000 gross.

RECENT CAPITALISATION OF RESERVES

Since August 31 there has been put into effect a further capitalisation of reserves as a result of which the issued ordinary share capital of the company has been increased by 50 per cent. by the issue of one new ordinary share for every two ordinary shares previously held. The preliminary steps to enable this to be carried out—namely, the capitalisation of part of the reserves by the operating subsidiaries, were taken during the year now under review and are reflected in the consolidated balance-sheet. The purpose of this issue was to bring the issued share capital somewhat more into line with the value of our business, although it still quite inadequately represents this, as the actual value of the land, buildings, plant and machinery vastly exceeds the book figures.

FUTURE PROSPECTS

As regards the future, I do not think that I can do better than quote the words I used last year as these are just as appropriate today as they were 12 months ago. I then said, "Since the date of the balance-sheet, results have continued to be satisfactory, and, subject to one important factor—namely, no unduly sharp fall in the price of wool—I am hopeful of being able next year to place before you results with which you will be satisfied." I should, however, add this cautionary note: that there appear to me to be more signs of difficulties ahead than were apparent 12 months ago.

I have already referred to the splendid work of the directors, managers, executives and all the employees of our operating subsidiaries and I am sure that you will wish me to extend to them our most sincere appreciation. I would also like to thank personally all my colleagues on this board. It has been an eventful year and the figures show how the position of your company and of its operating subsidiaries has been still further strengthened. My colleagues and I will endeavour—whatever the future may hold—to build up your great undertaking, in which we are all so vitally interested, from strength to strength.

The report and accounts were adopted and the retiring directors, Mr J. H. Lockwood and Mr A. B. Thoseby, F.C.A., were re-elected.

SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

SIR IAN BOLTON'S SPEECH

The 136th stated annual meeting of the Society was held in the Society's Head Office, Edinburgh, on February 28th, Sir Ian Bolton, Bt., O.B.E., C.A. (chairman of the ordinary court of directors), presiding.

In moving the adoption of the report and accounts, which were taken as read, the chairman said:

The report contains details of our operations during the year 1949—a year of growing financial and economic difficulties for the country. These led to the devaluation of the £1 sterling in September, and in the latter part of the year we had all the uncertainties which are inseparable from an impending general election. You would not expect these conditions to form a favourable background, and yet we are once again able to report that the Society transacted an increased amount of new life assurance business and reached the record total of £11,640,000 after deduction of amounts reassured with other offices. This is £1¼ million higher than in the preceding year, which was our bonus year—a year in which it is usual for the new business to be at an exceptionally high level. The ordinary life assurance business included in the total I have mentioned exceeded £9,600,000 for the first time and was over £650,000 more than in the previous year.

GROUP PENSION SCHEMES

The remainder of the assurance business, amounting to over £2,500,000, consists of assurances associated with group pension schemes and is also a record total. Our pension business has expanded satisfactorily and we have issued deferred annuities under schemes during the year amounting to more than £600,000 per annum.

My predecessors in this chair have drawn attention to the advantages to employers and their staffs of establishing pension schemes with a life assurance office. Not the least of these advantages is that under the usual plan a fixed and definite amount of pension is secured for each year of service with the employer and that pension is guaranteed by the assurance office—a guarantee which is supported not only by the funds accumulating in respect of all the pension schemes arranged by the office, but by the whole of its life assurance and annuity funds. There is no need for me to emphasise the value of having the Society's guarantee behind a pension scheme and I will only add that our experienced and efficient organisation is always ready to advise and assist those who are considering the introduction of a pension plan.

GROWTH OF PREMIUM INCOME

Our expanding business has led to a further increase of about £500,000 in the premium income, bringing the total over £4,000,000 for the first time in our history, and, with the growing funds, the interest income, both gross and net, was higher than in the preceding year. Although the yield available on new investments is now higher than we have seen in recent years, it would be too much to expect that the high interest rate of nearly 5 per cent., which we have been able to report in the past few years, would be fully maintained now that our funds are increasing more rapidly than previously. The directors therefore regard it as most satisfactory that the gross rate of interest for 1949, before deduction of income tax, was as high as £4 17s. 10d. per cent.—only 1s. 4d. per cent. less than in the preceding year and practically the same as in the year 1946, when the funds were about £7,500,000 less than the present level. The net rate, after deduction of income tax, was only 10d. less at £3 14s. 9d. per cent., which is a high rate in these days.

In relation to our increased premium revenue, the expenses represent a reduced proportion of 12.2 per cent., as compared with over 13 per cent. in 1948—a satisfactory fall.

VALUATION OF SECURITIES

We have, as I told you, been able to maintain our income at a high level, and on the capital side you will see from the balance sheet how the assets were invested. As usual, the Stock Exchange securities stood at less than the market selling prices at December 31st—that is, at less than the lower of the two prices quoted in the Stock Exchange list. There was general depreciation over the year in the prices of Stock Exchange securities, which has naturally reduced the margin mentioned by my predecessor between the market values of our securities and the values at which they stand in the balance sheet, but the remaining margin is still substantial.

The year 1948, as you know, was our valuation year—bonus year as it is commonly called—and we have now had under review the first year of a new quinquennium. The bonus declared a year ago for the preceding five years was 34s. per cent. per annum compound and the intermediate bonus then fixed for current claims and surrenders was 32s. per cent. compound. That rate remains unchanged and, while there are doubtless many difficulties ahead and much will happen before our next valuation four years hence, we are confident that in future, as in the past, a with-profits policy with the Society will prove to be a most satisfactory contract, giving results in keeping with the Society's reputation for a sustained high level of excellence.

The directors' report, and the accounts as audited, were adopted unanimously.

SUN LIFE ASSURANCE SOCIETY

RECORD PREMIUM INCOME

MR W. M. PRYOR'S STATEMENT

The annual general meeting of the Sun Life Assurance Society will be held at 63 Threadneedle Street, London, E.C.2, on Tuesday, March 28, 1950.

Mr W. M. Pryor, D.S.O., D.L., chairman of the Society, has issued a statement to shareholders, which in outline is as follows:—

FUNDS, INCOME AND OUTGO

During the year 1949 our total funds increased by £3,687,000 and amounted to £73,806,000 as at the end of the year. The life assurance fund increased by nearly £3,584,000 from £62,464,000 to £66,048,000, and the life premium income was £8,593,000, of which only £63,000 represented single premiums. It is gratifying to record that the premium income constitutes a record in the Society's history.

On the other side of the revenue account the claims by death of £1,801,000 compare with £1,691,000 in the previous year, and claims by maturity, amounting to £3,129,000, show an increase of £282,000; these increases, of course, reflect the larger volume of business on the books. The usual investigation has been made into the mortality experience for the year and, I am glad to say, reveals that the number of claims is considerably below the number expected.

NEW BUSINESS

The life assurance new business secured during the year consisted of 29,297 policies for sums assured of £31,087,755, all of which was obtained from our connections within the United Kingdom. This is an impressive total and is a testimony to the zeal and efficiency of our staff.

In view of the marked fall in other forms of savings during the past year, the large volume of new life assurance business transacted exemplifies the important contribution made by life assurance companies as a whole towards the national savings campaign to counteract the inflationary trend.

We look forward with confidence to the future because we believe that there is ample scope for expansion of life assurance in this country, and the service which we are able to offer to our policyholders and the public should result in our securing a satisfactory share of the future new business. We cater for all classes of the community and endeavour to issue policies adapted to the individual's circumstances. Our special scheme for relieving the policyholder of payment of premiums during prolonged illness or permanent incapacity continues to be popular. It is almost fifty years since the system of life assurance without medical examination was inaugurated in this country by the Society, and the facilities which we are able to offer as a result of our unique experience are still unsurpassed and are much appreciated by our connections.

Employers are more and more appreciating the advantage of making systematic provision for pensions for their staff, especially as, subject to approval of the scheme by the Inland Revenue, their contributions are allowed to rank as a trade expense for the purpose of assessment to income tax and profits tax. The Society was early in the field in the application of life assurance to the development of superannuation schemes for firms of every type and size, and a section of our staff is devoted exclusively to this business.

INVESTMENTS

The market value of our Stock Exchange investments was substantially in excess of their balance sheet value at the beginning of 1949, and I am pleased to report that the margin has more than sufficed to cover the depreciation which occurred during the year. Our holdings of British Government obligations amount to over £35 million, and I may add that 96 per cent. of our total assets is invested in Great Britain, while a further 3 per cent. is represented by Dominion securities. The lower market prices have enabled us to secure investments giving a higher yield than has been possible for many years.

Whilst your directors intend to adhere to their long-established policy of confining investments in the main to fixed interest securities possessing a final date of redemption, they have nevertheless taken opportunities to acquire a few high-grade ordinary and preference securities on favourable terms and this has led to a modest increase in the amounts shown under these classes of asset in the balance sheet.

You will also note that the item representing mortgages on property has increased by over £1,000,000, which reflects the popularity of the Society's attractive house purchase scheme. This class of business not only provides an outlet for a portion of our funds on satisfactory terms, but it also assists in some measure in the solution of the financial aspects of the national housing problem. The scheme is intended to assist persons desirous of purchasing houses for their own occupation, liberal amounts being advanced and provision made for repayment by means of endowment assurance. The borrower thus has the satisfaction of knowing that if he should die, no matter how soon after the granting of the loan, the proceeds of the policy would be available to repay the loan and free the house from mortgage.

TRIBUTE TO THE STAFF

In conclusion, I wish to pay tribute to Mr Murrell, our general manager, to his executive colleagues, and to every member of the staff for their patient and unremitting efforts to maintain the efficient functioning of our organisation during a year which has not, by any means, been free from difficulties.

LIEBIG'S EXTRACT OF MEAT COMPANY, LIMITED

TURNOVER MAINTAINED

The 85th annual general meeting of Liebig's Extract of Meat Company, Limited, was held on March 2nd in London, Mr Kenneth M. Carlisle, chairman of the company, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to August 31, 1949:—

I referred last year to the possibility that further capital of a permanent nature might shortly be required by the group, and, at an extraordinary general meeting held on June 23, 1949, the issue of a further £1,000,000 in the form of 4½ per cent. cumulative redeemable second preference shares of £1 each was authorised. Your directors decided to offer the new shares to existing stockholders. The issue, which took place under very trying market conditions, was oversubscribed and your directors regard this outcome as highly gratifying.

Profits less losses on trading, etc., are down by £69,000. In explaining this difference there have to be taken into account many ups and downs which are inherent in a business of such wide scope and covering so many countries. What in certain cases has been gained on the swings has in others been lost on the roundabouts, but the main inference of the decline by and large is provided by the writing down of the values of certain stocks to market levels. Volume of turnover and margin of profit were maintained on a satisfactory basis in virtually all countries.

After United Kingdom taxation, the group profit attributable to the parent company amounts to £386,000, as compared with £524,000 last year, a reduction of £138,000. Bearing in mind the reasons for variations as compared with last year, a year which benefited substantially from certain exceptional profits, and having regard to present-day trading difficulties, you will, I think, agree that we can consider ourselves fortunate in the results now shown.

The interim ordinary dividend of 2s. per £5 unit, tax free, was paid on July 6th. It is proposed to strengthen our reserve for contingencies by the addition of £150,000 and to maintain the final ordinary dividend at the rate of 7s. per £5 unit of stock, tax free.

DEMAND FOR OXO PRODUCTS

The trading of Oxo Limited in the United Kingdom and abroad has been maintained on a high level and the factories have worked at full capacity in producing Oxo cubes for home and export markets. While some increase over the previous year was achieved, we anticipate a further improvement during the current financial year as new plant comes into use, especially in the later months. Demand remains unabated, and it seems that the public have learned to regard this good and economical product as a boon, not only in providing an invigorating beverage, but also for its value in adding beefy flavour to their otherwise rather insipid fare.

The goodwill of our Fray Bentos brand is enhanced year by year by the growing popularity of our canned soups and other preserved products. Unfortunately, supplies of cans are limited by the need to export maximum supplies of tinplate. While achieving some increase in output, we have to await the days when tinplate will be in freer supply in order to reap the benefit of giving to the public the best quality soup that can be put into a can.

The report was adopted.

LAW DEBENTURE CORPORATION, LIMITED

SIXTY YEARS' GROWTH

The sixtieth ordinary general meeting of The Law Debenture Corporation, Limited, was held on February 24th in London.

Mr Robert R. J. Turner, O.B.E., the chairman, in the course of his speech, said:—

On this, the occasion of the diamond jubilee meeting of the corporation, it has occurred to me that members might be interested in a brief résumé of its history. Business commenced on December 12, 1889, with a board of 17 directors, and the unusual complement of 145 subscribers to the memorandum of association, most of whom were either bankers or leading members of the legal profession of the day. The first board of directors, no doubt, laid the foundations for the business proposed in the original prospectus, namely, the purchase and subsequent issue of debentures of industrial undertakings. The trustee business was later developed and now forms a large part of the corporation's activities, with the corresponding responsibilities.

In respect of the period ending December, 1890, a dividend of 5¼ per cent. on the ordinary shares was paid. For the next year no dividend was paid and the balance of profit was carried forward, while in the years 1892 and 1893 a dividend of 5 per cent. was paid on the ordinary shares, in addition to the dividend on 10 000 4½ per cent. preference shares of £10 each which had been issued in 1893 at a premium of 6s. per share.

For the years 1894 and 1895 dividends of 6 per cent. were paid on the ordinary shares, and in the latter year the Founders shares received their first dividend of £23 0s. 9d. per share. Those shares continued to receive dividends of varying amounts up to the end of the year 1900, when the figure dropped to 11s. 4d. per share.

No further dividend was paid on the Founders shares for 21 years until January, 1922, when they received £9 15s. 1d. on each share. Meanwhile, dividends on the ordinary shares during that period varied from 7 per cent. to 4 per cent.

In 1946 the Founders shareholders exchanged their rights for a very substantial allotment of ordinary stock.

The net profit at £47,202 appears to compare rather unfavourably with the corresponding figure of £64,366 for 1948. The difference is very largely due to the compulsory sales of our South American railway holdings in 1948, and we would gladly have dispensed with the realised profit on these which we had to bring into profit and loss account and on which we had to pay almost 60 per cent. to the Government in taxation.

Interest and dividends received show an increase of a little over £2,000, a healthy sign, but the fees as trustees and registrars continue the downward trend, and are less by £1,550. Out of the available balance of profit, £47,202, we have transferred £5,000 to general reserve, bringing that figure up to £295,000.

The valuation of the investments at £1,481,691 shows an appreciation of £194,725 or 15 per cent., which represents the difference between the market value and the book value of £1,286,966. That percentage of appreciation compared with 31 per cent. in 1948 may be considered to be not unsatisfactory in view of the many disturbing factors that have persisted throughout the year, and is a bleak reminder of the general decline in the quoted prices of most securities.

The 14 per cent. dividend which we propose to pay on the ordinary stock for the year 1949 has not varied during the past 16 years, notwithstanding the very high rate of income tax and increased profit tax for which the corporation is liable.

The report was adopted.

NOTICES

THE KING'S GOVERNMENT.—Lobby manœuvres and party politics: Wages, prices, trade union struggle and fiscal trends impartially reported from the inside. The weekly National Affairs edition of The Fleet Street Letter Service available by private subscription, post free, 5 guineas per half year; sample, 5s.—10, Ovington Square, London, S.W.3.

MANY a happy anniversary is enjoyed in the friendly atmosphere at S.F. Grill & Café, now celebrating its 25th Anniversary Year.—6, Denman Street, Piccadilly Circus.

SALES OFFICE MANAGER is required by Motor Accessory Manufacturer, Slough. Indispensable qualifications are a detailed knowledge of the motor manufacturing industry, good correspondent and ability to secure co-operation of travellers and staff. The position would offer full scope for an ambitious man who is prepared to work hard. Applicants should give details of education and career, including salary earned in each position and of interests outside business.—Box 352.

PERSONNEL Officer (male) wanted as assistant and understudy in department attached to factory. Must have some experience in personnel work, with special emphasis on recruitment for light engineering trades. Younger man preferred, prepared to work in junior position for about two years and earn promotion. Good prospects (factory is one of a large group). Moderate commencing salary; staff pension scheme. Applications giving full details of qualifications and career and present salary to: Urwick, Orr and Partners, Ltd., 7, Park Lane, London, W.1. Applications will be treated as strictly confidential.—Quote Reference: B/1032.

MEMORY. Mnemonicons for stage feats, platform, study, daily routine. Complete in "The Royal Road," 5/6. Mnemo, Room 22 (EC) 3, Bloomsbury Street, London, W.C.1.

THE NATIONAL BANK OF INDIA LIMITED

Notice is hereby given that the Transfer Books of the Bank will be closed from March 15th to 28th, both days inclusive.

By Order of the Board,
(Signed) W. KERR, London Manager.
26, Bishopsgate, London, E.C.2. Feb. 28, 1950.

THE NATIONAL BANK OF INDIA LIMITED

Notice is hereby given that the Annual General Meeting of the Shareholders will be held in the Bank's Premises at 24, Bishopsgate, London, E.C.2, on Tuesday, March 28th, at twelve o'clock noon precisely, to receive the Accounts to December 31st last with the relative reports by the Directors and the Auditors; to declare a Dividend; to elect Directors; to fix the remuneration of the Auditors; and to transact all such other business as can be transacted at an Annual General Meeting of the Company.

In connection with the election of Directors special notice has been received by the Company pursuant to the provisions of Sections 142 and 185(5) of the Companies Act, 1948, of the intention to move at the above Meeting a Resolution for the re-election as a Director of the Company Mr. J. R. H. Pinckney, C.B.E., who attained the age of 70 years on May 11, 1946. Mr. Pinckney retires by rotation and offers himself for re-election.

By Order of the Board,
W. KERR, London Manager.
The National Bank of India, Limited,
26, Bishopsgate, London, E.C.2.

FEDERAL UNION WEEK-END CONFERENCE, Arnold House Hotel, Brighton, March 10th-12th. Speakers include: Dr Rita Hinden, Rev John Collins, William Clark and Dr Joad. Inclusive fee, two guineas.—Inquiries, 20, Buckingham Street, W.C.2.

Investment Statistics

Company Notes

English Electric.—Consolidated balance on trading account increased from £1,960,966 to £2,661,134 and net profit after crediting £55,513 miscellaneous items and deducting taxation of £1,045,625 (£729,033), from £617,016 to £730,268 in 1949 (53-week period). Net current assets at the year end were £6,197,428 (£5,346,573); stocks and work in progress are higher at £12,050,323 (£11,862,239) after deducting £9,172,725 (£6,138,343) payments received on account. Bank overdraft has been increased from £5,402,086 to £5,608,385.

Ilford.—Consolidated "aggregate" profit amounted to £1,117,956 (£1,123,389) for the year ended October 31, 1949. Group net profit was £342,087 (£317,998). Net current assets increased from £2,027,833 to £3,172,873 on the year; stocks rose from £1,275,931 to £1,384,284 and debtors from £885,357 to £1,069,718. Turnover increased by 10 per cent in 1948-9.

British Home Stores.—Group trading profit rose from £747,134 to £881,202 for the year to December 31, 1949; net profit increased from £274,257 to £366,835. The dividend is raised from 10d. per stock unit to 1s. per stock unit for the year. Net current assets at the year end were £1,274,735 (£1,063,808); stocks were valued at £938,934 (£758,629).

Linen Thread.—Consolidated trading profit declined from £1,613,512 to £1,543,802 for the year ended September 30, 1949. Group net profit after inclusion of miscellaneous credits was £376,857 (£484,745). The distribution of 12½ per cent for the year is unchanged. Group stocks are up from £4,483,713 to £5,314,717 and debtors from £1,137,230 to £1,527,202.

Tate and Lyle.—Profit after depreciation amounted to £2,289,857 for the year to October 1, 1949 compared with £2,794,627 for the previous 53-week period. Taxation absorbed £1,011,083 (£1,455,522). A total distribution of 2s. 8.4d. per 15s. stock unit is recommended for the year making the total cash distribution the same as for 1947-8. Turnover was £76,000,000 (£78,000,000).

Bowater Paper Corporation.—Consolidated profit, including £300,394 profit on exchange arising from devaluation, amounted to £4,279,653 (£3,821,325) for the year to September 30, 1949. Net profit rose from £1,275,596 to £1,376,822 of which £934,396 (£862,121) has been retained by subsidiaries. The recommended dividend of 12½ per cent on the ordinary is unchanged; 1⅔ per cent participating dividend has been added to the rate for the participating preference stock (same).

Jute Industries.—Consolidated trading profit increased from £754,863 to £864,986, in the year ended September 30, 1949. Group net profit declined from £286,079 to £283,534. Stocks declined from £1,099,962 to £942,360 and debtors from £639,607 to £591,442; cash is up from £443,153 to £868,203 and tax reserve certificates are higher at £302,000 (£101,000).

John Crossley and Sons.—Group trading profit fell from £509,685 to £400,055 for the year to December 3, 1949; of this taxation absorbed £202,300 (£286,780). Stocks have risen to £1,197,303 (£1,079,277), debtors from £309,418 to £363,540; cash is down from £356,758 to £268,251.

Thomas Owen.—The trading loss for the year to July 31, 1949, was £15,302 after crediting £33,900 estimated recoverable expenditure, compared with a profit of £166,500 for 1948-9. Group net loss after crediting £25,000 from taxation contingencies reserve amounted to £58,110 (profit of £94,040). The balance carried forward is reduced from £109,589 to £12,992. Bank loans have been increased from £179,124 to £617,493; creditors are lower at £360,406 (£539,597) and reserves at £457,794 (£567,553). Net current liabilities amounted to £75,577 at the year end.

Thomas Tilling.—Consolidated profit, including £154,500 non-recurring items, amounted to £419,775 (£922,904) and net profit to £191,955 (£441,123) in 1949. These figures reflect the changes arising from the distribution of £20,000,000 British Transport 3 per cent 1968-73 stock by way of capital profits dividend. A dividend of 5 per cent is recommended on the ordinary stock.

I. and R. Morley.—Net profit for 1949 amounted to £171,538 (£171,146). The proposed dividend of 9 per cent for the year is unchanged.

Capital Issues

Stanley Motors.—Subject to shareholders' approval members of the company registered on March 22nd are to be offered two new 5s. ordinary shares at 10s. per share for every ten shares held. The issue would raise approximately £150,000.

Metal Traders.—The CIC has now approved the free bonus distribution of nine new 2s. shares for each 2s. share held. Application had first been made shortly prior to the ban on bonus issues.

British Industrial Plastics.—The company has issued to the British Shareholders Trust £250,000 4½ per cent unsecured notes at £98 per cent, less 2 per cent for brokerage and expenses.

Stanhope Steamship. By way of a scrip bonus shareholders are to receive free four new 1s. ordinary shares for every 1s. share held on February 28th.

Statistical Summary

EXCHEQUER RETURNS

For the week ended February 25, 1950, total ordinary revenue was £89,414,000, against ordinary expenditure of £58,641,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £14,670,000 the surplus accrued since April 1st is £631,725,000 compared with £843,426,255 for the corresponding period a year ago.

THE INSTITUTE OF PERSONNEL MANAGEMENT

THE INSTITUTE OF PERSONNEL MANAGEMENT is proceeding to appoint a full-time Director. The Institute is an independent association of practising personnel officers, working in co-operation with the British Institute of Management. Its two principal objects are to increase the knowledge and competence of its members, and to promote and develop personnel management. Desirable qualifications are: (a) A degree or equivalent professional qualifications; (b) Knowledge of industrial relations and personnel practice; (c) Experience in industry or commerce; (d) Administrative experience. Salary, £1,500 per year for a person with these qualifications, otherwise a period of training at a somewhat reduced salary may be offered.—Applications, giving all necessary details, marked confidential, to Dr C. H. Northcott, Institute of Personnel Management, Management House, Hill Street, London, W.1.

A LEADING ADVERTISING AGENCY requires an Information Officer. A person with first-class experience of research, and creative intelligence to pick up and see the practical application of marketing and other trade information in relation to advertising. Write, stating salary expected and giving full particulars of experience, to Box 364.

IS THIS MAN YOU?

A persuasive speaker in public, a cool, calm thinker, never embarrassed, a good loser, a good mixer, making friends without effort? If not, you need RAPIDISM, the fascinating new course, endorsed by leading psychologists.
Write now for free booklet to: THE RAPIDISM INSTITUTE, G.588, TUITION HOUSE, London, S.W.19
(or call at 235 Grand Buildings, Trafalgar Square)

On the Tightrope

THE King's Speech opening the first session of the new Parliament gave clear evidence—which the strong language and the close division in Thursday's debate did not controvert—that Ministers are to draw the logical conclusion from the election results. There was, indeed, little enough doubt about it. It is true that one or two of the wilder spirits in the party were for going full steam ahead with a socialist programme and damning the consequences—and it is an interesting historical reflection that they consisted in large part of the same bold spirits who clamoured for a Second Front in 1942 and would, then as now, cheerfully have lost the war for the sake of a theatrical gesture. But politics, like war, though it may have its romantic moments, is played in dead earnest and Mr Attlee, like Mr Churchill eight years ago, prefers to play safe and wait, hoping that time is on his side (though possibly with much less justification, since American aid was then just beginning and is now beginning to taper off).

Already there is a perceptible shift in the prevailing opinion. In the first flush of the election result, the air was full of predictions that this parliament would be strangled in the cradle and that there would be another appeal to the people almost at once—June was a favourite prediction. To this has succeeded the calmer reflection that it may be possible for the Government to continue for some time. It is true that with a majority of 6 or 7 the Labour Party cannot legislate—the programme in the King's Speech was anodyne to the point of comedy. But it has the sweets of office and it enjoys the vast powers of administration, that belong to His Majesty's Government. The Conservatives, on their side, are in the position of guerrillas in an occupied country. They can harass Authority, they can defeat it in little unrehearsed crossroads brushes, but they can neither choose their opportunities nor face a pitched battle.

The odds are that this parliament will go on until either the Government's majority melts away in by-elections or else Mr Attlee and Mr Morrison get tired of the strain of carrying on. That is equivalent to saying that they will get through to the autumn. But whether they can last much longer is, for a number of reasons, much more doubtful. For one thing, tempers may rise. It is not without significance that the Leaders of the House and of the Opposition are Mr Morrison and Mr Churchill, who do not like each other, and not, say, Mr Eden and Mr Chuter Ede, who could maintain the appearance of non-controversiality much more convincingly. Mr Churchill has more reason than his younger colleagues to be in a hurry and Mr Morrison, though he is in reality the sanest and most moderate member of the Cabinet, can never forget, when he is on his feet, that he is a cockney. Both sides may have the most excellent intentions of doing their duty in the stations to which it has pleased the electorate to call them, but the old Adam will not stay buried for long.

Furthermore, the major premise of a non-controversial parliament

must be that it is possible for the country to get along for a while without legislating on topics that will inevitably lead to open party warfare. Great as is a modern government's ability to write its laws in the departments it is not yet, fortunately, quite as great as that. It may be possible—just possible—to get through to July without touching on the great issues. But it is certainly not possible to go much further. Some acrimonious issues will be brought up by the calendar. October 1st is the first of the crucial dates in the implementation of the Iron and Steel Act. That issue can, if the Cabinet so desire, easily be deferred; but the argument over the whole range of planning and economic controls that will be raised by the necessity to renew the Supplies and Services Act cannot be dodged.

There are also other issues of the gravest importance that will be brought up by the development of events. The Estimates which have been appearing this week are a reminder that the basic issues of economic policy will have, before long, to be decided. These figures, which are set out in detail on later pages, make it quite plain that the Cripps policy is very near its end. The Cripps policy has, in reality, been one of dodging the issue, and though its imperfections have always been obvious, it has achieved this major aim with a fair degree of success. For two and a half years, Sir Stafford has contrived neither to bring the inflation he inherited from his predecessor decisively to an end, which might have endangered the seraphic state of overfull employment on which the Labour Party has now staked its existence, nor yet to let it gallop ahead too dangerously. Such a policy cannot, from its nature, be pursued for very long; that it has lasted as long as it has is very remarkable; and there are plenty of signs that it is now nearly finished. The buoyancy of the revenue (itself a convincing sign of inflation) may make it just possible to produce one more budget that will meet all the demands for expenditure and still show something that can be called a surplus. But expenditure is now out of hand and running away; Sir Stafford set his face a year ago against all supplementaries, but he now has to swallow £169 million of them. The policy of freezing wages is on its last legs; and if it goes, dividend limitation (which cannot be enforced without legislation) will follow it. Defence expenditure is rising; large capital programmes are gathering speed; and the effects of last September's devaluation on the internal price level have not yet worked themselves out.

It will not be possible to put off the choice of policy very much longer. What makes it a choice of peculiar political difficulty is that it is really a choice of what shall be done about the level of employment. One possibility is to abandon the attempt to keep inflation in check, to glory in the undeniable fact that it is the best (short-term) preservative of overfull employment, and to deal with the consequences of deliberate inflation by an ever wider variety of physical controls. In so far as there was any coherence at all in Dr Dalton's policy this was it; and there are advocates of it in the Government today. Indeed, if the phrase in the King's Speech that "should other measures prove to be immediately necessary for the maintenance of full employment . . . Ministers will not hesitate to submit them to Parliament, even though they may seem likely to prove contentious," is anything more than bravado, it is a promise that, when the time comes, the Government will choose this course. Mr Morrison was very indignant with Mr Churchill for quoting the warning given by Mr Kenney, the head of the EC Mission in this country, that the conditions that compelled the devaluation of last autumn may easily recu Mr Kenney is an authoritative and—as the rest of h report shows—a friendly observer. Indeed, the point familiar and obvious and Mr Morrison's indignation w quite misplaced. If the Labour Government, when length they come to the crossroads, choose the path th look like choosing, then the internal value of the pour will continue to fall and the external value will follow There is nothing either novel or irresponsible in pointir out such an obvious fact.

The other course is equally well known. It woul resolve the present uneasy compromise by coming dow definitely on the side of disinflation, of doing whatev might be necessary to reverse the trend and start th value of the pound rising. The first thing that would b necessary would be to reduce the rate of public expend ture. Such a policy would not only be highly unpopul in itself, it would obviously run the risk of raising th total of unemployment above its present exiguous leve There is, therefore, no cause for wonder that Ministe have shied away from it so long as they could do s without running to the other extreme; and that th Opposition, by and large, has done the same. Bu within a few months the choice will have to be made either rampant inflation, with more controls at home an another devaluation abroad; or disinflation in earnes with curtailed expenditure on the social services and rise in unemployment.

It is perhaps necessary to add—since the emotiona content of the word unemployment is so high—that n sane man desires any unemployment at all, either fo its own sake or as a means to other things. In this mid century generation, any economic policy must aim a the highest level of employment, taken as an averag over the years, that is compatible with the economi health of the community. The argument is not whethe full employment is desirable but whether the best wa to secure it in the long run is to take the steps that ar necessary for the balance and strength of the economy (which can alone guarantee full employment for an length of time) even if those steps run some risk of disturbing somebody's job now, or whether it is better t subordinate every form of prudence and providence t the single blind aim of maintaining the present pattern o employment, even though that involves drifting without any other purpose towards almost certain disaster.

This choice is bound to force itself on the parties with steadily rising urgency in the months ahead. With minor degrees of difference, the two major parties have hitherto been at one in dodging it—which is, of course, the sensible course for any politician. So long as that continues to be the case, a political crisis and a new election would revolve round nothing more fundamental than the choice of which party was to dodge it in office and which was to dodge it in opposition. Another election on that issue would be a waste of time and money. But at the very earliest moment when an election could record a clear choice of policy, it will become both desirable and urgent. Nobody can predict when that will be; it depends upon when the next bout of economic trouble arrives. That being so, we must hope that it comes quickly and is serious enough to put the electorate into a deciding mood. Until then we shall have to content ourselves with cattle grids.

Economic Dogmatism in Germany

THE Minister for Economics in the Federal German Government, Dr Erhard, has had an uncomfortable two months. Until the turn of the year, his undeviating faith in the policy of complete *laisser faire* seemed to be justifying itself in works as well. The phenomenal recovery of the German economy after currency reform coincided with a determined attempt to restore a "market economy" in western Germany, to remove all controls, to restore the price mechanism and to revert to monetary incentives. The programme was a practical success; it also earned the special commendation of Germany's American advisers. In December, however, Dr Erhard's fortunes changed. The presentation to the Organisation for European Economic Co-operation of the German "plan" for the next two years of Marshall aid opened a phase of acute criticism of German economic policy, during which—to the Germans' especial chagrin—American officials in the Economic Co-operation Administration were most vocal and dissatisfied. For almost three months, memoranda and counter-memoranda have passed between the German Government, the High Commissioners, the ECA in Frankfurt and the ECA in Washington. At the moment, there are signs of a truce. It seems certain, however, that the issues are not yet settled.

The debate began with the American discovery that the German forecast of the next two years resembled "a cry for help rather than a programme for viability." The report to OEEC estimated a trade deficit of $400 million in 1952, and even this figure had been reached only by making remarkably optimistic assumptions about trade with other Marshall aid countries and with the dollar area. Moreover, the policies proposed for the internal management of the west German economy suggested, in the American view, that the unbalance might be even more severe. While food in 1949 accounted for 70 per cent of Marshall aid, grain had been used wastefully as animal fodder and for distilling, while little attempt had been made to increase internal food supplies—the use of fertiliser had been particularly disappointing—or to divert German exports either to dollar markets or to other possible sources of food.

Industrial expansion promised no better. The level proposed—an index number of 107 as opposed to the 100 of 1936—was no doubt dictated by the fear that any ambitious programme of capital investment would carry with it the risk of reinflation. The Americans, however, attacked the programme not only because it left out of account the need for absorbing the swollen population of the western zones, but also because the expansion in itself inadequate, would not necessarily occur in essential industries—in housing, in sectors working for export or in undertakings likely to absorb most workers. This estimate of the insufficiency of the capital investment programme to sustain the proposed levels of consumption and export led the critics to the most vulnerable point in the German plan—the admission that in 1951 there would be as many as 1,800,000 men and women out of work.

The uneasiness created by the German forecast was increased by two factors. The first was the attitude of the German Government itself. Again and again in discussing the actions that might be taken to offset this or that result, the Government declined to consider intervention by the state, on the grounds that "German economic policy is as a matter of principle against regimentation and most controls are now withdrawn." To this attitude of dogmatic *laisser faire*, the administration added a tendency to blame most shortcomings on external circumstances—the nine million refugees in the western zones, the arrival of new refugees at the rate of about 3,000 a month, the division of Germany, the obstacles to east-west trade created by the American licensing system. The second factor was the sharp deterioration in the German position which occurred early in the New Year. Unemployment had increased by the end of February to over 2 million. At the same time, Germany suddenly acquired an adverse trading balance with every other state save Austria. In the autumn, the decision had been taken to remove all restrictions and quotas from about 35 per cent of Germany's foreign trade. Private traders bought with both hands. Whereas from January to September last year, Germany had on the average a favourable monthly balance of some $7 million with the Marshall countries, the deficit for December was $50.9 million. The total deficit had risen from a monthly average of $79.9 million to $160.7 million. It is true that the deficits with Europe—which

can be settled without recourse to dollars—may have the ultimate effect of expanding general trade. But the sudden appearance of so many deficits added fuel to the criticism of German policy.

Unhappily for understanding and good will in the west, criticism of the German plan, which began as a reasoned comment on certain inadequacies in the programme, soon developed into a violent political argument over the merits and demerits of *laisser faire* and planning. The Germans themselves are to some extent to blame for this. The British elections were about to take place, and it was tempting for both the supporters and the opponents of *laisser faire* in Germany to compare their own system with the British experiment which was about to be tried by popular vote. The German Government's decision to announce that all food rationing except for sugar would end in Germany on March 1st, and its attempt to end petrol rationing, seem to have sprung from political motives, since earlier dates could easily have been chosen ; food rationing had been a dead letter for some time and petrol was easily available on the black market. On the other side of the political arena, it seems likely that the German Opposition had some hand in allowing the news to leak to the press that both in Frankfurt and Washington, the Americans were taking a very critical view of some of the consequences of German *laisser faire*. As a result, the German economy has been painted in some peculiar colours in recent weeks, the supporters of free enterprise heightening the effects that please them most —the sharp rise in output, the incentives to work and earn, the tendency of the price of consumer goods to fall —while the defenders of the planned economy point to houses unbuilt while building workers are idle, to great contrasts in riches and poverty, to luxuries imported and produced before necessities and, above all, to the mass of unemployed.

*

This debate is a singularly fruitless contribution to an understanding of the German problem. It is clear on the one hand that a policy of complete non-intervention by the Government is unthinkable. The problems which face western Germany—the appalling housing problem, the destruction of physical assets and the obsolescence of industry, the extreme shortage of capital, the influx of refugees, the re-orientation of trade made necessary by the Iron Curtain, the limitations on steel making and shipbuilding still imposed by the Allies—cannot be satisfactorily solved by the unaided and unguided workings of the profit motive. In fact, the whole of current American criticism of German policy is simply a variation on the fundamental theme that the methods of non-intervention practised by the Government are insufficient to meet the peculiar conditions of western Germany today. On the other hand, it is equally fallacious to suppose—as some British critics are suggesting—that the British policy of semi-controlled inflation and overfull employment could be transplanted to German soil. There is no compact incorruptible civil service in Germany. There is no fiscal discipline. There is a pathological fear of inflation. Controls became derisory in the period before currency reform and in any case carry in Germany the memory of the Nazi version of planning.

Both sides in the debate have also done a disservice to Germany by seeking to underline an exclusive choice between complete *laisser faire* and complete control. Some of the German memoranda have suggested that there is no half way house between Dr Erhard's economics of pure non-intervention and a regimentation more complete than any practised in such economies as are still controlled in the West. But this rivalry between extreme creeds is not the issue in Germany today. The changes that are necessary—and that are being urged as much by the non-planning Americans as by the plan-minded British—are modifications and corrections of German policy, not total reversals of it. A Government does not need to announce its conversion to total planning if it agrees, by various predominantly fiscal methods, to introduce a measure of guidance into the workings of the economy. A number of measures are reported to be under discussion—tax relief on housing and other essential investment, purchase tax on luxuries, higher taxation of unearned income, the diversion of a proportion of the Counterpart Funds to agricultural investment, financial inducements for the greater use of fertilizers, dollar bonuses for dollar exports, a national loan for reconstruction—and Dr Adenauer, the Federal Chancellor, has given a general undertaking to increase public investment in housing and for transport. These changes have been brought about in part by Allied pressure, and such interventions are bound to be more effective if they leave the ideological issue to one side and concentrate upon observable shortcomings and practical remedies.

*

The fundamental reason for abandoning ideology in the discussion of German economic organisation is that, so long as critics debate whether too much *laisser faire* or too much planning is responsible for Germany's ills, they forget how much deeper go the political and economic roots of the crisis and how little, in fact, the cure can be found within the confines of western Germany. The problem of purchasing sufficient supplies of foodstuffs and raw materials in stiff competition with other exporters of manufactured goods and in a world in which so many of those supplies have the dollar sign over them is Germany's chief problem—but it is one shared with almost every other Marshall country. The only difference is that in western Germany there exists a special temptation to believe that the old suppliers of food—eastern Germany, eastern and south eastern Europe, Soviet Russia—could replace dollar and sterling supplies and this tends constantly to trouble Federal Germany's political allegiance to the West. Hitherto, the assumption has been that these economic siren calls across the Iron Curtain would be stilled by Germany's "integration" in the western economy which was to grow from the Marshall Plan. This, surely, is an assumption in far greater need of re-examination than the effectiveness or not of Germany's domestic economic policy. The drama of Germany is still its division—body and soul—between east and west. Indeed, without that division, many of the particular economic problems troubling the critics today would settle themselves. Germany's western neighbours might therefore with profit spend less time in hurling bouquets or brickbats at Dr Erhard and rather more in reflecting on the precarious balance of interest, economic and political, which secures Germany's continued adherence to the western world.

Defence Policy

THERE is no aspect of official policy which nowadays is accorded such piecemeal and unsatisfactory examination as defence—both in Parliament and among the general public. Many of the subjects which it covers —the details of strategy, the location and organisation of the forces, the development and production of weapons —are of course secret, but in the past four years the Government has cast a pall of obscurity over far more than the short list of subjects which no responsible person would expect to see divulged or discussed in public. For this reason, the annual Statement on Defence, which is always brief and has often been lacking in candour as well, has come to be almost the only guide by which to form an estimate of how well or ill the Government is providing for the military security of Britain and the British Commonwealth.

The first two Statements, for 1947 and 1948, were mainly concerned with the problems of putting the war-time forces of 1945 upon a peacetime footing. Last year's Statement was the first to recognise that Britain is faced with peacetime commitments and with an international situation that requires precautions far greater than those that are traditional in time of peace. It was, however, complacent in the extreme about the methods by which the difficulties of manpower, finance and organisation could be overcome. This year's Statement, which has been published this week, is more forthright and, although there are many questions which it leaves unanswered, it does permit of certain broad deductions being drawn about the successes and limitations of Britain's defence policy.

In the first place it is clear that events outside Britain have not worked towards a lessening of the military burden resting upon the British people. The defence budget for 1950-51 is estimated at £780 million, or £21 million higher than that for the current year. The Western European Defence Organisation has been in existence for over a year and the Atlantic Pact was signed ten months ago. It might have been reasonable to hope that the pooling of defences among the western nations would lead to some lessening of the strain upon that one of the group which, relatively to its resources, was previously doing most. But any such hopes are disappointed ; no important economies have so far been achieved from co-ordination of Britain's defence policy with its European and Atlantic allies. The reasons for this appear to be straightforward ; joint west European defence has meant a contribution of the only modern war material immediately available from western European resources—British fighter aircraft and their equipment. The necessity to win the confidence of the European allies for a stronger policy than that of *sauve qui peut* has made it necessary for Britain to expand its own military contribution, an expansion which may well have to go much further before a watertight defence organisation is a reality. Equally, direct military aid from the United States under the North Atlantic Treaty has so far resulted only in a programme to modernise and expand the RAF bomber command, not in any reduction in its cost. The indirect aid, extended in terms of dollar credits, means only that "we may recover some of the dollar costs of raw materials used in the additional armament production undertaken as a contribution to the defence of the North Atlantic area." In other words, there are no economies to be found in a co-operative as opposed to an isolated defence policy at a time when the whole system must be strengthened.

Nothing, however, is said or implied in the White Paper about the possibilities of economy through radical measures of integration between the armed forces of the different western and Atlantic powers—a silence which is perhaps not surprising in view of the snail's progress being made in creating the necessary international political framework for such a policy. It is very much to be hoped that next year's Statement on Defence will indicate a large measure of economy through the welding of armies and air forces into something approaching cohesive international units.

*

The second conclusion which can be drawn from this year's Statement is that the production of weapons and research into them are beginning to dominate questions of defence policy and expenditure. When the total defence budget is limited—however large it may appear —the advantages of paying a high wages bill for a strong force under arms have to be set against the alternative need to ensure that the vastly expanded armed forces that would spring up in the event of real danger could be promptly equipped with the latest weapons. It is evident from the estimates of expenditure for 1950-51 that this dilemma is being resolved in favour of the weapons—

THE DEFENCE BUDGET

(Estimated Net Expenditure in £ Million)

	1949-1950						1950-1951					
	Admiralty	War Office	Air Ministry	Ministry of Supply	Ministry of Defence	Total	Admiralty	War Office	Air Ministry	Ministry of Supply	Ministry of Defence	Total
1. Pay, etc., of service personnel	38·68	94·25	55·20	2·0	0·20	**190·33**	36·71	84·63	52·85	2·10	0·22	**176·51**

9. Non-effective charges	14·61	15·70	3·1	...	...	**33·41**	15·18	16·56	4·35	...	...	**36·09**
TOTAL	**189·25**	**304·70**	**207·45**	**57·75**	**0·71**	**759·86**	**193·00**	**299·00**	**223·00**	**65·00**	**0·82**	**780·82**

though more through the force of circumstances than by any freely taken decision. Since the number of regulars that is likely to be recruited to the forces is limited by social conditions, and the number of national servicemen by the mathematics of past birth rates, the services really have no present option but to concentrate a higher proportion of their resources on research and production. Thus in the coming financial year the Royal Navy will decline in size by about 20,000 men ; it will save £2,000,000 on its armed, and another £2,000,000 on its civil, wages bill ; but it will spend £10 million more on production and research (particularly on the latter). The Royal Air Force is now 10,000 men below the figure projected in last year's statement (which was based on over-optimism about regular recruiting), and is expected to remain at the present level ; it will save about £4,000,000 on its wages bill, but will spend an extra £13½ million on production and research.

The largest change in balance is to be found in the Army. The strength of its regular component will actually decline during 1950-51 from about 185,000 men to 178,000 men: this is based partly on the calculation that regular recruits will in any event fall off, partly on a deliberate policy of weeding out redundant men in headquarter staffs and schools. (According to the estimates of pay given in the 1950-51 Army Estimates 90 per cent of this reduction is to be in other ranks and only 10 per cent in officers.) The National Service component of the Army will be reduced accordingly, and over £10 million will be saved on pay. The vote for research and production shows an increase of £7,000,000, and it could be more, as the White Paper states that the size and commitments of the Army make it the least able of the three services to devote as much to research and new production as would be desirable.

This growing concentration of effort upon research and production (in 1948 it accounted for only 24.1 per cent of the total estimated defence budget, for 28.3 per cent in 1949 and for 31.9 per cent in this year's estimates) is probably inevitable. In an era of rapid technological change it would be folly to assume—as was indeed officially assumed until quite recently in regard to most types of equipment except aircraft—that the services could "live on their fat." The idea that the production of new equipment should not begin until the services had broken or worn out their wartime equipments would spell certain disaster in the event of a sudden emergency. Since the useful life of most equipment in service since 1945 is, with the possible exception of ships, coming to an end, it must be accepted that the budgetary provisions for new equipment will grow rather than diminish with each succeeding year if the existing forces are to be kept even reasonably efficient.

*

When it comes to deal with manpower, the Statement is both more realistic and more defensive than its predecessors. It admits that the rate of regular recruiting is not good, that in 1949 it fell well below the rate for 1948, and that in 1950 the rate of wastage in the Army will result in a net decline in the number of regulars. This at least is an advance on the pious hopes expressed in last year's Statement that some magic would improve recruiting. More money is being spent to provide accommodation and the services hope to complete 30,000 new permanent houses in the United Kingdom within the next five years. There is no doubt that decent living conditions are a strong incentive to enlisting, but the Statement is silent on the other two major inducements, improved conditions of service and better pay. It may be that pay is not the decisive factor, and it is arguable that it may be better to spend the available money on other things than improved pay. But if the Government are still of the belief (as they must be) that the Army and the Air Force need a larger regular element than at present, then they have no right to regard the problem as insoluble until they have at least tried the effect of definitely attractive rates of pay.

The concluding sentences of the White Paper make it quite clear that the present Government will not abandon or modify the existing system of national service. They reject what might be called the Liberal contention that "regular recruiting could be improved to such an extent as to make it unnecessary in the near future to employ national service men." They also reject as impracticable—that is politically impossible—the idea of selective service which has found favour with certain Conservatives. What they do not show, however, is that the present organisation—an army and air force with a small regular cadre strained to the utmost by the rival claims of training and operational commitments, and backed by reserves which are impressive only on paper—is the correct one for the present day.

This year's Statement on Defence marks a definite stage in defence policy. The Government have made up their mind that the balance between the three services "is about right"; they have instituted a number of small economies, but they have decided to spend the consequent savings and much more besides on improved production and research ; and they have decided to stand by their present manpower policy. The financial counterpart of these decisions is to dash any lingering hopes of a reduction in Britain's defence expenditure. Moreover, it is equally certain that, unless world events take a more peaceable turn in the near future, the trend of expenditure in the next few years will be upward and not downward.

It is a shocking thing to be spending nearly £800 million a year on defence in what is supposed to be time of peace, and there will be plenty of people ready to declare that the country "cannot afford" such expenditure. It is true that the country cannot long afford the present level of total government expenditure or the taxation that is necessary to support it. But there is no very good reason for picking out defence expenditure as the straw that breaks the camel's back. It has indeed increased, both absolutely and also in relation to the national resources ; but other forms of expenditure have increased much more. In 1938, expenditure on the social services was just below that on defence ; in 1949, if food subsidies are included, it was nearly double. If the community can "afford" to spend 13½ per cent of its income on the welfare state, can it not afford 7 per cent for defence ? The real question is whether the nation wishes to defend itself. If it does, then it is far more economical to spend enough in peacetime to avoid a war than to spend ten times as much in fighting it. The question for the public to ask is not how much the defence programme costs but whether it is technically adapted to serve its major purpose of averting war. And this is precisely the question on which the Government are still obstinately silent.

Africans in London

NOT every African chieftain finds an English bride in London, and on the whole the very small number of colonial people in Britain occasion few nice dilemmas involving such difficult decisions of imperial policy as have arisen in the case of Seretse Khama. Colour prejudice, where it exists, is not nearly as strong, for instance, as the prejudice against admitting foreign labour into Britain ; indeed, the one can almost be regarded as a small special aspect of the other. But it would be ostrich-like to assume that, because the numbers of coloured men and women from the colonies are small, their treatment in this country and their experiences here are unimportant. London is regarded throughout the British Empire as the fountain of the civilisation with which British administrators have sought to endow the colonies ; it is the Mecca of every ambitious colonial and the influence and opinions of visitors and students when they return to their native homes is out of all proportion to their numbers.

There is no compulsory registration of colonial people in Britain and therefore, between censuses, no accurate statistics ; but the Colonial Office estimates that there is now a permanent colonial community of at least 20,000 and possibly as much as 30,000 people, including English wives and children born here. There are also about 4,000 colonial students, some hundreds of colonial seamen and a handful of men who were brought to Britain durng the war and who have not yet returned to their own colonies. Most of them live in one or other of the big cities or ports—London, Liverpool, Cardiff, Manchester and Birmingham — of which London contains much the largest number.

These people can be divided roughly into four groups. There are first the permanent residents who have settled here and who have no intention of returning to their native countries. They regard themselves as British citizens, exercise their voting rights, and have taken their places as responsible members of the community. Most of them are well-educated and their standard of living, their trades and their professions are, in general, those of the middle classes. They suffer occasionally from colour prejudice on the part of their fellow citizens, but probably no more than the Jews suffer from the rare outbursts of anti-semitism. They are not in any sense a "problem," except in so much as they are slightly privileged in having the British Council and the Colonial Office to watch over their interests.

COLONIAL STUDENTS IN GREAT BRITAIN AND IRELAND AT DECEMBER 31, 1949*

	Scholarship Holders	Private Students	Totals
East and Central Africa	210	285	495
West Africa	565	1,095	1,660
Far East	167	213	380
Mediterranean	96	174	270
West Indies	410	594	1,004
Other territories (Falklands, Fiji, Mauritius, St. Helena, Seychelles)	70	135	205
TOTAL	1,518	2,496	4,014

* Colonial Office figures.

The second group are the students who are brought to Britain under the £1,000,000 scholarship scheme. There are some 1,500 colonial scholars, more than half of whom come from West and East Africa, scattered among most of the universities and training colleges in the country. They are carefully chosen by the colonial governments concerned, and their standard of education is the same as that of other scholars. The subjects which they read are fairly evenly distributed over the whole range of undergraduate studies. The order of preference, which is to some extent dictated by the needs of the colonies themselves, is: engineering, medicine, teaching, arts, nursing, science, law and accountancy. They are given adequate, possibly even generous, living allowances (from £295 at the provincial universities to a maximum of £365 at Oxford and Cambridge, with tuition and examination fees paid and additional allowances for travelling, etc.) and there are as well a number of voluntary organisations which make social arrangements for them during vacations.

The third group are private students who make their own way here and most of whom have little or no money. Nearly all of them realise before they come that they are going to find living in Britain difficult ; but they deliberately choose to put up with a hard life as the only means of acquiring the higher education from which they will be able to reap immense advantages—financial as well as social and political—when they return to their homes. There are at the moment about 2,500 such students in Britain. Most of them read law, with medicine and nursing a close second and third.

Finally, there are the seamen, and a heterogenous collection of people who have come to try their luck in this country rather than in their own. There is no reliable estimate of their numbers, but it is believed that they do not exceed more than a few hundred men and women.

There is little to say about the first two groups. Very few among them are discontented—though they are quick to report colour prejudice if they come across it—and, as far as they are concerned, England tends to live up to their expectations. They meet with kindness and hospitality almost everywhere. The students are genuine scholars and revel in the academic life to which they have been introduced. Their allowances are big enough to enable them to live in reasonable comfort, so that they can concentrate their energies on getting the maximum benefit from everything that they can learn here. The Colonial Office and the colonial governments are to be congratulated on the good work they have done.

*

The third and fourth groups, however, the private students, the seamen and casual adventurers, are a different matter. With the exception of the tiny minority of students who are the sons of wealthy parents, they live in slum-like conditions in what are usually the worst quarters of the towns where they have chosen to stay. Outside their studies or their work, they mix with the lowest strata of society. Although they seldom get into serious trouble, they are becoming associated in the public mind with the least desirable features of western civilisation, and are acquiring a quite false picture of its standards and principles.

The Africans are mainly gentle people, and it would be

a tragedy if the idea were allowed to gain ground, as a result of their associations in slum areas, that they were by nature vicious and criminal. It is among these people that the British Council, which has now taken over the responsibility for looking after colonial visitors to Britain, needs to work hardest. It is, however, an extremely difficult task. These groups of colonials are determined to retain their independence, and they resent attempts to lead them into healthier surroundings as an unwarrantable interference with their privacy. Worse still, some regard such attempts as an effort to carry out a policy of segregation—to set up a "Little South Africa" in Britain—and it is from them that the Communists find most of their recruits for future agitators in the colonies. The problem is to put before them opportunities of understanding and practising the British way of life without arousing resentment and suspicion of patronage.

Nothing can be gained from restricting the entry of such people into Britain. It has always been and it must continue to be a fundamental principle that any law-abiding British subject should have the right to come and go as he pleases. Any infringement of this right, any discrimination as between one law-abiding British subject and another, would be bound to have the most serious consequences throughout the Commonwealth. The real solution to the difficulty lies in the colonies themselves. Nearly all private students come to England because they cannot get the training or the education they are seeking in their own countries. If university education were more readily available there, the poorer students at least would not be so tempted to suffer hardship in London. It is true that a number of universities and training colleges have already been set up in the colonies; but many more are needed, and the curricula of those which already exist need to be much expanded, to include subjects which will bring material benefit to the individual as well as to the state. The technician and the lawyer are at least as important as the doctor and teacher.

In Britain itself more could be done with private students on arrival. It should not be left to the Communist Party to be the first to greet the colonial student as he sets foot in what is to him a strange and bewildering country. There are difficulties in the way of official action, but the field is open for voluntary organisations to do for the private students what the Government does for the scholars.

NOTES OF THE WEEK

The First Debate

The new parliament was opened with traditional ceremony and splendour on Monday, but during the debates on the Address which have occupied the first week of its life, the new House of Commons has been ill at ease. Both parties are groping for some method by which to reconcile their desire to avoid precipitating an immediate election with their equally strong wish to be in the best position when it comes. This has imposed a particular strain upon the Conservative leaders, for their back benchers have tasted blood at the polls, and are anxious for an immediate battle with the enemy, so irritatingly installed once more upon the Treasury bench. But the Conservative leaders are well aware of the need to replenish the coffers of the Exchequer—and of the party—before plunging the country into another election. This dualism was apparent in the contrast between the relatively restrained opening speech by Mr Eden on Monday, and the tabling on Monday night of two amendments to the Address on iron and steel and on housing.

The result of the division on the iron and steel amendment is not known as this page goes to press, but it will be a close one, in view of the fact that the Liberals have decided to vote with the Opposition. The amendment is cleverly worded, since in regretting the absence of all reference in the King's Speech to the nationalisation of iron and steel it emphasises the vagueness of the Government's intentions. Mr. Attlee's announcement that the Act will not be repealed represented the minimum that would satisfy his own followers, and Mr Morrison has been careful not to bind the Government to take action by any specific date, but the Conservatives can play upon the latent resentment in the country that the Government should still cling to this measure, even though the King's Speech did contain an implicit undertaking that further nationalisation measures would not be introduced.

Indeed, it is clear from this week's debate that the state of opinion in the country is what interests the politicians. On the one hand, the Labour strategists are paying close attention to the rural vote. The King's Speech contained not only a special reference to agriculture, but also promised action to improve rural water supplies and a tiny measure for maintaining cattle grids in highways. This concern was also shown in selecting Mr Dye, the member for South Norfolk, to move the Address in Reply, and the Tories were quick to follow up their line of appeal on Wednesday. On the other hand, Mr Churchill has continued his policy of trying to discredit the Liberal leadership in the House while attempting to woo the Liberal vote. On Tuesday he attacked Mr Clement Davies but at the same time put forward his plan for a Select Committee on the electoral system with a view to improving the Liberal representation in the House. This offer was no doubt sincere—Mr Churchill has toyed with proportional representation and the alternative vote for many years—but it is doubtful if he could carry the Tory party with him on any real move to change the system—although Lord Woolton is reported to favour it. It had all the appearance of a bait offered to the Liberals with the certainty that Mr Morrison would reject it out of hand.

* * *

Mr Bevan Faces the Music

Mr Attlee was quite right not to change his Minister of Health. Mr Bevan thus cannot avoid the responsibility of defending the heavy supplementary estimates for the health service, which were published this week. A year ago, there was general concern when it was learned that the cost of the health service in its first nine months would be £58 million more than had originally been estimated. This year's supplementary estimate of £98,730,000 completely dwarfs its predecessor even after allowance is made for the longer period which it covers. Nor is this the end. The vote on account, also published this week, shows that a further rise in the cost, of £34 million, is expected for the year 1950-51; this at least reflects a more honest calculation on the part of the Ministry of Health, which a year ago was actually budgeting for a decrease in the cost in the present year compared with 1948-49.

The rise in the total cost of the health service since the National Health Service Bills were introduced is set out in the following table, which shows the net cost to the taxpayer, after allowing for appropriations in aid:—

(£ Million)	
1946*	126
Final estimate, 1948-49†	278
Original estimate, 1949-50	260
Final estimate, 1949-50	359
Original estimate, 1950-51	393

* Estimate in financial memoranda to Bills.
† Calculated on annual basis.

The effect of this rise on Government expenditure is discussed elsewhere in this issue, but what is the effect on the health service itself? If a halt really is called to the rise in cost, how is the Ministry of Health to enforce it? It can continue the only serious attempts at economy it has hitherto made and chip away further at the fees of dentists, chemists and opticians. In this connection it is worth pointing out once again the serious distortion within the health service caused by the payment of these three groups by items of service. It means that the general practitioners, who are paid a fixed capitation fee, are valued at £47.1 million in the current year compared with the £48.6 million given to the dentists. Even the chemists have earned £35,300,000, or about 75 per cent of the general practitioners' earnings.

But any reduction in practitioners' fees—unless it were so big that there would be wholesale withdrawals from the service—would cause discontent out of all proportion to the savings in cost. The time has come to save, not ten or twenty million, but a hundred million and even more. The only way in which this can be achieved, and the comprehensiveness of the health service maintained, is to abandon altogether the principle that it should be entirely free. Exactly how a charge should be imposed will need to be carefully thought out (there would certainly have to be a means test to avoid hardship). But it has become quite obvious to all but the most prejudiced that a charge is the only way to bring home financial realities to patients and practitioners as well to restore the health of the health service itself.

* * *

The Cost of Social Services

The staggering cost of the national health service, and particularly the rise in its cost eclipse the estimates for all but one of the other social services in the national budget (although it should be remembered that almost the whole of the cost of the health service falls on the taxpayer, whereas a large part of total education and housing expenditure falls on the rates). The following table shows the approximate cost to the central taxpayer (excluding any further amounts that are met by rates and insurance contributions) of the various social services in the coming year, compared with that of 1949-50. Since the detailed civil estimates have not yet appeared, it is not possible to distinguish in every case the cost of the social service concerned from the total departmental vote, but the table gives a good indication of the relative order of magnitude:—

(£ Million)	Revised Estimate 1949-50	Original Estimate 1950-51
Education	212·0	219·5
University grants	17·7	23·4
National insurance (incl. family allowances)	209·9	214·6
Assistance Board	87·3	83·9
National health service	358·5	392·9
Housing	55·6	49·7
Ministry of Food (incl. food production services of Ministry of Agriculture)	469·5	438·3
	1,420·5	1,422·3

Virtually no rise in the coming year is estimated, but after this year's experience another set of supplementaries must be feared. In any case it is a decline in total expenditure on the social services that is urgently necessary, the more so as an increase in unemployment would wipe out the projected saving on the cost of the Assistance Board.

The one social service whose cost exceeds that of the health service is the food subsidies. The figure given in the table does not represent the exact cost of the subsidies, for that can be calculated only after allowance is made, among other things, for changes in food stocks. But it is worth noting that a supplementary estimate of £15,300,000 is required in the current year for the trading services of the Ministry of Food. This is the result of larger purchases than it expected to make during 1949-50, but these purchases have gone to build up stocks rather than increase rations. If these larger stocks lead to an increase in rations, the Ministry of Food will have to choose between putting food prices up and spending more money on subsidies.

* * *

Sabotage Law for France

It has been clear for some months now that the French Communist party has received its marching orders—to aid Russian plans in the Far East by sabotaging the delivery of arms to French troops in Indo-China and to aid Russian plans in Europe by preventing the delivery of American arms to France under the Mutual Assistance Pact. To fulfil these orders, violent action is necessary—the raiding of arsenals, riots at the docks, strikes prolonged by force—and the chief Communist problem is therefore to rally the party to a policy of violence and to hold together a sufficient band of "militants" for the necessary action.

The great mass of the Communist workers did not join the party to wage a civil war on Moscow's orders. They voted for Communism believing it could most effectively improve their often deplorable conditions. Where, therefore, Communist action can be disguised as strike action to raise wages and improve the lot of the working class, it has reasonable success. The strikes initiated by the *Confédération Générale du Travail* in a number of industries in recent weeks—metal workers, transport workers, textile operatives and now coal miners—have secured average support, although the drift back to work in the earlier strikes is already underway. But open illegality, open sabotage of the military effort is quite another thing; so, too, is the risk of imprisonment which ordinary strikes naturally do not entail, since the right to strike is safeguarded by the constitution.

M. Bidault's Government has therefore struck at a very vulnerable crack in Communist armour by introducing the law to make various acts of sabotage punishable by penal servitude. The Communists have betrayed their concern by their violent attempt to prevent its passage through the Assembly. In all-night sessions which have developed into fierce battles between enraged deputies, they have striven to prevent the legislation. But in vain: at dawn on March 8th the sabotage law was passed by 393 to 186.

The tide may now turn. The Communist reduction of parliamentary government to insults and blows has sickened the mass of Frenchmen who remember the Nazis' onslaught on the Weimar Republic. The existence of strong legal counter-measures will tend to deter all but the extremists. The law has, moreover, given the Government courage to use other measures vigorously. A threatened strike of workers in the public utilities has now been countered by a decree requisitioning the staffs. For all its narrow majority, M. Bidault's administration is proving it can act.

* * *

One-sided Silence

As the many policies and projects conceived between the Americans and the British reveal difficulties in execution, sharp differences of view are bound to arise. It is also

inevitable that some Americans, seeing most of Europe and much of Asia looking to them for aid and protection, should feel surprise—even pique—at the independent spirit—even obstinacy—of British statesmen and officials who feel they are defending important interests or principles. Such differences exist at the moment over the future of 71 American aircraft now grounded in Hongkong. They are due to be released to the Chinese Communists by a ruling of the colony's supreme court, but are also claimed by Washington as American property. They have arisen, too, over American objections to clauses in the proposed new trade agreement between western Germany and this country. They have existed long enough over projects of European "integration" and they will doubtless occur over other issues. The question arises whether ministries in Whitehall are right or wrong to keep silence on these differences.

It is true that some negotiations at some stages should be kept secret; otherwise ministers and officials may be forced by public criticism or emotion to adopt attitudes that are neither necessary nor helpful. The Americans are beginning to understand this and to see some virtues in the secret diplomacy which they used to regard with contempt and suspicion. But it is unfortunately a fact that secrets can be kept from the American press only with the greatest difficulty, whether in Washington or in other capitals. It frequently happens that the British public first learns of some dispute between London and Washington by the following process: an American columnist or reporter reveals that there are differences; the leader-writers take up attitudes; a press conference is given in Washington; British correspondents report the facts to London; and, at the end, several days late, when tempers have been heated and attitudes hardened, London either states its side of the story to the three or four newspapers that give serious attention to foreign affairs or gives a hushed and tactful press conference, which fails to make up for lost time.

This conspiracy of one-sided silence is really not good enough. It does Anglo-American relations more harm than good, by concealing from the British public that they will not always be cordial just because they are close. It may be argued that a franker policy would simply provide fuel for Communist propaganda. In fact, indiscretions at the American end already do that.

* * *

Arms for the Middle East

Are the prospects of peace settlements between the Arab States and Israel being impaired by an arms race? The Israelis and the American Zionists say yes, and blame Great Britain for unilaterally supplying arms to certain Arab states, so "enabling them to prepare for a second round in the Palestine war." Mr Acheson and British spokesmen say no, since the arms supplied from the western world are "for internal security purposes only."

The facts are as follows. Since the raising, last August, of the arms embargo imposed during the Palestine war, it has been British policy to continue the sale of new weapons to old customers in the area—to Egypt, Iraq and Jordan. These countries have acquired weapons which include, for Egypt, 110 jet planes and 40 Centurian tanks; for Iraq, 40 jets; and for Jordan an excellent outfit of 4.5 inch artillery. Simultaneously the British have refused to provide either weapons or training facilities to a fourth would-be customer, Israel. The reasons why the Israelis look to Britain are said to be, first, the number of officers on their general staff who learnt their job in the British forces, and secondly, their need to buy equipment from suppliers who—unlike the Americans—manufacture for long wear and no squandering.

The Israelis—who regard recent British policy over sterling releases and over Jerusalem as friendly and accommodating—see in this refusal of armaments evidence of pure prejudice. They can, of course, buy arms elsewhere and are receiving some from America. As they can pay largely in dollars, they are also finding ready sellers among British allies in western Europe, where they can buy some of the British types they want—at a premium. They are also buying in Czechoslovakia.

*

Just as the Israeli public is labelling Egypt as a potential aggressor, so the Egyptian and Arab publics are being encouraged in their fear of Israeli expansion. What can be done to stop this wave of fear and irritation? To any reasonable mind it looks insane. The Egyptians (unlike the Arabs of Asia) never had much heart for the Palestine war. The Israelis, in their present financial pass, cannot afford to spend 30-35 per cent. of their revenue on defence. In theory, therefore, the American and Turkish diplomats who are privately working to bring the two ex-enemies together should not find their task difficult. But Mr Bevin, who supplies arms to one side only, is thought by most of those concerned to be the trouble-maker.

The British dilemma is, of course, serious, and is understood abroad only by perceptive minds such as Mr Acheson's. For in the wider task of organising an anti-Communist front in Asia, it is western policy to make joint defence arrangements with countries like Turkey, Iraq and Egypt. To supply them with arms is to pave the way to the relevant treaties. To do the same to Israel would at the present stage incense Egypt and Iraq. Which, therefore, is to be the priority in British—or rather western—policy: renewed Anglo-Egyptian and Anglo-Iraqi defence arrangements, or a settlement of the aftermath of the Palestine war? In the present state of local tempers, both policies cannot be pursued simultaneously.

* * *

Seretse Khama

The British Government, it was announced in the House of Commons on Wednesday, have decided to withhold recognition of Seretse Khama as chief of the Bamangwato tribe in the Bechuanaland Protectorate for not less than five years and to exclude him for the same period from the Protectorate. There is no doubt at all that, in so doing, the Government have made a bad situation very much worse. The least that can be said is that they have acted with extraordinary clumsiness. Seretse cannot now fail—indeed, he has patently succeeded—in massing enormous public support behind him, even in South Africa. The Government have, in fact, given him much more power to embarrass them—if he chooses to do so—than he would have had unbanned.

But apart from these wider issues, there are three points about the case which still need clarification. First, and most important of all, does a substantial majority of Seretse Khama's tribesmen genuinely support his rule and his marriage with an Englishwoman? Second, was Seretse invited to London without realising that he might not be able to return? (He maintains that he was given a definite assurance that he would be allowed to go back.) Third, to what extent did the consideration of South African opinion affect the Government's attitude?

Answering these questions is not so difficult as might be supposed. By withholding the report of the commission of inquiry which was sent to Bechuanaland last autumn, the Government have made it clear that the Commission must have found that the final tribal meeting which confirmed Seretse as their chief and which approved his marriage was fairly and legally conducted. For, if this was not the case, the Government would have had a watertight excuse for their action. On the second point, Mr Gordon Walker emphatically stated that Seretse was under no illusions about his visit to London and knew that he might not be able to return. Indeed, it would be reasonable to suppose not merely than Seretse foresaw the likelihood of what has happened but also that it would have some advantages for him, since if he was prevented from returning public opinion would be so much in his favour that the Government would be made at least to reconsider their decision. On the third point there can be very little doubt that the present delicate position of all the protectorates and the need to refrain from giving South Africa even the shadow of an excuse for interfering dominated the case. It was clearly the Government's opinion that Seretse Khama had to be sacrificed in order to ensure the security of his country which was threatened by the ex-Regent, Tshekedi—who has also been banished—and by the fears of South Africans.

*

If ever there was a case for masterly inaction, this was it. Left to themselves, the 100,000 or so of Seretse's subjects might have fought among themselves; there might have been ominous rumblings from South Africa; but any positive course by the Government, once the legality of the majority support for Seretse had been established, was bound to cause worse trouble. Let the Government now publish the report of the commission of inquiry, withdraw their decision as best they can and allow Seretse to return. They will look a little silly, but the British Government are massive enough to be able to afford to lose some dignity. The alternative is to face an ugly issue over civil liberty in which they would certainly have opinion throughout the whole colonial empire against them.

* * *

Racial Conflict in Africa

Further evidence of the disturbing growth of hostile racial feelings in East and Central Africa is provided by the reaction in Kenya to the proposed constitutional changes in Tanganyika. Precisely what the proposals were is not known. For some reason the Tanganyika Government did not make them public but circulated them as a confidential memorandum. As might have been expected, they leaked out, and as also might have been expected they aroused immediate opposition among European settlers in Kenya and Tanganyika. From what has appeared in the press it seems that the government suggested that election to the Legislative Council should be made from electoral colleges. African members should be nominated at first, but eventually elected, while non-Africans would be elected from a common electoral role of Europeans and Asians, which, according to the Europeans, would mean that not a single European would be elected to the legislature. In addition, 15 members of the council would be nominated by the governor.

In the absence of accurate information, comment on the proposals themselves must be withheld. In any case, the Governor of Tanganyika has now appointed a committee, consisting of seven Europeans, four Africans and three Asians, to study constitutional reform, and the committee has emphasised that it has not accepted the government's proposals as a basis for discussion. What, however, is significant and disturbing is their effect on European opinion. Settlers in Tanganyika, instead of being content to express their opposition on their own, requested support from the Europeans in Kenya, and the European Electors' Union in Kenya, after a campaign of protest, has passed a resolution that steps should be taken to arrange a conference with Europeans in Northern Rhodesia and other countries to the south—which can only be taken to include the Union of South Africa—to "attain an increasing degree of unity in policy."

There are many Europeans in Kenya who completely dissociate themselves from the electors' union. It is very likely, too, that nothing will come of the proposed conference. Nevertheless, it is disturbing that an overdue constitutional reform in Tanganyika, where at present all the unofficial members of the Legislative Council are nominated, can have the apparent effect of lining up white against black, with the white opposition stretching, or attempting to stretch, from Kenya to the Union. Before such a deplorable situation becomes an irreversible fact, something should be done to lessen the racial tension in East and Central Africa. Part of Parliament's time in the present session might well be devoted to this aspect of colonial policy.

* * *

Not So Divided

The public, by now, has doubtless had its fill of election statistics and their interpreters. There is, however, one potentially dangerous false conclusion that is being widely drawn and which it is worth while trying to correct. This is the belief that the country is not only sharply divided into two almost equal halves—which is true enough—but that each of these halves is geographically compact and socially homogeneous. On the one side, it is being said, are the large cities and the industrial areas, which are solidly Labour. On the other side are the middle-class residential districts and the agricultural areas, which are no less solidly Conservative.

If this were true, it would be very alarming, as it would portend the sort of sharp fissure that leads eventually to civil strife. But it is not true. The MPs elected fall clearly enough into these two groups; such areas as South Wales and Durham are solidly Labour in their representation; Southern England, outside London and a few other towns, returns nothing but Conservatives. But the popular vote, even in these party strongholds, is much more evenly divided. In Durham and Tees-side, which sent back a solid block of Labour members, the Labour poll was only 60 per cent of the total; in the Yorkshire woollen district it was only the merest fraction over half; in the Black Country it was less than 54 per cent; even in the industrial area of South Wales it was less than two-thirds of the whole. It is simply not true that the industrial working class voted solidly for Labour; it did so by a narrow majority only. Similarly, on the other side, in none of the 25 regions for which figures were given in *The Economist* last week, did the Conservatives poll more than 55.1 per cent (except for the special case of Northern Ireland, and even there the figure was no more than 62.7 per cent). Apart from the other special case of non-industrial Wales (where there is a large Liberal vote) the only areas where they fell just below one-third were the Yorkshire coal and steel district, Durham and South Wales. It is a remarkable thing that very nearly one voter in three in South Wales is a Tory and on the south coast is a Socialist. The country is sharply divided, but neither by classes nor by areas.

* * *

Russians in the Shops

The first jubilant reports are now arriving from Moscow describing the effects of the price reductions announced last week by the Soviet Government. It is stated that turnover has already increased by more than one third and that there are goods to buy, although the buying spree cannot be expected to last. As this is the third batch of price cuts since the currency reform of December, 1947, Soviet commentators can urge on their listeners and readers the advantages of living in a socialist economy that moves steadily from strength to strength, untroubled by recurring crises of scarcity or unemployment. The general impression given is that—whatever the real relation between Soviet and western price levels and living standards—Russians are now firmly

launched on the way to the "state of plenty" they have been promised.

The cuts cover a wide range of foodstuffs and consumer goods ranging from bread to "lozenges and caramels unwrapped," from wool dresses to machine-made lace and from sewing machines to opera glasses. The cost of food has been reduced roughly by a quarter and the cost of clothing by 10 to 15 per cent. It is estimated that the cuts represent a saving in expenditure of 110 billion roubles a year to a population of 200 million. After the cuts of 1947 the estimated saving to the consumer was 86 billion roubles and after the cuts a year ago it was 71 billion. Each batch of price cuts has been made possible—it is claimed—by increased production and by successive reductions of the heavy turnover tax which is levied on all consumer goods, sometimes amounting to as much as 90 per cent. The revenue from this tax gives a rough idea of the volume of consumption. In some prewar years it provided two-thirds of the revenue; in 1943, when consumption was at its lowest ebb, it provided only one-third. By 1948 it was providing nearly two-thirds again.

Since the turnover tax is such an important part of the state revenue the government would hardly dare to reduce it appreciably unless it felt reasonably certain that the reductions would be compensated by increased sales. This assumption was to a large extent justified after the two previous reductions, and will presumably be justified again. The price cuts do not, however, necessarily provide conclusive evidence of increases in Soviet production of a number of articles which are known to be imported from the east European countries on favourable terms. The Soviet Government would, for example, hardly be able to cope with the increased demand for cotton textiles caused by a price cut of 15 per cent if it had to rely on output within the Soviet Union.

* * *

What Roubles will Buy

It is difficult but not impossible to estimate the effect of the new price cuts on the living conditions of the Russian people. On the whole, the industrial workers will benefit more than the peasants, probably less so than in 1947 and 1949. The Government evidently feels that the post-war tendency to favour the industrial workers at the expense of the peasants must not appear to go too far. The official directive on the price cuts carefully points out that they will result in "a considerable increase in the earnings of the peasantry" because they will need to spend less on manufactured goods and because "State prices for agricultural produce remain unaltered." But, while the wages of the factory worker remain the same, the peasant obtains a good part of his loose cash by the sale of his own produce in the free collective farm market, where—it is reported—some prices have also dropped by 25 to 30 per cent. Thus he can only take advantage of the reduced prices of clothing and household goods by digging into his stocks and taking more than usual to market.

Moscow Shop Prices*

Goods	New Price in Roubles	% reduction	Equivalent Price in Sterling†

* After price reductions of March 1st, 1950.
† Exchange rate £1=11·20 Roubles.
‡ When available.

To the industrial worker the cuts appear to be pure gain, and there is no doubt that he is much better off than he was a few years ago. A number of important items which are still scarce, such as meat and butter, are still out of the reach of the average worker, but the latest cuts bring a wider range of consumer goods within his means than did the previous cuts. There has been no lowering of monetary wages since the war, although the constant tendency to increase the work "norms" means that the pay packet of the inefficient worker is liable to shrink. The unskilled worker earns from 250 to 500 roubles a month, the skilled worker from 500 to 1,500, and the shock worker and Stakhanovite may earn up to 3,000 roubles.

As there is no real relation between the internal price level and the new exchange value given last week to the rouble, it is difficult to compare convincingly the purchasing power of the Soviet with that of the British consumer. But, making every allowance for this factor, it is clear from the accompanying table that the Russian city worker is still very much worse off than his British counterpart. It is true that the average wage of 600 roubles is now rated as equivalent to £54, while the British manual worker gets about £30 a month. But the fact remains that the Russian worker will still have to give a third of his month's wages for a very inferior pair of shoes. He is also worse off, for instance, than the worker in Western Germany, who now pays sixty times less than he did in 1946 for a pair of shoes while he himself only pays five times less. The Soviet worker, however, is so completely insulated from the west that the only comparison which has any meaning for him is that between his own present and past conditions.

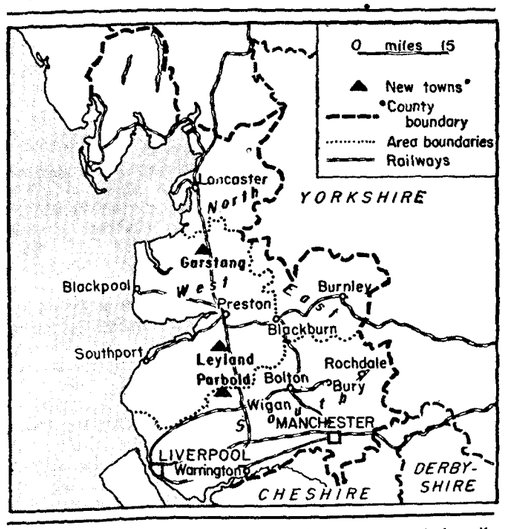
* * *

Manners at Bonn

The manners of German statesmen and politicians in Bonn have lately been insufferable and their tactics short-sighted. Having had, six weeks ago, a rousing exchange of discourtesies with the French over the Saar, they are now staging a second emotional scene, even though French policy has been modified. Dr Adenauer, the Federal Chancellor, has even gone so far as to suggest that there will be no vote in the *Bundestag* for German membership of the Council of Europe unless German claims over the Saar are satisfied.

It is characteristic of German mentality to treat a privilege freely offered as a bargaining counter. How much more seemly and intelligent it would have been if the Germans had bided their time, come into the Consultative Assembly at Strasburg and there tried to mobilise European voices for a new approach to the Saar question, which both French and German public opinions might have been persuaded to accept as a "European solution." By saying they may not go to Strasburg they are not just tilting at the French but also trying to bully the members of the club they want to join.

That having been said, it remains to repeat that the French have been very unwise in raising the whole Saar question, and that the British and the Americans are paying the price of letting the matter drift since the Moscow conference of 1947. The agreements between the French and Saar Governments signed on March 3rd are drafted so ingeniously that any argument about them is bound to become detailed and legalistic. The Saar, in customs union with France, is given autonomy in legislative, administrative and juridical matters—but the French control foreign policy, external security and basic economic legislation. The French promise to support the Saar Government's claim to ownership of the mines—the crux of the whole question—when a peace settlement with Germany is negotiated; but if the claim is accepted, then the new convention about the working of the mines will be extended for 50 years, giving the French virtual control. It is true that the new convention creates a supervisory council of nine Frenchmen and nine Saarlanders (with a French chairman) with wide advisory powers; but the fact remains that the mines will be run by Frenchmen and with the help of investments amounting already to 12 billion francs.



What precisely does this arrangement represent? Is it the kind of association which we are to understand by "union" or "integration"? It is said that the French have given up their claim to a lease of the mines; but what is it they have now, and believe they will keep after the German peace treaty is signed? So long as the Germans argue that this is not the way to do things if western Europe is to be drawn together, they had a good European case; by thumping the table and appealing to the passions that the French have such reason to hate and dread they have spoiled it and forfeited much sympathy.

Planning in Compartments

All county and county borough councils are obliged, under the Town and Country Planning Act, 1947, to submit development plans for their areas by July of next year. When this has been done, and the plans approved, the whole country will be covered by planning schemes, to be revised every five years, which will guide the general course of future development. Lancashire county council is one authority which has taken the wise course of issuing a preliminary plan for discussion, before proceeding to its main task.

Lancashire contains five million persons, but three million of them live in the 17 county boroughs which are separate planning authorities. It is the congested and blighted living conditions in many of these county boroughs which present the main problem. The population is heavily concentrated in the south of the county, round Manchester and Liverpool, where there is a serious lack of suitable building land to relieve the overcrowding in the towns. The area around Merseyside is of excellent agricultural value, other land is liable to mining subsidence, and "few sites can be found within 25 miles (of Manchester and Liverpool) for any new settlement on any large scale."

Eventually, it is estimated that room must be found for almost 600,000 people from the county boroughs. The county's plan suggests that about half of them should be accommodated in what are described "short-distance reception areas," and that another 118,000 should go to three new towns at Parbold, Leyland and Garstang. Some of the remaining surplus population would find a home in Cheshire. The plan asks for an early decision on the building of the proposed new towns.

This is an ambitious plan. But is it a wise one? It provides enough land, within the county of Lancashire, to meet the housing needs of Manchester and Liverpool for over 20 years; but these two towns border on Cheshire and much of their rehousing—at any rate during the first period—should surely take place in that county rather than on remote sites such as Garstang. The problems of South Lancashire extend beyond the county's borders and concern a large number of planning authorities, counties as well as county boroughs. The Lancashire plan may be the best that could be produced in the circumstances, but on the surface it looks like an example of the dangers of planning in compartments.

The London Traveller

In nearly all discussions of London life and labour the cost of the Londoner's travel figures prominently—a cost not only on the public and private purse, but on legs and arms, patience and health. The arguments of social and financial cost have so far been inadequately documented by facts and the London Transport Executive is, therefore, to be congratulated on a valuable sample survey, published last week,* and covering nearly 3,000 families.

Those who wrestle daily in bus queues or dangle precariously from straps will be surprised to know that 45 per cent of all households have no member travelling regularly to work by public transport and that out of every 100 Londoners at work 17 walk and 14 bicycle to it. They will, however, confirm from personal experience London Transport's statement that travel has increased by about 45 per cent since prewar days. The war accelerated the drift out of central London; prosperity has maintained it. Whatever joys the outer suburbs have to offer they certainly have increased the toll of time and money in travelling across and to the centre. The average Londoner takes 42 minutes to get to work and walks for 9 of them: he spends 4s. 1d. a week doing so, and the average expenditure of his household is 6s. 5d. a week. The better off who live farther out, spend more. The bus is far and away the major public carrier: of those who use public transport 55 per cent go by bus, 20 per cent by trolley-bus, 8 per cent by tram and 17 per cent by Underground. London north of the Thames has a significantly larger number of well-to-do families than south of the Thames, yet the average weekly expenditure per household on transport is well below the average of those living in the south.

The survey is a mine of interesting information of this kind which should be of value not only to London Transport but to all those concerned with the replanning of London. On the whole the average expenditure in cash is less than is commonly supposed and the expenditure of time and energy greater. That an average of 84 minutes a day should be spent under conditions often worse than those provided for travelling cattle should be a telling argument for the advocates of decentralisation. But until the new towns get a move on, Londoners will still agree with Macaulay that

> "An acre in Middlesex is better than a principality in Utopia"

* London Travel Survey, 1949.

although Macaulay never visualised even through the eyes of his amazed New Zealander anything comparable to the District Railway on a wet November evening.

* * *

Calories and Food

The report of the British Medical Association's Committee on Nutrition is for the most part a highly technical document, phrased with the utmost scientific caution, dealing with the quantity and quality of Britain's diet over the last ten years in terms of calories, proteins, vitamins and other constituents less familiar to the layman. The tentative conclusions—tentative both because of the margin of error in consumption statistics and because the scientific evidence regarding requirements for health and activity is by no means final—is that both in quantity and in quality the British diet is physiologically adequate. It would, in the authors' view, be a mistake to credit entirely to "nutritional improvements" the gain in the nation's vital statistics over the period in question—which has also seen the development of the antibiotics—but the policy of fair shares and special allocations for special needs gets a good mark.

The committee is, however, not so exclusively interested in the physiology of calories as to neglect the psychology of food. The dreariness of shopping, the impossibility of home entertaining, the vileness of institutional cookery and the general joylessness of the Briton's three meals a day are given as much weight in their conclusions as are the nutritional merits of the actual ingredients. They recommend that further information should be sought, in the interests of a scientific nutrition policy, about the consumption and the needs of various groups, notably industrial workers; but for more immediate benefit they suggest a meal service for old people, the provision of an equivalent of canteen meals for workers without canteen facilities, the restoring of the concession by which school milk used, during the holidays, to be made available at home, the improvement of hospital catering by special staff appointments, and more realism (based on better knowledge of home facilities) in the teaching of cookery. It is, in fact, in the handling, treating and serving of food that improvement is most urgently needed, since the likeliest cause of dietary deficiency, given the supplies now available, is not inadequate calories, but the sheer impossibility of swallowing enough of the dull or disgusting viands in which they are embodied. A meal consisting of fish sausage, watery potatoes, processed peas, macaroni pudding and wormy apples may be, on paper, nutritionally adequate. But to be actually nourished one must actually eat it, a penance which may well be broken off before the requirements of an active life have been properly met. The new Minister of Food has declared that he will talk about food rather than calories. It is pleasant to find that even the most calorie-minded of experts agree with his outlook.

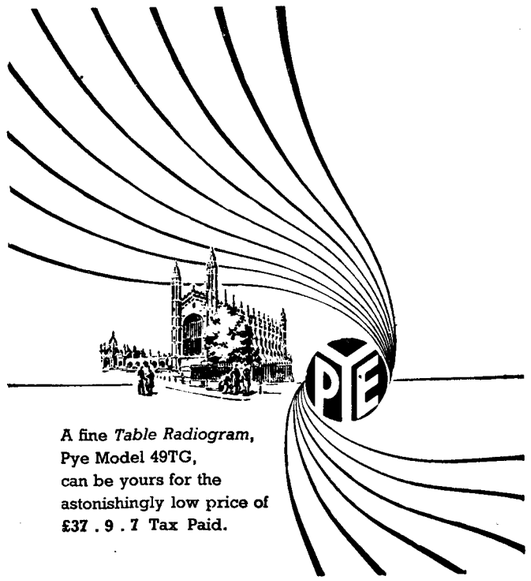
* * *

Hard Words on Soft Drinks

"If I had a thousand sons," said Falstaff, "the first human principle I would teach them should be to forswear thin potations." For "thin potations" read "soft drinks" and hosts of Frenchmen will—it appears—stand shoulder to shoulder with Sir John. Their representatives in the Chamber see in the American Coca-Cola a threat to the French way of life. Even *Le Monde*, commenting both on the beverage and the publicity made for it, has said gravely that "the moral landscape of France is at stake." And so it is that the Council of the Republic has had before it and rejected a Bill, passed by the National Assembly with a show of hands, that would give the Ministry of Health unlimited discretionary powers over any beverage "derived in whole or in part from plants or vegetable extracts." Coca-Cola is not mentioned by name, and the Minister would have to consult the Council of Hygiene and the National Academy of Medicine, but everyone knows what is intended.

It is not easy to separate the streams of interest and indignation that have poured into the resistance movement against "coca-colonialism." The winegrowers in Hérault appear to have made the first protests in defence of wine; presumably it was not they who argued that Coca-Cola is injurious to health because they themselves produce local wines whose effect on the liver cannot be entirely in the national interest. Then the Communists took up the defence of national health and the attack against "American imperialism" and soon had the press in full cry. Then the Prime Minister's own Progressive Republicans got involved and a Bill was sponsored by their M. Boulet from Montpellier. But M. Boulet soon found himself attacked from the flank by the Communists, who moved an amendment to his Bill naming Coca-Cola and banning it under the terms of the law. This, of course, had to be opposed, because the measure would then have constituted discrimination against an American product, which is ruled out by existing trade agreements.

So a new and not altogether minor action has begun in the cold war. The French having let off steam, and the Americans having had immense free publicity, they should call it a day. For any law that is passed can be evaded—for example, by adding rum—and any reprisals by the Americans will delight their enemies in France.



The Depressed Islands

We learn with pleasure, from the journals brought by the last mail from the West Indies, that the dark views in which the colonists rather delighted to indulge, are giving way to brighter prospects. They deemed themselves injured, by not being allowed to have their own way; and they were resolved, whether or not, to be ruined. To all our admonitions, and the admonitions of their other friends, they sulkily turned away. . . . They regarded all those who took a different view from their own as their enemies, and persisted in believing themselves for ever undone. What reason and experience could not effect, circumstances have brought about. The discovery of gold in California, which has driven so many other people wild, has helped to restore them to their senses. The most despairing of the islands was Jamaica, and Jamaica was soon visited in consequence of the discovery by a regular packet from the United States, on its way to and from Chagres. That circumstance was a novelty—it excited surprise—gave a stimulus to hope—and awakened the people, as from a dream, to a sense that it was yet possible to live and flourish. They were astonished, too, by the eulogies bestowed on the island by the keen, shrewd Americans. Nor was just reproof omitted, and their distress was by the Yankees plainly traced up to their extravagance, and they were told so. They were made sensible of their own sources of wealth by descriptions of them which appeared in the American newspapers, and were reprinted in the journals of the West Indies; and they were roused into emulation when several Americans came forward, and proposed to establish a company, and raise a million of dollars, to work their copper mines. . . . The Americans discovered, too, as many English residents have discovered, that Jamaica possesses a fine climate, which might recruit the wealthy New Orleanists, glad to escape from the contagious marshes of the vicinity of their abode. . . . All at once the inhabitants of Jamaica appear to have awakened to a new life, and are indulging in large hopes of the most substantial kind.

Letters to the Editor

Egypt's Sterling

SIR,—I have been surprised to read in your paper an article from a correspondent entitled "Egypt's Economic Prospects" which contains a number of inaccuracies. For example, the article states that "an increasing proportion of the country's trade is now carried on through multi-angular barter deals devised by the quick-witted Levantine arbitrageurs of Alexandria and Cairo." In fact, the so-called triangular transactions, so long as they were permissible under the Anglo-Egyptian Financial Agreement, were carried out in the opposite way: it was not the "Levantines" who were bartering away sterling against dollars but traders in certain western European countries who had an interest in selling dollar goods against Egyptian sterling. Since last year's agreement was signed in Cairo on March 31, 1949, such transactions have not been allowed by the Egyptian Exchange Control and the Control would be very much obliged to your correspondent if he would quote some of the clandestine sterling transactions which, according to him, "constitute an increasing proportion of the country's trade." Otherwise I must take it that he has been using your columns to spread a piece of unfounded gossip and would quote some of the clandestine sterling transactions which, I would ask you to publish an appropriate correction. Of course, no Exchange Control can be absolutely watertight: but you may be interested to know that Egypt has been recently informed by the British authorities that she has carried out most loyally the terms of the agreement in regard to triangular transactions and that there is no warrant for the critical references in the London press, which your correspondent is repeating. For further details on the subject of triangular trade I beg to refer you to the comments in the Bulletin of the National Bank of Egypt, No. 3 of 1949, pages 112-14.

Your correspondent has also put a completely wrong interpretation on the figures published in one of these Bulletins and showing that there was a difference of £10½ million between the official foreign trade returns for exports and the country's receipts in foreign exchange from exports. This amount does not represent the sums that have "escaped the net," as your correspondent puts it, but is a discrepancy due to time lags, different valuations, price reductions between the time of export and the moment of actual sale, and other such factors. The figure given in the Bulletin for export proceeds outstanding (between £10-11 million) is the total not yet repatriated since the export control was introduced in 1940. You will agree that the sum is rather small in comparison with an export turnover of some £140 million a year. It will be remembered that the permissible time lag between the date of exports and the repatriation of proceeds is six months.—Yours faithfully,

N. KOESTNER,
Adviser to the Director General of Exchange Operations
National Bank of Egypt

SIR,—The note which appeared in your issue of February 18th, entitled "Egypt asks for Gambling Money" seems to lack the objectivity which one expects from *The Economist*. Commenting on the recent purchase by the Egyptian Government of $25 million of gold and $22 million of US Treasury Bills, you say "These purchases, ostensibly designed to provide a solid basis for the currency, are evidently almost entirely speculative. . . ."

In support of this statement, you say that Egypt is reported to be "exporting the gold (at fancy prices) in the slightly ludicrous form of large gold ash trays." Egypt has for many centuries been famous for its craftsmanship in precious metals and recently arrangements were made for the development of gold manufactures (mainly by a local subsidiary of a well-known British firm). But these arrangements provide for the import, under licence, by the firms concerned, of gold ingots, financed by their clients abroad, and these imports and the subsequent exports have no connection whatsoever with the recent Government purchases. The business has resulted in the receipt of some $500,000 to the Egyptian exchange control during the past six months and an equivalent profit in Egyptian pounds to the firms concerned: and there seems nothing particularly "ludicrous" about it.

On this flimsy basis, however, you question the veracity of the press statement issued by the Egyptian Government which explained the object of the purchases in the following terms:—

> "The circumstances of the first world war necessitated most of the cover of the Egyptian currency being formed of British Treasury Bills. The situation remained unchanged until, after the second world war, the cover was frozen or blocked as the result of the non-convertibility of sterling. Up to the present no action has been taken to change the system and to replace it by another which would lead to the consolidation of the Egyptian currency with gold or foreign exchange convertible into gold, as well-known foreign experts, like Monsieur Van Zeeland, recommended. The present Government considers that the moment has come to undertake this consolidation and to connect our currency again with gold."

The statement concluded by giving details about the gold and US Treasury Bills purchased and stating that both were deposited with the Federal Reserve Bank in New York.

This is a perfectly straightforward statement. For more than thirty years, Egypt has kept her reserves in London. But since the blocking of her sterling assets, is it surprising that she should seek to strengthen her reserves of gold and convertible currencies? And if she can gradually build up such reserves, by economising her dollars, surely no exception can be taken to her policy? It is precisely what the United Kingdom is also doing, and no one criticises her for doing so. How far Egypt can afford to carry out this policy remains to be seen. She has certainly no plethora of dollars. In 1948, despite the fact that she has few raw materials and practically no manufacturing industries, her dollar expenditure represented less than £1 per head of her population, while the United Kingdom, with her magnificent industrial equipment and command of sterling raw materials, spent the equivalent in dollars of no less than £8 per head of her population. The United Kingdom, of course, maintains a much higher standard of living than Egypt does, but this is surely not a very good ground for refusing any releases in convertible currency to Egypt. I do not know who can judge impartially the comparative needs of the two countries: but there is clearly no justification for the statement that Egypt is asking for dollars "for speculative purposes."—Yours faithfully,

F. W. LEITH ROSS

[The article and the note to which the above letters respectively refer appeared in different issues of *The Economist*, were written by different hands (the former by a correspondent) and were based on information derived from different sources.

Our correspondent who wrote the article to which Mr. Koestner's letter refers informs us that he is disposed on reconsideration to agree that the phrase "an increasing proportion" was an overstatement. Nevertheless, as Mr Koestner states, no exchange control can be watertight, and deals of the character referred to certainly continued throughout last year. It was in March, 1949, that in an effort to stop three-angled deals of this kind, the British authorities insisted that the use of transferable sterling should be limited to direct transactions ; their first step in this direction was the limitation imposed upon Egyptian sterling. But it is only much more recently that similar arrangements have been made with all other transferable-account countries, which means that until lately there was scope for triangular operations of this kind initiated for European countries but with a ready Egyptian participant at one point of the triangle.

As for the "wrong interpretation" placed upon the figures published in a number of the National Bank's Bulletin (Vol. II, No.

2 of 1949, page 67) it is a pity that Mr Koestner's present contention was not there made clear. As published, the paragraph certainly lent itself to the interpretation put upon it in *The Economist*.—EDITOR.]

No Easy Way

SIR,—Your pessimistic analysis of the future of the Liberal Party is apparently founded on the assumption that a goodly portion of the nation cannot be influenced by intelligent argument, by imaginative leadership or by a combination of the two. Had such an assumption been accepted by philosophers and statesmen throughout the last 2,000 years, for example, I wonder what sort of a world we should be living in today.

The fact that there is no easy way back to power for the Liberal Party offers, I submit, the best hope of a bold and convincing educational offensive capable of perceiving in every obstacle an opportunity to prove the Liberal case.—Yours faithfully,

GERALD SAMSON

Vincent House, Pembridge Square, W.2

SIR,—You write as though the "Liberal voice" can only be heard through the Liberal Party. Surely this is to attach an absurd significance to mere names. The Liberal voice, so-called, can be heard wherever there are people with Liberal opinions and tongues to speak. It can be (and is) heard inside the Labour Party and inside the Conservative Party and surely those are the right places for the remaining Liberals to go to, to prevent either party becoming too extremist. Our constitution only works properly on a pro-party basis when there is not too big a cleavage between the parties' viewpoints. One cannot help feeling it is a desire for personal self-importance on the part of the Liberal leaders and the young men who stand for them in the constituencies (coupled with some good old muddled thinking of the sort condemned in my opening sentences) which prevents the obvious and desirable consummation, already largely achieved, from being wholly achieved.

I am a civil servant and therefore lack political opinions and sign myself.—Yours faithfully,

MODERATOR

Development of New Drugs

SIR,—May I be permitted to point out an omission from the article in *The Economist* of February 25th. Your contributor made no reference to the developments taking place in the application of homœopathic medicinal drugs under scientifically controlled research. There is no specific antagonism between the so-called allopathic drugs and those substances known and classified in the Homœopathic Pharmacopœia, but it is of great importance to note that homœopathic drugs have all been proved on healthy human beings, their symptomology carefully listed and the expected results when given to a sick human scientifically tabulated. Moreover, unlike the "after-effects" of empirical dosages of say "M. & B." (known only too well to influenza victims this past winter), which result in long periods of convalescence from business and employment, the homœopathic drug not only helps cure but leaves no bad after-consequences. Many of your industrial readers will be interested to know that, where homœopathic medicines have been used by doctors and first-aid teams in factories, the loss through absence after injury, or from "cold" epidemics, has been greatly reduced; the economic consequences therefore are of great importance.

It is relevant to inquire whether the "research" now being carried out into "new" drugs is being rightly directed when the existing range of homœopathic drugs, fully proved and tested, is ignored by the majority of pharmacologists.—Yours faithfully,

A. W. HOPKINS, Hon. Treasurer

British Homœopathic Association, 43 Russell Square, W.C.1

A CONTRIBUTION TO THE THEORY OF THE TRADE CYCLE
By J. R. HICKS. 10*s. net*
The author seeks to elaborate a hypothesis which may well account for most of the common features in the business fluctuations of modern times. Keynes has shown us why business activity varies; but he has not shown why it is that the variations tend to be cyclical in character. The explanation here advanced is based upon the so-called Acceleration Principle; but allowance is made for the consequences of this principle being at work in an advancing economy, of its being subject to complex lags, and of an asymmetry between its behaviour in booms and in slumps. Monetary disorders are viewed as a distinct cycle-making factor, which may or may not be important, but which does account for the severity of particular depressions, such as that of 1930-4.

Solitude and Wisdom

"Switzerland. A Democratic Way of Life." By André Siegfried, translated by Edward Fitzgerald. Jonathan Cape. 223 pages. 12s. 6d.

WHEN this book was first published in Switzerland some eighteen months ago it gave great pleasure to the Swiss, and the introductory quotation from La Rochefoucauld, "*C'est une grande folie de vouloir être sage tout seul*" could be heard at every dinner-table—quoted approvingly, for the Swiss are glad to be found wise, and are incapable of believing that it is ever a folly to be unique in anything. It is a good thing that there is now an English edition, for the books on Switzerland that are available to the English tend to be either offshoots of tourism or else ponderous tomes on political science, and M. Siegfried's essay is certainly neither of these. It leans, admittedly, to the latter, since M. Siegfried confines himself to the political, the social and the economic; the artistic creations both of man and of nature are outside his framework. But there is nothing heavy about the treatment. It is, indeed, a little too light; more even than M. Siegfried's other books, this one does not get beyond annotated description—a much more urbane and epigrammatic Gunther. It is really rather a pity that a book of this sort about the Swiss should be written by a Frenchman. For however cosmopolitan he may be, he can never wholly divest himself of the unquestioning belief in the superiority of French culture that was bred into him ("a culture of the Latin or Mediterranean type has a dynamism in the battle of ideas which the races of the north lack") nor can he entirely conceal his opinion that the Swiss are a bit dull. So they are; but the fault is not quite so unforgivable as it seems to a Frenchman.

For those nevertheless who want to know more about Switzerland than can be seen from the train window, M. Siegfried has provided a most agreeable introduction. He makes no mistake about the essential point—that the stability and moderation and equanimity of the Swiss do not arise out of any sameness about them, but on the contrary out of a conscious act of collective willpower in maintaining an equilibrium among the sharpest contrasts. Just how sharp those contrasts are is not often realised outside Switzerland. It is indeed remarkable, after so many centuries of such intimate intercourse, that the language frontier should still be so definite as to be visible to the naked eye. It is even more remarkable that, among those who speak the same language, religion should still be as localised as ever. The cantons of Vaud and Fribourg are both French-speaking and they lie side by side—it is only 40 miles from Lausanne to Fribourg—yet Vaud is to this day 82 per cent Protestant and Fribourg is 84 per cent Catholic. Switzerland is the most up-to-date country in the world in all technical matters; but women neither have the vote nor, it would almost appear, do they desire it. It may be that in this combination of nineteenth-century ideas with twentieth-century techniques lies a great deal of the Swiss secret. The results are at least productive of more contentment than the opposite combination to which Switzerland's neighbours in western Europe seem to be addicted—that of twentieth-century ideologies with nineteenth-century economic techniques.

Puritan Diplomat

"John Quincy Adams and the Foundations of American Foreign Policy." By Samuel Flagg Bemis. Knopf. 588 pages. $7.50.

THE crowning glory of John Quincy Adams came to him as the Old Man Eloquent of the anti-slavery controversy. This was after he had retired from the career as a diplomatist which had culminated in the White House and which, in itself, would have placed him in the front rank of American statesmen.

Family heredity determined that John Quincy should make his mark in foreign affairs and that his career in domestic politics should be that of a nationalist rather than a high Federalist. He always put national interest before party loyalty, and he broke with the Federalists by supporting Jefferson in the conflict with Great Britain which led to the War of 1812. It was as spokesman of American interest against the encroachments of the Old World that Adams attained national leadership; and as the brilliant expert and forceful delineator of the field of American interests Adams formulated the basic principles of American foreign policy.

The assertion of American national interest was no easy task. It took a generation before the relations between the ex-colonies and Great Britain could be redefined, and the constant pressure of European powers to draw the United States within their orbit put great strain on Washington's policy of non-entanglement. In Professor Bemis's deftly written pages we see Adams holding out for American rights and insisting on an independent sphere of influence for the Republic Aware of the importance of the hostage of Canada for the good behaviour of the British fleet, he was always prepared to take an independent line with Downing Street. It was Adams who was responsible for the Monroe Doctrine's being an unilateral declaration of policy instead of "a cock-boat in the wake of the British man-of-war." His success derived from his vision of the United States as a continental power. The first to believe fully in America's manifest destiny, he set the bounds of its national interest, not at the Mississippi, but at the Pacific. Where American rights were concerned he was a prickly negotiator; but his instincts were sound, and foreign statesmen, from Canning to Onís, came to treat him, and through him the Republic, with a new respect.

Adams's achievement is admirably set forth by Professor Bemis, who is a past-master at the unravelling of diplomatic negotiations. He is helped by the rich mine of Adams's own writings, for he has left a personal record from which the story almost writes itself. But it has dangers, especially for American biographers who often see the patriot first and the man only second; and in this case Adams is taken at his own valuation. As both a puritan and a child of a revolutionary generation he too often equated American interests with moral righteousness. For Adams American national interests were those of a superior nation, the unique exponent of a higher order of political life. The defence of those interests was therefore a moral duty. The principle of the freedom of the seas was not only the national interest of a trading nation with a weak navy, but a morally elevating principle. The Monroe Doctrine was a splendid gesture against the power politics of Europe, although it meant little without its unspoken corollary, the friendly British fleet. Where national interest appeared to conflict with moral principle, as, for a time, in the case of impressment *versus* slave trade, the latter was sacrificed. Thus in addition to Adams's basic principles of foreign policy as enunciated by Professor Bemis there should be added this "holier than thou" overtone which also was to become part of the American tradition. As a good puritan Adams was incapable of disentangling his motives. It is a pity that his biographer should not have felt able to disentangle them for us. To have done so would have brought to life not merely the patriot but the man.

War's Aftermath

"Island Administration in the South-West Pacific." By Cyril S. Belshaw. Royal Institute of International Affairs. 158 pages. 12s. 6d.

MR BELSHAW is an ex-District Commissioner from the Solomon Islands which, with the New Hebrides and New Caledonia, forms the subject of this essay. He writes too much

in sorrow and too little in anger, trying to be objective about the humiliations and frustrations which have always been the lot of conscientious and progressive officials in these areas. He also falls awkwardly between the two stools of a straightforward historical study and a discussion of administrative and economic remedies that might be applied. The main value of this book is that it gives a concise and well-documented outline of one of the most intractable colonial problems of today.

The South Pacific leapt into fame during the war when a combination of American, Australian, New Zealand and Fijian forces drove the Japanese army of occupation out of the Solomons, and a number of huge American bases were established on the islands. The strategic importance of these varied and widely scattered island colonies was thus brought home to the world. Before that they had been left, as Mr Belshaw reminds us, to the tender mercies of the most blatant administrative ineptitude (in the British Solomon Islands), the most heartless capitalist exploitation (in French New Caledonia and elsewhere) and the scandalous mockery of government in the Anglo-French condominium of the New Hebrides. They were also areas of ruthless missionary imperialism, with the different denominations competing with one another and exercising considerable political influence behind the scenes. "Blackbirding" depopulated the New Hebrides in the nineties and labour recruitment, even as carried on under stringent control in the British possessions, had a deleterious effect on native village life. There were also severe economic handicaps. New Caledonia's nickel mines, worked with indentured Asiatic labour, brought profits to overseas shareholders but contributed inadequately to local revenues. Copra, the main export crop, largely plantation produced, suffered from the fluctuations of world prices and from lack of organised shipping facilities. And to these were added the physical difficulties of communications by sea and the administrative difficulties posed by the exceptional tribal fragmentation of the native peoples. It is little wonder that the latter were either apathetic or frankly hostile to their European rulers. The Americans, Mr Belshaw records, had a shattering impact on this situation, both on account of their phenomenal supplies of mechanical equipment, tinned food and so forth, because of their extravagance in the payment of labour and in the purchase of curios, and because of their arrogance and irresponsibility. One result was a postwar "home rule" movement led by ex-servicemen with an element of mass hysteria in it and a belief in a coming American millennium as its rallying myth.

This is the background to the remedies suggested by Mr Belshaw. He would like to turn the Solomon Islanders into peasant farmers and reorganise their administration so as to give them a voice in it. A good point he makes is that the newly aroused demand for education, high money wages, and expensive manufactured goods like lorries might be exploited as an incentive towards economic and social advance. He is justifiably cautious about the benefits that might come from the South Pacific Commission established in 1947.

Reference and Text Books

"Yearbook of the United Nations, 1947-48." HM Stationery Office. 1126 pages. 80s. $12·50.

THIS yearbook surveys all the activities of the United Nations and its thirteen specialised agencies during the period from June 30, 1947, to September 21, 1948. It is arranged on the same general plan as its predecessor (which covered the United Nations from its inception up to July 1, 1947), but it quite rightly devotes more space to the activities, decisions and achievements of the various organs, and less to accounts of their origin, development and structure. Where necessary, the reader is referred back to relevant passages in the first yearbook; and unlike its predecessor, this volume contains full reference to the original documents, thus greatly enhancing the value of the series as an authoritative sourcebook for students of the United Nations.

"United Nations Statistical Yearbook, 1948." HMSO. 482 pages. £2.

THE first issue of the United Nations Statistical Yearbook, which is to be published annually, takes the place of the Statistical Yearbook of the League of Nations, last published in 1945. As was the case in the League Yearbook, the information is given in both English and French, and covers most countries of the world.

Most of the tables give figures from 1928 to 1948, and where changes in territory have affected the comparability of national series, these have been pointed out. Far more information is given than in the League of Nations Yearbook, and in much clearer form. Sections which were dealt with previously are more comprehensive, and there are many additional sections, including ones on transport and communications and social statistics and education. The difficulties of attempting to present figures from different countries on a comparable basis are great, but the scope of each country's figures is usually made clear by adequate footnotes. Some of the tables which are said to appear to have "restricted coverage" are published in the hope of encouraging the collection of more useful data by more countries.

"Sources of Statistical Information." Reprinted from the Journal of the Royal Statistical Society. Price 1s. each.

THE Royal Statistical Society has begun the publication of a series of papers on the statistics of the United Kingdom. Each paper contains details of the information available, its collection and interpretation and gives a bibliography of sources of information. The papers are reprinted from the Journal of the Royal Statistical Society and the complete series will number between 30 and 40. Those already published include: The Overseas Trade Statistics of the United Kingdom, by A. Maizels; United Kingdom Merchant Shipping Statistics, by M. G. Kendall; Statistics relating to the Coal Mining Industry, by R. F. George; Medical Statistics, by M. Greenwood; and Statistics of the Censuses of Production and Distribution, by H. Leak.

"Ranking and Spicer's Company Law." Edited by H. A. R. J. Wilson and T. W. South. HFL (Publishers) Limited. 496 pages. 21s. net.

THIS, the eighth edition of the standard work, has been recast and rewritten to incorporate the effects of the passing of the Companies Act, 1948. The new act is dissected and difficulties of interpretation laid bare both for the student and the professions.

"Butterworths Company Precedents. Volumes I and II." Edited by Ralph Sutton and W. J. Williams. Butterworth and Company. 1380 pages. In two volumes price £6 6s. per set.

THIS systematic and erudite outline of the effect of the Companies Act, 1948, section by section, is admirably documented with relative precedent and cases in this standard work.

"Companies and Company Law." By A. C. Connell and A. T. Purse. 6th Edition. Pitman. 537 pages. 15s. net.

A FULL and expert discussion of the existing corpus of company law in a practical setting. The changes wrought by recent legislation are explained with documentation of cases and an appendix incorporating the full Companies Act, 1948.

"The Book of the Stock Exchange." By F. E. Armstrong. Pitman. 448 pages. 30s. net.

THE fourth edition of Mr. Armstrong's story of the Stock Exchange relates closely to the previous editions in its exhaustive treatment of the mechanics of an institution keeping pace with the needs in the changing financial and economic environment. The book in its new edition frames in the old context the adjustments made necessary by war conditions and the subsequent adaptations to the new normalities of the postwar world. It is addressed first to those who would understand the *modus operandi* of the machinery of Throgmorton Street, but its lesson, epitomised by the Stock Exchange motto *Dictum Meum Pactum*, is of broader interest, and as such it will command a wider audience than brokers, jobbers and their minions.

"Group Accounts." A Complete Manual on Consolidated Accounts by D. J. Bogie. Jordan and Sons. 333 pages. £3 3s.

THE practical compilation of consolidated accounts is approached in a novel way in this textbook. It advances from an explanatory clearing of difficulties for the student, to the technique required for solution of the most advanced problems facing the practising accountant.

AMERICAN SURVEY

The New Normalcy

(From Our American Staff)

REPORTERS were straggling away from the White House after a Presidential press conference. "What an inconsequential little man he is," murmured one of them, "except in November." This comment was made before Mr Truman's unprecedented giving of an exclusive interview to Mr Arthur Krock of the *New York Times* enraged the rest of the press corps, and it accurately reflected the sense of unimportance which pervades Washington this winter. To be of Cabinet stature these days one does not have to be a very big man. Mr Acheson is an exception, and the controversy over the wisdom or unwisdom of his comments on the Hiss case has been exacerbated by his rather lonely prominence. The American Legion atmosphere is perhaps densest around the Defence Department, but the impression of government by buddies is not confined to any one place.

Normalcy is, of course, nothing new to Washington. If the city as it was five years after 1918 is compared with the city as it is five years after 1945, the present is much to be preferred. While there is no written law under which the doings of political promoters can be examined and regulated, the sale of political influence has been greatly reduced since President Harding's time, and is far less lucrative: today the "five per centers" are reproved for making as much as five per cent.

Furthermore, while the official world today may contain too many second-raters, at least few of the second-raters can be charged with being stooges. The time may not be far off when the Democratic Party will have to face some of the problems that the British Labour Party has before it now, and that the Republican Party had before it at various times in the past. But up to the present, the fact that American labour has no central, all-inclusive organisation has made it necessary for the Democratic leaders to seek support, both in votes and in money, among a number of trade unions and political agencies of unions, rather than from one centralised source. Thus, while the prevailing political climate is friendly to labour, the Democrats have not yet become a political front for a single economic group. To go back to a still earlier period of normalcy, there is now no single figure in politics with influence comparable to that exercised by Mr Mark Hanna, on the Republican Party and in the interests of big business, during the McKinley era of the eighteen-nineties.

However, a comparison between the present and previous periods of normalcy breaks down entirely when it comes to the relative size of government operations in respect to the American economy. President Truman's 1950 budget calls for the spending by the government of some $43 billion; the American economy is now producing at an annual rate of $255 billion. President Harding's 1923 budget took just over $3 billion out of a gross national product of $85 billion. Moreover, $31.7 of Mr Truman's billions are for military account; the defence of the Republic was thought to require only $x billion in Mr Harding's time. Nowadays, the defence establishment initiates decisions that affect the individual futures of every family, the purposes for which major portions of the national resources shall be used, and the continuance of the American way of life, both in terms of strict survival, and in terms of the distinctive quality given by the political and economic principles on which it is based.

Decisions on such a scale require first-raters to make them; yet some of the key posts in the defence establishment remain persistently vacant. In addition, a further large part of the budget, which existed only in embryo in Mr Harding's day and which is highly important both to the individual American and to the economy as a whole, is the group of programmes contributing to security in its non-military sense: on the farm and in the home, against disability, unemployment and old-age. Decisions of wide moment are being made in Washington on these matters as well.

*

Perhaps it is more accurate to say that big programmes dealing with all these matters are being administered in Washington: whether decisions are being taken on them is less certain. On the executive side of government, the new leads which have been given this winter, the evidences of forward thinking, can be counted on the fingers of one hand. On the legislative side, ever since the reconvening of Congress it has been clear that the main object of the session would be to get nothing done; the Republicans are against most of what has been proposed, and the manner in which the Democrats have made the proposals has shown that it is upon their "repudiation" by the Republicans, rather than upon their enactment by the Democrats, that the Democratic campaign is to be based next autumn.

It is privately agreed in Washington that the European recovery programme for the coming year will have to be given new and different content, but the strategy is evidently to get the new appropriation on the old basis, and work out a new one later on. Since no Bills on aid to education, health and such things are likely to pass this session of Congress, there is little discussion on what a good Bill on those subjects should contain. Congressional hearings are sparsely attended, with no one listening very hard. The alternation of power between President and Congress, depending on which is weak, is a well-known feature of American political life. When both are in the doldrums, a third contingent is likely to be heard from—the public: it has already shown its concern by the numerous queries in

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

the press on the condition of American defence, which began with the hydrogen bomb decision.

This is the reaction to the new normalcy in March. Will it affect the voting in November? From Maine to California, Republicans are wistful. They see their opportunity; with Senator Lodge in the March issue of the *Atlantic* magazine, they would like to "modernise the GOP." But for the most part they are defeatist, sure that the Republican elephant never forgets, and doubtful if he ever learns.

Meanwhile, the Democrats are repairing their regional fences. They began with their hardest area: the South. At the meeting held in Raleigh, North Carolina, at the end of January, Vice-President Barkley and his bride were there to sprinkle the sweet water of harmony over the invited guests who came. But the rebellious Dixiecrats would not come; the non-Dixiecrat conservative Democrats would not come; the liberal members of the party who do not hold office could not be invited, because it might then have become necessary to invite, and so provide a platform for, Mr James Byrnes, once Secretary of State, now out of office, but on the way to becoming a Dixiecrat. The spread between the northern and southern wings of the Democratic Party, on civil rights for Negroes, was demonstrated not only during the recent debates in Congress on the Fair Employment Practices Commission, but also at a recent session of the Democratic State Committee in Alabama. There, the emblem of the Democratic Party is a rampant rooster; above him are the words "For White Supremacy"; below, "And The Right." At the meeting, where lines were drawn for the coming fight between Democrats and Dixiecrats for control of the party machine in the State, the chairman touched off a controversy about the emblem. He proposed substituting for the lower legend "And States' Rights."

Outside the solid South, by contrast, Democratic solidarity appears firm. The meeting scheduled for mid-May at Chicago has every prospect of cheers and good cheer. In Iowa, it looks as if Mr Loveland, the Under-Secretary of Agriculture, will return from Washington to run against the Republican, Senator Hickenlooper—and beat him. In Colorado, it is rumoured that another Republican, Senator Millikin, may not be back next year. These States are not normally Democratic strongholds. Mr Truman may clearly be a man of consequence, next November.

Cloud over California

[FROM A CORRESPONDENT IN SAN FRANCISCO]

CALIFORNIA'S rapid and greatly publicised growth to industrial maturity during the last decade has tended to obscure a simple but important fact about the Golden State. Its economy still has deep roots in the soil and is widely affected by any change in the fortunes of its farmers. In 1945, nine of the eleven counties which led the United States in the value of their farm products were in California, and in 1946 farm incomes in the State reached a peak of $2,194 million. Since then the prosperity of California's farmers has been declining steadily and the fall seems almost certain to continue in 1950. Last year, for the first time since 1945, gross farm income in the State was under $2,000 million, although it was still far above prewar levels, of $675 million in 1940, for example.

California's farmers are therefore hardly paupers yet but, as their gross income has dropped, their costs have continued to rise and their net earnings have therefore dwindled. Inevitably, spending has tightened, both on the supplies and services required to operate a modern farm, and on the personal luxuries to which rural folk became accustomed during the ripe years. Merchants in rural communities report a steady slackening in purchases of automobiles, household appliances, clothing, and, in general, of all articles classified as luxuries. Construction of new farm buildings has slowed down. Nowadays broken fences are mended, not replaced. The demand for farm land has become sluggish, and the market value of the soil, highly inflated during the war years, has begun to decline. Bankers report a revival of borrowing by farmers.

This rural retrenchment has had its repercussions in the cities and factories, although the effect has been mitigated, so far, by a continued strong demand from town dwellers for consumer goods. The huge food processing plants have curtailed production and are therefore needing fewer workers and less tinplate, sugar, and other supplies. The farm implement factories which make tools, the lumber mills which provide framework for farm buildings, the steel mills which produce fence wire, all these and many others have felt, to some degree, the cutting back of farm income.

It is in the rural regions, however, that the economic cloud is most ominous. In the great Central Valley of California this winter, 50,000 itinerant cotton pickers relived the scenes described by Mr John Steinbeck in his "Grapes of Wrath"; they face a darker future, since California's cotton acreage is scheduled under the federal farm programme for a one-third reduction in 1950. In all the farming areas of the State, employment has been declining since late last summer and thousands are jobless. Most of the State's unemployed, who are estimated at 10 per cent of the working force, are either farm labourers or workers who formerly held jobs in industries closely connected with farming.

*

The cloud has gathered over Californian farmers for a variety of reasons. The State's agriculture is highly specialised and its products are largely so-called "luxury" foods—fruits and nuts, asparagus, artichokes and avocado pears, olives and dates—many of which are not produced elsewhere in the United States. On the other hand, California grows far less of the staple foods—cereals, meat, dairy products—than it consumes. Thus, the Californian farmer is particularly vulnerable when the public decides it can do without costly luxuries on its dinner-table. The consumer's purse-pinching has been apparent for many months. Sales of tinned fruits, such as peaches and fruit cocktail, have declined steadily and steeply. Almonds and walnuts have gone begging. Apples and dried fruits flood the market-place. Grapes and the products of grapes, wine and raisins, have found fewer buyers. Retail prices on nearly all of the Golden State's "fancy groceries" have been trimmed and trimmed again in the effort to make them attractive bargains in the eyes of the housewife.

Staple commodities have been similarly affected, but their problems can, in theory at least, be met quickly by the acreage reduction which is now being applied to cotton and wheat. California's specialised farm surpluses cannot easily be dealt with in this way. Almond trees or pear orchards cannot be uprooted overnight, each time a glut appears. Vineyards cannot be stripped to the ground, planted to forage crops, then replanted in grapes the next season. The trees and vines which produce many of California's richest crops require five years or more of growth before reaching maturity. During the war years, when every ounce of food was needed

and prospects for continued prosperity were bright, new plantings were heavy. These new trees and vines are now ready to make an additional contribution to the huge surpluses which have piled up as demand has declined.

Attempts, financed by government subsidies, are being made to " divert " these surpluses, but the return to farmers is only a small portion of their costs of production. Producers wince at the sorry spectacle of 100 million lb. of raisins fed to hogs, of 5,000,000 lb. of walnuts crushed into oil for thinning paints, and of apples rotting on the ground. Before the war foreign nations were avid buyers of Californian oranges and lemons, raisins and prunes and many other commodities. Dollar shortages have prevented a resumption of that buying and only a trickle of such foods is going abroad under the Marshall plan.

At the same time, producers in many foreign lands, especially the Mediterranean countries, where the climate and soil resemble California's, and the same crops can be grown, are competing in the United States, spurred by the need to obtain dollars. For example, Spain, which last year sent more than $20 million worth of olives to the United States, this year expects to harvest a crop four times greater than last year's. Imports of nuts and dates, sold at prices about equal to the production cost alone in California, are other instances of this competitive battle. It threatens to become more intense and, as it does so, demands for increased tariffs will grow also. But duties and trade barriers, subsidies and marketing agreements, " diversion " or destruction of surpluses, are only stop-gap measures, not basic cures for the problems of declining demand, over-production, and foreign competition which now face California's farmers.

American Notes

Costly Victory in Coal

The teeth of the Taft-Hartley Act have not proved sharp enough to hold Mr Lewis this time, and the miners' leader, thanks to the firmness of union discipline and his own ingenuity, has added one more to the list of his victories. Mr Lewis's lawyers argued that the union had fully complied with the court order, by asking the miners to return, and Judge Keech ruled that the government had produced no proof that this was done tongue in cheek. The only resource left to the President was to request authority to seize the mines. The operators, however, who had relied on the court to impose fines similar to those exacted in the past, and feared a permanent loss of many markets unless a settlement was reached, came to terms with the union before Congress could act. By making it clear that the government would negotiate no new contract with the miners if it seized the pits, Mr Truman ruled out any hopes the union might have entertained of securing more favourable terms from the government than from the industry.

The new contract, signed by all the main groups of operators, concedes most of Mr Lewis's cash claims: an increase in daily wage rates from $14.05 to $14.75 and an increase from 20 to 30 cents in the royalty charged on every ton of coal mined, on behalf of the miners' welfare fund. Mr Lewis originally demanded a wage of $15 and a royalty of 35 cents. The administration of the welfare fund—long a bone of contention—has been wholly surrendered to the union, by the appointment of trustees friendly to Mr Lewis. In return, Mr Lewis has abandoned his insistence on the provision that the miners would work only when " willing and able "—his chief means of controlling production, but one that had already been declared an unfair labour practice by Judge Keech. The operators, presumably, may now require full production—if they can sell the coal.

The new contract, so hardly won, has cost the average individual miner over $1,000 in lost pay. It is estimated that it will raise the cost of coal by about 20 cents a ton, though the large owners may reduce this by introducing more mechanisation, now that they can rely upon fewer stoppages. Any increase in the cost of coal will, of course, hasten the substitution of other fuels, which in any case has received a sharp spur from the shock of seeing coal stocks fall so low that maximum room temperatures had to be fixed by law in New York and the Great White Way had to be darkened. Spokesmen for the industry repudiate the President's description of coal as a " sick " industry, but there is much support for his proposal for an impartial commission to investigate the industry's excess capacity and failing markets.

Mr Lewis describes his long-drawn-out but successful campaign as his Marengo ; others profess to see in it the Waterloo of the Taft-Hartley Act. Mr Taft prefers to believe that the Act's ineffectiveness, in this emergency, was due to faulty handling of the government's case, and to Mr Truman's tardiness in invoking the law he is pledged to repeal. But many critics of the President's " mishandling " of the strike are convinced that a net which allows so large a fish to escape needs reinforcement, particularly as Mr Lewis, in his hour of triumph, has offered a " mutual aid pact " to the Congress of Industrial Organisations.

Mr McCarthy goes Red-hunting

Senator McCarthy, a Republican from Wisconsin, may well be exhausted long before the Democrats allow him to give up the chase which he began so irresponsibly two weeks ago. He then announced that there were, or had been, 205 Communists working in the State Department, some of them in important positions. He later modified this to 57, and finally settled on 81, of whom he gave details, but no names ; many were, however, easily recognisable. With an election approaching, the Democrats did not dare to leave either the Senator or his party with such a useful collection and at once appointed a sub-committee of the Senate Foreign Relations Committee to investigate the authenticity of Mr McCarthy's specimens.

Senator Tydings, the sub-committee's experienced chairman, is forcing Mr McCarthy to identify and pin down in turn each of these red moths, who are supposedly eating away the fabric of American foreign policy—and the moths are being allowed to answer back. The Democrats justify this unheard-of procedure by past experience which has shown that, unless the rebuttal starts at the same time as the charges, it never catches up with them. Mr McCarthy himself has perhaps been drawn into his present hunt by this delay: much of his evidence seems to have been collected during previous Congressional investigations and later disproved. It is partly because such undigested information is almost certain to mislead that the Administration has been so reluctant to hand over to Congress the files containing the records of inquiries conducted under the government's loyalty programme.

When the present investigation was authorised, the Republicans insisted that the committee be given power to subpœna such files. The expected show-down on this long-standing source of bitter friction between President and Congress has, however, apparently been avoided. Mr Truman is said to have accepted a compromise by which the committee will be given access to, but not possession of, the files. The President's amenability is a recognition of the political danger of giving an argument to those who allege that the files contain something that needs concealing, and that Congress is more concerned than is the Administration

about the loyalty of government employees. Even Mr Acheson has been obliged, as a concession to the discomfort of the Democrats in Congress, to submit to the humiliation of explaining that he was neither impugning the American judicial process, nor implying that he was tolerant of disloyalty in the State Department, but only expressing Christian compassion for a friend, when he said that he did not intend to turn his back on Mr Alger Hiss.

* * *

Veteran's Preference

The veteran—in the United States any one of any age who has been discharged from the Forces—can take his choice today between two approaches to veterans' problems. One is that of the Hoover Commission, which recommended drastic reorganisation of the Veterans' Administration in order to provide the veteran with the benefits to which he is entitled more quickly and at lower cost—since veterans are also taxpayers. The other approach is that of the American Legion, the largest veterans' pressure group, and three others, which denounce the Commission's "dismemberment" of the VA as a stab in the backs of men and women who served their country.

The last war threw a tremendously heavy burden on the VA, both in the form of 15 million more veterans, and a great expansion of benefits. One of the abuses against which the Hoover Report warned Congress has recently been amply corroborated: this is the exploitation of the educational and training programme by private trade and vocational schools, which have sprung up overnight to cater to the veterans and milk the government. The subsistence allowances granted to veteran students are in themselves an attraction to the unscrupulous veteran in a time of rising unemployment. The consequence is that the Administration has had to ask for $750 million more than was thought would be needed a year ago, and for Congressional authority to impose stricter standards, both on the schools, which are now subject only to State approval, and on the scholars. Yet in the past, even fervent advocates of federal economy, such as Senator Taft, have preferred continued waste to the risk of alienating the veterans' vote.

*

The VA is spending about $7 billion this year, approximately one-seventh of the federal budget. This is more than is being spent on any other function except defence, more, for example, than on the whole foreign aid programme. The Hoover report suggested that this cost might be reduced, without impairing veterans' benefits, by transferring certain functions to other agencies, home loans to the Federal Housing Authority, hospital building to the Department of the Interior, which handles other federal building, and medical care to a new United Medical Service. Veterans' insurance, which now occupies one employee for every 450 policies, would be turned over to a new government corporation, which might more nearly approximate the private case-load of 1,700 policies to each worker. Veterans' preference in obtaining civil service jobs would also be slightly modified to allow administrators more freedom of choice and fit veterans into the jobs for which they are best qualified.

These are the reforms for which Mr Hoover has been pilloried as the veterans' worst enemy, and against which the Legion is mobilising all its members. The American Veterans' Committee is the only veterans' organisation that supports them; it accuses the Legion of preferring chaos and extravagance to the loss of its own influence and patronage in the VA. This is a test case. Not only does the VA offer one of the most fertile fields for efficiency and saving but, if Congress caves in under the Legion's pressure, other entrenched interests will take heart, jeopardising the success of further reorganisation plans which the President is expected to send to Congress in the near future.

* * *

Restraint on Broadway

The "admirable uphill struggle for survival," which Mr Lee Shubert and his brothers say they have been making for the last fifty years, looks to the Department of Justice more like a deplorable attempt to keep competitors from setting foot on the hill at all. The Shuberts and their associates are being charged, under the Anti-Trust Acts, with restraint of trade through their control not only of half the theatres in New York's Broadway district and of all, or nearly all, the theatres in several other important cities, but also of the agencies through which these theatres are leased. The Shuberts are thus able, it is alleged, to deny stage space, both for the almost essential preliminary "try-out" in Boston or Philadelphia and for the post-Broadway road tour, to producers who refuse to rent Shubert-owned theatres in New York. And plays in which the Shuberts are financially interested are said to receive preferential treatment at those theatres.

*

The Department of Justice does not accuse the Shuberts of restraining trade in the booking of theatre seats, but Mr Celler, of the Congressional committee now investigating monopoly, thinks that they have something to do with the notorious difficulty of obtaining tickets for established Broadway successes at official prices. While present prosperity lasts, visitors to New York seem prepared to pay $60 for a $6 seat; but natives object to being "scalped" in this way and prefer the cheaper safety of a television set. The city authorities, concerned at the disrepute being brought upon New York's chief attraction (and one that no other American city has), have been investigating this black market for nearly a year. They have revoked the licences of about thirty of the agencies which handle three-quarters of the theatre ticket business, and are supposed to add only a 90-cent booking fee to the official price. The regulations governing the remaining agencies have also been strengthened and are to be enforced more stringently.

The real trouble, however, is the shortage of theatre seats on Broadway. Today there are only 32 legitimate theatres available in New York, compared with 96 in 1927. No new theatre has been built since that year and outmoded building codes even discourage those who might bring existing ones up to date and make them more economical to run. Costs of production have trebled in the last 15 years—and are said to be three times higher than in London—but the prices of seats have risen by only 20 to 25 per cent. High costs make it difficult for a play to run unless it is sure to draw full houses for a long time. In New York there are either smash hits or flops, but few of the moderate successes that are frequent in London. As a result theatre seats must be booked months in advance and yet there is serious unemployment among actors.

On Broadway this unemployment is blamed in part on the British actors who share the bright lights with Hollywood stars. The "angels," who provide the financial backing, tend to insist on one or the other for the leading roles. They also prefer to put their money on a formula that has proved its box-office appeal. Music—"Oklahoma" and "South Pacific"—and tragedy—"Streetcar Named Desire" and "Death of a Salesman"—are both sure attractions. One of this season's successes combines both, with a British actor and a libretto based on a best-selling novel, another requirement of the "angels": this theatrical paragon is "Lost in the Stars," from Mr Alan Paton's poetic study of the African colour problem, "Cry, the Beloved Country."

THE WORLD OVERSEAS

Fourth Republican Politics in 1950—1

(From Our Paris Correspondent)

M. BIDAULT has, in his first few months of office, run into heavy weather of a kind which makes M. Queuille's term seem like an idyll of long ago. The Assembly voted M. Petsche's budget in a curtailed form that endangers its equilibrium. The "affair of the generals" and the Soviet recognition of Ho Chi-minh have lent a spurious plausibility to the Communists' "hands-off-Indo-China" campaign, which is naturally accompanied by intensive "peace" propaganda and seditious incitement of the population against the reception of American military aid for Europe. Finally—at a moment when Soviet pressure on French democracy was daily gaining in strength—the French Socialist Party chose to withdraw its Ministers from the government. What exactly the Socialist policy of "support without participation" entails nobody knows; what is certain is that the manœuvre has left M. Bidault with a courtesy majority of 230 votes against 186, with 196 abstentions.

The fact that the important and long-debated law on the return to collective bargaining for wages was subsequently voted by 450 votes to nil, with only the parties of the Right abstaining, in no way diminishes the gravity of this parliament's plight. For M. Bidault (its last hope) at the head of 150 MRP deputies must receive the support of almost the whole Right, if he is opposed on a particular issue by Communists and Socialists together. The Prime Minister would, in fact, be most unlikely to obtain the votes of Radicals, Moderates and Gaullists at once. But even if he did, it is most improbable that his own party, which has a left wing of politically militant Catholics, would accept the substitution of Conservative for Socialist support. Nothing, at least, could be further from the wishes of the CFTC, the Christian Union, which is nearest politically to the MRP but nevertheless often co-operates closely with the Communists in the factories.

Desire for a General Election

The urgency of affairs, international and domestic, causes many people to look to a dissolution of parliament and a general election as the only way out. But not all the political groups are prepared for a dissolution; still less are all in favour of the preliminary electoral reform which some demand. It is a situation rich in arithmetical subtlety, and, above all, one which illustrates the rigid diversity of French persuasions and interests. For the French parliamentary system is not a modern party system in the British, North-West European or North American sense of the term. French parties are not, that is to say, nation-wide conglomerations of citizens subscribing, roughly and vaguely, to certain administrative and economic principles—they are rather cliques or sects. Nor do French parties produce anything resembling a modern executive. For France is "ruled" by a legislature very like that of the eighties, of which it has been written:*

> The Chamber did not want any person or institution to be potent save itself: to the degree that a large assembly can govern a country, the Chamber would govern it. What the Chamber could not do would not be done.
>
> In 1950 the Chamber can unfortunately do almost nothing at all. What is done is done through civil service channels by ministerial decree—as it were, surreptitiously. Policy may thus be continued for a few weeks or months until its effect is sufficiently unpopular to compel a Minister (under the orders of his party) to dissociate himself in the Assembly from his colleagues. There is then a "political crisis." It is this state of affairs which leads General de Gaulle to describe the Fourth Republican Government as "*l'équipe de la médiocrité qui est aussi celle du chloroforme*" and to demand a change in the constitution that would strengthen the executive.

* The Development of Modern France. Professor D. W. Brogan.

Obsolete Party System

But if the legislature and executive do not function properly, this fact is largely the result of the obsolete nature of the parties themselves. For the actual party system belongs not to the present but rather to a happier time when a Deputy was primarily a man who represented at once a concrete local interest and a general philosophic principle (in the nineteenth century the Conservative or Radical faith). Thus, economically, he would be an "independent," and philosophically a party-man. In spite of the advent of the new Marxist parties in the twentieth century, this antiquated conception of party seems largely to remain. There are, for instance, many independents in the National Assembly who, like several other small groups, are really a band of "local" Conservatives who are sent to the Palais Bourbon to defend certain interests and do not, consequently, always vote together. These deputies may number among them distinguished statesmen such as M. Reynaud and M. Petsche, but they do not constitute a modern national party.

On the other hand, the twentieth-century doctrinaire blocks are, in their own way, just as out of date as the "independents"—witness the Communists (the Soviet party), the Socialists (the anti-clerical, anti-war, pro-planning party)—since they profess principles which have no real application to France's living present. The only large modern French party is the MRP, a Catholic "Lib-Lab" party with a broad national appeal. Its brilliant beginnings in 1946 gave hope that it might become a real majority party. But the MRP is now generally held to be in process of eclipse some of its adherents turning to General de Gaulle's *Rassemblement du Peuple Français*. The political scene continues, therefore, apart from the RPF, to be peopled by many parties representing, for instance, the proletariat the civil servants or the farmers (France has its Peasant Party and by individual deputies defending the trade in wine, silk or crystallised fruits. Small wonder that the chances of the *Rassemblement* are growing every day.

In the event of elections, the RPF, which polled over 40 per cent of the votes in the municipal elections last March, might increase its present 22 seats in the Assembly five- or six-fold—if not more. In a house of 620 seats the General's party will, however, still need allies, which must be found among the Radicals and Moderates. Half the Radical deputies already vote with the RPF in the present parliament, and there is small reason to believe that those Moderates returned would refuse their support if the RPF triumphed. It is thought that the chief

losers in an immediate election would be the MRP, to which many followers of de Gaulle gave their support in 1946 when the General, having ceased to be Prime Minister, had no party of his own. (One of the MRP's founders, M. Michelet, has since joined the RPF.) A possible development is, therefore, the defection of the MRP's more right-wing voters. Presumably neither M. Bidault nor M. Teitgen nor M. Maurice Schumann would march with de Gaulle ; but they might find themselves at the head of a band one-third its present size.

(A succeeding article will describe the present electoral system and the different proposals for reform.)

Elections in the Soviet Union

[BY A CORRESPONDENT]

THE elections which are to be held in the Soviet Union on March 12th belong to the normal functioning of the "Stalin Constitution," adopted in 1936. This constitution instituted the present state structure of the Soviet Union which must not be confused with the quite separately organised Soviet Communist Party. Admittedly many prominent figures occupy high places in both state and party organisations ; but the Bolshevik Party is not the state and is best considered as a sort of order or brotherhood, which is scattered through Soviet society (particularly the upper strata), and which leavens it. The "Stalin Constitution" embodied numerous progressive and democratic ideals, and, on paper, provided for the peaceful existence of Soviet socialism, for democratic practice and for individual liberty. As organs of democratic government the Constitution, following a Russian revolutionary tradition, adopted "Soviets" (councils). These "Soviets" were formed in every administrative division, from a village upwards, and in the highest of them, the "Supreme Soviet," the supreme power was declared to be vested.

It is for this "Supreme Soviet," corresponding to a parliament, that elections are now going forward. The body consists of two equal chambers ; the "Council of Nationalities," consisting of representatives from each of the races inhabiting the Soviet Union (twenty-five representatives from each constituent republic, and lesser numbers from each smaller national area) and the "Council of the Union," elected on the basis of one representative from every 300,000 inhabitants.

Council of Ministers

These two chambers are elected every four years. Their first business is the election of two bodies nominally accountable to them: a "Præsidium" and a "Council of Ministers." The head of the "Præsidium" holds a position theoretically approximating to that of a French President and carries out such duties as receiving the credentials of ambassadors. This position is at present occupied by N. M. Shvernik, a minor Politburo member ; formerly it was held by Kalinin. Stalin's position under his own constitution is that of unanimously elected "President of the Council of Ministers," or, as we should say, "Prime Minister." The "Council of Ministers" elected along with Stalin includes the Politburo members, all of them except one "without portfolios," and the heads of the numerous ministries, such as Vyshinsky, Minister of Foreign Affairs. Besides electing these two bodies, the "Supreme Soviet" meets annually for about five days and ratifies the budget.

The candidates for election to the "Supreme Soviet" are proposed in the constituencies by such bodies as the local Communist Party or trade union organisations, are adopted unanimously at mass meetings, and are elected unopposed. The sophistry used to explain this phenomenon, and also the unanimity in the "Supreme Soviet," is that all contradictions in society spring from economic conflict ; since socialism has removed such conflict in the Soviet Union there can be no occasion for disagreement. The members of the "Supreme Soviet" fall into two categories ; those who are elected for ministerial or other posts, and others, such as Stakhanovites or successful milkmaids, who form a sort of proletarian background and supply the applause. It is a cardinal principle of the Soviet state that it rests for support on the whole people, and not simply on the Communist Party ; and so we find that about a quarter of the candidates are "non-party."

The suggestion that power really lies in the "Supreme Soviet" is apt to provoke a wry smile even from a Soviet citizen, for the hollowness of the sham is plain enough. Just as the "Stalin Constitution," with its guarantees of individual liberty, was adopted at the very time when the great purges were decimating the Party, so the "Supreme Soviet" is seen from its record to have been a mere rubber stamp. Throughout the late war it sat only twelve days ; the number of important questions, particularly questions of foreign policy, which it never discusses, is legion. Recently the Soviet-Chinese treaty has been negotiated, the death penalty has been reintroduced, and the rouble revalued, all without reference to the "Supreme Soviet," which, indeed, has not sat for nearly a year. Questions affecting personalities, such as the disappearance of Vosnezensky last year, are entirely taboo for the "Supreme Soviet," the members of which unfailingly applaud wildly the names of the leaders and re-elect the "Council of Ministers" without any note being taken of disappearances or replacements. Stalin, despite his position as Premier, says nothing at all in this singular assembly, but simply appears at one or two sessions to receive an ovation. The proceedings of the "Supreme Soviet" are published in a Soviet variation of *Hansard,* and suggests more than anything a kind of primitive ritual. The actions and language are wholly conventional ; each speech begins and ends with a eulogy of the All-Wise One, sometimes in verse form ; and unanimous acclamations occur every few minutes.

Undoubtedly the main purpose underlying the "Supreme Soviet" is a pretence at democratic procedure. The pretence is a failure, but it is at least encouraging that Stalin thinks it necessary to stage it. Other important though less obvious purposes are to provide a pretext for intensive local propaganda and to obtain through the deputies a check on opinions and conditions in the country.

The apparatus of government set up by the "Stalin Constitution," elaborate as it is, is only one of the means which the ruling oligarchy ensures that its directions are executed throughout the Soviet Union. There are several other powerful organisations working to the same end: the Communist Party, the youth organisation, the secret police and the Council of Trade Unions. Under the Stalinist system, if one body does not achieve the desired purpose, another will: and each body serves as a check on its fellows.

Economic Troubles in Italy

[FROM OUR ROME CORRESPONDENT]

THE part played by "Full Employment" theory in the Italian political struggle is peculiar. Any government headed by Signor de Gasperi, who for so long took his cue in economic questions from Professor (now President) Einaudi, and who now has the Einaudian Professor Pella as chief economic Minister, can be expected to feel a fundamental distrust of monetary stimulants. The embattled Communist opposition, with its heart fully occupied by sterner purposes, is, for its part, contemptuous of any doctrine smacking of New Dealism.

The latest De Gasperi cabinet took office four months after the devaluation of sterling—which was imitated only to the extent of 8 per cent by Rome, and which cut short the hesitant Italian recovery of early 1949. While employers and labour now join in diagnosing a condition of depression, the Government can point to cost of living indices which declined by 3 per cent in 1949 while wage indices rose by 2 per cent, and can argue, with technical support, that real wages are in 1950 better than in 1948 and much better than in 1938. Expenditure on non-essentials tells a similar tale: the average Italian smoked seven per cent more tobacco in 1949 than in 1948, and 22 per cent more than before the war. Consumption of coffee and sugar are on the rise. Government supporters even quote the present unemployment figure of about 2,000,000, compared with the figure of 2,160,000 at the same time last year, as evidence of economic improvement. But this reckoning, issued months late and not comparable in method with the larger figures of 1948, is not accepted on any side as an economic index. The General Confederation of Labour adduces calculations to show that the total of insured employed persons is 150,000 less than two years ago, though the population increases by 400,000 a year. It says there are also a quarter million of unemployed white-collars and a million part-timers in industry, and one and a half million agricultural workers with only spasmodic employment. The employers, on the contrary, regard the official figure as including (despite the 1948 purge) many who are not really unemployed. Both sides' criticisms are doubtless largely justified.

Obstacles to Progress

Is Italy, then, prosperous or declining, going forwards or backwards? Inclinations to optimism, based on the bright appearance of big towns and on the factors named, are checked first, by the seething discontent of the million or more *braccianti* in Romagna and Apulia—the landless labourers, the uprooted residue of big internal migrations towards the great public works of past generations ; second, by the endemic crisis of the Milan and Genoa ex-armament and ancillary concerns which it has been economically impossible to rationalise and socially impossible to close down ; and third, by the perilous obsolescence of the great textile industry.

To settle the *braccianti,* convert the ex-armament industry and modernise the textile industry are tasks calling for massive capital expenditure, which have a high priority in Government programmes. Altogether vaguer and vaster, however, are the needs arising from the revolt of the whole great southern and insular region of Italy against its traditional economic inferiority. Several millions of southerners can no longer be left living in hovels and caves, never tasting meat, milk, sugar or coffee, while twice their number live, with exceptions, commodiously and well, northwards from Rome. The latest De Gasperi government, and any conceivable successor, has to cope with the distinct and competing demands of the north-centre to recover its normality, and of the south to be dragged out of what was hitherto regarded, not without philosophic dignity, as a poverty decreed by Providence, but is now a perpetual incitement to rebellion. All this means a battle for the billions of investable capital and, in the margin, keen argument on whether monetary technique knows a safe way of creating billions which the investor and the taxpayer do not, at present, seem likely to produce.

The preference of Signor De Gasperi is no doubt to provide the traditional assurances for home and foreign investors to induce them to tackle these problems piecemeal and at their private risk. First of these assurances would be an unshakable currency. The Einaudi-Pella school is not keen, so soon after the monetary convulsions of 1943-47, to forgo the prestige of a large currency reserve, or to encourage the banks to widen credit margins. But American views have to be remembered. Like the previous De Gasperi Government, which was scolded by ECA for its financial caution, the new Government has had to revise its plans for utilising the remainder of the current ERP annuity (that is, the lira counterpart). The plans were changed after telephonic negotiations with Washington, on pain of seeing the last instalment of $70 million lopped off. With an eye on America, as well as on the local opposition, Signor De Gasperi has appointed three Ministers to concentrate upon investment expenditure, and Signor Campilli, in particular, has become showman for the Government's spending enterprise. He has "found" 300 billions of unused ERP lira balances (though old-fashioned economists have asked sceptically in what particular box) available for quick spending. The rhythm of actual and intended expenditure is meanwhile puzzling to follow, even for skilled observers. Signor Pella may, before this is printed, have announced an annual investment estimate of 1,500 billions for the new financial year. Of this, one-third may represent the initiative of the State. The investment programme will include expenditure ancillary to the Agrarian Reform, but that fundamental measure, estimated possibly to cost 1,000 billion lira in ten years, is still undergoing revisions on its way to a very mixed reception by the Government benches (not to mention the others) in Parliament. Incidental to the reform is a development programme of 120 billion lira a year for ten years, including 70 billion lira for aqueducts in the South, announced unconditionally by the Premier in his programme speech.

Meanwhile, the Communist-led CGIL, which claims five million adherents, has been advertising its own "constructive" purposes at a "National Economic Conference" in Rome. The "Plan," so far as it emerged, consists of an immediate engagement of 700,000 men on development work of many descriptions, to be financed by credit and currency

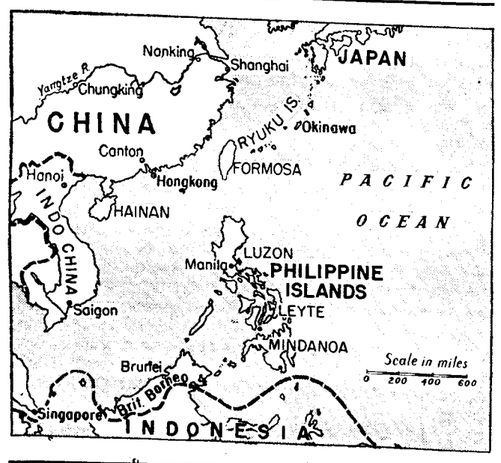
Spotlighting Waste

Administrative and productive costs tend imperceptibly, but steadily, to rise. Every unnecessary record, every needless operation pushes costs up. Our new booklets "500 Unnecessary Miles" and "An Invitation to Industry" tell you how we can help to get them down and keep them down. Why not write for a copy? Consultancy Division, Remington Rand Ltd., Dept. 3, Commonwealth House, 1-19 New Oxford Street, London, W.C.1.

expansion. The "Plan" was said to be workable without a previous socio-political revolution, and "sacrifices" for putting it into practice were offered on behalf of the workers. There is no reason to doubt that in preparing for this politically equivocal gathering the Confederation's experts brought together much valuable local information and some expert technical thinking. As a "constructive" gesture the "Plan" hardly established a basis of co-operation with the sixth De Gasperi Government, but it said something for civilisation that Ministers Lamalfa and Campilli were able to mount a Communist platform to the accompaniment of smiles and handshakes.

Crisis in the Philippines

[FROM A CORRESPONDENT]



WHEN the new Republic of the Philippines was established on July 4th, 1946, it inherited a situation compounded of hopeful and disturbing elements. During the half century of American sovereignty significant progress had been made by the Philippines. Important economic development had taken place, education had made great progress, and a well organised civil service had been developed, particularly during the last thirty years of American sovereignty when the Philippine Government for many practical purposes was largely autonomous. In addition, the new Republic had at its disposal at the time of independence exchange reserves of more than US $600 million; it had a preferential position in the American market; it had assurances of $400 million for war damage claims, as well as $120 million to be spent by the United States Government on rehabilitation and reconstruction; and, furthermore, it had the expectation of very substantial dollar expenditures by the personnel of various American agencies, particularly military and naval. The total of American government expenditures in the Philippines in fact has amounted to more than $1.5 billion. Only a very small percentage of this sum, however, has been direct aid to the Philippine Government. For example, 90 per cent of the $400 million war damage payments will have been paid to individual claimants in amounts of $500 each, or less. Similarly a high percentage of military and naval expenditures has been in the form of day-to-day purchases by members of the American Armed Forces; consequently, American expenditures have been diffused throughout the population and have not been directly available to the Philippine Government for capital investment increases.

A Post-war Spree

The disturbing elements in the situation arose from the ravages of the war against Japan. Although the reconstruction has proceeded smoothly and with amazing rapidity it was impossible that so much physical damage could be repaired within a five-year period. Much of the Philippine civil service was disrupted and many of its ablest members were killed by the occupying Japanese. Four years of isolation from world markets created so tremendous a demand for consumer goods that the Philippine Government deemed it politically impossible to demand continuing abstinence. The craving for hair oil, fountain pens, bicycles, motion pictures, and canned peaches was a political as well as an economic problem, even if it meant less exchange available for capital goods. To these factors must be added the psychological one. During the Japanese occupation it was patriotic for a large percentage of this population to steal, lie, loaf, sabotage, and use violence. As in other comparable occupied areas it soon became apparent that it would take time and patience to return to normal standards.

By late 1948 it was becoming increasingly apparent to the more responsible Philippine officials that the borrowed time of American expenditure was beginning to run out and that the country would face a serious economic and financial crisis unless drastic remedial measures were taken. At the same time, the export position of the country had not recovered sufficiently to compensate for anticipated exchange reductions. Little, if any, progress had been made in the rehabilitation of abaca; sugar was still far short of prewar production, and copra was bringing an unprecedentedly high price which could hardly be maintained. Obviously any increase in exports would require a long development period. The only remedy was an enforced reduction in imports. On January 1, 1949, import control regulations were put into effect, designed to effect savings of $100 million a year. These controls, however, were never effectively implemented and the exchange position continued to deteriorate during the year at an accelerated rate.

By November, 1949, dollar reserves had reached a new low of slightly more than $200 million and remittances abroad during October and November reached a new high. This

trend reflected not only the decreasing American payments and the continued failure of exports to increase but also to a certain extent a lack of confidence in the Government which had just won a presidential election under dubious and controversial circumstances. Hence on November 14th the Government imposed revised and drastically tightened import controls designed to effect a saving of $200 million a year. Practically every item of import was affected, and in many instances the cut in the import quotas amounted to 95 per cent.

Two weeks later, in anticipation of a possible flight of capital, exchange controls were imposed. Unfortunately these two recent developments caught the Philippine Government without the qualified or properly trained government machinery to handle the administration. The Philippine Government is also facing a dangerously large budgetary deficit of some 200 million pesos a year without the prospect of sufficiently increased revenue. An important source of revenue has always been the excise taxes on imports, which will now vanish if the import controls are effective. It is difficult at the moment to see whence the necessary additional revenues will come. Improved administration of the laxly enforced tax laws, including the income tax, would help a little, but hardly enough to compensate for anticipated losses. Basically the only answer is increased production for export, but that will require time and drastic measures. Perhaps the

A Sensible Policy for Process Steam—5

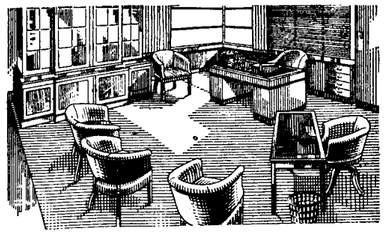
Meter your steam to get the facts

BY SPIRAX

Your records show how much fuel for steam raising you have bought in a year. The records *may* show also how much steam you got from the fuel.

But do your records show who used that steam and how much? Do they tell you what each department or process is costing for steam in relation to process output?

It is difficult to see the logic of insisting on getting 2,240 lbs. in every ton of coal you buy, without also insisting on knowing who or what has used that coal, in the form of steam, and how much they have used.



If it is necessary to have a weighing machine to measure the coal coming in, isn't it equally necessary to have a meter to measure the steam going out?

Departmental steam metering will put you in possession of the facts; will reveal the hidden or habitual sources of waste or misuse of steam.

Reflection

Your Board Room or Office is a reflection of your efficiency and should be a forceful part of the business of selling, whether it be sales or services. You will find this efficiency in Catesby Office Furnishings and we offer you our full experience and tradition of service. We invite your enquiries for a single item or complete new office to our Director of Contracts.

Your enquiries for floor-coverings, and for any assistance are cordially invited.

CATESBYS LIMITED

LONDON, W.1

Our only address. Telephone: Museum 7777

A HANDFUL OF TROUBLE

Removing scale from the inside of a steam boiler is one of those costly operations which can be avoided by the use of Calgon or other suitable phosphate in the boiler water. The modern way is to prevent the trouble before it starts. First determine the chemical composition of the feed water and then decide on the correct phosphate to use. Phosphate conditioning will prevent scale and the boiler troubles that go with it. It saves far more money than it costs, but it costs nothing at all to consult Albright & Wilson's Technical Service Department.

CALGON

a very little Calgon prevents a lot of scale

SIMON ENGINEERING GROUP

To keep in the forefront of technical progress has been a basic Simon principle for seventy years. In coal washeries, coke ovens, large water-tube boilers, chemical and gasworks plant, mechanical and pneumatic handling, and the building of granaries and flour mills, Simon engineers have made substantial contributions to modern technology and maintain world-wide contacts. During 1949, in the course of their various duties, twenty-five Simon directors, executives and technicians made seventy visits to twenty countries in both hemispheres and travelled well over a quarter of a million miles. Rolling stones gather no moss but many good ideas.

Prevention of Damage by Pests Act, 1949

Prevention of Damage by Pests Act, 1949

For action before March 31st.

On March 31st, the Prevention of Damage by Pests Act comes into operation. To owners and occupiers of land and premises the important fact to note under this new Act is that it is *their responsibility to see that effective steps are taken to clear their land and premises and prevent any re-infestation by rats, mice, and insect pests.* This fact was emphasised by the Joint Parliamentary Secretary to the Ministry of Agriculture in the House of Commons when speaking on the Act (*Hansard, 14th July*, 1949).

Don't delay! Get your premises cleared AT ONCE.

The Ratin Service is the largest commercial organisation of its kind in the country. The employment by the Ratin Service of the latest scientific methods means that the natural cunning and suspicions of rats and mice are defeated, thus whole colonies are wiped out.

Write TO-DAY for our new folder explaining your responsibility under the Act and giving details of how the Ratin Service can clear your premises and keep them clear.

only immediate answer is a reduction in the standard of living to which the Filipinos became accustomed during the half-century of American sovereignty.

But it is debatable how far the standard of living can be permitted to deteriorate without grave consequences, not only for the Philippines itself but also for South-East Asia as a whole. The Philippines has become the American show-window in Asia and the United States can hardly permit the Philippine experiment to fail without serious damage to American prestige in the Far East. At the same time, it can be anticipated that as a result of experience the United States will hardly be disposed to give additional aid to the Philippines without satisfactory assurances that such aid will be effectively used. On the other hand, it must also be assumed that the United States will do whatever is necessary to prevent disaster. The method of accomplishing these twin objectives is a problem Washington must now solve. There is no evidence as yet that President Quirino during his recent visit to Washington received assurances of any kind of specific aid from President Truman, beyond reliable reports that an American economic survey mission might be despatched to the Philippines in the near future to develop specific plans and recommendations.

Defence of Belgium

[FROM OUR BRUSSELS CORRESPONDENT]

THE voting of this year's military contingent, and the passing of the defence estimates through the Senate, have helped to define the position of Belgium in the plans for western defence. Almost simultaneously the military aid mission has installed itself in the former Japanese Embassy. Amid the secrecy prevailing on all matters of equipment, it has been stated that a first arrival, tentatively valued by the Belgians at frs. 4,000 million, is in progress and another of similar value will be put in hand as soon as the deficiency lists are agreed and the availabilities ascertained.

The Liberal defence minister, M. Albert Devèze, has renewed his reputation by infusing a spirit of keenness into the building up of Belgium's defence system on the western pattern. This enthusiasm is, however, chiefly confined to the professional cadres of officers, non-commissioned officers and specialist troops. The soldiers-of-the-line proper are, as ever, conscripts. They do their military service, which lasts a year, at the age of 21 and are apt to regard it as a nuisance.

The army is divided into home defence units and into combat troops which will be placed at the disposal of the Western Union command at Fontainebleau. In principle, the division now in Germany, which is to be brought up to its full strength, and certain detached troops, will come under Fontainebleau. To these will be added a second division for which the mobilisation arrangements have been laid down; and, subject to budget credits, a third division is to be formed this year.

Use of New Weapons

These second and third divisions will, until the actual moment of mobilisation, exist only on paper. In view of the very substantial changes in equipment the point at once arises of training the troops in the use of the new weapons. The obligations of the *milicien* consist of his year's service, plus 45 days during the fifteen years in which he is liable to be mobilised. For the most part, 15 days are taken in the year following the full-scale service, and this is agreed to be less than adequate for modern refresher courses in weapon technique. The authorities concerned are conscious of this problem, but it is still undecided whether to increase the period of service or to impose it at an earlier age which would be less inconvenient to the *milicien*. Belgian public opinion, alive as it is to the importance of western defence, has not yet reached a point at which increased service obligations would be accepted without opposition.

Home defence will be manned by the troops not seconded to Fontainebleau with, as a nucleus, the 10,000 men in the gendarmerie. This is a full-time corps which has been trained in the use of small arms, and which is to be specially fitted for anti-fifth-column duties. Side by side with the gendarmerie is the *Garde Territoriale Anti-Aérienne* now in process of formation. This, though it will make a slight call on the professional cadres, will be essentially a home guard depending on 553 part-time officers and non-commissioned officers and 2,795 part-time *Gardes*. Unlike the air defence of Great Britain, it will come directly under the home defence command, with its three regional commands at Brussels, Liège and Antwerp. The need for close liaison with fighter defence is, however, recognised.

Questions of Command

Though there is abundant evidence of Belgium's practical desire to co-operate in western defence, the Minister is keen to keep the troops under Belgian command to the highest possible level, and to ensure such representation as seems adequate to the inter-allied command. The same spirit may affect the actual allocation of troops to Fontainebleau; it is, for example, the Minister's expressed opinion that parachute troops should be classified as home defence rather than as combat troops. The general question of reorganising the high command cannot be fully settled till Belgium's constitutional pattern is clarified after the referendum on March 12th. The rule by which the King takes the field, as he did in 1940, as commander-in-chief of his army clearly needs adapting to Western Union conditions. This rule, too, is apparently responsible for the marked difference in standing between the chief of staff and, for example, the role of CIGS in the British hierarchy.

This year's total contingent, for the three fighting services, is 73,782 (excluding commissioned officers), an increase of 10,262 on 1949. This includes 42,275 conscripts, an increase of nearly five thousand, though still only two-thirds of the population of eligible age.

The budget credit asked for is frs. 5,685 million, an increase of some half a billion francs, including military pensions. Though this includes some slight provision for supplies to the base under construction at Kamina, there is no other provision for the defence of the Congo, which is in the hands of colonial troops under European officers, and the cost of which is borne by the Colonial Ministry vote. Nobody concerned, however, has any illusion as to the need for defending the Congo if conflict should develop in central Africa; nor, so long as Western Union endures, will this be exclusively a Belgian interest. The budget credit, which is almost 11 per cent of the nation's budget effort, is nevertheless proportionately smaller than in 1936; it is regarded in Belgium as being large for a country with no extra-metropolitan commitments. M. Devèze, speaking two weeks ago to the Foreign Press Union, emphasised Belgium's right to expect other nations to do as much.

Included in the proportion of the total is the frs. 2.5 billion proposed in the loan-financed extraordinary budget. This is earmarked for works and equipment including (with the MDAP supplies) the new fighter base in Hainaut, the radar network and the 85 new aircraft (including 50 Meteors and 20 Spitfires) destined to supplement the striking power of the air force. The air force has no difficulty in filling its cadres of young officers and is, indeed, over-strength with 515 officers. It is still somewhat below establishment, however, in the professional non-commissioned ranks, and this year its draft of *miliciens* is to be increased by nearly a thousand to 3,755.

THE BUSINESS WORLD

Implementing Point IV

NOW that Marshall aid is passing its half-way milestone and shrinking rapidly, increasing attention is naturally being given, both in the United States and in Europe, to the problem of covering the yawning dollar gap which, even on the most optimistic assumptions, is likely to remain after mid-1952. It is no doubt to these as yet informal and unofficial discussions that Mr Ernest Bevin was referring when, in the course of an election speech, he referred to the continuance of American aid after the Marshall programme had ended. That remark was quickly picked up by an ever-suspicious Congress, and Mr Paul Hoffman was called upon to deny that any discussions were proceeding for continuing Marshall aid beyond the statutory period. Mr Bevin and Mr Hoffman, however, were not talking about the same subject. There is no question or possibility of extending Marshall aid beyond 1952; under certain conditions Europe might indeed be fortunate if it were to last until then. But the best estimates made by OEEC show that, in the first post-Marshall year, western Europe and its dependent territories will still be running a dollar deficit of over $1 billion. That is a gap too great to be covered by the unaided, normal commercial export of American capital. It is not, therefore, too early to consider what special arrangements may have to be made, or machinery evolved, to stimulate this flow of "commercial" dollar capital.

Any approach to this problem should recognise at the outset the very obvious fact that emphasis must be laid rather upon measures to improve the credit-worthiness of the potential borrowers than upon changes—however necessary they may be—in the machinery for canalising US capital exports. This proposition is surely so self-evident as to need no elaboration; yet many experts are still prone to put the cart before the horse, to discuss machinery before they have decided upon the setting in which that machinery will have to function. A solution of the gravest problems which retard economic and political rehabilitation in Europe—among them the inclusion of western Germany in the western European community and the re-establishment of friendly and effective monetary relations between Britain and France—must be first secured if dollar capital is to be attracted to Europe and if the collaboration between American capital and European technique in canalising dollar capital to Europe's dependent territories is to be effective.

Provided, however, that the approach is realistic, the task of canalising American capital, whether under President Truman's Point IV programme or through other channels, is not so wholly out of range of reasonable possibilities as public discussion of the problem generally seems to imply. During the three years 1946-48, American private capital was invested outside the United States at an average rate of $840 million. In 1948 the export of such capital reached the remarkable figure of $1,077 million. A substantial proportion of this export of capital (no less than 53 per cent in 1948) represented development by the American oil companies outside the United States. This is foreign investment of the classic, self-supporting type. The United States will in due course become a large importer of oil, and the export of capital is thus building up industries and a prospective flow of trade which will themselves take due care of the problem of remitting to the United States the service on this external investment. Oil development will probably continue to provide one of the main streams in the flow of American capital exports. For that reason alone, special care should be taken to avoid any repetition of the heavy-footed tactlessness with which the former Ministers of Fuel and Power and Colonies so affronted the American oil industry.

*

When, however, all that can reasonably be attempted has been done to improve the attractions of the non-American world for dollar capital, and to maintain friendly relations with the greatest potential exporters of private capital, it will still be necessary to evolve a new market mechanism if the flow of American capital is to match the need for it. This necessity will arise particularly in the implementation of the Point IV programme. The Export-Import Bank of Washington has done valiant work in canalising dollar capital and in handling foreign reconstruction projects which, strictly viewed, were outside its terms of reference. But it can hardly be the vehicle for carrying the necessary expansion of dollar capital exports. It is too exclusively governmental, and by its statutes it is wholly restricted to loans of which the proceeds must be spent in the United States. It will continue to play its part in the development of American capital exports but the limitation of its resources and especially the tied character of its loans put it out of court as a major instrument for this purpose. The International Bank for Reconstruction and Development will equally be found wanting. Recent experience has shown that its rigid approach and conditions of lending (for which there is something to be said on other grounds) do not provide a flexible means of handling the infinite variety of projects that must emerge from any programme for the opening up of under-developed countries. It resembles commercial banks in the United States in that it is too intent on the collateral or security aspect of any operation. Moreover, given the degree and kind of security which it exacts, namely a governmental guarantee, it is on the whole an extremely expensive lender.

A more elastic mechanism is needed, therefore, if the mobilisation and shepherding of American capital in adequate volume are to be achieved. Whatever mechanism may ultimately be evolved, there is one point at which

US governmental intervention and perhaps subvention will be required. That is in providing cover for the transfer risk arising from all external investment operations. Some organisation akin to the Export Credits Guarantee Department will be needed. Such a governmental organisation would, in the performance of its function, be called upon to accumulate the foreign currency proceeds of interest and capital repayments which, for the time being, could not be converted into dollars, because of continuing difficulties in overseas balances of payments. Such an accumulation of foreign currencies would provide a visible and persistent inducement to the United States to pursue a commercial policy which would make dollars more abundant and enable its debtors abroad to meet the service on their loans, not merely in local currencies but in dollars. Such Government-provided insurance cover should be available to all private investment from the United States, subject to approval of the projects by the US authorities concerned.

*

Apart from this overall guarantee the situation will call for the maximum variety and elasticity in tapping the separate sources from which the export of American capital will be fed. The big American oil companies may be expected to continue their exploitations and search for a commodity of which the United States will be in increasingly short supply as the years go by. Private syndicates between merchant bankers and issuing houses in the United States and Europe may be expected to mobilise their combined strength to develop mineral and other resources throughout the world. There are already modest prototypes of this kind of welding of American capital and British "know how" in arrangements which have been made between British, American and Canadian houses to finance gold mining developments in the Orange Free State. Such a marriage of American capital with the knowledge of under-developed countries acquired over long periods, and by costly experience, by bankers and issuing houses in London, Brussels, Paris and Amsterdam, would appear to be the best approach to an effective realisation of the Truman Point IV programme. The experience of such syndicates acquired over the past two years does not, however, engender any great hopes of really massive mobilisation of American capital which might be placed with their assistance.

If such mobilisation is to be achieved, it will require the direct tapping of private savings and subscriptions to public issues by the American private investor. To achieve this it might be desirable to establish an investment corporation in the United States, so capitalised as to be able to offer a yield on its securities comparable with that obtainable on US corporate bonds and stocks. The capital would probably have to be highly geared in order to give the necessary encouragement and high yield-rating to the equity capital. Given a US Government guarantee of the transfer risk, presumably at a small or nominal cost, the yield basis on the various securities of such a foreign investment corporation should conform to the yields for high-grade American securities of similar type. Since the projects launched under the Truman programme would also call for the investment of a certain amount of sterling and other European capital, the new corporation would necessarily have to act in collaboration with similar or existing institutions in Europe. The main contribution which Europe would make in this venture, however, would be that of its knowledge of the spheres in which the money would be invested, of expert personnel and of technical help. It should not be forgotten that in its origin the Point IV programme of President Truman was essentially an offer of technical advice. That fact was clearly stressed and developed in the last report of the International Bank which pointed out that the main obstacle to the development of under-developed countries was not the lack of external capital but the lack of technical experts and of good administrators. Dollars will certainly be needed in the fulfilment of the Point IV programme, and if they can be provided in the form of completely untied loans and on terms which can be made reasonable by a guarantee of the transfer risk, they should go a long way to fill the dollar gap which will remain after Marshall aid has done its invaluable constructive work.

Opencast Coal

OPENCAST coal production has been used to supply the deficiency of output from the British mines over a number of critical years. The objections to it, in a crowded country where the land is precious and jealously guarded, have been forcible. Strong feeling is aroused by the desolate spectacle of an opencast site in course of working. And, though restoration of the land has lately, at least, been more careful than is generally credited, doubts about the future of the restored land cannot be entirely set at rest. Good crops have been grown immediately after restoration, but it is not yet possible to assess the ultimate effect on fertility. But necessity and the sheer want of an alternative have justified the opencast programme and carried it on. Today, as the deep mines get into better shape, it should be possible to set a term to the programme and assess with a slightly clearer perspective the services it will have performed.

The opencast coal programme in Britain has now reached its peak. Last year's output of 12.4 million tons may be exceeded in 1950 or 1951, but not greatly; and there is little doubt that after 1951 it will be permitted to decline. The former Minister of Fuel and Power stated the conditions of opencast coal policy for the next four years at a recent meeting with representatives of the civil engineering contractors. Mr Gaitskell then said that he hoped for a production of some 25 million tons from this source in the two-year period 1950 and 1951, and a further 15 or 20 million tons in the following two years.

But he added a warning: three factors would, he said, largely determine in practice what the output was to be. There was to be no further net financial loss on the programme; the Government's policy now was that opencast coal production must pay its way. Secondly, no more dollars could be spared to buy excavators from the United States. Thirdly, the need to "minimise" disturbance to the farming community continued. It may be worth while to examine what these conditions mean.

Given the Government's reluctance to spend any more

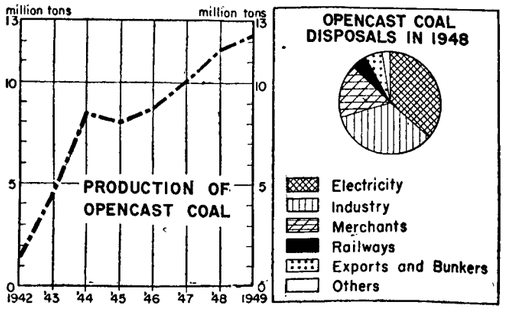
dollars on excavators or to lose any more money on the programme as a whole, a figure of 40 to 45 million tons over the next four years is almost certainly the most that can in fact be attained. The opencast programme could hardly have been carried out (in the actual conditions of the time) without large imports of American machinery, which during the war was acquired on Lend-Lease and after the war had to be paid for in hard dollars. The chief American supplier to the British programme was the Lima Hamilton Corporation which, when the British fuel shortage was most desperate, made special arrangements to give early delivery. This company supplied the Directorate of Opencast Coal Production with 85 excavators of 3½ cubic yards bucket capacity and 100 excavators of 2½ yards between 1946 and 1949. Some bigger machines (of 5, 6 and 8 yards, and one very large American machine with a 25-yard bucket) have been added, together with the relatively small output of British makers. The outcome of the whole effort is that about 1,600 cubic yards of excavator bucket capacity together with more than 500 tractor-scrapers and various other contrivances are now available for opencast coal work. The Directorate of Opencast Coal Production (a department of the Ministry of Fuel and Power) was for a time the largest owner of this machinery, but most of it has by now been sold to contractors, who, in addition to their own normal purchases, were often in effect obliged to buy it as a condition of taking opencast contracts.

Thus a large park of equipment has been amassed in a very few years. The machines are, however, being driven hard, and equipment of this kind, engaged night and day on very rough work for many months together, cannot have a very long working life. Their import has now ceased, and the new machines to take their place will have to come from a small number of British firms which have been expanding their capacity to build large excavators and are now producing machines based largely on American designs. Since economic production at the depths now being worked requires really heavy plant, it follows that the actual opencast output to be achieved in 1952 and 1953 will depend on (among other things) the speed and success of the expansion in production of this plant in Britain, to the need for which Mr Gaitskell drew attention in his talk with the civil engineers.

For these reasons, a determination to make the programme pay its way implies that the production targets will not be fixed beyond the capacity of the efficient available plant. But it implies, equally, a certain limitation on the sites to be worked. For the economics of the whole process are basically determined by a simple relationship: the ratio between the thickness of overburden (the earth and rock which have to be removed to get at the coal) and the thickness of the coal seam to be extracted. They are further influenced by the value of the coal to be extracted from a particular seam. South Wales anthracite in particular can economically be dug at greater depths, the more readily as the land which covers it is largely moorland or hill grazing of no great agricultural value. Opencast anthracite output is likely to be raised from 600,000 tons in 1949 to perhaps 1,000,000 tons in 1950; it will, if these plans are realised, supply about a quarter of the total South Wales anthracite production and will have an important export value.

Sites having a volumetric ratio more favourable than five of overburden to one of coal are rare in Britain; at the other end of the scale, sites with a ratio less favourable than twelve to one are not usually considered to be worth working. The extent of the proved coal reserves in Britain classified within these limits and still to be worked has been estimated not to exceed 66 million tons; and this figure includes coal now being worked.

It will not be possible to work all this coal; perhaps a quarter is "frozen" because of the objections of different departments or interests, and a further tonnage is known to be subject to other objections. In fact, therefore, no more than 45 million tons are available at the present time for working within the economic limits that have been laid down. No doubt the prospectors will find more sites. But their work is elaborate, and while they are prospecting, the known sites are being steadily used up. It is open to question whether they could find more sites quickly enough to expand the programme. This, then, may be the ultimate limitation.



Strip mining had been little practised in Britain until recent years, and its expansion for coal-getting has happened under pressure of emergency. To meet the emergency a considerable civil engineering effort has been mobilised and some unsuspected talents of an improvising kind have been revealed. But it has not, at least until the present time, been really possible for the people engaged to pause and take stock coolly of the task and of the methods. This fact had unfortunate results at times, and in earlier years (as last year's Sixth Report of the Select Committee on Estimates showed) it cost the taxpayer a good deal. The loss in 1945-46, when the year's output was 7.9 million tons, was about £7 million—some 17s. 8d. a ton. This was brought down in 1947-48 to a loss of £1.4 million on 11.1 million tons of coal (2s. 7d. a ton), and in the calendar year 1949, when output was 12.4 million tons, the loss was as low as fourpence a ton. Higher coal prices have made it easier to avoid losses, but costs of production have been substantially reduced during this period, despite the fact that the easiest sites tended to be used up first. Within the strict limits determined by geological factors, the methods and the tools employed in shifting earth and handling coal can influence costs greatly. The main burden of the work is in the bulk shifting of earth and rock, and this has been largely a matter of bringing more powerful machines to bear and utilising them more fully and efficiently. Some of the people most closely engaged have hardly had time to form an opinion of their own success or failure in this task, but an observer from outside can probably not avoid the conclusion that there have been gains in efficiency as the Ministry and the contractors have accumulated experience.

The programme yielded 12.4 million tons of coal last year to supplement a deep-mined output of 202.7 million tons. This year, when the National Coal Board expects the deep-mined output to be between 205 and 210 million tons, the opencast programme is expected to add about 13 million tons to this total. Without this contribution, it need hardly be explained that either exports or inland consumption would have to be severely cut, and the results in each case would be unpleasant. Taken over the whole period since opencast production started in 1942, the contribution has been 65.9 million tons; and in the same period the total British export of coal (including foreign bunkers) has been between 74 and 75 million tons. It is difficult not to conclude that without the opencast programme the British export trade in coal—which, as things are, has survived only on a diminished scale—might have been extinguished for many years.

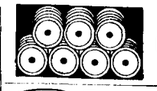
A glance at this year's projected coal budget is enough to show that dependence on opencast output for supplies of coal at the margin is by no means at an end. The export and bunker target "to which," as Lord Hyndley said in January, "we are now working" is more than 22 million tons. If the aggregate saleable output is between 218 and 223 million tons (205-210 million tons from the mines and 13 million tons from opencast) this will leave between 196 and 201 million tons (or less, if the exports prove greater) for inland consumption. This compares with actual figures of inland consumption of 195.1 million tons in 1949 and 192.7 million tons in 1948. It is a high figure compared with before the war, but there seems to be no expectation that inland consumption will fall, or even cease to rise, in the next few years—provided that full employment is maintained.

Clearly this balance does not at present permit the economy to manage without opencast coal. Moreover, in 1948, according to the last annual report of the Coal Board, 80 collieries, which produced 4,000,000 tons of coal, lost £5,500,000. To keep these pits in operation while forgoing opencast output which could pay its way would be expensive.

The opencast coal programme is unlikely, therefore, to be willingly abandoned so long as output from the mines is seriously insufficient in quantity, and so long as the marginal supplies of deep-mined coal are much more costly to extract. Only a steady improvement in the economic and physical performance of the mines will make the opencast programme unnecessary. But it is worth while to remember that, if such an improvement is too slow to come, the opencast programme will in any case fall away for technical reasons; it cannot be called to the rescue for many years longer.

SUMMARY OF OPENCAST COAL OPERATIONS IN BRITAIN, 1942-49

	Acres
Land requisitioned	54,604
,, released from requisition	14,149
,, still held by Directorate of Opencast Coal Production	40,455
of which :—	
Being restored or ready for restoration	13,175
Coaling or preparing to coal	27,280
	Tons per acre
Average yield of coal obtained (approx.)	1,600
	'000 tons
Total yield of coal	65,851



Figures to end December, 1949.

The table below shows some of the goods that the British West Indies bought from Britain in 1948. There is a market, too, for many other British products. ***Write for our new booklet 'Overseas Markets'.*** **It contains detailed trade tables for the British West Indies and other territories where the Bank has branches.**

TOTAL 1948 U.K. EXPORTS TO THE BRITISH WEST INDIES WERE £19,615,000. THESE INCLUDED

CARS & TAXIS £1,025,000

FINISHED SEWING THREAD ... £169,000

COCOA PREPARATIONS ... £204,000

PAINTS & ENAMELS £241,000

CORDAGE, CABLES, ROPES & TWINE £119,000

POTTERY, GLASS & ABRASIVES £1,080,000

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3.

Business Notes

Shadow of the Budget

The ominous shadow of the budget has this week spread itself over the financial and political scene. Its approach has been heralded by the presentation of supplementary estimates which reduce to mere mockery the Chancellor's solemn warnings to Departments last spring that no supplementary provision would be made except in very special circumstances and his pledges given in the autumn that renewed efforts would be made to ensure the utmost economy. It is true that this additional bill does not of itself mean that no economies are resulting from the promised drive, since under-spendings on one vote cannot be offset against over-spendings on another; but two-thirds of the bill (the details of which are discussed in a Note on page 520) are for the Health Service, which was known to be outrunning the constable long ago, and the excess here certainly cannot be excused, even by Sir Stafford Cripps, on the ground that the national interest necessitated a "major change in policy" which would constitute a "special circumstance." It is painfully apparent that this extravagance arises precisely because the policy, such as it is, has not been changed.

"ORDINARY" EXPENDITURE, 1948-51

£Mns.

	Actual 1948-49	Original 1949-50	Estimates 1950-51
CONSOLIDATED FUND SERVICES:—			
National Debt	477·2*	485·0	527·0†
Other	41·8	42·0	
	519·0	527·0	527·0†
SUPPLY SERVICES:—			
Admiralty	162·7	189·3	193·0
War Office	346·7	304·7	299·0
Air Ministry	186·9	207·4	223·0
Supply (Defence)	56·3	57·8	65·0
Ministry of Defence	0·6	0·7	0·8
TOTAL DEFENCE	753·2	759·9	780·8
Civil Votes	1,844·8	1,982·8	2,102·2
Revenue Depts.	35·8	31·3	34·4
Post Office (net)		7·4	7·5‡
TOTAL ORDINARY EXPENDITURE	3,152·8	3,308·4§	3,451·9

* Excluding £22·8 mn. sinking fund provisions to raise total to £500 mn. "fixed" debt charge.
† Unofficial estimate, assuming that any extra provision required for payments to Northern Ireland may be offset by a reduction in the "fixed" debt charge.
‡ Unofficial estimate.
§ Raised to £3,478·1 mn. by Supplementary Estimates.

More sombre still is the picture presented by the estimates for the coming year, for these reflect the full effects of any economy measures taken last autumn, and yet disclose only a minor reduction on the estimates for the current year after including the £169 million for supplementaries. The true comparison, moreover, is not the one traditionally made in the official papers, which always quote the revised estimates for the previous year; the only valid comparison is between original estimates, and after the bitter experience of the past two years, it is surely time that the official practice was altered. On this basis, adopted in the accompanying table, the bill for defence is expected in 1950-51 to be £21 million larger than it was at first expected to be in 1949-50; that for the civil departments is expected to be £120 million larger; and for the revenue-collecting departments, £3,000,000 larger. These Supply services, the estimates for which aggregate £2,917 million, are the only services for which official estimates will be available before Budget Day. The 1950-51 estimates for the other "above-line" services are unlikely, however, to differ much from those for 1949-50. If the Consolidated Fund services and the net charge for the Post Office are accordingly put at the £534 million they were expected to absorb in the current year, the grand total of "ordinary" expenditure for 1950-51 becomes approximately £3,450 million.

* * *

Ominous Expenditure

If this total is compared with the revised estimate of total expenditure for the current year (£3,478 million), there is an apparent improvement of some £25 million. But, as already noted, the actual expenditure this year is likely to fall short of the revised provision, perhaps by as much as £100 million. Indeed, if expenditure in the remaining four weeks were no greater than in the similar period of 1948-49 (ignoring a special charge brought into the final account), this year's shortfall below revised estimate would be £150 million. In other words, the Government is already expecting to spend in the coming year at least £50 million more, and perhaps £75-£100 million more, than is likely to be actually spent in the year now ending—and this in a period which takes full credit for the vaunted economy drive. Plainly, such economies as have been put in hand are far from sufficient even to keep pace with the so-called "natural" growth of the cost of existing major services. Moreover, past experience suggests that it would be optimistic to suppose that these first expectations of spending will not in the end be surpassed by at least £100 million—unless the Government can be forced to make radical changes in its system of financial control.

In one sense it is even regrettable that past inflation on the one hand, and fortuitous and special receipts on the other, have so strikingly inflated the Chancellor's realised surplus. Even after allowing for the new supplementary estimates, the current year will close with a large "above-line" surplus: on the worst reckoning (i.e. assuming that expenditure reached the revised estimate) the surplus would be within a few millions of the budgeted £470 million, and is likely in fact to be appreciably above that figure. Net expenditure "below the line" seems likely to be about £500 million (it now stands at about £465 million, before taking credit for the £8,000,000 gift from Australia; and in the last four weeks of 1948-49 £35 million net was spent). There is a good chance, therefore, of a moderate "overall" surplus before taking account of transfers to sinking fund. If the Chancellor is determined to resist pressure for retrenchment, this achievement may help him to do so. But he will need to indulge in some very fanciful estimating of revenue if he is to offer, on paper, any appreciable "overall" surplus for 1950-51.

* * *

"Moderation and Restraint"

The Stock Exchange this week has pursued its same course of dull uncertainty. The size of the supplementary estimates has shocked the gilt-edged market; and the King's speech, with its omission, as was expected, of any reference to nationalisation, has done nothing to help industrials. Financial policy and the tempo of Government spending seem likely to dominate the investment scene during this session of Parliament. The menace of rising expenditure assuredly calls for caution on the part of the investment community, not least by institutional investors. Uncertainties of a different kind arise from the challenge to the Government's stabilisation policy, which seems on the point of breaking out openly. The upward surge of prices continues, and is adding to the restiveness of many trade unions about the "wage freeze." It will not be long, too, before complaint is heard from the unions that industry is "breaking its word" on dividend limitation.

Since the sop of compulsory dividend limitation has been denied to the unions by the result of the election, it is time to examine what commitments industry has assumed. Mr Eden, opening the general debate on the Address last Monday, suggested in response to an interjection that he was in favour of "dividend limitation" being continued. Industry has committed itself to something rather different from strict "limitation" and has undertaken to pursue "moderation and restraint" in dividend policy; presumably Mr Eden was not intending to do more than lend support to that undertaking. The issue then turns on the interpretation which should be put upon the "moderation and restraint" formula.

It has not escaped the unions' attention that, since the election, a greater number of companies (though still a moderate and restrained number) have interpreted the undertaking as being consistent with some increase in their ordinary dividends. Towards the end of last week, Leyland Motors, Hoover, and Doulton and Company increased their payments. There have been a handful of less spectacular cases this week. By those who regard "moderation and restraint" as synonymous with total fixity, such increases will be marked as reprehensible and put forward as complete justification, without benefit of further proof, for increased wages. A more balanced view of dividend policy would set increases of this kind in their proper context by examining how far they may contribute to inflationary pressure and how far they absorb finance which industry urgently needs for strengthening its own resources. The framework of judgment is given in the table below:—

2,458 COMPANIES REPORTING IN 1949

	Previous Year	Latest Year
Ordinary dividends (£mn.)	109·5	109·1
Total provisions to depreciation and other reserves (£mn.)	277·0	327·0

In a purely accounting sense, industry could "afford" to pay considerably higher dividends. There are many companies, however, which are quite unable to contemplate increases in dividends (which they could otherwise easily pay) because they consider that their first duty is to supplement their internal resources to pay for new equipment or stocks. New investment of this kind is maintaining such high pressure on the financial resources of industry that it can be safely asserted that dividends would be most unlikely to rise very far or very fast, even if "limitation" were now to be regarded as a dead letter.

* * *

Stock Exchange Compensation Fund

The Stock Exchange Council is establishing a fund to compensate members of the public who may, in the future, suffer as a result of any failure of members to meet their obligations. The matter has been in the mind of the Council for some time—indeed the Committee for General Purposes considered such a measure in 1932—and the present scheme is the result of an intensive examination begun in October, 1948. Members will make an annual contribution of two guineas, the first contribution being in respect of the year commencing March 25th. This sum has been determined by reference to the average experience of defaults between 1932 and 1939, a period in which the hammer was heard some twenty-seven times. On the basis of the present membership of rather less than four thousand brokers and jobbers, the fund's income would be just over £8,000 a year. The Council has indicated that it will be prepared to consider making an advance to the fund if at any time its resources are insufficient to meet approved payments. The fund is to be created by trust deed; it will be administered by the council, and its assets are to be held by independent custodian trustees.

The fund is designed to cover losses which may arise under four specific heads: claims arising out of payment made for securities not delivered; claims arising out of securities delivered and not paid for; claims arising out of money in the hands of a defaulter pending investment; and claims arising out of securities or money in the hands of a defaulter which have been improperly dealt with. The Council will maintain absolute discretion in granting or withholding payments and no member of the public will have a legal claim to any payment. Contributory negligence will be taken into account in deciding the merits of any particular claim but the council will not have regard to the financial position of any claimant. The proposal has enjoyed wide approval among members, who generally regard it as a valuable addition to the safeguards offered to the public in dealing through the Stock Exchange.

Industry and Labour

Engineering Wages

A proposal from the Amalgamated Engineering Union that a national ballot should be taken to determine whether strike action or arbitration should follow the rejection of the engineers' claim for an increase of £1 a week was carried by the executive of the Confederation of Shipbuilding and Engineering Unions on Thursday. The majority of 624,000 to 519,000 was, however, unexpectedly narrow; the AEU, the most influential member of the Confederation, was supported only by the Electrical Trades Union, the foundry workers, and a few small craft unions.

The strongest opposition came from the two general workers' unions, which would prefer to press for a reform of the wages structure and a basic minimum wage of £5 a week. This, they contend, would be in line with Government and TUC policy; and it would lighten the burdens of many engineering and shipbuilding workers now on the present low minimum rate of 92s. a week. They were supported by most of the craft unions, which, for the first time in the Confederation's history, refused to support the AEU on a major issue.

In the national committee of the AEU the original proposal for the ballot was carried by 39 votes to 13, against the advice of the executive, which sought instead a government-sponsored inquiry into engineering profits. Such an inquiry would have had the effect of playing for time and might have produced some interesting results, even if these would not have been entirely the results which the unions would like to see. But the emphatic majority against this course seemed to suggest that discontent with wage stabilisation is widespread in the engineering industries. The alternative course to a strike ballot—reference of the claim to the National Arbitration Tribunal—is not popular. The AEU was among the unions which, at the Bridlington conference of the TUC, urged that compulsory arbitration should be terminated, and there is fairly widespread suspicion in the trade unions of undue Government pressure on "independent" tribunals. But does this mean that the engineers will want strike action? Probably not: any such action on a large scale would serve no purpose but to damage and discredit the industries concerned. In spite of the York decision, it is by no means certain that all the unions in the Confederation will carry out the ballot.

* * *

ECA and Oil Development

The efforts of the Economic Co-operation Administration to perform its task in Europe without appearing to damage any American commercial interest need to be watched with sympathy. They involve some nice steering, which becomes still more delicate with each success that is achieved in reducing the dependence of Europe on Ameri-

can supplies. On the whole, ECA has conducted its policy in a skilful and enlightened way in these narrow waters. But there are critical points at which firm decisions (which have to risk unpleasantness in one way or the other) cannot be avoided, and one such point has been reached over oil. This was shown by the statement submitted this week by Mr Hoffman, the ECA administrator, to a sub-committee of the House of Representatives in Washington. Mr Hoffman said that ECA was now withholding further finance for British oil company projects anywhere in the world until the present Anglo-American talks on the oil trade reach a successful outcome.

Mr Hoffman's statement goes further than anything that ECA has previously said on the subject. It is true that the great bulk of ECA allocations for the oil trade has been used to finance imports of refined petroleum products. The refinery projects, which require American equipment in varying proportions, have received a relatively small total of allocations, and oilfield development outside Europe has had little or nothing from ECA. Thus the big expansion of crude oil production and of refining by British and British-Dutch companies in Venezuela and the Middle East has been financed, as to the dollar part of its cost, substantially with "free" dollars.

Now that the refinery expansions of the "sterling" companies in Venezuela and Iran are nearly completed, the greater part of the expenditure still to be made is for two purposes: oilfield development overseas—that is, the getting and handling of crude oil in the British and British-Dutch concessions—and refining in Europe, including Britain. ECA has in general conceded that developments of this kind are necessary if Europe is not to depend on Marshall Aid for ever. But the large aggregate increase of capacity which they represent implies a threat to the traditional American share of the trade, and in some European projects (not those in which British interests are concerned) ECA has also been obliged to point out some blatant economic flaws.

*

For these reasons the petroleum equipment programme of ECA has from the start lagged behind the programme for financing the flow of refined products from dollar sources. What is to happen now? ECA has appropriated dollars for two British refineries (Llandarcy and Shellhaven) and those appropriations are not to suffer. British companies are concerned in certain refinery projects on the Continent, and it has been explained that two of those also will be unaffected; but there are more than two, and it does not seem to be known yet which are the lucky ones. It is worth noting that any aid for those projects would rank as aid not to Britain but to the countries in which the projects are to be carried out; this part of the ECA embargo hits at the "sterling" companies, not the British internal economy. It is a queer measure to come out of the American objection to "discrimination." The continuing programme of "sterling" oil development overseas is the target at which the American action is really aimed. But this has managed without direct ECA aid so far. The American attitude seems to be that if dollars have to be saved, they must be saved on oilfield and refinery development rather than on refined products. It is not a thesis that will commend itself in London, where (it is reported) the talks with the American companies are to be resumed at the end of this month.

* * *

Utility Cotton Cloth Prices

Action permitting manufacturers' and distributors' prices for utility cotton cloths to rise has at last been taken by the Board of Trade; orders were laid before Parliament this week. These orders, which take effect on March 13th and 27th, allow increases for different materials which average about five per cent for curtain cloths and "just under 10 per cent for the others." They cover cotton piece goods, household textiles, and handkerchiefs as well as curtain and upholstery cloths, together with "union" goods and certain linen goods; but garments are excluded, and on these the Board of Trade policy is clearly to go slow:

> Any consequential increase in garment prices will be less—in many cases much less—than these cloth price increases. It will in fact be several months before garments made from the higher-priced fabrics reach the shops in any substantial quantity.

Government anxiety to keep the interim index of retail prices as stable as possible is easily understood, particularly in view of the anxieties about the future of the wages stabilisation policy. But it is not at all clear how much good can be done by playing down and delaying price movements which have become inevitable. When the present increases were foreshadowed on December 2nd, the Board of Trade made clear its intention of allowing prices to rise only "as and when substantial quantities of those goods made from raw material bought since devaluation were ready for sale by manufacturers." This stage is now held to have been reached in cotton cloth, but not in the garments which are made from it. But it clearly does not arrive simultaneously for all manufacturers or for all merchandise, and the delay in meeting it (in such direct contrast to the policy of the Ministry of Supply about non-ferrous metal prices) compels the manufacturer to make good the loss of his real capital out of his own pocket. Since the retail prices have been held rigid, the movement in raw material prices has made itself felt in another way, by causing deliveries of utility cloths to be held back.

What is to happen now? The Board of Trade announcement shows a tendency to cling to delusions of power which are surely becoming inappropriate:

> Careful watch is being kept upon the level of utility cotton supplies. It is the intention of the Board of Trade to ensure that these are maintained and that they should be increased as cotton cloth production rises. There is close contact with the Cotton Board and the cotton industry to this end. . . .

But, if this intention is serious, no amount of careful watch will be as effective as the creation of less artificial and more flexible price conditions; flexibility need not always work to the consumer's disadvantage, nor does rigid control always help him to get what he wants at a price he can pay.

It is worth noting the long time-lag between commodity price movements and the movements permitted in the price-controlled sector of the economy. Mid-American cotton rose from 23.5d. to 28.15d. on September 20th, and by three further stages to 30.15d. on January 5th. These are the increases which have been taken into account in the new price schedules. Since January 5th the price for the same cotton has risen to 31.65d., but no notice is yet permitted to be taken of this fact. It is tempting to wonder whether similar rigidities will be insisted upon when the course of raw material prices takes a downward turn; or is such a possibility ruled out, these days?

* * *

Gas Turbines in Cars

The Rover Company's demonstration of a gas turbine in a standard passenger chassis cannot be taken to mean that the engineering problems connected with the production of low-powered turbines have been solved. The company's engineers have said that the vehicle is "a piece of test-bed apparatus and in consequence does not bear much resemblance to what the company has ultimately in mind for a motor car, either in power output, dimensions or weight." Compared with the 2,000 brake horse power of the smaller gas turbine aero engines, the demonstration engine has been roughly assessed at 200 brake horse power, although it was demonstrated at only half this power. To scale down the power of a gas turbine in this way is a considerable feat,

Beyond the Broad Counter

At the counter, money, cheques and passbooks are the familiar things of everyday; here for many customers banking begins and ends. And yet, beyond it, if they only knew, a continuous activity goes on, providing less familiar but immensely important services for all who wish to have their financial affairs dealt with in the safest and most convenient way. If, then, you have a problem connected with personal or business finance, trade or travel, or any question relating to money, mention it to the Manager. He will be pleased to help.

DISTRICT BANK
LIMITED
ESTABLISHED 1829

INDUSTRIAL AND COMMERCIAL
I. C. F. C.
FINANCE CORPORATION LTD.

I.C.F.C. was set up in 1945 by the English and Scottish Banks, with resources of £45,000,000, to supplement existing facilities by providing an accessible source of share capital and long term funds for well conducted businesses of small or medium size. It applies to all proposals the usual canons of sound finance and is not averse from supplying risk capital. I.C.F.C. so far has made available over £19,000,000 for British Industry, divided among more than 290 concerns of many kinds.

Full particulars of the facilities offered may be obtained from the General Manager,
7, Drapers Gardens, E.C.2.

THE
STANDARD BANK
OF SOUTH AFRICA . LIMITED

Bankers to the United Kingdom Government in South Africa and to the Governments of Southern Rhodesia, Northern Rhodesia, Nyasaland and Tanganyika

Capital Authorised and Subscribed	£10,000,000
Capital Paid-up	£5,000,000
Reserve Fund	£5,000,000

10 CLEMENTS LANE, LOMBARD STREET and 77 KING WILLIAM STREET, LONDON, E.C.4

LONDON WALL Branch—63 London Wall E.C.2.
WEST END Branch—9 Northumberland Avenue W.C.2
NEW YORK Agency—67 Wall Street
HAMBURG AGENCY—Speersort, 6

BRANCHES THROUGHOUT THE UNION OF SOUTH AFRICA, SOUTH-WEST AFRICA, SOUTHERN AND NORTHERN RHODESIA, NYASALAND, KENYA, UGANDA, TANGANYIKA, ZANZIBAR AND PORTUGUESE EAST AFRICA

Banking Business of every description transacted at all Branches and Agencies.

THE
UNITED COMMERCIAL BANK LIMITED

(Incorporated in India. Liability of Members is limited)
Head Office:
2 ROYAL EXCHANGE PLACE, CALCUTTA
G. D. BIRLA, Esq., Chairman.

AUTHORISED CAPITAL	Rs. 80,000,000
SUBSCRIBED CAPITAL	Rs. 40,000,000
PAID-UP CAPITAL	Rs. 20,000,000
RESERVE FUND	Rs. 5,250,000

With over 80 Branches at the leading centres of Industry and Commerce in India, Pakistan, Malaya and Burma, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business with India or intending to open connections with that country.

B. T. THAKUR, General Manager.

though several firms have done it. The more difficult problem, so far unsolved, is to reduce the power still further without impairing the efficiency of the engine. The full power of the present engine would be appropriate for only the very heaviest road vehicles. The more powerful production models of passenger cars, the Cadillac and Jaguar, have 160 b.h.p., the Daimler straight eight has 150. The Austin A40 has 40 b.h.p., the Rover 75, the Vanguard 68, and the 2½ litre Riley has 100 b.h.p.

The transmission of power from the turbine to the wheels is not believed to present serious mechanical problems; several motor manufacturers, including the Austin Motor Company, have applied for patents for various methods. If the difficulties of further reduction of power can be overcome the main problems will then be to reduce the fuel consumption of the gas turbine, now far above that of a reciprocating engine, and find storage for the large quantity of fuel required. It may also prove hard to reconcile the high priced materials and craftsmanship which are necessary with an economic cost of production.

* * *

Industrial Power from Atomic Energy

Professor M. L. Oliphant outlined the prospects of atomic energy as a source of power to industry in a lecture this week to the Royal Society of Arts. The following figures express the fundamental limits within which development is possible. Every pound of coal burned releases 3 to 4 kilowatt hours of heat, which produce 1 kilowatt hour of electricity, two-thirds of the coal's heat being wasted. One pound of uranium, fully utilised, provides as much heat as 1,500 tons of coal. The present price of uranium is 1,000 times that of coal, and this "leaves a factor of about 3,000 to cover the cost of converting the uranium to a form suitable for use in a reactor and the greater cost of a nuclear reactor over a coal furnace." Existing investment in the electricity generating industry would not, in general, need to be scrapped. The boilers, the generating equipment and the methods of distribution would remain as they are today, the only difference being that the coal furnace would be replaced by a nuclear reactor heating gas, water, or possibly liquid metal which would provide for the boilers the heat that is now obtained from coal. The boilers and the steam turbines might later be replaced by heat exchangers and gas turbines.

The consumer would notice little difference, beyond the absence of coal or smoke. Professor Oliphant suggests that there would be fewer interruptions in electricity supplies, but this would seem questionable. Difficulties in meeting the full demand for electricity now arise from the shortage of generating plant, not from shortages of fuel If it is assumed that the heat from the nuclear reactor proved no dearer than that from coal (some scientists think that it would be too costly) then there should not be any difference in the price of electricity. The costs of generation and distribution, including capital costs, represent two-thirds of the price of electricity; if coal were supplied free (Professor Oliphant remarked) prices would drop by less than 30 per cent. He argued, however, that "complete electrification of the country" and the "abolition" of domestic heating by solid fuel would so increase the load factor that the cost of electricity would fall. This is, to put it mildly, an unproved argument; a higher load factor depends on better spreading of the load rather than on a mere increase in the total amount of electricity consumed, and one advantage of the direct use of solid fuel is that it is independent of such consideration. Further, while the use of nuclear reactors would reduce the dependence of electricity supply on the output of the mines, it would not reduce the high cost of generating plant or the delays of installation. When there is sufficient experience in the use of gas turbine generators to meet peak loads, the way to "total" electrification may be more clear. This is not a fuel problem.

Design Problems of Nuclear Reactors

Professor Oliphant holds that power could be produced from atomic energy at an economic price, though not for 10 or 15 years yet. The time taken will depend on the resources which are spared for industrial as distinct from military research. The problems are largely of a practical engineering kind. The technique of atomic fission is to alter the number of particles which form the nucleus of the atom. When an extra particle is added to the nucleus of atoms of uranium 235 the nucleus splits into two smaller atoms, but certain particles are left at liberty. These loose particles reproduce the fission process in other atoms of U235 with which they may collide. The energy released by each fission is so great that one pound of U235 could provide 10 million kW of energy. A chain of such fissions can be started, and a nuclear reactor in its simplest form brings segments of U235 together to form a mass of material large enough to ensure a chain reaction, and separates them before the rate at which the fissions take place reaches a dangerous (i.e., explosive) frequency. Few materials are suitable for fission, and the best known of them, U235, is not only hard to separate from the non-fissile and plentiful U238, but occurs only as one part in every 140. It is here that the main engineering problem arises.

A modified type of reactor makes it possible to cause fission in U235 atoms without separating them from U238. But this needs several hundred tons of uranium in its structure and hundreds or even thousands of tons of damping materials. The potential power output of such a reactor is 1,000,000 kW, but such power cannot yet be achieved in practice. Uranium metal has to be shielded from the chemical action of the gas or water which is used for cooling, and the materials now used for protection corrode too easily to withstand the high temperatures at which the operation ought to be carried out. The more serious problem is the low natural concentration of U235 in uranium metal, so that, after a number of fissions have taken place, there may not be enough U235 atoms left to provide for an adequate rate of fission. The problem of taking the highly radio-active uranium out of the pile, purifying it and re-charging it with U235, all by remote control, may be more than engineering ingenuity can solve.

*

The solution probably lies in developing "breeder" reactors. While some of the particles, once released, cause other fissions, others can be absorbed into certain stable materials which they thereupon render fissile. Such a process can change U238 by stages into a fissile material. By a more direct process it will convert a stable element, thorium, into a third fissile form of uranium, U233, which does not occur naturally. The successful design of such a reactor depends on keeping it free of useless substances, and also in enabling the installation itself to resist the reactions taking place within. Two such reactors are being built in America; their cost is heavy. When the initial design problems are solved the further problem arises of disposing of the highly radio-active materials which will be the "ash" of the nuclear reactors. Professor Oliphant suggested that the only safe method of disposal was deep underground storage until they ceased to be radio-active.

* * *

ICI Seeks American Outlet

The ability of British companies to raise money in New York for extensive new operations in the United States is not often demonstrated nowadays. The offer which has been made by Imperial Chemical Industries for a controlling interest in the chemical manufacturing firm of Arnold, Hoffman and Company provides such a demonstration; for this reason, and also because it expresses a decided intention

to enter the American market on a much larger scale than before, it can fairly be taken as a cheerful portent. In effect, ICI is entering into chemical manufacture (particularly of dyestuffs and other synthetic organic chemicals) in the United States and, further, is acquiring a medium for the marketing in the United States of its British products. A letter from ICI to Arnold, Hoffman and Company, in which the offer was formally made, explained that the devaluation of sterling was one factor that influenced the decision. Presumably, therefore, it is now felt that a sufficient range of British chemical products has been brought down to competitive price levels to make a big export campaign worth while.

*

The American company operates chemical plants at Charlotte (North Carolina), Cincinnati (Ohio) and Dighton (Massachusetts). Its value to ICI lies, however, not only in these plants, but also in the ready-made marketing organisation which it will provide, and no doubt the good price that has been offered expresses this fact: ICI considered, and turned down, the idea of building a new organisation in the United States from scratch. Arnold, Hoffman and Company was selected as most suitable for the purpose because of the nature of its production and its good financial record, and also because it is a keen and efficient firm. The intention is that the existing management—no doubt with some reconstruction of the board to include ICI members—shall be kept in charge.

The offer that has been made is handsome, and there seems no reason to doubt that the shareholders of the American firm (to whom the offer was being circulated this week) will choose to accept. Arnold, Hoffman and Company has an issued capital of $930,000 in common shares of $10. Its dividend has lately been at the annual rate of $1 a share. For these shares, ICI is offering $55. The offer extends to not less than two-thirds or more than 70 per cent of the common stock. If the maximum number of shares is offered, ICI's commitment will be to buy 65,100 shares at $55 each; this would cost $3,580,500, and the Guaranty Trust Company of New York has agreed to lend the necessary dollars. When the offer has become effective, agreements are to be negotiated under which ICI will make available (in return for royalties and fees) its patents and processes for the production and use of dyestuffs, intermediates and certain other organic chemicals; and this technical collaboration may later be extended to other fields, so that the activities of the American firm will be broadened.

* * *

Radio and Television Sales

Sales of radio and television receivers rose steadily during 1949, and output rose with them. The radio industry stimulated these sales by reducing prices—the average price of a radio receiver fell by between 13 and 15 per cent between the autumn of 1947 and the autumn of 1949—and by introducing new models. These new models were indeed often the means of reducing prices, since they dispensed with some refinements which had been keeping prices up. But there are limits to economies of this kind. Some manufacturers who exhibited low-priced models at the industry's show in the autumn have found that the resulting reduction in quality was greater than they had anticipated. Rather than jeopardise their reputation, they have been obliged to revert to dearer sets.

A more general rise in prices is facing the industry when the stocks of materials which were held before devaluation are exhausted. Some manufacturers have already felt the effect of this, but it is hard to tell how widely stocks of materials bought at the old prices are still being used. The full effects of devaluation will not appear in costs for some months yet. It is generally believed that the cost of materials forms a relatively small part of the total cost of radio and television manufacture. But it is hardly possible to give exact proportions because, while some manufacturers make all their own components, some only make a proportion and others buy them all from component manufacturers. Some increases in costs can undoubtedly be absorbed by the methods already described. Longer runs can also lead to economies of production to offset rising material costs. Makers of television receivers have been able to bring down their prices as output rose. Manufacturers are undoubtedly anxious to avoid any increase in prices which might restrict sales. The restriction of hire purchase finance has meant that while before the war 80 per cent of the television receivers were sold on credit, 76 per cent of the sales made in December 1949 were for cash. Retailers find that these restrictions fall heavily on the small shops, the larger ones having enough capital to make their own hire-purchase arrangements.

PRODUCTION AND DISPOSAL OF RADIO AND TELEVISION RECEIVERS IN BRITAIN IN 1949

* Index prepared by the Radio and Television Retailers' Association to show average sales per retailer in England and Wales.

Exports during the year were far less satisfactory than the table would suggest. The total value of radio sets exported (there is as yet no export of television receivers) was £3,635,981 in 1948, but because of import restrictions in overseas markets and the development of domestic radio industries there, exports fell in 1949 to £2,963,947. Against this, there were slight increases in the export of various categories of components. The value of radio transmitters and radio communication equipment exported rose from £2,700,000 to £3,200,000 in 1949 and the outlook for exports of this class is said to be promising.

Competition in Footwear

The poorer trading experience of footwear companies in 1949 (shown in the table below) is underlined by the results of Lotus, whose report has been issued this week. The decline in this company's consolidated trading profit from £783,236 to £681,914 accords with the fall recorded by most of the leading companies. William Timpson has provided an exception with a rise in profits from £649,281 to £671,664. This result is reflected in the low yield of £5 3s. per cent on the 5s. units at the current price of 26s. 9d.; yields on the ordinary units of other share companies mainly fall within the range of £6 10s. per cent to £7 10s. per cent. The preliminary statement of Upsons showed a reduction from £907,839 to £833,913 in group profits before taxation and Saxone Shoe a similar decline in consolidated trading profit from £586,361 to £524,849.

Nearly all footwear companies can still show a comfortable earnings coverage for dividends; of the ten concerns analysed, only one—Bignalls—has reduced its dividend. In this case group earnings on the parent company's ordinary capital dropped sharply from 70 per cent to 37.6 per cent

in the year to November 30, 1949. The cut in the dividend rate of W. J. Martin from 50 per cent to 40 per cent is a consequence of the free bonus issue made during the year; the latest payment absorbed £28,875 compared with £27,500 in 1947-48.

The deterioration in the trading results of the industry has been clearly explained by the chairman of Lotus. This company scored an all-time record in boot and shoe pro-

duction, but profit margins have been reduced. It suffered, like the rest of the trade, from rising prices of raw materials and increased labour costs. Utility goods had to be sold at or under the ceiling prices fixed by the Government. The backlog of stocks has been made good—the stocks of the Lotus group have risen from £922,318 to £1,168,061 (debtors, reflecting perhaps less booming trade, are down from £374,925 to £301,560). The precaution has been taken of setting aside £100,000 as a trading reserve to meet a possible fall in the value of stocks.

The growth of stocks and a more exacting demand have led to increased competition; uncertainty reigns about Governmental action on ceiling prices and profit margins; post-devaluation increases in the price of raw materials—particularly of leather—have yet to be fully felt. Production is now generally in excess of current demand and more intense competition is expected in the industry. The general decline in profit noted in 1949 may be continued—and perhaps even accelerated—during the current year.

Commodities and Finance

Doubts about a Wool Scheme

The Dominion wool conference which had been reviewing the operations of the Joint Organisation was adjourned last week to enable delegates to report to their governments. The conference had been sitting for five weeks, and most of its time was devoted to working out a marketing scheme for wool. The Study Group should really have dealt with this matter, but the dominion members of the Joint Organisation, having experienced the security of a reserve price system which was incorporated in the stock disposal scheme, were anxious to ensure some continuity in the event of the JO being wound up. The 10½ million bales of wool which had accumulated at the end of the war had dwindled to a little over one million bales by last December, and if the current programme of offerings is fulfilled, the Joint Organisation's stocks will amount to no more than half a million bales by the end of June. By that time the disposal of wartime stocks will have been completed.

Australia, New Zealand and South Africa want to eliminate short-term fluctuations in wool prices which persisted before the war. They have proposed a buffer stock scheme under which wool would be purchased by the controlling authority when market prices fell below the published reserve prices; these stocks would be marketed when the price of wool was rising, thus damping down the more violent fluctuations. Such a scheme differs little from the JO scheme which is still in force. Both in 1948 and in 1949 wool prices fell very sharply in March and April, only to recover in the following month. Since January, wool prices, after reaching a peak, fell by nearly 20 per cent, then almost regained their peak level and have since fallen again. Clearly the JO scheme has been incapable of ironing out relatively violent price changes in the short period.

Presumably by "short-term fluctuations" the proponents of the scheme mean the movement of wool prices from season to season. A reserve price system could protect producers from sharp falls, but experience of the Joint Organisation scheme has shown in the past that even when stocks are large it is not always possible to protect consumers from absurdly high prices. The scheme is not intended to include the South American wool producers. But if they were excluded they would still benefit from the general support given to the wool market through the restriction of offerings and they would also be able to undercut the dominion wool growers in the United States, Canada and other markets where currency is no bar. Moreover, if a scheme of this sort were to fulfil its intention, it would support wool prices and encourage wool production, but it would also encourage the use of wool substitutes, thus involving the participating countries (including Britain) in the serious potential burden of carrying large stocks. Such a marketing scheme, whatever its short-term advantages (and they are by no means certain) would almost certainly be against the long-term interests of the wool industry.

Extended Wheat Agreement?

Next Monday the International Wheat Council meets to consider, for the third time, whether Germany and Japan should come into the agreement. Britain, representing the importers, and the United States, representing the exporters, hold opposed views. The United States and Canada would welcome Germany and Japan in the scheme; their arrival would add to the voices of consumers, but it would also provide larger guaranteed markets for the supplying countries. Germany and Japan would together take 100 million bushels a year and the United States and Canada already agreed last week in Ottawa to increase their quotas by 75 and 25 million bushels respectively to cover this prospective increase in sales.

The prospective entrants however, would also be potential competitors for the small supplies of sterling wheat which are available under the agreement. As the largest wheat importer, Britain might therefore find itself involved in larger dollar expenditure to the United States and Canada. Australia, the main sterling supplier of wheat, has a guaranteed export of only 80 million bushels a year and is at present unable to increase it.

It is on this ground of dollar risk that Britain has opposed the entry of Germany and Japan into the agreement. At least it would agree to their entry only on condition that they would not be eligible to buy more than 5,000,000 bushels a year from Australia. Australia appears to be opposed to Japan's entry for political reasons, but otherwise would prefer to have an extra competitor for its exports.

Britain's proposal is one which, if accepted, would have far-reaching consequences. One of the main advantages of the international wheat agreement (and there are not many in all) lies in its being a multilateral contract. Importers can buy from any exporter provided the price is within the upper and lower limits fixed in the agreement. The British condition would introduce a new bilateral element into the

Rayon for men

Today, makers of men's clothes rely more and more on rayon to give the best modern cloth designs. There is rayon in your suits; it is often attractively woven into tweeds, flannels, worsteds, and other textiles. Because of their admirable comfort and wear, rayon linings have a wide popularity. And so too have rayon shirts, pyjamas, underwear and ties. The complete list is very long, and all the time it grows longer still, as the strength, good looks and versatility of rayon are approvingly noted in town and countryside.

Courtaulds

THE GREATEST NAME IN RAYON

Courtaulds Limited, 16 St. Martins-le-Grand, London, E.C.1.

From Captain Cook's Journal May 26th. 1769

"Some flying showers again. This morning we hauled the pinnace a Shore to examine her bottom, and had the Satisfaction to find that not one worm hath touched it, notwithstanding she hath been in the water nearly as long as the Long Boat. This must be owing to the White Lead with which her bottom is painted .... for no other reason can be assigned why the one should be preserved and the other destroyed, when they are both built of the Same sort of Wood and have been in equal use. From this Circumstance alone the bottom of all boats sent into Countrys where these worms are ought to be painted with White Lead ..."

TWO CAPTAINS ON WHITE LEAD

From a letter to ASSOCIATED LEAD MANUFACTURERS September 3rd, 1949

"For many years I was Deputy Conservator of the Port of Rangoon and had under my charge four unattended light-ships. They were anchored off the mouth of the Rangoon River and were subject to rigorous climatic changes and sea conditions ...

In March 1942 the Port fell to the Japs. At the time all our light-ships were on station, with the exception of one relief. In May 1945 I returned to Rangoon and it was evident that none of these craft had received any paint attention during the Jap occupation but I found the *lead-painted* decks as intact and in as good order as the day we left them and some had not been painted for four years."

Yours faithfully,
H. C. Granger-Brown,
Captain M.N.

Trends in the Cotton Market

Despite the prospect of heavier surpluses at the end of the current season, the world cotton market has become noticeably firmer in the past three months. The world crop is still forecast at 31 million bales and consumption at 28½ million bales—yielding an increase in stocks of 2,500,000 bales, most of which will be in the United States. The trend in prices since August for the main growths is shown in the accompanying table; they are all quoted in American cents. American and Mexican middling 15/16 inch cotton are now dearer than they were immediately before devaluation of sterling whereas Brazilian and Pakistan medium staples have tended to cheapen. Egyptian Karnak, which has risen in the past three months, is still well below its pre-devaluation price, and this week it has been reduced by the Raw Cotton Commission, following the trend of prices in Alexandria, from 44.10d. to 42.10d. On the other hand, Ashmouni, an Egyptian cotton which to some extent can be substituted for American medium staples, has risen even in dollar terms.

The cotton market has been supported by the recovery in industrial activity in the United States. Demand for cotton by the American textile industry has been firm, although the demand for finished products is none too promising. Moreover, throughout 1949 the use of cotton in the manufacture of tyre fabrics has declined in favour of rayon—and this was once its most important outlet. Nevertheless, exports of raw cotton from the United States have been on a larger scale than last season. Foreign purchases have of course been assisted by Marshall aid, but consumption generally has shown no marked expansion.

On balance, then, this upswing in American prices might prove to be temporary and if the existence of stocks is allowed to have any influence on the market, prices should be down to their support levels before the end of the season. American prices, in any case, are lower than they were twelve months ago. The strong demand for Egyptian Ashmouni cotton is understandable, since it is a substitute for certain American types and it can be bought with soft currency. Brazilian cotton—also a substitute for American—has, however, cheapened quite considerably since September.

So far as British spinners are concerned, prices for most of the main types have risen steadily since devaluation. American middling is now being sold by the Raw Cotton Commission at 31.65d. a lb. against 23.50d. a lb. at the end of August. Ashmouni has risen from 29.15d. to 39.35d. a lb. and Karnak from 41.15d. to 44.10d though this week's reduction brings it down to 42.10d. East and West African cottons as well as Brazilian types have also become dearer. The Raw Cotton Commission has at least kept its pledge to maintain its selling prices at replacement costs in the world market.

Swollen Food Stocks

British food stocks have been built up to an extraordinary high level during the past twelve months as part of a deliberate policy to strengthen Britain's bargaining power with supplying countries and perhaps to avoid part of the cost of devaluation. Since October, the Ministry of Food's worry has no longer been one of securing adequate supplies to meet the rations, but of finding sufficient space to store them. Stocks of all foodstuffs have increased considerably during the year: wheat stocks are twice as heavy as they were twelve months ago, bacon, cheese and butter have more than trebled and other food stocks (except sugar) are between 25 and 50 per cent heavier. Stocks are also much larger than was customary before the war. Despite the increase in cold storage accommodation since 1939 the Ministry of Food has had to use this winter as many as fifteen refrigerated ships for additional storage of meat while it has also used three ordinary ships for grain. The direct cost of this floating storage space was well over £160,000 a month. The owners of the refrigerated ships had to be compensated for their loss of revenue and storage charges came to 70s. a ton a month compared with 27s. a ton for land storage. Two of the grain ships were old sailing barques—one the famous *Pamir*—waiting to be broken up.

This policy of building up unnecessarily large stocks has proved not only costly but ineffectual. Despite the present overcrowding of warehouses—and they are so full that, according to report, the Ministry of Food have asked Denmark to withhold shipments of bacon—Britain has at most only six weeks' supply of most foods, apart possibly from wheat and sugar. It may be asked whether six weeks' stock has much value as an argument to induce supplying countries to reduce their prices.

When shipping is uncertain, the need to hold adequate stocks of food in this country is obvious, but shipping has now returned to normal conditions. Before the war stocks tended to be distributed fairly evenly throughout the distributive channels from producer to retailer. Now they are largely concentrated in the importers' hands. Again, most of the food imported before the war went into the retail shops without being held in store; importers were able to rely on regular arrivals. It now appears that, in order to satisfy the Ministry's accounting requirements, imports must first be checked into a warehouse before delivery can be made to wholesalers. Last summer the British public saw only too clearly the result of such a system when eggs and bacon which had deteriorated in store were distributed on the ration.

* * *

The Use of Government Cold Stores

The root of the trouble is not insufficient storage space but a misconceived policy of distribution. Public cold storage capacity in the United Kingdom amounts to 41 million cubic feet, while the government-owned cold stores add a further 16 million cubic feet. Even if government-owned storage is ignored, the amount of refrigerated space available is more than sufficient for Britain's normal trading needs. A merchant before the war used the cold store as a means of "hedging"; goods were only stored if the market moved contrary to expectations. The present system of keeping the stores filled to the roof is no doubt profitable for the companies operating them, but it involves the country in considerable cost of double handling, deterioration, and physical waste.

The Government cold stores are all situated inland and at relatively inaccessible places, for strategic reasons. The commercial stores are situated mainly at the ports (and generally alongside wharves) and at centres of distribution. Goods sent to the Government stores have first to be unloaded at the docks, put on rail or road and then transported inland. When the same goods have to be distributed, more often than not they are brought to wholesalers in London and then returned (sometimes to retailers in the same area as the Government stores), involving two unnecessary journeys, besides unnecessary handling and waste.

These stores could, of course, be put on a care and maintenance basis so that they could be used in case of need. To attempt to fit them into a distributive system which has its focal point at London and subsidiary centres at the other main ports is open to serious question. If stocks were at their prewar level, these stores need not be used. The annual cost of the Ministry of Food would be considerably reduced, while the quality of food received by the public would be enhanced.

* * *

Sterling Payment Restrictions

Every step forward in the relaxation of sterling exchange control has recently been accompanied by two steps back. Reference was made in *The Economist* last week to the compulsion placed on banks in this country to use immediately, by direct transfer to another authorised account, any transferable sterling they receive; otherwise, the sterling in question will lose its character of transferability. The question has arisen as a result of a notice sent last month by the Bank of England to the Foreign Exchange Committee advising banks that "sterling payments from a transferable account of one country to another transferable account may be made only by direct transfer and may not be passed to accounts not so designated." It appears to have been the practice of certain London banks in the past to hold in suspense accounts for periods of some days sterling received from transferable accounts pending instructions from the payee (who had no transferable account) as to the destination of these funds. Even this measure of elasticity in the treatment of transferable sterling is not permissible. Admittedly, it is difficult for the exchange control here and in other countries concerned to keep continuous check of transferable sterling if, in the course of its peregrinations, it finds a temporary halting place in a suspense account. But this is no justification for placing restrictions on the international use of sterling at a time when such loud claims are made for it as the currency which ought to do all the work of the proposed European Payments Union and much else besides.

Another instance of the one-forward, two-backward progression is in the circular which has been sent to the Foreign Exchange Committee regarding the "concessions" on restrictions of capital that may be withdrawn from this country by emigrants. One surprising fact which emerges from this circular is that as from March 20, 1950, British emigrants, though they will for four years retain the status of British residents for purposes of Foreign Exchange Control, will no longer be allowed to use their sterling assets to make payments in this country or to other scheduled territories. Such sterling can be used only for investment in sterling securities having not less than ten years to run. Although not so stated in the "guide," some relaxations will probably be extended to emigrants allowing them to use their sterling resources to pay taxes (a kindly gesture), to pay insurance premiums, to meet regular personal remittances of compassionate character and, up to a reasonable figure, to meet their current expenditure when on visits to Britain. It would be interesting to know where these nails for the coffin of sterling as an international currency are being forged.

New Payments Pact with Switzerland

Full details of the new trade and payments agreement with Switzerland have yet to be released, but present indications suggest that the existing pact will be extended without substantial change. This would mean that Britain would still have to pay gold when Swiss-held sterling reached £15 million, but that Switzerland would not receive an exchange guarantee on the balances held in London on September 18th—or, indeed, any guarantee against future changes in exchange rates. Although Anglo-Swiss payments have been more nearly in balance since the devaluation—there have been no gold settlements for four months—it would be optimistic to assume that the relief from the gold drain is yet more than temporary. The causes of disequilibrium in Anglo-Swiss payments persist. Since the war the principle on which British negotiators with Switzerland have worked is that Britain's visible trade surplus with Switzerland should be sufficient to sustain the adverse trade balance of the other sterling countries and the adverse financial balance of all the sterling area ; but in practice Britain's trade receipts are never quite enough. Now Germany is focusing its export efforts more than ever on the Swiss market. Indeed, in the face of German competition, it is hard to believe that Britain can maintain its present foothold.

In one way and another trade plans have never come up to estimates despite Swiss efforts to promote sterling impors. Since the war over £25 million in gold has been lost to Switzerland. Britain therefore has no alternative but to continue restrictions on non-essential imports from Switzerland and must accordingly continue to ration tourist expenditure. The new tourist quota for 1950-51 announced in Parliament by Mr Gaitskell as this issue goes to press limits holiday expenditure in Switzerland to £5,700,000 in the twelve months from May 1st. Holiday travellers to Switzerland—or, indeed, to any other country outside Scandinavia—will again be rationed to spending not more than £50 each in the coming year. The indignation of the Swiss at the alleged discrimination in favour of the Scandinavian countries has died down—it has been allayed by the argument that people who would go to Switzerland if they were allowed to spend more than £50 will not generally seek instead the totally different attractions of Scandinavia merely because there is virtually no limit upon what they may spend there.

* * *

Mexican Railway Assented

The Mexican Government's proposals of 1946 for the resumption of partial service on the National Railways of Mexico bonds became operative last Friday. Holders of more than the required minimum of 55 per cent of the bonds have assented to one or other of the alternative plans ; no further details have been given. Bondholders had the option of accepting, under plan "A," a drastic reduction in the face value of their bonds, coupled with a resumption of modified interest payments and a small sinking fund, or of forgoing, under plan "B," all future interest in favour of a redemption programme that will repay all "B" assented bonds by 1975. Under plan "A," interest works out at an average rate of 4.35 per cent per annum (plus a cumulative sinking fund of 1.78 per cent), calculated on the face value of the bonds after reduction by 80 per cent to one peso for each dollar. Redemption under plan "B" will be carried out by drawings or purchases in the market. The compensation for getting little at first under this alternative is the prospect of annual increases in redemption payments. Under either plan bondholders will receive $8.70 gross per $100 nominal in respect of interest arrears from 1923 to 1946.

When dealings in the assented bonds opened in London and New York on Monday, prices remained virtually unchanged. Reports from New York suggest that ten times as many bonds have been assented under plan "A" as under plan "B," the alternative more widely favoured here. The "A" scheme suits American investors better for taxation reasons. In this country the capital redemption alternative should yield better profit. But it remains to be proved, whatever option is chosen, whether the new mood in Mexico will stay its full course to final redemption, whether of railway bonds, government securities, or Mexican Eagle annuities.

Shorter Notes

The International Monetary Fund decided last week to reduce the proportion of its sterling funds which is held in cash at the Bank of England from 10 per cent to 1 per cent and to increase correspondingly the proportion held in special interest-free notes of the British Treasury. This adjustment was reflected in the Exchequer Return in an increase of roughly £42 million in receipts from "Other Debt—Internal" and in the Bank Return in a corresponding reduction in "private" deposits.

*

A shipment of 8,000 tons of Welsh anthracite, the first to the United States since the war, arrived in Boston last week. Two smaller shipments are still to be delivered. Although the anthracite can be sold at a competitive price on the eastern seaboard, this is not likely to mark a general resumption of the prewar export of anthracite to America because supplies are far short of demand. Last year a total of just under one million tons was exported, most of it to western Europe. Nearly 306,000 tons were sent to Canada, and it is hoped this year to increase Canadian imports to between 400,000 and 450,000 tons.

*

The government broker, Sir Edward Cripps, is to retire on April 5th. He will be succeeded by Mr W. J. H. de Wette Mullens, who will also become senior partner of Mullens and Co. on that date.

*

The Abbey National Building Society set up new records in its centennial year. At the end of December, 1949, the number of share investors reached 372,110 (359,182 a year earlier), depositors numbered 19,228 (20,756) and borrowers 130,368 (122,608). Applications completed for advances during 1949 were £28,139,831 (£21,947,805). Total assets reached £103,899,956 (£87,889,266) of which £12,763,402 (£10,171,017) represented trustee securities, Tax Reserve Certificates and cash. The amount outstanding on mortgages at December 31, 1949, was £90,191,554 (£76,221,526).

*

The Ministry of Fuel and Power has decided to permit the negotiation of long-term contracts for the supply of petroleum products. Such contracts have hitherto (since the wartime control was instituted) been limited to one month ; the drawbacks of this restriction were discussed on page 503 of *The Economist* last week. The restriction is now removed, though it is stipulated that a suitable *force majeure* clause shall be incorporated in each contract and that, in order to meet the requirements of the import licensing system, all contracts shall be subject to one month's notice.

*

British output of steel ingots and castings last month attained a weekly average of 325,000 tons. This is equivalent to an annual rate of output of 16.9 million tons and is the highest level recorded in any month. The previous best month's performance was an annual rate of 16.4 million tons in 1949. Average weekly output of pig iron in February was 184,400 tons ; this was slightly less than in January.

REPORT OF THE AUDITORS TO THE MEMBERS.

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In o opinion proper books of account have been kept by the Bank so far as appears from our examination of those books and proper Returns adequate for the purposes our audit have been received from Branches not visited by us. We have examined the above Balance Sheet which is in agreement with the books of account a Returns. In our opinion and to the best of our information and according to the explanations given to us the said Balance Sheet gives the information required the Companies Act, 1948, in the manner thereby authorised for Banking Companies and on such basis the Balance Sheet gives a true and fair view of the state of t Bank's affairs as at 31st December, 1949.

We have also examined the annexed Consolidated Balance Sheet and Consolidated Profit and Loss Account of the Bank and its Subsidiaries dealt with there with the audited accounts of those Companies. In our opinion such Consolidated Balance Sheet and Consolidated Profit and Loss Account have been prepe prepared from such accounts in accordance with the provisions of the Companies Act, 1948, in the manner thereby authorised for Banking Companies and, on t basis, give a true and fair view of the state of affairs of the Bank and its Subsidiaries dealt with thereby so far as concerns members of The National Bank of Ind Limited and so far as is practicable having regard to the fact that the accounts of one Subsidiary are made up to a different date from those of The National Ba of India, Limited.

COMPANY MEETINGS

THE NATIONAL BANK OF INDIA, LIMITED

INCREASED NET PROFIT

MR J. K. MICHIE'S STATEMENT

The annual general meeting of The National Bank of India, Limited, will be held in London on March 28th.

The following is an extract from the statement of the chairman, Mr J. K. Michie, circulated with the report and accounts for the year to December 31, 1949:—

The balance sheet total at £92,972,507 shows an increase on the previous figure of just over £10 million. Current accounts and deposits have risen by about £9,000,000; on the other side, advances have gone up by £7,000,000 and cash by over £5,000,000, while investments have fallen by just under £4,000,000. Investments had to be realised when advances reached a high level in 1949. This expansion is due in part to Pakistan balances being valued at the new rate of exchange of 2s. 2d. to the rupee.

ANOTHER SATISFACTORY YEAR

After making full provision for taxation, bad debts and other necessary reservations net profits are £593,750 against £523,950 for 1948. This larger figure is partly accounted for by dividends received from Grindlays Bank Limited, but is also a reflection of an increased business, and we have to thank the management and staff for another very satisfactory year.

The increase in our capital requires a larger sum to cover dividends, while considerable expenditure incurred and in prospect has made it advisable to allot £50,000 to premises account against £30,000 last year. We are again able to place £100,000 to reserve fund, and this, coupled with the sum of £121,250 transferred from inner reserves previously made and no longer required, brings our published reserve funds to the satisfactory total of £3,500,000, apart from the carry forward, which is slightly increased at £279,906.

We are steadily increasing the strength of our overseas staff and so gradually making possible expansions of our banking services in the interests of our clients and our shareholders.

COMMERCIAL ADVANCES

Last year I mentioned the large volume of our commercial advances and some of the causes. These factors persisted throughout 1949; production costs, though tending to stabilise, remain high and capital markets, where they exist, need very considerable inducement, showing that Central Bank rates are no longer the dominating criterion of money values. On the other hand, the devaluation by the sterling area (excepting Pakistan) in September last—which was in fact a recognition of an inflationary situation—has brought relief to primary producers in India, Ceylon and East Africa.

Unfortunately, the different policies followed by India and Pakistan in regard to their exchanges have had consequences inimical to the economies of both countries, and as I write five months after the announcement of devaluation no rate of exchange between the Indian and Pakistan rupees has been agreed by these countries, whose principal trade has always been and should be with each other. Apart from transactions covered at unofficial rates of exchange there is therefore no trade passing between the two countries.

POSITION IN PAKISTAN

One result is that the Government of Pakistan is being forced to finance its jute crop pending export, while Calcutta mills wonder where their raw material will come from; another that Bombay Cotton Mills buy cotton for dollars from the U.S.A., while from Karachi, which is virtually next door, cotton is being shipped to distant markets. I have little doubt that the statesmen in both countries are tackling the problem of reaching a working understanding, for they know far better than any onlooker can that failure to reach one will entail consequences that cannot be confined to economics alone.

A brighter portent is that Pakistan has just taken the necessary preliminary steps to becoming a member of the International Monetary Fund and the International Bank for Reconstruction and Development. This means that the exchange value of her currency will have to be agreed by the International Monetary Fund and when that happens it is logical to expect that this will enable normal trade relations between India and Pakistan to be resumed.

In the circumstances I have described it was inevitable that Pakistan would have a difficult year, but at time of writing her markets show more stability. One of her principal needs is a more rapid development of the port of Chittagong, through which an increasing volume of trade must pass. Naturally, non-devaluation has meant a fall in the internal prices of her principal exports, of which perhaps the most vulnerable is tea.

Banking, perhaps overseas banking particularly, continues to be presented with problems the responsibility for which lies in other hands. Assuming that "the state" is not to be the sole purveyor of capital in the future, a reduction in direct taxation would be a tremendous encouragement. Failing such action I can foresee a considerable further period of stalemate and economic stagnation. It is most encouraging to see India giving a lead in this enlightened policy.

MERCANTILE BANK OF INDIA, LIMITED

FURTHER EXPANSION

SIR CHARLES INNES ON FAR EASTERN CONDITIONS

The fifty-seventh annual general meeting of The Mercantile Bank of India, Limited, will be held at Winchester House, Old Broad Street, London, E.C., on March 30th.

The following are extracts from the statement of the chairman, Sir Charles A. Innes, K.C.S.I., C.I.E., circulated with the report and accounts for the year to December 31, 1949:—

The accounts show that in 1949 the business of the bank continued to expand, the balance sheet total being £54 million, compared with £49½ million in 1948. The increase is due to a rise in deposits, which now stand at nearly £50 million, or £4,500,000 in excess of the previous year's figure. On the assets side, cash is up by £2,200,000 and investments at £14,055,552 are about the same. There has been an expansion in bills and loans and advances and they total £27 million, nearly £2,200,000 more than in 1948. The profit works out at £191,805, and we are maintaining the dividend at 12 per cent., less tax.

There has been a heavy fall in the values of gilt-edged securities in the Stock Exchange during the past year. Fortunately, most of the securities in our portfolio are short dated securities and though there has been some depreciation, the market value is still in excess of the value at which the securities stand in our books.

We have maintained our policy of extending the operations of the bank. Last year we opened a new branch in Chittagong. This year we have opened branches in Tokyo and Osaka in Japan.

TRADE HAMPERED

The pattern of international trade continued in 1949 to be distorted by the exchange and other controls which many countries found it necessary to maintain or impose, and there were also signs that market conditions were beginning to turn in favour of the buyer. Nevertheless, as the figures show, the bank continued to prosper, and except in such places as Shanghai, our branches did good business.

Perhaps the most important immediate effect of the devaluation of sterling from the bank's point of view was that it sent up the sterling price of rubber and tin and thereby benefited not only the industries themselves, but also the economy of Malaya. The increase in the rubber price also helped Ceylon. It is too early to say what effect devaluation will have on internal prices in the countries which adopted this device. It should also be remembered that inflationary trends still persist in most of the countries in which we have branches. Inflation increases both profits and expenses, and the danger is that when trade begins to recede, the profits will diminish, but not the expenses.

As regards the future, I think it necessary to remind you that the background against which we work in the East is in some respects a sombre one. A disquieting feature is the worsening relations between India and Pakistan. The Kashmir problem still remains unsolved, despite the efforts of the United Nations.

INDIA'S PROGRESS

The progress made by India since partition has been remarkable. The new constitution has been framed and on January 26th last India became an independent Republic, though at the same time she decided to remain within the Commonwealth. Good work has been done in the rapid integration into India of the territories formerly under Indian State rule, firm action has been taken against the Communist menace, and a pleasing result of India's new political status is the very cordial relations between Indians and the British business community. In some respects, too, the economic situation is better than it was in 1948.

In Pakistan, the Government were faced with an even more difficult task than India when partition took place. They had to establish themselves in a new capital and to organize from the very foundations all the complicated machinery of a Central Government. It is no exaggeration to say that they have done a wonderful job.

OTHER COUNTRIES

The political situation in Burma showed no improvement. Ceylon and Mauritius both enjoyed a year of peace and prosperity. In Thailand there was a good deal of political unrest and the political situation remains obscure, but economically the country is prosperous.

The trade figures for 1949 for Malaya showed an improvement on those of the previous year, but there were signs of a recession of trade in the spring and summer.

Hongkong has experienced another year of great prosperity. There are two great question marks in regard to the future of Hongkong, namely: (1) What will be the attitude of the Chinese Communists towards the colony? and (2) How will its prosperity be affected if Shanghai ever recovers its former position as a great centre of trade and industry? I do not propose to indulge in any prophecy, but it is worth noticing that the business community in Hongkong takes an optimistic view in regard to both questions. I have little to say about Shanghai. Like all British concerns, we have reduced our staff there to a minimum, and the branch is doing little business. The Communists have been no more successful than the Nationalists in maintaining the value of the currency and import and export trade has been reduced to a mere trickle.

THOMAS TILLING LIMITED

RE-INVESTMENT OF RESOURCES

MR W. LIONEL FRASER'S STATEMENT

The fifty-third annual general meeting of Thomas Tilling Limited will be held in London on March 28th.

The following is a summary of the review by the chairman, Mr W. Lionel Fraser, C.M.G., circulated with the report and accounts for the year to 31st December, 1949:—

The accounts now presented to you reflect the major changes which have taken place as a result of the sale to the British Transport Commission of the company's interests in passenger road transport and road haulage undertakings.

The profit and loss account shows that the profit for the year before taxation was £361,619. This includes £154,500 in respect of interest from January 1st to March 31, 1949, on the £20,600,000 British Transport 3 per cent. guaranteed stock 1968-73, which was distributed to stockholders on April 1, 1949. Without this non-recurring income the profit for the year would have been £207,119, which approximately accords with the forecast made by the late chairman in his statement to stockholders on November 8, 1948. After deducting taxation of £195,000 on the profit of the year, and adding the amount of £266,849 brought forward from the previous year, the balance standing to credit of profit and loss account is £433,468. The preference dividend, less tax, for the year required £9,075, and the directors now recommend that a dividend of 5 per cent., less tax, be paid on the ordinary stock, absorbing £113,300, and that £69,407 be transferred to general reserve. This will leave £241,686 to be carried forward to next year.

SUBSIDIARY COMPANIES

The balance sheet shows that our holdings in subsidiary companies have increased by over £150,000, due largely to the fact that we have during the year acquired on satisfactory terms the balance of the issued share capital of Daimler Hire Limited, and of Stratstone Limited, in which companies we previously held a 75 per cent. and a 91¾ per cent. interest respectively. These companies have vigorous and progressive managements, and despite difficult conditions, both have achieved successful results for the past year. Daimler Hire Limited, is embarking upon considerable expansion, especially as regards its drive-yourself service.

The results of the Cornhill Insurance Company Limited are shown by way of a statement annexed to the balance sheet, but up to the end of 1948 only. You will be pleased to know that this company had a record year in 1948, and from the preliminary figures now available, there is little reason to doubt that the results for 1949 will be equally satisfactory. This is a fine performance.

The figure for loans to subsidiaries has also increased, the whole of this being represented by further loans to the Troy Group of building and contracting companies to enable them to finance their increasing activities. We have been very conservative in drawing up the accounts of this Group for the past year, and although conditions in the building trade have not become easier, we remain confident that the reconstruction and development policy being pursued will yield good results in the future.

SUBSTANTIAL ACQUISITIONS

I would draw your attention to the item associated companies, for we have during the year acquired substantial holdings in two further companies. The first of these, British Steam Specialties Limited, is an old-established company principally engaged in the manufacture and distribution of bronze and iron valves, also a wide range of pipe line ancillary equipment with many applications for gas, steam, air, water and oil services. It is a company with a steady history of development, a good profit record, and with sound prospects for the future. The other company, E. R. Holloway Limited, specialises in the production of plastic powders and the manufacture of combs and similar products. It is a comparatively small business, but very up to date and well managed. Our small investment in the Westpool Investment Trust is also included under the heading of associated companies.

We have made only small changes in our holdings of quoted investments, which are mainly composed of high-class equities. Should a favourable opportunity offer itself one of these days for further re-investment in industry, or should we need funds for our existing subsidiaries or associated companies, we should not hesitate to dispose of such of these securities as we thought fit.

It might be opportune at this juncture to make some reference to an important event which has taken place since the date of the balance sheet. As has already been announced in the press, we have recently completed the purchase from Pilkington Brothers Limited of a 60 per cent. interest in James A. Jobling & Company Limited, manufacturers of the well-known "Pyrex" overware and laboratory, industrial and lighting glassware. This is now our largest subsidiary and will, I feel sure, prove to be an interesting acquisition.

BOARD'S POLICY

Before dealing with the question of our future, there are a few general comments which I should like to make. Until the end of 1948 the company was largely identified with road transport, though it had by then already acquired substantial interests in other forms of industry. With the passing of the Transport Act and the subsequent disposal of our transport and haulage interests to the British Transport Commission, the company entered upon a new era. It is therefore only right that I should give you some indication as to the policy of your Board.

Let me at once emphasise that we do not consider the evolution of the company to lie in the direction of developing into an investment trust. On the contrary, we envisage for ourselves a more positive and active role, whereby we can use our still considerable funds in a constructive manner by further direct participation in industry, and at the same time by the development and expansion of our existing interests. It is true that, apart from ownership of property, your company is entirely a holding company. It has been substantially this for a good many years, but we have always taken an active part in the direction of our subsidiaries. This we shall continue to do, in addition to being represented on the boards of our associated companies, and we shall in all cases give the benefit of our experience and support to the fullest extent.

LONG-TERM PLAN

As can be seen, we have already gone some way towards re-investing our resources, and we have under consideration other potentially interesting propositions. For some part of the year the bulk of our available funds has been on loan at short call, at consequently unremunerative rates, and there is little doubt that we shall maintain this policy of liquidity for the uninvested portion until attractive situations arise for permanent investment. We have confidence that the investments which have already been made will enhance the future income of the company, although no large increase is to be expected rapidly. We are to some extent in the process of creating a new Tillings, and some of our plans are of a long-term nature. If we are to be successful, we must follow the example of our predecessors, and show sound judgment in our actions, whilst not lacking in courage and enterprise nor fearing to take reasonable risks.

Last, but not least, I should like to thank my colleagues for their support, and at the same time to pay a high tribute to the managing directors, executives and all other employees, not only of this company, but of our subsidiary and associated companies, for their valuable work during the past year.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

SIR ALEXANDER GRAY'S REVIEW

The one hundred and twelfth annual general meeting of The Scottish Provident Institution was held in Edinburgh on March 7th.

Professor Sir Alexander Gray, C.B.E., the chairman, said that the report was from all points of view highly satisfactory. The net new sums assured, £4,060,000, were the highest in the Institution's long history and, in addition, under group life and pension schemes, new policies were issued for sums assured of £304,000 with associated pensions of £70,000 per annum; £273,000 was received as consideration for annuities granted.

The increase in interest income to £1,179,000, or £903,000 net, was a most encouraging achievement in a difficult year for investors, and resulted in average yields of £4 7s. 10d. per cent. gross, or £3 7s. 8d. per cent. net, calculated on the total funds.

Claims under policies were almost unaltered at £1,400,000, those arising by death being the lowest for many years, thus reflecting a very favourable mortality experience, while claims by survivance showed only the normal increase to be expected from an expanding business.

The funds had increased by nearly one million pounds to £27,765,000. Life assurance funds played an important part in national economy by helping to keep the price levels of marketable securities more stable. As they comprised investments carefully chosen with regard to future commitments, there was not the necessity to realise securities when prices were temporarily reduced that there might sometimes be in the case of an individual. Also the balance of income available for investment each year provided further support to the market when suitable occasions arose. Such factors enabled life assurance business to withstand financial upheavals and to give policyholders a valuable stake in funds, providing the highest degree of security. In the case of the Institution, there was a substantial margin between the aggregate market and book values of the assets.

The report was adopteid.

DECCA RECORD COMPANY, LIMITED

PROGRESS IN RADAR AND NAVIGATOR

The twentieth annual general meeting of the Decca Record Company, Limited, was held on March 7th in London.

Sir Cyril F. Entwistle, K.C., M.C., the chairman, said that the balance from trading account, £304,811, showed an increase of £33,696, and the directors recommended a final dividend of 70 and 5/6ths per cent., making 112½ per cent., less tax, for the fifth consecutive year. The progress of the Decca Navigator Company had continued and contracts for hirings were now well past the 800 mark. Rentals on Decca Navigator equipment for the current year to date showed an increase of 50 per cent. over those of the similar period last year, and sales of equipment would also show an increase.

On the air side progress had been slower, but the great value of the system as a navigational aid was becoming more generally recognised, and they had good grounds for anticipating adoption of the system on a much wider scale. The most important development since they last met had been the introduction of Decca Marine Radar. This had a range up to 25 miles and could be operated successfully down to a distance of 20 yards. particularly valuable for navigation in narrow channels.

This marine radar had been so engineered that, despite its outstanding features, they were in a position to market it at a price lower than any similar equipment manufactured either in this country or elsewhere. Already contracts had been obtained from the navies of two foreign countries and from many shipping companies at home and abroad and in a few months since the introduction of Decca radar orders had been received from various overseas territories. Installations in ships were proceeding at a very satisfactory rate. In view of the growing importance of Decca radar they were proposing to form a separate totally owned subsidiary company to exploit exclusively that side of the business.

EXPANSION OF RECORD BUSINESS

The record side of the business continued to expand in both home and export markets, turnover during the year under review being the highest ever. In the section dealing with radio and gramophones turnover was less than for the previous year; that they attributed to the increase in purchase tax to 66⅔ per cent. in the 1948 Finance Act.

The turnover in the home market for the six months of the current year showed a considerable fall in comparison with the same period of the previous year. He was glad to say that there had since been a substantial and sustained recovery and they expected that sales for the full twelve months would be up to the level of those for the previous year.

In addition to their range of Decolas, Beau-Deccas, Deccalians and Double-Deccas, they were now making television receivers, the demand for which was in excess of capacity to supply. Their large screen projection television marked an advance over existing technique, and should find an extensive market.

In the current year the results of the Decca Navigator Company, Limited, would for the first time be brought into the consolidated trading account, and they were hopeful that revenue would approximately balance expenditure. The year's trading of the London Gramophone Corporation should result in a credit balance.

The report was adopted.

STERLING TRUST, LIMITED

DIVIDEND AGAIN 6½ PER CENT.

The thirty-third annual general meeting of the Sterling Trust, Limited, was held on March 9th in London, Mr M. Hely-Hutchinson, M.C., the chairman, presiding.

The following is an extract from his circulated statement:—

In my statement last year, stockholders were informed that the income for 1949 would probably show a fall. In the event, however, the normal income increased by £454 to £231,344, while the fluctuating arrears, which cannot be estimated, decreased by £1,268 to £3,920.

For the third year in succession there has been a fall in prices which became more pronounced and widespread in 1949. Lack of confidence in sterling caused a progressive decline in gilt-edged securities and a rise in interest rates; a general feeling of uncertainty brought about considerably lower prices for ordinary stocks; in addition, recent court decisions resulted in high dividend-bearing Preference stocks losing a substantial portion of their market premiums.

The valuation of the investments at December 31, 1949, amounted to £4,892,357, showing an appreciation of £544,049, or 12½ per cent. on the figure at which they stand in the balance sheet which compares with 25½ per cent. for the previous year. Your directors recommend a final dividend of 4½ per cent. on the Ordinary stock, which maintains the total rate at 6½ per cent.

The revenue prospects for 1950 are obscured by many difficulties. We must be prepared for some reduction of income in the current year, but our estimate shows that this should not be material in respect of the normal income.

The report was adopted.

LEACH'S ARGENTINE ESTATES, LIMITED

TRANSFER TO ARGENTINA

The adjourned thirty-seventh annual general meeting of Leach's Argentine Estates, Limited, will be held on March 27th in London.

The following is an extract from the statement of the chairman, Mr R. Roy Leach:—

The trading profit for the year, at $6,274,589, was only $178,168 less than the previous record year. We have again had a very satisfactory year's trading.

The board are forced to the conclusion that the obvious and only way of solving most of the company's difficulties is to transfer the business to an Argentine company. While this procedure cannot solve all our problems, notably that of remittances, it is a step which must now be taken by the company. It has been agreed with our lawyers that the first move to be made in this direction is to transfer the seat of control of the company from this country to Argentina.

There is enclosed with this statement a notice of an extraordinary general meeting to be held, with a view to changing the company's articles of association so as to vest the management and control of the company in a board which would meet in Argentina.

Negotiations have for some time been in progress with Garovaglio & Zorraquin, Ltda., who are desirous of acquiring our estates and principal assets with a view to a merger with S.A. La Merced, an Argentine company owning canefields and a sugar factory adjoining our "La Esperanza" property. It is anticipated that if the negotiations are brought to a successful conclusion our company will own about 70 per cent. of the capital of the two concerns.

THE CONSOLIDATED MINES SELECTION COMPANY, LIMITED

The fifty-fourth annual general meeting of this company will be held in London on March 28th.

The following is an extract from the circulated statement by the chairman, Mr S. S. Taylor, C.M.G., D.S.O.:—

Current assets exceed current liabilities by £74,000, but allowance must be made for the reserve of £15,000 for future United Kingdom income tax, leaving an actual surplus of £59,000, compared with the previous year's figure of £32,000.

Dividends and interest from investments are slightly higher than last year. Net share-dealing profits and revenue from other sources show a substantial rise from £46,429 for the preceding year to £87,422. Increased opportunities for profitable dealing in investments have contributed to this improvement, and we have again been able to secure participations in underwriting in London and in similar business offered to us by Anglo American Corporation of South Africa, Limited. The profit at £220,207 shows an increase of £42,384. The rate of dividend recommended is unchanged.

Already an important part of your company's interests lie directly or indirectly in the development of the gold mining industry in the Orange Free State. As this new goldfield progresses it is becoming increasingly apparent that many new opportunities of profitable investment will present themselves. Moreover, our association with Anglo American Corporation of South Africa, Limited, may give us scope for successful investment in other directions. The board has the financial position of the company under constant review and appreciates that it may in due course be necessary to consider raising additional capital.

BEAUMONT PROPERTY TRUST, LIMITED

A WELCOME IMPROVEMENT

The sixteenth annual general meeting of the Beaumont Property Trust, Limited, was held on March 9th in London, Mr C. W. Black, M.P., J.P., F.R.I.C.S., the chairman, presiding.

The following is an extract from his circulated statement:—

The profit for the year, including dividends received from the three subsidiary companies, amounts to £66,629 after providing £54,061 for income-tax and profits tax. This figure shows a moderate but welcome improvement on the profit for the previous year, the increase amounting to £5,063.

Our three subsidiary companies have made satisfactory progress during the year, and have declared dividends on their preference and ordinary capital amounting to a total of £76,563 gross, leaving, after deduction of income-tax, a net amount of £42,110. Your directors are recommending that a final dividend should be paid of 4½ per cent., less income-tax, making a total of 7 per cent., less income-tax, for the year.

Further progress has been made during the year in the reinstatement of war damaged properties. As a result, the revenue of the group should benefit in the current year from the rents of these reinstated properties. It is anticipated that all such work of reinstatement should be completed during the current year.

A GOOD DEMAND

The demand for tenancies of properties of nearly all classes continues to be good, and, owing to the very slow rate of building of new properties, the demand continues much to exceed the supply. There is, accordingly, at present little difficulty in promptly reletting any properties which come into possession.

Before the war, we were profitably employed in our subsidiary development companies in the erection of new residential and business premises. These operations, while profitable to your companies, helped to meet the demand by the public for such premises, and, without any subsidies from the State or local authorities, we were creating assets of great value to the community. Since the war, private building has been largely banned, and the local authorities made virtually the sole providers of new houses and flats, and in respect of every new house or flat thus built the community has had to find, through rates and taxes, a minimum subsidy of £1,320 (£22 per annum for 60 years). It is to be hoped that the wisdom of allowing the private developer to play his part in solving the acute housing shortage will, even at this late hour, be recognised by the Government.

The report was adopted.

THE STEETLEY COMPANY, LIMITED

RECORD PRODUCTION AND SALES

MR N. M. PEECH'S STATEMENT

The twentieth annual general meeting of The Steetley Company, Limited, will be held on March 31st at the Royal Victoria Hotel, Sheffield.

The following is the statement by the chairman and managing director, Mr N. M. Peech, which has been circulated with the report and accounts for the year ended December 31, 1949:—

Your company is but a very small part of a large trading nation, and the Government of that large trading nation now controls the supplies and prices of fuel, electric power, imported raw materials as well as transport services and rates. National policy is also responsible for the basic remuneration of labour. Thus, the efficiency of the manufacturing community controls the cost of the finished article which has to be sold in world markets only to a limited degree depending on the type of product made. Whatever a manufacturing concern may achieve, under these conditions, in the way of improved fuel consumption, productivity, etc., cost and prices become more and more dependent on circumstances outside the manufacturer's control. The nation's cost of coal production was 46s. a ton in 1948, against 16s. a ton in 1938, and it may interest you to know that your company's fuel and power bill represents 28 per cent. of their gross sales, which is a big figure.

EFFECTS OF DEVALUATION

If a trading company continues to spend more than it earns, it goes bankrupt and the assets have to be written down or the company is unable to continue to trade. That is what happened to this country in September last, when, despite generous Marshall Aid, the pound sterling had to be devalued. The full effect of devaluing the pound will not be felt for another 12 months or so and it remains to be seen whether our exports in future will balance the higher cost of imported raw materials and food.

The reason for the economic pass to which we have come is not far to seek—it is insufficient production per head of population at too high a cost. The country has been told that our production is bigger than ever before with a clear inference that we are "doing fine." Even if it is 30 per cent. higher than in prewar days, it is still not big enough for a country which is so largely dependent on exports to pay for the wherewithal to feed its factories and population. The fact that American production is twice what it was prewar is the key to her high standard of living and astounding economic predominance today.

Reference is made here to Great Britain's economic position, first, because the sooner the whole nation is aware of and understands the facts of our critical position and industry is given a freer hand and every encouragement to improve efficiency in all ways, the sooner will we get out of our economic difficulties and rise again in the eyes of the world; second, because the country's economic position must have a considerable effect upon every British industrial enterprise. Let me now refer to your company's affairs.

DIVISIONAL REPORTS

The group production and sales were again records. In the dolomite division, the benefit of a full year's working of the new Cadeby works, near Doncaster, was obtained. The installation of large machinery in the quarries and the re-equipment of the processing plant at the Coxhoe works in Durham should be completed this summer. The rebuilding of the Taffs Well works in South Wales modelled on the lines of the Cadeby works has commenced.

In the refractory brick division both the works at Oughtibridge and Worksop were undergoing re-equipment and some extension, also new products were being developed. Thus, the financial results of this division were adversely affected.

In the magnesia division, great strides were made at the Hartlepool sea-water works, of which we are the managers, production being no less than 30 per cent. above the previous record. This is particularly gratifying as it was achieved by technical improvement and not by the employment of additional plant. The requirements of the home market are now being fully satisfied, which results in an annual saving of foreign currency amounting to £750,000, and the export market is being tackled.

In order to obtain the most up-to-date information on refractory and other developments in which the company is interested and to complete certain arrangements with American interests of value to our works operations, a tour was made of the eastern seaboard of the United States by the chairman in the latter part of the year.

GROUP BALANCE-SHEET

The issued capital now amounts to 387,500 4½ per cent. preference shares and 776,260 ordinary shares of £1. The latter reflects the issue of 200,000 shares at 40s. each which was made in June. The premium of 20s. per share (£200,000), less expenses of issue (£5,869), creates the share premium account of £194,131 and increases the capital reserve to a total of £359,046

The high proportion of the surplus on trading being taken in taxation, depreciation being based on the original and not on the replacement value of equipment, and machinery prices being two to three times the prewar figure, made it undesirable for the company to finance from its own resources the re-equipment and development of its old business and new lines.

A figure is shown in the balance sheet for tax on the excess of wear and tear and initial allowances over depreciation charged in the accounts. This arises from the increase to 40 per cent. in initial allowances on new plant in the last Finance Act. The reserve created will be useful in reducing the company's taxation charge in later years, particularly if there should be a recession in trade. The board and the auditors consider that the depreciation charged in the accounts is sufficient.

The additions to plant and machinery during the year amount to £303,647 (which includes £57,320 transferred from buildings), and the authorised expenditure on capital account outstanding at December 31, 1949, amounts to £376,000. Our subsidiary, the British Periclase Company, paid the sum of £54,669 to acquire certain patents that are being operated in the magnesia from dolomite and sea-water process.

PROFIT AND LOSS ACCOUNT

The group trading profit of £474,773 compares with £367,284 last year. After deducting depreciation (amounting to £99,501), taxation (amounting to £207,859), and directors' fees (amounting to £4,583), the net profit is £167,092, compared with £117,545 in 1948.

It is satisfactory to see the increase in earnings on the larger capital invested in the business which resulted in a further improvement in operating efficiency as well as higher productions.

The revenue reserves have been increased by £125,000, which sum includes £26,097 from the pension fund no longer required; the balance on profit and loss account, after making this allocation and providing for the recommended dividends amounting to £65,093, will be £65,570.

APPRECIATION

The production and sales volume and manufacturing efficiency are reflected in the trading profit and the staff and workpeople are responsible for these results. We are indeed grateful to them all. The frustrations and delays in getting permits to proceed even with essential work, are well known to everyone, and we admire the staff, who have fought our battles to the end with the officials of numerous government departments involved in every project, great or small.

BOARD CHANGES

Mr J. A. Russell, who joined the board in 1932, retired in July on going to live in Jersey. The company is fortunate in that Mr A. MacLeod, who has wide experience and is well known in the steel industry, agreed to fill the vacancy. Mr M. Douglas, who had for some time suffered ill-health, resigned his executive positions and directorships, and his place has been filled by Mr W. Stocks, M.B.E., the general manager of the dolomite division, who in the past 32 years has risen from the ranks of the company.

CURRENT PROSPECTS

The demand for your company's products remains at a high level. The management continue to seek new markets and have made progress in that direction. In the current year we can expect to obtain further benefit from the works re-equipment and extension programmes and the new products. Subject therefore to the circumstances outside our control to which reference has already been made and the fact that our national finances are still far from being on a satisfactory footing, there is reason to believe that we should be able to present another acceptable report to the members at the next annual meeting.

Investment Statistics

Company Notes

Brush Electrical Engineering.—Group trading profit in 1949 amounted to £1,917,992 (£1,312,091), and net profit to £653,878 (£651,510). Dividend recommended is 10 per cent for the year (unchanged).

Westinghouse Brake.—Trading profit of the group, after depreciation, £110,393 (£98,864), and directors £21,444 (£22,262) was £489,110 (£465,740). Net current assets were £2,261,897 (£1,367,493), bank overdraft £52,755 (£652,900), and stocks £2,126,983 (£2,227,921) at the year-end.

Lotus.—Group trading profit fell from £783,236 to £681,914 in 1949; stocks increased from £922,318 to £1,168,061 at the year-end. The year's appropriations include £100,000 (nil) to trading reserve.

Upsons.—Consolidated trading profit in 1949 amounted to £833,913 (£907,839), and net profit to £357,542 (£370,331). The proposed dividend of 20 per cent for the year is unchanged.

Saxone Shoe.—Combined trading profit declined from £581,185 to £524,664, and net profit from £245,032 to £207,441 in 1949. The proposed dividend of 20 per cent for the year is unchanged. Stocks have risen from £906,288 to £1,364,234. Liquid funds amounted to £23,049 (£592,288) at the year-end.

J. Sears and Co.—Trading profit of the group declined from £1,460,931 to £1,360,737, and net profit from £596,615 to £548,911 in 1949. Stocks increased from £2,110,315 to £2,891,714; cash is lower at £562,738 (£978,121).

The Steetley Company.—Group trading profit rose from £367,284 to £474,773, and group net profit from £117,545 to £167,092 in 1949. The proposed dividend for the year is 13 per cent. The company's fuel and power bill represented 28 per cent of gross sales for the year.

English China Clays.—Group trading profit increased from £573,150 to £775,774 and the parent company's net profit from £222,487 to £292,249 in the year to September 30, 1949. The dividend of 4 per cent recommended for the year is unchanged. Stocks have risen from £1,203,212 to £1,320,895 on the year; bank overdraft has been reduced from £418,952 to £260,726.

I. and R. Morley.—Consolidated trading profit in 1949 was £441,457 (£480,000). Stocks increased from £1,070,869 to £1,143,953 on the year.

Leyland Motors.—Trading profit of the parent company increased from £1,422,768 to £1,895,206 and net profit from £591,508 to £674,097 in the year to September 30, 1949. Depreciation absorbed £229,977 (£211,689). taxation £974,257 (£653,235) and provision for liabilities not yet ascertained £75,000 (nil). Stock depreciation £200,000 (same); purchase and replacement of plant reserve £200,000 (same). It is proposed to increase the dividend from 15 per cent to 20 per cent for the year; a further 5 per cent tax free (same) is recommended from surplus realised on sale of fixed assets.

Bowater Paper Corporation.—Group trading profit including £300,394 (nil) exchange differences amounted to £4,279,653 (£3,821,325) for the year to September 30, 1949. Net current assets valued at post-devaluation rates of exchange were £8,709,746 (£6,812,832) at the year-end.

Hoover.—Consolidated trading profit after charging depreciation £262,297 (£214,633) was £1,719,378 (£829,072). A dividend of 45 per cent actual is recommended on the £935,000 ordinary stock.

Woolcombers.—Trading profit declined from £360,304 to £346,428 in 1949. Net profit amounted to £163,887 (£178,947). Dividend recommended for the year is 13½ per cent after deduction of tax. Stocks rose from £353,867 to £363,080 on the year.

A. W. Gamage.—Trading profit for year to January 31, 1950, was £384,849 (£418,818). Stocks increased from £383,223 to £505,995 at the year-end.

William Whiteley.—Trading profit declined from £231,010 to £161,750 in the year to January 31, 1950. Stocks are up from £383,979 to £413,515.

Radiation.—Consolidated trading profit for 1949 was £1,091,753 (£1,010,461) and net profit £431,545 (£382,931). The proposed dividend of 12½ per cent for the year is unchanged.

Capital Issues

Boots Pure Drug.—Underwriting of the issue to shareholders of one new 5s. ordinary share at 35s. per share for every five shares held has been completed.

D. Sebel (toy makers). — Stockholders registered on March 13th are offered one new 2s. ordinary share at 4s. per share for every share held. The issue will raise some £231,000.

John Jacks (caterers).—Subsequent to a bonus issue of one 1s. share for every 1s. share held and consolidating the two shares into 2s. units, shareholders are to be offered 232,500 2s. ordinary shares at 7s. 6d. per share, in the proportion of one new share for every three shares held on February 16th.

Brunner Investment Trust.—The trust's issued share capital of £450,000 in Five per cent cumulative preference stock and £300,000 in ordinary stock is shortly to be marketed. In addition, there is £300,000 3½ per cent debenture stock, 1950-55, already quoted, and £150,000 in two further loan stock issues.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'.
(n) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield.
* Assumed average life 14 years 3 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (h) Assumed dividend 18⅛% after capital bonus. (l) To latest redemption date. † Free of tax. (m) Final dividend on increased capital. Yield basis 35%. (n) Yield basis 26⅛% after capital bonus.

Statistical Summary

EXCHEQUER RETURNS

For the week ended March 4, 1950, total ordinary revenue was £111,013,000, against ordinary expenditure of £89,245,000 and issues to sinking funds £4,043,000. Thus, including sinking fund allocations of £18,713,000 the surplus accrued since April 1st is £649,450,000 compared with £885,058,000 for the corresponding period a year ago.

UNIVERSITY OF ABERDEEN

DEPARTMENT OF POLITICAL ECONOMY

Applications are invited for the post of Assistant in Economic History, whose duties will be mainly in Research. Salary £450 per annum with F.S.S.U. Applications to be lodged by March 20, 1950. Form of Application may be obtained from the undersigned. University of Aberdeen. H. J. BUTCHART, Secretary.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Assistant Lecturer in Economics in the Faculty of Economic and Social Studies. Salary scale £450 to £500 per annum, with membership of the F.S.S.U. and Children's Allowance Scheme. Applications, should be sent not later than April 14, 1950, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

A COMPANY in the North of England has openings in its Market Research Department for a male research assistant. This Market Research Department is a comparatively large one, and it operates in most fields of Market Research. The successful applicant will be aged between 22 and 30, and have a good educational background which includes mathematics, statistics or one of the scientific subjects, preferably to university standard. An initial interest in Market Research is desirable. A comprehensive training will be given, including a certain amount of field work. The commencing salary for a man aged 22 will be above the average for this type of position. In fixing the commencing salary for an older man, his additional age and experience will be taken into account. The prospects for promotion to an executive appointment within the next few years are good.—Please write in the first place to Box 353.

URWICK, ORR AND PARTNERS seek additional staff for the Control Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:—

1. Professional qualification in Accountancy.
2. Some years' executive experience in responsible industrial appointments.
3. Knowledge and experience of modern techniques of Cost Control.
4. Sound general education and wide interest in contemporary affairs.

Applications should be addressed in writing to the Company's Offices at 7, Park Lane, London, W.1, quoting Reference C/1031.

ACORNS produce oak trees without advertising. But good publicity is an essential "fertiliser" in the growth of modern businesses. Talk to SAMSON CLARKS about it.—57-61, Mortimer Street, W.1. MUSeum 5050.

SALES OFFICE MANAGER is required by Motor Accessory Manufacturer, Slough. Indispensable qualifications are a detailed knowledge of the motor manufacturing industry, good correspondent and ability to secure co-operation of travellers and staff. The position would offer full scope for an ambitious man who is prepared to work hard. Applicants should give details of education and career, including salary earned in each position and of interests outside business.—Box 352.

TYNESIDE Businessman requiring Junior Manager is sought by exiled ex-cavalry officer, B.Com., 26, with industrial experience with respected concerns.—Box 359.

INCORPORATED ACCOUNTANTS

THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS EXAMINATIONS.

The next Examinations will be held at London, Manchester, Leeds, Birmingham, Liverpool, Cardiff, Glasgow, Dublin and Belfast, as follows:—

Final Examination: May 16, 17 and 18, 1950.
Intermediate Examination: May 17 and 18, 1950.
Preliminary Examination: May 16 and 17, 1950.

Applications on the appropriate forms, which can be obtained from local Hon. Secretaries of District Societies, must be lodged with the Secretary, Incorporated Accountants' Hall, Temple Place, Victoria Embankment, London, W.C.2, on or before Monday, March 20, 1950.

THE INSTITUTE OF PERSONNEL MANAGEMENT

THE INSTITUTE OF PERSONNEL MANAGEMENT is proceeding to appoint a full-time Director. The Institute is an independent association of practising personnel officers, working in co-operation with the British Institute of Management. Its two principal objects are to increase the knowledge and competence of its members, and to promote and develop personnel management. Desirable qualifications are: (a) A degree or equivalent professional qualifications; (b) Knowledge of industrial relations and personnel practice; (c) Experience in industry or commerce; (d) Administrative experience. Salary, £1,500 per year for a person with these qualifications; otherwise a period of training at a somewhat reduced salary may be offered.—Applications, giving all necessary details, marked confidential, to Dr C. H. Northcott, Institute of Personnel Management, House, Hill Street, London, W.1.

THE BOND STREET STAMP AUCTIONS

The H. R. Harmer Saleroom is the Mecca of all serious Philatelists. The auctioneers of the "Hind" and "Roosevelt" Collections invite you to contact them if you have fine stamps or Collections for disposal. If you wish to buy, write for Catalogue subscription blank. Airmail editions of Catalogues are available six to seven weeks in advance of Sales. To all serious Philatelists, the H. R. Harmer Service is indispensable.

H. R. HARMER, LTD., 39-42, New Bond Street, London, W.1.
Tel.: No. MAY. 0218. Cables: "Phistamsel London."

THE EASTERN BANK LIMITED

The Transfer Books and Register of Members will be CLOSED from March 27 to April 11, 1950, both days inclusive.

By Order of the Board,
C. L. MANNING, Secretary.

2, & 3, Crosby Square, London, E.C.3. March 8, 1950.

Third Appropriation

THE debate in Congress on the appropriation for the third year of the Marshall Plan has been going on for some weeks and most of the major testimony has been heard. It is possible by now to distinguish the main trends in Congressional opinion and to have some idea of the arguments and counter-arguments that will sway the final decision. Domestic issues weigh heavily upon the deliberations. With a budgetary deficit of $5 billion and the prospect of a deficit next year certainly no smaller, the hands of Senators and Congressmen feel for the pruning knife. Mr Hoffman has attempted to counter this mood by carrying over $150 million from last year's appropriation and thus reducing his request for aid from just over $3 billion to $2,950 million. Even so, there is the sound in the halls of Congress of axes being sharpened. This desire to reduce government expenditure in an area apparently least likely to annoy voters at home—1950 is an election year—is only to some extent offset by fears that a reduction in the volume of the aid extended might exacerbate the problem of American farm surpluses. The farmers realise that Europe, by means of Marshall Aid, has been their best customer. While this difficulty may not blunt the weapons of the keenest critics, it will strengthen the move to tie the grant of dollars to the purchase of particular commodities of which there is a surplus.

It is only natural that these domestic issues should take pride of place. The budget, the deficit, the burden of taxation are uppermost in the mind of Congress. What is rather more difficult to understand is the very narrow basis upon which the international implications of Marshall Aid are being discussed. Mr Acheson attempted, at the very beginning of the hearings, to place the continuance of the Plan in its world wide setting as an essential instrument for containing Communism and achieving a stable and prosperous community in the west. "The fundamental answer," he said, "is to build a successful, functioning political and economic society of free nations." But in the course of the discussion, this wider picture has faded. Instead, almost all the questions and controversy have been concentrated on the two-way relationship between the United States and western Europe, and the means by which in 1952 equilibrium between the two partners will have to be attained.

America's part is seen to lie in a more ready admission of European goods. Both Mr Hoffman and Mr Acheson threw out the suggestion that, if lowered tariffs were to damage domestic manufacturers severely, the government might accept the financial responsibility of assisting management and labour to change their line of business. Europe's complementary function would be to improve the price and the quality of its exports and back them by vigorous salesmanship. It is in this context that the project of "European integration" has come to take so large a place in the Congressional debates. The purpose of integration is, in Mr Hoffman's words, the creation of a unified market. The scheme has, of course, many other

political overtones—American preference for federal solutions, for instance, or the desire to give the Atlantic Pact a firm European foundation — but its chief attraction is undoubtedly the belief that European industry is backward and uncompetitive because its markets are broken up by tariffs and trading barriers ; whereas if it were unified, rationalised and introduced to mass production, its goods would be competitive, its exports would rise and the dollar gap would vanish.

European integration has thus come to occupy the centre of the Congressional stage. Mr Hoffman has set the tone of the debate by admitting that he finds the progress made towards integration " disappointing " and feels that British hesitations and British preference for a controlled economy have had a particularly retarding effect. The greatest single step that can be made at this time towards greater unification is, in the American view, the adoption by Europe of the new payments scheme—the European Payments Union—which has been discussed at length in Paris and to which, indeed, Congress has been asked to devote $600 million of this year's appropriation. Yet Mr Hoffman feels that Britain was almost solely responsible for the failure of the Marshall countries to adopt the scheme at their last Council meeting in February. As a result, the tide of disappointment runs high.

*

The British Government must accept considerable responsibility for this unfortunate misunderstanding. It has failed not only to enlighten American opinion on the real nature of its difficulties, but it has singularly failed to explain them even to public opinion at home, and attempts to piece together the official British argument (such as are made in an article on page 607) have to be made without the assistance of any authoritative exposition. Moreover, the Government appears to have made no attempt to bring the discussion of Marshall Aid back into a context in which British hesitations make sense. It is widely but vaguely understood that Britain's caution over the particular case of the Payments Union and the general issue of European integration springs from its concern with its extra-European commitments —with the Commonwealth, the sterling area and the awkward appendage of that area, the sterling balances. So long, however, as Marshall Aid and the dollar gap are discussed—as they are being discussed in Washington now—against the narrow background of America's relations with Europe alone, Britain's hesitations can be made to seem disloyalty to Europe rather than concern for the wider community of the free world. Sterling, a currency in which about 50 per cent of the world's trade is conducted, is reduced to a recalcitrant member of the group of West European currencies. The drain on British resources, which includes the fight against Communism in Malaya, the development of the Australian economy and the stability of India, becomes no more than a distraction from the primary European task in hand.

To discuss this wider issue of world stability is not simply an attempt to divert the lightning from Britain's head. The facts speak for themselves. To reconstruct Europe is an essential part, but still only a part, of the struggle to maintain a free world. The Communist victory in China is not so old that its implications can already be forgotten. Above all, the European problem itself cannot be solved in the terms in which it is being discussed today in Congress. The aim behind all the payments plans, the tariff reductions, the subsidies and the grants which make up the substance of American-European relations today is surely to restore to Europe at least the degree of viability and balance in its exchanges that it enjoyed before the war. But at no time has Europe solved its dollar problem by direct trade with the United States. Until 1939, as the accompanying table illustrates, surpluses in commodity trade with the United States were earned only in Asia and South America, and western Europe, then as now, had a deficit with the United States. If, by inadvertence, the whole emphasis in European recovery is placed on filling the present dollar gap by way of direct European trade with the United States, the outcome is bound to be distorted and unsatisfactory. It is as vital to the general aims of the Marshall Plan to restore the surpluses in " third party " trade as it is to expand European exports ; indeed, it can be argued that it is more vital, since western Europe has already made some progress towards restoring its old level of exports, though not of imports ; whereas in a number of trading centres in Asia—for instance, India and Pakistan, Indonesia and the Philippines—a prewar surplus has been changed into a sizeable deficit.

Moreover, any expectation of expanding direct sales from Europe to America much above the prewar level—which will be necessary if " third party " trade is not restored—must take into account a number of markedly unfavourable factors. The increase of trading among themselves that could reasonably be expected to follow if the European countries formed an effective Payments

Union—and which is, indeed, its object—might easily divert their exports from the dollar market. In any case, the increase of trade within a group, each member of which has a dollar deficit, cannot contribute either directly, or in the short run, to lessening the dollar gap, however desirable the scheme is on other grounds. The trend of trade in the last thirty years shows that western Europe has captured a steadily declining share of America's rising market. The range of goods offered for sale—mainly manufactures—are competitive with some of the most largely developed American industries. This is not to say that an increase in European sales is impossible ; it is simply to underline the need to give the restoring of " third party " trade and the development of Europe's commercial relations with the

non-dollar world equal consideration with European integration and with Europe's sales to the United States.

Here, surely, is the opportunity to put both Britain's difficulties and its special contribution into proper perspective. American thinking along these lines is not by any means negative. The American Administration has given much earnest thought to the wider problems of restoring world stability. To give only one instance, much of the work undertaken in relation to Point Four covers the problem of reviving and stimulating " third party " trade. Thus the present debate in Congress does not by any means represent the last word in American policy. It may be, of course, that the British Government is closely in touch with the Americans on these points and that both the role of sterling as a world currency and the function of the Commonwealth in Asian and African development are being submitted to thorough joint examination. But, if this is the case, no hint of it has reached public opinion in either country, or even, it seems, the officials of the ECA. No spokesman on either side of the Atlantic, British or American, has given a reasoned statement of Britain's difficulties. For weeks and weeks, British amendments to the payments scheme have been neither published nor explained. Secrecy and defensiveness shroud the British case. The result is not only a grave disservice to Britain's good repute ; it can lead to a general distortion in the free world's plans for recovery.

The Labour Party's Future

GREAT heart-searching has been going on within the Labour Party ever since the election, not unaccompanied by personal recrimination ; what can be read in the Labour press is only the smaller part that shows above the surface. There is cause for an inquest. For those far-sighted members of the party who look to the future, its performance in last month's election has elements of disquiet. Not all the satisfaction over the fact that Labour did, after all, just win the election ; not all the boasting about the highest-ever popular vote, can obscure the fact that the Labour vote fell back from 48½ per cent of the total to 46 per cent. It is, of course, an achievement, with which any government has a right to feel some satisfaction, to lose only 2½ per cent of the popular vote after nearly five years in office. But that is not exactly the point. What should worry the Labour leaders is not that their vote is only 2½ per cent below that of 1945, but that it is still 4 per cent below half the electorate. For in what circumstances can Labour hope to do better than this time ? It had just completed the experience that comes to a political party only once or twice in a century—that of putting substantially the whole of its programme of legislation through in a single parliament. It has been able to take the credit for a gigantic transfer of real purchasing power to the wage-earners of the country, and for completing the structure of the welfare state. Throughout its term of office, unemployment has remained at a very low level hardly ever before experienced. Opinions might differ on the extent to which the Labour Government has brought these things about, or even on the extent to which it has actively contributed to keeping them in being ; what is important, electorally, is that they have happened while it has been in office. Yet the result is only 46 per cent of the electorate. Although there must be some 18 million incomes of less than £500 a year in the country—and many " incomes " in the tax sense carry two votes—the Labour Party collected only 13¾ million votes. Yet when again can it hope to have such favourable conditions ? Labour has identified itself as closely as it is possible for any political party to do to the fact of full employment. Does it really believe that it can produce an unemployment rate of 1½ per cent whenever it chooses ? Yet if events should knock away this strongest of all Labour's electoral arguments, what other leg will it have to stand on ? In spite of the last two elections, it may, after all, turn out to be true that Britain's normal political state is still Conservative.

It is the suspicion that this is so, sometimes only half realised, that underlies much of the unrest in the Labour Party. Why is it that, in these exceptionally favourable circumstances, it cannot carry with it as much as half the nation or much more than half even of what might reasonably be regarded as the working-class ? Should the party keep its ideology pure even if that means accepting a permanent minority position ? Or should it prepare itself to make all the concessions and compromises that will be necessary to win a majority ? In particular, should it have more of a policy or less ? The Tories, after all, got on very well for a great many years without much that was discernible in the way of a policy, and their attempt to fill the gap in preparation for last month's election was not an unqualified success. This —though they might not avow it so bluntly in public—

is the attitude that tends to be taken up by Mr Herbert Morrison and those who think with him. Labour's general attitude of benevolence to the working man and of suspicion towards big business is well enough known, they say ; to have too many specific projects of policy—especially extreme ones—will make few friends and many enemies. Let the party pursue an empirical, opportunist policy, moving towards its general objectives as occasion offers but always putting the pursuit of office above ideological purity. It is a perfectly tenable thesis, and slowly it has the immediate practical advantage that it would please the trade union wing of the party. If this school of thought has its way, the Labour Party may be able to collect enough votes to put it into office whenever its general humanitarian bias in favour of the humble and the poor pleases the electorate, these periods alternating with others when it is dismissed from office owing to the economic crises produced by the sentimental unrealism that seems to be inseparable from good intentions.

It is a realistic and not wholly unattractive thesis. But it will not satisfy the more ardent spirits in the party, not merely those, like Mr Bevan and Dr Dalton, who burn to avenge themselves on society, but also the heirs, most of whom are now in the Labour Party (or at least not in the Conservative Party), of the great stream of progressive thought that has run so strongly through so many generations of British politics. The reformers, the radicals, the socialists—all those who, in their various ways, have ever believed that it is society's duty, by taking thought, to reform itself and to control the environment within which it lives—feel instinctive disgust at a policy of mere opportunism. A party of the Right may be able to get along without a policy ; but if a party of the Left follows suit, it loses its main reason for existence.

To a socialist, of course, having a policy means more socialism. But what exactly, in practical terms appropriate to the year 1950, does "more socialism" mean ? The immediate answer, of course, is more nationalisation. But nationalisation in 1950 has infinitely less content of real meaning than it had in 1945. The big obvious industries have been brought into public ownership ; and the proofs are already piling up that the mere alteration of ownership from private to public alters very little —and alters that very little for the worse, unless there is a very precise and positive policy for the new owners to apply. The Labour Party has never been in the least clear what it wanted to do with its industries when it had bought control of them, and this poverty of thought was very clearly revealed by the list of industries in "Labour Believes in Britain" which were chosen for nationalisation precisely because the state, having bought them and cashiered their officers, would be able to run them on the principle of "carry on, sergeant-major !" It is a long time since any socialist has advanced any positive reason for nationalising any industry, save for a number of variations on the general theme that every nationalisation scheme presents one more opportunity for penalising a group of capitalists. There is neither any hope of positive economic benefit from nationalisation left in the Labour Party nor—as the recent election campaign showed—any belief among the practical politicians in the party that the advocacy of further nationalisation will win any votes. Indeed, it does not take much boldness in prophecy to conclude that the nationalisation of industry, as a policy, is certainly moribund and quite possibly already dead.

Yet if the nationalisation of industry is removed, what is left of the socialist policy ? The welfare state—not in any event, neither originally nor distinctively socialist—is now in existence. There is no line of advance there. There is more likely to be a line of retreat unless the productive wealth of the nation can be greatly and rapidly increased to support the burden it imposes. For the rest, the heads of socialist policy are either hopelessly nebulous—such as greater workers' participation in industry or better joint consultation—or totally irrelevant, or merely destructive, such as the capital levy and other devices for soaking the rich, which bring more votes to Labour's opponents than benefits to its supporters.

What, then, one must repeat, does socialism mean, in practical terms—in terms, that is to say, that will affect either the national income or the balance of payments, the two great indicators of economic health ? The answer is that nobody knows, least of all the leaders of the Labour Party. Apart from nationalisation, they have not known the whole time they have been in office. One of their great pieces of good fortune has been that they have been able—thanks to American aid and to the phenomenal world-wide continuance of the postwar boom—to get by without an overall economic policy.

This vacuum of positive policy is visibly disturbing to many of the Labour intellectuals. But neither of the strains of thought that can be seen in their organs provides a basis for turning Labour into a majority party. One of these is the new philosophy of "buoyant inflation," which says that you can spend as much money as you like on the welfare state and on maintaining full employment and avoid all the evil consequences by piling up physical controls. The vacuum of positive ideas is shown very clearly by the speed with which this foolishness is being allowed to rush in. For it is obvious nonsense for Britain ; no country that lives by foreign trade can afford to let inflation rip, and no country that values human liberty can proliferate controls. The other strain, visible particularly among the followers of Mr Bevan, is simply to intensify the war against property and success of all kinds, on the principle of Donnybrook Fair—"see a head and hit it."

The argument looks like going, by sheer default, to Mr Morrison. He may not know how to win any more votes, but the others know only how to lose them. And all the time the great pity of it is that the country badly needs a really effective party of the Left and, if it appeared, might well reward it with a real majority. If, after the heart-searching that is now going on, the Labour Party wishes to essay this role, then it will do well to scrap the text books of ideological socialism that have stood it in good stead for the past fifty years and start again from the beginning to think out, in the context of postwar reality, what its aims and its methods should be for the next fifty years. The proper course is first to study the facts of the national life in a spirit of scientific realism—that is, without assuming the answers from the start—and to build up policy, not on spite and envy, but on a close analysis of cause and effect in the affairs of society. If the Labour Party could set itself to this task and could bring to it the same gifts of diligence and imagination, of human tolerance and intellectual honesty, that inspired the earlier Fabians, it could yet rally to itself that great central mass of liberal and radical opinion whose support it has now so patently failed to retain.

Russia, China and Uno

THE United Nations is confronted with the major problem of when, and by what procedure, it shall decide which China—Mao Tse-tung's or Chiang Kai-shek's—may sit upon its Councils and Commissions. So long as it defers this decision, the Kuomintang attends, and the Russians and their satellites boycott its meetings. Lawyers are able to argue that this absence, being voluntary, amounts to mere abstention, but in fact it has graver implications. While it lasts, such decisions as the United Nations may take are not universal in terms of east and west. To take action, therefore, may invite the risk that, when in due course the China problem is settled and the Russians return, they will ask for the rescinding of actions of which they did not approve, or else will walk out again. Yet can the Organisation carry on month after month, deterred from major action by Russian displeasure ?

The issue has not yet become urgent, since over a wide field the United Nations has shown that it can do useful work without Soviet participation. This has long been the case with the Specialised Agencies. In the last two months, evidence of the same possibilities has appeared in the Councils and Commissions of the United Nations itself. At first, in part by chance, in part by design, little business was transacted, but in the last week or so the position has changed. If, as now seems probable, the Security Council succeeds in appointing an acceptable mediator in the Kashmir dispute, it will have proved that it can act usefully even when the Russians are not there. It should be noted that the Security Council has, however, simultaneously refrained from bringing up any of the thornier questions that are perennially on its agenda—notably the contol of atomic energy and the review of the waiting list of applicants for membership. In the Economic and Social Council, no decisions of moment have been taken. But this is chiefly because its recent meeting (which is described in an article on page 601) was saddled, before the Russians walked out, with an unimportant agenda which gave little scope for dashing activity. Such work as was done proves, however, that in the field of technical and financial assistance to underdeveloped areas, it can get on with a very large measure of its work whether or not the Russians are there. The Trusteeship Council, which is at present meeting in Geneva, completed the new trusteeship agreement for Somalia with a speed and efficiency that would not have been possible if a Russian delegate had participated. But on other topics Russian absence seems to have made little difference to the pace or course of events. Without the Russians, a majority of the Trusteeship Council consists of states administering trust territories, but the non-administering states are sufficiently vocal to mask this fact except when a close vote is entailed. In a word, the United Nations can perform all its minor functions, and cross most of its medium-sized hurdles, with or without the Russians.

Nevertheless, the issue of Russia's presence or absence cannot be delayed indefinitely on the pretext that a sufficient volume of business is being transacted, and the Secretary General, Mr Trygve Lie, has sought to bring the issue to a head by laying before the member-states a memorandum which, while it primarily discusses the legal problems raised by the existence of two rival claimants to the Government of China is, nevertheless, an attempt to persuade the states members to clarify their views and abandon a policy of drift.

The memorandum discusses the conditions that are necessary for the acceptance of a new government's representatives instead of the old—a situation for which there is no precedent in the history of the United Nations, since no sitting member's credentials have ever yet been questioned. Although Mr Lie does not say so, the nearest approach to a precedent is to be found in the Italo-Ethiopian dispute of 1935-36, when the League of Nations, in order to deprive Ethiopia of membership and to satisfy Mussolini, refused to recognise the credentials of the Emperor Haile Selassie's delegation to the 1936 Assembly. For lack of a parallel in the experience of the United Nations, Mr Lie is obliged to base his argument on the procedure for admitting new members. In doing so, he devotes most of his space to the contention that diplomatic recognition is not a pre-requisite of admission to membership. Burma and the Yemen, for instance, were voted for by many states which had not given them diplomatic recognition. Conversely, he adds, a vote for a member's admission does not imply readiness to recognise its government. He thus disposes, legally speaking, of the contention that once two more members of the Security Council have recognised the new China—Britain, India, Russia, Norway and Jugoslavia have already done so—a majority will exist and a *modus vivendi* can be arranged. In practice, of course, the greater the number of recognitions, the easier the transition. But in Mr Lie's view, the criterion is not the existence of diplomatic recognitions, which are, as often as not, given or withheld purely from motives of political prejudice. The correct criterion is the more practical consideration that is set out in Article 4 of the Covenant—that of ability and willingness to carry out the obligations of United Nations membership. The existing members must decide, he contends, which of the two rival claimants to speak for China is the better able to employ that country's resources and direct its people ; which is habitually obeyed by the bulk of the population ; which, in fact, exercises effective authority.

*

There can be no doubt which government, on Mr Lie's interpretation, should represent China at Lake Success. The Communist regime has control of the Chinese mainland and can exercise effective authority over most of the country. For those who wish to recognise harsh realities without involving themselves in a decision to withdraw recognition from Chiang Kai-shek, Mr Lie has provided a way out.

The real question is, however, whether the western powers wish or ought to wish to purchase Russia's return at the cost of great diplomatic discomfiture and of some weakening of their position in the Security Council. These are the motives that predominate, not legalistic arguments about what can or what cannot be done. There are, it is true, those who argue that the business of the United Nations can be better transacted in the absence of aggressive political orators and obstructive delegates from the far side of the Iron

Curtain. They talk freely of the virtues of an organisation of like minds, in which everyone means roughly the same thing by words like "freedom" and "democracy," and in which states members can frankly admit to shortcomings without fear of exposure to a spate of attack for every phrase of their admission. A United Nations on these lines, they claim, will be a better and freer organisation and more genuinely effective.

But does this argument hold water? If the western nations wish to join together in common action without "Soviet intransigence" to bar the way, there are endless committees, councils, pacts and meetings available for the purpose. The real issue to be decided is whether or not there is still any virtue in the genuine universality of the United Nations. Does the world need, in short, one place where, in spite of the fear and tensions of the cold war, both sides can still meet and even, on rare occasions, transact business?

To this, surely, there can be only one answer. The only value of the United Nations lies in its all-embracing quality. If peace can be safeguarded for as much as a year by the existence of a common meeting ground, it is in the interests of the genuinely peace-loving nations (not those who threaten aggression to prove their pacific intentions) to keep such a forum in existence. Admittedly, to swallow Russian bad manners is not agreeable. To admit Communist China is a bitter diplomatic pill—but no more bitter than the victory itself, which has to be accepted and lived with. The pill can even be sweetened by the thought that it would deprive Russia of its present chance of making immense propaganda on the theme of western capitalism's link with the "decadent feudalism" of Chiang Kai-shek. But the overriding reason for following up Mr Lie's initiative lies in the need to keep one area where all the powers meet. Any urgent western business can be conducted elsewhere—as the Marshall Plan has been conducted. In the United Nations itself, the chief need is that east and west should still retain some contact, however cold and unproductive that contact may be.

The Implications of Seretse

THE Secretary of State for Commonwealth Relations presumably did not think that his decision in the case of Seretse Khama would be accepted without protest. But he can hardly have anticipated the degree of trouble that he has stirred up for himself. At home, the disquiet within Mr Gordon Walker's own party is enough to be a real threat to the stability of the government, and even if this were not so, no Minister could feel happy about the volume and the sources of the discontent that is expressed. The reaction throughout the colonial world seems, from such evidence as is available, to be as unfortunate as was to be expected. And even in Bechuanaland itself, whose interests inspired the decision, the loyalty of Seretse's subjects to his cause looks like depriving Mr Gordon Walker's policy of even this justification. One of its principal objcts was said to be that it would pave the way for a more representative form of local government of the Bamangwato tribe, but in fact it has temporarily made any form of local native government impossible. The headmen refused to attend the meeting called last Monday by the British High Commissioner, Sir Evelyn Baring, and stated that they would not pay taxes or take any part in the administration until Seretse had been allowed to return to them. The result is that even in the purely local context of Bechuanaland the Government have failed in their objective. If all this had been foreseen—and most of it could have been—it would surely have been more than enough to give the Government pause. It is certainly enough to make the decision most ill-advised in the event, whatever it was in the conception.

It would, nevertheless, be unfair to condemn the Government out of hand for what has happened. They were faced with an extremely difficult situation, and while it is fairly clear now at least what they should not have done, it was by no means clear at the time. There were three choices before the Government: they could have confirmed the wish of the majority of the Bamangwato tribe and installed Seretse as their chief; they could, as they eventually did, have banished Seretse and his uncle, Tshekedi, until the political reforms which they wished to introduce and which might have put an end to dynastic feuds had been completed; or they could have allowed Seretse to continue to live with his English wife in Bechuanaland, postponing the decision about his chieftainship until the reforms had been put in hand.

The arguments against the first choice were strong. It was held, according to Sir Evelyn Baring, that the confirmation of Seretse as chief, since it was opposed by Tshekedi, was bound to lead to serious tribal warfare. The Bamangwato tribe has suffered in the past from a large number of dynastic quarrels which have greatly weakened the native administration; yet another feud might have led to anarchy and would certainly have made the reorganisation of the administration very much more difficult, besides causing a great deal of unnecessary bloodshed. Nor could South Africa be expected to stand idly by while a tribal war raged on, and probably across, its borders, especially one which, on *prima facie* evidence, had been caused by a mixed marriage. Dr Malan would have had an excellent excuse for interfering to restore order; indeed, the British Government might even have been obliged to ask for his help. Once this had happened, it would be impossible to refuse the South Africans' request that the Protectorates should be handed over to their care. Finally, the question of Seretse's succession could not be omitted. In Africa, half-breeds are disliked by black and white alike, and, although Seretse's heir might obtain a small following in the tribe, even worse troubles would be caused by his appointment as chief as have been by Seretse's marriage.

* *

The arguments against the second choice—the banishment of Seretse and his uncle—are as strong as those against the first. It has been only too plain during the past week that its adoption has laid the Government open to the charges of interfering with civil liberties and of lending their approval to the colour bar. The consequences throughout the whole colonial empire are serious, and, particularly in Africa, it is likely to bring every aspect of British colonial policy into disrepute. Britain has retained the respect of the colonial peoples by its justice, its tolerance and, in recent years, by its elaborate efforts to guide them along the road to responsible self-government. The action of the British Government in the case of Seretse Khama is, on the surface at least, a fall from grace which will not easily be remedied. To the African, it must appear to have been neither just nor tolerant, quite apart from being a serious misjudgment of character and of the strength of local feeling. Worse still, the British Government are now inevitably linked in many minds with Dr Malan's Government in their policy towards Africans, and, however strongly they may deny it, there is no escaping the suspicion that they have done what they did because they put the wishes of white South Africans before the interests of Africans as a whole.

If the Government had had to decide only between these two alternatives, they would have deserved sympathy rather than blame. The loss of the Protectorates (and, under the special circumstances which might have attended that loss, Britain's inability to do anything about it) would destroy British prestige in the colonies quite as much as the banishment of Seretse. It can reasonably be argued that it would have been better to have accepted the risk of trouble in Bechuanaland and the possible loss of the Protectorates rather than the certainty of trouble throughout all the colonies. If the decision had been in the hands of the Colonial Office, this, it may be assumed, would have been its choice, and it may be that the Commonwealth Relations Office—which, although responsible for the Protectorates, has far less experience of colonial affairs—underestimated the trouble which its decision would cause. But it would have been a choice of grave evils.

There was, however, a third choice before the Government—one which Seretse himself is said to have put forward. This was to leave the question of recognising his chieftainship in abeyance, but to allow him to live with his wife in Bechuanaland and actively to help the Government to bring about the constitutional reforms which are needed. It is unlikely that there would then have been any serious disturbances within the Protectorate, and the risk of South African interference would consequently have been very much less. Admittedly, such a course would not solve the main issue at stake—the clash between British and South African policies—but it would have avoided for some years and possibly for ever the evil results of either of the first two choices. The small concession which the Government made on Thursday—allowing Seretse to return to Bechuanaland until his child is born—could easily be extended without very much loss of face.

It is natural that Mr Gordon Walker, the new Secretary of State for Commonwealth Relations, should be concerned with preserving good will between Britain and South Africa, but the issue over policy towards the native Africans cannot be avoided for ever. It was right not to allow that issue to come up in the case of Seretse Khama, but the furore that has been aroused by the case is a much needed reminder about the importance of the issue. It is a most difficult issue, and nobody should allow his emotions to drive him into taking a side from which his reason may later force him to depart.

NOTES OF THE WEEK

Acheson on Asia

An important speech on foreign policy delivered by Mr Acheson at San Francisco on Wednesday went a long way towards stating where lies—in American eyes—the line on which Soviet directed Communist expansion must be held in Asia. He wisely insisted that American aid would vary in form according to the circumstances in each threatened country: military aid here, technical assistance there, grants or loans where there is promise of real economic improvement. This is not the dramatic and improvised Truman doctrine of 1947, provoked by the peril of Greece, but a more sober strategy to last over a longer period—in fact as long as may be necessary—and which conforms to the definition of "total diplomacy" which the Secretary of State advocated last week.

To the Chinese Communist Government a quite explicit warning is given, which Mao Tse-tung might one day conceivably find helpful if Moscow tried too hard to divert his attention from Manchuria to mischief-making in the south. The Chinese people, said Mr Acheson, for whom Americans feel their traditional friendship,

> should understand that, whatever happens within their own country, they can only bring grave trouble on themselves and their friends, both in Asia and beyond, if they are led by their new rulers into aggressive or subversive adventures beyond their borders. Such adventures . . . would violate the United Nations Charter. They would violate the peace which the Charter was designed to preserve.

This reference to the United Nations is obviously intended to indicate to Peking the kind of behaviour that Washington expects before it is prepared to support the replacement of the Kuomintang representative by a Communist in the Security Council. As for the recognition of Mao Tse-tung's government, Mr Acheson was non-committal, as indeed he is bound to be after the frustrating experiences of the British who, in spite of recognition, are being compelled to haggle with Peking over such matters as the status of ambassadors. The Americans would like to trade with China, but

> trade requires certain standards of conduct. Ships, planes and traders must be received under conditions of security and decency. Contracts must be honoured.

To all of which British businessmen will say, Aye, and wish that Mr Bevin would say it too.

Mr Acheson's analysis of the Asian situation was as thorough and authoritative an exposition as one could wish for. "Revulsion against misery and poverty as the normal condition of life" has combined with "revulsion against foreign domination" to "fuse in the positive conception of national independence." But one may question how long this analysis will adequately portray the Asian scene. In fact, there is little foreign domination left in south-east Asia, and it remains to be seen whether the nationalist leaders in newly independent states have sufficient vision and statesmanship to begin creating the conditions which would render the Communist appeal innocuous. Force cannot be dispensed with, because in Asia terror is as effective a Communist weapon as idealism.

The test of the Acheson policy is already being made in Indo-China. Dr Jessup is now reporting on the results of his fact-finding tour, and the French believe that they will get military aid for themselves and economic aid for Bao Dai which will bring some relief into what is now the most lively sector of the cold war's front line.

Anti-Bandit Month in Malaya

The decision to send to Malaya a brigade of Ghurkas from Hongkong and a squadron of heavy bombers from this country is timely. It has been felt among the British troops there that London does not understand the importance of getting decisive results against the Communist bandits before the course of events in neighbouring countries could influence parts of the population, if not in their favour at least towards a neutral attitude. It has been pointed out, for example, that the new GOC, General Urquhart, will stay only a few months in Malaya before moving on to the Sudan; yet it takes more than a few months for officers to master the special difficulties and needs of the campaign. There have also been complaints about equipment which Mr Strachey might look into.

Malaya's anti-bandit month is now well into its third week. No outstanding achievements have yet been reported, but in this type of warfare decisive set battles are almost unknown. Working in small groups throughout the country, Malaya's armed forces, helped by some 430,000 civilian volunteers, are engaged in a concentrated campaign to round up the scattered bands of Communist raiders. It will not be until all their reports are collected that a reliable estimate can be made of the damage inflicted on the bandits, who show an extraordinary capacity to "come back." Indeed, their attacks have been increasing both in number and scale, and it was bold of Mr Dugdale to say in the House of Commons on Wednesday that the latest reinforcements were "final requirements."

In the meantime, Mr. Malcolm MacDonald, the Commissioner-General in South-East Asia, has been seeing to it that the other possibilities in his area are not overlooked. In a recent speech he stressed the political progress which had been made in Asia and the signs of the "mighty help" that might be coming from America and the west. Mr MacDonald said that the danger is not open assault by Communist armies, but terrorism, insidious propaganda and fifth column activities. The emphasis is correct only if the directives issued at the Peking conference of the World Federation of Trade Unions in November are ignored. In speeches which resembled those made when Zhdanov launched the Cominform in 1947, it was clearly laid down that the Communist party in each Asian country must build up a national liberation army and take the strategy of the Chinese Communists as its model. The task in Malaya is to destroy quickly the nuclei around which such forces might be built and to make it clear beyond any doubt that the British will stay in Malaya just as long as it is necessary to ensure that its peoples have the strength, unity and administrative competence to maintain stability and prosperity by their own efforts.

* * *

The Unfinished War

In spite of the time which has elapsed since the Communist conquest of the south coast of the Chinese mainland and the embarrassment caused to the Communists by Nationalist blockade operations, no decisive action has yet been undertaken against the two remaining Nationalist insular strongholds of Formosa and Hainan. The Communists have indeed captured the small island of Weichow in the Gulf of Tongking, which should facilitate the invasion of Hainan, and have landed guerilla units on the coast of Hainan itself, but no serious attack has yet been launched. Hainan is the nearer to the mainland of the two large islands, and its capture should be a much less formidable undertaking than the reduction of Formosa, which is separated from the continent by about a hundred miles of sea.

The residue of territory left to the Chinese Nationalists—apart from the forces which they claim to have still operating in the far west of China—is small in comparison to the vast extent of China now, at least nominally, under Communist rule, but it remains important because the American Government shows no sign of transferring diplomatic recognition to the Communist Government, and as long as the Nationalists continue to hold any area of China the international deadlock created by divisions among the powers on the recognition issue seems likely to remain. There is still a civil war in China, however circumscribed its range may now have become, and the bombing raids by Nationalist aircraft, which now involve the Canton-Hongkong area as well as Shanghai, continue both to cause much suffering to the Chinese population and to inflict serious losses on British commercial concerns. The basic fact of the situation is that the United States is still on the opposite side to Russia in the Chinese civil war, even though its recent aid to the Government it legally recognises has been little and grudging, while Britain wanders with uncertain footsteps in an attempt to pursue an independent policy which has already incurred severe criticism in the United States without having met with much appreciative response from the victorious party in China.

General Chiang Kai-shek has now formally resumed the Presidency from which he "retired" in favour of Li Tsung-jen before the fall of Nanking, and has reconstructed his Cabinet in Formosa with General Chen Cheng as Prime Minister. Li Tsung-jen, who departed to America after a series of not very skilful political manœuvres, is thus eliminated, though he continues to denounce both Chiang and the Communists from American soil. The quarrels and regroupings of the defeated party are, however, unimportant in comparison with the real issue, which is whether the Nationalists can hold Formosa or not; on the answer to this question much may still depend.

* * *

Strength of the Government

The Government has survived the first tests of strength in the new Parliament with a margin which has allowed the Labour whips to breathe at least a little more freely, and which caused Mr Osbert Peake, when winding up for the Tories on Tuesday night, to suggest that the Parliament might last for "a period which is sure to be months and which may be for a year or more." By the most strenuous whipping seen for generations, and by bringing "marginal" members from hospital, accompanied, in one case at least, by a doctor and nurse, the Government managed to get a majority of 14 on the issue of steel policy, of 25 on housing, and of 19 on the Treasury's control—or lack of control—over the supplementary estimates. The changes in the totals were almost entirely due to the shifts of Liberal opinion. On steel all 9 Liberals voted in the Opposition Lobby. On housing 6 of them voted with the Government, and 3 were absent, while on the supplementary estimates all abstained. Each of these actions was explained in the House by an exercise of dialectics which tested to the utmost the subtleties of Mr Roderic Bowen (on steel), Lady Megan Lloyd George (on housing) and Mr Clement Davies (on the estimates).

Though the introduction of three critical Opposition amendments at this stage of the new Parliament can hardly be reconciled with Mr Eden's promise of no factious or fractious opposition, they have in fact helped to clear the air. The Government now has confidence that it can rally its supporters to face a major challenge. Both major parties can now get on with the urgent business of supply without the feeling that at any moment the present delicate balance, which neither wishes for the moment to upset, can be maintained. The parties resemble in fact nothing so much as two heavyweight wrestlers locked in a tight grip, when the spectator knows that the slightest shift of advantage one way or the other may produce a fall—and the end of the bout. Such a spectacle may be impressive, but it robs the Parliamentary scene of some of that free give and take, not only between parties, but within parties, which is one of the important contributions to democratic government. This is already obvious on the issue of Seretse Khama. The Government's decision would in the last Parliament have certainly created such a stir on their own back benches as to have produced either a change in policy or at least a first class Parliamentary row. As it is the argument, even inside the Parliamentary Labour Party, has been pained rather than angry, and the discussion of the issue in the House has been very unsatisfactory. It has been left to the Liberals who, however internally divided they may be, still retain real freedom of manœuvre, to try to force a full discussion by tabling a motion in Seretse's interests.

* * *

Whitewash for New Ceilings

Although the Opposition's amendment in the debate on the supplementary estimates was in form directed against the Chancellor of the Exchequer, most members, on both sides of the House, devoted their speeches to a discussion of the cost of the health service. In view of the large supplementary for the service, this was perhaps inevitable, but the Opposition would have been more effective if more of its members had tried to pin the Chancellor down on exactly how he will reinstate Treasury control over the departments instead of trying to criticise the supplementary estimate for the health service without appearing to criticise the service itself.

On the question of Treasury control Sir Stafford Cripps was very inadequate. All his stern words a year ago, all his declarations about moderating the speed of the extension of the social services to the country's ability to pay for them, all his warnings about the possibility of a charge or tax being imposed in respect of the health service—all these apparently were meaningless symbols. If the Government had refused to allow overspending on the health service in the year just ending, he said, the hospitals would have had to close beds. And so a new ceiling has been fixed. The net estimate of £393 million for the year 1950-51 is a limit

> beyond which we must not be carried by new developments or extensions of existing services which cannot be provided out of ascertained economies in other directions.

*

Except, however, for a reference to a closer association between the Ministry of Health and hospital management committees and regional boards, Sir Stafford gave no indication of why a limit would be enforced any more successfully in the coming year than in the present one. Nor did Mr Bevan, who seemed to rely for economies on limiting the use of proprietary medicines and on bulk purchases. Yet it is surely significant that speaker after speaker in the debate emphasised the need for extensions in the health service—indeed they are inevitable with every advance in medical treatment. In the face of public pressure to open more hospital beds, and so on, how can the ceiling be maintained? In his maiden speech, Dr. Charles Hill, secretary of the British Medical Association, proposed that the service should be financed by fixed allocations from the Ministry of Health to the main branches of the service, as is already the case with the general practitioner service. But he did not state the obvious corollary—that if an allocation is to be exceeded the deficit should be made up by the patients not the taxpayers.

Conservatives have here an opportunity to put forward a constructive argument. As one of their new members, Mr Ian MacLeod, put it, the conception of the traditional function of the social services as being the establishment of a minimum standard of living is disappearing in favour of the conception of an average standard, to which "the old-fashioned virtues of thrift, industry and ability become irrelevant." The social services, he went on, have become the weapon of financial policy, not of social policy. Here is something on which the electorate could vote. Conservatives, notably Mr Eden, have already hinted that their thinking is moving in favour of the minimum standard. But they have yet to show that they are confronting the electorate with these alternatives.

* * *

No Change in Housing

On Monday the debate on the Address came to an end with a discussion of the Opposition's amendment on housing. To say that it was a better debate than has been usual on housing does not mean that it was a good debate. The Opposition made full use of the strategic advantage presented to them by the fact that the line of development in the Government's housing policy is virtually at an end. The point of their attack was that the Government was betraying the people by decreasing the tempo of the housing programme, that costs were too high, and that private enterprise could do the job more efficiently if given a freer hand. Mr Walter Elliot, Sir David Maxwell Fyfe, and Mr Marples made good Opposition speeches, but on the whole the attack on the Government's policy contained no fresh advance on the stale arguments of the past four years.

Mr Bevan had little difficulty in disposing of the criticisms of the reduced level of house building, by asking what equivalent cuts in the capital investment programme could be made if the share of housing were to be again increased. But what was alarming was his almost insolent complacence about the other disturbing features of the contemporary housing problem. The present housing programme cannot go on for much longer: costs are too high; the burden on local authorities is too great, and the incidence of housing subsidies regarded as a social service is too haphazard. It is true that the annual charge of the housing subsidies is small compared with the cost of the health service on which Mr Bevan had a tougher battle to fight the next day. But they will rise by nearly £4,000,000 a year from now on for each 200,000 houses built.

These are serious questions on which the public can reasonably demand a serious answer from the Minister of Health. Instead Mr Bevan chose to treat the House to yet another of his arrogant little homilies on his view of social justice and his childhood, thereby proving once again the gap that divides his administrative ability from his political judgment. Despite the vocal support which Mr Bevan receives from his admiring *claque* of leftwing periodical journalists, there is no doubt that a repetition of this week's performances in Parliament will hasten the already noticeable decline of his strength and influence within the Labour party.

* * *

Liberal Regime for Greece?

No fundamental issues divided the 2,800 odd candidates who competed on March 5th for 250 seats in the Greek parliament. In 1946 the future of the monarchy was the overriding issue; yet now even those who still maintain republican principles agree that the monarchy has won the right to be placed above political controversy. All parties agree with varying degrees of emphasis and sincerity on the need to fight Communism, to secure a fairer distribution of wealth, to co-operate closely with the western powers and to make the most efficient use of Marshall aid. This election struggle was over personalities, not about policies. Indeed, its chief significance lay in the fact that, less than six months after the Greek rebels had officially given up the military struggle, it should have been possible to hold elections which can be considered reasonably fair and free by Mediterranean standards.

The outstanding result is the Populist party's loss of support in the country. Although at the time of writing

(15 seats have still to be distributed) it just manages to remain the largest party, it holds only a little over a fifth of all the seats instead of nearly a half. The support which the Populist party felt it deserved as senior partner in the coalition which beat the guerrillas, has been lost by its inefficient and corrupt administration.

The Communists were not allowed to put up candidates of their own and so were urged by their leaders to vote in protest against the "fascist character" of the elections. (In 1946 Communist disapproval was expressed by not voting at all.) Most of them probably voted for the extreme left-wing Democratic Front coalition led by Mr Sophianopoulos, Professor Svolos, the Socialist leader, and others, which has so far acquired only 21 seats. In districts where there were no "honest democratic candidates" party members were instructed to place in the ballot box a piece of paper inscribed with the names of "well-known fighters who are chained in prison." The silliness of this trick was matched by the futile Communist effort to maintain simultaneously that the elections were held under the "most horrible terror" and yet resulted in a crushing defeat of the right-wing.

The largest proportion of votes went to the various centre parties, of which the three chief ones—the "historic" Liberal party led by Mr Venizelos, the Social Democratic party led by Mr Papandreou and the new Centre Progressive Union led by General Plastiras and Mr Tsouderos—between them already hold 130 seats. The three leaders have already agreed that, if called on to form a coalition government, Mr Venizelos and Mr Papandreou would serve as deputy prime ministers under General Plastiras. Such a government—the best and most likely combination—would not produce any startling changes. General Plastiras has described himself as a Liberal of neither the right nor the left. Although he calls himself a progressive he is certainly not a socialist and in any case his more conservative colleagues in the Liberal party will certainly try to hold him in check. He is unreservedly anti-Communist, but he favours some sort of political amnesty, and would work for better relations with the Soviet Union and—what is more immediately important—with Jugoslavia. Economic affairs would be under Mr Tsouderos, a former governor of the Bank of Greece and prime minister of the Greek Government in exile. Mr Tsouderos cannot be expected to set about making the best use of Marshall aid by embarking on any far-reaching economic reforms. But he should at least produce a far more clear, consistent and vigorous direction of economic policy than his predecessors.

* * *

Prague Goes on Purging

Dr Clementis, Foreign Minister of Czechoslovakia, has not lasted long. He stepped into a dead man's shoes in March, 1948, a few days after Jan Masaryk committed suicide, and his future was already the subject of many rumours at the end of last year. Since then the shadow of party censure was obviously hanging over him, as men like the editor of *Rude Pravo* and the head of the information department of the Prague Foreign Office became victims of the drive against former members of the group that worked in London during the war. Dr Clementis's friendship with Mr Vyshinsky is probably the reason why he has been "released" rather than disgraced; and he is succeeded by the Slovak Communist, Mr Siroky, who is free from any taint of association with the west and was chosen in December to present Czechoslovakia's birthday gift to Stalin. He will be regarded in Moscow as a sound man.

It looks as if there is some connection between this discreetly managed switch of Ministers and the meeting at the end of last month of the Central Committee of the Communist Party. For the outstanding feature of that occasion was a speech by Ladislav Kopriva, specialist in party purges, who suggested that many positions of influence in the country and party were still occupied by "home reactionaries" and quoted several cases of the "absolutely inadequate vigilance, often naïve trustfulness and carelessness" of party officials.

A certain Bohdan Benda, a prominent official of the party in Prague, had been revealed—he said—as an "agent of the Tito clique" working for "imperialist bosses." A group of officials responsible for foreign trade had been "unearthed," who advocated "an orientation of Czechoslovak trade towards the west." The chief editor of *Rude Pravo*, a member of the central committee of the Party, had committed espionage and shown that he was "more closely related to the bourgeosie and to the western countries than to the working classes and the Soviet Union." Then there was Milan Reiman, a departmental chief in the Cabinet *presidium*, who had meddled with secret files and plans which were no concern of his, and committed suicide rather than face an investigation. And so it will go on, a succession of merciless houndings of men who find it impossible to resign themselves to a future of monotonous subservience and are therefore called Titoists. For Kopriva has spoken and must be obeyed:

> Let us not cease to purge the party of bad people who serve the class enemy. Let us purge the party of careerists who camouflage themselves with the mask of watchfulness.

* * *

Oder-Neisse Refugees

The exchange of angry Notes between Great Britain and Poland over the proposed expulsion of 180,000 Germans from Poland's western territories to Federal Germany tells only half the story of a delicate and complicated situation. It is true enough that the Poles and the Czechs see the value of aggravating the overcrowded state of western Germany; but this appears to be only a secondary matter.

The truth is that the continued presence of these Germans in the new western territories of Poland is seen both as a reminder of the past and as a menace for the fuutre. Whatever Warsaw may say, the Pole newly settled there still feels insecure and the fear that the Germans may once more rise to a dominant position is constant. This has not been lessened by the frequent and flattering protestations of friendship that pass between the Soviet Union and eastern Germany. Stalin's message to President Pieck last October suggesting that the Russians and the Germans were destined to share enterprises of world importance caused much consternation in Poland, even in the Communist Party. It is a matter of common knowledge that the whole flirtation has caused near-panic among the new Polish settlers in Silesia and Pomerania. Many peasants slackened off in their farming effort, and the Government was forced to send down special propaganda agents to counteract disillusion and fear. It should also be recalled that the chief accusation which Mr Hilary Minc made against the now disgraced Communist leader, Gomulka, was that he showed distrust of Stalin on the grounds that he would one day do a deal with Germany over the western territories.

The desire of the Bierut regime to get rid of the remaining Germans is, therefore, motivated less by a desire to increase unemployment in western Germany than to calm the fears of its own people. The Polish Communist Party finds it impossible to convince the peasant that 180,000 Germans do not constitute the nucleus of a future fifth column. Propaganda about "the revolutionary psychological change in the German attitude to Poles" is just not believed. There is the further complication that the Germans are regarded as a danger to "security," for these western territories, industrially and strategically, are becoming increasingly important from the point of view of Polish defence.

The whole affair is a reminder of the human suffering that has been, and will yet be, caused by the Oder-Neisse line. Fears and ambitions about it dominate the thoughts of Poles and western Germans, and will one day determine whether or not any agreement to live and let live is possible between the two halves of Europe. As things are going, it is becoming the Soviet frontier with the free world.

* * *

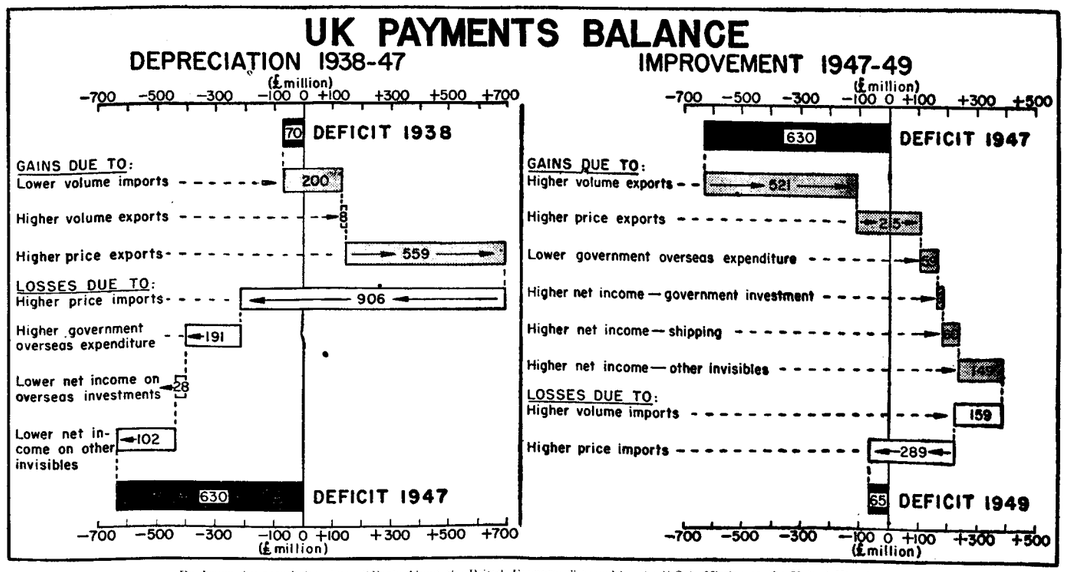
No Move from the TUC

The position of statesmanlike restraint adopted by the TUC is becoming increasingly untenable. By a narrow margin of votes the TUC itself is committed—though to what extent its member unions are equally committed is another matter—to the policy of a wages standstill, provided the retail price index does not rise above 118 or fall below 106. The index, whose published figure was 112 in January when the special conference of union executives reached this decision, has risen by only one point. Yet many unions are now openly ignoring the majority decision, which the General Council has in any case no power to enforce. The decision of the Confederation of Shipbuilding and Engineering Unions, also by a narrow majority, to take a ballot of their members on strike or arbitration action, following the rejection of their claim for a general increase of £1 a week, may encourage other unions to exert pressure for higher wages. Quite apart from the general effects of this decision on industry it is already having serious internal repercussions which may seriously weaken the cohesion of the Confederation.

The members of the TUC's Economic Committee are anxious to see the Chancellor of the Exchequer before the full meeting of the General Council. It is difficult to see exactly what purpose will be achieved by such a meeting. The TUC have nothing new to propose, beyond telling Sir Stafford of their difficulties and again pressing for action—budgetary or otherwise—to limit price rises and offset the possible effects of devaluation.

The TUC's dilemma is reflected in an article in the magazine *Labour*, by Mr Vincent Tewson, its general secretary. The article is in effect a final and desperate appeal to the rank and file to "hold the line" and to place loyalty to the Labour Government, with its attenuated majority, before all other considerations. Mr Tewson goes so far as to draw a horrible picture of what might happen if the Conservatives were returned to power.

> If the electors decide to put a Tory Government in power, and to set every man and woman free to pursue private and sectional interests, then the electors must understand that the same freedom of action must also be accorded to trade unionists. . . . They can be expected only to pursue a line of reason and responsibility so long as the Government of the day is pledged to a basic policy which makes the safety and well-being of the community as a whole paramount and into which the policy of the trade unions . . . can logically fit.



This is an absurd threat by which Mr Tewson denies that the TUC is a grown-up organisation, since reason and responsibility demand something more than co-operation only with those who will give way at the first pressure. But, to judge from the present mood of the engineers and certain other groups, it looks as if important groups of industrial workers, while ready to support the Labour Government at the polling booths, are tired of a responsible attitude towards their sectional interests. This is the challenge which the TUC General Council must face.

* * *

Wooing the Farmer

It is clear that agriculture is going to receive a good deal of attention in the new Parliament. Legislation to rationalise the marketing and distribution of farm produce has been postponed for the time being, despite the belief of many Labour members that this is one of the few ways open, consistent with party doctrine, of reducing the cost of living. But it would not have been popular with the farmers' leaders, who are anxious to extend producers' control by promoting marketing schemes of their own for a number of commodities, and the idea has consequently been shelved.

The Minister of Agriculture has declared in Parliament that he is satisfied with the results of the 1950 election. Perhaps unwisely, in view of the fact that an unusually delicate review of farm prices is at the moment taking place, he went on to boast that "prices paid to farmers over the past several years were never higher, farmers were never more prosperous." Mr Tom Williams seems almost to have forgotten that the Labour party once stood for nationalisation of the land. He made it clear that public ownership, even of marginal land (save where the owner is manifestly unwilling or unable to bring land into production) forms "no part of our programme and policy today." For the rest,

Re-drawn, by permission from "Facts About the British Economy" issued by the E.C.A. Mission to the United Kingdom

he was able to point with satisfaction to progress in expanding livestock production and in the rehabilitation of hill farms.

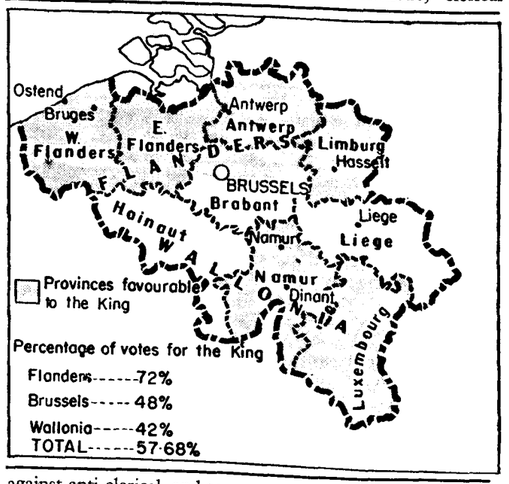
* * *

True and False Economies

The first test of the Government's agricultural policy will come when the new schedule of guaranteed farm prices is announced. The farmers are demanding higher prices for livestock products as compensation for the removal of the Government subsidies in respect of their purchases of feedingstuffs and of fertilisers. In the light of the Labour party's present attitude, and of the Minister's own words, it seems more than likely that the farmers will get their way —at least in part.

In this event, the Government's juggling with farm subsidies and prices will turn out to be a serious blunder. The decision to eliminate the feedingstuffs and fertiliser subsidies was taken last autumn as a contribution to the cutting of Government expenditure. This particular economy was no doubt chosen partly because it had no immediate effect on either producers or consumers. But somebody has eventually to bear the cost—and if it is not to be the producer, it can only be the consumer who will probably be asked to pay higher prices for a number of basic foodstuffs. Precisely the same result would have been achieved if the Government had taken the more straightforward course of cutting food subsidies in the first place. But this it obstinately refused to do—it preferred to buy popularity by procrastination.

But that is not the only disadvantage. The direct subsidies to farmers which have been abolished were a strong stimulus to higher production and efficiency. The availability of relatively cheap feedingstuffs, for instance, was largely responsible for the big increase in the pig population. The fertiliser subsidy in particular is doing a great deal to improve the yield of crops on poorer land. An equivalent increase in farm prices will be much less effective in stimulating output—for it will be spread over the whole farming community, and will particularly benefit the prosperous high-output farmers who need it least, whereas the essence of a good farm subsidy is surely that it should assist those farmers who need it most.



Thus the Government is in a dilemma of its own making. If it gives the farmers higher prices, there will be no reduction in the total cost of British agriculture—but the money will be spent to less good effect, and a rise in food prices will be unavoidable. If it finds the courage to stand firm, its courtship of the farmers will have come to an untimely end. The Government should reflect that it might after all be better to impose some true economies (on both consumer and producer) rather than to dabble in false ones.

* * *

Leopold and the Referendum

The belief that King Leopold divides his countrymen along the most dangerous lines of cleavage has now been amply confirmed by the referendum held last Sunday to inquire whether or not the King should return to the throne. In the predominantly Catholic, overwhelmingly Flemish provinces, the majority for the King's return was as high as 73 per cent. In French Wallonia where nationalism, socialist ideology and Communism are factors in popular thought, the vote for his return was as low as 40 per cent. Even in Brussels itself, the capital city and therefore a centre where all strains—political, racial and religious—of Belgian life meet, the King could not secure a majority. The final figure of 2,933,382 in favour of the King's return and 2,151,881 in opposition gives a majority of only 57.6 per cent in favour of the King's return. Unhappily, this percentage is 2½ per cent higher than the minimum majority fixed by the King himself, and this tiny loophole is, presumably, his excuse for delaying the only sane solution—abdication in favour of his son.

There can be few cases in modern history in which the salvation of a country depended upon the decision of one man. If the King returns, the country will be split, Fleming against Walloon, Catholic against non-Catholic, clerical

against anti-clerical, and to some extent town against country. If, on the other hand, King Leopold has the wisdom and humility to leave the path open for his son, Belgians of all classes and regions can reunite round the monarchy which all save the Communists support.

Selective Call Up

The annual Statement on Defence, published last week, stated categorically that the Government regarded as impracticable any question of abandoning the principle of universal national service in favour of selective service. Selective service is the method, employed hitherto by the United States armed forces, whereby only a certain proportion of youths of the age group available for national service are chosen. This has the advantage of enabling the forces to vary the number

CALL-UP ESTIMATES

Numbers due to register in the relevant age-class	*1950–51* **292,000***	*1951–52* **277,000***	*1952–53* **285,000***
Men who may be granted deferment :—			
Agricultural workers, coalminers and seamen	32,000	29,000	29,500
Apprentices	70,000	70,000	71,000
Students	8,000	7,500	8,000
Men who may be granted postponement on grounds of exceptional hardship, conscientious objectors, etc.	3,000	2,500	2,500
Wastage after registration (largely men who volunteer for the Services after registration)	12,000	11,500	11,500
Medically unfit for service	35,000	32,500	33,500
	160,000	153,000	156,000
Immediate yield from registrations...	**132,000**	**124,000**	**129,000**
Men from earlier age classes available for calling up on expiry of deferment, postponement, etc.	45,000	57,000	57,000
Total numbers likely to be available for calling up.	**177,000**	**181,000**	**186,000**

they will accept, and it involves no period of deferment or uncertainty for the youth. It has the necessary disadvantage of employing some arbitrary method of choice such as a ballot, a method which is apparently acceptable to Americans, but which, so it has always been said, would be repugnant to the British sense of social justice and equal shares.

However, from the accompanying table, which is reproduced from a written answer to a Parliamentary question this week, it is clear that the application of the universal principle in Britain produces something very like selective service. It will be seen that over the next three years well over half of the eighteen year old youths will have their service deferred for one reason or another. Of those who are deferred only about 45 per cent, that is to say students and apprentices, are likely to serve their term at all since the farmworkers and miners are exempt as long as they remain in those occupations. It would be unwise to reject the possibility of some form of selective service, when there is a haphazard form of it already in operation.

Strategic Exports

The news that the Americans are about to clamp controls on the export outside the western hemisphere of 600 more commodities raises again the problem of how to reconcile the requirements of defence with those of a balanced trading account. The United States itself can afford to deny to the Communists any goods of possible strategic importance, since trade with eastern Europe and with China is not of vital importance to it. But the State Department expects all the countries of western Europe to follow suit. Most of them do comply to a lesser or greater degree, but since the development of trade across the iron curtain is a promising method of bridging the dollar gap—if only for a few years—they can hardly be expected to do so with enthusiasm or even efficiency, particularly Switzerland and Sweden.

The problem is seen in its most acute form in western Germany. There the most strenuous efforts have been made to enforce the controls because of the strong American influence on the conduct of foreign trade. It is there, consequently, that the controls have caused most irritation and misrepresentation. There was, for instance, the recent storm over the American ban—later partially lifted—on the export of steel rails to Communist China. The Germans in the Federal Republic said openly that they were inclined to agree with the propagandists of the Soviet zone that it was all a deep plot by the British to boost their own trade at the expense of the German. It is also in western Germany that the most serious leak, through the Soviet zone, can take place. In theory the Bonn authorities are supposed to licence the export of goods to the eastern zone; in practice they are either unwilling to act or inefficient when they do. Even if the leak could be sealed off would it be in the best interests of western Germany and western Europe? If the Federal Republic is to balance its payments by 1952-53, it is estimated that its exports to eastern Europe must be vastly increased, to 19 per cent of its total exports. Germany's neighbours too, especially France, are anxious that all the increasing output of German consumer goods should not be brought into competition with their own goods.

Britain is in a better position than most of its fellow members of the OEEC to fall in with American policy, at least as far as eastern Europe is concerned. On the whole British trade treaties with the Soviet satellites mean much more to them than they do to Britain; and its refusal after the Sanders trial to reopen trade negotiations with Hungary shows that it feels in a position to sacrifice trade with eastern Europe for political considerations. It is the extension of the American export controls to the Far East since last November that will affect Britain more closely. For the British Government has recognised the Peking Government largely in the hope of protecting the important British business interests in China, especially in Hongkong.

It is still a open question whether it is wise to allow the Communist states to be driven into ever-closer economic dependence on what looks like becoming a rouble bloc. Would it not be better to impose an outright ban—as the United States and Britain already do—on a small number of really important strategic products and concentrate on making that ban completely effective?

Controversy on Flogging

The Lord Chief Justice's remarks on the wisdom of abolishing flogging as a punishment for crimes of violence, which have been repeated by other judges, have had the effect of reopening the whole matter in Parliament—where it was debated at length during the discussions on the Criminal Justice Bill in 1947-48. There is to be a debate on the subject next week in the House of Lords; and two motions have been tabled in the House of Commons, calling for an amendment to the Criminal Justice Act which would allow flogging to be reintroduced. These motions have been tabled by a Conservative group and a Labour group, for corporal punishment, like capital punishment, cuts across party differences. A counter motion has also been tabled by some Labour members, and it is not possible to foresee how the voting would go even if the Government allowed time for the motion.

It is, however, to be hoped that the Government will not agree lightly to the reintroduction of flogging in the face of this strong pressure. It is also to be hoped that members will, before the subject is debated, read the report of the committee which investigated it exhaustively in 1938 and came to the conclusion that it is ineffective as a deterrent and does more harm than good. It is worth pointing out that the members of the committee were unanimous in their recommendations. The statistics produced by the Home Secretary, so far as they go, certainly bear out the committee's views. Crimes punishable by flogging numbered 711 in the nine months to September, 1948, when corporal punishment was abolished. In the corresponding nine months of 1949 they were 597—though it may be that statistics for the last three months will show an increase.

"Facts," said one learned judge the other day, "speak louder than statistics"—though on what these facts are he said no more than that the degree of violence is worse. It would indeed be interesting to have some facts on the nature of these crimes. An enquiry might well reveal some startling similarities as a result of the publicity given to them in the press—which is itself largely the result of the judges' comments at the trials. The added publicity which would follow from the return of flogging, with all its morbid effect on the public, might well lead to an increase in violent crimes. The issue is simple: should violence be met with violence? Or with a strengthened police so that crimes are prevented—and punishment forestalled?

* * *

Treasury and Tribunal

There can be no tribunal which is more directly influenced by the Government's policy of restraint on personal incomes than the Civil Service Arbitration Tribunal. Its tight-rope dance is therefore peculiarly difficult—so difficult in fact that last week it refused to perform. The performance was called for by a claim for higher salaries affecting 1,556 principals and 502 assistant principals who constitute the lowest ranks of the administrative class of the Civil Service. The claim was first put before the Treasury in 1947, and in despair of any action by the Treasury was brought to arbitration a fortnight ago. But even with the arbitration machinery the Civil Servants have fared no better. Taking advantage of the fact that the demand was that the new scales should be put into operation "no later than October, 1951," the tribunal have sought refuge behind the argument that the claim could be determined better in the light of the circumstances ruling nearer that date.

In such a delicate situation a decision by the tribunal must be hard to make, but if arbitration is to mean anything a tribunal must surely make up its mind. In this case it seems clear that the sympathies were with the claimants, but that in its own or other people's wisdom it took what

slender excuse it could to put off decision. In the case of the senior administrative grades the Treasury had the advantage that, in seeking the advice of the Chorley Committee, it did not bind itself to accept their recommendations. But it would be bound to accept the decision of the Tribunal, and it is this that accounts for the frantic efforts to postpone a decision.

New Wavelengths for Europe

The new wavelengths which came into operation throughout Europe on March 15th appear in their first days of trial to have given less trouble than engineers and officials had feared. In this country, the switch over has not caused any fresh difficulties, though it cannot yet be said whether listeners on the east and south coasts will lose the "ghost in galoshes" that has haunted their reception at various times. The Third Programme, whose inaudibility has caused an undercurrent of protest since it was introduced over three years ago, should now enjoy a better hearing.

Interesting as are the internal consequences of the changeover in this country, the main point of the new plan, decided in Copenhagen eighteen months ago, is its international application. The scheme is unique, since apart from the ending of the airlift, it is virtually the only policy upon which east and west have recently agreed. Russia and its satellites are a party to the Copenhagen plan and although two different radio organisations now exist to supervise and police the agreement, the first evidence suggests that it is being observed.

So much agreement is, however, too much for our troubled world. The Americans have, in the interests of their German dependants, refused to accept the allotment of wavelengths assigned to Germany. They complain—not without justification—that the Germans have been underprovided for in the general distribution. But the German right to wavelengths wrung few hearts at Copenhagen, the delegates refused to give way and the Americans accordingly refused assent. First reports speak of great confusion in Germany as a result of the new scheme. The danger is that the Russians may use American tactics as an excuse for one-sided modifications of their own.

Trade Talks at Geneva

After some preliminary skirmishing, the fourth session of the Contracting Parties to the General Agreement on Trade and Tariffs has settled down to cope with one of the major problems raised by the liberalisation of trade among the Marshall Aid countries in Paris. It is the impossible position in which virtuous low-tariff countries —particularly the Benelux group and Scandinavia—find themselves *vis-à-vis* such frankly protectionist countries as France and Italy. From what has been seen of parts of its intended tariff, Western Germany is probably also in the protectionist group. Italy's continued delay in accepting the obligations of the Agreement until it has completed the upward revision of its tariff seems to have caused considerable resentment. The principal Dutch delegate, Mr Spierenburg, has commented bitterly that no one could afford to reduce tariffs unless they already had high ones. Under the agreement, quantitative restrictions can only be applied for balance of payments reasons. But, with most quantitative controls gone, the low-tariff countries find their domestic markets open to competition from countries whose high tariffs effectively keep out their exports.

The low-tariff countries are not demanding equality of tariffs, but that the high-tariff countries should make substantial reductions without demanding concessions in return. If this does not happen, the low-tariff countries have threatened that they may have to consider using new discrimination against high-tariff countries, "within the framework of the Agreement."

The problem has now passed to the working parties. It has, however, already been agreed that there shall be a third round of tariff negotiations in Torquay in September. Perhaps the most comforting aspects of the position are that nobody has yet talked of cancelling his ticket to Torquay, that the Americans have taken a reasonable line and seem prepared to discuss their own tariff levels realistically, and that, on this subject at least, the British have so far managed to keep out of trouble.

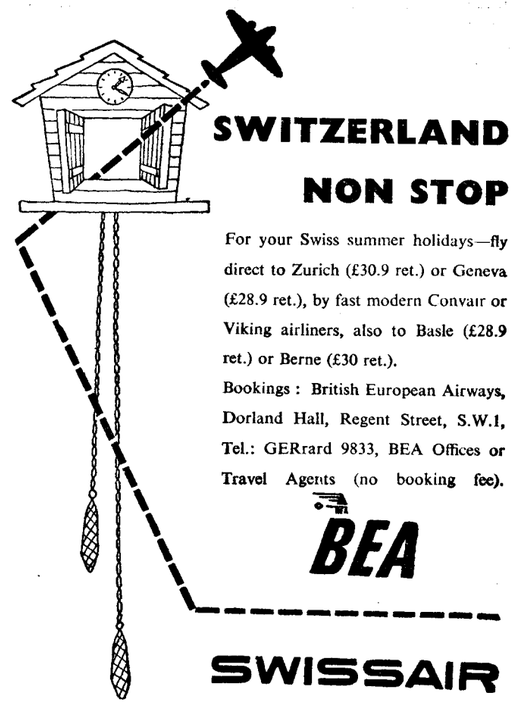
* * *

The Cost of Social Services

The following table should be substituted for the table giving the net cost to the taxpayer of the social services, which appeared in *The Economist* last week, page 521, and from which some Scottish estimates were omitted.

	Revised estimate 1949–50	Original estimate 1950–51
	(£ million)	
Education	212·0	219·5
University grants	17·7	23·4
National insurance (incl. family allowances)	209·9	214·6
Assistance Board	87·3	83·9
Housing	66·4	60·8
Ministry of Food (incl. food production services of Ministry of Agriculture)	477·6	444·4
National Health Service	358·5	392·9
TOTAL	1,429·4	1,439·5

Marvels of the Ten Hour Act



LORD ASHLEY made his motion on Thursday evening for leave to bring in a Bill "to declare the intentions of the legislature in respect of the hours and mode of working under the Factory Act." There was no opposition to the motion. . . . The House of Commons approves of Lord Ashley's statements, and sanctions his measure to improve the Ten Hours' Act, because it has been so wonderfully efficacious. Even some Free Traders cheered and supported him. They believe, therefore, that the Act has had the marvellous effects ascribed to it, and that all the changes in our commercial laws since 1842 have been worthless. They listen to the representations of ignorant constituents, blessed by they know not what, and in obedience to them they are ready to give a flat contradiction to the previous labours of their lives. That is the most serious point in the controversy. The people are prone to believe that all improvements are due to the Ten Hours' Act; and they are encouraged in that belief by veteran Free Traders, to the prolongation of error and the encouragement of restrictive legislation. Our hope that the measure will yet be defeated is much strengthened by a remark of Sir J. Graham: "He understood his noble Friend's arguments to go the full length of requiring that *machinery should not run for more than ten hours a day*. . . . The intention then is to limit the running of machinery . . . to one uniform time of ten hours. The operations of capital, which Adam Smith thought no legislator should meddle with, are by this measure to be strictly repressed. To deprive the land of half of its fertility, if that were in the power of legislation, would not be a greater folly than to limit the productive power of machinery. At the same time, it would be less unjust, for the limitation cannot be placed on capital without making a direct attack on the rights of property."

Meet the Family

THE SNAPSHOTS are brought out, and the school reports and the letters and maybe a cutting from the local paper. Family pride? Well, why not? Most of us are tolerant and can "take it". *This* story, too, is a family story. Does it matter that the members of this family are not children but companies? We confidently claim a little of your tolerance for our parental pride. For consider:

Associated Electrical Industries — A.E.I. to family friends — is the parent concern of many famous companies including those listed below. Their 30 British factories operate in 20 towns and employ 53,000 people. Yearly output reaches £50m. in money — reaches also the highest standard of quality, in a 100,000 kW. Turbo-Alternator or in a flex for your bedside lamp. Cause for family pride, don't you think? And this family does not live only in the present, nor dwell complacently on the achievements of the past 50 years, but also, as a prudent family should, plans and puts away for the future.

That is why it maintains its great Apprenticeship scheme; that is why it devotes £1,000,000 every year to research.

WHAT does it ADD UP TO?

Output per year	**£50,000,000**
Exports per year	**£15,000,000**
Floor space (sq. ft.)	**10,000,000**
Number of employees	**53,000**
Apprentices (present)	**2,900**
Past apprentices	**15,800**

It all adds up to **AEI**

Associated Electrical Industries

MEET THE FAMILY

The British Thomson-Houston Co. Ltd.
Metropolitan-Vickers Electrical Co. Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.
International Refrigerator Co. Ltd.
Newton Victor Ltd.
Premier Electric Heaters Ltd.

Letters to the Editor

DPs and Point Four

SIR,—The report of the International Bank is certainly correct, when stressing that "the main obstacle to the development of under-developed countries was not the lack of external capital but the lack of technical experts and of good administrators."

However, it is generally known that there is a large number of technical experts and good administrators among the refugees, lingering in DP camps in western Europe. Even those of them who finally get admission into one of the free countries for work are mostly directed to employments below their training. While everybody must understand that refugees, whatever their qualifications, cannot displace citizens of the countries giving asylum from attractive situations—there should be given to the refugees every opportunity to emigrate to such territories, where their knowledge and experience is required for "implementing Point IV."

It would be extremely regrettable if the Fuchs case aroused an understandable but exaggerated ill-feeling and distrust towards refugees in general. After all, history recorded great many instances when victims of persecution forced to leave their old homes became most useful citizens of their new countries.—Yours faithfully,

Hever, Kent GEORGE A. FLORIS

Danger in the Home

SIR,—In your issue of August 6, 1949, you called attention to the heavy loss which results every year from burning and scalding accidents in the home. You also called attention to the "dangers inherent in the growing use of virtually unguarded electric and gas fires, and the reluctance of the manufacturers to do anything about it."

In this connection it is disappointing to find that at this year's Ideal Home Exhibition, although there are a few more safe fires than last year, there is again a preponderance of virtually unguarded fires. In particular, many of the fires shown by the Gas Council have no guards of any sort.

More than three years ago the Ministry of Health asked the British Standards Institution to consider, with the manufacturers of gas and electric fires, what safety regulations were required—and if so what the specifications should be. I am told that their deliberations are still continuing but that at some time in the future specifications of safety are likely to be agreed upon. I am also told, however, that when that does happen and the more reputable manufacturers take the necessary steps to comply with these safety specifications, other manufacturers (and usually those making the less expensive fires) may fail to do so.

Surely in these circumstances there is a strong case for legislation which will prevent the sale of dangerous fires—just as we prevent the unrestricted sale of poisonous drugs and of firearms. On a recent visit to Sweden I found that in that country—where the death rate from burns is less than half what it is in England—no electric fire may be sold without a mark indicating that it complies with the officially recognised safety regulations. I believe that the same applies in Denmark. I do not suggest that our own manufacturers are lacking in humanity or concern for children, but I do suggest that they lack imagination; and short of seeing for themselves, as I have done, many children and old people grievously burned by the chance contact of their clothing with these fires, they are not stirred to take action.—Yours faithfully,

LEONARD COLEBROOK

Late Director, *Medical Research Council Burns Unit, Birmingham Accident Hospital*

Health Service Payments

SIR,—Your statement that "even the chemists have earned £35.3 million, or about 75 per cent, of the general practitioners' earnings" for providing pharmaceutical services under the National Health Service Acts is based on a false premise. More than 50 per cent of the total of £35.3 million represents the *net* cost of the drugs and medicines supplied and clearly does not form part of the chemists' earnings. The actual percentage will not be known for many months because pricing of the prescriptions is so seriously in arrear; prescriptions have not yet been priced, still less paid for in full, for months subsequent to July, 1949.

Out of the margin between costs of materials supplied and the total payments to chemists, establishment charges, wages and salaries and all other overhead expenses incurred in providing pharmaceutical services have to be met. A valid comparison of chemists' earnings and those of general practitioners from the National Health Services could only be drawn by taking these matters into account.—Yours faithfully,

H. NOBLE,
The National Pharmaceutical Union Secretary

SIR,—It is surprising to find *The Economist* perpetuating the delusion that the earnings of doctors, dentists and chemists can be intelligently compared by stating the lump sums allotted to them in the health service. Yet this is surely the inference to be drawn from your statement that "the general practitioners . . . are valued at £47.1 million . . . compared with the £48.6 million given to the dentists" and that "the chemists have earned £35.3 million, or about 75 per cent of the general practitioners' earnings"

The expense ratio in the GP's practice may not be negligible, but it is vastly below the dentist's, which may be 55 per cent or more, so that the net earnings of the dentists amount to nearer £20 million than £48.6 million. Both dentists and chemists have to pay out heavily for skilled services and costly materials, and this should be taken into account before any comparison is made.—Yours faithfully,

55 Hampstead High St., N.W.3 W. NORMAN

[It was not intended to make a comparison of the net earnings of practitioners in the health service, but to show how much of the cost of the service is accounted for by each group. A comparison of net earnings would have to take into account among many other things, the doctor's total responsibility for his patients for 24 hours a day, and the fact that there are about 20,000 doctors to share £47 million and 10,500 dentists to share £48 million.—EDITOR.]

Film Finance

SIR,—No one wishes to decry the National Film Finance Corporation for any support which it gives to the production of films of the quality of "Morning Departure." Nevertheless, in the comment in your issue of March 4th, you omit one vital fact.

For "Morning Departure" a 75 per cent distribution guarantee was given by General Film Distributors Limited, a company within this group. This guarantee means that if at the expiration of twelve months from the date of general release of the film in the United Kingdom or fifteen months from the date of delivery of the film, whichever is the earlier, the amount received by the producers is less than 75 per cent of the certified cost of the negative the difference is paid by General Film Distributors to the producers. To say, therefore, that "The project got no support from the banks and the Corporation put up all the funds for the production except those which the producer, Mr Jay Lewis, provided himself" is unfair to a good many people who, believing in the picture, did everything possible to help forward its production.

Without such a guarantee the film would not have been made.
—Yours faithfully, SYDNEY WYNNE
J. Arthur Rank Organisation Ltd., 38 South Street, W.1

[It is true that a distributor's guarantee is indispensable. Presumably, also, a supply of British films is also indispensable to fill the screens and meet the quota obligations of the cinema circuits with which General Film Distributors is associated. The giving of this guarantee was no doubt part of the normal business of the distributing firm, and no doubt it was useful to both parties. But it does not affect the accuracy of our statement as to who put up the money.—EDITOR.]

Meat Surcharge Dispute

SIR,—I have read your article on this subject which appeared in your issue of February 4th with deep interest.

The Ministry of Food now only permit the net return of 6 per cent to retail butchers, and as more than 50 per cent of butchers' shops have a trade of £80 or less per week, this means that each of such shopkeepers only earns up to £4 16s. per week to cover the wage of the working proprietor, interest on capital, and a return for the heavy responsibilities he undertakes as a distributor of meat, etc. This meagre return is below the respective minimum managers' rates for a similar trade, and below the rates paid to unskilled workers in other industries. The gravity of the position is thus apparent.

The Ministry of Food have always been keen to quote astronomical figures involving millions of pounds which have a tendency to create a delusive impression in the minds of the public. For the purpose of placing such figures in a clearer perspective, it is of interest to understand that an amount of £1,000,000 per annum represents an actual return of only 8s. 6d. per shop per week.

Furthermore, when the result of the 1949 costings became known the Federation perceived, and the Ministry duly admitted, that the Ministry had erred in their original estimation of the aggregate net earnings of the trade by an amount of £1,000,000 per annum owing to an over-calculation on their part of 12½ per cent. If an error of that magnitude could occur in one case, it is possible that similar errors may have occurred in relation to the calculations and conclusions reached by the Ministry from the 1949 costings, as to the aggregate net earnings on a 1s. 6d. ration.

In this connection it should be understood that the Ministry have estimated that the same percentage of gross profit will be earned on a 1s. 6d. ration as was earned on a 1s. 1d. ration (the period covered by the 1949 costings), but they have omitted to take account of:

(1) the gradually increasing consumer resistance;
(2) the attendant depreciation in the gross profit percentage as supplies increase; and
(3) they have made no additional allowance for the extra expenses incurred consequent upon the increase of 5d. in the ration since the costings investigation.

Moreover, although wages generally have increased by 82 per cent since 1938 and the cost of living by at least 78 per cent, the Minister has ordered that the aggregate net earnings of the trade shall be pegged on the present basis at a figure which is only 47 per cent above the estimated earnings in 1938. When a dispute over wages arises in an industry, the parties concerned are able to have the matter adjudicated by an independent tribunal, which is in accordance with democratic procedure. We trust, therefore, as the butcher has no such right of appeal, that the new Minister will reconsider the decision to remain the sole judge of a dispute to which he is a party.—Yours faithfully,
A. J. JACKSON.
General Secretary
The National Federation of Meat Traders' Associations

Books and Publications

Droit Administratif in Britain

"Law and the Executive in Britain." By Bernard Schwartz. New York and Cambridge University Presses. 388 pages. 45s.

"The Planned State and the Rule of Law." By W. Friedmann. Melbourne University Press. 32 pages. 2s. 6d.

MR SCHWARTZ'S book is a comparative study, written by an American for Americans, and designed to inform them of developments in British administrative law since the appearance of the Donoughmore Committee's Report on Ministers' Powers in 1932. It gives a fair and well-balanced picture of these developments and is up to date in its information: the Statutory Instruments Act is examined, the work of the Scrutiny Committee in the last Parliament briefly reported on and a fair sample of recent cases is cited, including *Franklin v. Minister of Town and Country Planning*.

Mr Schwartz starts out from "the rule of law," and it is his professed object to safeguard that principle while at the same time "adjusting" it so that it becomes compatible with the vast administrative activity of the modern state. He is not very critical in his statement of the principle. Dicey he knows has been much blown on, but he is not very clear what should be put in his place. He contents himself with two points. One, that the rule of law "presupposes that there are certain legal principles about the State. These are what we usually comprehend by the expression 'individual rights of the person'": these must be safeguarded against the encroachments of arbitrary power. Two, the rule of law requires "some separation of governmental power in a state," though not necessarily the "Montesquieuian trichotomy." These statements may contain important truths—how important and how true, however, we have no means of knowing unless the meaning attached to them by the author is fully explained and defended. This Mr Schwartz does not do, nor probably is he the man to do it, if his fondness for loose expressions like "the administrative process" is anything to go by. It is, nevertheless, a fundamental weakness in a book wholly devoted to judicial review if the hypothesis on which the necessity for review is grounded is given no more substantial treatment than a few rhetorical observations on the Social Service State and the opposition of Law and Power.

Granted the hypothesis, that the prime method of satisfying the rule of law is adequate judicial review, the rest of the book provides a very serviceable analysis of the various forms of judicial control of the executive and of the scope of review in each instance, and there is a chapter also on legislative checks on delegated legislation. Much of the ground covered is familiar to English readers. What are helpful and very welcome are the comparisons with American procedure and in particular in the sections on administrative justice, the references to America's Administrative Procedure Act of 1948. This Federal Act is, of course, a solution for the problems of administrative justice under a very different constitutional system from that of Great Britain. Yet there can be little doubt that something like it is required in this country. In its provisions enjoining full disclosure of the reports used in administrative inquiries, in its requirement of reasoned decisions in all such inquiries, as well as in its careful building-up of the judicial position of the officer conducting an inquiry it constitutes an important advance on the present state of affairs in Britain.

In this opinion Professor Friedmann, in his able pamphlet, concurs. Like Mr Schwartz he is concerned to adapt the rule of law to the conception of the state as engaged in large-scale administration. He looks at the rule of law more closely than does Mr Schwartz, but it may be doubted whether, despite his considerable expertise in this field of general legal theory, he really leaves us much clearer.

Of the liberal conception of the rule of law [he writes] there remain only two principles: the safeguarding of protected individual rights by impartial judicial authority . . . and the principle of equality before the law of those who engage in comparable legal transactions and enterprises.

These fragments of Dicey might be allowed to pass if they had not been preceded by the now common-form refutation of Dicey's main positions—as, for example:

The second great fallacy was Dicey's half-hearted attempt to compromise between the supremacy of law-making by Parliament as it prevails in the United Kingdom, and the supremacy of fixed principles of law which is possible only under a written constitution which restricts the sovereignty of Parliament.

Does Professor Friedmann propose to dispense with the principle of the legislative supremacy of Parliament? Or are his two principles, salvaged from the liberal conception, not "fixed principles of law"? Dicey's "half-hearted attempt" is not a fallacy. It may be a mistake. If so, it seems to be one Professor Friedmann is determined to repeat. There is no doubt that the Rule of Law badly needs restatement (and Professor Friedmann is very well equipped to do it), but it will need more careful thought than this. It remains to say that the essay is full of the most suggestive practical recommendations, many of which will, however, have to be rewritten as the lecture was clearly delivered before the passage of the Crown Proceedings Act of 1947.

Russia's Air Strength

"The Soviet Air Force." By Asher Lee. Duckworth. 207 pages. Illustrated. 8s. 6d.

RUSSIA'S air strength has always been an enigma. Even the war with Germany did little to lift the curtain. For several years, between 1941 and 1943, the Luftwaffe dominated the Red Air Force with much smaller numbers of aircraft, in spite of the fact that thousands of British and American aircraft were supplied to the east. Because the full strength of the Luftwaffe was never opposed to the Red Air Force, no practical measure of Russian progress in aviation emerged from the war. But one thing was clear—the Russian conception of air power was in the tactical and close support rôle and not as an independent strategic arm. Since the war little factual evidence has emerged from behind the iron curtain to shed light on the progress of Russian air strength.

Nor does Mr Lee's book do much to clarify the picture. With painstaking thoroughness he has compiled a record of such facts as could be gained during the war. His factual evidence virtually ceases at 1945. The past four years form the basis of much supposition on the part of the author. He appears to have fallen into the trap—always inviting to the unwary—of dressing up undocumented guesses in the form of positive assertions. Such statements as—"It can be taken with certainty that the Soviet are producing not less than 7,500 single and twin-jet aircraft a year—a total of at least 10,000 single and twin-jet aircraft a year should be reached soon," and, of the IL 12 transport aeroplane, "an annual production target of about 1,000 planes of this type probably represents the current figure"—throw doubt about the veracity and judgment embodied in many other positive but unsupported statements.

Nor does Mr Lee appear to be well-informed on later aircraft developments. For instance, there is no mention of the MIG9 twin-jet fighter, which has been in squadron service now for a couple of years, nor of a later swept-wing jet design, while the Russian-built copy of the American B.29 (the TU-4) is erroneously designated the TU-70 (which is a transport aeroplane). On the other hand, the TU-2 (TY-2) medium attack bomber, mainstay of support squadrons, is dismissed with one brief mention.

These criticisms do not detract from the merit of Mr Lee's rather pedestrian historical account of the build-up of the Soviet Air Force. It is a useful compendium of the facts as known up to 1945 and a valuable analysis of the Red Air Force's part in the recent war. The author is less strong on the technical side.

Mr Lee's final summing up of Soviet Air strength appears sound. He says:—

Its strength lies in . . . . the air-mindedness of the Government and of the people. . . . The Soviet Air Force has acquired a tradition and a reputation enhanced both by its easy victories and its heroic efforts of World War Two. Its weaknesses are a lack of reserves and depth, inexperience in operating modern weapons and equipment, particularly radar. It is likely to deteriorate quickly under the pressure of modern large-scale air operations, particularly in strategic attack or strategic defence. . . . Its hitting power is tactical in every sense of the word. In Moscow they know that if the Soviet Air Force is rough, it is ready.

Presidential Papers

"The Roosevelt Letters, Volume II. 1905-1928." Edited by Elliott Roosevelt. Harrap. 528 pages. 21s.

THE Franklin D. Roosevelt Library at Hyde Park, New York containing all the late President's personal letters and papers, is being opened to the public on March 17th. President Roosevelt broke the long tradition that presidential papers should be left to the Library of Congress and in his will directed that they should be preserved in his old family home, now a museum. There, they have been carefully sorted under the general supervision of Judge Samuel Rosenman and Miss Grace Tully, two close associates of the President. About one-sixth of the documents have been withheld for the present on the grounds that they contain state secrets, or that they would embarrass people still alive. The collection will be a gold mine for historians of the nineteen-thirties and of the last war, even though the work of indexing the papers according to subject will take many years to complete.

Meanwhile, however, publication of the Roosevelt public papers, edited by Judge Rosenman, has just been completed, and the second volume of Mr Roosevelt's private correspondence, edited by his son Elliott, has also now appeared. It covers the years from his marriage to his election as Governor of New York State in 1928, reserving to the third and last volume the whole period of the Presidency and the war. These are essentially family letters, containing few discussions of ideas or of people. With the help of the editor's notes, however, a very clear impression is gained of the society in which the Roosevelts moved. This is the period of his early zestful fights as a Senator in the New York State Assembly and of the responsi-

and those who come after?

bilities and interest of the first years of federal office, as Assistant Secretary of the Navy. Then came the great blow of infantile paralysis; the editor stresses that this did not fundamentally alter his father's character, but the illness and the long struggle back to an active public life do seem to have given Mr Roosevelt an appreciation of suffering and of failure which could hardly have been acquired through the triumphant progress of his early years. The letters also reveal an enormous interest in a great variety of subjects and of people, and a directness of purpose and basic simplicity of character. These personal characteristics go far to explain why Mr Roosevelt's four presidential campaigns were all victorious.

Orthodox Socialism

"Socialist Economics." By G. D. H. Cole. Gollancz. 150 pages. 8s. 6d.

THIS is a pleasant, clear, coherent statement of What Every Young Socialist Should Know—and if every young Socialist did know it, the gain to public life would be considerable. Socialist and orthodox economics, Professor Cole points out, overlap considerably in spite of starting from different postulates (e.g., the latter assumes, as the former does not, the legitimacy of property rights; the former assumes, as the latter does not, the aim of social equality) and the nature of the overlap, the impossibility of having one's cake and eating it too, is precisely that which the Socialist rank and file finds it so distasteful to accept. The line of argument is fairly familiar; capitalism is immoral (morals are built into Professor Cole's economics; no "neutrality" for him) and capitalism, even run on the most enlightened Keynesian lines, will not work. (The demonstration of this argument is a little sketchy, but Professor Cole puts his finger on some genuine difficulties.) Given that both ethically and practically Socialism is desirable, its economic articulations are neatly anatomised and a working sketch-plan drawn up which would be quite convincing had one never observed planners in action—or, for that matter, trade unionists. An essential part of Professor Cole's structure is the abolition of free wage negotiation—there must be a national wage policy; and the apparatus of physical control which he implicitly envisages would make those of 1950 look like a pocket battery beside an atom-smasher. Neither of these features has much appeal for anyone valuing freedom; but even if, in deference to the peculiar Socialist definition of that word, this objection is set aside, there remains the massive fact that there are not enough first-rate administrators to work the machine and that any administration less than first-rate—in intelligence, objective public spirit, and ordinary horse-sense—would certainly wreck it. It is possible, however, that an adequate corps of administrators might be built up in the considerable time which is likely to elapse before Professor Cole succeeds in selling his national wages policy to the Trade Unions.

Pocket Editions

With shillings scarce, book-buyers are turning more and more to cheaper editions. The World's Classics and the Everyman series have long been famous, and nowadays modern works, such as the novels of E. M. Forster, Aldous Huxley, Evelyn Waugh, and Elizabeth Bowen can be obtained in attractive uniform editions at 7s. 6d. or less.

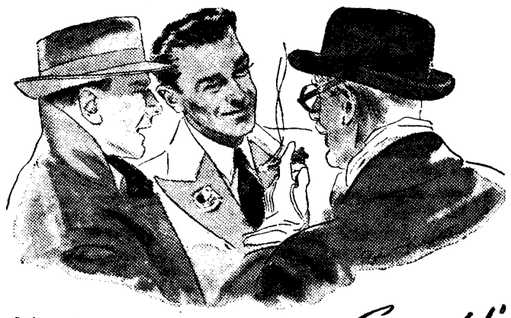
The War at Sea

"Sea Warfare, 1939-1945; A Short History." By Captain John Creswell, RN. Longmans Green. 344 pages. 25s.



CAPTAIN CRESWELL sets out in this book to "give an account of the war at sea in its true proportions," and in this aim he has succeeded admirably. Of the twenty-two chapters, thirteen are devoted to the war in the Atlantic and Mediterranean, eight to the Pacific and Indian Ocean campaigns, and an introductory chapter provides a summary of thought on naval strategy before 1939. The weakest parts of the book are those in which the author deals, in a very general way, with submarine warfare in the Atlantic; he justifies this general approach on the grounds that to give details of particular convoy battles by way of illustration would unduly disturb the balance of a short history. This may be so, but the price paid is a high one, for the excitement which Captain Creswell captures so well in his accounts of other actions—Matapan and the sinkings of the *Bismarck* and *Scharnhorst* are notable examples—is almost entirely lacking here. The author seems to have in mind the possibility of revising and strengthening these chapters: what exactly he is waiting for is not clear, but it is certainly to be hoped that he will not wait too long.

The chapters devoted to American naval and amphibious operations in the Pacific are in many ways the best in the book. Remarkably little is known in England about the war in the Pacific; yet no naval campaign has ever surpassed it for sustained and varied fighting. Captain Creswell gives an admirably clear and vivid (though necessarily simplified) account both of the strategy of the war as a whole and of the many individual actions of which it was made up. But here, as elsewhere, he scorns the help of those agreeable track charts and diagrams which should surely be an inseparable part of every book on naval affairs; even the maps—of which there are fourteen—are of a uniform dullness, and are not made to earn their full keep. It would be worth Captain Creswell's while to repair these omissions, for by doing so he would add even further to the value and interest of a book which only the most landlubberly of readers could fail to enjoy.

Australia Revisited

"Freedom and Planning in Australia." A. Campbell Garnett. The University of Wisconsin Press. 331 pages. $4.00

MR GARNETT'S object in this book is to explain his native Australia to his adopted America. The result is a refreshing interpretation of the Commonwealth, but the author does not avoid condescension. At times he damns the economic embryo with faint praise; at others he runs dangerously close to a false perspective of Australian social development. For instance the assertion that "most though not all the social experiments in Australia are either the work of the Labour Party or have been carried through with its aid" is an indefensible statement, no more justifiable than the modern claim of Socialists in Britain to be the sole champions of social progress. True, he garnered his material on a six months' visit at the height of Mr Chifley's power. But this bias is a flaw in the book. One must also demur at the description of the late E. G. Theodore as "the most far-sighted in Australian politics" during the 1931-33 depression. The great influence of economists such as Professor D. B. Copeland in guiding the economy out of that depression is understated, nor does the infusion of three chapters written by members of the three leading political parties restore the balance of the book.

"Another comfortable journey Steward!"

BUSINESS MEN with urgent appointments in Paris catch the Night Ferry at nine o'clock from Victoria, sleeping their way over the Channel without leaving the train and arriving in the heart of the French capital just after breakfast on the train. It is possible to return by the Golden Arrow at 12.20 p.m., arriving back in London in time for dinner. Another outward journey is by the Golden Arrow, which leaves Victoria at 9.30 a.m. and gets into Paris just before dinner. Either way offers courteous personal service, punctuality, regularity and an opportunity for rest and refreshment before getting down to business.

For tickets, reservations etc. apply Continental Enquiry Office, VICTORIA STATION, London, S.W.1, or principal Travel Agencies.

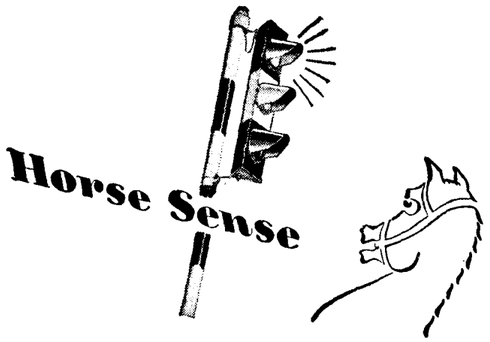
PICTURE POST

PICTURE POST stays right at the top of the list for many major firms with big advertising plans for 1950.

For example, over 100 national advertisers are represented in the issue dated 18th March, which is also the biggest issue for ten years.



Experienced business men know that PICTURE POST plays an essential part in planning successful campaigns. For PICTURE POST really goes to the country with a 1½ million all-round circulation. **It is read by one in every four men and women in Britain.**

PICTURE POST has unrivalled impact on the public. Consumers and retailers both have extra confidence in the quality and reliability of the goods and services advertised in its pages. In PICTURE POST a product shares the added prestige that goes with Britain's leading weekly picture magazine.

And firms who wish to bring their advertising into the nation's shop windows can follow through with the PICTURE POST Merchandising Service. This tested Service links up at point of sale—backing your advertisement with the most powerful sales force in the country.

BRITAIN'S BEST SELLER

Whether horses can learn to obey the coloured lights of traffic signals — whether, indeed, they can even distinguish one colour from another — may be debatable points.

There is no indecision however when it comes to assessing the value of A.T.M. Electro-matic vehicle-actuated signals for the control of street traffic and the safeguarding of pedestrians.

Electro-matic control delays nobody longer than is absolutely necessary for safety, and the flexibility of the system renders it capable of adaptation to every type of road layout and every form of traffic. Police not required for regulating traffic are released for duty elsewhere.

"Glad you like this sherry — it's South African

It's extremely good. I got some South African wine the other day . . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

AMERICAN SURVEY

Political Paradoxes

(From Our American Staff)

PARADOXES, both political and economic, are today the outstanding characteristics of the confused American scene. Passionate partisans of peace attack the Secretary of State because he is too mild with the Russians, and because he is not mild enough. President Truman begins to look like a statesman not because of what he does but because of what the Republicans say about it. The advocates of high agricultural prices, faced with the shame of rotting grain and potatoes dyed blue to keep them off the market, are now trying to lower the level of price supports for farm products. A Senator who set out to prove that the State Department is riddled with Communists directed his first fire at two persons who had distinguished themselves in the United Nations as defenders of the American position against Communist attack. The oldest railroad in the west is distributing to passengers a wistful little booklet entitled: "Why don't trains fly?"

Nor are such paradoxes confined to the American scene. In Britain, the continued emphasis of the Socialists on high consumption for all is apparently making everyone go hungry: at least this is what Americans deduce from the record set by a British productivity team composed of fourteen men and two women, all makers of paper boxes, who gained a net total of 220 pounds—an average of 13⅜ each—in six weeks of eating American food while touring American factories. And in Spain, Colonel Robert McCormick, who publishes Chicago's largest newspaper, arrived to visit General Franco with the flag of the Spanish Republic painted on his airplane.

These paradoxes cannot be dismissed as accidents or coincidences, if only because there are too many of them. Like the continual animosity of the American business man towards a regime which has given him the chance to make the highest profits in his history—or at least has not prevented him from so doing—or the present trend in employment figures which shows the national policy of full employment and high wages leading toward unemployment and no wages, they must be regarded as surface phenomena which mark the movement of changing currents deep in the national life.

*

What these currents are and where they may be leading is more disputable. In Washington, where the principal business is "the getting, holding and destroying of political power," the surface phenomena are so absorbing and, as in the recurrent spy hunts, so productive of drama that it is hard to plumb the slower movements underneath. But there are reasons to think that the present American confusion, while offering opportunities from which Communists may benefit, is not merely, as European visitors often think, the kind which Soviet sympathisers sow for their own advantage. On the contrary, it seems to develop out of the changes during the last three decades in the relationship between the United States and the rest of the world.

The first obvious source of these disturbances lies in the political situation. The Democratic Party has been in power eighteen years and, from the point of view of the Republicans (who do not forget that they won almost twenty-two million popular votes in 1948 to the Democrats' twenty-four million), this is at least fourteen years too long. The conditions under which the Democrats took, and kept, that power make the time seem even longer to the Republicans. Recovery from a major depression, the fighting of a major war, the search for a peace which is not yet a peace, are experiences of such intensity that they double the usual sense of living. For the same reason, Americans have been forced into a superficial unity for twice as long as they could be expected to endure it happily—which explains the strain and acrimony within parties, apparent even in that "gentleman's club," the United States Senate.

The natural irritability of the Republicans at repeated failures to gain power is heightened by the obsessive persistence of their animosity toward President Roosevelt, and all the people and ideas that served him. Perhaps for the very reason that he eluded so successfully their attempts to defeat him—first by the circumstance of the war which kept him in office, and second by the act of dying shortly after he had been re-elected for the fourth time—this animosity has become more bitter with the years. Much of the violence of feeling behind the present attempt to force Mr Acheson out of office, regardless of the cost to the country, arises out of his identification with Mr Roosevelt in this feud against the dead.

At the same time the complex of planned controls which the New Deal instituted, and on which Mr Truman and his Fair Deal lean so heavily, also shows and creates its share of strain. Believed in the beginning to be highly flexible, able to be put on quickly in an emergency and taken off when the emergency was over, these controls have taken on a political sanctity which, regardless of their economic effect, makes their removal dangerous to those who profit by their existence. Like the people who assail the Secretary of Defence for his economies in closing empty military hospitals which, when full, gave them business, the proponents of controls find them useful and will not be deprived of them. Yet the fact remains that the country has, during war and inflation, been governed within a framework invented to get it out of depression and deflation. It is not surprising if, in the minds of some people, the life jackets seem to have turned into strait jackets.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

All these political factors are intensified at appropriation time, especially when a President is weak and a Congress turbulent and divided; in addition there are economic factors which are no less strained. The country believes itself to be still enjoying its longest period of uninterrupted prosperity, but since the war that enjoyment has been made difficult by repeated warnings of the dire calamities which lie ahead. In 1945 it was crash and chaos just around the corner. In 1950 it is war with Russia, and extinction by means of atomic warfare. By contrast with such a fate the slow slipping of price, production and employment levels goes almost unnoticed. The state of perpetual unease in which many people live makes planning of any kind—personal, national or international—an unwarranted luxury.

*

Meanwhile, the nation is trying in the midst of this stress to find its place in the postwar world. Of all its obligations, to itself and to others, this is perhaps the most difficult for it to meet. The struggle between those citizens who long to return to a fictitious "normalcy" and those who fear such an illusion goes very deep. Only the most light-hearted optimist could believe that it would be resolved if the Republicans came to power. Even so small a question as the stabilising of what Lord Keynes in 1946 described as "America's capacity to accept goods and services from the rest of the world on a scale adequate to secure a reasonable equilibrium in her overall balance of payments" is unsettled. Lord Keynes put the basic problem in challenging terms:

> The United States is becoming a high-living, high-cost country past any previous experience. Unless their internal, as well as their external, economic life is to become paralysed by the Midas touch, they will discover ways of life which, compared with the ways of the less fortunate regions of the world must tend towards, and not away from, external equilibrium.

Thus far, the Marshall Plan and Point Four are the only attempts to do this that have been made. It is not yet certain how long the country will think it can afford them, or what would happen if it abandoned them.

Electricity—Public or Private?

[FROM A CORRESPONDENT IN COLORADO]

NOT long ago President Truman announced, in a press conference, that one of the Administration's objectives was a great national network of river projects to control floods, provide water for irrigation and stimulate economic development through an inexhaustible supply of cheap public electricity. This is a vision similar to that entertained by Mr Roosevelt, after the New Deal had pioneered the way with the Tennessee Valley Authority, but it was turned down by Congress in 1937. The private electricity companies, led by Wendell Willkie, lost their battle against TVA, but were able to block further government experiments. Today, thanks to the postwar shortage of electric power, the private companies, which are also expanding their facilities, have, for the most part, abandoned their objection to the production of cheap electricity from government multi-purpose projects on such great rivers as the Missouri. Congress has even authorised a steam plant for the TVA, thus relieving it of complete dependence upon water flow. The controversy now is over the question whether it shall be the private companies, or public bodies, that shall distribute the power.

It is Mr Truman's view that private transmission should prevail only if it is as cheap as public transmission.

At present, only 20 per cent of the electricity in the United States is generated by public bodies, and only half of this is from federal projects, though there are wide regional variations: New England enjoys no federal power, while in the North-west the big government dams supply half of the region's supplies. But the government's share is likely to rise rapidly. In the Missouri River Basin alone, the federal government contemplates spending over $9 billion in a development programme that includes more than 100 dams. The generators on these dams, when completed, will produce about 2,600,000 kilowatts, most of it from the big dams on the main stem of the river—two in Montana, one in North Dakota, and four in South Dakota. Two of the latter are on the stretch of river that forms the boundary between South Dakota and Nebraska.

There will be keen competition for this electricity; power in this region is comparatively scanty and costly. Applications already on file request more than twice the amount

THE MISSOURI BASIN

of electricity that will be available by 1954. This competition may force States now served mainly by private distributors to create public authorities for the purpose. For whether the dams are built by the US Army Engineers, or by the Bureau of Reclamation, the electricity generated will be marketed by the Bureau; and under the law, in selling the power Reclamation officials must give preference to publicly-owned agencies and co-operatives. Private distributors must be content with their leavings.

Along the Missouri, this is not an academic question. Nebraska is the first State in the country to be wholly served by public power, while in North Dakota, South Dakota and Montana, where most of the new electricity is to be generated, distribution is mainly in private hands. If the law is not altered, and these States do not authorise public distribution systems, Nebraska will have a prior claim on the enlarged supplies of electricity, particularly from neighbouring South Dakota. Private companies in South Dakota will not be able to obtain power from the big dams in the heart of their own State until Nebraska's claims are fully satisfied.

In an effort to restore harmony among the States of the Basin, federal authorities ruled that electricity might not be transmitted more than 150 miles from a dam, nor out of its home State, until all home requirements were satisfied. But this provision did not allay South Dakota's fears; the

State Legislature, which a year before, by one vote, refused to pass a Public Power Bill, this winter adopted a modified version of it. This Act permits the formation of public power authorities, known as public power districts. The private electricity companies succeeded in securing a provision that these might only be formed with the approval of the majority of the people in the district.

But once organised, these districts can proceed to take over private facilities, though they may not sell electricity more than 12 miles outside their own borders. While a much milder measure than the original Bill to create a State authority, this is a victory for public ownership. Now that South Dakota has acted to strengthen its claim on the electricity from the big new federal dams under construction, the question arises, will its neighbouring States begin to waver? Will Nebraska, as the first public power State, prove the nucleus of a public power region covering one-fifth of the nation?

*

In the Pacific North-west, public ownership of both the production and distribution of electricity has gone much further than it has in the Missouri Basin. Not only does about half the region's electricity supply come from the Bonneville and Grand Coulee dams, built by the New Deal to harness the Columbia River, but there is also a long tradition of public ownership in the North-west; Tacoma and Seattle in Washington have owned their own electricity systems for half a century. In 1931 laws were passed in Washington and Oregon authorising the formation of public utility districts (the so-called PUD's) empowered to buy and transmit power directly from the big federal dams on the Columbia. Their growth has been checked, until now, by the refusal of the region's private electricity companies—still largely under the control of eastern holding companies—to sell out to them, though private managers complain it is hard to compete against tax-free public facilities, and one company, at least, believes the struggle to be hopeless.

In recent months, however, one of the holding companies, required to divest itself of certain subsidiaries, agreed to a provision in the sale contract permitting the disposal of the facilities of one subsidiary to public bodies, though private utility executives made strenuous efforts to prevent this. So more of the North-west's remaining private facilities may be lost to public power. It may be a race between the people of the Missouri and Columbia Basins as to which is first served wholly by public electricity.

In the South-western States of Texas, Oklahoma and Arkansas, the distribution of electricity from the public dams is carried out by the region's private companies, which are paid, in power, for transmitting it over their lines to various public consumers, such as farmers' rural electrification associations. So far, they have successfully resisted the attempts of the South-western Power Administration to set up a public grid. Last spring Congress, which had hitherto long refused to authorise government transmission lines that would compete with private facilities, granted funds to the SPA for this purpose, but with the stipulation that the authorisation should first be used as a bargaining weapon to obtain better terms from the companies. Reports from the South-west suggest that an agreement is in sight, and some spokesmen for the private interests—though not the government officials concerned—have hailed this type of arrangement—the private transmission of further electricity—as a promising solution of the whole dispute between public and private power.

The MANCHESTER GUARDIAN

American Notes

Communist Associations

Senator McCarthy has entangled himself so thoroughly in the net which he spread for Mr Acheson that the Republicans have little hope of proving that the Secretary of State has neglected American interests by tolerating Communists in his Department. The charge has, therefore, been changed, and the Secretary is now being accused of unfitness for office and of interfering with justice, because he has recommended the deportation, rather than the imprisonment, of Mr Gubitchev, the Russian engineer on the staff of the United Nations who has been found guilty of conspiracy and attempted espionage. The State Department does not accept the Soviet view that Mr Gubitchev is entitled to diplomatic immunity, but it is prepared to make this concession to it for the sake of Americans working in eastern Europe who might be penalised if Mr Gubitchev were made to serve his fifteen-year sentence.

The statute of limitations and other legal loopholes saved Mr Alger Hiss from being tried on charges similar to those on which Mr Gubitchev and his associate, Miss Judith Coplon, of the Department of Justice, were convicted. The House has now passed a law closing these loopholes and the Senate Judiciary Committee has also dealt with them in its Bill for the control of Communism, which will make it a crime for any federal employee to transmit secret information to a foreign agent or to a member of a Communist organisation. This is the main change in a Bill otherwise very similar to the Mundt-Nixon Bill on which the last Congress failed to complete action. Heavy penalties are provided for conspiring to set up a Communist dictatorship in the United States, and Communist and Communist-front organisations would be required to register themselves, their members and their members' aliases. Critics of the Bill believe that it is so vague that thousands of innocent citizens would find themselves liable to persecution, if not prosecution. Under it "joiners" of organisations that later turned out to be dominated by Communists would be tarred with the brush of "guilt by association" that Mr McCarthy has been waving with such abandon as to make it seem ridiculous.

But the brush is still able to stain the reputations of the scientists and students who will be spattered by it if the House of Representatives has its way. It has approved an amendment to the Bill establishing a National Science Foundation preventing anyone who has ever belonged to an organisation which has at any time been declared subversive from being employed, or awarded a scholarship, by the Foundation. Since it is intended to foster "pure" rather than military research and since the Bill already contains adequate security provisions, this amendment, more stringent even than the loyalty regulations governing the Atomic Energy Commission, seems to go too far. Another amendment, requiring the Federal Bureau of Investigation also to clear any foreigner associated with the Foundation, was the direct and inevitable outcome of the Fuchs case. The case's most immediate result, however, was the postponement of a new atomic agreement between Britain, Canada and the United States until security arrangements have been reviewed and until the shock of Dr Fuchs's treachery is less fresh in Congressional minds.

Hoffman's Carrot, Connally's Stick

The Senate Foreign Relations Committee is expected this week to approve Mr Hoffman's request for $2.9 billion for the third year of Marshall aid, without, however, prejudicing the right of any Senator to vote later for a lower appropriation. How much the economisers hope to reduce the budget deficit by cutting funds for European co-operation may be known sooner than usual this year, for all appropriations are being dealt with in a single omnibus Bill which, it is believed, on rather slender evidence, may be easier to prune—and harder for the President to hold up—than a series of money Bills.

The Foreign Relations Committee has already approved the allocation of $600 million of ECA's requested $2.9 billion to a European Payments Union to encourage the liberalisation of trade and payments policies. Mr Hoffman has made it clear that whatever Britain's special difficulties—and these are not overlooked—Britain will have to join it or forgo the $150 million to be impounded out of a tentative aid allocation of $687 million. Mr Hoffman is a believer in the carrot, but some of his Congressional questioners have shown a preference for the stick. A number believe all Marshall aid should be contingent upon Europe's economic integration; but Senator Connally, the shepherd of all foreign aid legislation, as well as the spokesman for Texan oil interests, has thought better of his proposal that Britain should get no more Marshall dollars until it abandons discrimination against American enterprise. To placate the oil companies, ECA has announced a suspension of further financing of British oil refineries, until the "hoped-for successful" outcome of the present negotiations; Mr Blaisdell, of the Commerce Department, testified that in these talks the United States was insisting that British companies with dollar costs share the reductions in dollar-oil purchases. These reductions are widely suspected of being designed not only to save dollars, but to obtain commercial advantages at American expense.

*

Senator Lodge, on the other hand, whose Massachusetts constituents are feeling the pinch of foreign competition, argues that if Britain bought only sterling oil, its dollar gap would be halved, thus relieving much of the pressure to expand exports to the United States. This left Senator Connally gasping, and prompted Mr Hoffman to point out that British oil production is insufficient to meet British needs and sales abroad. Mr Hoffman, evangelist though he is for increasing imports from Europe, does not believe that the sacrifices this will exact from American producers should be exaggerated. He puts the most optimistic estimate of European *competitive* exports into the American market by 1953 at under $1.3 billion—less than 1 per cent of the total American production of goods of $140 billion and urges that it is unflattering to American enterprise to suggest that this minor element of competition could not be easily absorbed. In his view, aid to Americans displaced by foreign competition should take the form of extended unemployment insurance and employee retraining, rather than subsidies to firms.

* * *

Surpluses in the Saddle

Not even the spectacle of mountains of potatoes, bought by the Government at high prices, being sold back to farmers for fertiliser at less than the cost of the sacks containing them, has emboldened the Senate to tackle the problem of surpluses in an election year. The potato has become the symbol of the wastefulness of the present system of farm price supports, yet Senator Lucas's move to deprive this year's potato crop of Government support, unless marketing quotas are adopted, has been subjected to bipartisan defeat. Effective production curbs will not go into effect until next year—after the election.

The mounting cost of the farm programme has been brought home to Congress in the request for another $2 billion in borrowing authority for the Commodity Credit Corporation to support farm prices; this has been approved by the agriculture committees in both houses. Yet at the same time the Senate voted to soften the impact of acreage restrictions imposed on cotton, wheat, and peanut growers to avoid further surpluses. The House has already approved an extension of cotton acreage. The CCC at present has close on $4 billion invested in commodities, of which approximately one quarter is in wheat, and another quarter in cotton. Mr Brannan, the Secretary of Agriculture, estimates that by the end of next year the CCC, if Congress agrees to increase its resources to $6.7 billion, may have $6.3 billion of this tied up in surpluses.

Congress has so far refused to bring to a vote the rival scheme of Mr Brannan. But it seems unable or unwilling to halt the piling up of surpluses that, in time, and unless pests or bad harvests come to the rescue, seem almost certain to overload the present plan and open the way to alternative experiments. The present law provides for a gradual reduction in support prices in coming years, but an effort to advance the date of these reductions, and thus discourage overplanting, has also been defeated in the Senate.

*

The Brannan plan, as originally proposed, did not suggest major changes in the method of supporting the prices of storable commodities. Its novel and best known feature was the suggestion that perishable commodities, which account for 75 per cent of farmers' incomes, should be sold for what they could fetch, while the government sustained the farmer's income by direct payments. Most of the farm organisations opposed the Brannan plan root and branch, as a scheme to regiment the farmer which would also prove wildly extravagant. There are signs, however, that the individual farmer is turning a more receptive ear; farm income has dropped by nearly 25 per cent in the last two years and is likely to go on dropping this year, while public irritation with the CCC's growing hoards mounts. The Administration has always felt that the Brannan scheme's combination of income supports for farmers with low prices for consumers would prove a popular programme once the farmer came to understand it.

The original appeal of the Brannan plan was to producers of perishable products—meat, butter, eggs, potatoes, and so on—which deteriorate if stored for long under the present scheme. Mr Brannan has now hinted that though the plan, if approved by Congress, would first be applied to perishables, it could later be applied with profit to the basic storable commodities. To cotton growers, he holds out the hope that cotton might regain its lost markets, if its price were allowed to fall and the farmer reimbursed directly by the government. In wheat, there would no longer be the awkwardness of a two-price system, one for home consumption, one for the international trade. The Brannan plan would restrict subsidies to the family-sized farm, which may account for some of the opposition. But if it is not to be given a trial, perhaps on potatoes, Mr Brannan's opponents will have to think out some promising alternative before long.

Obstacle Race for DPs

A vote on the Bill liberalising the Displaced Persons Act is now within sight, since an agreement has been reached in the Senate to hold the final debate at the end of March, and to limit debate on each amendment. Reform of this discriminatory Act was one of Mr Truman's campaign promises in 1948 and, although the House approved a Bill revising it nine months ago, in the Senate the main race has still to be run. The present Senate Bill satisfies neither Senator McCarran, the chief obstacle in the way of a more generous measure, nor the majority of the members of the Judiciary sub-committee. They want a truly liberal measure and only voted for the Bill in the Committee in order to get it out on to the floor of the Senate and thus remove it from the jurisdiction of Senator McCarran, who is Chairman of the Committee.

Like the House Bill, the Senate version extends the date by which DPs must have been displaced, in order to qualify

A revolution in office dictation!

The Dictaphone TIME-MASTER

No discs, no cylinders — TIME-MASTER records on a tiny plastic belt!

NOW DICTAPHONE puts an entirely new type of dictating machine at your service—the TIME-MASTER with its plastic MEMOBELT. The Time-Master gives you perfect, crystal-clear recording. Yet the machine is the *smallest ever* and so easy to use, so dependable!

A real time saver! Odd moments between calls, interviews, conferences—they need never be wasted. With a Time-Master, you can *instantly* record letters or sudden thoughts without calling for your secretary.

Clear, uniform recording on the MEMOBELT. You can slip MEMOBELTS in and out in a second—tiny plastic belts, each taking 15 minutes perfect recording. And they can be sent by post in a standard envelope, up to ten at a time for a 2½d. stamp.

Only the Time-Master offers all this!
Streamlined machine, only 4½ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back spacing, rapid place finding. 4. Simple, automatic operation. 5. Mailable, filable, expendable MEMOBELTS, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd. (Dept. O), 107 Kingsway, London, W.C.2.

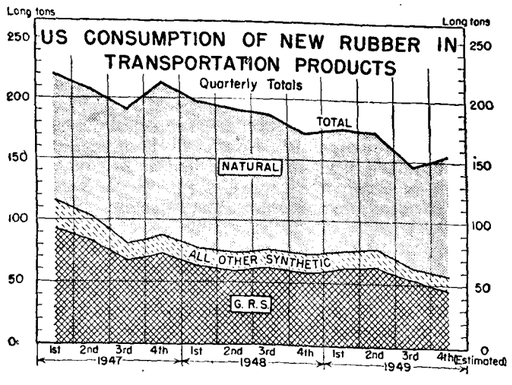
for admission, from December, 1945, to January, 1949. But though it raises the total number of DPs to be admitted from 205,000 to 320,000 and extends the time limit for admission to June, 1951, this is still lower than the figure of 339,000 approved by the House. The Senate total is even smaller than it appears, because the term "DP" is redefined to include German expellees, many of them former Nazis. Moreover, the Bill unblushingly retains the two provisions of the original measure, eliminated by the House, that give the present Act its discriminatory character. These are the requirements that 30 per cent of the entrants must be agricultural workers, and 40 per cent must come from lands *de facto* annexed. These provisions make it harder for Jews and Catholics to qualify, and easier for the Protestant Balts. At first the DP Commission disregarded these clauses, but as the prospect of a more generous Act receded with the long delays in the Senate, they have had to try to implement them. This has brought a sharp reduction in the number of DPs obtaining American visas.



Even this degree of "liberalisation" seems dangerous to Senator McCarran, who favours two additional amendments, one to disqualify any DP who has ever joined a Communist organisation or subscribed to Marxist doctrines, and another to shut off immigration completely whenever more than 2,000,000 American families are forced to live with their relations because of housing shortages, or if more than 4,000,000 Americans are unemployed. As there are now about 4,500,000 unemployed, all immigration would be shut off if this amendment were adopted. But a bipartisan group of 18 Senators is offering a substitute, patterned on the House Bill, and there is hope that by early April the Senate may have voted to vindicate the American tradition of equal opportunity and to discharge its obligations to the International Refugee Organisation. The United States has provided over 44 per cent of the funds of this body, but has taken only 10 per cent of the people who have been resettled under its auspices. The IRO hopes to end its work in March, 1951, and to hand over its responsibilities for DPs who are still unsettled to the German Government this summer. If Congress does not approve a new Bill, the general problem will be intensified, and the United States may well be asked to continue to subscribe to refugee funds.

Rubber Bounces Back

Mr Truman's offer to turn over to private enterprise the government's $700 million synthetic rubber industry, just as it has begun to lose money, has met with a stony reception from the Armed Services Committee of the House of Representatives and scarcely a more enthusiastic one from the interested industries—petroleum, chemicals, and rubber. Synthetic rubber, the miracle of war production that saved the United States when the Japanese overran the Far East, has been sheltered since the war by the rubber shortage and by the Rubber Act of 1948. The Act, which requires that 665,000 long tons capacity, about two-thirds of the total, be kept ready for an emergency, and that consumption of synthetic rubber be at least 222,000 tons a year, expires on June 30th. It directs the President to draw up a scheme for disposing of the plants—of which 17 are now in operation—to private concerns. But it cannot guarantee that Congress will accept the plan—or that private buyers will accept the terms on which the Government is willing to sell.

The government plants turned out 289,000 long tons of general purpose rubber (GR-S) last year, and 52,000 tons of butyl which, because of its air-retaining properties, is even better than natural rubber for inner tubes of tyres. Substantial consumption and production of both are necessary if technical improvements are to be encouraged and the industry kept ready to expand quickly in the event of war. Butyl presents no problem; more than twice as much was used last year as was required by law. But consumption of GR-S fell off sharply after the government, in September, reduced the amount that must be used in tyres, in order to enlarge the market for natural rubber, an important dollar earner for foreign countries. The proportion of GR-S to all new rubber used in transportation products fell from 36 per cent in the first three quarters of the year to 29 per cent in the fourth quarter. Prospective purchasers shied even more when the Reconstruction Finance Corporation announced recently that it expected losses on synthetic rubber production of $2 billion in 1949-50, and $6 billion in 1950-51, owing to increased use of natural rubber. A profit of $6 million was made in 1948-49. Only the two butyl plants, the cream of the government's synthetic assets, appeal powerfully to private buyers.

Mr Truman has proposed that the new legislation should give him the power to fix and vary the minimum required consumption of GR-S for as long as necessary; at first this would be fixed at one-quarter of the total of GR-S and natural rubber, but at not less than 200,000 tons a year. Mr Vinson, chairman of the House Armed Services Committee which conducted hearings on the Bill, cannot see that this is any improvement, from the defence point of view, over the present Act, while Congress is reluctant to give the President powers, for ten years, now exercised by itself. The rubber manufacturing industry would prefer a much shorter life for controls, and a reduced level of required consumption in order, it says, to test the staying power of synthetic rubber in a freer market, but perhaps also to give the manufacturers more freedom to use natural rubber when it is cheaper. The Administration insists this would involve an unwarranted gamble with the national security.

One reason for the industry's hostility to controls is that, if consumers are compelled by law to use GR-S, the government must interest itself both in prices and quality. Compulsion to sell GR-S might also discourage the private search for a better product. Another difficulty is that, although the government recognises that large amounts of capital are necessary to run the plants efficiently, it insists that their sale must not foster monopoly or vertical integration in the industry. This rules out many of the most likely buyers and, according to the critics, would prevent efficient, low-cost organisation and thus postpone, rather than accelerate, the day when synthetic rubber can survive on its own merits. The likelihood, consequently, is that Congress may refuse to do much more than extend the present Act and thus compel Mr Truman to continue to operate a nationalised industry. This is what the House Committee has recommended.

A SPECIAL OFFER OF

90,000 BANK-UNITS

at a maximum price of 22/6d. net per Unit

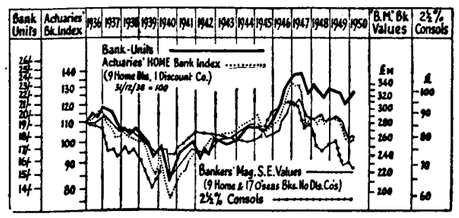
BANK-UNITS are a freely marketable investment in a Trust Fund spread over the shares of 45 Dominion, Colonial and Home banks and discount companies. The Trust Fund, 55% of which is invested overseas, is as under:

Canadian $ bank shares	30%
Australian banks	8%
Other Dominion, Colonial & Overseas banks	17%
Home banks & discount companies	40%
Trustee Securities	5%

Record Dividend.

The gross annual dividend on Bank-Units for 1949/50 is the highest paid since the Trust was formed, and, as shown in the 10-year Record of Distributions below, the sixth consecutive annual increase.

There should be a further increase for 1950/51 when the Trust's large $ holdings will have the benefit of devaluation for a full year.



Gross Distribution per 100 Units.

1940/1941	£3.9.11	1945/1946	£3.3.8
1941/1942	£3.7.11	1946/1947	£3.11.4
1942/1943	£3.3.8	1947/1948	£3.15.7
1943/1944	£3.2.8	1948/1949	£3.16.10
1944/1945	£3.3.0	1949/1950	£4.1.7

Managers' Investment Policy

Since 1936, the Managers have steadily invested in Dominion, Colonial and Overseas banks, particularly in **Canada**, where great natural wealth is combined with sound political economy and good management.

The success of this policy is shown in the chart below which compares Bank-Units with other indexes of investment.

The gross yield on Bank-Units, conservatively calculated on the above "all-in" cost price and allowing for the effect of devaluation for a full year, is approx. £3/10/5d. ½ subject to tax at *reduced* rate after allowing for D.I.T. relief. This yield may be increased by up to ½% according to the amount of the Unit-holder's statutory income for tax purposes, as explained in Bank-Units Report 28.

THE WORLD OVERSEAS

The Russians and Manchuria

(By a Correspondent)

AT the banquet given by the Soviet Government in Moscow to Mao Tse-tung and other representatives of China, after the signing of the Soviet-Chinese Alliance Treaty, it was notable that the vice-chairman of the Manchurian regional administration was given precedence by mention in the Soviet official report over the Chinese Ambassador to the Soviet Union. There is unlikely to have been any accident in this, for the Russians attach very great importance to matters of protocol. The remarkable honour done to a man who is not even the formal head of a provincial authority within China may be taken as a sign that the Russians intend to insist in the future, despite the creation of an all-China central government, on dealing with Manchuria as a semi-independent political entity.

The Soviet interest in Manchuria is so much greater than it is in China south of the Great Wall that it is natural for any Soviet government to consider Manchuria as a special area to be detached and kept as far as possible apart from it. On the other hand it has always been the aim of Chinese patriots to integrate Manchurian territory, overwhelmingly Chinese in population, within the structure of a unified Chinese state, so that, even if it retains a measure of internal autonomy, its relations with foreign powers may be brought strictly under the control of the central government. This was so neither in the period of Russian domination before the Russo-Japanese war of 1904, nor in the period after that war when Russia and Japan made a series of treaties recognising each other's spheres of influence and agreeing to maintain them by joint action, nor yet in the "war-lord" era of the twenties, when Chang Tso-lin, as virtually independent ruler of Manchuria, made agreements on his own authority with both Russia and Japan. It was the inclination of his son and successor Chang Hsueh-liang to submit himself to direction by the Kuomintang Government established in Nanking that caused Japan to evict him and detach Manchuria formally from China as the sovereign state of "Manchukuo." This Japanese creation disappeared with the collapse of its promoter in 1945; but the advantages which Japan had derived from it had not passed unobserved in Moscow, and Soviet policy has since been trying to bring about a real detachment of Manchuria under its own influence without the direct challenge to Chinese patriotism involved in openly setting up a separate state.

A Frontier on the Amur

The Soviet Union first obtained a special status for Manchuria by means of the concessions over Port Arthur, Dairen and the Manchurian railways agreed to by the United States and Britain at Yalta, and then extorted from the Chinese Nationalist government by the treaty of August, 1945. This treaty, though it restored to China less than full sovereignty over Manchuria, was made palatable to the Chinese Nationalists by the undertaking that they alone would be entitled to the transfer of authority in Manchuria by the commanders of the Soviet occupation forces. But Moscow was not prepared to have the Nationalists in Manchuria, even with the safeguards which the treaty granted, and a variety of tricks were employed to obstruct the entry of Nationalist troops and officials and to aid the local Chinese Communists; the Kuomintang Government also contributed to its own discomfiture by its carpet bagger methods of reoccupation of a territory which had been under foreign rule for fourteen years. The Nationalists were finally evicted by the Communist forces, but long before that a regional Manchurian Communist administration had been set up; it was the first of such Communist area governments in China to control large towns and it had become a powerful autonomous political unit by the time the central government of the Chinese People's Republic was set up last year in Peking.

The Russians have now undertaken in the new Soviet-Chinese Alliance Treaty to give back to China Port Arthur and the Manchurian railways by the end of 1952. This was politically necessary for Mao Tse-tung in order to avert the charge of subservience to a foreign power encroaching on Chinese territory, and in order to establish the credit of the Soviet Union as China's friend, without which it would be difficult to defend the alliance in China, even among Communists. But the renunciation involves for the Russians the risk of losing the grip on Manchuria which the Yalta agreement assured. The Kremlin has to contemplate two adverse possibilities: the first, that the Communist regime in China will prove to be unstable and will be overthrown in some fresh civil war; and the second, that the Communist leadership itself will in time develop Titoist tendencies. In either case a Manchuria fully under the control of a Chinese central government located south of the wall would be in danger of passing out of the Russian sphere of control and the Amur, with the huge salient which it makes northward into eastern Siberia, would become a real frontier.

Arsenal and Food Reserves

Strategically the Soviet interest in Manchuria has been obvious ever since it was decided in the nineties of the last century to build a railway by the direct route between Chita and Vladivostok through Harbin. The southward drive for access to the Yellow Sea has been less urgent, but it counts among Russia's historic quests for open-sea ports. The language which Stalin himself used in announcing the recovery of Port Arthur suggests that a real, as distinct from a nominal, withdrawal of Soviet power from that area is unthinkable. On economic grounds, too, Manchuria must be reckoned high among Russian priority interests—much higher than it was in Tsarist or early Soviet policy. With the building of a vast defence system in eastern Siberia, including the new bases in the extreme north-east towards Alaska, and the development of various supporting industries on the Amur and the Pacific coast, Eastern Siberia has become a food deficiency area. For climatic reasons it cannot have a flourishing agriculture and its mountainous terrain makes it difficult to obtain supplies in bulk from other parts of the Soviet Union.

It is, therefore, highly convenient for the Russians to feed eastern Siberia from the food surplus of Manchuria, and this is now the main Soviet economic stake there—in contrast to the Japanese concern with the country, which they valued rather as a supplier of minerals and as a mainland armament base. But in a normal national economy—at least on a basis of modern economic nationalism—China would use Manchurian foodstuffs to supply its own food deficiency areas. The Soviet effort to integrate the Manchurian economy with Siberia rather than with the rest of China can therefore be a permanent potential cause of conflict between Peking and Moscow.

The Russians now have till the end of 1952 to see how things turn out in China. If by the end of that time there are any signs either of collapse or of anti-Russian insubordination in the Chinese Communist regime, a Soviet "Manchukuo" can still be set up in Manchuria instead of fulfilling the renunciation clauses of the recent treaty. Meanwhile, the most can be made politically of the treaty to show how genuine and disinterested is Soviet friendship for Asiatic national movements which are not tainted by American dollars, and this will undoubtedly be a propaganda asset of great value for the Communists in south-east Asia and India. Some Chinese, however, may reflect that a promise to restore is not the same thing as actual restoration; and a few will remember that in 1902 Russia undertook to withdraw by specified dates forces then in occupation of Manchuria, but that the agreement reached was not kept.

•

Fourth Republican Politics in 1950—II

[FROM OUR PARIS CORRESPONDENT]

As regards electoral reform, the chief losers from a change in the present system would undoubtedly be the Communists. Thus, were some of the other parties—notably the MRP and Socialists—prepared to cut off their own noses in order to spite the Communists' faces, a reform could be voted by the present parliament that would diminish the Communist representation from some 180 to perhaps 40 or 50 deputies.

The actual system of voting (*scrutin de liste proportionel*) operates as follows. Each *circonscription* (normally a department) is allotted a certain number of deputies according to its population. Let us suppose that a *circonscription* has 5 seats and 200,000 voters: divide 200,000 by 5; which gives a quotient of 40,000. Suppose, then, the following poll:—

ACTUAL SYSTEM IN OPERATION SINCE 1946

	Votes	Proportion	Elected Members
Communists	80,000	= 2 x quotient	have 2 deputies
RPF	80,000	= 2 x quotient	have 2 deputies
MRP	40,000	= 1 x quotient	have 1 deputy
	200,000	= 5 x quotient	5 deputies

Suppose alternatively a more complicated distribution of votes among a greater number of parties:—

	Votes	Proportion	Elected Members First Round
Communists	70,000	= 1·75 x q.	1
RPF	50,000	= 1·25 x q.	1
MRP	40,000	= 1·00 x q.	1
Socialists	30,000	= 0·75 x q.	0
Radicals	10,000	= 0·25 x q.	0

	Second Round					Third Round	Total of Elected Members
	(*a*)	(*b*)	(*c*)	(*d*)	(*e*)	(*f*)	
Communists	2	35	1	3	13	0	2
RPF	2	25	0	2	25	0	1
MRP	2	20	0	2	20	0	1
Socialists	1	30	0	1	30	1	1
Radicals	1	10	0	1	10	0	0

The process illustrated in the above table is as follows: on the first round one deputy each is allotted to the Communists, RPF and MRP, since they have received the quotient (40,000) *plus*: the other two parties, having received less than the quotient, are given no deputies. Next (column (*a*)) the figure 1 is added to the number of deputies allotted on the first round to each party, giving the figures shown in the column. Then (column (*b*)) the votes received by each party are divided by the figures in column (*a*). The winning party receives (column (*c*)) an additional deputy. The same process is then repeated, giving the award in column (*f*) of another deputy, the fifth and last of those allotted to the *circonscription* as a whole. This elegant (but to some unsatisfactory) device is known as the *scrutin de liste proportionel à la plus forte moyenne*. Its tendency is clearly to favour parties with a heavy following in the *circonscription*, the system permitting them to win seats in proportion to their votes. In the case of the Communists the *scrutin proportionel* adds to their party's strength on account of the normal high percentage of (non-Communist) abstentions.

Coalitions Against Communists

There are several proposals for electoral reform, of which two carry the greatest weight, since the systems proposed have, at different times, already been in operation in France. First, *scrutin de liste majoritaire départemental*. This system works as follows:—If in a *département* a party obtains an *absolute* majority it receives all the seats allocated to the *département*. If, however, it does not, the seats are distributed on the principle of proportional representation. Secondly, a return to the system of 1936 (the last general election before the war) is proposed. This system (which is least unlike the British one) is called *scrutin uninominal d'arrondissement*.

Suppose an *arrondissement* (a district comparable to a British constituency) of 100,000 voters. This electorate has to vote for a single candidate—not, as under the proportional system, to choose a party and put its cross on a list composed by the party and containing as many names as there are seats to fill.

Suppose the following result:—

Communists	55,000
RPF	35,000
MRP	10,000
	100,000

In this event the Communist deputy, having the absolute majority, is elected without further ado. If, however, the voting goes, say,

Communist	40,000
RPF	40,000
MRP	20,000

there is in the *scrutin d'arrondissement* a second round of voting after a week's delay. But on the second round one of the candidates has the right to desist. In the present example either the RPF candidate or the MRP one would probably stand down in the hope of the Communist being defeated by a single opponent. Nowadays it is indeed this last system which the Communists least relish, since where they have no absolute majority and are nobody's second preference, the other parties would tend, on a second round, to coalesce against them. (Conversely, since the *scrutin d'arrondissement* is primarily a vote for an individual, it favours the local personality, perhaps of a relatively unimportant party, to pull off a coup against the giants.) Furthermore, the Communists equally dislike the *scrutin d'arrondissement* in areas where they *have* an absolute majority, since they can at best win there only one seat instead of many. Nor is this all. For the whole principle of the individual "popular" member tells against Communist party discipline, which favours control of the member not by his constituency but by the party *militants* in the great centres.

Since France has not evolved a modern parliamentary system, it is continually faced with the choice of authori-

tarianism or government by coalition. The *raison d'être* of the now crumbling Third Force was that it provided a second best for a maximum number of citizens. For the Right it was not as bad as the Left and vice versa. Now that national problems are becoming overwhelming and that it seems as if only a majority party of the right-centre stands a chance of holding power, it is interesting to hear the voices of Frenchmen raised in alarm at the impending unity which events may inexorably dictate. M. Claude Bourdet has written in *Combat* of the possibility of government by a majority party: "This is possible only in a truly democratic climate. In France the temperament of our fellow-countrymen, always divided in their opinions, but easily tyrannical when they are in power, would force us to adopt a regime of coalitions, even if there were no Communist Party and no RPF. . . ." M. Bourdet therefore pleads for an electoral scheme that would not disfavour the small parties. The more of them, the merrier. "A Parliament divided into smaller groups, thanks to a fairer proportional representation, would represent more exactly than the present Assembly the *nuances* of a country where intelligence is lively and opinions manifold." There is doubtless much to be said for a true and more varied representation of opinion and safeguards against tyranny. If France could live an eighteenth century existence—a conglomeration of beautiful provinces with Paris its cultural capital—nothing would be more stimulating than an Assembly of highly-coloured, razor-brained personalities. But what has this picture to do with the real world of 1950?

Sovietisation of the Baltic Peoples

[BY A CORRESPONDENT]

IT is now thirty-one years since Estonia, Latvia and Lithuania proclaimed their independence. Despite their small size these states attained in their twenty years of existence a remarkable measure of stable government, civic freedom and material prosperity, and they compared favourably with the other states which owed their creation to the settlement following the First World War. Now, however, after enduring two occupations and much fighting in the period 1939-1944, they have been firmly walled into the Soviet Union. All the changes which are as yet only beginning to be made in the satellites—besides some special local policies—have been fully developed in the Baltic, and the resulting picture deserves the attention of all countries which follow the Soviet model.

By far the most significant development has been the steady removal of the local populations and their replacement by people from other parts of the Soviet Union. Russian names are disproportionately numerous in the Communist hierarchy and the governments (this, incidentally, is true of all the Soviet republics, particularly the Central Asian ones); collective farms and their "presidents" often have Russian names; in the press and on the radio the Russian language occupies a place out of all proportion to the prewar Russian population of the area (6 per cent); a group of Volga fishermen has removed to the Baltic coast; the population of Tallinn is to be half a million (before the war it had 150,000 inhabitants and all Estonia had 1,100,000); over 80,000 Lithuanians have "voluntarily" removed to the Soviet Union; and "thousands" of Soviet specialists have arrived in Riga. All these indications are gleaned from Soviet sources; they are supported by ample direct evidence from refugees and returned Germans which attests that hundreds of thousands of Balts have been sent to the interior of the Soviet Union (especially to the Komi republic and to eastern Siberia). Besides these Soviet transfers, there were large-scale Nazi deportations and wartime casualties; there was a mass flight before the returning Soviet armies. The International Refugee Organisation counted 200,000 Baltic DPs in the western occupation zones in 1946; 30,000 Balts are still in Sweden; and many of those fleeing must have been stranded in Poland and eastern Germany. Clearly all these losses together have considerably reduced the 6,000,000 inhabitants of 1934.

Population transfers are not without precedent in Soviet history: the Volga Germans were sent to Siberia during the war, and thousands of non-Soviet nationals were deported from Caucasus to Kazakhistan last summer. If one considers how nearly Leningrad was lost in 1920 and in 1942 the policy has a certain logic from the Soviet viewpoint. Having taken the trouble to secure the Gulf of Finland by acquiring the Baltic states and the Finnish bases, why leave in a vital area a population which gave ample proof in the last war of its hostility to Russian domination?

"Bourgeois Nationalism" Persists

The educated classes and all that they stood for have been relentlessly crushed by the new regime, and the old civilisation has been replaced by the unvarying and lifeless cant which now passes for culture from the Oder to the Pacific.

Marxism (revised version) is the basic study of all university faculties; professors and students spend their time exhorting one another, exposing each other and passing resolutions against admiration of the west; Baltic history between the wars has become a tale of Anglo-American exploitation, impoverishment and fascism; and literature has become Staliniana (and, at that, mostly translated from the Russian). Particularly noteworthy has been the assault on the Catholic Church in Lithuania. Of fourteen Lithuanian bishops in 1939 only one is now left, and the numbers of priests have also been greatly reduced, as was evident from a Tass statement of December, 1946. The survival of the Baltic languages is threatened by an increasing use of Russian for teaching. The administrative divisions of all three countries have been altered, and in Estonia many local Communists, who welcomed the return of Soviet power in 1944, have now been disgraced and replaced by Soviet Communists.

It must not be thought that all these oppressions have been meekly accepted. In the forests guerrilla resistance against the Soviet occupiers began in 1944 and continues even now, despite energetic Soviet measures. Nor has the Soviet outlook been learnt overnight, and the Soviet press constantly finds occasion to complain of the "low ideological level," the "bourgeois nationalism" and the "objectivism"

of the Baltic intelligentsia. In the present "Lithuanian Republic" there are 26,000 Party members, including local Soviet administrators and members of the armed forces. The prewar population of the same area was 3,000,000.

War Against the Kulaks

In the economic field the main change in these predominantly agricultural countries has been the introduction of collective farming. It is noteworthy that the Sovietisers held their hand till 1948 and disclaimed any intention of imposing collectivisation. However, this was the immediate postwar period when the Soviet Union was less confidently assertive, and when popular fronts, allied control commissions and a free Czechoslovakia were tolerated in eastern Europe. But the delay was used to pave the way for collectivisation by a number of economic measures, such as the splitting up of the land into tiny farms, often too small to be worked independently. Finally, before the spring sowing of 1948, a collectivisation campaign was launched, and was accompanied by a wave of deportations. The same occurred in 1949. The deportations removed any family classed as "kulak"; for Soviet agricultural policy does not aim at assimilating the "kulaks" (who are, indeed, to be prevented from "penetrating" the kolkhozes), but to "liquidate them as a class." As a result of this ruthless campaign collectivisation was completed to the following extent by last November:

Estonia	70 per cent
Latvia	86 per cent
Lithuania	50 per cent

(It may be noted for comparison that in the western Ukraine, another new Soviet territory, agriculture is now 60 per cent collectivised). It will be seen that Lithuania, where resistance was particularly tough, is "progressing" slowly; but the latest reports tell of new collective farms being formed there; and it is to be expected that this year, or, at the latest, next, will see collectivisation completed in all areas.

Soviet statements insist that the collectivisation is "voluntary," but such allegations accord ill with the campaigns and pledges to complete it. Many indications of the true state of affairs have appeared in the Baltic press and on the Baltic radio. Such are the tales of "kulak" hostility to collectivisation, the innumerable infractions of the Kolkhoz statute and the downright threats against those who resist. There is no doubt that what has really gone on is a repetition on a smaller scale of the bloody struggles which accompanied collectivisation in Russia, with the difference that the Baltic peasants faced overwhelming odds, and were the more relentlessly and speedily crushed.

Industrial policy has been aimed at especially developing the industries important to "All-Union" economy. Thus the shale deposits at Kokhtla-Yarve in Estonia have been developed and now supply gas to Leningrad; and Riga makes electric trains and telephone equipment for Moscow. Light industries, food production and housing are secondary considerations and the living standard in the Baltic has been falling to the Soviet level.

From a strategic point of view the acquisition of the Baltic states is extremely valuable to the Soviet Union in two ways. It neatly rounds off the western frontier; it includes within the Soviet defences territory which is close to the big towns of European Russia and which, in the hands of independent or even satellite governments, would have been a constant anxiety; secondly, it solidly establishes Soviet naval power on the Baltic and provides a series of secondary bases as subsidiaries to Kronstadt. There is abundant evidence from refugees and returned Germans of the general militarisation of the area, and of the eviction of inhabitants from coastal regions. There is now a naval training centre at Riga, and a destroyer and seaplane base is under construction in the northern Estonian islands. The three-mile limit off the Soviet Baltic coast appears to have been arbitrarily extended to a twelve-mile limit, and on several occasions vessels transgressing this unpublished rule have been detained.

Ecosoc's Tenth Session

[BY A SPECIAL CORRESPONDENT]

THE tenth session of the Economic and Social Council has lately finished at Lake Success. That it took place with exemplary speed, and a saving in cost which corresponds to its saving in time, does not mean that it won public recognition for these virtues. Its meetings were unspectacular. Its agenda, though 41 items long, called for no decisions of prime importance. Its eleventh session, due in Geneva in the summer, is likely to deal with weightier matters. Nevertheless its members were diligent and have to their credit some paper work of real value. Of the forty-one topics they handled, perhaps ten were procedural, and fifteen could be shifted to other shoulders; but the remainder were squarely faced.

The major emphasis was on economic as contrasted with social matters. The Council had before it not only the experts' report on National and International Measures for Full Employment (discussed in *The Economist* of January 28th) but also the complex arrangements for technical assistance to underdeveloped countries and the problem of financing them.

The report on full employment represented the flowering of at least two decades of national concern and effort. Anyone who noted the conferences on postwar planning which were held in many countries while their governments were actively engaged in war observed the surprising frequency with which full employment was declared officially to be a primary postwar goal. Nations wanted it with passion; they became convinced that they could not get it by their own efforts alone; they instructed their delegates to seek the help of an

appropriate international body in discovering what international action might bring the attainment of the goal within reach. The matter came by natural selection to Ecosoc, which enlisted experts of the first rank for its consideration. Their report, handed to the Council at this session, had with it the comments of the Economic and Employment Commission. After earnest debate the Council approved the report and recommended that it be sent to the various governments for their study.

In a word, the process of national inquiry, international study, and the return of the best available advice to the nations seeking guidance had come full circle. The next move is up to the national governments.

Pool of World Knowledge

Another piece of work of the same nature was done when the Council handled the volumes of technical papers on primary resources presented to the delegates as the report of the United Nations Scientific Conference on Conservation and Utilisation of Resources held last summer. This also was a measure of achievement. Here also a complex of problems which preoccupied the world had been brought into focus. The results of this expert conference were unanimously approved by the Council and are to be forwarded to the various governments, which thus have before them the cream of the world's knowledge on such problems as the management of forests, fisheries and mineral reserves.

These activities represent the information-gathering efforts of an international agency on a high level. Traffic in problems is clearly an important function of an organisation of Ecosoc size and nature. But it must never become its whole job. There is some danger of this when so many of the problems that it handles are also the concern of the Specialised Agencies which—in the distant capitals in which they have been planted—are sometimes inclined to behave as if Ecosoc should do all the talking and leave the practical execution to them and their technicians. Painstaking—often exasperating—effort is called for if all poaching is to be avoided. But Ecosoc will never work to the best of its ability if its members rest content to be gatherers of information and a good inter-organisation shunting yard. Its chartered task of promoting "higher standards of living, full employment and conditions of economic and social progress and development" will require other inventions for the public good.

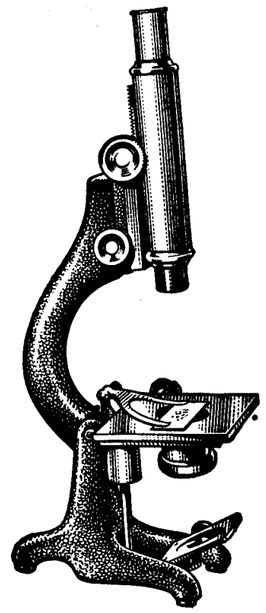
Technical Assistance

That its members know this was evident throughout the debates on technical assistance to underdeveloped areas. These were based on material drawn from many sources. The secretariat had prepared a third report on activities under way (including 68 fellowships awarded and now in operation), and a survey of the policies affecting private foreign investment. The delegates also had before them a report on Major Economic Changes in 1949 (to which the United States took exception) and the annual reports of the Bank and the Fund. Frankness was not lacking; it was perhaps a measure of the need felt for quick decisions. The Bank came in for unexpected attack by the delegates from India, Pakistan, and several South American countries, partly because they thought its interest rates too high, and partly because they found it a bank rather than a development agency dedicated to the promotion of good ideas. The consensus of opinion was that while its beginnings were sound and its conduct from a purely financial viewpoint beyond criticism it had fallen notably short in the compassion expected of it. Mr Eugene Black, who had come expecting to be praised for sound management, replied to this odd censure with more spirit than satisfaction.

The next step is to be a Conference called by the Technical Assistance Board, the new executive organ which held its organising meeting during the Ecosoc session. Financial arrangements will be the subject under discussion. That action on the part of the United States Congress is a vital part of the programme goes without saying. There is still a long way to go before international technical assistance is available on any scale.

One other piece of useful work deserves mention. It arose upon a discussion of Trade Union rights which should never have come before the Council in the first place but which, once there, has been given competent consideration and handed on to the proper specialised agency—in this case the International Labour Office. This principle was accepted last year in Geneva, but the Council at its tenth session accepted the plan which the ILO has since put forward and which includes the establishment of a fact finding and conciliatory commission for dealing with complaints lodged against members of the United Nations who are not members of the ILO. To critics who argue that here is merely another sample of Ecosoc eagerness to shift responsibilities on to other shoulders, the answer is plain: so long as Uno and its related agencies have not all the same memberships, some pushing of topics to and fro is inevitable. In this particular case the to-ing and fro-ing has produced a competent, workable result which imparts a definite sense that the gears of the international machine are properly meshing.

Better Tempo and Tempers



The absence of the Russians was little noticed except for its effect on the tone of debate and the pace of procedure. These threw into sudden relief the extent to which the Russian policy of attack and the western obsession with defence constitute a drain on human resources. Delegates, while talking more sparingly than usual, did so more frankly. The lack of need to defend themselves at every turn gave them a heady sense of freedom to make admissions; all told, better understanding prevailed between human beings. This is not to say that Russia was not missed. The tempo of meetings has for so long been geared to expansive Soviet oratory that delegates found themselves unable to adjust their time schedules. A morning session sometimes ended before 12 because debate on one matter had finished before preparations had been made for the next. Other committees held in the last two months have had the same experience. One delegate is said to have complained that the new speed of procedure left him insufficient time to read his documents—a task which, it must be deduced, he was accustomed to perform while the Russians were speaking. These incidents are a timely reminder to the Secretariat that it must make more effort to get background material circulated to delegates before they start from home. The present tendency is to hand them voluminous duplicated studies, done up in daunting bundles, only on the morning that a session starts. Once days are taken up with meetings and drafting committees there is no time for proper reflection upon such material. The Russians will have done future delegations a good turn if their absence serves to highlight this past deficiency.

IMPERIAL SMELTING

MICROSCOPES AND MOTOR TYRES NEED US

We make the Mazak zinc alloy that makes the die cast bodies of a good many microscopes—for Mazak die casting means accuracy, stability and strength produced at the highest possible speed.

We make the zinc oxide that helps to make car, lorry and bus tyres—for it helps to cure and reinforce the rubber and it reduces heat generation.

Those are two of the ways in which we help to make the world go round. In fact there's hardly anything you use to which we haven't somehow, at some point, contributed!

WE MAKE ZINC, ZINC ALLOY, ZINC PIGMENTS, ZINC DUST, HIGH PURITY ZINC AND CADMIUM SULPHIDES, CADMIUM, VANADIUM CATALYST, SULPHURIC ACID, METALLIC ARSENIC, FUNGICIDES AND FLUORIDES

IMPERIAL SMELTING CORPORATION (SALES) LIMITED 37 DOVER STREET LONDON W1

Because of its great success, the Exhibition has been

EXTENDED FOR TWO WEEKS

AN EXHIBITION OF

BAKELITE, WARERITE & VYBAK PLASTICS

IS BEING HELD AT THE EXHIBITION ROOMS OF THE BRITISH COLOUR COUNCIL, 13 PORTMAN SQ., W1, EXTENDED TO MARCH 30th

This display covers a very wide range of applications of plastics to industry. The central feature is the Bakelite Travelling Exhibition which was recently shown in Brussels, Oslo and Stockholm. A number of larger items which it was not possible to send overseas are also included.

The Bakelite Limited colour film 'The Nature of Plastics' will be shown at 11 a.m. and 3 p.m. daily

Admission by ticket only

Progress that makes you think

Making the most of our own fuel resources is vital to this country. Between the wars the steel industry reduced the amount of coal required to make a ton of finished steel from over 60 cwt. to 41 cwt.

Since the war progress has again continued. For 1948, the figure was 39½ cwt.; for 1949, 37 cwt. The 21 million tons of coal used for the record output last year was thus actually less than was used in 1948.

This is just one way in which the steel industry keeps down costs by the best use of raw materials and plant.

STEEL is serving you well

Murder by Hormones

'Methoxone' is the proprietary name given to the sodium salt of 4-chlor-2-methyl-phenoxyacetic acid. Its development at the Jealott's Hill Research Station of I.C.I. marked a revolution in the technique of weedkilling. 'Methoxone' represents the achievement of agricultural scientists probing the mysteries of plant growth. Growth in plants, as in animals, is controlled by minute secretions known as hormones. These are complex substances, but physiologists are now able to isolate them and to produce similar compounds artificially. In 1940 the Jealott's Hill biologists discovered that certain concentrations of plant hormones could hinder as well as assist growth. Some plants were more affected than others, and as many weeds of cornland were among these, it was at once seen that hormones held the possibility of selective weedkilling. The next step was to find a synthetic hormone with the maximum effect in retarding growth. Drs. W. G. Templeman and W. A. Sexton of I.C.I. undertook the necessary research. Of the many compounds which they produced and examined, 'Methoxone' gave greatest promise, and in nation-wide field trials, their laboratory results were amply confirmed. Today, 'Methoxone' preparations, under the trade name 'Agroxone', can be obtained by farmers everywhere. Thus the age-old problem of the wheat and the tares has been brought a noteworthy step nearer solution.

ICI

THE BUSINESS WORLD

Budget Prospects

THE budget season this year promises to be more than usually exciting—not because anything spectacular is to be expected in the content of the budget itself, but rather for the political pitfalls which it holds for a Government which presumably wants to stay in office and an Opposition which, for a time, probably wants to stay out of it. Tuesday's debate on the supplementary estimates gave some slight foretaste of the piquancy of this situation. The Government's problem is to produce a budget which equates to a nicety the political forces of the Opposition on the one hand and of the trade unions and its own left-wing on the other. On Tuesday the balance was tilting towards the former; with expenditure on the health service so obviously out of control, the Chancellor was forced on to the defensive—forced to make a show of taking steps to get control, and forced even to concede that the service must not be "extended" until countervailing economies have been secured. But the very fact that he has had to be thus conciliatory even before the budget must be adding greatly to the Government's anxieties in its search for a counterpoise to redress the balance. Presumably, it is trying to decide what are the smallest tax reliefs that might prevent the early liquidation of the wage-freeze; if so, the price is likely to rise with every apparent concession to the Opposition on the issue of expenditure.

The broad pattern of expenditure is sufficiently indicated by the figures given in these columns last week. The adjustments and clearances in the closing weeks of the year are generally so large that the final total for 1949-50 cannot be forecast with accuracy. The full estimate for "above-line" spending, including the supplementary estimates of nearly £170 million for the year as a whole, is £3,478 million, but underspendings on other votes should ensure that the actual bill falls appreciably short of this. Sir Stafford Cripps confirmed this week that there will be such a shortfall, but naturally did not say how large it will be. If the final total is guessed at £3,400 million (by March 11 the figure was £3,047 million, excluding £19 million for sinking fund), the increase over 1948-49 spendings would be about £250 million, but roughly £100 million of this increase would be due to the accounting accident that an advance payment made by the Ministry of Food to Argentina in 1948 was made at the very end of the financial year. This adjustment, though favourable to the comparison with 1948-49, makes the effective increase in expenditure since the lowest postwar year look the more ominous. On this basis, the expansion since 1947-48 would be appreciably more than £300 million, despite the fact that a roughly equivalent sum has been saved during these past two years by the running down of war terminal expenditure.

In the coming year, despite further savings of this kind and despite the "drive" for administrative economies and for the elimination of certain minor services, there will be a further increase. The estimates for Supply departments for 1950-51, as noted last week, total £2,917 million (compared with original estimates for 1949-50 of £2,781 million). Among Consolidated Fund services, the estimates for which are not disclosed until budget day, interest on the national debt has this year been running about £5,000,000 below 1948-49, while payments to Northern Ireland are exceeding estimate by a roughly similar sum. A continuing increase under this head might conceivably be offset by a reduction in the "fixed" debt charge (though this would imply a distinctly optimistic view of the trend of interest rates). If so, the Consolidated Fund services could be kept down to the £527 million estimated for 1949-50, and the aggregate "ordinary" expenditure for 1950-51 would thus be estimated at approximately £3,450 million. This would represent an increase of £50 million on the guessed figure for 1949-50 and one of about £365 million on the adjusted nadir figure of 1947-48—before making any allowance for the probability that 1950-51, despite the Chancellor's promises, will produce its own crop of supplementaries.

*

At first glance, the performance of revenue appears more heartening. The out-turn of the current year still cannot be estimated with precision. But the effects of past inflation have induced such buoyancy that a large "above-line" surplus is assured, despite the efforts of Mr Bevan. Indeed, even if expenditure were to absorb the whole available votes (including supplementaries) it is probable that the above-line surplus would just reach the £470 million (after sinking fund) for which the Chancellor budgeted last April. But, on the assumption that actual spending is kept down to £3,400 million (plus sinking fund), the realised surplus may surpass estimate by some £60-70 million—though it would fall short of the 1948-49 surplus by nearly £300 million. These estimates are based on the assumption that revenue in the closing weeks of the year will be roughly the same as that brought in during the similar period of last year (excluding a special credit last year of £55 million of "miscellaneous" revenue); on this basis, the 1949-50 revenue is guessed at just under £3,950 million, or some £170 million above estimate.

There are two principal reasons for this rather surprising prospect. The Chancellor budgeted last year for a decline in revenue by £229 million, and of this fall virtually £200 million was expected to arise from a large contraction in the previously very bloated categories of "terminal" revenue—sales of surplus war stores, receipts from trading services, and miscellaneous receipts—which in 1948-49 had contributed no less than

£308 million. In fact they have already surpassed estimate by £84 million. Secondly, it was assumed that the source of EPT had virtually dried up, and that in 1949-50 EPT and Profits Tax combined would contribute £39 million less than in 1948-49, or £240 million. They seem likely to contribute almost £300 million, (including some £35 million of EPT), thanks to the continuing expansion of profits, though at a slackening rate, in company-accounting years ending in 1948. These two groups of revenue—the one special and largely non-recurring and the other dominated by the influence of the early postwar inflation—thus account for some five-sixths of the total excess of revenue over estimates.

The traditional categories of revenue have all held up well, but none has shown any remarkable buoyancy. Income tax, from which an additional £122 million was envisaged, seems likely to yield only about £100 million more. It is noteworthy that three months ago the shortfall below estimate seemed likely to be rather larger than this. In other words, the buoyancy has not been in the currently-assessed portion of the tax but in the portion assessed in arrear and payable in large lumps in the last quarter of the financial year following the financial year in which the income was received. Surtax (which has a still greater lag) has, significantly, been much more buoyant; it was expected to rise by £7,000,000, and may actually rise by twice that sum. Death duties, for which a decline in "natural" yield by £12 million was expected to be nearly made good by the yield from last year's changes in rates, seems likely to show a net gain of at least £10 million. Stamps should just surpass estimate, but the residual payment of Special Contribution (the "once-for-all" levy) may fall short by £5,000,000. There will also be a shortfall in Customs, but this will be more than offset by a gain in Excise despite the presumed shortfall from beer (which, with spirits and wines, was expected to fall by £29 million after allowing for last year's reduction in the beer duty). Customs and Excise together should top the estimates by £20-25 million.

★

What, now, of the prospect for 1950-51? The analysis above shows that the main elements of buoyancy are losing their force, and in some items they must have totally exhausted themselves. The curve of profits (as recent articles in these columns have shown) flattened out in accounting years ending in the first half of 1949, and probably turned downwards thereafter. The Chancellor cannot count upon collecting another £300 million from Profits Tax and EPT in 1950-51; the former is likely to fall slightly and the latter steeply. Similarly, there can hardly be any further gain, and may be some fall, in surtax; and the same is likely to be true of death duties and stamps. The Special Contribution is virtually exhausted, and so may involve a loss of about £15 million. Given the pressures on family budgets, the yield from beer, purchase tax and perhaps even tobacco will be less buoyant. The special items of revenue—surplus stores, trading services and miscellaneous receipts—seem bound to fall steeply, perhaps by £100 million or more. Against these prospective losses, aggregating perhaps £150-£180 million, the only offsetting gain will come from income tax; and here, it seems, the main hope of gain comes from the incomes which are taxed in arrear. The national income rose further in 1949, but the rise was certainly less than in 1948; it would probably be optimistic to put the prospective gain in income tax at more than £50-£70 million or so. On that basis, the net decline in aggregate revenue, before taking account of the effects of the tax changes made last April, would be in the region of £100 million.

Those changes will involve a further loss of about £22 million, mainly in consequence of last year's doubling of the initial allowances for depreciation. This concession shows its first budgetary effect in the coming year, when the expected cost will be £40 million; in 1951-52 the cost is likely to rise by a further £35 million. In 1950-51, however, the burden will be offset to the extent of £9,000,000 by the effect of last year's revision in death duties and to the extent of some £13 million by the yield from last autumn's increase in the distributed profits tax. Other minor changes made last April will involve a loss of about £4,000,000.

★

The upshot of this estimation—much of it, of course, is no more than guess-work—is that, although revenue is declining, the Chancellor will still have a prospective above-line surplus. On the figures suggested above, it would be rather under £400 million—much less than the probable actual surplus for 1949-50, and almost £100 million less than the prospective surplus he thought necessary twelve months ago. From a book-keeping point of view, part of this loss—perhaps most of it—will be offset by some prospective savings in "below-line" expenditure (the total of which is likely to be about £500 million this year). War damage payments, which in 1949-50 were enlarged by the £62½ million settlement with the public utilities, will be substantially reduced, and there may be some contraction in loans to local authorities (because of their recent borrowings in advance of spendings. If the Chancellor allows liberally for this unknown factor—thereby implicitly admitting the unwisdom of his interest-rate policy—he may succeed in showing a balance on the "overall" account, or even a small surplus. At least, this account will show a smaller deterioration than that in the "above-line" account alone.

But, despite the apparent improvement in accounting technique which is involved in the "overall" reckoning of the surplus or deficit, the fact remains that most of the elements now included "below" the line either have no inflationary significance or are better considered in relation to the capital account for the national economy as a whole. For example, if rebuilding for war damage declines, and cost-of-works payments fall (showing a gain in the "below-line" Exchequer account), that does not mean that the total investment outlay to be financed by the economy as a whole will be any smaller, because other outlays (e.g. those stimulated by the increased initial allowance) may have risen correspondingly. Such questions as these must be deferred until the *Economic Survey* gives estimates for the whole capital budget. But until these estimates are available, a clearer view of the chances of disinflationary budgeting, within the narrow limits set by the political dilemma, will be obtained by looking at the Exchequer's "above-line" position rather than at its "overall" account. And this "above-line" position is deteriorating.

Sterling and European Payments

THE proposed European Payments Union has become the apple of discord in OEEC and ECA discussions. It was Britain's attitude to the EPU which recently earned Mr Paul Hoffman's publicly-declared "annoyance." This remark has in turn led to a mounting tide of anti-British comment in the American press. It is the EPU which has drawn Dr Stikker to London to exercise his functions as the Political Conciliator of OEEC. It is the implementation of the EPU which is going to occupy most of the attention of the technical committee of OEEC in Paris during the next few weeks.

The principles of this union were agreed in Paris last January and the text of the agreement which was then reached was incorporated in the Second Report of the OEEC. The basic principle then accepted by all members was to make the currencies of OEEC countries freely transferable within these countries as a group, so that in consequence the problem of their balances of payments with one another would then become one single problem and not, as has tended to be the case hitherto, a series of more or less isolated, and insulated, balance of payments relations. On the implementation of that agreement depends much of the other work to which OEEC has been putting its hand and, in particular, the operation of the proposals for the liberalisation of trade.

When, however, it came to filling in the details of the principles agreed in Paris, difficulties inevitably arose. Some of them had already arisen before the last council meeting of OEEC came to an end. They have certainly come into clearer focus in the past few weeks. The main difficulty comes from the association of sterling, which is a widely used international currency, with a union whose other constituents will be essentially national currencies with a largely domestic circulation. Britain has a good case for asking that sterling should be given a special relationship to the EPU. If that case has as yet received very little recognition, it is hardly surprising, for no particular effort has been made to expound or publicise it. The truth is that sterling is already doing most valuable work in maintaining multilateral trade and payments over a wide area—even wider than that of the "scheduled territories." It is estimated that, in 1948, international trade to a total value of £5 billion was transacted in sterling. This represents 36 per cent of total visible world trade in that year. In the finance of invisible transactions, sterling probably accounted for more than 50 per cent of the total. In 1948, countries outside the sterling and American account areas transferred sterling among themselves to the amount of £240 million, and that figure grew to £266 million in 1949—a striking illustration of the extent to which sterling is used between non-sterling countries. In 1948, Continental OEEC countries used sterling to the extent of £1,200 million in their trade with the sterling area, to the extent of £130 million in their trade with countries outside the sterling area which do not participate in the Marshall Plan, and to the extent of £60 million in payments among themselves. Most of these payments were based on existing payments and monetary agreements to which the United Kingdom is one of the parties. The point at issue is how far those payments and monetary agreements should be cancelled and superseded, so far as Europe is concerned, by the proposed machinery to be set up under EPU.

The British case throughout the discussions has been that it would be the height of irresponsibility to attempt to sweep away these existing agreements and yield to the pressure exerted by some countries, notably Belgium, in favour of making EPU a comprehensive system for settling all bilateral surpluses and deficits within Europe. If the EPU acquired this all-embracing character it would be extremely difficult to fit into it the existing sterling area mechanism. Sterling is a currency in which substantial working balances and currency reserves are normally kept. If the balances maintained in London were to be made available for the periodic compensations which will be operated by the EPU, an impossible position would immediately arise. A great deal of sterling now held in the normal course by countries in Europe would be converted into claims against the clearing union, for which sooner or later Great Britain would have to start paying gold. If any such version of the EPU scheme were to prevail, Britain (it is argued) would in fact be compelled in self-defence to block balances such as those held on French, Italian and Swedish account—balances which are now freely available for current payments, within the limits set by the monetary and payments agreements with the countries in question. The British view has been that the transferability of currencies with Europe will not be served by abolishing a mechanism which already serves that purpose so well.

The line to be pursued, according to this view, is to increase the multilateral facilities offered by sterling and, to leave existing monetary arrangements undisturbed. The EPU would then be a lender of last resort, to be used only when the facilities of existing monetary agreements had been exhausted.

When this question of the supersession of monetary agreements is discussed, it is only to sterling that it has real relevance. The problem which it creates is, therefore, one of establishing some special relation between sterling and the proposed EPU. There is no doubt that Britain fully accepts the principle that debits and credits in OEEC trade should be transferable and multilateral. In fact it was British initiative which blew the dust off the old Keynes scheme for an International Clearing Union and put it into European circulation. But there is no reason why Britain should succumb to the negative and destructive suggestion that EPU should supersede a mechanism which is already functioning well and to the satisfaction of most people concerned.

*

If, however, Britain is to retain the existing monetary and payments agreements and the borrowing rights which it enjoys under them, it might be reasonable to suggest that Britain should refrain from seeking any borrowing rights from the EPU. To claim such rights would be asking for a double dose of facilities. It might well be in this direction, therefore, that Britain could justify a special relationship with the EPU. It would offer a lending quota to the EPU but would refrain from claiming a borrowing quota. There might be some elements of an " act of faith " in such a gesture, but it could probably be made with safety. In the first place Britain's borrowing powers under all existing payments and monetary agreements exceed its lending obligations, since many of these are sterling agreements which provide for the accumulation of balances in London but not for accumulations in other currencies. Secondly, the balance of payments of the United Kingdom and of the rest of the sterling area is already running at a surplus with the OEEC countries as a whole, and is likely to continue to do so for some time to come.

Under such a " one way " relation between Britain and EPU any deficit by the sterling area as a whole with OEEC countries would be handled as at present under the existing payments and monetary agreements, though any gold payments arising out of these agreements could be effected through the machinery of the European Payments Union. Any surplus with OEEC Europe, on the other hand, would be handled through the normal EPU machinery and covered, in the first instance, out of existing sterling resources of the debtor countries, and then by the line of credit which the United Kingdom would open in favour of other OEEC countries through EPU.

Such a development would in fact make sterling freely transferable among OEEC countries. It would not, however, shift countries such as Belgium and France, with which Britain has bilateral payments arrangements, into the transferable account group, since countries in that group but outside the circle of OEEC would still be unable to transfer sterling to or accept it from those countries except with the specific permission of the Bank of England.

*

It is by some such device that Britain could secure full membership of the proposed European Payments Union and at the same time retain the existing payments mechanism which has been gradually evolved under the sterling area system. It would be a way of ensuring that Britain's participation in the European payments scheme brought with it the participation of the whole sterling area, which is an objective that all parties concerned must wish to realise. It might be objected in some quarters that if the existing payments agreements are being maintained and if, as in the case of the British negotiations with Germany, a policy is pursued to make the credit facilities established under these agreements virtually unrestricted, the European Payments Union machinery would, in fact, be undermined. The argument would be that there is never need for a lender of last resort when there is no limit to the facilities offered by lenders of first resort. That, however, is to mistake the conception of the " dollar-free " payments agreements which Britain has recently been negotiating with European countries. If, under those agreements, an OEEC country such as western Germany were running a surplus with the sterling area, it could presumably choose between clearing that surplus through EPU or building up sterling balances. If it did the latter voluntarily, no undermining of EPU would, in fact, take place.

The differences of view on the problem of European payments come down to the familiar clash between those who think that there must be demolition before a new structure is built and others who believe in the process of gradual evolution and are convinced that a better result would be achieved by starting from and adapting an already going concern. There is no question of seeking undue protection for sterling; and the report from Washington that Britain has been asking for an American guarantee against all gold losses incurred in intra-European trade may be dismissed as groundless and irresponsible. But if the whole sterling area is to bring its contribution to the proposed scheme and to all that goes with it in terms of European reconstruction, it is reasonable to claim that a special, though certainly not a privileged, relationship should be established between the European Payments Union and the United Kingdom.

The Monopolies Commission

Members of " the general public " may be forgiven if they find the first report on the operation of the Monopolies and Restrictive Practices (Inquiry and Control) Act a little difficult to follow. In the first place, it may need to be explained that it is the Board of Trade, not the Monopolies Commission itself, which reports. Thus, while the first part of the document describes the commission's work (substantially, on matters which the Board of Trade has referred to it), the bulk of the complaints and suggestions mentioned occur in the second part, which reviews the communications received by the Board of Trade from " the general public " or from interested bodies. The Board of Trade is obliged to review these matters in this annual report. It is not, however, obliged to refer them to the Commission.

The entertaining collection of suggestions which occurs towards the end of the report is in this second group, and it would perhaps be unfortunate if the idea became widespread that anything was necessarily being done about them. They come mostly from " people who find themselves unable to enter a particular trade or who cannot obtain from suppliers the rate of discount to which they feel themselves entitled." There is "a strong family likeness " between these many complaints: trades do not want new members; they do not want interlopers to get trade discounts; or they require new entrants—if there must be such people—to buy goods which they do not want, or to refrain from buying goods which they may want from people outside the trade association. The mention of chemists' goods, cycles and motor cycles, motor cars, laboratory equipment, tyres and (an unexpected flash of imagination) tea seed oil refers to alleged practices of this kind in the distributive trades; there are many others in manufacturing. No doubt they will be sifted, and some may eventually find their way on to the commission's agenda.

But their very extent and variety threaten to clutter up the whole machine. What is the situation of the commission now? It has organised itself in a modest way, acquiring civil servants, statisticians, executive officers, clerks and typists to the number of 37. This team cannot clean out the whole vast stable. From the first six references made to it by the Board of Trade it has selected three—dental goods, electric lamps, and builders' castings—to which conditions of resale price maintenance appear to apply in common. To investigate these three subjects it has collected much written and oral evidence. It has done some travelling between factories and business premises, and looked at the working of anti-monopoly legislation in the United States, Canada, and Sweden. Nobody can possibly know how much this activity amounts to; everybody would be astonished, and many people would be pained and upset if it amounted to much. But at some stage the whole nebulous procedure will have to focus on some specific matter where the case for action is strong; it will then have to move in a decided manner. Otherwise, it will die of inanition.

Transport Debated

Wednesday offered the unusual spectacle of two debates on transport in the Lords and Commons. Neither, it must be regretfully concluded, advanced public knowledge very far. The Minister of Transport disclosed that the Transport Tribunal had reported on February 16th (a week before the General Election) on the application for an increase of one-sixth in freight charges. After considering all the arguments levelled against the proposed increase, the Tribunal " see no alternative but to ask the Minister to authorise those charges." The Government is at present considering this recommendation and, said Mr Barnes, " they are considering the repercussions of such an increase before any final decision is made." The matter of urgency last November, when the application was first submitted, remains undecided four months later.

It is undeniable, as the Minister argued, that the deficits of the Transport Commission could not be allowed to accumulate to £100 million by 1952, which is the earliest date by which charges schemes could be introduced—they may well be later. But the argument that the increase in charges was " largely for the purpose of paying interest to the stockholders of the railways " is quite inadmissible, even though the Minister was careful to add that interest was a legitimate charge. The whole corpus of railway expenditure and receipts is in question, not one part of it. Nor is it possible to accept without qualification the Minister's contention that a review of the work of the British Transport Commission shows that " it has thoroughly justified itself up to the present moment." There are too many obvious errors of organisation and weaknesses of administration to justify any claim of that sort.

To the Minister, at any rate, transport economics seem soluble in only three ways. " Severe " economies are " not possible, because if we cut to that extent we would vitally injure our railway system." The second is a subsidy. If a subsidy is impossible (it is quite certainly most undesirable) how can the deficiency be met, asked Mr Barnes, " unless it is met by an increase in charges "? This defeatist conclusion is unacceptable. The whole attack on railway charges must be made through costs. It is here that the Commission has to prove itself, and talk of severe cuts which would ruin the railway system (as if it were not rapidly ruining itself) misses the whole point that economies and greater operating efficiency are desirable and possible.

Improved Profits Announcements

A letter has been sent out this week to 6,500 companies over the signature of the chairman of the London Stock Exchange, seeking an improvement in the form of preliminary profits statements. Mr John Braithwaite points out that preliminary statements, " which are almost as important as final accounts," could in some instances be more informative, and he suggests that sufficient experience has been gained of the Companies Act of 1948 to enable minimum preliminary information about profits to be given on a more uniform basis. The Stock Exchange authorities, with the assistance of the two main accountancy bodies and the Chartered Institute of Secretaries, have therefore drawn up a specimen form of the preliminary announcement; it is put forward only as a specimen and the chairman's letter recognises that it may have to be modified to fit the circumstances of

any particular case. The minimum information which is requested from holding companies is:

(*a*) Group profit (or loss) after all charges including taxation.

(*b*) UK taxation charged in arriving at (*a*).

(*c*) Amount of (*a*) attributable to members of the holding company after deducting profits attributable to outside interests.

(*d*) If material, the extent of which (*a*) is affected by special credits (including transfers from reserves) and/or debits.

(*e*) Rates of dividend of the holding company paid and proposed and the net cost.

(*f*) Comparative figures for heads (*a*) to (*e*) for the preceding year.

(*g*) Any supplementary information which the directors think necessary for a reasonable appreciation of the results of the year or other material changes in the aggregate of the balances on profit and loss account and other reserves of the group.

Corresponding information is requested of single companies, and it is emphasised that information additional to that set out in the minimum requirements will continue to be welcome.

*

It might be suggested that Stock Exchange authorities could have asked for a profits figure before the deduction of all charges, some of which (such as depreciation) might vary fairly widely from year to year. Presumably, however, the reservation under (*g*) that directors should provide further information necessary for "a reasonable appreciation of the results of the year" would cover cases in which a considerable movement in total trading profits is offset by comparable movements in charges against trading profits, so that the shareholder would not be left to suppose that comparative stability of net profits after tax meant an unchanged trading experience during the year.

The request of the chairman, it is hoped, will be sympathetically received by directors of public companies—the more so since the proposals are submitted as a guide to what the Stock Exchange Council would like and not as a set of regulations which they are in a position to compel. Reminders that the share and loan department is ready at all times to advise on the timing and method of announcement about offers of purchase of companies or shares and of the desirability of giving as full details as possible about the reasons compelling a reduction or the passing of a dividend, are important and timely. The chairman's letter suggests that there is much to be said for taking important decisions after the close of the Stock Exchanges so that interested parties all over the country may receive the news at the same time on the following morning. This point is wisely left to the discretion of individual boards, but its importance rests on the desirability, as far as possible, of avoiding a false market in shares.

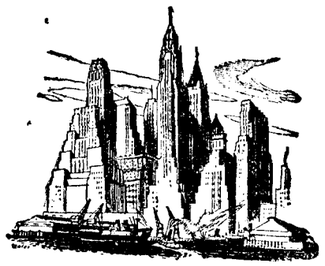
Control of Engagements Dropped



Mr Isaacs's hurried decision to withdraw the Control of Engagement Order and abandon his powers of direction came as a surprise. How many Labour speakers had lately stressed the importance of this control as part of "the machinery of economic planning"? Yet it has gone at a stroke, and its disappearance is to make no difference at all. Political expediency was clearly behind the Cabinet's decision. There might have been awkward Parliamentary consequences if the Conservatives had pressed their motion to annul the Order; some Labour members might have felt no enthusiasm to resist such a motion.

The dropping of the Control of Engagement Order will probably not make very much immediate difference to the distribution of manpower. Its existence may have had a

COMPLETE WORLD-WIDE BANKING SERVICE

With the immense strength of its combined resources and experience, the Three Banks Group is exceptionally well-equipped to fulfil the many varied functions of a modern Banking Service. Although the Group serves the interests of many large and important concerns, it is careful to preserve the personal touch that has been a tradition of each of its members during two centuries.

Let LLOYDS BANK look after *your* interests

stabilising effect for a time. It may even—temporarily—have contributed towards building up the labour force in certain undermanned industries. When it was introduced in October, 1947, the numbers passing through employment exchanges immediately increased by 50 per cent, and of a total number of 10,408,000 placings by employment exchanges between October, 1947, and January, 1950, 1,214,000 were in "first preference" industries. Perhaps, too, the sanction in the background may have had some influence on possible recalcitrants, but it would be difficult to prove; the power was hardly ever used. The real authority of the employment exchanges was limited from the first. But much will now depend on the degree of effectiveness with which they can continue to exercise their powers of persuasion.

It may therefore be argued that, even leaving aside the political considerations, the Government has done the sensible thing in discarding a control which was too unpopular to be usable. Perhaps it is charitable to overlook the curious fact that nothing has happened to alter the situation since Mr Isaacs swore by the necessity of the Order in December. But, granted all this, it is still necessary to remember that the distribution of manpower is unsatisfactory. The latest figures show that while the numbers in the manufacturing industries increased by 38,000 in January, bringing the total to 8,411,000, building and distribution are still occupying far more workers than the Government has forecast or intended. Coal manpower is still declining and is 31,000 below the now forgotten "target" for 1949.

The Government has no alternative method for influencing manpower distribution. Circumstances do not permit it to have a wages policy. Its electoral commitments seem to bind it to high expenditure all round, and there is no sign of an end to inflation. How, in these circumstances, can manpower be turned from the occupations which can dispense with it towards those to which the national interest requires it to flow? Compulsory powers have been dropped. Wages are rigid. No recourse seems to remain.

Industry

Cotton Spinning Productivity

The inferiority in productivity of British to American cotton mills was described in the report of the Platt mission six years ago, and the essential factors have not changed since then; but it can do no harm that a team sent by the Anglo-American Council on Productivity has visited the American cotton spinning mills and faced the facts once more. These are set out in the table below, extracted from the team's report.* The first line of figures shows that for every 100 operatives required to produce a given output in an average American cardroom, 263 are required in an average British cardroom. The other figures, which give qualified comparisons designed to set the British performance in its most favourable light, are still to the disadvantage of the British mills:—

PRODUCTIVITY IN ENGLISH COTTON SPINNING MILLS
(Comparison with USA in operative hours per 100 lb. of product)
American average = 100 in all cases.

	Card Room	Ring Room
